

ESP32-C3

ESP-IDF Programming Guide

Release v5.0.5
Espressif Systems
Dec 13, 2023

Table of contents

Table of contents	i
1 Get Started	3
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	13
1.3 Installation	13
1.3.1 IDE	13
1.3.2 Manual Installation	14
1.4 Build Your First Project	43
1.5 Uninstall ESP-IDF	43
2 API Reference	45
2.1 API Conventions	45
2.1.1 Error handling	45
2.1.2 Configuration structures	45
2.1.3 Private APIs	46
2.1.4 Components in example projects	46
2.1.5 API Stability	47
2.2 Application Protocols	48
2.2.1 ASIO port	48
2.2.2 ESP-Modbus	48
2.2.3 ESP-MQTT	49
2.2.4 ESP-TLS	64
2.2.5 ESP HTTP Client	79
2.2.6 ESP Local Control	94
2.2.7 ESP Serial Slave Link	103
2.2.8 ESP x509 Certificate Bundle	117
2.2.9 HTTP Server	119
2.2.10 HTTPS Server	147
2.2.11 ICMP Echo	150
2.2.12 mDNS Service	155
2.2.13 Mbed TLS	156
2.2.14 IP Network Layer	157
2.3 Bluetooth API	157
2.3.1 BT COMMON	158
2.3.2 BT LE	166
2.3.3 Controller && VHCI	295
2.3.4 ESP-BLE-MESH	305
2.3.5 NimBLE-based host APIs	586
2.4 Error Codes Reference	588
2.5 Networking APIs	595
2.5.1 Wi-Fi	595
2.5.2 Ethernet	715
2.5.3 Thread	743
2.5.4 ESP-NETIF	750

2.5.5	IP Network Layer	781
2.5.6	Application Layer	784
2.6	Peripherals API	784
2.6.1	Analog to Digital Converter (ADC) Oneshot Mode Driver	784
2.6.2	Analog to Digital Converter (ADC) Continuous Mode Driver	793
2.6.3	Analog to Digital Converter (ADC) Calibration Driver	800
2.6.4	Clock Tree	803
2.6.5	GPIO & RTC GPIO	809
2.6.6	General Purpose Timer (GPTimer)	824
2.6.7	Dedicated GPIO	836
2.6.8	Hash-based Message Authentication Code (HMAC)	840
2.6.9	Digital Signature (DS)	844
2.6.10	Inter-Integrated Circuit (I2C)	850
2.6.11	Inter-IC Sound (I2S)	866
2.6.12	LCD	906
2.6.13	LED Control (LEDC)	920
2.6.14	Remote Control Transceiver (RMT)	938
2.6.15	SD SPI Host Driver	964
2.6.16	Sigma-Delta Modulation (SDM)	969
2.6.17	SPI Master Driver	974
2.6.18	SPI Slave Driver	995
2.6.19	Temperature Sensor	1001
2.6.20	Two-Wire Automotive Interface (TWAI)	1004
2.6.21	Universal Asynchronous Receiver/Transmitter (UART)	1022
2.7	Project Configuration	1046
2.7.1	Introduction	1046
2.7.2	Project Configuration Menu	1046
2.7.3	Using sdkconfig.defaults	1046
2.7.4	Kconfig Formatting Rules	1046
2.7.5	Backward Compatibility of Kconfig Options	1047
2.7.6	Configuration Options Reference	1047
2.8	Provisioning API	1307
2.8.1	Protocol Communication	1307
2.8.2	Unified Provisioning	1322
2.8.3	Wi-Fi Provisioning	1329
2.9	Storage API	1347
2.9.1	FAT Filesystem Support	1347
2.9.2	Manufacturing Utility	1355
2.9.3	Non-volatile Storage Library	1359
2.9.4	NVS Partition Generator Utility	1381
2.9.5	SD/SDIO/MMC Driver	1386
2.9.6	SPI Flash API	1398
2.9.7	SPIFFS Filesystem	1436
2.9.8	Virtual filesystem component	1440
2.9.9	Wear Levelling API	1456
2.10	System API	1459
2.10.1	App Image Format	1459
2.10.2	Application Level Tracing	1464
2.10.3	Call function with external stack	1469
2.10.4	Chip Revision	1471
2.10.5	Console	1473
2.10.6	eFuse Manager	1482
2.10.7	Error Codes and Helper Functions	1509
2.10.8	ESP HTTPS OTA	1512
2.10.9	Event Loop Library	1519
2.10.10	FreeRTOS (Overview)	1531
2.10.11	FreeRTOS (ESP-IDF)	1533
2.10.12	FreeRTOS (Supplemental Features)	1651

2.10.13	Heap Memory Allocation	1670
2.10.14	Heap Memory Debugging	1683
2.10.15	High Resolution Timer (ESP Timer)	1694
2.10.16	Internal and Unstable APIs	1701
2.10.17	Interrupt allocation	1702
2.10.18	Logging library	1708
2.10.19	Miscellaneous System APIs	1715
2.10.20	Over The Air Updates (OTA)	1730
2.10.21	Power Management	1741
2.10.22	POSIX Threads Support	1748
2.10.23	Random Number Generation	1752
2.10.24	Sleep Modes	1754
2.10.25	SoC Capabilities	1764
2.10.26	System Time	1775
2.10.27	The Async memcpy API	1781
2.10.28	Watchdogs	1784
3	Hardware Reference	1791
3.1	Chip Series Comparison	1791
3.1.1	Related Documents	1794
4	API Guides	1795
4.1	Application Level Tracing library	1795
4.1.1	Overview	1795
4.1.2	Modes of Operation	1795
4.1.3	Configuration Options and Dependencies	1796
4.1.4	How to Use This Library	1797
4.2	Application Startup Flow	1805
4.2.1	First stage bootloader	1805
4.2.2	Second stage bootloader	1806
4.2.3	Application startup	1806
4.3	BluFi	1807
4.3.1	Overview	1808
4.3.2	The BluFi Flow	1808
4.3.3	The Flow Chart of BluFi	1808
4.3.4	The Frame Formats Defined in BluFi	1808
4.3.5	The Security Implementation of ESP32-C3	1814
4.3.6	GATT Related Instructions	1815
4.4	Bootloader	1815
4.4.1	Bootloader compatibility	1816
4.4.2	Log Level	1816
4.4.3	Factory reset	1816
4.4.4	Boot from Test Firmware	1817
4.4.5	Rollback	1817
4.4.6	Watchdog	1817
4.4.7	Bootloader Size	1818
4.4.8	Fast boot from Deep Sleep	1818
4.4.9	Custom bootloader	1818
4.5	Build System	1819
4.5.1	Overview	1819
4.5.2	Using the Build System	1819
4.5.3	Example Project	1821
4.5.4	Project CMakeLists File	1822
4.5.5	Component CMakeLists Files	1823
4.5.6	Component Configuration	1826
4.5.7	Preprocessor Definitions	1826
4.5.8	Component Requirements	1826
4.5.9	Overriding Parts of the Project	1830

4.5.10	Configuration-Only Components	1831
4.5.11	Debugging CMake	1831
4.5.12	Example Component CMakeLists	1831
4.5.13	Custom sdkconfig defaults	1835
4.5.14	Flash arguments	1836
4.5.15	Building the Bootloader	1836
4.5.16	Writing Pure CMake Components	1837
4.5.17	Using Third-Party CMake Projects with Components	1837
4.5.18	Using Prebuilt Libraries with Components	1838
4.5.19	Using ESP-IDF in Custom CMake Projects	1838
4.5.20	ESP-IDF CMake Build System API	1839
4.5.21	File Globbing & Incremental Builds	1843
4.5.22	Build System Metadata	1843
4.5.23	Build System Internals	1844
4.5.24	Migrating from ESP-IDF GNU Make System	1845
4.6	Core Dump	1847
4.6.1	Overview	1847
4.6.2	Configurations	1847
4.6.3	Save core dump to flash	1848
4.6.4	Print core dump to UART	1848
4.6.5	ROM Functions in Backtraces	1849
4.6.6	Dumping variables on demand	1849
4.6.7	Running <code>espcoredump.py</code>	1849
4.7	Deep Sleep Wake Stubs	1850
4.7.1	Rules for Wake Stubs	1852
4.7.2	Implementing A Stub	1852
4.7.3	Loading Code Into RTC Memory	1853
4.7.4	Loading Data Into RTC Memory	1853
4.7.5	CRC Check For Wake Stubs	1854
4.7.6	Example	1854
4.8	Error Handling	1854
4.8.1	Overview	1854
4.8.2	Error codes	1854
4.8.3	Converting error codes to error messages	1855
4.8.4	<code>ESP_ERROR_CHECK</code> macro	1855
4.8.5	<code>ESP_ERROR_CHECK_WITHOUT_ABORT</code> macro	1855
4.8.6	<code>ESP_RETURN_ON_ERROR</code> macro	1855
4.8.7	<code>ESP_GOTO_ON_ERROR</code> macro	1856
4.8.8	<code>ESP_RETURN_ON_FALSE</code> macro	1856
4.8.9	<code>ESP_GOTO_ON_FALSE</code> macro	1856
4.8.10	CHECK MACROS Examples	1856
4.8.11	Error handling patterns	1856
4.8.12	C++ Exceptions	1857
4.9	ESP-BLE-MESH	1857
4.9.1	Getting Started with ESP-BLE-MESH	1858
4.9.2	ESP-BLE-MESH Examples	1865
4.9.3	ESP-BLE-MESH Demo Videos	1865
4.9.4	ESP-BLE-MESH FAQ	1866
4.9.5	Related Documents	1866
4.10	ESP-WIFI-MESH	1895
4.10.1	Overview	1895
4.10.2	Introduction	1895
4.10.3	ESP-WIFI-MESH Concepts	1896
4.10.4	Building a Network	1902
4.10.5	Managing a Network	1907
4.10.6	Data Transmission	1910
4.10.7	Channel Switching	1912
4.10.8	Performance	1915

4.10.9	Further Notes	1916
4.11	Event Handling	1916
4.11.1	Wi-Fi, Ethernet, and IP Events	1916
4.11.2	Mesh Events	1917
4.11.3	Bluetooth Events	1918
4.12	Fatal Errors	1918
4.12.1	Overview	1918
4.12.2	Panic Handler	1918
4.12.3	Register Dump and Backtrace	1919
4.12.4	GDB Stub	1922
4.12.5	RTC Watchdog Timeout	1923
4.12.6	Guru Meditation Errors	1923
4.12.7	Other Fatal Errors	1924
4.13	Flash Encryption	1927
4.13.1	Introduction	1927
4.13.2	Relevant eFuses	1928
4.13.3	Flash Encryption Process	1928
4.13.4	Flash Encryption Configuration	1929
4.13.5	Possible Failures	1934
4.13.6	ESP32-C3 Flash Encryption Status	1936
4.13.7	Reading and Writing Data in Encrypted Flash	1936
4.13.8	Updating Encrypted Flash	1937
4.13.9	Disabling Flash Encryption	1937
4.13.10	Key Points About Flash Encryption	1938
4.13.11	Limitations of Flash Encryption	1938
4.13.12	Flash Encryption and Secure Boot	1938
4.13.13	Advanced Features	1938
4.13.14	Technical Details	1940
4.14	Hardware Abstraction	1940
4.14.1	Architecture	1941
4.14.2	LL (Low Level) Layer	1942
4.14.3	HAL (Hardware Abstraction Layer)	1943
4.15	JTAG Debugging	1944
4.15.1	Introduction	1944
4.15.2	How it Works?	1945
4.15.3	Selecting JTAG Adapter	1945
4.15.4	Setup of OpenOCD	1946
4.15.5	Configuring ESP32-C3 Target	1946
4.15.6	Launching Debugger	1949
4.15.7	Debugging Examples	1949
4.15.8	Building OpenOCD from Sources	1949
4.15.9	Tips and Quirks	1954
4.15.10	Related Documents	1958
4.16	Linker Script Generation	1983
4.16.1	Overview	1983
4.16.2	Quick Start	1983
4.16.3	Linker Script Generation Internals	1986
4.17	lwIP	1992
4.17.1	Supported APIs	1993
4.17.2	BSD Sockets API	1993
4.17.3	Netconn API	1997
4.17.4	lwIP FreeRTOS Task	1997
4.17.5	IPv6 Support	1997
4.17.6	esp-lwip custom modifications	1998
4.17.7	Performance Optimization	1999
4.18	Memory Types	2000
4.18.1	DRAM (Data RAM)	2001
4.18.2	IRAM (Instruction RAM)	2001

4.18.3	IROM (code executed from flash)	2002
4.18.4	DROM (data stored in flash)	2002
4.18.5	RTC FAST memory	2002
4.18.6	DMA Capable Requirement	2003
4.18.7	DMA Buffer in the stack	2003
4.19	OpenThread	2004
4.19.1	Modes of the OpenThread stack	2004
4.19.2	How to Write an OpenThread Application	2004
4.19.3	The OpenThread Border Router	2005
4.20	Partition Tables	2006
4.20.1	Overview	2006
4.20.2	Built-in Partition Tables	2006
4.20.3	Creating Custom Tables	2006
4.20.4	Generating Binary Partition Table	2009
4.20.5	Partition Size Checks	2009
4.20.6	Flashing the partition table	2010
4.20.7	Partition Tool (parttool.py)	2010
4.21	Performance	2011
4.21.1	How to Optimize Performance	2011
4.21.2	Guides	2012
4.22	RF calibration	2028
4.22.1	Partial calibration	2028
4.22.2	Full calibration	2028
4.22.3	No calibration	2028
4.22.4	PHY initialization data	2029
4.22.5	API Reference	2029
4.23	Secure Boot V2	2032
4.23.1	Background	2032
4.23.2	Advantages	2032
4.23.3	Secure Boot V2 Process	2033
4.23.4	Signature Block Format	2033
4.23.5	Secure Padding	2034
4.23.6	Verifying a Signature Block	2034
4.23.7	Verifying an Image	2034
4.23.8	Bootloader Size	2035
4.23.9	eFuse usage	2035
4.23.10	How To Enable Secure Boot V2	2035
4.23.11	Restrictions after Secure Boot is enabled	2036
4.23.12	Generating Secure Boot Signing Key	2036
4.23.13	Remote Signing of Images	2036
4.23.14	Secure Boot Best Practices	2037
4.23.15	Key Management	2038
4.23.16	Multiple Keys	2038
4.23.17	Key Revocation	2038
4.23.18	Technical Details	2039
4.23.19	Secure Boot & Flash Encryption	2039
4.23.20	Signed App Verification Without Hardware Secure Boot	2039
4.23.21	Advanced Features	2040
4.24	Thread Local Storage	2040
4.24.1	Overview	2040
4.24.2	FreeRTOS Native API	2040
4.24.3	Pthread API	2041
4.24.4	C11 Standard	2041
4.25	Tools	2041
4.25.1	IDF Frontend - idf.py	2041
4.25.2	IDF Docker Image	2045
4.25.3	IDF Windows Installer	2047
4.25.4	IDF Component Manager	2048

4.25.5	IDF Clang Tidy	2049
4.25.6	Downloadable Tools	2050
4.26	Unit Testing in ESP32-C3	2064
4.26.1	Normal Test Cases	2064
4.26.2	Multi-device Test Cases	2065
4.26.3	Multi-stage Test Cases	2066
4.26.4	Tests For Different Targets	2066
4.26.5	Building Unit Test App	2067
4.26.6	Running Unit Tests	2067
4.26.7	Timing Code with Cache Compensated Timer	2068
4.26.8	Mocks	2069
4.27	Unit Testing on Linux	2071
4.27.1	Embedded Software Tests	2071
4.27.2	IDF Unit Tests on Linux Host	2072
4.28	USB Serial/JTAG Controller Console	2073
4.28.1	Hardware Requirements	2073
4.28.2	Software Configuration	2073
4.28.3	Uploading the Application	2073
4.28.4	Limitations	2073
4.29	Wi-Fi Driver	2074
4.29.1	ESP32-C3 Wi-Fi Feature List	2074
4.29.2	How To Write a Wi-Fi Application	2074
4.29.3	ESP32-C3 Wi-Fi API Error Code	2075
4.29.4	ESP32-C3 Wi-Fi API Parameter Initialization	2076
4.29.5	ESP32-C3 Wi-Fi Programming Model	2076
4.29.6	ESP32-C3 Wi-Fi Event Description	2076
4.29.7	ESP32-C3 Wi-Fi Station General Scenario	2079
4.29.8	ESP32-C3 Wi-Fi AP General Scenario	2082
4.29.9	ESP32-C3 Wi-Fi Scan	2082
4.29.10	ESP32-C3 Wi-Fi Station Connecting Scenario	2089
4.29.11	ESP32-C3 Wi-Fi Station Connecting When Multiple APs Are Found	2096
4.29.12	Wi-Fi Reconnect	2096
4.29.13	Wi-Fi Beacon Timeout	2096
4.29.14	ESP32-C3 Wi-Fi Configuration	2097
4.29.15	Wi-Fi Easy Connect™ (DPP)	2103
4.29.16	Wireless Network Management	2103
4.29.17	Radio Resource Measurement	2103
4.29.18	Fast BSS Transition	2104
4.29.19	Wi-Fi Location	2104
4.29.20	ESP32-C3 Wi-Fi Power-saving Mode	2105
4.29.21	ESP32-C3 Wi-Fi Throughput	2106
4.29.22	Wi-Fi 80211 Packet Send	2107
4.29.23	Wi-Fi Sniffer Mode	2108
4.29.24	Wi-Fi Multiple Antennas	2109
4.29.25	Wi-Fi Channel State Information	2110
4.29.26	Wi-Fi Channel State Information Configure	2112
4.29.27	Wi-Fi HT20/40	2112
4.29.28	Wi-Fi QoS	2112
4.29.29	Wi-Fi AMSDU	2113
4.29.30	Wi-Fi Fragment	2113
4.29.31	WPS Enrollee	2113
4.29.32	Wi-Fi Buffer Usage	2113
4.29.33	How to Improve Wi-Fi Performance	2114
4.29.34	Wi-Fi Menuconfig	2116
4.29.35	Troubleshooting	2119
4.30	Wi-Fi Security	2122
4.30.1	ESP32-C3 Wi-Fi Security Features	2122
4.30.2	Protected Management Frames (PMF)	2125

4.30.3	WiFi Enterprise	2126
4.30.4	WPA3-Personal	2126
4.30.5	Wi-Fi Enhanced Open™	2127
4.31	RF Coexistence	2127
4.31.1	Overview	2128
4.31.2	Supported Coexistence Scenario for ESP32-C3	2128
4.31.3	Coexistence Mechanism and Policy	2128
4.31.4	How to Use the Coexistence Feature	2129
4.32	Reproducible Builds	2130
4.32.1	Introduction	2130
4.32.2	Reasons for non-reproducible builds	2131
4.32.3	Enabling reproducible builds in ESP-IDF	2131
4.32.4	How reproducible builds are achieved	2131
4.32.5	Reproducible builds and debugging	2131
4.32.6	Factors which still affect reproducible builds	2132
5	Migration Guides	2133
5.1	ESP-IDF 5.x Migration Guide	2133
5.1.1	Migration from 4.4 to 5.0	2133
6	Libraries and Frameworks	2163
6.1	Cloud Frameworks	2163
6.1.1	ESP RainMaker	2163
6.1.2	AWS IoT	2163
6.1.3	Azure IoT	2163
6.1.4	Google IoT Core	2163
6.1.5	Aliyun IoT	2163
6.1.6	Joylink IoT	2163
6.1.7	Tencent IoT	2164
6.1.8	Tencentyun IoT	2164
6.1.9	Baidu IoT	2164
6.2	Espressif's Frameworks	2164
6.2.1	Espressif Audio Development Framework	2164
6.2.2	ESP-CSI	2164
6.2.3	Espressif DSP Library	2164
6.2.4	ESP-WIFI-MESH Development Framework	2165
6.2.5	ESP-WHO	2165
6.2.6	ESP RainMaker	2165
6.2.7	ESP-IoT-Solution	2165
6.2.8	ESP-Protocols	2165
6.2.9	ESP-BSP	2166
7	Contributions Guide	2167
7.1	How to Contribute	2167
7.2	Before Contributing	2167
7.3	Pull Request Process	2167
7.4	Legal Part	2168
7.5	Related Documents	2168
7.5.1	Espressif IoT Development Framework Style Guide	2168
7.5.2	Install pre-commit Hook for ESP-IDF Project	2175
7.5.3	Documenting Code	2176
7.5.4	Creating Examples	2181
7.5.5	API Documentation Template	2182
7.5.6	Contributor Agreement	2184
7.5.7	Copyright Header Guide	2186
7.5.8	ESP-IDF Tests with Pytest Guide	2187
8	ESP-IDF Versions	2197

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#) and [ESP32-C Series SoCs](#).

This document describes using ESP-IDF with the ESP32-C3 SoC.

		
Get Started	API Reference	API Guides

Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C3 board.

Note: This is documentation for stable version v5.0.5 of ESP-IDF. Other *ESP-IDF Versions* are also available.

1.1 Introduction

ESP32-C3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An **ESP32-C3** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

If you have one of ESP32-C3 official development boards listed below, you can click on the link to learn more about the hardware.

ESP32-C3-DevKitM-1

This user guide will help you get started with ESP32-C3-DevKitM-1 and will also provide more in-depth information.

ESP32-C3-DevKitM-1 is an entry-level development board based on [ESP32-C3-MINI-1](#), a module named for its small size. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the ESP32-C3-MINI-1 module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitM-1 on a breadboard.

Fig. 1: ESP32-C3-DevKitM-1

The document consists of the following major sections:

- *Getting Started*: Overview of ESP32-C3-DevKitM-1 and hardware/software setup instructions to get started.
- *Hardware Reference*: More detailed information about the ESP32-C3-DevKitM-1's hardware.
- *Hardware Revision Details*: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitM-1.
- *Related Documents*: Links to related documentation.

Getting Started This section provides a brief introduction of ESP32-C3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

Description of Components The key components of the board are described in a counter-clockwise direction.

Fig. 2: ESP32-C3-DevKitM-1 - front

Key Component	Description
ESP32-C3-MINI-1	ESP32-C3-MINI-1 is a general-purpose Wi-Fi and Bluetooth LE combo module that comes with a PCB antenna. At the core of this module is ESP32-C3FN4 , a chip that has an embedded flash of 4 MB. Since flash is packaged in the ESP32-C3FN4 chip, rather than integrated into the module, ESP32-C3-MINI-1 has a smaller package size.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block .
Boot Button	Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3FN4 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

Start Application Development Before powering up your ESP32-C3-DevKitM-1, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- ESP32-C3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Software Setup Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment and then flash an application example onto your ESP32-C3-DevKitM-1.

Contents and Packaging

Retail Orders If you order one or several samples, each ESP32-C3-DevKitM-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to <https://www.espressif.com/en/contact-us/get-samples>.

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to <https://www.espressif.com/en/contact-us/sales-questions>.

Hardware Reference

Block Diagram The block diagram below shows the components of ESP32-C3-DevKitM-1 and their interconnections.

Fig. 3: ESP32-C3-DevKitM-1 (click to enlarge)

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro-USB Port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

Header Block The two tables below provide the **Name** and **Function** of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in *ESP32-C3-DevKitM-1 - front*. The numbering is the same as in the *ESP32-C3-DevKitM-1 Schematic* (PDF).

J1

No.	Name	Type ^{Page 1}	Function

¹ P: Power supply; I: Input; O: Output; T: High impedance.

² GPIO2, GPIO8, and GPIO9 are strapping pins of the ESP32-C3FN4 chip. These pins are used to control several chip functions depending on binary voltage values applied to the pins during chip power-up or system reset. For description and application of the strapping pins, please refer to Section Strapping Pins in [ESP32-C3 Datasheet](#).

ESP32-C3-DevKitM-1

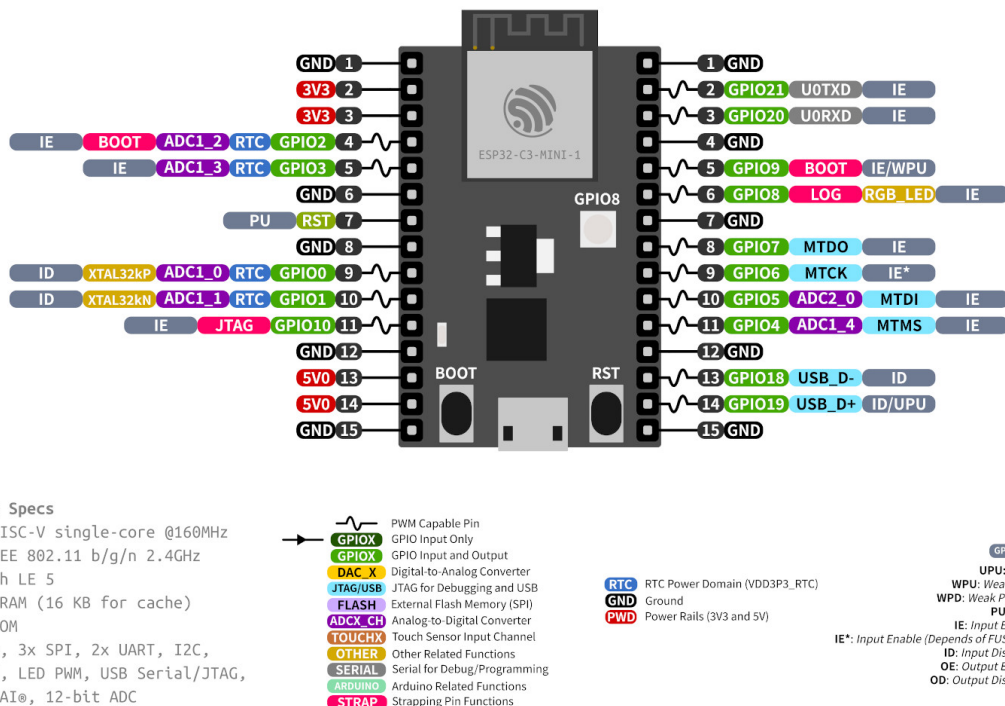

Fig. 4: ESP32-C3-DevKitM-1 Pin Layout (click to enlarge)

ESP32-C3-DevKitC-02

This user guide will help you get started with ESP32-C3-DevKitC-02 and will also provide more in-depth information. ESP32-C3-DevKitC-02 is an entry-level development board based on ESP32-C3-WROOM-02, a general-purpose module with 4 MB SPI flash. This board integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-C3-DevKitC-02 on a breadboard.

The document consists of the following major sections:

- *Getting Started*: Overview of ESP32-C3-DevKitC-02 and hardware/software setup instructions to get started.
- *Hardware Reference*: More detailed information about the ESP32-C3-DevKitC-02's hardware.
- *Hardware Revision Details*: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-C3-DevKitC-02.
- *Related Documents*: Links to related documentation.

Getting Started This section provides a brief introduction of ESP32-C3-DevKitC-02, instructions on how to do the initial hardware setup and how to flash firmware onto it.

Description of Components The key components of the board are described in a counter-clockwise direction.

Fig. 5: ESP32-C3-DevKitC-02

Fig. 6: ESP32-C3-DevKitC-02 - front

Key Component	Description
ESP32-C3-WROOM-02	ESP32-C3-WROOM-02 from Espressif is a powerful and general-purpose module that offers Wi-Fi and Bluetooth LE coexistence. It has a PCB antenna and a 4 MB SPI flash.
5 V to 3.3 V LDO	Power regulator that converts a 5 V supply into a 3.3 V output.
5 V Power On LED	Turns on when the USB power is connected to the board.
Pin Headers	All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board. For details, please see Header Block .
Boot Button	Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.
Micro-USB Port	USB interface. Power supply for the board as well as the communication interface between a computer and the ESP32-C3 chip.
Reset Button	Press this button to restart the system.
USB-to-UART Bridge	Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED	Addressable RGB LED, driven by GPIO8.

Start Application Development Before powering up your ESP32-C3-DevKitC-02, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- ESP32-C3-DevKitC-02
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

For further design documentation for the board, please contact us at sales@espressif.com.

1.2.2 Software

To start using ESP-IDF on **ESP32-C3**, install the following software:

- **Toolchain** to compile code for ESP32-C3
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C3 and scripts to operate the **Toolchain**

1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 IDE

Note: We highly recommend installing the ESP-IDF through your favorite IDE.

- [Eclipse Plugin](#)
- [VSCode Extension](#)

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

Standard Setup of Toolchain for Windows

Introduction ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

Note: Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

ESP-IDF Tools Installer The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

What is the usecase for Online and Offline Installer Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

Components of the installation The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- [CMake](#) and [Ninja](#) build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

Launching ESP-IDF Environment At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (`cmd.exe`). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

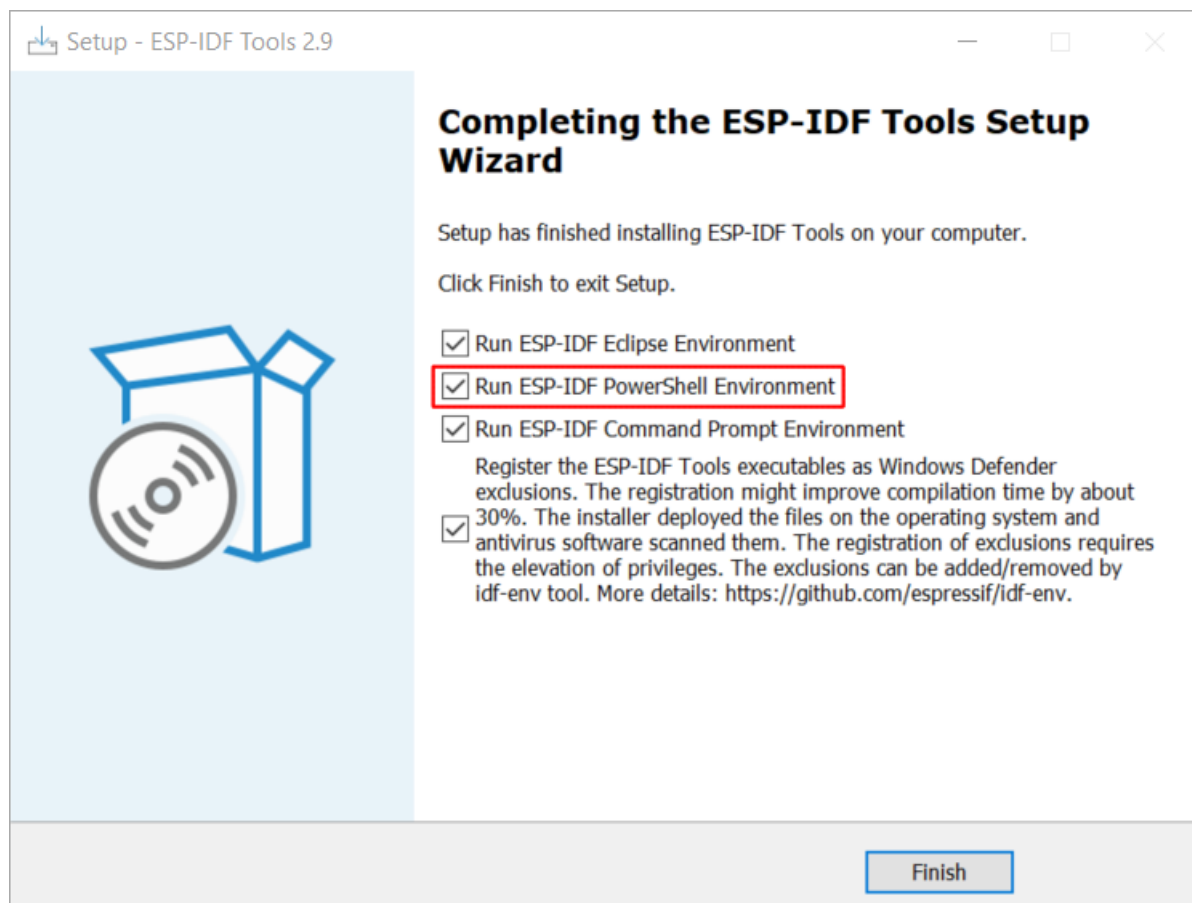

Fig. 9: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

Using the Command Prompt For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

```

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 12: ESP-IDF Command Prompt

First Steps on ESP-IDF Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

Start a Project Now you are ready to prepare your application for ESP32-C3. You can start with [get-started/hello_world](#) project from [examples](#) directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project [get-started/hello_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

Note: There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device Now connect your ESP32-C3 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C3](#) for full details.

Note: Keep the port name handy as you will need it in the next steps.

Configure Your Project Navigate to your `hello_world` directory, set ESP32-C3 as the target, and run the project configuration utility `menuconfig`.

Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c3`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello_word”, since this example runs with default configuration.

```

Note: The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

Build the Project Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition-table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build will finish by generating the firmware binary `.bin` files.

Flash onto the Device Flash the binaries that you just built (`bootloader.bin`, `partition-table.bin` and `hello_world.bin`) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with your ESP32-C3 board's serial port name.

You can also change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

Note: The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C3](#)). The DTR and RTS control lines are in turn connected to `GPIO9` and `CHIP_PU (EN)` pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (`GPIO9`) and press the **EN** button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO9` down.

Normal Operation When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↪after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB_
↪0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000_
↪hello_world.bin

Hard resetting via RTS pin...
Done

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCoDe Extension](#).

Monitor the Output To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↳world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```

...
Hello world!
Restarting in 10 seconds...
This is esp32c3 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2MB
↳external flash
Minimum free heap size: 337332 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

To exit IDF monitor use the shortcut `Ctrl+]`.

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

That's all that you need to get started with ESP32-C3!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

Important: Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

Additional Tips

Permission issues /dev/ttyUSB0 With some Linux distributions, you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32-C3. *This can be solved by adding the current user to the `dialout` group.*

Python compatibility ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

Related Documents For advanced users who want to customize the install process:

- [Updating ESP-IDF tools on Windows](#)
- [Establish Serial Connection with ESP32-C3](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

Updating ESP-IDF tools on Windows

Install ESP-IDF tools using a script From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

Add ESP-IDF tools to PATH using an export script ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt” . This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

Establish Serial Connection with ESP32-C3

This section provides guidance how to establish serial connection between ESP32-C3 and PC.

Connect ESP32-C3 to PC Connect the ESP32-C3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-C3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

Check port on Windows Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

Check port on Linux and macOS To check the device name for the serial port of your ESP32-C3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

Note: macOS users: if you don't see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-C3 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly

Fig. 14: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Fig. 15: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer ...” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C3.

The default console baud rate on ESP32-C3 is 115200.

Windows and Linux In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-C3. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#).

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32-C3, see [Example Output](#). To exit the `screen` session type `Ctrl-A + \`.

Note: Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

Fig. 16: Setting Serial Communication in PuTTY on Windows

Fig. 17: Setting Serial Communication in PuTTY on Linux

Example Output An example log is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)

I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10

...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-C3.

Note: For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

If you got here from [Step 5. First Steps on ESP-IDF](#) when installing s/w for ESP32-C3 development, then you can continue with [Step 5. First Steps on ESP-IDF](#).

IDF Monitor

IDF Monitor is mainly a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running `idf.py monitor`.

Keyboard Shortcuts For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+]]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+]]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	
Ctrl+C	Interrupt running application	Pauses IDF Monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

IDF-specific features

Automatic Address Decoding Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_____, IDF Monitor uses `addr2line_` to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```

abort() was called at PC 0x42067cd5 on core 0

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

Note: Set environment variable `ESP_MONITOR_DECODE` to 0 or call `idf_monitor.py` with specific command line option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

Target Reset on Connection By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf_monitor.py --no-reset`).

Note: The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

Launching GDB with GDBStub GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board's Reset button).

Note: In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↳ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

Output Filtering IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for *logging*.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

Note: Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

Standard Toolchain Setup for Linux and macOS

Installation Step by Step This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment These are the steps for setting up the ESP-IDF for your ESP32-C3.

- *Step 1. Install Prerequisites*
- *Step 2. Get ESP-IDF*
- *Step 3. Set up the tools*
- *Step 4. Set up the environment variables*
- *Step 5. First Steps on ESP-IDF*

Step 1. Install Prerequisites In order to use ESP-IDF with the ESP32-C3, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

For Linux Users To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusb
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja-build ccache dfu-util libusb
```

Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf_tools.py install cmake” to install a suitable version if your OS versions doesn’t have one.
 - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
-

For macOS Users ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
 - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

Note: If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools), missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

Apple M1 Users If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-  
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

Installing Python 3 Based on [macOS Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

Step 2. Get ESP-IDF To build applications for the ESP32-C3, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp  
cd ~/esp  
git clone -b v5.0.5 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

Step 3. Set up the tools Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-C3.

```
cd ~/esp/esp-idf  
./install.sh esp32c3
```

or with Fish shell

```
cd ~/esp/esp-idf  
./install.fish esp32c3
```

The above commands install tools for ESP32-C3 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

Note: For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable_
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

Alternative File Downloads The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

Note: This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

Customizing the tools installation path The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

Step 4. Set up the environment variables The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing `export .sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add `export .sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

Step 5. First Steps on ESP-IDF Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C3 and build, flash, and monitor the device output.

Note: If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

Start a Project Now you are ready to prepare your application for ESP32-C3. You can start with [get-started/hello_world](#) project from [examples](#) directory in ESP-IDF.

Important: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project [get-started/hello_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

Note: There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

Connect Your Device Now connect your ESP32-C3 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C3](#) for full details.

Note: Keep the port name handy as you will need it in the next steps.

Configure Your Project Navigate to your `hello_world` directory, set ESP32-C3 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32c3
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c3`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

```
(Top)
Espressif IoT Development Framework Configuration
SDK tool configuration --->
Build type --->
Application manager --->
Bootloader config --->
Security features --->
Serial flasher config --->
Partition Table --->
Compiler options --->
Component config --->
Compatibility options --->

[Space/Enter] Toggle/enter  [ESC] Leave menu          [S] Save
[O] Load                    [?] Symbol info          [/] Jump to symbol
[F] Toggle show-help mode  [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)
```

Fig. 18: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “`hello_world`”, since this example runs with default configuration.

Note: The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

Build the Project Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
```

(continues on next page)

(continued from previous page)

```
Warn about uninitialized values.

-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../.././././components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary `.bin` files.

Flash onto the Device Flash the binaries that you just built (`bootloader.bin`, `partition-table.bin` and `hello_world.bin`) onto your ESP32-C3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace `PORT` with your ESP32-C3 board's serial port name.

You can also change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

Note: The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [Troubleshooting](#).

`esptool.py` resets ESP32-C3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C3](#)). The DTR and RTS control lines are in turn connected to `GPIO9` and `CHIP_PU (EN)` pins of ESP32-C3, thus changes in the voltage levels of DTR and RTS will boot ESP32-C3 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot** button (`GPIO9`) and press the **EN** button (`CHIP_PU`).

- For other types of hardware, try pulling GPIO9 down.

Normal Operation When flashing, you will see the output log similar to the following:

```
...
esptool.py --chip esp32c3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
↳after=hard_reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB_
↳0x8000 partition_table/partition-table.bin 0x0 bootloader/bootloader.bin 0x10000_
↳hello_world.bin

```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

Monitor the Output To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↳world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
```

(continues on next page)

(continued from previous page)

```
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---

```

To exit IDF monitor use the shortcut `Ctrl+]`.

Note: You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32-C3!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

Important: Some of examples do not support ESP32-C3 because required hardware is not included in ESP32-C3 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C3 target, or the table does not exist at all, the example will work on ESP32-C3.

Additional Tips

Permission issues /dev/ttyUSB0 With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C3. *This can be solved by adding the current user to the dialout group.*

Python compatibility ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

Tip: Updating ESP-IDF It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the *build system guide*.
- *Kconfig* options can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See *Error Handling* section for more information about error handling approaches. *Error Code Reference* contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration structures

Important: Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);

```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```

esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);

```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};

```

C++ language doesn't support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```

esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;

```

Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```

httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);

```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

2.1.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.

This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [versions page](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system [renaming mechanism](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don't fall into the categories below.

- [Private APIs](#).
- [Components in example projects](#).
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.

- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of *Kconfig* options in menuconfig.
- Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO port

Asio is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`

Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESP-Modbus component on GitHub](#)

Hosted Documentation

The documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb_slave](#)
- [protocols/modbus/serial/mb_master](#)
- [protocols/modbus/tcp/mb_tcp_slave](#)
- [protocols/modbus/tcp/mb_tcp_master](#)

Please refer to the specific example README.md for details.

Protocol References

- <https://modbus.org/specs.php>: Modbus Organization with protocol specifications.

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of [MQTT](mqtt.org) protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- [protocols/mqtt/tcp](#): MQTT over tcp, default port 1883
- [protocols/mqtt/ssl](#): MQTT over tls, default port 8883
- [protocols/mqtt/ssl_ds](#): MQTT over tls using digital signature peripheral for authentication, default port 8883.
- [protocols/mqtt/ssl_mutual_auth](#): MQTT over tls using certificates for authentication, default port 8883
- [protocols/mqtt/ssl_psk](#): MQTT over tls using pre-shared keys for authentication, default port 8883.
- [protocols/mqtt/ws](#): MQTT over Websocket, default port 80
- [protocols/mqtt/wss](#): MQTT over Websocket Secure, default port 443

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `broker` - Allow to set address and security verification.
- `credentials` - Client credentials for authentication.
- `session` - Configuration for MQTT session aspects.
- `network` - Networking related configuration.
- `task` - Allow to configure FreeRTOS task.
- `buffer` - Buffer size for input and output.

In the following session the most common aspects are detailed.

Broker

Address Broker address can be set by usage of `broker.address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in websocket connections.

The `uri` field is used in the following format `scheme://hostname:port/path`. - Curently support `mqtt`, `mqttps`, `ws`, `wss` schemes - MQTT over TCP samples:

- `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883:
- `mqtt://mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884:

- `mqtt://username:password@mqtt.eclipseprojects.io:1884` MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
 - `mqttps://mqtt.eclipseprojects.io:MQTT over SSL, port 8883`
 - `mqttps://mqtt.eclipseprojects.io:8884:MQTT over SSL, port 8884`
- MQTT over Websocket samples:
 - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
 - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    ↪client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

Verification For secure connections TLS is used, and to guarantee Broker's identity the `broker_verification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER the equivalent `_len` field must be set, otherwise a NULL terminated string in PEM format should be provided to certificate field.

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqttps://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};
```

To details on other fields check the Reference API and [TLS Server verification](#).

Client Credentials All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI.
- `client_id`: pointer to the client id, defaults to `ESP32_%CHIPID%` where `%CHIPID%` are the last 3 bytes of MAC address in hex format

Authentication It's possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- Using a password by setting `authentication.password`.
- Mutual authentication with TLS by setting `authentication.certificate` and `authentication.key`, both can be provided in PEM or DER format.
- Using secure element available in ESP32-WROOM-32SE, setting `authentication.use_secure_element`.
- Using Digital Signature Peripheral available in some Espressif devices, setting `authentication.ds_data`.

Session For MQTT session related configurations `session` fields should be used.

Last Will and Testament MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t.session.last_will`-struct.

- `topic`: pointer to the LWT message topic
- `msg`: pointer to the LWT message
- `msg_len`: length of the LWT message, required if `msg` is not null-terminated
- `qos`: quality of service for the LWT message
- `retain`: specifies the retain flag of the LWT message

Change settings in Project Configuration Menu The settings for MQTT can be found using `idf.py menuconfig`, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL`, `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of `mqtt_outbox`, so a specific implementation can be supplied

Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

API Reference

Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` *config)

Creates *MQTT* client handle based on the configuration.

Parameters **config** –MQTT configuration structure

Returns mqtt_client_handle if successfully created, NULL on error

esp_err_t **esp_mqtt_client_set_uri** (*esp_mqtt_client_handle_t* client, const char *uri)

Sets MQTT connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

Parameters

- **client** –MQTT client handle
- **uri** –

Returns ESP_FAIL if URI parse error, ESP_OK on success

esp_err_t **esp_mqtt_client_start** (*esp_mqtt_client_handle_t* client)

Starts MQTT client with already created client handle.

Parameters **client** –MQTT client handle

Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

esp_err_t **esp_mqtt_client_reconnect** (*esp_mqtt_client_handle_t* client)

This api is typically used to force reconnection upon a specific event.

Parameters **client** –MQTT client handle

Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

esp_err_t **esp_mqtt_client_disconnect** (*esp_mqtt_client_handle_t* client)

This api is typically used to force disconnection from the broker.

Parameters **client** –MQTT client handle

Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_client_stop** (*esp_mqtt_client_handle_t* client)

Stops MQTT client tasks.

- Notes:
- Cannot be called from the MQTT event handler

Parameters **client** –MQTT client handle

Returns ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

int **esp_mqtt_client_subscribe** (*esp_mqtt_client_handle_t* client, const char *topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Parameters

- **client** –MQTT client handle
- **topic** –
- **qos** –// TODO describe parameters

Returns message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_unsubscribe** (*esp_mqtt_client_handle_t* client, const char *topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message

- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

Parameters

- **client** –MQTT client handle
- **topic** –

Returns message_id of the subscribe message on success -1 on failure

int **esp_mqtt_client_publish** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

Parameters

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag

Returns message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

int **esp_mqtt_client_enqueue** (*esp_mqtt_client_handle_t* client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

Parameters

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

Returns message_id if queued successfully, -1 otherwise

esp_err_t **esp_mqtt_client_destroy** (*esp_mqtt_client_handle_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the MQTT event handler

Parameters **client** –MQTT client handle

Returns ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

esp_err_t **esp_mqtt_set_config** (*esp_mqtt_client_handle_t* client, const *esp_mqtt_client_config_t* *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Parameters

- **client** –MQTT client handle
- **config** –MQTT configuration structure

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

esp_err_t **esp_mqtt_client_register_event** (*esp_mqtt_client_handle_t* client, *esp_mqtt_event_id_t* event, *esp_event_handler_t* event_handler, void *event_handler_arg)

Registers MQTT event.

Parameters

- **client** –MQTT client handle
- **event** –event type
- **event_handler** –handler callback
- **event_handler_arg** –handlers context

Returns ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

int **esp_mqtt_client_get_outbox_size** (*esp_mqtt_client_handle_t* client)

Get outbox size.

Parameters **client** –MQTT client handle

Returns outbox size 0 on wrong initialization

Structures

struct **esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp_tls_last_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp_tls_last_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

error_type	related member variables	note
MQTT_ERROR_TYPE_TCP_TRANSPORT	esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno	Error reported from tcp_transport/esp-tls
MQTT_ERROR_TYPE_CONNECTION_REFUSED	connect_return_code	Internal error reported from MQTT broker on connection

Public Members

esp_err_t **esp_tls_last_esp_err**

last esp_err code reported from esp-tls component

int **esp_tls_stack_err**

tls specific error code reported from underlying tls stack

int **esp_tls_cert_verify_flags**

tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t **error_type**

error type referring to the source of the error

esp_mqtt_connect_return_code_t **connect_return_code**

connection refused error code reported from MQTT* broker on connection

int **esp_transport_sock_errno**

errno from the underlying socket

struct **esp_mqtt_event_t**

MQTT event configuration structure

Public Members

esp_mqtt_event_id_t **event_id**

MQTT event type

esp_mqtt_client_handle_t **client**

MQTT client handle for this event

char ***data**

Data associated with this event

int **data_len**

Length of the data for this event

int **total_data_len**

Total length of the data (longer data are supplied with multiple events)

int **current_data_offset**

Actual offset for the data associated with this event

char ***topic**

Topic associated with this event

int **topic_len**

Length of the topic for this event associated with this event

int **msg_id**

MQTT messaged id of message

int **session_present**

MQTT session_present flag for connection event

esp_mqtt_error_codes_t ***error_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

struct **esp_mqtt_client_config_t**

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct *esp_mqtt_client_config_t::broker_t* **broker**

Broker address and security verification

struct *esp_mqtt_client_config_t::credentials_t* **credentials**

User credentials for broker

struct *esp_mqtt_client_config_t::session_t* **session**

MQTT session configuration.

struct *esp_mqtt_client_config_t::network_t* **network**

Network configuration

struct *esp_mqtt_client_config_t::task_t* **task**

FreeRTOS task configuration.

struct *esp_mqtt_client_config_t::buffer_t* **buffer**

Buffer size configuration.

struct **broker_t**

Broker related configuration

Public Members

struct *esp_mqtt_client_config_t::broker_t::address_t* **address**

Broker address configuration

```
struct esp_mqtt_client_config_t::broker_t::verification_t verification
```

Security verification of the broker

```
struct address_t
```

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

Public Members

```
const char *uri
```

Complete *MQTT* broker URI

```
const char *hostname
```

Hostname, to set ipv4 pass it as string)

```
esp_mqtt_transport_t transport
```

Selects transport

```
const char *path
```

Path in the URI

```
uint32_t port
```

MQTT server port

```
struct verification_t
```

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

Public Members

```
bool use_global_ca_store
```

Use a global ca_store, look esp-tls documentation for details.

```
esp_err_t (*crt_bundle_attach)(void *conf)
```

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

```
const char *certificate
```

Certificate data, default is NULL, not required to verify the server.

```
size_t certificate_len
```

Length of the buffer pointed to by certificate.

const struct *psk_key_hint* ***psk_hint_key**

Pointer to PSK struct defined in `esp_tls.h` to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char ****alpn_protos**

NULL-terminated list of supported application protocols to be used for ALPN

struct **buffer_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

Public Members

int **size**

size of *MQTT* send/receive buffer

int **out_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials_t**

Client related credentials for authentication.

Public Members

const char ***username**

MQTT username

const char ***client_id**

Set *MQTT* client identifier. Ignored if `set_null_client_id == true` If NULL set the default client id. Default client id is `ESP32_CHIPID%` where `CHIPID%` are last 3 bytes of MAC address in hex format

bool **set_null_client_id**

Selects a NULL client id

struct *esp_mqtt_client_config_t::credentials_t::authentication_t* **authentication**

Client authentication

struct **authentication_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

Public Members

const char ***password**

MQTT password

const char ***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with *key*.

size_t **certificate_len**

Length of the buffer pointed to by *certificate*.

const char ***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also *certificate* has to be provided.

size_t **key_len**

Length of the buffer pointed to by *key*.

const char ***key_password**

Client key decryption password, not PEM nor DER, if provided *key_password_len* must be correctly set.

int **key_password_len**

Length of the password pointed to by *key_password*

bool **use_secure_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void ***ds_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct **network_t**

Network related configuration

Public Members

int **reconnect_timeout_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh_connection_after_ms**

Refresh connection after this value (in milliseconds)

bool **disable_auto_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

struct **session_t**

MQTT Session related configuration

Public Members

struct *esp_mqtt_client_config_t::session_t::last_will_t* **last_will**

Last will configuration

bool **disable_clean_session**

MQTT clean session, default `clean_session` is true

int **keepalive**

MQTT keepalive, default is 120 seconds

bool **disable_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t **protocol_ver**

MQTT protocol version used for connection.

int **message_retransmit_timeout**

timeout for retransmitting of failed packet

struct **last_will_t**

Last Will and Testament message configuration.

Public Members

const char ***topic**

LWT (Last Will and Testament) message topic

const char ***msg**

LWT message, may be NULL terminated

int **msg_len**

LWT message length, if `msg` isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task_t**
Client task configuration

Public Members

int **priority**
MQTT task priority

int **stack_size**
MQTT task stack size

Macros

MQTT_ERROR_TYPE_ESP_TLS

MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from **MQTT_ERROR_TYPE_ESP_TLS** layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions

typedef struct esp_mqtt_client ***esp_mqtt_client_handle_t**

typedef enum *esp_mqtt_event_id_t* **esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- *client* - *MQTT* client handle
- various other data depending on event type

typedef enum *esp_mqtt_connect_return_code_t* **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

typedef enum *esp_mqtt_error_type_t* **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

typedef enum *esp_mqtt_transport_t* **esp_mqtt_transport_t**

typedef enum *esp_mqtt_protocol_ver_t* **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

typedef struct *esp_mqtt_error_codes* **esp_mqtt_error_codes_t**

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp_tls_last_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp_tls_last_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking *error_type* first and then appropriate error code depending on the source of the error:

| *error_type* | related member variables | note | | **MQTT_ERROR_TYPE_TCP_TRANSPORT** |
esp_tls_last_esp_err, *esp_tls_stack_err*, *esp_tls_cert_verify_flags*, *sock_errno* | Error reported from

tcp_transport/esp-tls || MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from *MQTT* broker on connection |

typedef struct *esp_mqtt_event_t* **esp_mqtt_event_t**

MQTT event configuration structure

typedef *esp_mqtt_event_t* ***esp_mqtt_event_handle_t**

typedef *esp_err_t* (***mqtt_event_callback_t**)(*esp_mqtt_event_handle_t* event)

typedef struct *esp_mqtt_client_config_t* **esp_mqtt_client_config_t**

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Enumerations

enum **esp_mqtt_event_id_t**

MQTT event types.

User event handler receives context data in *esp_mqtt_event_t* structure with

- `client` - *MQTT* client handle
- various other data depending on event type

Values:

enumerator **MQTT_EVENT_ANY**

enumerator **MQTT_EVENT_ERROR**

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

enumerator **MQTT_EVENT_CONNECTED**

connected event, additional context: `session_present` flag

enumerator **MQTT_EVENT_DISCONNECTED**

disconnected event

enumerator **MQTT_EVENT_SUBSCRIBED**

subscribed event, additional context:

- `msg_id` message id
- data pointer to the received data
- `data_len` length of the data for this event

enumerator **MQTT_EVENT_UNSUBSCRIBED**

unsubscribed event

enumerator **MQTT_EVENT_PUBLISHED**

published event, additional context: `msg_id`

enumerator **MQTT_EVENT_DATA**

data event, additional context:

- `msg_id` message id
- topic pointer to the received topic
- `topic_len` length of the topic
- data pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received
- retain retain flag of the message
- `qos` QoS level of the message
- `dup` dup flag of the message Note: Multiple **MQTT_EVENT_DATA** could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT_EVENT_BEFORE_CONNECT**

The event occurs before connecting

enumerator **MQTT_EVENT_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

enum **esp_mqtt_connect_return_code_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_CONNECTION_ACCEPTED**

Connection accepted

enumerator **MQTT_CONNECTION_REFUSE_PROTOCOL**

MQTT connection refused reason: Wrong protocol

enumerator **MQTT_CONNECTION_REFUSE_ID_REJECTED**

MQTT connection refused reason: ID rejected

enumerator **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**

MQTT connection refused reason: Server unavailable

enumerator **MQTT_CONNECTION_REFUSE_BAD_USERNAME**

MQTT connection refused reason: Wrong user

enumerator **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**

MQTT connection refused reason: Wrong username or password

enum **esp_mqtt_error_type_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT_ERROR_TYPE_NONE**

enumerator **MQTT_ERROR_TYPE_TCP_TRANSPORT**

enumerator **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

enum **esp_mqtt_transport_t**

Values:

enumerator **MQTT_TRANSPORT_UNKNOWN**

enumerator **MQTT_TRANSPORT_OVER_TCP**

MQTT over TCP, using scheme: **MQTT**

enumerator **MQTT_TRANSPORT_OVER_SSL**

MQTT over SSL, using scheme: **MQTTS**

enumerator **MQTT_TRANSPORT_OVER_WS**

MQTT over Websocket, using scheme: **ws**

enumerator **MQTT_TRANSPORT_OVER_WSS**

MQTT over Websocket Secure, using scheme: **wss**

enum **esp_mqtt_protocol_ver_t**

MQTT protocol version used for connection

Values:

enumerator **MQTT_PROTOCOL_UNDEFINED**

enumerator **MQTT_PROTOCOL_V_3_1**

enumerator **MQTT_PROTOCOL_V_3_1_1**

enumerator **MQTT_PROTOCOL_V_5**

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](#).

Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
├── private_include
│   ├── esp_tls_mbedtls.h
│   └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
 - `cacert_buf` - pointer to the buffer which contains the CA cert.
 - `cacert_bytes` - size of the CA certificate in bytes.
- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.*

ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

Note: *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in CMakeLists.txt of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations

set to default. (*mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively*)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

Note: *These values are subject to change with change in configuration options and version of respective libraries.*

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see *Configure the DS Peripheral* in [Digital Signature](#).

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

Note: When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert_buf*) and the DS params (*ds_data*) are required and the client key (*clientkey_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File

- [components/esp-tls/esp_tls.h](#)

Functions

esp_tls_t ***esp_tls_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

Returns tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

esp_tls_t ***esp_tls_conn_http_new** (const char *url, const *esp_tls_cfg_t* *cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp_tls_conn_http_new_sync* (and its asynchronous version *esp_tls_conn_http_new_async*)

Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp_tls_cfg_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp_tls_cfg_t*’. At a minimum, this structure should be zero-initialized.

Returns pointer to *esp_tls_t*, or NULL if connection couldn’t be opened.

int **esp_tls_conn_new_sync** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp_tls_cfg_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp_tls_cfg_t*. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_http_new_sync** (const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as *esp_tls_conn_new_sync*() API. However this API accepts host’s url.

Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp_tls_cfg_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp_tls_cfg_t*’. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp_tls_conn_new_async** (const char *hostname, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp_tls_cfg_t*. *non_block* member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp_tls_conn_http_new_async** (const char *url, const *esp_tls_cfg_t* *cfg, *esp_tls_t* *tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host’s url.

Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp_tls_cfg_t*.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize_t **esp_tls_conn_write** (*esp_tls_t* *tls, const void *data, size_t datalen)

Write from buffer ‘data’ into specified tls connection.

Parameters

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

Returns

- ≥ 0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- < 0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize_t **esp_tls_conn_read** (*esp_tls_t* *tls, void *data, size_t datalen)

Read from specified tls connection into the buffer ‘data’ .

Parameters

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

Returns

- > 0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- < 0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int **esp_tls_conn_destroy** (*esp_tls_t* *tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

Parameters **tls** –[in] pointer to esp-tls as esp-tls handle.

Returns - 0 on success

- -1 if socket error or an invalid argument

ssize_t **esp_tls_get_bytes_avail** (*esp_tls_t* *tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over `mbedtls’s mbedtls_ssl_get_bytes_avail()` API.

Parameters `tls` **–[in]** pointer to esp-tls as esp-tls handle.

Returns

- -1 in case of invalid arg
- bytes available in the application data record read buffer

esp_err_t `esp_tls_get_conn_sockfd` (*esp_tls_t* *tls, int *sockfd)

Returns the connection socket file descriptor from esp_tls session.

Parameters

- `tls` **–[in]** handle to esp_tls context
- `sockfd` **–[out]** int pointer to sockfd value.

Returns - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

void *`esp_tls_get_ssl_context` (*esp_tls_t* *tls)

Returns the ssl context.

Parameters `tls` **–[in]** handle to esp_tls context

Returns - ssl_ctx pointer to ssl context of underlying TLS layer on success

- NULL in case of error

esp_err_t `esp_tls_init_global_ca_store` (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

Returns

- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

esp_err_t `esp_tls_set_global_ca_store` (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

Parameters

- `cacert_pem_buf` **–[in]** Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- `cacert_pem_bytes` **–[in]** Length of the buffer.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void `esp_tls_free_global_ca_store` (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t `esp_tls_get_and_clear_last_error` (*esp_tls_error_handle_t* h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Parameters

- `h` **–[in]** esp-tls error handle.

- **esp_tls_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- **esp_tls_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

Returns

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

esp_err_t **esp_tls_get_and_clear_error_type** (*esp_tls_error_handle_t* h, *esp_tls_error_type_t* err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

Parameters

- **h** –[in] esp-tls error handle.
- **err_type** –[in] specific error type
- **error_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

Returns

- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

esp_err_t **esp_tls_get_error_handle** (*esp_tls_t* *tls, *esp_tls_error_handle_t* *error_handle)

Returns the ESP-TLS error_handle.

Parameters

- **tls** –[in] handle to esp_tls context
- **error_handle** –[out] pointer to the error handle.

Returns

- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

mbedtls_x509_crt ***esp_tls_get_global_ca_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

Note: Modifying the pointer might cause a failure in verifying the certificates.

Returns

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t **esp_tls_plain_tcp_connect** (const char *host, int hostlen, int port, const *esp_tls_cfg_t* *cfg, *esp_tls_error_handle_t* error_handle, int *sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Parameters

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] ESP-TLS configuration as esp_tls_cfg_t.
- **error_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** –[out] Socket descriptor if successfully connected on TCP layer

Returns ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Structures

struct **psk_key_hint**

ESP-TLS preshared key and hint structure.

Public Members

const uint8_t ***key**

key in PSK authentication mode in binary format

const size_t **key_size**

length of the key

const char ***hint**

hint in PSK authentication mode in string format

struct **tls_keep_alive_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time (second)

int **keep_alive_interval**

Keep-alive interval time (second)

int **keep_alive_count**

Keep-alive packet retry send count

struct **esp_tls_cfg**

ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

Public Members

const char ****alpn_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char ****alpn_protos** = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char ***cacert_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***cacert_pem_buf**

CA certificate buffer legacy name

unsigned int **cacert_bytes**

Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert_pem_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char ***clientcert_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientcert_pem_buf**

Client certificate legacy name

unsigned int **clientcert_bytes**

Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert_pem_bytes**

Size of client certificate legacy name

const unsigned char ***clientkey_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char ***clientkey_pem_buf**

Client key legacy name

unsigned int **clientkey_bytes**

Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey_pem_bytes**

Size of client key legacy name

const unsigned char ***clientkey_password**

Client key decryption password string

unsigned int **clientkey_password_len**

String length of the password pointed to by clientkey_password

bool **non_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use_secure_element**

Enable this option to use secure element or atec608a chip (Integrated with ESP32-WROOM-32SE)

int **timeout_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

const char ***common_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip_common_name**

Skip any validation of server certificate CN field

tls_keep_alive_cfg_t ***keep_alive_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk_hint_key_t* ***psk_hint_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to esp_cert_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void ***ds_data**

Pointer for digital signature peripheral context

bool **is_plain_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

esp_tls_addr_family_t **addr_family**

The address family to use when connecting to a host.

Type Definitions

typedef enum *esp_tls_conn_state* **esp_tls_conn_state_t**

ESP-TLS Connection State.

typedef enum *esp_tls_role* **esp_tls_role_t**

typedef struct *psk_key_hint* **psk_hint_key_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls_keep_alive_cfg* **tls_keep_alive_cfg_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp_tls_addr_family* **esp_tls_addr_family_t**

typedef struct *esp_tls_cfg* **esp_tls_cfg_t**

ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
 - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
 - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
-

typedef struct esp_tls **esp_tls_t**

Enumerations

enum **esp_tls_conn_state**

ESP-TLS Connection State.

Values:

enumerator **ESP_TLS_INIT**

enumerator **ESP_TLS_CONNECTING**

enumerator **ESP_TLS_HANDSHAKE**

enumerator **ESP_TLS_FAIL**

enumerator **ESP_TLS_DONE**

enum **esp_tls_role**

Values:

enumerator **ESP_TLS_CLIENT**

enumerator **ESP_TLS_SERVER**

enum **esp_tls_addr_family**

Values:

enumerator **ESP_TLS_AF_UNSPEC**

Unspecified address family.

enumerator **ESP_TLS_AF_INET**

IPv4 address family.

enumerator **ESP_TLS_AF_INET6**

IPv6 address family.

Header File

- [components/esp-tls/esp_tls_errors.h](#)

Structures

struct **esp_tls_last_error**

Error structure containing relevant errors in case tls error occurred.

Public Members

esp_err_t **last_error**

error code (based on **ESP_ERR_ESP_TLS_BASE**) of the last occurred error

int **esp_tls_error_code**

esp_tls error code from last esp_tls failed api

int **esp_tls_flags**

last certification verification flags

Macros

ESP_ERR_ESP_TLS_BASE

Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME

Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET

Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY

Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST

Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED

failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT

new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK

mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED

mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED

mbedtls api returned error

wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED

wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED

wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp_tls_conn_read()
- esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE**ESP_TLS_ERR_SSL_TIMEOUT**

Type Definitions

```
typedef struct esp_tls_last_error *esp_tls_error_handle_t
```

```
typedef struct esp_tls_last_error esp_tls_last_error_t
```

Error structure containing relevant errors in case tls error occurred.

Enumerations

```
enum esp_tls_error_type_t
```

Definition of different types/sources of error codes reported from different components

Values:

enumerator **ESP_TLS_ERR_TYPE_UNKNOWN**

enumerator **ESP_TLS_ERR_TYPE_SYSTEM**

System error `— errno`

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP_TLS_ERR_TYPE_ESP**

ESP-IDF error type `— esp_err_t`

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP_TLS_ERR_TYPE_MAX**

Last err type `— invalid entry`

2.2.5 ESP HTTP Client

Overview

`esp_http_client` provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_config_t` instance i.e. a HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

Note: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)

HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform operation to pass the authentication process.

- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

API Reference

Header File

- [components/esp_http_client/include/esp_http_client.h](#)

Functions

esp_http_client_handle_t **esp_http_client_init** (const *esp_http_client_config_t* *config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

Parameters `config` **–[in]** The configurations, see `http_client_config_t`

Returns

- `esp_http_client_handle_t`
- NULL if any errors

esp_err_t **esp_http_client_perform** (*esp_http_client_handle_t* client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of *esp_http_client_config_t* must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

Note: You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

Parameters `client` –The `esp_http_client` handle

Returns

- ESP_OK on successful
- ESP_FAIL on error

esp_err_t `esp_http_client_set_url` (*esp_http_client_handle_t* client, const char *url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

Parameters

- `client` –[in] The `esp_http_client` handle
- `url` –[in] The url

Returns

- ESP_OK
- ESP_FAIL

esp_err_t `esp_http_client_set_post_field` (*esp_http_client_handle_t* client, const char *data, int len)

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

Parameters

- `client` –[in] The `esp_http_client` handle
- `data` –[in] post data pointer
- `len` –[in] post length

Returns

- ESP_OK
- ESP_FAIL

int `esp_http_client_get_post_field` (*esp_http_client_handle_t* client, char **data)

Get current post field information.

Parameters

- `client` –[in] The client
- `data` –[out] Point to post data pointer

Returns Size of post data

esp_err_t `esp_http_client_set_header` (*esp_http_client_handle_t* client, const char *key, const char *value)

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

Parameters

- `client` –[in] The `esp_http_client` handle
- `key` –[in] The header key
- `value` –[in] The header value

Returns

- ESP_OK
- ESP_FAIL

esp_err_t `esp_http_client_get_header` (*esp_http_client_handle_t* client, const char *key, char **value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Parameters

- **client** –[in] The esp_http_client handle
- **key** –[in] The header key
- **value** –[out] The header value

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_username** (*esp_http_client_handle_t* client, char **value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- **client** –[in] The esp_http_client handle
- **value** –[out] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_username** (*esp_http_client_handle_t* client, const char *username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Parameters

- **client** –[in] The esp_http_client handle
- **username** –[in] The username value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_get_password** (*esp_http_client_handle_t* client, char **value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

Parameters

- **client** –[in] The esp_http_client handle
- **value** –[out] The password value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_password** (*esp_http_client_handle_t* client, const char *password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Parameters

- **client** –[in] The esp_http_client handle
- **password** –[in] The password value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_auth_type** (*esp_http_client_handle_t* client, *esp_http_client_auth_type_t* auth_type)

Set http request auth_type.

Parameters

- **client** –[in] The esp_http_client handle
- **auth_type** –[in] The esp_http_client auth type

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

int **esp_http_client_get_errno** (*esp_http_client_handle_t* client)

Get HTTP client session errno.

Parameters **client** –[in] The esp_http_client handle

Returns

- (-1) if invalid argument
- errno

esp_err_t **esp_http_client_set_method** (*esp_http_client_handle_t* client, *esp_http_client_method_t* method)

Set http request method.

Parameters

- **client** –[in] The esp_http_client handle
- **method** –[in] The method

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_set_timeout_ms** (*esp_http_client_handle_t* client, int timeout_ms)

Set http request timeout.

Parameters

- **client** –[in] The esp_http_client handle
- **timeout_ms** –[in] The timeout value

Returns

- ESP_OK
- ESP_ERR_INVALID_ARG

esp_err_t **esp_http_client_delete_header** (*esp_http_client_handle_t* client, const char *key)

Delete http request header.

Parameters

- **client** –[in] The esp_http_client handle
- **key** –[in] The key

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_open** (*esp_http_client_handle_t* client, int write_len)

This function will be open the connection, write all header strings and return.

Parameters

- **client** –[in] The esp_http_client handle
- **write_len** –[in] HTTP Content length need to write to the server

Returns

- ESP_OK
- ESP_FAIL

int **esp_http_client_write** (*esp_http_client_handle_t* client, const char *buffer, int len)

This function will write data to the HTTP connection previously opened by esp_http_client_open()

Parameters

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

Returns

- (-1) if any errors
- Length of data written

`int64_t esp_http_client_fetch_headers` (*esp_http_client_handle_t* client)

This function need to call after `esp_http_client_open`, it will read from http stream, process all receive headers.

Parameters `client` –[in] The `esp_http_client` handle

Returns

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by `esp_http_client_is_chunked` response)
- (-1: `ESP_FAIL`) if any errors
- (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) if call is timed-out before any data was ready
- Download data length defined by content-length header

`bool esp_http_client_is_chunked_response` (*esp_http_client_handle_t* client)

Check response data is chunked.

Parameters `client` –[in] The `esp_http_client` handle

Returns true or false

`int esp_http_client_read` (*esp_http_client_handle_t* client, char *buffer, int len)

Read data from http stream.

Note: (`-ESP_ERR_HTTP_EAGAIN = -0x7007`) is returned when call is timed-out before any data was ready

Parameters

- `client` –[in] The `esp_http_client` handle
- `buffer` –The buffer
- `len` –[in] The length

Returns

- (-1) if any errors
- Length of data was read

`int esp_http_client_get_status_code` (*esp_http_client_handle_t* client)

Get http response status code, the valid value if this function invoke after `esp_http_client_perform`

Parameters `client` –[in] The `esp_http_client` handle

Returns Status code

`int64_t esp_http_client_get_content_length` (*esp_http_client_handle_t* client)

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

Parameters `client` –[in] The `esp_http_client` handle

Returns

- (-1) Chunked transfer
- Content-Length value as bytes

esp_err_t `esp_http_client_close` (*esp_http_client_handle_t* client)

Close http connection, still kept all http request resources.

Parameters `client` –[in] The `esp_http_client` handle

Returns

- `ESP_OK`
- `ESP_FAIL`

esp_err_t `esp_http_client_cleanup` (*esp_http_client_handle_t* client)

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

Parameters `client` –[in] The `esp_http_client` handle

Returns

- ESP_OK
- ESP_FAIL

esp_http_client_transport_t **esp_http_client_get_transport_type** (*esp_http_client_handle_t* client)

Get transport type.

Parameters **client** –[in] The esp_http_client handle

Returns

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

esp_err_t **esp_http_client_set_redirection** (*esp_http_client_handle_t* client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

Parameters **client** –[in] The esp_http_client handle

Returns

- ESP_OK
- ESP_FAIL

void **esp_http_client_add_auth** (*esp_http_client_handle_t* client)

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters **client** –[in] The esp_http_client handle

bool **esp_http_client_is_complete_data_received** (*esp_http_client_handle_t* client)

Checks if entire data in the response has been read without any error.

Parameters **client** –[in] The esp_http_client handle

Returns

- true
- false

int **esp_http_client_read_response** (*esp_http_client_handle_t* client, char *buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

Parameters

- **client** –[in] The esp_http_client handle
- **buffer** –The buffer
- **len** –[in] The buffer length

Returns

- Length of data was read

esp_err_t **esp_http_client_flush_response** (*esp_http_client_handle_t* client, int *len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

Parameters

- **client** –[in] The esp_http_client handle
- **len** –Length of data discarded

Returns

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

esp_err_t **esp_http_client_get_url** (*esp_http_client_handle_t* client, char *url, const int len)

Get URL from client.

Parameters

- **client** –[in] The esp_http_client handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_http_client_get_chunk_length** (*esp_http_client_handle_t* client, int *len)

Get Chunk-Length from client.

Parameters

- **client** –[in] The esp_http_client handle
- **len** –[out] Variable to store length

Returns

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct **esp_http_client_event**

HTTP Client events data.

Public Members

esp_http_client_event_id_t **event_id**

event_id, to know the cause of the event

esp_http_client_handle_t **client**

esp_http_client_handle_t context

void ***data**

data of the event

int **data_len**

data length of data

void ***user_data**

user_data context, from *esp_http_client_config_t* user_data

char ***header_key**

For HTTP_EVENT_ON_HEADER event_id, it' s store current http header key

char ***header_value**

For HTTP_EVENT_ON_HEADER event_id, it' s store current http header value

struct **esp_http_client_config_t**

HTTP configuration.

Public Members

const char ***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char ***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char ***username**

Using for Http authentication

const char ***password**

Using for Http authentication

esp_http_client_auth_type_t **auth_type**

Http authentication type, see esp_http_client_auth_type_t

const char ***path**

HTTP Path, if not set, default is /

const char ***query**

HTTP query

const char ***cert_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size_t **cert_len**

Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char ***client_cert_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size_t **client_cert_len**

Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char ***client_key_pem**

SSL client key, PEM format as string, if the server requires to verify client

size_t **client_key_len**

Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char ***client_key_password**

Client key decryption password string

size_t **client_key_password_len**

String length of the password pointed to by client_key_password

const char ***user_agent**

The User Agent string to send with HTTP requests

esp_http_client_method_t **method**

HTTP Method

int **timeout_ms**

Network timeout in milliseconds

bool **disable_auto_redirect**

Disable HTTP automatic redirects

int **max_redirection_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max_authorization_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb **event_handler**

HTTP Event Handle

esp_http_client_transport_t **transport_type**

HTTP transport type, see esp_http_client_transport_t

int **buffer_size**

HTTP receive buffer size

int **buffer_size_tx**

HTTP transmit buffer size

void ***user_data**

HTTP user_data context

bool **is_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use_global_ca_store**

Use a global ca_store for all the connections in which this bool is set.

bool **skip_cert_common_name_check**

Skip any validation of server certificate CN field

esp_err_t (***crt_bundle_attach**)(void *conf)

Function pointer to `esp_crt_bundle_attach`. Enables the use of certification bundle for server verification, must be enabled in `menuconfig`

bool **keep_alive_enable**

Enable keep-alive timeout

int **keep_alive_idle**

Keep-alive idle time. Default is 5 (second)

int **keep_alive_interval**

Keep-alive interval time. Default is 5 (second)

int **keep_alive_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq ***if_name**

The name of interface for data to go through. Use the default interface without setting

void ***ds_data**

Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE

Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT

The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT

Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA

Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER

Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT

There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING

HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN

Mapping of `errno` EAGAIN to `esp_err_t`

ESP_ERR_HTTP_CONNECTION_CLOSED

Read FIN from peer and the connection closed

Type Definitions

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

Enumerations

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

Values:

```
enumerator HTTP_EVENT_ERROR
```

This event occurs when there are any errors during execution

```
enumerator HTTP_EVENT_ON_CONNECTED
```

Once the HTTP has been connected to the server, no data exchange has been performed

```
enumerator HTTP_EVENT_HEADERS_SENT
```

After sending all the headers to the server

```
enumerator HTTP_EVENT_HEADER_SENT
```

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

```
enumerator HTTP_EVENT_ON_HEADER
```

Occurs when receiving each header sent from the server

```
enumerator HTTP_EVENT_ON_DATA
```

Occurs when receiving data from the server, possibly multiple portions of the packet

```
enumerator HTTP_EVENT_ON_FINISH
```

Occurs when finish a HTTP session

```
enumerator HTTP_EVENT_DISCONNECTED
```

The connection has been disconnected

```
enumerator HTTP_EVENT_REDIRECT
```

Intercepting HTTP redirects to handle them manually

enum **esp_http_client_transport_t**

HTTP Client transport.

Values:

enumerator **HTTP_TRANSPORT_UNKNOWN**

Unknown

enumerator **HTTP_TRANSPORT_OVER_TCP**

Transport over tcp

enumerator **HTTP_TRANSPORT_OVER_SSL**

Transport over ssl

enum **esp_http_client_method_t**

HTTP method.

Values:

enumerator **HTTP_METHOD_GET**

HTTP GET Method

enumerator **HTTP_METHOD_POST**

HTTP POST Method

enumerator **HTTP_METHOD_PUT**

HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**

HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**

HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**

HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**

HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**

HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**

HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**

HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**

enum **esp_http_client_auth_type_t**

HTTP Authentication type.

Values:

enumerator **HTTP_AUTH_TYPE_NONE**

No authentication

enumerator **HTTP_AUTH_TYPE_BASIC**

HTTP Basic authentication

enumerator **HTTP_AUTH_TYPE_DIGEST**

HTTP Digest authentication

enum **HttpStatus_Code**

Enum for the HTTP status codes.

Values:

enumerator **HttpStatus_Ok**

enumerator **HttpStatus_MultipleChoices**

enumerator **HttpStatus_MovedPermanently**

enumerator **HttpStatus_Found**

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

2.2.6 ESP Local Control

Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = &(protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};
```

(continues on next page)

(continued from previous page)

```

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]   asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[]   asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .pop = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. **PROTCOM_SEC2**: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. **PROTCOM_SEC1**: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. **PROTCOM_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTCOM_SEC_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide *custom_handle* of type *protocomm_security_t ** in this context.

Note: The respective security schemes need to be enabled through the project configuration menu. Please refer to

the Enabling protocol security version section in *Protocol Communication* for more details.

Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if it's a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a *ctx* field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                   const esp_local_ctrl_prop_t *props,
                                   const esp_local_ctrl_prop_val_t *
                                   ↪prop_values,
                                   void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", ↪
            ↪props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp_local_ctrl](#)

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp_local_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp_local_ctrl** service:

1. *get_prop_count* : This should simply return the total number of properties supported by the service
2. *get_prop_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set_prop_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get_prop_count* and then *get_prop_values*, hence form an index to name mapping for all properties. Now when calling *set_prop_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp_local_ctrl** are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl	https://<hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl	https://<hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

API Reference

Header File

- `components/esp_local_ctrl/include/esp_local_ctrl.h`

Functions

`const esp_local_ctrl_transport_t*esp_local_ctrl_get_transport_ble` (void)

Function for obtaining BLE transport mode.

`const esp_local_ctrl_transport_t*esp_local_ctrl_get_transport_httpd` (void)

Function for obtaining HTTPD transport mode.

`esp_err_t esp_local_ctrl_start` (const `esp_local_ctrl_config_t` *config)

Start local control service.

Parameters `config` –[in] Pointer to configuration structure

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

`esp_err_t esp_local_ctrl_stop` (void)

Stop local control service.

`esp_err_t esp_local_ctrl_add_property` (const `esp_local_ctrl_prop_t` *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

Parameters `prop` –[in] Property description structure

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

`esp_err_t esp_local_ctrl_remove_property` (const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Parameters `name` –[in] Name of the property to remove

Returns

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Failure

`const esp_local_ctrl_prop_t*esp_local_ctrl_get_property` (const char *name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

Parameters `name` –[in] Name of the property to find

Returns

- Pointer to property
- `NULL` if not found

`esp_err_t esp_local_ctrl_set_handler` (const char *ep_name, `protocomm_req_handler_t` handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Parameters

- **ep_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user_ctx** –[in] User data

Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

Unions

union **esp_local_ctrl_transport_config_t**

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

struct **esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

char ***name**

Unique name of property

uint32_t **type**

Type of property. This may be set to application defined enums

size_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32_t flags

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (*ctx_free_fn)(void *ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

struct esp_local_ctrl_prop_val

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members**void *data**

Pointer to memory holding property value

size_t size

Size of property value

void (*free_fn)(void *data)

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

struct esp_local_ctrl_handlers

Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (***get_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the current values for which have been requested by the client

Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

Param usr_ctx [in] This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

esp_err_t (***set_prop_values**)(size_t props_count, const *esp_local_ctrl_prop_t* props[], const *esp_local_ctrl_prop_val_t* prop_values[], void *usr_ctx)

Handler function to be implemented for changing values of properties.

Note: If any of the properties have variable sizes, the size field of the corresponding element in *prop_values* must be checked explicitly before making any assumptions on the size.

Param props_count [in] Total elements in the props array

Param props [in] Array of properties, the values for which the client requests to change

Param prop_values [in] Array of property values, the elements of which need to be used for updating those properties specified by props argument

Param usr_ctx [in] This provides value of the *usr_ctx* field of *esp_local_ctrl_handlers_t* structure

Return Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

void ***usr_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the *esp_local_ctrl* service, and freed only when the service is stopped.

void (***usr_ctx_free_fn**)(void *usr_ctx)

Pointer to function which will be internally invoked on *usr_ctx* for freeing the context resources when *esp_local_ctrl_stop()* is called.

struct **esp_local_ctrl_proto_sec_cfg**

Protocom security configs

Public Members

esp_local_ctrl_proto_sec_t **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via *proto_sec_custom_handle* below

void ***custom_handle**

Custom security handle if security is set custom via *proto_sec* above. This handle must follow *protocomm_security_t* signature

const void ***pop**

Proof of possession to be used for local control. Could be NULL.

const void ***sec_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

struct **esp_local_ctrl_config**

Configuration structure to pass to `esp_local_ctrl_start()`

Public Members

const *esp_local_ctrl_transport_t* ***transport**

Transport layer over which service will be provided

esp_local_ctrl_transport_config_t **transport_config**

Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t **proto_sec**

Security version and POP

esp_local_ctrl_handlers_t **handlers**

Register handlers for responding to get/set requests on properties

size_t **max_properties**

This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct *esp_local_ctrl_prop* **esp_local_ctrl_prop_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp_local_ctrl_prop_val* **esp_local_ctrl_prop_val_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp_local_ctrl_handlers* **esp_local_ctrl_handlers_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp_local_ctrl_transport* **esp_local_ctrl_transport_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm_ble_config* **esp_local_ctrl_transport_config_ble_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd_config* **esp_local_ctrl_transport_config_httpd_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

typedef enum *esp_local_ctrl_proto_sec* **esp_local_ctrl_proto_sec_t**

Security types for `esp_local_control`.

typedef *protocomm_security1_params_t* **esp_local_ctrl_security1_params_t**

typedef *protocomm_security2_params_t* **esp_local_ctrl_security2_params_t**

typedef struct *esp_local_ctrl_proto_sec_cfg* **esp_local_ctrl_proto_sec_cfg_t**

Protocom security configs

typedef struct *esp_local_ctrl_config* **esp_local_ctrl_config_t**

Configuration structure to pass to `esp_local_ctrl_start()`

Enumerations

enum **esp_local_ctrl_proto_sec**

Security types for `esp_local_control`.

Values:

enumerator **PROTOCOL_SEC0**

enumerator **PROTOCOL_SEC1**

enumerator **PROTOCOL_SEC2**

enumerator **PROTOCOL_SEC_CUSTOM**

2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp_serial_slave_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp_serial_slave_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- **Address:** 8-bit, master to slave, optional
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

Data IO Modes In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See [Supported Commands](#)), except the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

Supported Commands

Note: The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

Segment Transaction Mode Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp_serial_slave_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

ESP SDIO Slave The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`) structure.

2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

ESP SPI Slave

Note: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn't been supported yet.

APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional) Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32-C3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

API Reference

Header File

- [components/driver/test/esp_serial_slave_link/include/esp_serial_slave_link/essl.h](#)

Functions

esp_err_t **essl_init** (*essl_handle_t* handle, uint32_t wait_ms)

Initialize the slave.

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

esp_err_t **essl_wait_for_ready** (*essl_handle_t* handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_tx_buffer_num** (*essl_handle_t* handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Parameters

- **handle** –Handle of a ESSL device.
- **out_tx_num** –Output of buffer num that host can send data to ESSL slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_get_rx_data_size** (*essl_handle_t* handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

Parameters

- **handle** –Handle of an ESSL device.
- **out_rx_size** –Output of data size to read from slave, in bytes
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_reset_cnt** (*essl_handle_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

Parameters **handle** –Handle of an ESSL device.

Returns

- ESP_OK: Success

- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init.

`esp_err_t` **essl_send_packet** (*essl_handle_t* handle, const void *start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

Parameters

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init or other argument is not valid.
- `ESP_ERR_TIMEOUT`: No buffer to use, or error from SDMMC host controller.
- `ESP_ERR_NOT_FOUND`: Slave is not ready for receiving.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t` **essl_get_packet** (*essl_handle_t* handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **out_data** –[**out**] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out_length** –[**out**] Output of length the data actually received from slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success: All the data has been read from the slave.
- `ESP_ERR_INVALID_ARG`: Invalid argument, The handle is not initialized or the other arguments are invalid.
- `ESP_ERR_NOT_FINISHED`: Read was successful, but there is still data remaining.
- `ESP_ERR_NOT_FOUND`: Slave is not ready to send data.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t` **essl_write_reg** (*essl_handle_t* handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

Note: `sdio 28-31` are reserved, the lower API helps to skip.

Parameters

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value_o** –Output of the returned written value.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_read_reg** (*essl_handle_t* handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

Parameters

- **handle** –Handle of a *essl* device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see *essl_spi.h*
- **value_o** –Output value read from the register.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

esp_err_t **essl_wait_int** (*essl_handle_t* handle, uint32_t wait_ms)

wait for an interrupt of the slave

Parameters

- **handle** –Handle of an ESSL device.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

esp_err_t **essl_clear_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to clear.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_get_intr** (*essl_handle_t* handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)

Get interrupt bits of ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success
- ESP_INVALID_ARG: If both *intr_raw* and *intr_st* are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

esp_err_t **essl_set_intr_ena** (*essl_handle_t* handle, uint32_t ena_mask, uint32_t wait_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters

- **handle** –Handle of an ESSL device.
- **ena_mask** –Mask of the interrupt bits to enable.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- ESP_OK: Success

- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_get_intr_ena** (*essl_handle_t* handle, uint32_t *ena_mask_o, uint32_t wait_ms)

Get interrupt enable bits of ESSL slave.

Parameters

- **handle** –Handle of an ESSL device.
- **ena_mask_o** –Output of interrupt bit enable mask.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK` Success
- One of the error codes from SDMMC host controller

`esp_err_t` **essl_send_slave_intr** (*essl_handle_t* handle, uint32_t intr_mask, uint32_t wait_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

Parameters

- **handle** –Handle of an ESSL device.
- **intr_mask** –Mask of interrupt bits to send to slave.
- **wait_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

Header File

- `components/driver/test/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h`

Functions

`esp_err_t` **essl_sdio_init_dev** (*essl_handle_t* *out_handle, const *essl_sdio_config_t* *config)

Initialize the ESSL SDIO device and get its handle.

Parameters

- **out_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

Returns

- `ESP_OK`: on success
- `ESP_ERR_NO_MEM`: memory exhausted.

`esp_err_t` **essl_sdio_deinit_dev** (*essl_handle_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

Parameters **handle** –Handle of the ESSL SDIO device to deinit.

Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: wrong handle passed

Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t ***card**

The initialized sdmmc card pointer of the slave.

int **recv_buffer_size**

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- `components/driver/test/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

Functions

esp_err_t **essl_spi_init_dev** (*essl_handle_t* *out_handle, const *essl_spi_config_t* *init_config)

Initialize the ESSL SPI device function list and get its handle.

Parameters

- **out_handle** –[out] Output of the handle
- **init_config** –Configuration for the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t **essl_spi_deinit_dev** (*essl_handle_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters **handle** –Handle of the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t **essl_spi_read_reg** (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- **out_value** –[out] Read buffer for the shared registers.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_get_packet** (void *arg, void *out_data, size_t size, uint32_t wait_ms)

Get a packet from Slave.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out_data** –[out] Output data address
- **size** –The size of the output data.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl_spi_write_reg** (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

Note: Feature of checking the actual written value (`out_value`) is not supported.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out_value** –[out] Not supported, should be set to `NULL`.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl_spi_send_packet** (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl_spi_reset_cnt** (void *arg)

Reset the counter in Master context.

Note: Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters **arg** –Context of the component. (Member **arg** from **essl_handle_t**)

esp_err_t **essl_spi_rdbuf** (*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in ISR way.

Note: The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note: **out_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_rdbuf_polling** (*spi_device_handle_t* spi, uint8_t *out_data, int addr, int len, uint32_t flags)

Read the shared buffer from the slave in polling way.

Note: **out_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrbuf** (*spi_device_handle_t* spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in ISR way.

Note: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl_spi_wrbuf_polling** (`spi_device_handle_t` spi, const uint8_t *data, int addr, int len, uint32_t flags)

Write the shared buffer of the slave in polling way.

Note: `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

`esp_err_t` **essl_spi_rddma** (`spi_device_handle_t` spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

Note: This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_rddma_seg** (*spi_device_handle_t* spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

Note: To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

Parameters

- **spi** –SPI device handle representing the slave
- **out_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg_len** –Length of this segment
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_rddma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

Note: This is required only when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_wrdma** (*spi_device_handle_t* spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

Note: This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

esp_err_t **essl_spi_wrdma_seg** (*spi_device_handle_t* spi, const uint8_t *data, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

Note: To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg_len** –Length of this segment
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

esp_err_t **essl_spi_wrdma_done** (*spi_device_handle_t* spi, uint32_t flags)

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note: This is required only when the slave is working in segment mode.

Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns

- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

Structures

struct **essl_spi_config_t**

Configuration of ESSL SPI device.

Public Members

spi_device_handle_t ***spi**

Pointer to SPI device handle.

uint32_t **tx_buf_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8_t **tx_sync_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t **rx_sync_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jul 19 03:12:06 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

Configuration

Most configuration is done through `menuconfig`. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https_x509_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https_mbedtls](#).

API Reference

Header File

- [components/mbedtls/esp_cert_bundle/include/esp_cert_bundle.h](#)

Functions

esp_err_t **esp_cert_bundle_attach** (void *conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

Parameters **conf** –[in] The config struct for the SSL connection.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp_cert_bundle_detach** (mbedtls_ssl_config *conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters **conf** –[in] The config struct for the SSL connection.

esp_err_t **esp_cert_bundle_set** (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters

- **x509_bundle** –[in] A pointer to the certificate bundle.
- **bundle_size** –[in] Size of the certificate bundle in bytes.

Returns

- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

2.2.9 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C3. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri name`, `method type` (eg. `HTTPD_GET/HTTPD_POST/HTTPD_PUT` etc.), `function pointer of type esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */

```

(continues on next page)

(continued from previous page)

```
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
```

Simple HTTP Server Example Check HTTP server example under [protocols/http_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↳data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↳context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http_server/persistent_sockets](#).

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http_server/ws_echo_server](#) example which demonstrates usage of the websocket feature.

Event Handling

ESP HTTP Server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP Server. `esp_http_server_event_id_t` has all the events which can happen for ESP HTTP Server.

Expected data type for different ESP HTTP Server events in event loop:

- HTTP_SERVER_EVENT_ERROR: httpd_err_code_t
- HTTP_SERVER_EVENT_START: NULL
- HTTP_SERVER_EVENT_ON_CONNECTED: int
- HTTP_SERVER_EVENT_ON_HEADER: int
- HTTP_SERVER_EVENT_HEADERS_SENT: int
- HTTP_SERVER_EVENT_ON_DATA: esp_http_server_event_data
- HTTP_SERVER_EVENT_SENT_DATA: esp_http_server_event_data
- HTTP_SERVER_EVENT_DISCONNECTED: int
- HTTP_SERVER_EVENT_STOP: NULL

API Reference

Header File

- [components/esp_http_server/include/esp_http_server.h](#)

Functions

esp_err_t **httpd_register_uri_handler** (*httpd_handle_t* handle, const *httpd_uri_t* *uri_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri_handler** –[in] pointer to handler that needs to be registered

Returns

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

esp_err_t **httpd_unregister_uri_handler** (*httpd_handle_t* handle, const char *uri, *httpd_method_t* method)

Unregister a URI handler.

Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string

- **method** –[in] HTTP method

Returns

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

esp_err_t **httpd_unregister_uri** (*httpd_handle_t* handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

Returns

- ESP_OK : On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : No handler registered with specified uri string

esp_err_t **httpd_sess_set_recv_override** (*httpd_handle_t* hd, int sockfd, *httpd_recv_func_t* recv_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv_func** –[in] The receive function to be set for this session

Returns

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_send_override** (*httpd_handle_t* hd, int sockfd, *httpd_send_func_t* send_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **send_func** –[in] The send function to be set for this session

Returns

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

esp_err_t **httpd_sess_set_pending_override** (*httpd_handle_t* hd, int sockfd, *httpd_pending_func_t* pending_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

Note: This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
 - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
-

Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending_func** –[in] The receive function to be set for this session

Returns

- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

int `httpd_req_to_sockfd` (*httpd_req_t* *r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

Note: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

Parameters **r** –[in] The request whose socket descriptor should be found

Returns

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int `httpd_req_recv` (*httpd_req_t* *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
 - Presently Chunked Encoding is not supported
-

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf_len** –[in] Length of the buffer

Returns

- Bytes : Number of bytes read into the buffer successfully

- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t **httpd_req_get_hdr_value_len** (*httpd_req_t* *r, const char *field)

Search for a field in request headers and return the string length of it' s value.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
 - Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

Returns

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp_err_t **httpd_req_get_hdr_value_str** (*httpd_req_t* *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

Note:

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
 - Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
 - Use httpd_req_get_hdr_value_len() to know the right buffer length
-

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val_size** –[in] Size of the user buffer “val”

Returns

- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

size_t **httpd_req_get_url_query_len** (*httpd_req_t* *r)

Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Parameters **r** –[in] The request being responded to

Returns

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

esp_err_t **httpd_req_get_url_query_str** (*httpd_req_t* *r, char *buf, size_t buf_len)

Get Query string from the request URL.

Note:

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Parameters

- **r** –[in] The request being responded to
- **buf** –[out] Pointer to the buffer into which the query string will be copied (if found)
- **buf_len** –[in] Length of output buffer

Returns

- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

esp_err_t **httpd_query_key_value** (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1¶m2=val2.

Note:

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.

Parameters

- **qry** –[in] Pointer to query string
- **key** –[in] The key to be searched in the query string
- **val** –[out] Pointer to the buffer into which the value will be copied if the key is found
- **val_size** –[in] Size of the user buffer “val”

Returns

- ESP_OK : Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

esp_err_t **httpd_req_get_cookie_val** (*httpd_req_t* *req, const char *cookie_name, char *val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Parameters

- **req** –[in] Pointer to the HTTP request
- **cookie_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

Returns

- ESP_OK : Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated
- ESP_ERR_NO_MEM : Memory allocation failure

bool **httpd_uri_match_wildcard** (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Parameters

- **uri_template** –[in] URI template (pattern)
- **uri_to_match** –[in] URI to be matched
- **match_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

esp_err_t **httpd_resp_send** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf_len** –[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

esp_err_t **httpd_resp_send_chunk** (*httpd_req_t* *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf_len** –[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

Returns

- ESP_OK : On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_sendstr** (*httpd_req_t* *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline *esp_err_t* **httpd_resp_sendstr_chunk** (*httpd_req_t* *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

esp_err_t **httpd_resp_set_status** (*httpd_req_t* *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the status string is valid till send function is called.
-

Parameters

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t **httpd_resp_set_type** (*httpd_req_t* *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
 - Make sure that the lifetime of the type string is valid till send function is called.
-

Parameters

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

esp_err_t **httpd_resp_set_hdr** (*httpd_req_t* *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - The header isn't sent out until any of the send APIs is executed.
 - The maximum allowed number of additional headers is limited to value of *max_resp_headers* in config structure.
 - Make sure that the lifetime of the field value strings are valid till send function is called.
-

Parameters

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

Returns

- *ESP_OK* : On successfully appending new header
- *ESP_ERR_INVALID_ARG* : Null arguments
- *ESP_ERR_HTTPD_RESP_HDR* : Total additional headers exceed max allowed
- *ESP_ERR_HTTPD_INVALID_REQ* : Invalid request pointer

esp_err_t **httpd_resp_send_err** (*httpd_req_t* *req, *httpd_err_code_t* error, const char *msg)

For sending out error code in response to HTTP request.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
 - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
-

Parameters

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

Returns

- *ESP_OK* : On successfully sending the response packet
- *ESP_ERR_INVALID_ARG* : Null arguments
- *ESP_ERR_HTTPD_RESP_SEND* : Error in raw send
- *ESP_ERR_HTTPD_INVALID_REQ* : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_404** (*httpd_req_t* *r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters **r** –[in] The request being responded to

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_408** (*httpd_req_t* *r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters **r** –[in] The request being responded to

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline *esp_err_t* **httpd_resp_send_500** (*httpd_req_t* *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

- This API is supposed to be called only from the context of a URI handler where *httpd_req_t** request pointer is valid.
 - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
-

Parameters **r** –[in] The request being responded to

Returns

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int **httpd_send** (*httpd_req_t* *r, const char *buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
 - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
-

Parameters

- **r** `–[in]` The request being responded to
- **buf** `–[in]` Buffer from where the fully constructed packet is to be read
- **buf_len** `–[in]` Length of the buffer

Returns

- Bytes : Number of bytes that were sent successfully
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_send` (*[httpd_handle_t](#)* hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Parameters

- **hd** `–[in]` server instance
- **sockfd** `–[in]` session socket file descriptor
- **buf** `–[in]` buffer with bytes to send
- **buf_len** `–[in]` data size
- **flags** `–[in]` flags for the send() function

Returns

- Bytes : The number of bytes sent successfully
- `HTTPD SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*[httpd_handle_t](#)* hd, int sockfd, char *buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Parameters

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf_len** –[in] data size
- **flags** –[in] flags for the send() function

Returns

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

esp_err_t **httpd_register_err_handler** (*httpd_handle_t* handle, *httpd_err_code_t* error, *httpd_err_handler_func_t* handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd_err_code_t*. See prototype *httpd_err_handler_func_t* above for details.

Parameters

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

Returns

- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

esp_err_t **httpd_start** (*httpd_handle_t* *handle, const *httpd_config_t* *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

Parameters

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

Returns

- ESP_OK : Instance created successfully
- ESP_ERR_INVALID_ARG : Null argument(s)

- ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK : Failed to launch server task

esp_err_t **httpd_stop** (*httpd_handle_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Parameters **handle** –[in] Handle to server returned by `httpd_start`

Returns

- ESP_OK : Server stopped successfully
- ESP_ERR_INVALID_ARG : Handle argument is Null

esp_err_t **httpd_queue_work** (*httpd_handle_t* handle, *httpd_work_fn_t* work, void *arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

Note: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **work** –[in] Pointer to the function to be executed in the HTTPD' s context
- **arg** –[in] Pointer to the arguments that should be passed to this function

Returns

- ESP_OK : On successfully queueing the work
- ESP_FAIL : Failure in ctrl socket
- ESP_ERR_INVALID_ARG : Null arguments

void ***httpd_sess_get_ctx** (*httpd_handle_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

Returns

- void* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session context by socket descriptor.

Parameters

- **handle** –[in] Handle to server returned by httpd_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free_fn** –[in] Function that should be called to free the context

void ***httpd_sess_get_transport_ctx** (*httpd_handle_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:

httpd_sess_get_ctx()

Parameters

- **handle** –[in] Handle to server returned by httpd_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

Returns

- void* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd_sess_set_transport_ctx** (*httpd_handle_t* handle, int sockfd, void *ctx, *httpd_free_ctx_fn_t* free_fn)

Set session ‘transport’ context by socket descriptor.

See also:

httpd_sess_set_ctx()

Parameters

- **handle** –[in] Handle to server returned by httpd_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free_fn** –[in] Function that should be called to free the transport context

void ***httpd_get_global_user_ctx** (*httpd_handle_t* handle)

Get HTTPD global user context (it was set in the server config struct)

Parameters **handle** –[in] Handle to server returned by httpd_start

Returns global user context

void ***httpd_get_global_transport_ctx** (*httpd_handle_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

Parameters **handle** –[in] Handle to server returned by httpd_start

Returns global transport context

esp_err_t **httpd_sess_trigger_close** (*httpd_handle_t* handle, int sockfd)

Trigger an httpd session close externally.

Note: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

Returns

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_sess_update_lru_counter** (*httpd_handle_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note: Calling this API is only necessary if the LRU Purge Enable option is enabled.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

Returns

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

esp_err_t **httpd_get_client_list** (*httpd_handle_t* handle, size_t *fds, int *client_fds)

Returns list of current socket descriptors of active sessions.

Note: Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

Parameters

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client_fds** –[out] Array of client fds

Returns

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

Structures

struct **esp_http_server_event_data**

Argument structure for `HTTP_SERVER_EVENT_ON_DATA` and `HTTP_SERVER_EVENT_SENT_DATA` event

Public Members

int **fd**

Session socket file descriptor

int **data_len**

Data length

struct **httpd_config**

HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

unsigned **task_priority**

Priority of FreeRTOS task which runs the server

size_t **stack_size**

The maximum stack size allowed for the server task

BaseType_t **core_id**

The core the HTTP server task will run on

uint16_t **server_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16_t **ctrl_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t **max_open_sockets**

Max number of sockets/clients connected at any time

uint16_t **max_uri_handlers**

Maximum allowed uri handlers

uint16_t **max_resp_headers**

Maximum allowed additional headers in HTTP response

uint16_t **backlog_conn**

Number of backlog connections

bool **lru_purge_enable**

Purge “Least Recently Used” connection

uint16_t **recv_wait_timeout**

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[*httpd_free_ctx_fn_t*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[*httpd_free_ctx_fn_t*](#) `global_transport_ctx_free_fn`

Free function for global transport context

`bool enable_so_linger`

bool to enable/disable linger

`int linger_timeout`

linger timeout (in seconds)

`bool keep_alive_enable`

Enable keep-alive timeout

`int keep_alive_idle`

Keep-alive idle time. Default is 5 (second)

`int keep_alive_interval`

Keep-alive interval time. Default is 5 (second)

`int keep_alive_count`

Keep-alive packet retry send count. Default is 3 counts

[*httpd_open_func_t*](#) `open_fn`

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

***httpd_close_func_t* close_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

***httpd_uri_match_func_t* uri_match_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

struct httpd_req

HTTP Request Data Structure.

Public Members***httpd_handle_t* handle**

Handle to server instance

int method

The type of HTTP request, -1 if unsupported method

const char uri[HTTPD_MAX_URI_LEN + 1]

The URI of this request (1 byte extra for null termination)

size_t content_len

Length of the request body

void *aux

Internally used members

void *user_ctx

User context pointer passed during URI registration.

void *sess_ctx

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

httpd_free_ctx_fn_t **free_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

bool **ignore_sess_ctx_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

struct **httpd_uri**

Structure for URI handler.

Public Members

const char ***uri**

The URI to handle

httpd_method_t **method**

Method supported by the URI

esp_err_t (***handler**)(*httpd_req_t* *r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

void ***user_ctx**

Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD SOCK_ERR_FAIL

HTTPD SOCK_ERR_INVALID

HTTPD SOCK_ERR_TIMEOUT

HTTPD_200

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML

HTTPD_TYPE_OCTET

HTTP Content type octext-stream

ESP_HTTPD_DEF_CTRL_PORT

HTTP Server control socket port

HTTPD_DEFAULT_CONFIG ()

ESP_ERR_HTTPD_BASE

Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL

All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS

URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ

Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC

Result string truncated

ESP_ERR_HTTPD_RESP_HDR

Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND

Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM

Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK

Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN**Type Definitions**

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

Note: User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

Param `hd` [in] server instance

Param `sockfd` [in] session socket file descriptor

Param `buf` [in] buffer with bytes to send

Param `buf_len` [in] data size

Param `flags` [in] flags for the `send()` function

Return

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level `recv` function.

Note: User specified `recv` function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

Param `hd` [in] server instance

Param `sockfd` [in] session socket file descriptor

Param `buf` [in] buffer with bytes to send

Param buf_len [in] data size

Param flags [in] flags for the send() function

Return

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will be handled accordingly in the server task.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- Bytes : The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_resp_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
 - When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
 - The function must return `ESP_OK` if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.
-

Param req [in] HTTP request for which the error needs to be handled

Param error [in] Error type

Return

- `ESP_OK` : error handled successful
- `ESP_FAIL` : failure indicates that the underlying socket needs to be closed

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method **httpd_method_t**

HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (***httpd_free_ctx_fn_t**)(void *ctx)

Prototype for freeing context data (if any)

Param ctx [in] object to free

typedef *esp_err_t* (***httpd_open_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

Return

- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

typedef void (***httpd_close_func_t**)(*httpd_handle_t* hd, int sockfd)

Function prototype for closing a session.

Note: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

Param hd [in] server instance

Param sockfd [in] session socket file descriptor

typedef bool (***httpd_uri_match_func_t**)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched

Param uri_to_match [in] URI/template being matched to the reference URI/template

Param match_upto [in] For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

Return true on match

typedef struct *httpd_config* **httpd_config_t**

HTTP Server Configuration Structure.

Note: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (***httpd_work_fn_t**)(void *arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

Param arg [in] The arguments for this work function

Enumerations

enum **httpd_err_code_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

Values:

enumerator **HTTPD_500_INTERNAL_SERVER_ERROR**

enumerator **HTTPD_501_METHOD_NOT_IMPLEMENTED**

enumerator **HTTPD_505_VERSION_NOT_SUPPORTED**

enumerator **HTTPD_400_BAD_REQUEST**

enumerator **HTTPD_401_UNAUTHORIZED**

enumerator **HTTPD_403_FORBIDDEN**

enumerator **HTTPD_404_NOT_FOUND**

enumerator **HTTPD_405_METHOD_NOT_ALLOWED**

enumerator **HTTPD_408_REQ_TIMEOUT**

enumerator **HTTPD_411_LENGTH_REQUIRED**

enumerator **HTTPD_414_URI_TOO_LONG**

enumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

enumerator **HTTPD_ERR_CODE_MAX**

enum **esp_http_server_event_id_t**

HTTP Server events id.

Values:

enumerator **HTTP_SERVER_EVENT_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP_SERVER_EVENT_START**

This event occurs when HTTP Server is started

enumerator **HTTP_SERVER_EVENT_ON_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP_SERVER_EVENT_ON_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP_SERVER_EVENT_HEADERS_SENT**

After sending all the headers to the client

enumerator **HTTP_SERVER_EVENT_ON_DATA**

Occurs when receiving data from the client

enumerator **HTTP_SERVER_EVENT_SENT_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP_SERVER_EVENT_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP_SERVER_EVENT_STOP**

This event occurs when HTTP Server is stopped

2.2.10 HTTPS Server

Overview

This component is built on top of *HTTP Server*. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for *HTTP Server* applies also to a server you create this way.

Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send” , “receive” and “pending” callback registration functions - secure socket handling
 - `httpd_sess_set_send_override()`
 - `httpd_sess_set_recv_override()`
 - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
 - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
 - `httpd_sess_set_transport_ctx()`
 - `httpd_get_global_transport_ctx()` - returns the shared SSL context
 - `httpd_config::global_transport_ctx`
 - `httpd_config::global_transport_ctx_free_fn`
 - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example [protocols/https_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- `components/esp_https_server/include/esp_https_server.h`

Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t *handle`, `httpd_ssl_config_t *config`)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Parameters

- **config** –[inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** –[out] - storage for the server handle, must be a valid pointer

Returns success

`esp_err_t httpd_ssl_stop` (`httpd_handle_t handle`)

Stop the server. Blocks until the server is shut down.

Parameters **handle** –[in]

Returns

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

Structures

struct `esp_https_server_user_cb_arg`

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

Public Members

`httpd_ssl_user_cb_state_t user_cb_state`

State of user callback

`esp_tls_t *tls`

ESP-TLS connection handle

struct `httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

Public Members

`httpd_config_t httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t ***servercert**

Server certificate

size_t **servercert_len**

Server certificate byte length

const uint8_t ***cacert_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size_t **cacert_len**

CA certificate byte length

const uint8_t ***prvtkey_pem**

Private key

size_t **prvtkey_len**

Private key byte length

httpd_ssl_transport_mode_t **transport_mode**

Transport Mode (default secure)

uint16_t **port_secure**

Port used when transport mode is secure (default 443)

uint16_t **port_insecure**

Port used when transport mode is insecure (default 80)

bool **session_tickets**

Enable tls session tickets

bool **use_secure_element**

Enable secure element for server session

esp_https_server_user_cb ***user_cb**

User callback for esp_https_server

void ***ssl_userdata**

user data to add to the ssl context

esp_tls_handshake_callback **cert_select_cb**

Certificate selection callback to use

Macros

HTTPD_SSL_CONFIG_DEFAULT ()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport_mode'

- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

typedef struct *esp_https_server_user_cb_arg* **esp_https_server_user_cb_arg_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void **esp_https_server_user_cb** (*esp_https_server_user_cb_arg_t* *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

Param user_cb Callback data struct

typedef struct *httpd_ssl_config* **httpd_ssl_config_t**

Enumerations

enum **httpd_ssl_transport_mode_t**

Values:

enumerator **HTTPD_SSL_TRANSPORT_SECURE**

enumerator **HTTPD_SSL_TRANSPORT_INSECURE**

enum **httpd_ssl_user_cb_state_t**

Indicates the state at which the user callback is executed, i.e at session creation or session close.

Values:

enumerator **HTTPD_SSL_USER_CB_SESS_CREATE**

enumerator **HTTPD_SSL_USER_CB_SESS_CLOSE**

2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

Create a new ping session To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
    ↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
    ↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
    ↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted,
    ↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
}
```

(continues on next page)

```

freeaddrinfo(res);

esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
ping_config.target_addr = target_addr;           // target IP address
ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↳ping_stop can stop it

/* set callback functions */
esp_ping_callbacks_t cbs;
cbs.on_ping_success = test_on_ping_success;
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
↳can be NULL
cbs.cb_args = eth_event_group;

esp_ping_handle_t ping;
esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: [protocols/icmp_echo](#)

API Reference

Header File

- `components/lwip/include/apps/ping/ping_sock.h`

Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` *config, const `esp_ping_callbacks_t` *cbs, `esp_ping_handle_t` *hdl_out)

Create a ping session.

Parameters

- **config** –ping configuration
- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl_out** –handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)

- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

esp_err_t **esp_ping_delete_session** (*esp_ping_handle_t* hdl)

Delete a ping session.

Parameters **hdl** –handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully

esp_err_t **esp_ping_start** (*esp_ping_handle_t* hdl)

Start the ping session.

Parameters **hdl** –handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

esp_err_t **esp_ping_stop** (*esp_ping_handle_t* hdl)

Stop the ping session.

Parameters **hdl** –handle of ping session

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

esp_err_t **esp_ping_get_profile** (*esp_ping_handle_t* hdl, *esp_ping_profile_t* profile, void *data, uint32_t size)

Get runtime profile of ping session.

Parameters

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

Returns

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn't match the “size” parameter
- ESP_OK: get profile successfully

Structures

struct **esp_ping_callbacks_t**

Type of “ping” callback functions.

Public Members

void ***cb_args**

arguments for callback functions

void (***on_ping_success**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (***on_ping_timeout**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (***on_ping_end**)(*esp_ping_handle_t* hdl, void *args)

Invoked by internal ping thread when a ping session is finished.

struct **esp_ping_config_t**

Type of “ping” configuration.

Public Members

uint32_t **count**

A “ping” session contains count procedures

uint32_t **interval_ms**

Milliseconds between each ping procedure

uint32_t **timeout_ms**

Timeout value (in milliseconds) of each ping procedure

uint32_t **data_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip_addr_t **target_addr**

Target IP address, either IPv4 or IPv6

uint32_t **task_stack_size**

Stack size of internal ping task

uint32_t **task_prio**

Priority of internal ping task

uint32_t **interface**

Netif index, interface=0 means NETIF_NO_INDEX

Macros

ESP_PING_DEFAULT_CONFIG ()

Default ping configuration.

ESP_PING_COUNT_INFINITE

Set ping count to zero will ping target infinitely

Type Definitions

typedef void ***esp_ping_handle_t**

Type of “ping” session handle.

Enumerations

enum **esp_ping_profile_t**

Profile of ping session.

Values:

enumerator **ESP_PING_PROF_SEQNO**

Sequence number of a ping procedure

enumerator **ESP_PING_PROF_TOS**

Type of service of a ping procedure

enumerator **ESP_PING_PROF_TTL**

Time to live of a ping procedure

enumerator **ESP_PING_PROF_REQUEST**

Number of request packets sent out

enumerator **ESP_PING_PROF_REPLY**

Number of reply packets received

enumerator **ESP_PING_PROF_IPADDR**

IP address of replied target

enumerator **ESP_PING_PROF_SIZE**

Size of received packet

enumerator **ESP_PING_PROF_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP_PING_PROF_DURATION**

Elapsed time of the whole ping session

2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component *mDNS* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run *idf.py add-dependency espressif/mdns*.

Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

Note: ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Note: Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](#).

Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF [here](#).

Note: Please refer the [ESP-IDF Migration Guide](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https_server/simple](#) (Simple HTTPS server) and [protocols/https_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https_mbedtls](#).

Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedtls`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3

- *CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- *CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS*: Support for TLS Session Resumption: Client session tickets
- *CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS*: Support for TLS Session Resumption: Server session tickets
- *CONFIG_MBEDTLS_HARDWARE_SHA*: Support for hardware SHA acceleration
- *CONFIG_MBEDTLS_HARDWARE_AES*: Support for hardware AES acceleration
- *CONFIG_MBEDTLS_HARDWARE_MPI*: Support for hardware MPI (bignum) acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

Performance and Memory Tweaks

Reducing Heap Usage The following table shows typical memory usage with different configs when the [protocols/https_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	<i>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</i>	42120 B
Disable Keep Peer Certificate	<i>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</i>	38533 B
Enable Dynamic TX/RX Buffer	<i>CONFIG_MBEDTLS_DYNAMIC_BUFFER</i> <i>FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</i> <i>FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</i>	<i>CON-</i> <i>CON-</i> 22013 B

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

2.3 Bluetooth API

2.3.1 BT COMMON

BT GENERIC DEFINES

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_defs.h](#)

Structures

struct **esp_bt_uuid_t**

UUID type.

Public Members

uint16_t **len**

UUID length, 16bit, 32bit or 128bit

uint16_t **uuid16**

16bit UUID

uint32_t **uuid32**

32bit UUID

uint8_t **uuid128**[ESP_UUID_LEN_128]

128bit UUID

union *esp_bt_uuid_t*::[anonymous] **uuid**

UUID

Macros

ESP_BLUEDROID_STATUS_CHECK (status)

ESP_BT_STATUS_BASE_FOR_HCI_ERR

ESP_BT_OCTET16_LEN

ESP_BT_OCTET8_LEN

ESP_DEFAULT_GATT_IF

Default GATT interface id.

ESP_BLE_PRIM_ADV_INT_MIN

Minimum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_PRIM_ADV_INT_MAX

Maximum advertising interval for undirected and low duty cycle directed advertising

ESP_BLE_CONN_INT_MIN

relate to BTM_BLE_CONN_INT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_INT_MAX

relate to BTM_BLE_CONN_INT_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_LATENCY_MAX

relate to ESP_BLE_CONN_LATENCY_MAX in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MIN

relate to BTM_BLE_CONN_SUP_TOUT_MIN in stack/btm_ble_api.h

ESP_BLE_CONN_SUP_TOUT_MAX

relate to ESP_BLE_CONN_SUP_TOUT_MAX in stack/btm_ble_api.h

ESP_BLE_IS_VALID_PARAM (x, min, max)

Check the param is valid or not.

ESP_UUID_LEN_16

ESP_UUID_LEN_32

ESP_UUID_LEN_128

ESP_BD_ADDR_LEN

Bluetooth address length.

ESP_BLE_ENC_KEY_MASK

Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK

Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK

Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN

Minimum of the application id.

ESP_APP_ID_MAX

Maximum of the application id.

ESP_BD_ADDR_STR

ESP_BD_ADDR_HEX (addr)

Type Definitions

typedef uint8_t **esp_bt_octet16_t**[ESP_BT_OCTET16_LEN]

typedef uint8_t **esp_bt_octet8_t**[ESP_BT_OCTET8_LEN]

typedef uint8_t **esp_link_key**[ESP_BT_OCTET16_LEN]

typedef uint8_t **esp_bd_addr_t**[ESP_BD_ADDR_LEN]

Bluetooth device address.

typedef uint8_t **esp_ble_key_mask_t**

Enumerations

enum **esp_bt_status_t**

Status Return Value.

Values:

enumerator **ESP_BT_STATUS_SUCCESS**

enumerator **ESP_BT_STATUS_FAIL**

enumerator **ESP_BT_DEVICE_TYPE_BREDR**

enumerator **ESP_BT_DEVICE_TYPE_BLE**

enumerator **ESP_BT_DEVICE_TYPE_DUMO**

enum **esp_ble_addr_type_t**

BLE device address type.

Values:

enumerator **BLE_ADDR_TYPE_PUBLIC**

Public Device Address

enumerator **BLE_ADDR_TYPE_RANDOM**

Random Device Address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enumerator **BLE_ADDR_TYPE_RPA_PUBLIC**

Resolvable Private Address (RPA) with public identity address

enumerator **BLE_ADDR_TYPE_RPA_RANDOM**

Resolvable Private Address (RPA) with random identity address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enum **esp_ble_wl_addr_type_t**

white list address type

Values:

enumerator **BLE_WL_ADDR_TYPE_PUBLIC**

enumerator **BLE_WL_ADDR_TYPE_RANDOM**

BT MAIN API

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_main.h](#)

Functions

esp_bluedroid_status_t **esp_bluedroid_get_status** (void)

Get bluetooth stack status.

Returns Bluetooth stack status

esp_err_t **esp_bluedroid_enable** (void)

Enable bluetooth, must after esp_bluedroid_init().

Returns

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_disable** (void)

Disable bluetooth, must prior to esp_bluedroid_deinit().

Returns

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Returns

- ESP_OK : Succeed
- Other : Failed

esp_err_t **esp_bluedroid_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Returns

- ESP_OK : Succeed
- Other : Failed

Enumerations

enum **esp_bluedroid_status_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

enumerator **ESP_BLUEDROID_STATUS_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP_BLUEDROID_STATUS_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP_BLUEDROID_STATUS_ENABLED**

Bluetooth initialized and enabled

BT DEVICE APIs

Overview Bluetooth device reference APIs.

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_bt_device.h](#)

Functions

`const uint8_t *esp_bt_dev_get_address` (void)

Get bluetooth device address. Must use after “`esp_bluedroid_enable`” .

Returns bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

`esp_err_t esp_bt_dev_set_device_name` (const char *name)

Set bluetooth device name. This function should be called after `esp_bluedroid_enable()` completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Parameters `name` –[in] : device name to be set

Returns

- `ESP_OK` : Succeed
- `ESP_ERR_INVALID_ARG` : if name is NULL pointer or empty, or string length out of limit
- `ESP_ERR_INVALID_STATE` : if bluetooth stack is not yet enabled
- `ESP_FAIL` : others

2.3.2 BT LE

GAP API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
 - [bluetooth/bluedroid/ble/gatt_security_client](#)
 - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h](#)

Functions

`esp_err_t esp_ble_gap_register_callback` (`esp_gap_ble_cb_t` callback)

This function is called to occur gap event, such as scan result.

Parameters `callback` –[in] callback function

Returns

- `ESP_OK` : success
- other : failed

`esp_err_t esp_ble_gap_config_adv_data` (`esp_ble_adv_data_t` *adv_data)

This function is called to override the BTA default ADV parameters.

Parameters **adv_data** –[in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of `config_adv_data` is received.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_scan_params** (*esp_ble_scan_params_t* *scan_params)

This function is called to set scan parameters.

Parameters **scan_params** –[in] Pointer to User defined scan_params data structure. This memory space can not be freed until callback of `set_scan_params`

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_scanning** (uint32_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

Parameters **duration** –[in] Keeping the scanning time, the unit is second.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_start_advertising** (*esp_ble_adv_params_t* *adv_params)

This function is called to start advertising.

Parameters **adv_params** –[in] pointer to User defined adv_params data structure.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_stop_advertising** (void)

This function is called to stop advertising.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_conn_params** (*esp_ble_conn_update_params_t* *params)

Update connection parameters, can only be used when connection is up.

Parameters **params** –[in] - connection update parameters

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_pkt_data_len** (*esp_bd_addr_t* remote_device, uint16_t tx_data_length)

This function is to set maximum LE data packet size.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_rand_addr** (*esp_bd_addr_t* rand_addr)

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

Parameters **rand_addr** –[in] The address to be configured. Refer to the table below for possible address subtypes:

address [47:46]	Address Type
0b00	Non-Resolvable Private Address
0b11	Static Random Address

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_rand_addr** (void)

This function clears the random address for the application.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_privacy** (bool privacy_enable)

Enable/disable privacy (including address resolution) on the local device.

Parameters **privacy_enable** –[in] - enable/disable privacy on remote device.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_local_icon** (uint16_t icon)

set local gap appearance icon

Parameters **icon** –[in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/assigned-numbers/>

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_update_whitelist** (bool add_remove, *esp_bd_addr_t* remote_bda, *esp_ble_wl_addr_type_t* wl_addr_type)

Add or remove device from white list.

Parameters

- **add_remove** –[in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote_bda** –[in] the remote device address add/remove from the white list.
- **wl_addr_type** –[in] whitelist address type

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clear_whitelist** (void)

Clear all white list.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_whitelist_size** (uint16_t *length)

Get the whitelist size in the controller.

Parameters **length** –[out] the white list length.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_prefer_conn_params** (*esp_bd_addr_t* bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Parameters

- **bd_addr** –[in] BD address of the peripheral
- **min_conn_int** –[in] minimum preferred connection interval
- **max_conn_int** –[in] maximum preferred connection interval
- **slave_latency** –[in] preferred slave latency
- **supervision_tout** –[in] preferred supervision timeout

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_device_name** (const char *name)

Set device name to the local device Note: This API don't affect the advertising data.

Parameters **name** –[in] - device name.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_device_name** (void)

Get device name of the local device.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_get_local_used_addr** (*esp_bd_addr_t* local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

Parameters

- **local_used_addr** –[in] - current local used ble address (six bytes)
- **addr_type** –[in] - ble address type

Returns - ESP_OK : success

- other : failed

uint8_t ***esp_ble_resolve_adv_data** (uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

Parameters

- **adv_data** –[in] - pointer of ADV data which to be resolved
- **type** –[in] - finding ADV data type
- **length** –[out] - return the length of ADV data not including type

Returns pointer of ADV data

esp_err_t **esp_ble_gap_config_adv_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters

- **raw_data** –[in] : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2] ...
- **raw_data_len** –[in] : raw advertising data length , less than 31 bytes

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_config_scan_rsp_data_raw** (uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

Parameters

- **raw_data** –[in] : raw scan response data
- **raw_data_len** –[in] : raw scan response data length , less than 31 bytes

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_read_rssi** (*esp_bd_addr_t* remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Parameters **remote_addr** –[in] : The remote connection device address.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_add_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to add a device info into the duplicate scan exceptional list.

Parameters

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_remove_duplicate_scan_exceptional_device** (*esp_ble_duplicate_exceptional_info_type_t* type, *esp_duplicate_info_t* device_info)

This function is called to remove a device info from the duplicate scan exceptional list.

Parameters

- **type** –[in] device info type, it is defined in *esp_ble_duplicate_exceptional_info_type_t* when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- **device_info** –[in] the device information.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_clean_duplicate_scan_exceptional_list** (*esp_duplicate_scan_exceptional_list_type_t* list_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Parameters **list_type** –[in] duplicate scan exceptional list type, the value can be one or more of *esp_duplicate_scan_exceptional_list_type_t*.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_set_security_param** (*esp_ble_sm_param_t* param_type, void *value, uint8_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only `secure connection mode`, it is necessary do as following:

1. Set bit `ESP_LE_AUTH_REQ_SC_ONLY` (`param_type` is `ESP_BLE_SM_AUTHEN_REQ_MODE`), bit `ESP_LE_AUTH_BOND` and bit `ESP_LE_AUTH_REQ_MITM` is optional as required.
2. Set to `ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE` (`param_type` is `ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`).

Parameters

- **param_type** `–[in]`: the type of the param which to be set
- **value** `–[in]`: the param value
- **len** `–[in]`: the length of the param value

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_security_rsp** (*esp_bd_addr_t* bd_addr, bool accept)

Grant security request access.

Parameters

- **bd_addr** `–[in]`: BD address of the peer
- **accept** `–[in]`: accept the security request or not

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_set_encryption** (*esp_bd_addr_t* bd_addr, *esp_ble_sec_act_t* sec_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

Parameters

- **bd_addr** `–[in]`: the address of the peer device need to encryption
- **sec_act** `–[in]`: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_passkey_reply** (*esp_bd_addr_t* bd_addr, bool accept, uint32_t passkey)

Reply the key value to the peer device in the legacy connection stage.

Parameters

- **bd_addr** `–[in]`: BD address of the peer
- **accept** `–[in]`: passkey entry successful or declined.
- **passkey** `–[in]`: passkey value, must be a 6 digit number, can be lead by 0.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_confirm_reply** (*esp_bd_addr_t* bd_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

Parameters

- **bd_addr** `–[in]`: BD address of the peer device

- **accept** –[in] : numbers to compare are the same or different.
- Returns** - ESP_OK : success
- other : failed

esp_err_t **esp_ble_remove_bond_device** (*esp_bd_addr_t* bd_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Parameters **bd_addr** –[in] : BD address of the peer device

- Returns** - ESP_OK : success
- other : failed

int **esp_ble_get_bond_device_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Returns - >= 0 : bonded devices number.

- ESP_FAIL : failed

esp_err_t **esp_ble_get_bond_device_list** (int *dev_num, *esp_ble_bond_dev_t* *dev_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Parameters

- **dev_num** –[inout] Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- **dev_list** –[out] an array(buffer) of *esp_ble_bond_dev_t* type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t *TK, uint8_t len)

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **TK** –[in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** –[in] length of temporary key, should always be 128-bit

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_sc_oob_req_reply** (*esp_bd_addr_t* bd_addr, uint8_t p_c[16], uint8_t p_r[16])

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_SC_OOB_REQ_EVT.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **p_c** –[in] Confirmation value, it shall be a 128-bit random number
- **p_r** –[in] Randomizer value, it should be a 128-bit random number

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_create_sc_oob_data** (void)

This function is called to create the OOB data for SMP when secure connection.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_disconnect** (*esp_bd_addr_t* remote_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t

conn_id) only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Parameters remote_device –[in] : BD address of the peer device

Returns - ESP_OK : success
 • other : failed

esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)

This function is called to read the connection parameters information of the device.

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **conn_params** –[out] the connection parameters information

Returns - ESP_OK : success
 • other : failed

esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels_t channels)

BLE set channels.

Parameters channels –[in] : The nth such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

Returns - ESP_OK : success
 • ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
 • other : failed

esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

Parameters

- **bd_addr** –[in] BD address of the peer device.
- **authorize** –[out] Authorized the link or not.

Returns - ESP_OK : success
 • other : failed

esp_err_t esp_ble_gap_read_phy (esp_bd_addr_t bd_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Parameters bd_addr –[in] : BD address of the peer device

Returns - ESP_OK : success
 • other : failed

esp_err_t esp_ble_gap_set_preferred_default_phy (esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Parameters

- **tx_phy_mask** –[in] : indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –[in] : indicates the receiver PHYs that the Host prefers the Controller to use

Returns - ESP_OK : success
 • other : failed

esp_err_t esp_ble_gap_set_preferred_phy (esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Parameters

- **bd_addr** –[in]: remote address
- **all_phys_mask** –[in]: a bit field that allows the Host to specify
- **tx_phy_mask** –[in]: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx_phy_mask** –[in]: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy_options** –[in]: a bit field that allows the Host to specify options for PHYs

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_rand_addr** (uint8_t instance, *esp_bd_addr_t* rand_addr)

This function is used by the Host to set the random device address specified by the Random_Address parameter.

Parameters

- **instance** –[in]: Used to identify an advertising set
- **rand_addr** –[in]: Random Device Address

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_params** (uint8_t instance, const *esp_ble_gap_ext_adv_params_t* *params)

This function is used by the Host to set the advertising parameters.

Parameters

- **instance** –[in]: identifies the advertising set whose parameters are being configured.
- **params** –[in]: advertising parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in advertising PDUs that have a data field.

Parameters

- **instance** –[in]: identifies the advertising set whose data are being configured
- **length** –[in]: data length
- **data** –[in]: data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_ext_scan_rsp_data_raw** (uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

Parameters

- **instance** –[in]: identifies the advertising set whose response data are being configured.
- **length** –[in]: response data length
- **scan_rsp_data** –[in]: response data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_start** (uint8_t num_adv, const *esp_ble_gap_ext_adv_t* *ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters

- **num_adv** –[in] : Number of advertising sets to enable or disable
 - **ext_adv** –[in] : adv parameters
- Returns** - ESP_OK : success
- other : failed

esp_err_t **esp_ble_gap_ext_adv_stop** (uint8_t num_adv, const uint8_t *ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Parameters

- **num_adv** –[in] : Number of advertising sets to enable or disable
- **ext_adv_inst** –[in] : ext adv instance

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_remove** (uint8_t instance)

This function is used to remove an advertising set from the Controller.

Parameters **instance** –[in] : Used to identify an advertising set

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_ext_adv_set_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_params** (uint8_t instance, const *esp_ble_gap_periodic_adv_params_t* *params)

This function is used by the Host to set the parameters for periodic advertising.

Parameters

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** –[in] : periodic adv parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

Parameters

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** –[in] : the length of periodic data
- **data** –[in] : periodic data information

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Parameters **instance** –[in] : Used to identify an advertising set

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_stop** (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Parameters **instance** –[in] : Used to identify an advertising set

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_set_ext_scan_params** (const *esp_ble_ext_scan_params_t* *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

Parameters **params** –[in] : scan parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_start_ext_scan** (uint32_t duration, uint16_t period)

This function is used to enable scanning.

Parameters

- **duration** –[in] : Scan duration
- **period** –[in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_create_sync** (const *esp_ble_gap_periodic_adv_sync_params_t* *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Parameters **params** –[in] : sync parameters

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_terminate** (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

Parameters **sync_handle** –[in] : identify the periodic advertiser

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_add_dev_to_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

Parameters

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_periodic_adv_remove_dev_from_list** (*esp_ble_addr_type_t* addr_type, *esp_bd_addr_t* addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

Parameters

- **addr_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

Returns - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

Returns - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_prefer_ext_connect_params_set** (*esp_bd_addr_t* addr, *esp_ble_gap_phy_mask_t* phy_mask, const *esp_ble_gap_conn_params_t* *phy_1m_conn_params, const *esp_ble_gap_conn_params_t* *phy_2m_conn_params, const *esp_ble_gap_conn_params_t* *phy_coded_conn_params)

This function is used to set aux connection parameters.

Parameters

- **addr** –[in] : device address
- **phy_mask** –[in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy_1m_conn_params** –[in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy_2m_conn_params** –[in] : Connection parameters for the LE 2M PHY are provided.
- **phy_coded_conn_params** –[in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

Returns - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_recv_enable** (uint16_t sync_handle, uint8_t enable)

This function is used to set periodic advertising receive enable.

Parameters

- **sync_handle** –[in] : Handle of periodic advertising sync
- **enable** –[in] : Determines whether reporting and duplicate filtering are enabled or disabled

Returns - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_sync_trans** (*esp_bd_addr_t* addr, uint16_t service_data, uint16_t sync_handle)

This function is used to transfer periodic advertising sync.

Parameters

- **addr** –[in] : Peer device address
- **service_data** –[in] : Service data used by Host
- **sync_handle** –[in] : Handle of periodic advertising sync

Returns - ESP_OK : success
 • other : failed

esp_err_t **esp_ble_gap_periodic_adv_set_info_trans** (*esp_bd_addr_t* addr, uint16_t service_data, uint8_t adv_handle)

This function is used to transfer periodic advertising set info.

Parameters

- **addr** –[in] : Peer device address
- **service_data** –[in] : Service data used by Host
- **adv_handle** –[in] : Handle of advertising set

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_set_periodic_adv_sync_trans_params** (*esp_bd_addr_t* addr, const *esp_ble_gap_past_params_t* *params)

This function is used to set periodic advertising sync transfer params.

Parameters

- **addr** –[in] : Peer device address
- **params** –[in] : Params of periodic advertising sync transfer

Returns - ESP_OK : success

- other : failed

esp_err_t **esp_ble_gap_clear_advertising** (void)

This function is used to clear legacy advertising.

Returns - ESP_OK : success

- other : failed

Unions

union **esp_ble_key_value_t**

esp_ble_gap_phy_t **rx_phy**

rx phy type

struct **ble_read_rssi_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the read adv tx power operation success status

int8_t **rssi**

The ble remote device rssi value, the range is from -127 to 20, the unit is dbm, if the RSSI cannot be read, the RSSI metric shall be set to 127.

esp_bd_addr_t **remote_addr**

The remote device address

struct **ble_remove_bond_dev_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the remove bond device operation success status

esp_bd_addr_t **bd_addr**

The device address which has been remove from the bond list

struct **ble_scan_param_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set scan param operation success status

struct **ble_scan_req_received_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT.

Public Members

uint8_t **adv_instance**
extend advertising handle

esp_ble_addr_type_t **scan_addr_type**
scanner address type

esp_bd_addr_t **scan_addr**
scanner address

struct **ble_scan_result_evt_param**
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RESULT_EVT.

Public Members

esp_gap_search_evt_t **search_evt**
Search event type

esp_bd_addr_t **bda**
Bluetooth device address which has been searched

esp_bt_dev_type_t **dev_type**
Device type

esp_ble_addr_type_t **ble_addr_type**
Ble device address type

esp_ble_evt_type_t **ble_evt_type**
Ble scan result event type

int **rssi**
Searched device' s RSSI

uint8_t **ble_adv**[ESP_BLE_ADV_DATA_LEN_MAX +
ESP_BLE_SCAN_RSP_DATA_LEN_MAX]
Received EIR

int **flag**
Advertising data flag bit

int **num_resps**
Scan result number

uint8_t **adv_data_len**
Adv data length

uint8_t **scan_rsp_len**

Scan response length

uint32_t **num_dis**

The number of discard packets

struct **ble_scan_rsp_data_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set scan response data operation success status

struct **ble_scan_rsp_data_raw_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate the set raw advertising data operation success status

struct **ble_scan_start_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate scan start operation success status

struct **ble_scan_stop_cmpl_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t **status**

Indicate scan stop operation success status

struct **ble_set_channels_evt_param**

#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.

Public Members

esp_bt_status_t **stat**

BLE set channel status

```
struct ble_set_ext_scan_params_cmpl_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate extend advertising parameters set status

```
struct ble_set_past_params_cmpl_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Set periodic advertising sync transfer params status

esp_bd_addr_t **bda**
The remote device address

```
struct ble_set_perf_def_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate perf default phy set status

```
struct ble_set_perf_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate perf phy set status

```
struct ble_set_rand_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

Public Members

esp_bt_status_t **status**
Indicate set static rand address operation success status

```
struct ble_update_conn_params_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

Public Members

esp_bt_status_t **status**

Indicate update connection parameters success status

esp_bd_addr_t **bda**

Bluetooth device address

uint16_t **min_int**

Min connection interval

uint16_t **max_int**

Max connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **conn_int**

Current connection interval

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct **ble_update_duplicate_exceptional_list_cmpl_evt_param**

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```

Public Members

esp_bt_status_t **status**

Indicate update duplicate scan exceptional list operation success status

uint8_t **subcode**

Define in `esp_bt_duplicate_exceptional_subcode_type_t`

uint16_t **length**

The length of `device_info`

esp_duplicate_info_t **device_info**

device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

struct **ble_update_whitelist_cmpl_evt_param**

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

Public Members

***esp_bt_status_t* status**

Indicate the add or remove whitelist operation success status

***esp_ble_wl_operation_t* wl_operation**

The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

struct **esp_ble_adv_params_t**

Advertising parameters.

Public Members

uint16_t **adv_int_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t **adv_int_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

esp_ble_adv_type_t **adv_type**

Advertising type

esp_ble_addr_type_t **own_addr_type**

Owner bluetooth device address type

esp_bd_addr_t **peer_addr**

Peer device bluetooth device address

esp_ble_addr_type_t **peer_addr_type**

Peer device bluetooth device address type, only support public address type and random address type

esp_ble_adv_channel_t **channel_map**

Advertising channel map

esp_ble_adv_filter_t **adv_filter_policy**

Advertising filter policy

struct **esp_ble_adv_data_t**

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

Public Members

bool **set_scan_rsp**

Set this advertising data as scan response or not

bool **include_name**

Advertising data include device name or not

bool **include_txpower**

Advertising data include TX power

int **min_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner: $\text{connIntervalmin} = \text{Conn_Interval_Min} * 1.25 \text{ ms}$ Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner: $\text{connIntervalmax} = \text{Conn_Interval_Max} * 1.25 \text{ ms}$ Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**

External appearance of device

uint16_t **manufacturer_len**

Manufacturer data length

uint8_t ***p_manufacturer_data**

Manufacturer data point

uint16_t **service_data_len**

Service data length

uint8_t ***p_service_data**

Service data point

uint16_t **service_uuid_len**

Service uuid length

uint8_t ***p_service_uuid**

Service uuid array point

uint8_t **flag**

Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct **esp_ble_scan_params_t**

Ble scan parameters.

Public Members

[*esp_ble_scan_type_t*](#) **scan_type**

Scan type

esp_ble_addr_type_t **own_addr_type**

Owner address type

esp_ble_scan_filter_t **scan_filter_policy**

Scan filter policy

uint16_t **scan_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t **scan_window**

Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t **scan_duplicate**

The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp_gap_conn_params_t**

connection parameters information

Public Members

uint16_t **interval**

connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_ble_conn_update_params_t**

Connection update parameters.

Public Members

esp_bd_addr_t **bda**

Bluetooth device address

uint16_t **min_int**

Min connection interval

uint16_t **max_int**

Max connection interval

uint16_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct **esp_ble_pkt_data_length_params_t**

BLE pkt data length keys.

Public Members

uint16_t **rx_len**

pkt rx data length value

uint16_t **tx_len**

pkt tx data length value

struct **esp_ble_penc_keys_t**

BLE encryption keys.

Public Members

esp_bt_octet16_t **ltk**

The long term key

esp_bt_octet8_t **rand**

The random number

uint16_t **ediv**

The ediv value

uint8_t **sec_level**

The security level of the security link

uint8_t **key_size**

The key size(7~16) of the security link

struct **esp_ble_pcsrkeys_t**

BLE CSRK keys.

Public Members

uint32_t **counter**

The counter

esp_bt_octet16_t **csrkey**

The csrkey

uint8_t **sec_level**

The security level

struct **esp_ble_pid_keys_t**

BLE pid keys.

Public Members

esp_bt_octet16_t **irk**

The irk value

esp_ble_addr_type_t **addr_type**

The address type

esp_bd_addr_t **static_addr**

The static address

struct **esp_ble_lenc_keys_t**

BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t **ltk**

The long term key

uint16_t **div**

The div value

uint8_t **key_size**

The key size of the security link

uint8_t **sec_level**

The security level of the security link

struct **esp_ble_lcsrkey_keys**

BLE SRK keys.

Public Members

uint32_t **counter**

The counter value

uint16_t **div**

The div value

uint8_t **sec_level**

The security level of the security link

esp_bt_octet16_t **csr_k**

The csr_k key value

struct **esp_ble_sec_key_notif_t**

Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t **bd_addr**

peer address

uint32_t **passkey**

the numeric value for comparison. If just_works, do not show this number to UI

struct **esp_ble_sec_req_t**

Structure of the security request.

Public Members

esp_bd_addr_t **bd_addr**

peer address

struct **esp_ble_bond_key_info_t**

struct type of the bond key information value

Public Members

esp_ble_key_mask_t **key_mask**

the key mask to indicate witch key is present

esp_ble_penc_keys_t **penc_key**

received peer encryption key

esp_ble_pcsr_k_keys_t **pcsr_k_key**

received peer device SRK

esp_ble_pid_keys_t **pid_key**

peer device ID key

struct **esp_ble_bond_dev_t**

struct type of the bond device value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_bond_key_info_t **bond_key**

the bond key information

struct **esp_ble_key_t**

union type of the security key value

Public Members

esp_bd_addr_t **bd_addr**

peer address

esp_ble_key_type_t **key_type**

key type of the security link

esp_ble_key_value_t **p_key_value**

the pointer to the key value

struct **esp_ble_local_id_keys_t**

structure type of the ble local id keys value

Public Members

esp_bt_octet16_t **ir**

the 16 bits of the ir value

esp_bt_octet16_t **irk**

the 16 bits of the ir key value

esp_bt_octet16_t **dhk**

the 16 bits of the dh key value

struct **esp_ble_local_oob_data_t**

structure type of the ble local oob data value

Public Members

esp_bt_octet16_t **oob_c**

the 128 bits of confirmation value

esp_bt_octet16_t **oob_r**

the 128 bits of randomizer value

struct **esp_ble_auth_cmpl_t**

Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t **bd_addr**

BD address peer device.

bool **key_present**

Valid link key value in key element

esp_link_key **key**

Link key associated with peer device.

uint8_t **key_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8_t **fail_reason**

The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t **addr_type**

Peer device address type

esp_bt_dev_type_t **dev_type**

Device type

esp_ble_auth_req_t **auth_mode**

authentication mode

struct **esp_ble_gap_ext_adv_params_t**

ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t **type**

ext adv type

uint32_t **interval_min**
ext adv minimum interval

uint32_t **interval_max**
ext adv maximum interval

esp_ble_adv_channel_t **channel_map**
ext adv channel map

esp_ble_addr_type_t **own_addr_type**
ext adv own address type

esp_ble_addr_type_t **peer_addr_type**
ext adv peer address type

esp_bd_addr_t **peer_addr**
ext adv peer address

esp_ble_adv_filter_t **filter_policy**
ext adv filter policy

int8_t **tx_power**
ext adv tx power

esp_ble_gap_pri_phy_t **primary_phy**
ext adv primary phy

uint8_t **max_skip**
ext adv maximum skip

esp_ble_gap_phy_t **secondary_phy**
ext adv secondary phy

uint8_t **sid**
ext adv sid

bool **scan_req_notif**
ext adv scan request event notify

struct **esp_ble_ext_scan_cfg_t**
ext scan config

Public Members

esp_ble_scan_type_t **scan_type**
ext scan type

uint16_t **scan_interval**

ext scan interval

uint16_t **scan_window**

ext scan window

struct **esp_ble_ext_scan_params_t**

ext scan parameters

Public Members

esp_ble_addr_type_t **own_addr_type**

ext scan own address type

esp_ble_scan_filter_t **filter_policy**

ext scan filter policy

esp_ble_scan_duplicate_t **scan_duplicate**

ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t **cfg_mask**

ext scan config mask

esp_ble_ext_scan_cfg_t **uncoded_cfg**

ext scan uncoded config parameters

esp_ble_ext_scan_cfg_t **coded_cfg**

ext scan coded config parameters

struct **esp_ble_gap_conn_params_t**

create extend connection parameters

Public Members

uint16_t **scan_interval**

init scan interval

uint16_t **scan_window**

init scan window

uint16_t **interval_min**

minimum interval

uint16_t **interval_max**

maximum interval

uint16_t **latency**

ext scan type

uint16_t **supervision_timeout**

connection supervision timeout

uint16_t **min_ce_len**

minimum ce length

uint16_t **max_ce_len**

maximum ce length

struct **esp_ble_gap_ext_adv_t**

extend adv enable parameters

Public Members

uint8_t **instance**

advertising handle

int **duration**

advertising duration

int **max_events**

maximum number of extended advertising events

struct **esp_ble_gap_periodic_adv_params_t**

periodic adv parameters

Public Members

uint16_t **interval_min**

periodic advertising minimum interval

uint16_t **interval_max**

periodic advertising maximum interval

uint8_t **properties**

periodic advertising properties

struct **esp_ble_gap_periodic_adv_sync_params_t**

periodic adv sync parameters

Public Members

esp_ble_gap_sync_t **filter_policy**
periodic advertising sync filter policy

uint8_t **sid**
periodic advertising sid

esp_ble_addr_type_t **addr_type**
periodic advertising address type

esp_bd_addr_t **addr**
periodic advertising address

uint16_t **skip**
the maximum number of periodic advertising events that can be skipped

uint16_t **sync_timeout**
synchronization timeout

struct **esp_ble_gap_ext_adv_reprot_t**
extend adv report parameters

Public Members

esp_ble_gap_adv_type_t **event_type**
extend advertising type

uint8_t **addr_type**
extend advertising address type

esp_bd_addr_t **addr**
extend advertising address

esp_ble_gap_pri_phy_t **primary_phy**
extend advertising primary phy

esp_ble_gap_phy_t **secondly_phy**
extend advertising secondary phy

uint8_t **sid**
extend advertising sid

uint8_t **tx_power**
extend advertising tx power

int8_t **rss_i**
extend advertising rssi

uint16_t **per_adv_interval**

periodic advertising interval

uint8_t **dir_addr_type**

direct address type

esp_ble_addr_t **dir_addr**

direct address

esp_ble_gap_ext_adv_data_status_t **data_status**

data type

uint8_t **adv_data_len**

extend advertising data length

uint8_t **adv_data**[251]

extend advertising data

struct **esp_ble_gap_periodic_adv_report_t**

periodic adv report parameters

Public Members

uint16_t **sync_handle**

periodic advertising train handle

uint8_t **tx_power**

periodic advertising tx power

int8_t **rss_i**

periodic advertising rssi

esp_ble_gap_ext_adv_data_status_t **data_status**

periodic advertising data type

uint8_t **data_length**

periodic advertising data length

uint8_t **data**[251]

periodic advertising data

struct **esp_ble_gap_periodic_adv_sync_estab_t**

periodic adv sync establish parameters

Public Members

uint8_t **status**

periodic advertising sync status

uint16_t **sync_handle**

periodic advertising train handle

uint8_t **sid**

periodic advertising sid

esp_ble_addr_type_t **addr_type**

periodic advertising address type

esp_bd_addr_t **adv_addr**

periodic advertising address

esp_ble_gap_phy_t **adv_phy**

periodic advertising adv phy type

uint16_t **period_adv_interval**

periodic advertising interval

uint8_t **adv_clk_accuracy**

periodic advertising clock accuracy

struct **esp_ble_gap_past_params_t**

periodic adv sync transfer parameters

Public Members

esp_ble_gap_past_mode_t **mode**

periodic advertising sync transfer mode

uint16_t **skip**

the number of periodic advertising packets that can be skipped

uint16_t **sync_timeout**

synchronization timeout for the periodic advertising train

uint8_t **cte_type**

periodic advertising sync transfer CET type

Macros

ESP_BLE_ADV_FLAG_LIMIT_DISC

BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag.

ESP_BLE_ADV_FLAG_GEN_DISC

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD in stack/btm_ble_api.h

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV

relate to BTM_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV in stack/btm_ble_api.h

ESP_GAP_BLE_CHANNELS_LEN

channel length

ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT

This is the old name, just for backwards compatibility.

ESP_BLE_ADV_DATA_LEN_MAX

Advertising data maximum length.

ESP_BLE_SCAN_RSP_DATA_LEN_MAX

Scan response data maximum length.

BLE_BIT (n)

ESP_BLE_GAP_SET_EXT_ADV_PROP_NONCONN_NONSCANNABLE_UNDIRECTED

Non-Connectable and Non-Scannable Undirected advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_CONNECTABLE

Connectable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_SCANNABLE

Scannable advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_DIRECTED

Directed advertising

ESP_BLE_GAP_SET_EXT_ADV_PROP_HD_DIRECTED

High Duty Cycle Directed Connectable advertising (≤ 3.75 ms Advertising Interval)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY

Use legacy advertising PDUs

ESP_BLE_GAP_SET_EXT_ADV_PROP_ANON_ADV

Omit advertiser's address from all PDUs ("anonymous advertising")

ESP_BLE_GAP_SET_EXT_ADV_PROP_INCLUDE_TX_PWR

Include TxPower in the extended header of the advertising PDU

ESP_BLE_GAP_SET_EXT_ADV_PROP_MASK

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (≤ 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_IND

ADV_DIRECT_IND (low duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_LD_DIR

ADV_DIRECT_IND (high duty cycle)

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_HD_DIR

ADV_SCAN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_SCAN

ADV_NONCONN_IND

ESP_BLE_GAP_SET_EXT_ADV_PROP_LEGACY_NONCONN

ESP_BLE_GAP_PHY_1M

Secondary Advertisement PHY is LE1M

ESP_BLE_GAP_PHY_2M

Secondary Advertisement PHY is LE2M

ESP_BLE_GAP_PHY_CODED

Secondary Advertisement PHY is LE Coded

ESP_BLE_GAP_NO_PREFER_TRANSMIT_PHY

No Prefer TX PHY supported by controller

ESP_BLE_GAP_NO_PREFER_RECEIVE_PHY

No Prefer RX PHY supported by controller

ESP_BLE_GAP_PRI_PHY_1M

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

ESP_BLE_GAP_PRI_PHY_CODED

Primary Phy is LE CODED

ESP_BLE_GAP_PHY_1M_PREF_MASK

The Host prefers use the LE1M transmitter or reciever PHY

ESP_BLE_GAP_PHY_2M_PREF_MASK

The Host prefers use the LE2M transmitter or reciever PHY

ESP_BLE_GAP_PHY_CODED_PREF_MASK

The Host prefers use the LE CODED transmitter or reciever PHY

ESP_BLE_GAP_PHY_OPTIONS_NO_PREF

The Host has no preferred coding when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S2_CODING

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_PHY_OPTIONS_PREF_S8_CODING

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

ESP_BLE_GAP_EXT_SCAN_CFG_UNCODE_MASK

Scan Advertisements on the LE1M PHY

ESP_BLE_GAP_EXT_SCAN_CFG_CODE_MASK

Scan advertisements on the LE coded PHY

ESP_BLE_GAP_EXT_ADV_DATA_COMPLETE

Advertising data.

extended advertising data compete

ESP_BLE_GAP_EXT_ADV_DATA_INCOMPLETE

extended advertising data incomplete

ESP_BLE_GAP_EXT_ADV_DATA_TRUNCATED

extended advertising data truncated mode

ESP_BLE_GAP_SYNC_POLICY_BY_ADV_INFO

Advertising SYNC policy.

sync policy by advertising info

ESP_BLE_GAP_SYNC_POLICY_BY_PERIODIC_LIST

periodic advertising sync policy

ESP_BLE_ADV_REPORT_EXT_ADV_IND

Advertising report.

advertising report with extended advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_IND

advertising report with extended scan indication type

ESP_BLE_ADV_REPORT_EXT_DIRECT_ADV

advertising report with extended direct advertising indication type

ESP_BLE_ADV_REPORT_EXT_SCAN_RSP

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

ESP_BLE_LEGACY_ADV_TYPE_IND

advertising report with legacy advertising indication type

ESP_BLE_LEGACY_ADV_TYPE_DIRECT_IND

advertising report with legacy direct indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_IND

advertising report with legacy scan indication type

ESP_BLE_LEGACY_ADV_TYPE_NONCON_IND

advertising report with legacy non connectable indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_IND

advertising report with legacy scan response indication type

ESP_BLE_LEGACY_ADV_TYPE_SCAN_RSP_TO_ADV_SCAN_IND

advertising report with legacy advertising with scan response indication type

EXT_ADV_TX_PWR_NO_PREFERENCE

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

ESP_BLE_GAP_PAST_MODE_NO_SYNC_EVT

Periodic advertising sync trans mode.

No attempt is made to sync and no periodic adv sync transfer received event

ESP_BLE_GAP_PAST_MODE_NO_REPORT_EVT

An periodic adv sync transfer received event and no periodic adv report events

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_DISABLED

Periodic adv report events will be enabled with duplicate filtering disabled

ESP_BLE_GAP_PAST_MODE_DUP_FILTER_ENABLED

Periodic adv report events will be enabled with duplicate filtering enabled

Type Definitions

```
typedef uint8_t esp_ble_key_type_t
```

```
typedef uint8_t esp_ble_auth_req_t
```

combination of the above bit pattern

```
typedef uint8_t esp_ble_io_cap_t
```

combination of the io capability

```
typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]
```

```
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]

```

```
typedef uint8_t esp_ble_gap_phy_mask_t
```

```
typedef uint16_t esp_ble_gap_prefer_phy_options_t
```

```
typedef uint8_t esp_ble_ext_scan_cfg_mask_t
```

```
typedef uint8_t esp_ble_gap_ext_adv_data_status_t
```

```
typedef uint8_t esp_ble_gap_sync_t
```

```
typedef uint8_t esp_ble_gap_adv_type_t
```

```
typedef uint8_t esp_ble_gap_past_mode_t
```

```
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
```

GAP callback function type.

Param event : Event type

Param param : Point to callback parameter, currently is union type

Enumerations

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

Values:

enumerator **ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT**

When advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT**

When scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT**

When scan parameters set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RESULT_EVT**

When one scan result ready, the event comes each time

enumerator **ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT**

When raw scan response data set complete, the event comes

enumerator **ESP_GAP_BLE_ADV_START_COMPLETE_EVT**

When start advertising complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_START_COMPLETE_EVT**

When start scan complete, the event comes

enumerator **ESP_GAP_BLE_AUTH_CMPL_EVT**

Authentication complete indication.

enumerator **ESP_GAP_BLE_KEY_EVT**

BLE key event for peer device keys

enumerator **ESP_GAP_BLE_SEC_REQ_EVT**

BLE security request

enumerator **ESP_GAP_BLE_PASSKEY_NOTIF_EVT**

passkey notification event

enumerator **ESP_GAP_BLE_PASSKEY_REQ_EVT**

passkey request event

enumerator **ESP_GAP_BLE_OOB_REQ_EVT**

OOB request event

enumerator **ESP_GAP_BLE_LOCAL_IR_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP_GAP_BLE_LOCAL_ER_EVT**

BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP_GAP_BLE_NC_REQ_EVT**

Numeric Comparison request event

enumerator **ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT**

When stop adv complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT**

When stop scan complete, the event comes

enumerator **ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT**

When set the static rand address complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT**

When update connection parameters complete, the event comes

enumerator **ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT**

When set pkt length complete, the event comes

enumerator **ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT**

When remove the bond device complete, the event comes

enumerator **ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT**

When get the bond device list complete, the event comes

enumerator **ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT**

When read the rssi complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP_GAP_BLE_SET_CHANNELS_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP_GAP_BLE_READ_PHY_COMPLETE_EVT**

when reading phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT**

when preferred default phy complete, this event comes

enumerator **ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT**

when preferred phy complete , this event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT**
when extended set random address complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT**
when extended advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT**
when extended advertising data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT**
when extended scan response data complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT**
when extended advertising start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT**
when extended advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT**
when extended advertising set remove complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT**
when extended advertising set clear complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT**
when periodic advertising parameter complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT**
when periodic advertising data complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT**
when periodic advertising start complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT**
when periodic advertising stop complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT**
when periodic advertising create sync complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT**
when extended advertising sync cancel complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT**
when extended advertising sync terminate complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT**
when extended advertising add device complete , the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT**

when extended advertising remove device complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT**

when extended advertising clear device, the event comes

enumerator **ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT**

when extended scan parameter complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT**

when extended scan start complete, the event comes

enumerator **ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT**

when extended scan stop complete, the event comes

enumerator **ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT**

when extended prefer connection parameter set complete, the event comes

enumerator **ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT**

when ble phy update complete, the event comes

enumerator **ESP_GAP_BLE_EXT_ADV_REPORT_EVT**

when extended advertising report complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_TIMEOUT_EVT**

when scan timeout complete, the event comes

enumerator **ESP_GAP_BLE_ADV_TERMINATED_EVT**

when advertising terminate data complete, the event comes

enumerator **ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT**

when scan req received complete, the event comes

enumerator **ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT**

when channel select algorithm complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT**

when periodic report advertising complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT**

when periodic advertising sync lost complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTAB_EVT**

when periodic advertising sync establish complete, the event comes

enumerator **ESP_GAP_BLE_SC_OOB_REQ_EVT**

Secure Connection OOB request event

enumerator **ESP_GAP_BLE_SC_CR_LOC_OOB_EVT**

Secure Connection create OOB data complete event

enumerator **ESP_GAP_BLE_GET_DEV_NAME_COMPLETE_EVT**

When getting BT device name complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_RECV_ENABLE_COMPLETE_EVT**

when set periodic advertising receive enable complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_COMPLETE_EVT**

when periodic advertising sync transfer complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SET_INFO_TRANS_COMPLETE_EVT**

when periodic advertising set info transfer complete, the event comes

enumerator **ESP_GAP_BLE_SET_PAST_PARAMS_COMPLETE_EVT**

when set periodic advertising sync transfer params complete, the event comes

enumerator **ESP_GAP_BLE_PERIODIC_ADV_SYNC_TRANS_RECV_EVT**

when periodic advertising sync transfer received, the event comes

enumerator **ESP_GAP_BLE_ADV_CLEAR_COMPLETE_EVT**

When clear advertising complete, the event comes

enumerator **ESP_GAP_BLE_EVT_MAX**

when maximum advertising event complete, the event comes

enum **esp_ble_adv_data_type**

The type of advertising data(not adv_type)

Values:

enumerator **ESP_BLE_AD_TYPE_FLAG**

enumerator **ESP_BLE_AD_TYPE_16SRV_PART**

enumerator **ESP_BLE_AD_TYPE_16SRV_CMPL**

enumerator **ESP_BLE_AD_TYPE_32SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_128SERVICE_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_CONFIRM**

enumerator **ESP_BLE_AD_TYPE_LE_SECURE_RANDOM**

enumerator **ESP_BLE_AD_TYPE_URI**

enumerator **ESP_BLE_AD_TYPE_INDOOR_POSITION**

enumerator **ESP_BLE_AD_TYPE_TRANS_DISC_DATA**

enumerator **ESP_BLE_AD_TYPE_LE_SUPPORT_FEATURE**

enumerator **ESP_BLE_AD_TYPE_CHAN_MAP_UPDATE**

enumerator **ESP_BLE_AD_MANUFACTURER_SPECIFIC_TYPE**

enum **esp_ble_adv_type_t**

Advertising mode.

Values:

enumerator **ADV_TYPE_IND**

enumerator **ADV_TYPE_DIRECT_IND_HIGH**

enumerator **ADV_TYPE_SCAN_IND**

enumerator **ADV_TYPE_NONCONN_IND**

enumerator **ADV_TYPE_DIRECT_IND_LOW**

enum **esp_ble_adv_channel_t**

Advertising channel mask.

Values:

enumerator **ADV_CHNL_37**

enumerator **ADV_CHNL_38**

enumerator **ADV_CHNL_39**

enumerator **ADV_CHNL_ALL**

enum **esp_ble_adv_filter_t**

Values:

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST**

Allow scan and connection requests from White List devices only.

enum **esp_ble_sec_act_t**

Values:

enumerator **ESP_BLE_SEC_ENCRYPT**

relate to **BTA_DM_BLE_SEC_ENCRYPT** in `bta/bta_api.h`. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will use the default authentication request used the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_NO_MITM**

relate to **BTA_DM_BLE_SEC_ENCRYPT_NO_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) Whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP_BLE_SEC_ENCRYPT_MITM**

relate to **BTA_DM_BLE_SEC_ENCRYPT_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enum **esp_ble_sm_param_t**

Values:

enumerator **ESP_BLE_SM_PASSKEY**

Authentication requirements of local device

enumerator **ESP_BLE_SM_AUTHEN_REQ_MODE**

The IO capability of local device

enumerator **ESP_BLE_SM_IOCAP_MODE**

Initiator Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_INIT_KEY**

Responder Key Distribution/Generation

enumerator **ESP_BLE_SM_SET_RSP_KEY**

Maximum Encryption key size to support

enumerator **ESP_BLE_SM_MAX_KEY_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP_BLE_SM_MIN_KEY_SIZE**

Set static Passkey

enumerator **ESP_BLE_SM_SET_STATIC_PASSKEY**

Reset static Passkey

enumerator **ESP_BLE_SM_CLEAR_STATIC_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**

Enable/Disable OOB support

enumerator **ESP_BLE_SM_OOB_SUPPORT**

Appl encryption key size

enumerator **ESP_BLE_APP_ENC_KEY_SIZE**

authentication max param

enumerator **ESP_BLE_SM_MAX_PARAM**

enum **esp_ble_scan_type_t**

Ble scan type.

Values:

enumerator **BLE_SCAN_TYPE_PASSIVE**

Passive scan

enumerator **BLE_SCAN_TYPE_ACTIVE**

Active scan

enum **esp_ble_scan_filter_t**

Ble scan filter type.

Values:

enumerator **BLE_SCAN_FILTER_ALLOW_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE_SCAN_FILTER_ALLOW_ONLY_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp_ble_scan_duplicate_t**

Ble scan duplicate type.

Values:

enumerator **BLE_SCAN_DUPLICATE_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE_SCAN_DUPLICATE_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE_SCAN_DUPLICATE_MAX**

0x02 –0xFF, Reserved for future use

enum **esp_gap_search_evt_t**

Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

enumerator **ESP_GAP_SEARCH_INQ_RES_EVT**

Inquiry result for a peer device.

enumerator **ESP_GAP_SEARCH_INQ_CMPL_EVT**

Inquiry complete.

enumerator **ESP_GAP_SEARCH_DISC_RES_EVT**

Discovery result for a peer device.

enumerator **ESP_GAP_SEARCH_DISC_BLE_RES_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP_GAP_SEARCH_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_DI_DISC_CMPL_EVT**

Discovery complete.

enumerator **ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT**

Search cancelled

enumerator **ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT**

The number of pkt discarded by flow control

enum **esp_ble_evt_type_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

enumerator **ESP_BLE_EVT_CONN_ADV**

Connectable undirected advertising (ADV_IND)

enumerator **ESP_BLE_EVT_CONN_DIR_ADV**

Connectable directed advertising (ADV_DIRECT_IND)

enumerator **ESP_BLE_EVT_DISC_ADV**

Scannable undirected advertising (ADV_SCAN_IND)

enumerator **ESP_BLE_EVT_NON_CONN_ADV**

Non connectable undirected advertising (ADV_NONCONN_IND)

enumerator **ESP_BLE_EVT_SCAN_RSP**

Scan Response (SCAN_RSP)

enum **esp_ble_wl_operation_t**

Values:

enumerator **ESP_BLE_WHITELIST_REMOVE**

remove mac from whitelist

enumerator **ESP_BLE_WHITELIST_ADD**

add address to whitelist

enumerator **ESP_BLE_WHITELIST_CLEAR**

clear all device in whitelist

enum **esp_bt_duplicate_exceptional_subcode_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD**

Add device info into duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE**

Remove device info from duplicate scan exceptional list

enumerator **ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**

Clean duplicate scan exceptional list

enum **esp_ble_duplicate_exceptional_info_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR**

BLE advertising address , device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SOLIC_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1859 | ... |

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_URI_ADV**

BLE mesh URI adv, the format is ... | Len | 0x24 | data | ...

enum **esp_duplicate_scan_exceptional_list_type_t**

Values:

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST**

duplicate scan exceptional addr list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST**

duplicate scan exceptional mesh adv with proxy service uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SOLIC_ADV_LIST**

duplicate scan exceptional mesh adv with proxy solicitation PDU uuid

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_URI_ADV_LIST**

duplicate scan exceptional URI list

enumerator **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST**

duplicate scan exceptional all list

GATT DEFINES

API Reference

Header File

- `components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h`

Unions

union **esp_gatt_rsp_t**

#include <esp_gatt_defs.h> GATT remote read request response type.

Public Members

esp_gatt_value_t **attr_value**

Gatt attribute structure

uint16_t **handle**

Gatt attribute handle

Structures

struct **esp_gatt_id_t**

Gatt id, include uuid and instance id.

Public Members

esp_bt_uuid_t **uuid**

UUID

uint8_t **inst_id**

Instance id

struct **esp_gatt_srv_id_t**

Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

esp_gatt_id_t **id**

Gatt id, include uuid and instance

bool **is_primary**

This service is primary or not

struct **esp_attr_desc_t**

Attribute description (used to create database)

Public Members

uint16_t **uuid_length**

UUID length

uint8_t ***uuid_p**

UUID value

uint16_t **perm**

Attribute permission

uint16_t **max_length**

Maximum length of the element

uint16_t **length**

Current length of the element

uint8_t ***value**

Element value array

struct **esp_attr_control_t**

attribute auto response flag

Public Members

uint8_t **auto_rsp**

if `auto_rsp` set to `ESP_GATT_RSP_BY_APP`, means the response of Write/Read operation will be replied by application. if `auto_rsp` set to `ESP_GATT_AUTO_RSP`, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp_gatts_attr_db_t**

attribute type added to the gatt server database

Public Members

esp_attr_control_t **attr_control**

The attribute control type

esp_attr_desc_t **att_desc**

The attribute type

struct **esp_attr_value_t**

set the attribute value type

Public Members

uint16_t **attr_max_len**

attribute max value length

uint16_t **attr_len**

attribute current value length

uint8_t ***attr_value**

the pointer to attribute value

struct **esp_gatts_incl_svc_desc_t**

Gatt include service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included service

uint16_t **end_hdl**

Gatt end handle value of included service

uint16_t **uuid**

Gatt attribute value UUID of included service

struct **esp_gatts_incl128_svc_desc_t**

Gatt include 128 bit service entry element.

Public Members

uint16_t **start_hdl**

Gatt start handle value of included 128 bit service

uint16_t **end_hdl**

Gatt end handle value of included 128 bit service

struct **esp_gatt_value_t**

Gatt attribute value.

Public Members

uint8_t **value**[ESP_GATT_MAX_ATTR_LEN]

Gatt attribute value

uint16_t **handle**

Gatt attribute handle

uint16_t **offset**

Gatt attribute value offset

uint16_t **len**

Gatt attribute value length

`uint8_t auth_req`
Gatt authentication request

struct `esp_gatt_conn_params_t`
Connection parameters information.

Public Members

`uint16_t interval`
connection interval

`uint16_t latency`
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

`uint16_t timeout`
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct `esp_gattc_multi_t`
read multiple attribute

Public Members

`uint8_t num_attr`
The number of the attribute

`uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]`
The handles list

struct `esp_gattc_db_elem_t`
data base attribute element

Public Members

`esp_gatt_db_attr_type_t type`
The attribute type

`uint16_t attribute_handle`
The attribute handle, it' s valid for all of the type

`uint16_t start_handle`
The service start handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`uint16_t end_handle`
The service end handle, it' s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

esp_gatt_char_prop_t **properties**

The characteristic properties, it's valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t **uuid**

The attribute uuid, it's valid for all of the type

struct **esp_gattc_service_elem_t**
service element

Public Members

bool **is_primary**

The service flag, true if the service is primary service, else is secondary service

uint16_t **start_handle**

The start handle of the service

uint16_t **end_handle**

The end handle of the service

esp_bt_uuid_t **uuid**

The uuid of the service

struct **esp_gattc_char_elem_t**
characteristic element

Public Members

uint16_t **char_handle**

The characteristic handle

esp_gatt_char_prop_t **properties**

The characteristic properties

esp_bt_uuid_t **uuid**

The characteristic uuid

struct **esp_gattc_descr_elem_t**
descriptor element

Public Members

uint16_t **handle**

The characteristic descriptor handle

esp_bt_uuid_t **uuid**

The characteristic descriptor uuid

struct **esp_gattc_incl_svc_elem_t**
include service element

Public Members

uint16_t **handle**

The include service current attribute handle

uint16_t **incl_srvc_s_handle**

The start handle of the service which has been included

uint16_t **incl_srvc_e_handle**

The end handle of the service which has been included

esp_bt_uuid_t **uuid**

The include service uuid

ESP_GATT_CHAR_PROP_BIT_EXT_PROP

ESP_GATT_MAX_ATTR_LEN

GATT maximum attribute length.

ESP_GATT_RSP_BY_APP

ESP_GATT_AUTO_RSP

ESP_GATT_IF_NONE

If callback report `gatt_if/gatts_if` as this macro, means this event is not correspond to any app

Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

typedef uint8_t **esp_gatt_if_t**

Gatt interface type, different application on GATT client use different gatt_if

Enumerations

enum **esp_gatt_prep_write_type**

Attribute write data type from the client.

Values:

enumerator **ESP_GATT_PREP_WRITE_CANCEL**

Prepare write cancel

enumerator **ESP_GATT_PREP_WRITE_EXEC**

Prepare write execute

enum **esp_gatt_status_t**

GATT success code and error codes.

Values:

enumerator **ESP_GATT_OK**

enumerator **ESP_GATT_INVALID_HANDLE**

enumerator **ESP_GATT_READ_NOT_PERMIT**

enumerator **ESP_GATT_WRITE_NOT_PERMIT**

enumerator **ESP_GATT_INVALID_PDU**

enumerator **ESP_GATT_INSUF_AUTHENTICATION**

enumerator **ESP_GATT_REQ_NOT_SUPPORTED**

enumerator **ESP_GATT_INVALID_OFFSET**

enumerator **ESP_GATT_INSUF_AUTHORIZATION**

enumerator **ESP_GATT_PREPARE_Q_FULL**

enumerator **ESP_GATT_NOT_FOUND**

enumerator **ESP_GATT_NOT_LONG**

enumerator **ESP_GATT_INSUF_KEY_SIZE**

enumerator **ESP_GATT_INVALID_ATTR_LEN**

enumerator **ESP_GATT_ERR_UNLIKELY**

enumerator **ESP_GATT_INSUF_ENCRYPTION**

enumerator **ESP_GATT_UNSUPPORT_GRP_TYPE**

enumerator **ESP_GATT_INSUF_RESOURCE**

enumerator **ESP_GATT_NO_RESOURCES**

enumerator **ESP_GATT_INTERNAL_ERROR**

enumerator **ESP_GATT_WRONG_STATE**

enumerator **ESP_GATT_DB_FULL**

enumerator **ESP_GATT_BUSY**

enumerator **ESP_GATT_ERROR**

enumerator **ESP_GATT_CMD_STARTED**

enumerator **ESP_GATT_ILLEGAL_PARAMETER**

enumerator **ESP_GATT_PENDING**

enumerator **ESP_GATT_AUTH_FAIL**

enumerator **ESP_GATT_MORE**

enumerator **ESP_GATT_INVALID_CFG**

enumerator **ESP_GATT_SERVICE_STARTED**

enumerator **ESP_GATT_ENCRYPTED_MITM**

enumerator **ESP_GATT_ENCRYPTED_NO_MITM**

enumerator **ESP_GATT_NOT_ENCRYPTED**

enumerator **ESP_GATT_CONGESTED**

enumerator **ESP_GATT_DUP_REG**

enumerator **ESP_GATT_ALREADY_OPEN**

enumerator **ESP_GATT_CANCEL**

enumerator **ESP_GATT_STACK_RSP**

enumerator **ESP_GATT_APP_RSP**

enumerator **ESP_GATT_UNKNOWN_ERROR**

enumerator **ESP_GATT_CCC_CFG_ERR**

enumerator **ESP_GATT_PRC_IN_PROGRESS**

enumerator **ESP_GATT_OUT_OF_RANGE**

enum **esp_gatt_conn_reason_t**

Gatt Connection reason enum.

Values:

enumerator **ESP_GATT_CONN_UNKNOWN**

Gatt connection unknown

enumerator **ESP_GATT_CONN_L2C_FAILURE**

General L2cap failure

enumerator **ESP_GATT_CONN_TIMEOUT**

Connection timeout

enumerator **ESP_GATT_CONN_TERMINATE_PEER_USER**

Connection terminate by peer user

enumerator **ESP_GATT_CONN_TERMINATE_LOCAL_HOST**

Connection terminated by local host

enumerator **ESP_GATT_CONN_FAIL_ESTABLISH**

Connection fail to establish

enumerator **ESP_GATT_CONN_LMP_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP_GATT_CONN_CONN_CANCEL**

L2CAP connection cancelled

enumerator **ESP_GATT_CONN_NONE**

No connection to cancel

enum **esp_gatt_auth_req_t**

Gatt authentication request type.

Values:

enumerator **ESP_GATT_AUTH_REQ_NONE**

enumerator **ESP_GATT_AUTH_REQ_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_NO_MITM**

enumerator **ESP_GATT_AUTH_REQ_SIGNED_MITM**

enum **esp_service_source_t**

Values:

enumerator **ESP_GATT_SERVICE_FROM_REMOTE_DEVICE**

enumerator **ESP_GATT_SERVICE_FROM_NVS_FLASH**

enumerator **ESP_GATT_SERVICE_FROM_UNKNOWN**

enum **esp_gatt_write_type_t**

Gatt write type.

Values:

enumerator **ESP_GATT_WRITE_TYPE_NO_RSP**

Gatt write attribute need no response

enumerator **ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response

enum **esp_gatt_db_attr_type_t**

the type of attribute element

Values:

enumerator **ESP_GATT_DB_PRIMARY_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP_GATT_DB_SECONDARY_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP_GATT_DB_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP_GATT_DB_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP_GATT_DB_INCLUDED_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP_GATT_DB_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
 - [bluetooth/bluedroid/ble/gatt_server_service_table](#)
 - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
 - [bluetooth/bluedroid/ble/gatt_server](#)
 - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
 - [bluetooth/bluedroid/ble/ble_spp_server](#)

API Reference

Header File

- [components/bt/host/bluedroid/api/include/api/esp_gatts_api.h](#)

Functions

esp_err_t **esp_ble_gatts_register_callback** (*esp_gatts_cb_t* callback)

This function is called to register application callbacks with BTA GATTS module.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_register** (uint16_t app_id)

This function is called to register application identifier.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_app_unregister** (*esp_gatt_if_t* gatts_if)

unregister with GATT Server.

Parameters *gatts_if* –[in] GATT server access interface

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_service** (*esp_gatt_if_t* gatts_if, *esp_gatt_srvc_id_t* *service_id, uint16_t num_handle)

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

Parameters

- *gatts_if* –[in] GATT server access interface

- **service_id** –[in] service ID.
- **num_handle** –[in] number of handle requested for this service.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_create_attr_tab** (const *esp_gatts_attr_db_t* *gatts_attr_db, *esp_gatt_if_t* gatts_if, uint16_t max_nb_attr, uint8_t srvc_inst_id)

Create a service attribute tab.

Parameters

- **gatts_attr_db** –[in] the pointer to the service attr tab
- **gatts_if** –[in] GATT server access interface
- **max_nb_attr** –[in] the number of attribute to be added to the service database.
- **srvc_inst_id** –[in] the instance id of the service

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_included_service** (uint16_t service_handle, uint16_t included_service_handle)

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Parameters

- **service_handle** –[in] service handle to which this included service is to be added.
- **included_service_handle** –[in] the service ID to be included.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char** (uint16_t service_handle, *esp_bt_uuid_t* *char_uuid, *esp_gatt_perm_t* perm, *esp_gatt_char_prop_t* property, *esp_attr_value_t* *char_val, *esp_attr_control_t* *control)

This function is called to add a characteristic into a service.

Parameters

- **service_handle** –[in] service handle to which this included service is to be added.
- **char_uuid** –[in] : Characteristic UUID.
- **perm** –[in] : Characteristic value declaration attribute permission.
- **property** –[in] : Characteristic Properties
- **char_val** –[in] : Characteristic value
- **control** –[in] : attribute response control byte

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_add_char_descr** (uint16_t service_handle, *esp_bt_uuid_t* *descr_uuid, *esp_gatt_perm_t* perm, *esp_attr_value_t* *char_descr_val, *esp_attr_control_t* *control)

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Parameters

- **service_handle** –[in] service handle to which this characteristic descriptor is to be added.
- **perm** –[in] descriptor access permission.
- **descr_uuid** –[in] descriptor UUID.
- **char_descr_val** –[in] : Characteristic descriptor value
- **control** –[in] : attribute response control byte

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_delete_service** (uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Parameters **service_handle** –[in] service_handle to be deleted.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_start_service** (uint16_t service_handle)

This function is called to start a service.

Parameters **service_handle** –[in] the service handle to be started.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_stop_service** (uint16_t service_handle)

This function is called to stop a service.

Parameters **service_handle** –[in] - service to be topped.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_indicate** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size,see “esp_ble_gattc_send_mtu_req”

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection id to indicate.
- **attr_handle** –[in] - attribute handle to indicate.
- **value_len** –[in] - indicate value length.
- **value** –[in] value to indicate.
- **need_confirm** –[in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_response** (*esp_gatt_if_t* gatts_if, uint16_t conn_id, uint32_t trans_id, *esp_gatt_status_t* status, *esp_gatt_rsp_t* *rsp)

This function is called to send a response to a request.

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] - connection identifier.
- **trans_id** –[in] - transfer id
- **status** –[in] - response status
- **rsp** –[in] - response data.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_set_attr_value** (uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

Parameters

- **attr_handle** –[in] the attribute handle which to be set
- **length** –[in] the value length
- **value** –[in] the pointer to the attribute value

Returns

- ESP_OK : success
- other : failed

esp_gatt_status_t **esp_ble_gatts_get_attr_value** (uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

Parameters

- **attr_handle** –[in] Attribute handle.
- **length** –[out] pointer to the attribute value length
- **value** –[out] Pointer to attribute value payload, the value cannot be modified by user

Returns

- ESP_GATT_OK : success
- other : failed

esp_err_t **esp_ble_gatts_open** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

Parameters

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address.
- **is_direct** –[in] direct connection or background auto connection

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_close** (*esp_gatt_if_t* gatts_if, uint16_t conn_id)

Close a connection a remote device.

Parameters

- **gatts_if** –[in] GATT server access interface
- **conn_id** –[in] connection ID to be closed.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_send_service_change_indication** (*esp_gatt_if_t* gatts_if, *esp_bd_addr_t* remote_bda)

Send service change indication.

Parameters

- **gatts_if** –[in] GATT server access interface
- **remote_bda** –[in] remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_gatts_show_local_database** (void)

Print local database (GATT service table)

Returns

- ESP_OK : success

- other : failed

Unions

union **esp_ble_gatts_cb_param_t**

#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct *esp_ble_gatts_cb_param_t::gatts_reg_evt_param* **reg**

Gatt server callback param of ESP_GATTS_REG_EVT

struct *esp_ble_gatts_cb_param_t::gatts_read_evt_param* **read**

Gatt server callback param of ESP_GATTS_READ_EVT

struct *esp_ble_gatts_cb_param_t::gatts_write_evt_param* **write**

Gatt server callback param of ESP_GATTS_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param* **exec_write**

Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_mtu_evt_param* **mtu**

Gatt server callback param of ESP_GATTS_MTU_EVT

struct *esp_ble_gatts_cb_param_t::gatts_conf_evt_param* **conf**

Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct *esp_ble_gatts_cb_param_t::gatts_create_evt_param* **create**

Gatt server callback param of ESP_GATTS_CREATE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param* **add_incl_srvc**

Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_evt_param* **add_char**

Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param* **add_char_descr**

Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct *esp_ble_gatts_cb_param_t::gatts_delete_evt_param* **del**

Gatt server callback param of ESP_GATTS_DELETE_EVT

struct *esp_ble_gatts_cb_param_t::gatts_start_evt_param* **start**

Gatt server callback param of ESP_GATTS_START_EVT

struct *esp_ble_gatts_cb_param_t::gatts_stop_evt_param* **stop**

Gatt server callback param of ESP_GATTS_STOP_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect  
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

The attribute handle

uint16_t **offset**

Offset of the value, if the value is too long

bool **need_rsp**

The write operation need to do response

bool **is_prep**

This write operation is prepare write

uint16_t **len**

The write attribute value length

uint8_t ***value**

The write attribute value

Macros

ESP_GATT_PREP_WRITE_CANCEL

Prepare write flag to indicate cancel prepare write

ESP_GATT_PREP_WRITE_EXEC

Prepare write flag to indicate execute prepare write

Type Definitions

typedef void (***esp_gatts_cb_t**)(*esp_gatts_cb_event_t* event, *esp_gatt_if_t* gatts_if, *esp_ble_gatts_cb_param_t* *param)

GATT Server callback function type.

Param event : Event type

Param gatts_if : GATT server access interface, normally different gatts_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gatts_cb_event_t**

GATT Server callback function events.

Values:

enumerator **ESP_GATTS_REG_EVT**

When register application id, the event comes

enumerator **ESP_GATTS_READ_EVT**

When gatt client request read operation, the event comes

enumerator **ESP_GATTS_WRITE_EVT**

When gatt client request write operation, the event comes

enumerator **ESP_GATTS_EXEC_WRITE_EVT**

When gatt client request execute write, the event comes

enumerator **ESP_GATTS_MTU_EVT**

When set mtu complete, the event comes

enumerator **ESP_GATTS_CONF_EVT**

When receive confirm, the event comes

enumerator **ESP_GATTS_UNREG_EVT**

When unregister application id, the event comes

enumerator **ESP_GATTS_CREATE_EVT**

When create service complete, the event comes

enumerator **ESP_GATTS_ADD_INCL_SRVC_EVT**

When add included service complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_EVT**

When add characteristic complete, the event comes

enumerator **ESP_GATTS_ADD_CHAR_DESCR_EVT**

When add descriptor complete, the event comes

enumerator **ESP_GATTS_DELETE_EVT**

When delete service complete, the event comes

enumerator **ESP_GATTS_START_EVT**

When start service complete, the event comes

enumerator **ESP_GATTS_STOP_EVT**

When stop service complete, the event comes

enumerator **ESP_GATTS_CONNECT_EVT**

When gatt client connect, the event comes

enumerator **ESP_GATTS_DISCONNECT_EVT**

When gatt client disconnect, the event comes

enumerator **ESP_GATTS_OPEN_EVT**

When connect to peer, the event comes

enumerator **ESP_GATTS_CANCEL_OPEN_EVT**

When disconnect from peer, the event comes

enumerator **ESP_GATTS_CLOSE_EVT**

When gatt server close, the event comes

enumerator **ESP_GATTS_LISTEN_EVT**

When gatt listen to be connected the event comes

enumerator **ESP_GATTS_CONGEST_EVT**

When congest happen, the event comes

enumerator **ESP_GATTS_RESPONSE_EVT**

When gatt send response complete, the event comes

enumerator **ESP_GATTS_CREAT_ATTR_TAB_EVT**

When gatt create table complete, the event comes

enumerator **ESP_GATTS_SET_ATTR_VAL_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP_GATTS_SEND_SERVICE_CHANGE_EVT**

When gatt send service change indication complete, the event comes

GATT CLIENT API

Application Example Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
 - [bluetooth/bluedroid/ble/gatt_client](#)
 - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
 - [bluetooth/bluedroid/ble/gattc_multi_connect](#)
 - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.

Functions

esp_err_t **esp_ble_gattc_register_callback** (*esp_gattc_cb_t* callback)

This function is called to register application callbacks with GATTC module.

Parameters **callback** –[in] : pointer to the application callback function.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_app_register** (uint16_t app_id)

This function is called to register application callbacks with GATTC module.

Parameters **app_id** –[in] : Application Identify (UUID), for different application

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_app_unregister** (*esp_gatt_if_t* gattc_if)

This function is called to unregister an application from GATTC module.

Parameters **gattc_if** –[in] Gatt client access interface.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

Open a direct connection or add a background auto connection.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **remote_bda** –[in] remote device bluetooth device address.
- **remote_addr_type** –[in] remote device bluetooth device the address type.
- **is_direct** –[in] direct connection or background auto connection (by now, background auto connection is not supported).

Returns

- ESP_OK: success

- other: failed

esp_err_t **esp_ble_gattc_aux_open** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* remote_bda, *esp_ble_addr_type_t* remote_addr_type, bool is_direct)

esp_err_t **esp_ble_gattc_close** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID to be closed.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_send_mtu_req** (*esp_gatt_if_t* gattc_if, uint16_t conn_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gattc_set_local_mtu() to configure the local MTU size.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_search_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *filter_uuid)

This function is called to get service from local cache. This function report service search result by a call-back event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID.
- **filter_uuid** –[in] a UUID of the service application is interested in. If Null, discover for all services.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_service** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_bt_uuid_t* *svc_uuid, *esp_gattc_service_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **svc_uuid** –[in] the pointer to the service uuid.
- **result** –[out] The pointer to the service which has been found in the gattc cache.
- **count** –[inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –[in] Offset of the service position to get.

Returns

- ESP_OK: success

- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_char_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle.
- **end_handle** –[in] the attribute end handle
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –[in] Offset of the characteristic position to get.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_all_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t char_handle, *esp_gattc_descr_elem_t* *result, uint16_t *count, uint16_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the given characteristic handle
- **result** –[out] The pointer to the descriptor in the characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –[in] Offset of the descriptor position to get.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_char_by_uuid** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* char_uuid, *esp_gattc_char_elem_t* *result, uint16_t *count)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
start_handle, uint16_t end_handle, esp_bt_uuid_t
char_uuid, esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **char_uuid** –[in] the characteristic uuid.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t
conn_id, uint16_t char_handle,
esp_bt_uuid_t descr_uuid,
esp_gattc_descr_elem_t *result,
uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **char_handle** –[in] the characteristic handle.
- **descr_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

Returns

- ESP_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t start_handle, uint16_t end_handle,
esp_bt_uuid_t *incl_uuid,
esp_gattc_incl_svc_elem_t *result, uint16_t
*count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **incl_uuid** –[in] the include service uuid
- **result** –[out] The pointer to the include service in the given service.
- **count** –[inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

Returns

- ESP_OK: success

- other: failed

esp_gatt_status_t **esp_ble_gattc_get_attr_count** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gatt_db_attr_type_t* type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)

Find the attribute count with the given service or characteristic in the gattc cache.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] connection ID which identify the server.
- **type** –[in] the attribute type.
- **start_handle** –[in] the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **end_handle** –[in] the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- **char_handle** –[in] the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn't ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- **count** –[out] output the number of attribute has been found in the gattc cache with the given attribute type.

Returns

- ESP_OK: success
- other: failed

esp_gatt_status_t **esp_ble_gattc_get_db** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_gattc_db_elem_t* *db, uint16_t *count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **start_handle** –[in] the attribute start handle
- **end_handle** –[in] the attribute end handle
- **conn_id** –[in] connection ID which identify the server.
- **db** –[in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –[in] number of elements in database.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service's characteristics of the given characteristic handle.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteritic handle to read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_by_type** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, *esp_bt_uuid_t* *uuid, *esp_gatt_auth_req_t* auth_req)

This function is called to read a service's characteristics of the given characteristic UUID.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **start_handle** –[in] : the attribute start handle.
- **end_handle** –[in] : the attribute end handle
- **uuid** –[in] : The UUID of attribute which will be read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gatt_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple characteristic or characteristic descriptors.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_multiple_variable** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, *esp_gatt_multi_t* *read_multi, *esp_gatt_auth_req_t* auth_req)

This function is called to read multiple variable length characteristic or characteristic descriptors.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **read_multi** –[in] : pointer to the read multiple parameter.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_read_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, *esp_gatt_auth_req_t* auth_req)

This function is called to read a characteristics descriptor.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : descriptor handle to read.
- **auth_req** –[in] : authenticate request type

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.

- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, *esp_gatt_write_type_t* write_type, *esp_gatt_auth_req_t* auth_req)

This function is called to write characteristic descriptor value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID
- **handle** –[in] : descriptor handle to write.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write_type** –[in] : the type of attribute write operation.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_prepare_write_char_descr** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, *esp_gatt_auth_req_t* auth_req)

This function is called to prepare write a characteristic descriptor value.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **handle** –[in] : characteristic descriptor handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth_req** –[in] : authentication request.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_execute_write** (*esp_gatt_if_t* gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **conn_id** –[in] : connection ID.
- **is_execute** –[in] : execute or cancel.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_register_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to register for notification of a service.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

Returns

- ESP_OK: registration succeeds
- other: failed

esp_err_t **esp_ble_gattc_unregister_for_notify** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* server_bda, uint16_t handle)

This function is called to de-register for notification of a service.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **server_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

Returns

- ESP_OK: unregister succeeds
- other: failed

esp_err_t **esp_ble_gattc_cache_refresh** (*esp_bd_addr_t* remote_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

Parameters **remote_bda** –[in] remote device BD address.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_assoc** (*esp_gatt_if_t* gattc_if, *esp_bd_addr_t* src_addr, *esp_bd_addr_t* assoc_addr, bool is_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

Parameters

- **gattc_if** –[in] Gatt client access interface.
- **src_addr** –[in] the source address which provide the attribute table.
- **assoc_addr** –[in] the associated device address which went to share the attribute table with the source address.
- **is_assoc** –[in] true add the associated device address, false remove the associated device address.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_get_addr_list** (*esp_gatt_if_t* gattc_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

Parameters **gattc_if** –[in] Gatt client access interface.

Returns

- ESP_OK: success
- other: failed

esp_err_t **esp_ble_gattc_cache_clean** (*esp_bd_addr_t* remote_bda)

Clean the service cache of this device in the gattc stack,.

Parameters **remote_bda** –[in] remote device BD address.

Returns

- ESP_OK: success
- other: failed

Unions

union **esp_ble_gattc_cb_param_t**

#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

struct *esp_ble_gattc_cb_param_t::gattc_reg_evt_param* **reg**

Gatt client callback param of ESP_GATTC_REG_EVT

The prepare write offset, this value is valid only when prepare write

Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

Param event : Event type

Param gattc_if : GATT client access interface, normally different gattc_if correspond to different profile

Param param : Point to callback parameter, currently is union type

Enumerations

enum **esp_gattc_cb_event_t**

GATT Client callback function events.

Values:

enumerator **ESP_GATTC_REG_EVT**

When GATT client is registered, the event comes

enumerator **ESP_GATTC_UNREG_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP_GATTC_OPEN_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP_GATTC_READ_CHAR_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP_GATTC_WRITE_CHAR_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP_GATTC_CLOSE_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP_GATTC_SEARCH_CMPL_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP_GATTC_SEARCH_RES_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP_GATTC_READ_DESCR_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP_GATTC_WRITE_DESCR_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP_GATTC_NOTIFY_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP_GATTC_PREP_WRITE_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP_GATTC_EXEC_EVT**

When write execution completes, the event comes

enumerator **ESP_GATTC_ACL_EVT**

When ACL connection is up, the event comes

enumerator **ESP_GATTC_CANCEL_OPEN_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP_GATTC_SRVC_CHG_EVT**

When “service changed” occurs, the event comes

enumerator **ESP_GATTC_ENC_CMPL_CB_EVT**

When encryption procedure completes, the event comes

enumerator **ESP_GATTC_CFG_MTU_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP_GATTC_ADV_DATA_EVT**

When advertising of data, the event comes

enumerator **ESP_GATTC_MULT_ADV_ENB_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP_GATTC_MULT_ADV_UPD_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP_GATTC_MULT_ADV_DATA_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP_GATTC_MULT_ADV_DIS_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP_GATTC_CONGEST_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP_GATTC_BTH_SCAN_ENB_EVT**

When batch scan is enabled, the event comes

enumerator **ESP_GATTC_BTH_SCAN_CFG_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP_GATTC_BTH_SCAN_RD_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP_GATTC_BTH_SCAN_THR_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_PARAM_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP_GATTC_BTH_SCAN_DIS_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP_GATTC_SCAN_FLT_CFG_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP_GATTC_SCAN_FLT_PARAM_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP_GATTC_SCAN_FLT_STATUS_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP_GATTC_ADV_VSC_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP_GATTC_REG_FOR_NOTIFY_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP_GATTC_UNREG_FOR_NOTIFY_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP_GATTC_CONNECT_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP_GATTC_DISCONNECT_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP_GATTC_READ_MULTIPLE_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP_GATTC_QUEUE_FULL_EVT**

When the gattc command queue full, the event comes

enumerator **ESP_GATTC_SET_ASSOC_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP_GATTC_GET_ADDR_LIST_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP_GATTC_DIS_SRVC_CMPL_EVT**

When the ble discover service complete, the event comes

enumerator **ESP_GATTC_READ_MULTI_VAR_EVT**

When read multiple variable characteristic complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - `bluetooth/blufi`

API Reference

Header File

- `components/bt/common/api/include/api/esp_blufi_api.h`

Functions

`esp_err_t esp_blufi_register_callbacks` (`esp_blufi_callbacks_t *callbacks`)

This function is called to receive blufi callback event.

Parameters `callbacks` –[in] callback functions

Returns `ESP_OK` - success, other - failed

`esp_err_t esp_blufi_profile_init` (void)

This function is called to initialize blufi_profile.

Returns `ESP_OK` - success, other - failed

`esp_err_t esp_blufi_profile_deinit` (void)

This function is called to de-initialize blufi_profile.

Returns `ESP_OK` - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report` (`wifi_mode_t` opmode, `esp_blufi_sta_conn_state_t` sta_conn_state, `uint8_t` softap_conn_num, `esp_blufi_extra_info_t *extra_info`)

This function is called to send wifi connection report.

Parameters

- `opmode` –: wifi opmode
- `sta_conn_state` –: station is already in connection or not
- `softap_conn_num` –: softap connection number
- `extra_info` –: extra information, such as `sta_ssid`, `softap_ssid` and etc.

Returns `ESP_OK` - success, other - failed

`esp_err_t esp_blufi_send_wifi_list` (`uint16_t` apCount, `esp_blufi_ap_record_t *list`)

This function is called to send wifi list.

Parameters

- `apCount` –: wifi list count
- `list` –: wifi list

Returns `ESP_OK` - success, other - failed

`uint16_t esp_blufi_get_version` (void)

Get BLUFI profile version.

Returns Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_send_error_info` (`esp_blufi_error_state_t` state)

This function is called to send blufi error information.

Parameters `state` –: error state

Returns ESP_OK - success, other - failed

esp_err_t **esp_blufi_send_custom_data** (uint8_t *data, uint32_t data_len)

This function is called to custom data.

Parameters

- **data** –: custom data value
- **data_len** –: the length of custom data

Returns ESP_OK - success, other - failed

Unions

union **esp_blufi_cb_param_t**

#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

struct *esp_blufi_cb_param_t::blufi_init_finish_evt_param* **init_finish**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_deinit_finish_evt_param* **deinit_finish**

Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct *esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param* **wifi_mode**

Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct *esp_blufi_cb_param_t::blufi_connect_evt_param* **connect**

Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct *esp_blufi_cb_param_t::blufi_disconnect_evt_param* **disconnect**

Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT

struct *esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param* **sta_bssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

struct *esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param* **sta_ssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

struct *esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param* **sta_passwd**

Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD

struct *esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param* **softap_ssid**

Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID

struct *esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param* **softap_passwd**

Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct *esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param* **softap_max_conn_num**

Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct *esp_blufi_cb_param_t::blufi_rcv_softap_auth_mode_evt_param* **softap_auth_mode**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct *esp_blufi_cb_param_t::blufi_rcv_softap_channel_evt_param* **softap_channel**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

struct *esp_blufi_cb_param_t::blufi_rcv_username_evt_param* **username**
Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct *esp_blufi_cb_param_t::blufi_rcv_ca_evt_param* **ca**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

struct *esp_blufi_cb_param_t::blufi_rcv_client_cert_evt_param* **client_cert**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

struct *esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param* **server_cert**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

struct *esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param* **client_pkey**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

struct *esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param* **server_pkey**
Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

struct *esp_blufi_cb_param_t::blufi_get_error_evt_param* **report_error**
Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

struct *esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param* **custom_data**
Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

struct **blufi_connect_evt_param**
#include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.

Public Members

Wifi operation mode

Structures

struct **esp_blufi_extra_info_t**

BLUFI extra information structure.

Public Members

uint8_t **sta_bssid**[6]

BSSID of station interface

bool **sta_bssid_set**

is BSSID of station interface set

uint8_t ***sta_ssid**

SSID of station interface

int **sta_ssid_len**

length of SSID of station interface

uint8_t ***sta_passwd**

password of station interface

int **sta_passwd_len**

length of password of station interface

uint8_t ***softap_ssid**

SSID of softap interface

int **softap_ssid_len**

length of SSID of softap interface

uint8_t ***softap_passwd**

password of station interface

int **softap_passwd_len**

length of password of station interface

uint8_t **softap_authmode**
authentication mode of softap interface

bool **softap_authmode_set**
is authentication mode of softap interface set

uint8_t **softap_max_conn_num**
max connection number of softap interface

bool **softap_max_conn_num_set**
is max connection number of softap interface set

uint8_t **softap_channel**
channel of softap interface

bool **softap_channel_set**
is channel of softap interface set

uint8_t **sta_max_conn_retry**
max retry of sta establish connection

bool **sta_max_conn_retry_set**
is max retry of sta establish connection set

uint8_t **sta_conn_end_reason**
reason of sta connection end

bool **sta_conn_end_reason_set**
is reason of sta connection end set

int8_t **sta_conn_rssi**
rssi of sta connection

bool **sta_conn_rssi_set**
is rssi of sta connection set

struct **esp_blufi_ap_record_t**
Description of an WiFi AP.

Public Members

uint8_t **ssid**[33]
SSID of AP

int8_t **rssi**
signal strength of AP

struct **esp_blufi_callbacks_t**
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t **event_cb**

BLUFI event callback

esp_blufi_negotiate_data_handler_t **negotiate_data_handler**

BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t **encrypt_func**

BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t **decrypt_func**

BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t **checksum_func**

BLUFI check sum function (FCS)

Macros

ESP_BLUFI_BD_ADDR_LEN

Bluetooth address length.

Type Definitions

typedef uint8_t **esp_blufi_bd_addr_t**[ESP_BLUFI_BD_ADDR_LEN]

Bluetooth device address.

typedef void (***esp_blufi_event_cb_t**)(*esp_blufi_cb_event_t* event, *esp_blufi_cb_param_t* *param)

BLUFI event callback function type.

Param event : Event type

Param param : Point to callback parameter, currently is union type

typedef void (***esp_blufi_negotiate_data_handler_t**)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Param data : data from phone

Param len : length of data from phone

Param output_data : data want to send to phone

Param output_len : length of data want to send to phone

Param need_free : output reporting if memory needs to be freed or not *

typedef int (***esp_blufi_encrypt_func_t**)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param crypt_data : plain text and encrypted data, the encrypt function must support autochthonous encrypt

Param crypt_len : length of plain text

Return Nonnegative number is encrypted length, if error, return negative number;

```
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param crypt_data : encrypted data and plain text, the encrypt function must support autochthonous decrypt

Param crypt_len : length of encrypted text

Return Nonnegative number is decrypted length, if error, return negative number;

```
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

Param iv8 : initial vector(8bit), normally, blufi core will input packet sequence number

Param data : data need to checksum

Param len : length of data

Enumerations

```
enum esp_blufi_cb_event_t
```

Values:

enumerator **ESP_BLUFI_EVENT_INIT_FINISH**

enumerator **ESP_BLUFI_EVENT_DEINIT_FINISH**

enumerator **ESP_BLUFI_EVENT_SET_WIFI_OPMODE**

2.3.3 Controller && VHCI

Application Example

Check [bluetooth/hci](#) folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller_vhci_ble_adv](#).

API Reference

Header File

- `components/bt/include/esp32/include/esp_bt.h`

Functions

esp_err_t **esp_ble_tx_power_set** (*esp_ble_power_type_t* power_type, *esp_power_level_t* power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Parameters

- **power_type** –: The type of which tx power, could set Advertising/Connection/Default and etc
- **power_level** –Power level(index) corresponding to absolute value(dbm)

Returns ESP_OK - success, other - failed

esp_power_level_t **esp_ble_tx_power_get** (*esp_ble_power_type_t* power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Parameters **power_type** –: The type of which tx power, could set Advertising/Connection/Default and etc

Returns >= 0 - Power level, < 0 - Invalid

esp_err_t **esp_bredr_tx_power_set** (*esp_power_level_t* min_power_level, *esp_power_level_t* max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

Parameters

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

Returns ESP_OK - success, other - failed

esp_err_t **esp_bredr_tx_power_get** (*esp_power_level_t* *min_power_level, *esp_power_level_t* *max_power_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Parameters

- **min_power_level** –The minimum power level
- **max_power_level** –The maximum power level

Returns ESP_OK - success, other - failed

esp_err_t **esp_bredr_sco_datapath_set** (*esp_sco_data_path_t* data_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Parameters **data_path** –SCO data path

Returns ESP_OK - success, other - failed

esp_err_t **esp_bt_controller_init** (*esp_bt_controller_config_t* *cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Parameters **cfg** –Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

Returns ESP_OK - success, other - failed

esp_err_t esp_bt_controller_deinit (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

Returns ESP_OK - success, other - failed

esp_err_t esp_bt_controller_enable (*esp_bt_mode_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

Parameters **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of `esp_bt_controller_init()`.

Returns ESP_OK - success, other - failed

esp_err_t esp_bt_controller_disable (void)

Disable BT controller.

Returns ESP_OK - success, other - failed

esp_bt_controller_status_t esp_bt_controller_get_status (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

Returns status value

bool esp_vhci_host_check_send_available (void)

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

Returns true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)

`esp_vhci_host_send_packet` host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters

- **data** –the packet point
- **len** –the packet length

esp_err_t esp_vhci_host_register_callback (const *esp_vhci_host_callback_t* *callback)

`esp_vhci_host_register_callback` register the vhci reference callback struct defined by `vhci_host_callback` structure.

Parameters **callback** –*esp_vhci_host_callback* type variable

Returns ESP_OK - success, ESP_FAIL - failed

esp_err_t esp_bt_controller_mem_release (*esp_bt_mode_t* mode)

`esp_bt_controller_mem_release` release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

`esp_bt_controller_mem_release(mode)` should be called only before `esp_bt_controller_init()` or after `esp_bt_controller_deinit()`.

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is `ESP_BT_MODE_BTDM`, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function

Parameters `mode` –: the mode want to release memory

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_mem_release** (*esp_bt_mode_t* mode)

`esp_bt_mem_release` release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling `esp_bt_controller_mem_release()`. Additionally, if the mode is set to `ESP_BT_MODE_BTDM`, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

Note: In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

Parameters `mode` –: the mode whose memory is to be released

Returns `ESP_OK` - success, other - failed

esp_err_t **esp_bt_sleep_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is `ORIG` mode, and another is `EVED` Mode. `EVED` Mode is intended for BLE only.

For `ORIG` mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “`ORIG` mode” is selected. In `ORIG` modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

Returns

- `ESP_OK` : success
- other : failed

esp_err_t **esp_bt_sleep_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

Returns

- ESP_OK : success
- other : failed

esp_err_t **esp_ble_scan_duplicate_list_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in `menuconfig`.

Note: This function name is incorrectly spelled, it will be fixed in release 5.x version.

Returns

- ESP_OK : success
- other : failed

void **esp_wifi_bt_power_domain_on** (void)

bt Wi-Fi power domain power on

void **esp_wifi_bt_power_domain_off** (void)

bt Wi-Fi power domain power off

Structures

struct **esp_bt_controller_config_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t **controller_task_stack_size**

Bluetooth controller task stack size

uint8_t **controller_task_prio**

Bluetooth controller task priority

uint8_t **hci_uart_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32_t **hci_uart_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
scan duplicate mode

uint8_t scan_duplicate_type
scan duplicate type

uint16_t normal_adv_size
Normal adv size for scan duplicate

uint16_t mesh_adv_size
Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
Controller minimum memory value

uint32_t controller_debug_flag
Controller debug log flag

uint8_t mode
Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
BLE maximum connection numbers

uint8_t bt_max_acl_conn
BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
SCO data path, i.e. HCI or PCM module

bool auto_latency
BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
BLE low power crystal accuracy index

uint8_t pcm_role
PCM role (master & slave)

uint8_t pcm_polar
PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16_t **dup_list_refresh_period**

Duplicate scan list refresh period

uint32_t **magic**

Magic number

struct **esp_vhci_host_callback**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (***notify_host_send_available**)(void)

callback used to notify that the host can send packet to controller

int (***notify_host_recv**)(uint8_t *data, uint16_t len)

callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL

BT_CONTROLLER_INIT_CONFIG_DEFAULT ()

Type Definitions

typedef struct *esp_vhci_host_callback* **esp_vhci_host_callback_t**

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum **esp_bt_mode_t**

Bluetooth mode for controller enable/disable.

Values:

enumerator **ESP_BT_MODE_IDLE**

Bluetooth is not running

enumerator **ESP_BT_MODE_BLE**

Run BLE mode

enumerator **ESP_BT_MODE_CLASSIC_BT**

Run Classic BT mode

enumerator **ESP_BT_MODE_BTDM**

Run dual mode

enum **[anonymous]**

BLE sleep clock accuracy(SCA), values for ble_sca field in *esp_bt_controller_config_t*, currently only ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

enumerator **ESP_BLE_SCA_500PPM**

BLE SCA at 500ppm

enumerator **ESP_BLE_SCA_250PPM**

BLE SCA at 250ppm

enumerator **ESP_BLE_SCA_150PPM**

BLE SCA at 150ppm

enumerator **ESP_BLE_SCA_100PPM**

BLE SCA at 100ppm

enumerator **ESP_BLE_SCA_75PPM**

BLE SCA at 75ppm

enumerator **ESP_BLE_SCA_50PPM**

BLE SCA at 50ppm

enumerator **ESP_BLE_SCA_30PPM**

BLE SCA at 30ppm

enumerator **ESP_BLE_SCA_20PPM**

BLE SCA at 20ppm

enum **esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

enumerator **ESP_BT_CONTROLLER_STATUS_IDLE**

enumerator **ESP_BT_CONTROLLER_STATUS_INITED**

enumerator **ESP_BT_CONTROLLER_STATUS_ENABLED**

enumerator **ESP_BT_CONTROLLER_STATUS_NUM**

enum **esp_ble_power_type_t**

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV : for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN : for scan. ESP_BLE_PWR_TYPE_DEFAULT : if each connection' s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL0**

For connection handle 0

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL1**

For connection handle 1

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL2**

For connection handle 2

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL3**

For connection handle 3

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL4**

For connection handle 4

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL5**

For connection handle 5

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL6**

For connection handle 6

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL7**

For connection handle 7

enumerator **ESP_BLE_PWR_TYPE_CONN_HDL8**

For connection handle 8

enumerator **ESP_BLE_PWR_TYPE_ADV**

For advertising

enumerator **ESP_BLE_PWR_TYPE_SCAN**

For scan

enumerator **ESP_BLE_PWR_TYPE_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP_BLE_PWR_TYPE_NUM**

TYPE numbers

enum **esp_power_level_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

Values:

enumerator **ESP_PWR_LVL_N12**

Corresponding to -12dbm

enumerator **ESP_PWR_LVL_N9**

Corresponding to -9dbm

enumerator **ESP_PWR_LVL_N6**

Corresponding to -6dbm

enumerator **ESP_PWR_LVL_N3**

Corresponding to -3dbm

enumerator **ESP_PWR_LVL_N0**

Corresponding to 0dbm

enumerator **ESP_PWR_LVL_P3**

Corresponding to +3dbm

enumerator **ESP_PWR_LVL_P6**

Corresponding to +6dbm

enumerator **ESP_PWR_LVL_P9**

Corresponding to +9dbm

enumerator **ESP_PWR_LVL_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP_PWR_LVL_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP_PWR_LVL_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP_PWR_LVL_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP_PWR_LVL_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP_PWR_LVL_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP_PWR_LVL_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP_PWR_LVL_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp_sco_data_path_t**

Bluetooth audio data transport path.

Values:

enumerator **ESP_SCO_DATA_PATH_HCI**

data over HCI transport

enumerator **ESP_SCO_DATA_PATH_PCM**

data over PCM interface

2.3.4 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [Getting Started with ESP-BLE-MESH](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH Architecture](#).

Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH Examples](#) and [ESP-BLE-MESH Demo Videos](#).

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param*
provisioner_update_app_key_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param*
provisioner_bind_app_key_to_model_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param*
provisioner_add_net_key_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param*
provisioner_update_net_key_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param*
provisioner_store_node_comp_data_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param*
provisioner_delete_node_with_uuid_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param*
provisioner_delete_node_with_addr_comp

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int **err_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous] **provisioner_recv_heartbeat**
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]
provisioner_direct_erase_settings_comp

ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT

uint8_t **index**

Index of Provisioner settings

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_open_settings_with_index_comp

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char **uid**[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]

Provisioner settings user id

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_open_settings_with_uid_comp

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_close_settings_with_index_comp

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_close_settings_with_uid_comp

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_delete_settings_with_index_comp

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.

Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::[anonymous]

provisioner_delete_settings_with_uid_comp

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.

Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_set_fast_prov_info_comp_param*

set_fast_prov_info_comp

Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_set_fast_prov_action_comp_param*

set_fast_prov_action_comp

Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t*::*ble_mesh_heartbeat_msg_rcv_param* **heartbeat_msg_rcv**

Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_enable_comp_param* **lpn_enable_comp**
Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_disable_comp_param* **lpn_disable_comp**
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct *esp_ble_mesh_prov_cb_param_t::ble_mesh_lpn_poll_comp_param* **lpn_poll_comp**
Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

```

Public Types

enum **[anonymous]**

This enum value is the reason of friendship termination on the friend node side

Values:

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL**

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT**

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**

Receive Friend Request from existing Low Power Node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**

Receive Friend Clear from other friend node

enumerator **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t **lpn_addr**

Low Power Node unicast address

enum *esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous]*
reason

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct **ble_mesh_heartbeat_msg_rcv_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

Public Members

int **err_code**

Indicate the result of storing node composition data by the Provisioner

uint16_t **addr**

Node element address

struct **ble_mesh_provisioner_update_local_app_key_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating local AppKey by the Provisioner

uint16_t **net_idx**

NetKey Index

uint16_t **app_idx**

AppKey Index

struct **ble_mesh_provisioner_update_local_net_key_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating local NetKey by the Provisioner

uint16_t **net_idx**

NetKey Index

struct **ble_mesh_proxy_client_add_filter_addr_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client add filter address

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_connect_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client connect

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_connected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_disconnect_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client disconnect

uint8_t **conn_handle**

Proxy connection handle

struct **ble_mesh_proxy_client_disconnected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address of the Proxy Server

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

uint8_t **reason**

Proxy disconnect reason

struct **ble_mesh_proxy_client_recv_adv_pkt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT.

Public Members

esp_ble_mesh_bd_addr_t **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint16_t **net_idx**

Network ID related NetKey Index

uint8_t **net_id**[8]

Network ID contained in the advertising packet

int8_t **rss_i**

RSSI of the received advertising packet

struct **ble_mesh_proxy_client_rcv_filter_status_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

uint16_t **server_addr**

Proxy Server primary element address

uint16_t **net_idx**

Corresponding NetKey Index

uint8_t **filter_type**

Proxy Server filter type(whitelist or blacklist)

uint16_t **list_size**

Number of addresses in the Proxy Server filter list

struct **ble_mesh_proxy_client_remove_filter_addr_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client remove filter address

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_client_set_filter_type_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of Proxy Client set filter type

uint8_t **conn_handle**

Proxy connection handle

uint16_t **net_idx**

Corresponding NetKey Index

struct **ble_mesh_proxy_gatt_disable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of disabling Mesh Proxy Service

struct **ble_mesh_proxy_gatt_enable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of enabling Mesh Proxy Service

struct **ble_mesh_proxy_identity_enable_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of enabling Mesh Proxy advertising

struct **ble_mesh_proxy_server_connected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

struct **ble_mesh_proxy_server_disconnected_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT.

Public Members

uint8_t **conn_handle**

Proxy connection handle

uint8_t **reason**

Proxy disconnect reason

struct **ble_mesh_set_fast_prov_action_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.

Public Members

uint8_t **status_action**

Indicate the result of setting action of fast provisioning

struct **ble_mesh_set_fast_prov_info_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.

Public Members

uint8_t **status_unicast**

Indicate the result of setting unicast address range of fast provisioning

uint8_t **status_net_idx**

Indicate the result of setting NetKey Index of fast provisioning

uint8_t **status_match**

Indicate the result of setting matching Device UUID of fast provisioning

struct **ble_mesh_set_oob_pub_key_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int **err_code**

Indicate the result of setting OOB Public Key

struct **ble_mesh_set_unprov_dev_name_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int **err_code**

Indicate the result of setting BLE Mesh device name

union **esp_ble_mesh_server_state_value_t**

#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t **onoff**

The value of the Generic OnOff state

The value of the Light LC Light OnOff state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_onoff**

The Generic OnOff state

int16_t **level**

The value of the Generic Level state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_level**

The Generic Level state

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_onpowerup**

The Generic OnPowerUp state

uint16_t **power**

The value of the Generic Power Actual state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **gen_power_actual**

The Generic Power Actual state

uint16_t **lightness**

The value of the Light Lightness Actual state

The value of the Light Lightness Linear state

The value of the Light CTL Lightness state

The value of the Light HSL Lightness state

The value of the Light xyL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lightness_actual**

The Light Lightness Actual state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lightness_linear**

The Light Lightness Linear state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_ctl_lightness**

The Light CTL Lightness state

uint16_t **temperature**

The value of the Light CTL Temperature state

int16_t **delta_uv**

The value of the Light CTL Delta UV state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_ctl_temp_delta_uv**

The Light CTL Temperature & Delta UV states

uint16_t **hue**

The value of the Light HSL Hue state

uint16_t **saturation**

The value of the Light HSL Saturation state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl**

The Light HSL composite state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_lightness**

The Light HSL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_hue**

The Light HSL Hue state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_hsl_saturation**

The Light HSL Saturation state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_xyl_lightness**

The Light xyL Lightness state

struct *esp_ble_mesh_server_state_value_t*::[anonymous] **light_lc_light_onoff**

The Light LC Light OnOff state

union **esp_ble_mesh_model_cb_param_t**

#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_operation_evt_param* **model_operation**

Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_send_comp_param* **model_send_comp**

Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct *esp_ble_mesh_model_cb_param_t*::*ble_mesh_model_publish_comp_param* **model_publish_comp**

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_rcv_publish_msg_param  
client_rcv_publish_msg  
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
```

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param  
client_send_timeout  
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
```

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param  
model_publish_update  
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
```

```
struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param  
server_model_update_state  
    Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
```

```
struct ble_mesh_client_model_send_timeout_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.
```

Public Members

`uint32_t opcode`
 Opcode of the previously sent message

`esp_ble_mesh_model_t *model`
 Pointer to the model which sends the previous message

`esp_ble_mesh_msg_ctx_t *ctx`
 Pointer to the context of the previous message

```
struct ble_mesh_mod_rcv_publish_msg_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.
```

Public Members

`uint32_t opcode`
 Opcode of the unsolicited received message

`esp_ble_mesh_model_t *model`
 Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`
 Pointer to the context of the message

`uint16_t length`
 Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_operation_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

Public Members

uint32_t **opcode**

Opcode of the received message

esp_ble_mesh_model_t ***model**

Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t ***ctx**

Pointer to the context of the received message

uint16_t **length**

Length of the received message

uint8_t ***msg**

Value of the received message

struct **ble_mesh_model_publish_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int **err_code**

Indicate the result of publishing a message

esp_ble_mesh_model_t ***model**

Pointer to the model which publishes the message

struct **ble_mesh_model_publish_update_evt_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model which is going to update its publish message

struct **ble_mesh_model_send_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int **err_code**

Indicate the result of sending a message

uint32_t **opcode**

Opcode of the message

esp_ble_mesh_model_t ***model**

Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t ***ctx**

Context of the message

struct **ble_mesh_server_model_update_state_comp_param**

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.

Public Members

int **err_code**

Indicate the result of updating server model state

esp_ble_mesh_model_t ***model**

Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t **type**

Type of the updated server state

Structures

struct **esp_ble_mesh_deinit_param_t**

BLE Mesh deinit parameters

Public Members

bool **erase_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp_ble_mesh_elem_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

Public Members

uint16_t **element_addr**

Element Address, assigned during provisioning.

const uint16_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **sig_model_count**

SIG Model count

const uint8_t **vnd_model_count**

Vendor Model count

esp_ble_mesh_model_t ***sig_models**

SIG Models

esp_ble_mesh_model_t ***vnd_models**

Vendor Models

struct **esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t **publish_addr**

Publish Address.

uint16_t **app_idx**

Publish AppKey Index.

uint16_t **cred**

Friendship Credentials Flag.

uint16_t **send_rel**

Force reliable sending (segment acks)

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t **period_div**

Divisor for the Period.

uint8_t **fast_period**

Use FastPeriodDivisor

uint8_t **count**

Retransmissions left.

uint32_t **period_start**

Start of the current period.

struct net_buf_simple ***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

`ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);`

esp_ble_mesh_cb_t **update**

Callback used to update publish message. Initialized by the stack.

struct k_delayed_work **timer**

Publish Period Timer. Initialized by the stack.

uint8_t **dev_role**

Role of the device that is going to publish messages

struct **esp_ble_mesh_model_op_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

Public Members

const uint32_t **opcode**

Message opcode

const size_t **min_len**

Message minimum length

esp_ble_mesh_cb_t **param_cb**

Callback used to handle message. Initialized by the stack.

struct **esp_ble_mesh_model_cbs_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

Public Members

esp_ble_mesh_cb_t **init_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp_ble_mesh_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`

Public Members

const uint16_t **model_id**

16-bit model identifier

uint16_t **company_id**

16-bit company identifier

uint16_t **model_id**

16-bit model identifier

struct *esp_ble_mesh_model*::[anonymous]::[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp_ble_mesh_model*::[anonymous] [**anonymous**]

Model ID

uint8_t **element_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8_t **model_idx**

Is the Nth model in the element

uint16_t **flags**

Information about what has changed

esp_ble_mesh_elem_t ***element**

The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const **pub**

Model Publication

uint16_t **keys**[CONFIG_BLE_MESH_MODEL_KEY_COUNT]

AppKey List

uint16_t **groups**[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]

Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t ***op**

Model operation context

esp_ble_mesh_model_cbs_t ***cb**

Model callback structure

void ***user_data**

Model-specific user data

struct **esp_ble_mesh_msg_ctx_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`

Public Members

uint16_t **net_idx**

NetKey Index of the subnet through which to send the message.

uint16_t **app_idx**

AppKey Index for message encryption.

uint16_t **addr**

Remote address.

uint16_t **recv_dst**

Destination address of a received message. Not used for sending.

int8_t **recv_rssi**

RSSI of received packet. Not used for sending.

uint8_t **recv_ttl**

Received TTL value. Not used for sending.

uint8_t **send_rel**

Force sending reliably by using segment acknowledgement

uint8_t **send_ttl**

TTL, or `ESP_BLE_MESH_TTL_DEFAULT` for default TTL.

uint32_t **recv_op**

Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t ***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp_ble_mesh_prov_t**

Provisioning properties & capabilities. This structure is associated with struct `bt_mesh_prov` in `mesh_access.h`

struct **esp_ble_mesh_comp_t**

Node Composition data context. This structure is associated with struct `bt_mesh_comp` in `mesh_access.h`

Public Members**uint16_t cid**

16-bit SIG-assigned company identifier

uint16_t pid

16-bit vendor-assigned product identifier

uint16_t vid

16-bit vendor-assigned product version identifier

size_t element_count

Element count

esp_ble_mesh_elem_t ***elements**

A sequence of elements

struct **esp_ble_mesh_unprov_dev_add_t**

Information of the device which is going to be added for provisioning.

Public Members*esp_ble_mesh_bd_addr_t* **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t uuid[16]

Device UUID

uint16_t oob_info

Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t **bearer**

Provisioning Bearer

struct **esp_ble_mesh_device_delete_t**

Information of the device which is going to be deleted.

Public Members*esp_ble_mesh_bd_addr_t* **addr**

Device address

esp_ble_mesh_addr_type_t **addr_type**

Device address type

uint8_t **uuid**[16]
Device UUID

uint8_t **flag**
BIT0: device address; BIT1: device UUID

struct **esp_ble_mesh_prov_data_info_t**
Information of the provisioner which is going to be updated.

Public Members

uint16_t **net_idx**
NetKey Index

uint8_t **flags**
Flags

uint32_t **iv_index**
IV Index

uint8_t **flag**
BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct **esp_ble_mesh_node_t**
Information of the provisioned node

Public Members

esp_ble_mesh_bd_addr_t **addr**
Node device address

esp_ble_mesh_addr_type_t **addr_type**
Node device address type

uint8_t **dev_uuid**[16]
Device UUID

uint16_t **oob_info**
Node OOB information

uint16_t **unicast_addr**
Node unicast address

uint8_t **element_num**
Node element number

uint16_t **net_idx**

Node NetKey Index

uint8_t **flags**

Node key refresh flag and iv update flag

uint32_t **iv_index**

Node IV Index

uint8_t **dev_key**[16]

Node device key

char **name**[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]

Node name

uint16_t **comp_length**

Length of Composition Data

uint8_t ***comp_data**

Value of Composition Data

struct **esp_ble_mesh_fast_prov_info_t**

Context of fast provisioning which need to be set.

Public Members

uint16_t **unicast_min**

Minimum unicast address used for fast provisioning

uint16_t **unicast_max**

Maximum unicast address used for fast provisioning

uint16_t **net_idx**

Netkey index used for fast provisioning

uint8_t **flags**

Flags used for fast provisioning

uint32_t **iv_index**

IV Index used for fast provisioning

uint8_t **offset**

Offset of the UUID to be compared

uint8_t **match_len**

Length of the UUID to be compared

uint8_t **match_val**[16]

Value of UUID to be compared

struct **esp_ble_mesh_heartbeat_filter_info_t**

Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t **hb_src**

Heartbeat source address (unicast address)

uint16_t **hb_dst**

Heartbeat destination address (unicast address or group address)

struct **esp_ble_mesh_client_op_pair_t**

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

Public Members

uint32_t **cli_op**

The client message opcode

uint32_t **status_op**

The server status opcode corresponding to the client message opcode

struct **esp_ble_mesh_client_t**

Client Model user data context.

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the client model. Initialized by the stack.

int **op_pair_size**

Size of the op_pair

const *esp_ble_mesh_client_op_pair_t* ***op_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32_t **publish_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void ***internal_data**

Pointer to the internal data of client model

`uint8_t msg_role`

Role of the device (Node/Provisioner) that is going to send messages

struct `esp_ble_mesh_client_common_param_t`

Common parameters of the messages sent by Client Model.

Public Members

`esp_ble_mesh_opcode_t opcode`

Message opcode

`esp_ble_mesh_model_t *model`

Pointer to the client model structure

`esp_ble_mesh_msg_ctx_t ctx`

The context used to send message

`int32_t msg_timeout`

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

`uint8_t msg_role`

Role of the device - Node/Provisioner

struct `esp_ble_mesh_state_transition_t`

Parameters of the server model state transition

Public Functions

`BLE_MESH_ATOMIC_DEFINE` (flag, `ESP_BLE_MESH_SERVER_FLAG_MAX`)

Flag used to indicate if the transition timer has been started internally.

If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

`bool just_started`

Indicate if the state transition has just started

`uint8_t trans_time`

State transition time

`uint8_t remain_time`

Remaining time of state transition

uint8_t **delay**

Delay before starting state transition

uint32_t **quo_tt**

Duration of each divided transition step

uint32_t **counter**

Number of steps which the transition duration is divided

uint32_t **total_duration**

State transition total duration

int64_t **start_timestamp**

Time when the state transition is started

struct k_delayed_work **timer**

Timer used for state transition

struct **esp_ble_mesh_last_msg_info_t**

Parameters of the server model received last same set message.

Public Members

uint8_t **tid**

Transaction number of the last message

uint16_t **src**

Source address of the last message

uint16_t **dst**

Destination address of the last message

int64_t **timestamp**

Time when the last message is received

struct **esp_ble_mesh_server_rsp_ctrl_t**

Parameters of the Server Model response control

Public Members

uint8_t **get_auto_rsp**

BLE Mesh Server Response Option.

- i. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
- ii. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;

- iii. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
- iv. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
- v. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
- vi. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

`uint8_t set_auto_rsp`

Response control for Client Set messages

`uint8_t status_auto_rsp`

Response control for Server Status messages

Macros

ESP_BLE_MESH_SDU_MAX_LEN

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

ESP_BLE_MESH_MIC_SHORT

Length of a long Mesh MIC.

ESP_BLE_MESH_MIC_LONG

The maximum length of a BLE Mesh provisioned node name

ESP_BLE_MESH_NODE_NAME_MAX_LEN

The maximum length of a BLE Mesh unprovisioned device name

ESP_BLE_MESH_DEVICE_NAME_MAX_LEN

The maximum length of settings user id

ESP_BLE_MESH_SETTINGS_UID_SIZE

Invalid settings index

ESP_BLE_MESH_INVALID_SETTINGS_IDX

Define the BLE Mesh octet 16 bytes size

ESP_BLE_MESH_OCTET16_LEN

ESP_BLE_MESH_OCTET8_LEN

ESP_BLE_MESH_CID_NVAL

Special TTL value to request using configured default TTL

ESP_BLE_MESH_TTL_DEFAULT

Maximum allowed TTL value

ESP_BLE_MESH_TTL_MAX

ESP_BLE_MESH_ADDR_UNASSIGNED

ESP_BLE_MESH_ADDR_ALL_NODES

ESP_BLE_MESH_ADDR_PROXIES

ESP_BLE_MESH_ADDR_FRIENDS

ESP_BLE_MESH_ADDR_RELAYS

ESP_BLE_MESH_KEY_UNUSED

ESP_BLE_MESH_KEY_DEV

ESP_BLE_MESH_KEY_PRIMARY

ESP_BLE_MESH_KEY_ANY

Primary Network Key index

ESP_BLE_MESH_NET_PRIMARY

Relay state value

ESP_BLE_MESH_RELAY_DISABLED

ESP_BLE_MESH_NODE_IDENTITY_RUNNING

ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED

Supported features

ESP_BLE_MESH_FEATURE_RELAY

ESP_BLE_MESH_FEATURE_PROXY

ESP_BLE_MESH_FEATURE_FRIEND

ESP_BLE_MESH_FEATURE_LOW_POWER

ESP_BLE_MESH_FEATURE_ALL_SUPPORTED

ESP_BLE_MESH_ADDR_IS_UNICAST (addr)

ESP_BLE_MESH_ADDR_IS_GROUP (addr)

ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)

ESP_BLE_MESH_ADDR_IS_RFU (addr)

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)

Encode transmission count & interval steps.

Note: For example, `ESP_BLE_MESH_TRANSMIT(2, 20)` means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

Parameters

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)

Decode transmit count from a transmit value.

Parameters

- **transmit** –Encoded transmit count & interval value.

Returns Transmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)

Decode transmit interval from a transmit value.

Parameters

- **transmit** –Encoded transmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)

Encode Publish Retransmit count & interval steps.

Parameters

- **count** –Number of retransmissions (first transmission is excluded).
- **int_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

Returns BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)

Decode Publish Retransmit count from a given value.

Parameters

- **transmit** –Encoded Publish Retransmit count & interval value.

Returns Retransmission count (actual transmissions equal to N + 1).

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Parameters

- **transmit** –Encoded Publish Retransmit count & interval value.

Returns Transmission interval in milliseconds.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN

Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN

Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)

ESP_BLE_MESH_MODEL_OP_2 (b0, b1)

ESP_BLE_MESH_MODEL_OP_3 (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note: This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters

- **_loc** –Location Descriptor.
- **_mods** –Array of SIG models.
- **_vnd_mods** –Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)

Define a model publication context.

Parameters

- **_name** –Variable name given to the context.
- **_msg_len** –Length of the publication message.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)

Define a model operation context.

Parameters

- **_opcode** –Message opcode.
- **_min_len** –Message minimum length.

ESP_BLE_MESH_MODEL_OP_END

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

PROV_DATA_FLAGS_FLAG

PROV_DATA_IV_INDEX_FLAG

Type Definitions

typedef uint8_t **esp_ble_mesh_octet16_t**[ESP_BLE_MESH_OCTET16_LEN]

Define the BLE Mesh octet 8 bytes size

typedef uint8_t **esp_ble_mesh_octet8_t**[ESP_BLE_MESH_OCTET8_LEN]

Invalid Company ID

typedef uint32_t **esp_ble_mesh_cb_t**

typedef uint8_t **UINT8**

typedef uint16_t **UINT16**

```
typedef uint32_t UINT32
```

```
typedef uint64_t UINT64
```

```
typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]
```

```
typedef uint8_t BD_ADDR[BD_ADDR_LEN]
```

```
typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
```

```
typedef uint8_t esp_ble_mesh_addr_type_t
```

BLE device address type.

```
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
```

```
typedef uint8_t esp_ble_mesh_dev_add_flag_t
```

```
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
```

`esp_ble_mesh_opcode_config_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_get_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
```

`esp_ble_mesh_opcode_config_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_config_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_config_client_set_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_config_status_t
```

`esp_ble_mesh_opcode_config_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

```
typedef uint8_t esp_ble_mesh_cfg_status_t
```

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

```
typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
```

`esp_ble_mesh_opcode_health_client_get_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_get_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_get_state` function.

```
typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
```

`esp_ble_mesh_opcode_health_client_set_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by `esp_ble_mesh_health_client_set_state`. The following opcodes will only be used in the `esp_ble_mesh_health_client_set_state` function.

```
typedef uint32_t esp_ble_mesh_health_model_status_t
```

`esp_ble_mesh_health_model_status_t` belongs to `esp_ble_mesh_opcode_t`, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

typedef uint32_t **esp_ble_mesh_generic_message_opcode_t**

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode

typedef uint32_t **esp_ble_mesh_sensor_message_opcode_t**

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t **esp_ble_mesh_time_scene_message_opcode_t**

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t **esp_ble_mesh_light_message_opcode_t**

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Lightness Message Opcode

typedef uint32_t **esp_ble_mesh_opcode_t**

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t **esp_ble_mesh_model_status_t**

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum **esp_ble_mesh_cb_type_t**

Values:

enumerator **ESP_BLE_MESH_TYPE_PROV_CB**

enumerator **ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB**

enumerator **ESP_BLE_MESH_PROV_OOB_IN_MANUAL**

enumerator **ESP_BLE_MESH_PROV_OOB_ON_DEV**

enum **esp_ble_mesh_dev_role_t**

Values:

enumerator **ROLE_NODE**

enumerator **ROLE_PROVISIONER**

enumerator **ROLE_FAST_PROV**

enum **esp_ble_mesh_fast_prov_action_t**

Values:

enumerator **FAST_PROV_ACT_NONE**

enumerator **FAST_PROV_ACT_ENTER**

enumerator **FAST_PROV_ACT_SUSPEND**

enumerator **FAST_PROV_ACT_EXIT**

enumerator **FAST_PROV_ACT_MAX**

enum **esp_ble_mesh_proxy_filter_type_t**

Values:

enumerator **PROXY_FILTER_WHITELIST**

enumerator **PROXY_FILTER_BLACKLIST**

enum **esp_ble_mesh_prov_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_PROV_REGISTER_COMP_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT**

Set the unprovisioned device name completion event

enumerator **ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT**

Enable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT**

Disable node provisioning functionality completion event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT**

Establish a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT**

Close a BLE Mesh link event

enumerator **ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT**

Generate Node input OOB public key event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT**

Generate Node Output Number event

enumerator **ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT**

Generate Node Output String event

enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_EVT**

Event requiring the user to input a number or string

enumerator **ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT**

Provisioning done event

enumerator **ESP_BLE_MESH_NODE_PROV_RESET_EVT**

Provisioning reset event

enumerator **ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT**

Node set oob public key completion event

- enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT**
Node input number completion event
- enumerator **ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT**
Node input string completion event
- enumerator **ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT**
Enable BLE Mesh Proxy Identity advertising completion event
- enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT**
Enable BLE Mesh GATT Proxy Service completion event
- enumerator **ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT**
Disable BLE Mesh GATT Proxy Service completion event
- enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT**
Node add NetKey locally completion event
- enumerator **ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT**
Node add AppKey locally completion event
- enumerator **ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT**
Node bind AppKey to model locally completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT**
Provisioner enable provisioning functionality completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT**
Provisioner disable provisioning functionality completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT**
Provisioner receives unprovisioned device beacon event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT**
Provisioner read unprovisioned device OOB public key event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT**
Provisioner input value for provisioning procedure event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT**
Provisioner output value for provisioning procedure event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT**
Provisioner establish a BLE Mesh link event
- enumerator **ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT**
Provisioner close a BLE Mesh link event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT**

Provisioner provisioning done event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT**

Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**

Provisioner start to provision an unprovisioned device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**

Provisioner delete a device from the list, close provisioning link with the device completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**

Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**

Provisioner set net_idx/flags/iv_index used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**

Provisioner set static oob value used for provisioning completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**

Provisioner set unicast address of primary element completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**

Provisioner read unprovisioned device OOB public key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**

Provisioner input number completion event

enumerator **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**

Provisioner input string completion event

enumerator **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**

Provisioner set node name completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**

Provisioner add local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**

Provisioner update local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**

Provisioner bind local model with local app key completion event

enumerator **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**

Provisioner add local network key completion event

- enumerator **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
Provisioner update local network key completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event
- enumerator **ESP_BLE_MESH_PROVISIONER_DIRECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event
- enumerator **ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event
- enumerator **ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

enumerator **ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**

Set fast provisioning action completion event

enumerator **ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**

Receive Heartbeat message event

enumerator **ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**

Enable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**

Disable Low Power Node completion event

enumerator **ESP_BLE_MESH_LPN_POLL_COMP_EVT**

Low Power Node send Friend Poll completion event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**

Low Power Node establishes friendship event

enumerator **ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**

Low Power Node terminates friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**

Friend Node establishes friendship event

enumerator **ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT**

Friend Node terminates friendship event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT**

Proxy Client connect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT**

Proxy Client disconnect completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT**

Proxy Client set filter type completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**

Proxy Client add filter address completion event

enumerator **ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**

Proxy Client remove filter address completion event

enumerator **ESP_BLE_MESH_PROXY_SERVER_CONNECTED_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP_BLE_MESH_PROXY_SERVER_DISCONNECTED_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model subscribes group address completion event

enumerator **ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**

Local model unsubscribes group address completion event

enumerator **ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP_BLE_MESH_PROV_EVT_MAX**

enum [**anonymous**]

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

Values:

enumerator **ESP_BLE_MESH_SERVER_TRANS_TIMER_START**

enumerator **ESP_BLE_MESH_SERVER_FLAG_MAX**

enum **esp_ble_mesh_server_state_type_t**

This enum value is the type of server model states

Values:

enumerator **ESP_BLE_MESH_GENERIC_ONOFF_STATE**

enumerator **ESP_BLE_MESH_GENERIC_LEVEL_STATE**

enumerator **ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE**

enumerator **ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_HUE_STATE**

enumerator **ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE**

enumerator **ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE**

enumerator **ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE**

enumerator **ESP_BLE_MESH_SERVER_MODEL_STATE_MAX**

enum **esp_ble_mesh_model_cb_event_t**

Values:

enumerator **ESP_BLE_MESH_MODEL_OPERATION_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP_BLE_MESH_MODEL_SEND_COMP_EVT**

User-defined models send messages completion event

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT**

User-defined models publish messages completion event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT**

User-defined client models receive publish messages event

enumerator **ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT**

Server models update state value completion event

enumerator **ESP_BLE_MESH_MODEL_EVT_MAX**

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

ESP-BLE-MESH Stack Initialization

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h`

Functions

`esp_err_t esp_ble_mesh_init` (`esp_ble_mesh_prov_t` *prov, `esp_ble_mesh_comp_t` *comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note: After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

Parameters

- **prov** –[in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –[in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_deinit` (`esp_ble_mesh_deinit_param_t` *param)

De-initialize BLE Mesh module.

Note: This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

Parameters **param** –[in] Pointer to the structure of BLE Mesh deinit parameters.

Returns ESP_OK on success or error code otherwise.

Reading of Local Data Information

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h`

Functions

`int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)`

Get the model publish period, the unit is ms.

Parameters `model` –[in] Model instance pointer.

Returns Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

`uint16_t esp_ble_mesh_get_primary_element_address (void)`

Get the address of the primary element.

Returns Address of the primary element on success, or `ESP_BLE_MESH_ADDR_UNASSIGNED` on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model, uint16_t group_addr)`

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

Parameters

- `model` –[in] Pointer to the model.
- `group_addr` –[in] Group address.

Returns Pointer to the group address within the Subscription List of the model on success, or `NULL` on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to `0x0000` in order to unsubscribe the model from the group.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element (uint16_t element_addr)`

Find the BLE Mesh element pointer via the element address.

Parameters `element_addr` –[in] Element address.

Returns Pointer to the element on success, or `NULL` on failure.

`uint8_t esp_ble_mesh_get_element_count (void)`

Get the number of elements that have been registered.

Returns Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

Parameters

- `element` –[in] Element to which the model belongs.
- `company_id` –[in] A 16-bit company identifier assigned by the Bluetooth SIG.
- `model_id` –[in] A 16-bit vendor-assigned model identifier.

Returns Pointer to the Vendor Model on success, or `NULL` on failure which means the Vendor Model is not found.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *element, uint16_t model_id)`

Find the SIG model with the given element and Model id.

Parameters

- `element` –[in] Element to which the model belongs.
- `model_id` –[in] SIG model identifier.

Returns Pointer to the SIG Model on success, or `NULL` on failure which means the SIG Model is not found.

`const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)`

Get the Composition data which has been registered.

Returns Pointer to the Composition data on success, or `NULL` on failure which means the Composition data is not initialized.

esp_err_t **esp_ble_mesh_model_subscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters

- **element_addr** –[in] Unicast address of the element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The group address to be subscribed.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_unsubscribe_group_addr** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

Note: This function shall not be invoked before node is provisioned or Provisioner is enabled.

Parameters

- **element_addr** –[in] Unicast address of the element to which the model belongs.
- **company_id** –[in] A 16-bit company identifier.
- **model_id** –[in] A 16-bit model identifier.
- **group_addr** –[in] The subscribed group address.

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_node_get_local_net_key** (uint16_t net_idx)

This function is called by Node to get the local NetKey.

Parameters **net_idx** –[in] NetKey index.

Returns NetKey on success, or NULL on failure.

const uint8_t ***esp_ble_mesh_node_get_local_app_key** (uint16_t app_idx)

This function is called by Node to get the local AppKey.

Parameters **app_idx** –[in] AppKey index.

Returns AppKey on success, or NULL on failure.

esp_err_t **esp_ble_mesh_node_add_local_net_key** (const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

Note: This function can only be called after the device is provisioned.

Parameters

- **net_key** –[in] NetKey to be added.
- **net_idx** –[in] NetKey Index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

Note: The `net_idx` must be an existing one. This function can only be called after the device is provisioned.

Parameters

- **app_key** –[in] AppKey to be added.
- **net_idx** –[in] NetKey Index.
- **app_idx** –[in] AppKey Index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_bind_app_key_to_local_model** (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

Note: If going to bind `app_key` with local vendor model, the `company_id` shall be set to 0xFFFF. This function can only be called after the device is provisioned.

Parameters

- **element_addr** –[in] Node local element address
- **company_id** –[in] Node local company id
- **model_id** –[in] Node local model id
- **app_idx** –[in] Node local appkey index

Returns ESP_OK on success or error code otherwise.

Low Power Operation (Updating)

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h`

Functions

esp_err_t **esp_ble_mesh_lpn_enable** (void)

Enable BLE Mesh device LPN functionality.

Note: This API enables LPN functionality. Once called, the proper Friend Request will be sent.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_disable** (bool force)

Disable BLE Mesh device LPN functionality.

Parameters **force** –[in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_lpn_poll** (void)

LPN tries to poll messages from the Friend Node.

Note: The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer

expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

Returns ESP_OK on success or error code otherwise.

Send/Publish Messages, add Local AppKey, etc.

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h`

Functions

esp_err_t **esp_ble_mesh_register_custom_model_callback** (*esp_ble_mesh_model_cb_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

Note: The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

Parameters `callback` –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_msg_opcode_init** (*uint8_t* *data, *uint32_t* opcode)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

Note: This API is only used to set the opcode of the message.

Parameters

- `data` –[in] Pointer to the message data.
- `opcode` –[in] The message opcode.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_init** (*esp_ble_mesh_model_t* *model)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Note: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t_`) of the client model need to be initialized.

Parameters `model` –[in] BLE Mesh Client model to which the message belongs.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_deinit** (*esp_ble_mesh_model_t* *model)

De-initialize the user-defined client model.

Note: This function shall be invoked before `esp_ble_mesh_deinit()` is called.

Parameters **model** –[in] Pointer of the Client model.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_server_model_send_msg** (*esp_ble_mesh_model_t* *model,
esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
 uint16_t length, uint8_t *data)

Send server model messages(such as server model status messages).

Parameters

- **model** –[in] BLE Mesh Server Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of Access Payload (exclude the message opcode) to be sent.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_client_model_send_msg** (*esp_ble_mesh_model_t* *model,
esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode,
 uint16_t length, uint8_t *data, int32_t
 msg_timeout, bool need_rsp,
esp_ble_mesh_dev_role_t device_role)

Send client model message (such as model get, set, etc).

Parameters

- **model** –[in] BLE Mesh Client Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg_timeout** –[in] Time to get response to the message (in milliseconds).
- **need_rsp** –[in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device_role** –[in] Role of the device (Node/Provisioner) that sends the message.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_model_publish** (*esp_ble_mesh_model_t* *model, uint32_t opcode, uint16_t
 length, uint8_t *data, *esp_ble_mesh_dev_role_t* device_role)

Send a model publication message.

Note: Before calling this function, the user needs to ensure that the model publication message (*esp_ble_mesh_model_pub_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Parameters

- **model** –[in] Mesh (client) Model publishing the message.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device_role** –[in] Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_server_model_update_state** (*esp_ble_mesh_model_t* *model,
esp_ble_mesh_server_state_type_t type,
esp_ble_mesh_server_state_value_t *value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note: Currently this API is used to update bound state value, not for all server model states.

Parameters

- **model** –[in] Server model which is going to update the state.
- **type** –[in] Server model state type.
- **value** –[in] Server model state value.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_local_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

Note: All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_node_name** (uint16_t index, const char *name)

This function is called to set the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters

- **index** –[in] Index of the node in the node queue.
- **name** –[in] Name (end by ‘\0’) to be set for the node.

Returns ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_node_name** (uint16_t index)

This function is called to get the node (provisioned device) name.

Note: index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters **index** –[in] Index of the node in the node queue.

Returns Node name on success, or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_node_index** (const char *name)

This function is called to get the node (provisioned device) index.

Parameters **name** –[in] Name of the node (end by ‘\0’).

Returns Node index on success, or an invalid value (0xFFFF) on failure.

esp_err_t **esp_ble_mesh_provisioner_store_node_comp_data** (uint16_t unicast_addr, uint8_t
*data, uint16_t length)

This function is called to store the Composition Data of the node.

Parameters

- **unicast_addr** –[in] Element address of the node
- **data** –[in] Pointer of Composition Data
- **length** –[in] Length of Composition Data

Returns ESP_OK on success or error code otherwise.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_uuid** (const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

Parameters **uuid** –[in] Device UUID of the node

Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_addr** (uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

Parameters **unicast_addr** –[in] Unicast address of the node

Returns Pointer of the node info struct or NULL on failure.

esp_ble_mesh_node_t ***esp_ble_mesh_provisioner_get_node_with_name** (const char *name)

This function is called to get the provisioned node information with the node name.

Parameters **name** –[in] Name of the node (end by ‘\0’).

Returns Pointer of the node info struct or NULL on failure.

uint16_t **esp_ble_mesh_provisioner_get_prov_node_count** (void)

This function is called by Provisioner to get provisioned node count.

Returns Number of the provisioned nodes.

const *esp_ble_mesh_node_t* ****esp_ble_mesh_provisioner_get_node_table_entry** (void)

This function is called by Provisioner to get the entry of the node table.

Note: After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t **node)` is NULL. For example: `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ... } }`

Returns Pointer to the start of the node table.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_uuid** (const uint8_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

Parameters **uuid** –[in] Device UUID of the node

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_node_with_addr** (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

Parameters **unicast_addr** –[in] Unicast address of the node

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_app_key** (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

Note: `app_key`: If set to NULL, `app_key` will be generated internally. `net_idx`: Should be an existing one. `app_idx`: If it is going to be generated internally, it should be set to 0xFFFF, and the new `app_idx` will be

reported via an event.

Parameters

- **app_key** –[in] The app key to be set for the local BLE Mesh stack.
- **net_idx** –[in] The network key index.
- **app_idx** –[in] The app key index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_app_key** (const uint8_t app_key[16],
uint16_t net_idx, uint16_t
app_idx)

This function is used to update a local AppKey for Provisioner.

Parameters

- **app_key** –[in] Value of the AppKey.
- **net_idx** –[in] Corresponding NetKey Index.
- **app_idx** –[in] The AppKey Index

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_provisioner_get_local_app_key** (uint16_t net_idx, uint16_t
app_idx)

This function is called by Provisioner to get the local app key value.

Parameters

- **net_idx** –[in] Network key index.
- **app_idx** –[in] Application key index.

Returns App key on success, or NULL on failure.

esp_err_t **esp_ble_mesh_provisioner_bind_app_key_to_local_model** (uint16_t element_addr,
uint16_t app_idx,
uint16_t model_id,
uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note: company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Parameters

- **element_addr** –[in] Provisioner local element address
- **app_idx** –[in] Provisioner local appkey index
- **model_id** –[in] Provisioner local model id
- **company_id** –[in] Provisioner local company id

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_local_net_key** (const uint8_t net_key[16], uint16_t
net_idx)

This function is called by Provisioner to add local network key.

Note: net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Parameters

- **net_key** –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- **net_idx** –[in] The network key index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_update_local_net_key** (const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Parameters

- **net_key** –[in] Value of the NetKey.
- **net_idx** –[in] The NetKey Index.

Returns ESP_OK on success or error code otherwise.

const uint8_t ***esp_ble_mesh_provisioner_get_local_net_key** (uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Parameters **net_idx** –[in] Network key index.

Returns Network key on success, or NULL on failure.

esp_err_t **esp_ble_mesh_provisioner_recv_heartbeat** (bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note: If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Parameters **enable** –[in] Enable or disable receiving heartbeat messages.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_type** (uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

Note: 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

- a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
-

Parameters **type** –[in] Heartbeat filter type (acceptlist or rejectlist).

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_heartbeat_filter_info** (uint8_t op,
esp_ble_mesh_heartbeat_filter_info_t
*info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- a. If the operation is “REMOVE” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
 - The filter entry with the same SRC or DST will be removed.
-

Note: 1. If the operation is “ADD” , the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
- If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.

- If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.
-

Parameters

- **op** –[in] Add or REMOVE
- **info** –[in] Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_direct_erase_settings** (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note: This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_index** (uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **index** –[in] Settings index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_open_settings_with_uid** (const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Parameters **uid** –[in] Settings user id.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_index** (uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.

- When the function is invoked, the Provisioner functionality will be disabled firstly, and:
 - If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
 - If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
 - If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
 - The working process shall be as following:
 - Open settings A
 - Start to provision and control nodes
 - Close settings A
 - Open settings B
 - Start to provision and control other nodes
 - Close settings B
 - g)
-

Parameters

- **index** –[in] Settings index.
 - **erase** –[in] Indicate if erasing mesh information.
-

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_close_settings_with_uid** (const char *uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
 - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
 - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
- b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
- c. The working process shall be as following:
 - a) Open settings A
 - b) Start to provision and control nodes
 - c) Close settings A
 - d) Open settings B
 - e) Start to provision and control other nodes
 - f) Close settings B
 - g)

Parameters

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_index** (uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Parameters **index** –[in] Settings index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_settings_with_uid** (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note: When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Parameters **uid** –[in] Settings user id.

Returns ESP_OK on success or error code otherwise.

const char ***esp_ble_mesh_provisioner_get_settings_uid** (uint8_t index)

This function is called by Provisioner to get settings user id.

Parameters **index** –[in] Settings index.

Returns Setting user id on success or NULL on failure.

uint8_t **esp_ble_mesh_provisioner_get_settings_index** (const char *uid)

This function is called by Provisioner to get settings index.

Parameters **uid** –[in] Settings user id.

Returns Settings index.

`uint8_t esp_ble_mesh_provisioner_get_free_settings_count` (void)

This function is called by Provisioner to get the number of free settings user id.

Returns Number of free settings user id.

`const uint8_t *esp_ble_mesh_get_fast_prov_app_key` (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

Parameters

- **net_idx** –[in] Network key index.
- **app_idx** –[in] Application key index.

Returns Application key on success, or NULL on failure.

Type Definitions

`typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,
esp_ble_mesh_model_cb_param_t *param)`

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h`

Functions

`esp_err_t esp_ble_mesh_register_prov_callback` (esp_ble_mesh_prov_cb_t callback)

Register BLE Mesh provisioning callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

`bool esp_ble_mesh_node_is_provisioned` (void)

Check if a device has been provisioned.

Returns TRUE if the device is provisioned, FALSE if the device is unprovisioned.

`esp_err_t esp_ble_mesh_node_prov_enable` (esp_ble_mesh_prov_bearer_t bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

Note: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Parameters **bearers** –Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_prov_disable` (esp_ble_mesh_prov_bearer_t bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Parameters **bearers** –Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_node_set_oob_pub_key` (uint8_t pub_key_x[32], uint8_t pub_key_y[32],
uint8_t private_key[32])

Unprovisioned device set own oob public key & private key pair.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as

an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Parameters

- **pub_key_x** –[in] Unprovisioned device's Public Key X
- **pub_key_y** –[in] Unprovisioned device's Public Key Y
- **private_key** –[in] Unprovisioned device's Private Key

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_number** (uint32_t number)

Provide provisioning input OOB number.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Parameters **number** –[in] Number input by device.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_node_input_string** (const char *string)

Provide provisioning input OOB string.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Parameters **string** –[in] String input by device.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_unprovisioned_device_name** (const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

Note: This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

Parameters **name** –[in] Unprovisioned device name

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_read_oob_pub_key** (uint8_t link_idx, uint8_t pub_key_x[32],
uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device's oob public key.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

Parameters

- **link_idx** –[in] The provisioning link index
- **pub_key_x** –[in] Unprovisioned device's Public Key X
- **pub_key_y** –[in] Unprovisioned device's Public Key Y

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_string** (const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

```

This is intended to be called after the esp_ble_mesh_prov_t prov_
↪input_num
callback has been called with ESP_BLE_MESH_ENTER_STRING as the_
↪action.

```

Parameters

- **string** –[in] String input by Provisioner.
- **link_idx** –[in] The provisioning link index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_input_number** (uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

```

This is intended to be called after the esp_ble_mesh_prov_t prov_
↪input_num
callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the_
↪action.

```

Parameters

- **number** –[in] Number input by Provisioner.
- **link_idx** –[in] The provisioning link index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_enable** (*esp_ble_mesh_prov_bearer_t* bearers)

Enable one or more provisioning bearers.

Note: PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

Parameters **bearers** –[in] Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_prov_disable** (*esp_ble_mesh_prov_bearer_t* bearers)

Disable one or more provisioning bearers.

Note: PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

Parameters **bearers** –[in] Bit-wise OR of provisioning bearers.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_add_unprov_dev** (*esp_ble_mesh_unprov_dev_add_t* *add_dev, *esp_ble_mesh_dev_add_flag_t* flags)

Add unprovisioned device info to the unprov_dev queue.

Note: : 1. Currently address type only supports public address and static random address.

- a. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
- b. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
 - In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
- c. Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
 - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
 - Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters

- **add_dev** – [in] Pointer to a struct containing the device information
- **flags** – [in] Flags indicate several operations on the device information
 - Remove device information from queue after device has been provisioned (BIT0)
 - Start provisioning immediately after device is added to queue (BIT1)
 - Device can be removed if device queue is full (BIT2)

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr (const uint8_t uuid[16],
                                                         esp_ble_mesh_bd_addr_t addr,
                                                         esp_ble_mesh_addr_type_t
                                                         addr_type,
                                                         esp_ble_mesh_prov_bearer_t
                                                         bearer, uint16_t oob_info,
                                                         uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Note : 1. Currently address type only supports public address and static random address.

- a. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
- b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

- c. Recommend to use only one of the functions “`esp_ble_mesh_provisioner_add_unprov_dev`” and “`esp_ble_mesh_provisioner_prov_device_with_addr`” by a Provisioner.

Parameters

- **uuid** –[in] Device UUID of the unprovisioned device
- **addr** –[in] Device address of the unprovisioned device
- **addr_type** –[in] Device address type of the unprovisioned device
- **bearer** –[in] Provisioning bearer going to be used by Provisioner
- **oob_info** –[in] OOB info of the unprovisioned device
- **unicast_addr** –[in] Unicast address going to be allocated for the unprovisioned device

Returns Zero on success or (negative) error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_delete_dev** (*esp_ble_mesh_device_delete_t* *del_dev)

Delete device from queue, and reset current provisioning link with the device.

Note: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Parameters **del_dev** –[in] Pointer to a struct containing the device information.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_dev_uuid_match** (const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Parameters

- **match_val** –[in] Value to be compared with the part of the device UUID.
- **match_len** –[in] Length of the compared match value.
- **offset** –[in] Offset of the device UUID to be compared (based on zero).
- **prov_after_match** –[in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_prov_data_info** (*esp_ble_mesh_prov_data_info_t* *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

Parameters **prov_data_info** –[in] Pointer to a struct containing net_idx or flags or iv_index.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_static_oob_value** (const uint8_t *value, uint8_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note: The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a

brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Parameters

- **value** –[in] Pointer to the static oob value.
- **length** –[in] Length of the static oob value.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_provisioner_set_primary_elem_addr** (uint16_t addr)

This function is called by Provisioner to set own Primary element address.

Note: This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Parameters **addr** –[in] Unicast address of the Primary element of Provisioner.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_info** (*esp_ble_mesh_fast_prov_info_t* *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

Parameters **fast_prov_info** –[in] Pointer to a struct containing unicast address range, net_idx, etc.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_set_fast_prov_action** (*esp_ble_mesh_fast_prov_action_t* action)

This function is called to start/suspend/exit fast provisioning.

Parameters **action** –[in] fast provisioning action (i.e. enter, suspend, exit).

Returns ESP_OK on success or error code otherwise.

Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,  
esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const  
esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,  
esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

Param **addr** [in] Pointer to the unprovisioned device address.

Param **addr_type** [in] Unprovisioned device address type.

Param **adv_type** [in] Adv packet type(ADV_IND or ADV_NONCONN_IND).

Param **dev_uuid** [in] Unprovisioned device UUID pointer.

Param **oob_info** [in] OOB information of the unprovisioned device.

Param **bearer** [in] Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h`

Functions

`esp_err_t esp_ble_mesh_proxy_identity_enable` (void)

Enable advertising with Node Identity.

Note: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable` (void)

Enable BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable` (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_connect` (`esp_ble_mesh_bd_addr_t` addr,
`esp_ble_mesh_addr_type_t` addr_type, `uint16_t`
`net_idx`)

Proxy Client creates a connection with the Proxy Server.

Parameters

- **addr** –[in] Device address of the Proxy Server.
- **addr_type** –[in] Device address type(public or static random).
- **net_idx** –[in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_disconnect` (`uint8_t` conn_handle)

Proxy Client terminates a connection with the Proxy Server.

Parameters **conn_handle** –[in] Proxy connection handle.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_set_filter_type` (`uint8_t` conn_handle, `uint16_t` net_idx,
`esp_ble_mesh_proxy_filter_type_t`
`filter_type`)

Proxy Client sets the filter type of the Proxy Server.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **filter_type** –[in] whitelist or blacklist.

Returns ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_add_filter_addr` (`uint8_t` conn_handle, `uint16_t` net_idx,
`uint16_t` *addr, `uint16_t` addr_num)

Proxy Client adds address to the Proxy Server filter list.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_proxy_client_remove_filter_addr** (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

Parameters

- **conn_handle** –[in] Proxy connection handle.
- **net_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr_num** –[in] Number of the filter address.

Returns ESP_OK on success or error code otherwise.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_config_client_callback** (*esp_ble_mesh_cfg_client_cb_t* callback)

Register BLE Mesh Config Client Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_config_server_callback** (*esp_ble_mesh_cfg_server_cb_t* callback)

Register BLE Mesh Config Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_config_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_cfg_client_get_state_t* *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_config_client_set_state (esp_ble_mesh_client_common_param_t
                                             *params, esp_ble_mesh_cfg_client_set_state_t
                                             *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

Structures

struct **esp_ble_mesh_cfg_srv**

Configuration Server Model context

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Configuration Server Model

uint8_t **net_transmit**

Network Transmit state

uint8_t **relay**

Relay Mode state

uint8_t **relay_retransmit**

Relay Retransmit state

uint8_t **beacon**

Secure Network Beacon state

uint8_t **gatt_proxy**

GATT Proxy state

uint8_t **friend_state**

Friend state

uint8_t **default_ttl**

Default TTL

struct k_delayed_work **timer**

Heartbeat Publication timer

uint16_t **dst**

Destination address for Heartbeat messages

uint16_t **count**

Number of Heartbeat messages to be sent

Number of Heartbeat messages received

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t **net_idx**

NetKey Index used by Heartbeat Publication

struct *esp_ble_mesh_cfg_srv*::[anonymous] **heartbeat_pub**

Heartbeat Publication

int64_t **expiry**

Timestamp when Heartbeat subscription period is expired

uint16_t **src**

Source address for Heartbeat messages

uint8_t **min_hops**

Minimum hops when receiving Heartbeat messages

uint8_t **max_hops**

Maximum hops when receiving Heartbeat messages

esp_ble_mesh_cb_t **heartbeat_recv_cb**

Optional heartbeat subscription tracking function

struct *esp_ble_mesh_cfg_srv::*[anonymous] **heartbeat_sub**

Heartbeat Subscription

struct **esp_ble_mesh_cfg_composition_data_get_t**

Parameters of Config Composition Data Get.

Public Members

uint8_t **page**

Page number of the Composition Data.

struct **esp_ble_mesh_cfg_model_pub_get_t**

Parameters of Config Model Publication Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_sig_model_sub_get_t**

Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

struct **esp_ble_mesh_cfg_vnd_model_sub_get_t**
Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t **element_addr**
The element address

uint16_t **model_id**
The model id

uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_app_key_get_t**
Parameters of Config AppKey Get.

Public Members

uint16_t **net_idx**
The network key index

struct **esp_ble_mesh_cfg_node_identity_get_t**
Parameters of Config Node Identity Get.

Public Members

uint16_t **net_idx**
The network key index

struct **esp_ble_mesh_cfg_sig_model_app_get_t**
Parameters of Config SIG Model App Get.

Public Members

uint16_t **element_addr**
The element address

uint16_t **model_id**
The model id

struct **esp_ble_mesh_cfg_vnd_model_app_get_t**
Parameters of Config Vendor Model App Get.

Public Members**uint16_t element_addr**

The element address

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_get_t**

Parameters of Config Key Refresh Phase Get.

Public Members**uint16_t net_idx**

The network key index

struct **esp_ble_mesh_cfg_lpn_polltimeout_get_t**

Parameters of Config Low Power Node PollTimeout Get.

Public Members**uint16_t lpn_addr**

The unicast address of the Low Power node

struct **esp_ble_mesh_cfg_beacon_set_t**

Parameters of Config Beacon Set.

Public Members**uint8_t beacon**

New Secure Network Beacon state

struct **esp_ble_mesh_cfg_default_ttl_set_t**

Parameters of Config Default TTL Set.

Public Members**uint8_t ttl**

The default TTL state value

struct **esp_ble_mesh_cfg_friend_set_t**

Parameters of Config Friend Set.

Public Members

uint8_t **friend_state**

The friend state value

struct **esp_ble_mesh_cfg_gatt_proxy_set_t**

Parameters of Config GATT Proxy Set.

Public Members

uint8_t **gatt_proxy**

The GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_set_t**

Parameters of Config Relay Set.

Public Members

uint8_t **relay**

The relay value

uint8_t **relay_retransmit**

The relay retransmit value

struct **esp_ble_mesh_cfg_net_key_add_t**

Parameters of Config NetKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_app_key_add_t**

Parameters of Config AppKey Add.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_model_app_bind_t**

Parameters of Config Model App Bind.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_app_idx**

Index of the app key to bind with the model

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_set_t**

Parameters of Config Model Publication Set.

Public Members

uint16_t **element_addr**

The element address

uint16_t **publish_addr**

Value of the publish address

uint16_t **publish_app_idx**

Index of the application key

bool **cred_flag**

Value of the Friendship Credential Flag

uint8_t **publish_ttl**

Default TTL value for the publishing messages

uint8_t **publish_period**

Period for periodic status publishing

uint8_t **publish_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_add_t**

Parameters of Config Model Subscription Add.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_t**

Parameters of Config Model Subscription Delete.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_overwrite_t**

Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t **element_addr**

The element address

uint16_t **sub_addr**

The address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_add_t**

Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_delete_t**

Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t **element_addr**

The element address

uint8_t **label_uuid**[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_va_overwrite_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_pub_va_set_t**

Parameters of Config Model Publication Virtual Address Set.

Public Members**uint16_t element_addr**

The element address

uint8_t label_uuid[16]

Value of the Label UUID publish address

uint16_t publish_app_idx

Index of the application key

bool cred_flag

Value of the Friendship Credential Flag

uint8_t publish_ttl

Default TTL value for the publishing messages

uint8_t publish_period

Period for periodic status publishing

uint8_t publish_retransmit

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_model_sub_delete_all_t**

Parameters of Config Model Subscription Delete All.

Public Members

uint16_t **element_addr**

The element address

uint16_t **model_id**

The model id

uint16_t **company_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_net_key_update_t**

Parameters of Config NetKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint8_t **net_key**[16]

The network key value

struct **esp_ble_mesh_cfg_net_key_delete_t**

Parameters of Config NetKey Delete.

Public Members

uint16_t **net_idx**

The network key index

struct **esp_ble_mesh_cfg_app_key_update_t**

Parameters of Config AppKey Update.

Public Members

uint16_t **net_idx**

The network key index

uint16_t **app_idx**

The app key index

uint8_t **app_key**[16]

The app key value

struct **esp_ble_mesh_cfg_app_key_delete_t**

Parameters of Config AppKey Delete.

Public Members**uint16_t net_idx**

The network key index

uint16_t app_idx

The app key index

struct **esp_ble_mesh_cfg_node_identity_set_t**

Parameters of Config Node Identity Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t identity

New Node Identity state

struct **esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

Public Members**uint16_t element_addr**

The element address

uint16_t model_app_idx

Index of the app key to bind with the model

uint16_t model_id

The model id

uint16_t company_id

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

Public Members**uint16_t net_idx**

The network key index

uint8_t transition

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_net_transmit_set_t**

Parameters of Config Network Transmit Set.

Public Members

uint8_t **net_transmit**

Network Transmit State

struct **esp_ble_mesh_cfg_heartbeat_pub_set_t**

Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **count**

Number of Heartbeat messages to be sent

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16_t **net_idx**

NetKey Index

struct **esp_ble_mesh_cfg_heartbeat_sub_set_t**

Parameters of Config Model Heartbeat Subscription Set.

Public Members

uint16_t **src**

Source address for Heartbeat messages

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **period**

Period for receiving Heartbeat messages

struct **esp_ble_mesh_cfg_beacon_status_cb_t**

Parameter of Config Beacon Status

Public Members**uint8_t beacon**

Secure Network Beacon state value

struct **esp_ble_mesh_cfg_comp_data_status_cb_t**

Parameters of Config Composition Data Status

Public Members**uint8_t page**

Page number of the Composition Data

struct net_buf_simple ***composition_data**

Pointer to Composition Data for the identified page

struct **esp_ble_mesh_cfg_default_ttl_status_cb_t**

Parameter of Config Default TTL Status

Public Members**uint8_t default_ttl**

Default TTL state value

struct **esp_ble_mesh_cfg_gatt_proxy_status_cb_t**

Parameter of Config GATT Proxy Status

Public Members**uint8_t gatt_proxy**

GATT Proxy state value

struct **esp_ble_mesh_cfg_relay_status_cb_t**

Parameters of Config Relay Status

Public Members**uint8_t relay**

Relay state value

uint8_t retransmit

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp_ble_mesh_cfg_model_pub_status_cb_t**

Parameters of Config Model Publication Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t publish_addr

Value of the publish address

uint16_t app_idx

Index of the application key

bool cred_flag

Value of the Friendship Credential Flag

uint8_t ttl

Default TTL value for the outgoing messages

uint8_t period

Period for periodic status publishing

uint8_t transmit

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id

Company ID

uint16_t model_id

Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t

Parameters of Config Model Subscription Status

Public Members**uint8_t status**

Status Code for the request message

uint16_t element_addr

Address of the element

uint16_t sub_addr

Value of the address

uint16_t company_id

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_net_key_status_cb_t**

Parameters of Config NetKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_app_key_status_cb_t**

Parameters of Config AppKey Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **net_idx**

Index of the NetKey

uint16_t **app_idx**

Index of the application key

struct **esp_ble_mesh_cfg_mod_app_status_cb_t**

Parameters of Config Model App Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **element_addr**

Address of the element

uint16_t **app_idx**

Index of the application key

uint16_t **company_id**

Company ID

uint16_t **model_id**

Model ID

struct **esp_ble_mesh_cfg_friend_status_cb_t**

Parameter of Config Friend Status

Public Members

uint8_t **friend_state**

Friend state value

struct **esp_ble_mesh_cfg_hb_pub_status_cb_t**

Parameters of Config Heartbeat Publication Status

Public Members

uint8_t **status**

Status Code for the request message

uint16_t **dst**

Destination address for Heartbeat messages

uint8_t **count**

Number of Heartbeat messages remaining to be sent

uint8_t **period**

Period for sending Heartbeat messages

uint8_t **ttl**

TTL to be used when sending Heartbeat messages

uint16_t **features**

Features that trigger Heartbeat messages when changed

uint16_t **net_idx**

Index of the NetKey

struct **esp_ble_mesh_cfg_hb_sub_status_cb_t**

Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t **status**

Status Code for the request message

`uint16_t src`

Source address for Heartbeat messages

`uint16_t dst`

Destination address for Heartbeat messages

`uint8_t period`

Remaining Period for processing Heartbeat messages

`uint8_t count`

Number of Heartbeat messages received

`uint8_t min_hops`

Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`

Maximum hops when receiving Heartbeat messages

struct `esp_ble_mesh_cfg_net_trans_status_cb_t`

Parameters of Config Network Transmit Status

Public Members

`uint8_t net_trans_count`

Number of transmissions for each Network PDU originating from the node

`uint8_t net_trans_step`

Maximum hops when receiving Heartbeat messages

struct `esp_ble_mesh_cfg_model_sub_list_cb_t`

Parameters of Config SIG/Vendor Subscription List

Public Members

`uint8_t status`

Status Code for the request message

`uint16_t element_addr`

Address of the element

`uint16_t company_id`

Company ID

`uint16_t model_id`

Model ID

```
struct net_buf_simple *sub_addr
```

A block of all addresses from the Subscription List

```
struct esp_ble_mesh_cfg_net_key_list_cb_t
```

Parameter of Config NetKey List

Public Members

```
struct net_buf_simple *net_idx
```

A list of NetKey Indexes known to the node

```
struct esp_ble_mesh_cfg_app_key_list_cb_t
```

Parameters of Config AppKey List

Public Members

```
uint8_t status
```

Status Code for the request message

```
uint16_t net_idx
```

NetKey Index of the NetKey that the AppKeys are bound to

```
struct net_buf_simple *app_idx
```

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

```
struct esp_ble_mesh_cfg_node_id_status_cb_t
```

Parameters of Config Node Identity Status

Public Members

```
uint8_t status
```

Status Code for the request message

```
uint16_t net_idx
```

Index of the NetKey

```
uint8_t identity
```

Node Identity state

```
struct esp_ble_mesh_cfg_model_app_list_cb_t
```

Parameters of Config SIG/Vendor Model App List

Public Members

```
uint8_t status
```

Status Code for the request message

uint16_t **element_addr**
Address of the element

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

struct net_buf_simple ***app_idx**
All AppKey indexes bound to the Model

struct **esp_ble_mesh_cfg_kr_phase_status_cb_t**
Parameters of Config Key Refresh Phase Status

Public Members

uint8_t **status**
Status Code for the request message

uint16_t **net_idx**
Index of the NetKey

uint8_t **phase**
Key Refresh Phase state

struct **esp_ble_mesh_cfg_lpn_pollto_status_cb_t**
Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t **lpn_addr**
The unicast address of the Low Power node

int32_t **poll_timeout**
The current value of the PollTimeout timer of the Low Power node

struct **esp_ble_mesh_cfg_client_cb_param_t**
Configuration Client Model callback parameters

Public Members

int **error_code**
Appropriate error code

esp_ble_mesh_client_common_param_t *params

The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb

The config status message callback values

struct **esp_ble_mesh_state_change_cfg_mod_pub_set_t**

Configuration Server model related context.

Public Members

uint8_t **kr_phase**

New Key Refresh Phase Transition

struct **esp_ble_mesh_cfg_server_cb_param_t**

Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the server model structure

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received message

esp_ble_mesh_cfg_server_cb_value_t **value**

Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)

Define a new Config Server Model.

Note: The Config Server Model can only be included by a Primary Element.

Parameters

- **srv_data** –Pointer to a unique Config Server Model user_data.

Returns New Config Server Model instance.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)

Define a new Config Client Model.

Note: The Config Client Model can only be included by a Primary Element.

Parameters

- **cli_data** –Pointer to a unique struct *esp_ble_mesh_client_t*.

Returns New Config Client Model instance.

Type Definitions

typedef struct *esp_ble_mesh_cfg_srv* **esp_ble_mesh_cfg_srv_t**

Configuration Server Model context

typedef void (***esp_ble_mesh_cfg_client_cb_t**)(*esp_ble_mesh_cfg_client_cb_event_t* event,
esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,  
esp_ble_mesh_cfg_server_cb_param_t *param)
```

Configuration Server Model callback function type.

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

Values:

```
enumerator ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
```

```
enumerator ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
```

```
enumerator ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
```

```
enumerator ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
```

```
enumerator ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
```

```
enum esp_ble_mesh_cfg_server_cb_event_t
```

This enum value is the event of Configuration Server model

Values:

```
enumerator ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
```

```
enumerator ESP_BLE_MESH_CFG_SERVER_EVT_MAX
```

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

```
esp_err_t esp_ble_mesh_register_health_client_callback (esp_ble_mesh_health_client_cb_t  
callback)
```

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_health_server_callback (esp_ble_mesh_health_server_cb_t  
callback)
```

Register BLE Mesh Health Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_health_client_get_state (esp_ble_mesh_client_common_param_t
                                             *params, esp_ble_mesh_health_client_get_state_t
                                             *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_health_client_set_state (esp_ble_mesh_client_common_param_t
                                             *params, esp_ble_mesh_health_client_set_state_t
                                             *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

Parameters **element** –[in] The element to which the Health Server Model belongs.

Returns ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_health_client_get_state_t**

`#include <esp_ble_mesh_health_model_api.h>` For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

Public Members

`esp_ble_mesh_health_fault_get_t` **fault_get**

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union **esp_ble_mesh_health_client_set_state_t**

Structures

struct **esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t **fault_clear**

Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t **fault_test**

Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t **attention_on**

Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t **attention_off**

Health attention off callback. Initialized by the stack.

struct **esp_ble_mesh_health_test_t**

ESP BLE Mesh Health Server test Context

Public Members

uint8_t **id_count**

Number of Health self-test ID

const uint8_t ***test_ids**

Array of Health self-test IDs

uint16_t **company_id**

Company ID used to identify the Health Fault state

uint8_t **prev_test_id**

Current test ID of the health fault test

uint8_t **current_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]

Array of current faults

uint8_t **registered_faults**[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]

Array of registered faults

struct **esp_ble_mesh_health_srv_t**
ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t ***model**
Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t **health_cb**
Health callback struct

struct k_delayed_work **attention_timer**
Attention Timer state

bool **attention_timer_start**
Attention Timer start flag

esp_ble_mesh_health_test_t **health_test**
Health Server fault test

struct **esp_ble_mesh_health_fault_get_t**
Parameter of Health Fault Get

Public Members

uint16_t **company_id**
Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_set_t**
Parameter of Health Attention Set

Public Members

uint8_t **attention**
Value of the Attention Timer state

struct **esp_ble_mesh_health_period_set_t**
Parameter of Health Period Set

Public Members

uint8_t **fast_period_divisor**
Divider for the Publish Period

struct **esp_ble_mesh_health_fault_test_t**
Parameter of Health Fault Test

Public Members**uint16_t company_id**

Bluetooth assigned 16-bit Company ID

uint8_t test_id

ID of a specific test to be performed

struct **esp_ble_mesh_health_fault_clear_t**

Parameter of Health Fault Clear

Public Members**uint16_t company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_current_status_cb_t**

Parameters of Health Current Status

Public Members**uint8_t test_id**

ID of a most recently performed test

uint16_t company_id

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_fault_status_cb_t**

Parameters of Health Fault Status

Public Members**uint8_t test_id**

ID of a most recently performed test

uint16_t company_id

Bluetooth assigned 16-bit Company ID

struct net_buf_simple ***fault_array**

FaultArray field contains a sequence of 1-octet fault values

struct **esp_ble_mesh_health_period_status_cb_t**

Parameter of Health Period Status

Public Members

uint8_t **fast_period_divisor**

Divider for the Publish Period

struct **esp_ble_mesh_health_attention_status_cb_t**

Parameter of Health Attention Status

Public Members

uint8_t **attention**

Value of the Attention Timer state

struct **esp_ble_mesh_health_client_cb_param_t**

Health Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t **status_cb**

The health message status callback values

struct **esp_ble_mesh_health_fault_update_comp_cb_t**

Parameter of publishing Health Current Status completion event

Public Members

int **error_code**

The result of publishing Health Current Status

esp_ble_mesh_elem_t ***element**

Pointer to the element which contains the Health Server Model

struct **esp_ble_mesh_health_fault_clear_cb_t**

Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_fault_test_cb_t**

Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint8_t **test_id**

ID of a specific test to be performed

uint16_t **company_id**

Bluetooth assigned 16-bit Company ID

struct **esp_ble_mesh_health_attention_on_cb_t**

Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

uint8_t **time**

Duration of attention timer on (in seconds)

struct **esp_ble_mesh_health_attention_off_cb_t**

Parameter of Health Attention Off event

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Health Server Model

Macros

ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)

Define a new Health Server Model.

Note: The Health Server Model can only be included by a Primary Element.

Parameters

- **srv** –Pointer to the unique struct *esp_ble_mesh_health_srv_t*.
- **pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.

Returns New Health Server Model instance.

ESP_BLE_MESH_HEALTH_CLI (*cli_data*)

Define a new Health Client Model.

Note: This API needs to be called for each element on which the application needs to have a Health Client Model.

Parameters

- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Health Client Model instance.

ESP_BLE_MESH_HEALTH_PUB_DEFINE (*_name*, *_max*, *_role*)

A helper to define a health publication context

Parameters

- **_name** –Name given to the publication context variable.
- **_max** –Maximum number of faults the element can have.
- **_role** –Role of the device which contains the model.

ESP_BLE_MESH_HEALTH_STANDARD_TEST

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

ESP_BLE_MESH_NO_FAULT

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Generic Client/Server Models

Header File

- [components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h](#)

Functions

esp_err_t **esp_ble_mesh_register_generic_client_callback** (*esp_ble_mesh_generic_client_cb_t* callback)

Register BLE Mesh Generic Client Model callback.

Parameters *callback* –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_generic_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_generic_client_get_state_t* *get_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to generic get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_generic_client_set_state (esp_ble_mesh_client_common_param_t
                                                *params,
                                                esp_ble_mesh_generic_client_set_state_t
                                                *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to generic set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_generic_server_callback (esp_ble_mesh_generic_server_cb_t
                                                         callback)
```

Register BLE Mesh Generic Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_generic_client_get_state_t**

Structures

struct **esp_ble_mesh_gen_onoff_set_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint8_t **onoff**

Target value of Generic OnOff state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_level_set_t**

Parameters of Generic Level Set.

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **level**

Target value of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_delta_set_t**

Parameters of Generic Delta Set.

Public Members**bool op_en**

Indicate if optional parameters are included

int32_t level

Delta change of Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_move_set_t**

Parameters of Generic Move Set.

Public Members**bool op_en**

Indicate if optional parameters are included

int16_t delta_level

Delta Level step to calculate Move speed for Generic Level state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set.

Public Members**uint8_t trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set.

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_set_t**

Parameters of Generic Power Level Set.

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_gen_power_default_set_t**

Parameter of Generic Power Default Set.

Public Members**uint16_t power**

The value of the Generic Power Default state

struct **esp_ble_mesh_gen_power_range_set_t**

Parameters of Generic Power Range Set.

Public Members**uint16_t range_min**

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_loc_global_set_t**

Parameters of Generic Location Global Set.

Public Members

`int32_t global_latitude`

Global Coordinates (Latitude)

`int32_t global_longitude`

Global Coordinates (Longitude)

`int16_t global_altitude`

Global Altitude

struct `esp_ble_mesh_gen_loc_local_set_t`

Parameters of Generic Location Local Set.

Public Members

`int16_t local_north`

Local Coordinates (North)

`int16_t local_east`

Local Coordinates (East)

`int16_t local_altitude`

Local Altitude

`uint8_t floor_number`

Floor Number

`uint16_t uncertainty`

Uncertainty

struct `esp_ble_mesh_gen_user_property_get_t`

Parameter of Generic User Property Get.

Public Members

`uint16_t property_id`

Property ID identifying a Generic User Property

struct `esp_ble_mesh_gen_user_property_set_t`

Parameters of Generic User Property Set.

Public Members

`uint16_t property_id`

Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**

Raw value for the User Property

struct **esp_ble_mesh_gen_admin_property_get_t**

Parameter of Generic Admin Property Get.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_gen_admin_property_set_t**

Parameters of Generic Admin Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_gen_manufacturer_property_get_t**

Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_gen_manufacturer_property_set_t**

Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access

struct **esp_ble_mesh_gen_client_properties_get_t**

Parameter of Generic Client Properties Get.

Public Members**uint16_t property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_gen_onoff_status_cb_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t present_onoff

Current value of Generic OnOff state

uint8_t target_onoff

Target value of Generic OnOff state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_level_status_cb_t**

Parameters of Generic Level Status.

Public Members**bool op_en**

Indicate if optional parameters are included

int16_t present_level

Current value of Generic Level state

int16_t target_level

Target value of the Generic Level state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_def_trans_time_status_cb_t**

Parameter of Generic Default Transition Time Status.

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_status_cb_t**

Parameter of Generic OnPowerUp Status.

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_status_cb_t**

Parameters of Generic Power Level Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_power**

Current value of Generic Power Actual state

uint16_t **target_power**

Target value of Generic Power Actual state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_gen_power_last_status_cb_t**

Parameter of Generic Power Last Status.

Public Members

uint16_t **power**

The value of the Generic Power Last state

struct **esp_ble_mesh_gen_power_default_status_cb_t**

Parameter of Generic Power Default Status.

Public Members

uint16_t **power**

The value of the Generic Default Last state

struct **esp_ble_mesh_gen_power_range_status_cb_t**

Parameters of Generic Power Range Status.

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of Range Min field of Generic Power Range state

uint16_t **range_max**

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_gen_battery_status_cb_t**

Parameters of Generic Battery Status.

Public Members

uint32_t **battery_level**

Value of Generic Battery Level state

uint32_t **time_to_discharge**

Value of Generic Battery Time to Discharge state

uint32_t **time_to_charge**

Value of Generic Battery Time to Charge state

uint32_t **flags**

Value of Generic Battery Flags state

struct **esp_ble_mesh_gen_loc_global_status_cb_t**

Parameters of Generic Location Global Status.

Public Members

int32_t **global_latitude**

Global Coordinates (Latitude)

int32_t **global_longitude**

Global Coordinates (Longitude)

int16_t **global_altitude**

Global Altitude

struct **esp_ble_mesh_gen_loc_local_status_cb_t**

Parameters of Generic Location Local Status.

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct **esp_ble_mesh_gen_user_properties_status_cb_t**

Parameter of Generic User Properties Status.

Public Membersstruct net_buf_simple ***property_ids**

Buffer contains a sequence of N User Property IDs

struct **esp_ble_mesh_gen_user_property_status_cb_t**

Parameters of Generic User Property Status.

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t property_id

Property ID identifying a Generic User Property

uint8_t user_access

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the User Property (C.1)

struct **esp_ble_mesh_gen_admin_properties_status_cb_t**

Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Admin Property IDs

struct **esp_ble_mesh_gen_admin_property_status_cb_t**

Parameters of Generic Admin Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic Admin Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the Admin Property (C.1)

struct **esp_ble_mesh_gen_manufacturer_properties_status_cb_t**

Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple ***property_ids**

Buffer contains a sequence of N Manufacturer Property IDs

struct **esp_ble_mesh_gen_manufacturer_property_status_cb_t**

Parameters of Generic Manufacturer Property Status.

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**

Enumeration indicating user access (optional)

struct net_buf_simple ***property_value**

Raw value for the Manufacturer Property (C.1)

struct **esp_ble_mesh_gen_client_properties_status_cb_t**
Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple ***property_ids**
Buffer contains a sequence of N Client Property IDs

struct **esp_ble_mesh_generic_client_cb_param_t**
Generic Client Model callback parameters

Public Members

int **error_code**
Appropriate error code

esp_ble_mesh_client_common_param_t ***params**
The client common parameters.

esp_ble_mesh_gen_client_status_cb_t **status_cb**
The generic status message callback values

struct **esp_ble_mesh_gen_onoff_state_t**
Parameters of Generic OnOff state

Public Members

uint8_t **onoff**
The present value of the Generic OnOff state

uint8_t **target_onoff**
The target value of the Generic OnOff state

struct **esp_ble_mesh_gen_onoff_srv_t**
User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t **state**
Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_gen_level_state_t**

Parameters of Generic Level state

Public Members

int16_t **level**

The present value of the Generic Level state

int16_t **target_level**

The target value of the Generic Level state

int16_t **last_level**

When a new transaction starts, level should be set to last_level, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t **last_delta**

The last delta change of the Generic Level state

bool **move_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp_ble_mesh_gen_level_srv_t**

User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_level_state_t **state**

Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_def_trans_time_state_t**

Parameter of Generic Default Transition Time state

Public Members

uint8_t **trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_def_trans_time_srv_t**

User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t **state**

Parameters of the Generic Default Transition Time state

struct **esp_ble_mesh_gen_onpowerup_state_t**

Parameter of Generic OnPowerUp state

Public Members

uint8_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_srv_t**

User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_onoff_setup_srv_t**

User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t *model

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl

Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state

Parameters of the Generic OnPowerUp state

struct **esp_ble_mesh_gen_power_level_state_t**

Parameters of Generic Power Level state

Public Members

uint16_t **power_actual**

The present value of the Generic Power Actual state

uint16_t **target_power_actual**

The target value of the Generic Power Actual state

uint16_t **power_last**

The value of the Generic Power Last state

uint16_t **power_default**

The value of the Generic Power Default state

uint8_t **status_code**

The status code of setting Generic Power Range state

uint16_t **power_range_min**

The minimum value of the Generic Power Range state

uint16_t **power_range_max**

The maximum value of the Generic Power Range state

struct **esp_ble_mesh_gen_power_level_srv_t**

User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_level**

Delta change value of level state transition

struct **esp_ble_mesh_gen_power_level_setup_srv_t**

User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t ***state**

Parameters of the Generic Power Level state

struct **esp_ble_mesh_gen_battery_state_t**

Parameters of Generic Battery state

Public Members

uint32_t **battery_level**

The value of the Generic Battery Level state

uint32_t **time_to_discharge**

The value of the Generic Battery Time to Discharge state

uint32_t **time_to_charge**

The value of the Generic Battery Time to Charge state

uint32_t **battery_flags**

The value of the Generic Battery Flags state

struct **esp_ble_mesh_gen_battery_srv_t**

User data of Generic Battery Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Battery Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_battery_state_t **state**

Parameters of the Generic Battery state

struct **esp_ble_mesh_gen_location_state_t**

Parameters of Generic Location state

Public Members

int32_t **global_latitude**

The value of the Global Latitude field

int32_t **global_longitude**

The value of the Global Longitude field

int16_t **global_altitude**

The value of the Global Altitude field

int16_t **local_north**

The value of the Local North field

int16_t **local_east**

The value of the Local East field

int16_t **local_altitude**

The value of the Local Altitude field

uint8_t **floor_number**

The value of the Floor Number field

uint16_t **uncertainty**

The value of the Uncertainty field

struct **esp_ble_mesh_gen_location_srv_t**

User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_gen_location_setup_srv_t**

User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_gen_location_state_t ***state**

Parameters of the Generic Location state

struct **esp_ble_mesh_generic_property_t**

Parameters of Generic Property states

Public Members

uint16_t **id**

The value of User/Admin/Manufacturer Property ID

uint8_t **user_access**

The value of User Access field

uint8_t **admin_access**

The value of Admin Access field

uint8_t **manu_access**

The value of Manufacturer Access field

struct net_buf_simple ***val**

The value of User/Admin/Manufacturer Property

struct **esp_ble_mesh_gen_user_prop_srv_t**

User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic User Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic User Property state

struct **esp_ble_mesh_gen_admin_prop_srv_t**

User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Admin Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Admin Property state

struct **esp_ble_mesh_gen_manu_prop_srv_t**

User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **property_count**

Generic Manufacturer Property count

esp_ble_mesh_generic_property_t ***properties**

Parameters of the Generic Manufacturer Property state

struct **esp_ble_mesh_gen_client_prop_srv_t**

User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Generic Client Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

uint8_t **id_count**

Generic Client Property ID count

uint16_t ***property_ids**

Parameters of the Generic Client Property state

struct **esp_ble_mesh_state_change_gen_onoff_set_t**

Parameter of Generic OnOff Set state change event

Public Members

uint8_t **onoff**

The value of Generic OnOff state

struct **esp_ble_mesh_state_change_gen_level_set_t**

Parameter of Generic Level Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_delta_set_t**

Parameter of Generic Delta Set state change event

Public Members

int16_t **level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_move_set_t**

Parameter of Generic Move Set state change event

Public Members**int16_t level**

The value of Generic Level state

struct **esp_ble_mesh_state_change_gen_def_trans_time_set_t**

Parameter of Generic Default Transition Time Set state change event

Public Members**uint8_t trans_time**

The value of Generic Default Transition Time state

struct **esp_ble_mesh_state_change_gen_onpowerup_set_t**

Parameter of Generic OnPowerUp Set state change event

Public Members**uint8_t onpowerup**

The value of Generic OnPowerUp state

struct **esp_ble_mesh_state_change_gen_power_level_set_t**

Parameter of Generic Power Level Set state change event

Public Members**uint16_t power**

The value of Generic Power Actual state

struct **esp_ble_mesh_state_change_gen_power_default_set_t**

Parameter of Generic Power Default Set state change event

Public Members**uint16_t power**

The value of Generic Power Default state

struct **esp_ble_mesh_state_change_gen_power_range_set_t**

Parameters of Generic Power Range Set state change event

Public Members**uint16_t range_min**

The minimum value of Generic Power Range state

uint16_t **range_max**

The maximum value of Generic Power Range state

struct **esp_ble_mesh_state_change_gen_loc_global_set_t**

Parameters of Generic Location Global Set state change event

Public Members

int32_t **latitude**

The Global Latitude value of Generic Location state

int32_t **longitude**

The Global Longitude value of Generic Location state

int16_t **altitude**

The Global Altitude value of Generic Location state

struct **esp_ble_mesh_state_change_gen_loc_local_set_t**

Parameters of Generic Location Local Set state change event

Public Members

int16_t **north**

The Local North value of Generic Location state

int16_t **east**

The Local East value of Generic Location state

int16_t **altitude**

The Local Altitude value of Generic Location state

uint8_t **floor_number**

The Floor Number value of Generic Location state

uint16_t **uncertainty**

The Uncertainty value of Generic Location state

struct **esp_ble_mesh_state_change_gen_user_property_set_t**

Parameters of Generic User Property Set state change event

Public Members

uint16_t **id**

The property id of Generic User Property state

struct net_buf_simple ***value**

The property value of Generic User Property state

struct **esp_ble_mesh_state_change_gen_admin_property_set_t**

Parameters of Generic Admin Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Admin Property state

uint8_t **access**

The property access of Generic Admin Property state

struct net_buf_simple ***value**

The property value of Generic Admin Property state

struct **esp_ble_mesh_state_change_gen_manu_property_set_t**

Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t **id**

The property id of Generic Manufacturer Property state

uint8_t **access**

The property value of Generic Manufacturer Property state

struct **esp_ble_mesh_server_rcv_gen_user_property_get_t**

Context of the received Generic User Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic User Property

struct **esp_ble_mesh_server_rcv_gen_admin_property_get_t**

Context of the received Generic Admin Property Get message

Public Members

uint16_t **property_id**

Property ID identifying a Generic Admin Property

struct **esp_ble_mesh_server_rcv_gen_manufacturer_property_get_t**

Context of the received Generic Manufacturer Property message

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

struct **esp_ble_mesh_server_rcv_gen_client_properties_get_t**

Context of the received Generic Client Properties Get message

Public Members**uint16_t property_id**

A starting Client Property ID present within an element

struct **esp_ble_mesh_server_rcv_gen_onoff_set_t**

Context of the received Generic OnOff Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t onoff

Target value of Generic OnOff state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_level_set_t**

Context of the received Generic Level Set message

Public Members**bool op_en**

Indicate if optional parameters are included

int16_t level

Target value of Generic Level state

uint8_t tid

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_delta_set_t**

Context of the received Generic Delta Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int32_t **delta_level**

Delta change of Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_move_set_t**

Context of the received Generic Move Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

int16_t **delta_level**

Delta Level step to calculate Move speed for Generic Level state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_def_trans_time_set_t**

Context of the received Generic Default Transition Time Set message

Public Members**uint8_t trans_time**

The value of the Generic Default Transition Time state

struct **esp_ble_mesh_server_rcv_gen_onpowerup_set_t**

Context of the received Generic OnPowerUp Set message

Public Members**uint8_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp_ble_mesh_server_rcv_gen_power_level_set_t**

Context of the received Generic Power Level Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t power

Target value of Generic Power Actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_gen_power_default_set_t**

Context of the received Generic Power Default Set message

Public Members**uint16_t power**

The value of the Generic Power Default state

struct **esp_ble_mesh_server_rcv_gen_power_range_set_t**

Context of the received Generic Power Range Set message

Public Members**uint16_t range_min**

Value of Range Min field of Generic Power Range state

uint16_t range_max

Value of Range Max field of Generic Power Range state

struct **esp_ble_mesh_server_rcv_gen_loc_global_set_t**

Context of the received Generic Location Global Set message

Public Members**int32_t global_latitude**

Global Coordinates (Latitude)

int32_t global_longitude

Global Coordinates (Longitude)

int16_t global_altitude

Global Altitude

struct **esp_ble_mesh_server_rcv_gen_loc_local_set_t**

Context of the received Generic Location Local Set message

Public Members**int16_t local_north**

Local Coordinates (North)

int16_t local_east

Local Coordinates (East)

int16_t local_altitude

Local Altitude

uint8_t floor_number

Floor Number

uint16_t uncertainty

Uncertainty

struct **esp_ble_mesh_server_rcv_gen_user_property_set_t**

Context of the received Generic User Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Generic User Property

struct net_buf_simple ***property_value**

Raw value for the User Property

struct **esp_ble_mesh_server_recv_gen_admin_property_set_t**

Context of the received Generic Admin Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Generic Admin Property

uint8_t user_access

Enumeration indicating user access

struct net_buf_simple ***property_value**

Raw value for the Admin Property

struct **esp_ble_mesh_server_recv_gen_manufacturer_property_set_t**

Context of the received Generic Manufacturer Property Set message

Public Members**uint16_t property_id**

Property ID identifying a Generic Manufacturer Property

uint8_t user_access

Enumeration indicating user access

struct **esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

Public Members*esp_ble_mesh_model_t* ***model**

Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_generic_server_cb_value_t **value**

Value of the received Generic Messages

Macros**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic OnOff Client Model instance.**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Level Client Model instance.**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)

Define a new Generic Default Transition Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Default Transition Time Client Model instance.**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic Power OnOff Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Power OnOff Client Model instance.**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Power Level Client Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)

Define a new Generic Battery Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Battery Client Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)

Define a new Generic Location Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)

Define a new Generic Property Client Model.

Note: This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Generic Location Client Model instance.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

Note: 1. The Generic OnOff Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_onoff_srv_t*.

Returns New Generic OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Level Server Model.

Note: 1. The Generic Level Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_level_srv_t*.

Returns New Generic Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.

Note: 1. The Generic Default Transition Time Server Model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_def_trans_time_srv_t*.

Returns New Generic Default Transition Time Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Server Model.

Note: 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

- a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
 - b. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_srv_t*.

Returns New Generic Power OnOff Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power OnOff Setup Server Model.

Note: 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_onoff_setup_srv_t*.

Returns New Generic Power OnOff Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)

Define a new Generic Power Level Server Model.

Note: 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_srv_t*.

Returns New Generic Power Level Server Model instance.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

Note: 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_power_level_setup_srv_t*.

Returns New Generic Power Level Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)

Define a new Generic Battery Server Model.

Note: 1. The Generic Battery Server Model is a root model.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that is powered by a battery.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_battery_srv_t*.

Returns New Generic Battery Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)

Define a new Generic Location Server Model.

Note: 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be used to represent an element that knows its location (global or local).
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_srv_t*.

Returns New Generic Location Server Model instance.

ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

Note: 1. The Generic Location Setup Server model extends the Generic Location Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_location_setup_srv_t*.

Returns New Generic Location Setup Server Model instance.

ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note: 1. The Generic User Property Server model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_user_prop_srv_t*.

Returns New Generic User Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

Note: 1. The Generic Admin Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_admin_prop_srv_t*.

Returns New Generic Admin Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)

Define a new Generic Manufacturer Property Server Model.

Note: 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_manu_prop_srv_t*.

Returns New Generic Manufacturer Property Server Model instance.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

Note: 1. The Generic Client Property Server model is a root model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_gen_client_prop_srv_t*.

Returns New Generic Client Property Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,  
esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,  
esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

Values:

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_admin_prop_access_t**

This enum value is the access value of Generic Admin Property

Values:

enumerator **ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE**

enumerator **ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE**

enum **esp_ble_mesh_gen_manu_prop_access_t**

This enum value is the access value of Generic Manufacturer Property

Values:

enumerator **ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP**

enumerator **ESP_BLE_MESH_GEN_MANU_ACCESS_READ**

enum **esp_ble_mesh_generic_server_cb_event_t**

This enum value is the event of Generic Server Model

Values:

enumerator **ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX**

Sensor Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

Functions

esp_err_t **esp_ble_mesh_register_sensor_client_callback** (*esp_ble_mesh_sensor_client_cb_t* callback)

Register BLE Mesh Sensor Client Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_get_state_t* *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to sensor get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_sensor_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_sensor_client_set_state_t* *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp_ble_mesh_sensor_message_opcode_t* in *esp_ble_mesh_defs.h*

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to sensor set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_sensor_server_callback** (*esp_ble_mesh_sensor_server_cb_t* callback)

Register BLE Mesh Sensor Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Unions

union **esp_ble_mesh_sensor_client_get_state_t**

Structures

struct **esp_ble_mesh_sensor_descriptor_get_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_sensor_cadence_get_t**

Parameter of Sensor Cadence Get

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_sensor_cadence_set_t**

Parameters of Sensor Cadence Set

Public Members**uint16_t property_id**

Property ID for the sensor

uint8_t fast_cadence_period_divisor

Divisor for the publish period

uint8_t status_trigger_type

The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down

Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up

Delta up value that triggers a status message

uint8_t status_min_interval

Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low

Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high

Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t

Parameter of Sensor Settings Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t

Parameters of Sensor Setting Get

Public Members**uint16_t sensor_property_id**

Property ID of a sensor

uint16_t sensor_setting_property_id

Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t

Parameters of Sensor Setting Set

Public Members

uint16_t **sensor_property_id**
Property ID identifying a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

struct net_buf_simple ***sensor_setting_raw**
Raw value for the setting

struct **esp_ble_mesh_sensor_get_t**
Parameters of Sensor Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct **esp_ble_mesh_sensor_column_get_t**
Parameters of Sensor Column Get

Public Members

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x**
Raw value identifying a column

struct **esp_ble_mesh_sensor_series_get_t**
Parameters of Sensor Series Get

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x1**
Raw value identifying a starting column (optional)

struct net_buf_simple ***raw_value_x2**
Raw value identifying an ending column (C.1)

struct **esp_ble_mesh_sensor_descriptor_status_cb_t**
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple ***descriptor**
Sequence of 8-octet sensor descriptors (optional)

struct **esp_ble_mesh_sensor_cadence_status_cb_t**
Parameters of Sensor Cadence Status

Public Members

uint16_t **property_id**
Property for the sensor

struct net_buf_simple ***sensor_cadence_value**
Value of sensor cadence state

struct **esp_ble_mesh_sensor_settings_status_cb_t**
Parameters of Sensor Settings Status

Public Members

uint16_t **sensor_property_id**
Property ID identifying a sensor

struct net_buf_simple ***sensor_setting_property_ids**
A sequence of N sensor setting property IDs (optional)

struct **esp_ble_mesh_sensor_setting_status_cb_t**
Parameters of Sensor Setting Status

Public Members

bool **op_en**
Indicate id optional parameters are included

uint16_t **sensor_property_id**
Property ID identifying a sensor

uint16_t **sensor_setting_property_id**
Setting ID identifying a setting within a sensor

uint8_t **sensor_setting_access**
Read/Write access rights for the setting (optional)

struct net_buf_simple ***sensor_setting_raw**
Raw value for the setting

struct **esp_ble_mesh_sensor_status_cb_t**
Parameter of Sensor Status

Public Members

struct net_buf_simple ***marshalled_sensor_data**
Value of sensor data state (optional)

struct **esp_ble_mesh_sensor_column_status_cb_t**
Parameters of Sensor Column Status

Public Members

uint16_t **property_id**
Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_column_value**
Left values of sensor column status

struct **esp_ble_mesh_sensor_series_status_cb_t**
Parameters of Sensor Series Status

Public Members

uint16_t **property_id**
Property identifying a sensor and the Y axis

struct net_buf_simple ***sensor_series_value**
Left values of sensor series status

struct **esp_ble_mesh_sensor_client_cb_param_t**
Sensor Client Model callback parameters

Public Members

int **error_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t **status_cb**

The sensor status message callback values

struct **esp_ble_mesh_sensor_descriptor_t**

Parameters of Sensor Descriptor state

Public Members

uint32_t **positive_tolerance**

The value of Sensor Positive Tolerance field

uint32_t **negative_tolerance**

The value of Sensor Negative Tolerance field

uint32_t **sampling_function**

The value of Sensor Sampling Function field

uint8_t **measure_period**

The value of Sensor Measurement Period field

uint8_t **update_interval**

The value of Sensor Update Interval field

struct **esp_ble_mesh_sensor_setting_t**

Parameters of Sensor Setting state

Public Members

uint16_t **property_id**

The value of Sensor Setting Property ID field

uint8_t **access**

The value of Sensor Setting Access field

struct net_buf_simple ***raw**

The value of Sensor Setting Raw field

struct **esp_ble_mesh_sensor_cadence_t**

Parameters of Sensor Cadence state

Public Members

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor field

uint8_t **trigger_type**

The value of Status Trigger Type field

struct net_buf_simple ***trigger_delta_down**

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up field

uint8_t **min_interval**

The value of Status Min Interval field

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low field

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High field

struct **esp_ble_mesh_sensor_data_t**

Parameters of Sensor Data state

Public Members

uint8_t **format**

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t **length**

The value of the Sensor Data length

struct net_buf_simple ***raw_value**

The value of Sensor Data raw value

struct **esp_ble_mesh_sensor_series_column_t**

Parameters of Sensor Series Column state

Public Members

struct net_buf_simple ***raw_value_x**
The value of Sensor Raw Value X field

struct net_buf_simple ***column_width**
The value of Sensor Column Width field

struct net_buf_simple ***raw_value_y**
The value of Sensor Raw Value Y field

struct **esp_ble_mesh_sensor_state_t**
Parameters of Sensor states

Public Members

uint16_t **sensor_property_id**
The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t **descriptor**
Parameters of the Sensor Descriptor state

const uint8_t **setting_count**
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t ***settings**
Parameters of the Sensor Setting state

esp_ble_mesh_sensor_cadence_t ***cadence**
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics” . Parameters of the Sensor Cadence state

esp_ble_mesh_sensor_data_t **sensor_data**
Parameters of the Sensor Data state

esp_ble_mesh_sensor_series_column_t **series_column**
Parameters of the Sensor Series Column state

struct **esp_ble_mesh_sensor_srv_t**
User data of Sensor Server Model

Public Members

esp_ble_mesh_model_t ***model**
Pointer to the Sensor Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_sensor_setup_srv_t**

User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

const uint8_t **state_count**

Sensor state count

esp_ble_mesh_sensor_state_t ***states**

Parameters of the Sensor states

struct **esp_ble_mesh_state_change_sensor_cadence_set_t**

Parameters of Sensor Cadence Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint8_t **period_divisor**

The value of Fast Cadence Period Divisor state

uint8_t **trigger_type**

The value of Status Trigger Type state

struct net_buf_simple ***trigger_delta_down**

The value of Status Trigger Delta Down state

struct net_buf_simple ***trigger_delta_up**

The value of Status Trigger Delta Up state

uint8_t **min_interval**

The value of Status Min Interval state

struct net_buf_simple ***fast_cadence_low**

The value of Fast Cadence Low state

struct net_buf_simple ***fast_cadence_high**

The value of Fast Cadence High state

struct **esp_ble_mesh_state_change_sensor_setting_set_t**

Parameters of Sensor Setting Set state change event

Public Members

uint16_t **property_id**

The value of Sensor Property ID state

uint16_t **setting_property_id**

The value of Sensor Setting Property ID state

struct net_buf_simple ***setting_value**

The value of Sensor Property Value state

struct **esp_ble_mesh_server_rcv_sensor_descriptor_get_t**

Context of the received Sensor Descriptor Get message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **property_id**

Property ID of a sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_cadence_get_t**

Context of the received Sensor Cadence Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_settings_get_t**

Context of the received Sensor Settings Get message

Public Members

uint16_t **property_id**

Property ID of a sensor

struct **esp_ble_mesh_server_rcv_sensor_setting_get_t**
Context of the received Sensor Setting Get message

Public Members

uint16_t **property_id**
Property ID of a sensor

uint16_t **setting_property_id**
Setting ID identifying a setting within a sensor

struct **esp_ble_mesh_server_rcv_sensor_get_t**
Context of the received Sensor Get message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property ID for the sensor (optional)

struct **esp_ble_mesh_server_rcv_sensor_column_get_t**
Context of the received Sensor Column Get message

Public Members

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value_x**
Raw value identifying a column

struct **esp_ble_mesh_server_rcv_sensor_series_get_t**
Context of the received Sensor Series Get message

Public Members

bool **op_en**
Indicate if optional parameters are included

uint16_t **property_id**
Property identifying a sensor

struct net_buf_simple ***raw_value**
Raw value containing X1 and X2 (optional)

struct **esp_ble_mesh_server_rcv_sensor_cadence_set_t**

Context of the received Sensor Cadence Set message

Public Members

uint16_t **property_id**

Property ID for the sensor

struct net_buf_simple ***cadence**

Value of Sensor Cadence state

struct **esp_ble_mesh_server_rcv_sensor_setting_set_t**

Context of the received Sensor Setting Set message

Public Members

uint16_t **property_id**

Property ID identifying a sensor

uint16_t **setting_property_id**

Setting ID identifying a setting within a sensor

struct net_buf_simple ***setting_raw**

Raw value for the setting

struct **esp_ble_mesh_sensor_server_cb_param_t**

Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t **value**

Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)

Define a new Sensor Client Model.

Note: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Sensor Client Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

Note: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_srv_t*.

Returns New Sensor Server Model instance.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)

Define a new Sensor Setup Server Model.

Note: 1. The Sensor Setup Server model extends the Sensor Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_sensor_setup_srv_t*.

Returns New Sensor Setup Server Model instance.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID

Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN

Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN

Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE

Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE

Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD

Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL

Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID

Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN

Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN

Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ

Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE

Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN

Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN

Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE

Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX

Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16

Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A

Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B

Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN

MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN

MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)

Get format of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.

Returns Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)

Get length of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

Returns Length (zero-based) of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)

Get Sensor Property ID of the sensor data.

Note: Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Parameters

- **_data** –Pointer to the start of the sensor data.
- **_fmt** –Format of the sensor data.

Returns Sensor Property ID of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)

Generate a MPID value for sensor data with Format A.

Note: 1. The Format field is 0b0 and indicates that Format A is used.

- a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
 - b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
 - c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.
-

Parameters

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

Returns 2-octet MPID value for sensor data with Format A.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)

Generate a MPID value for sensor data with Format B.

Note: 1. The Format field is 0b1 and indicates Format B is used.

- a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
 - b. The Property ID is a 16-bit bit field representing a Property ID.
 - c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
 - d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID
-

Parameters

- **_len** –Length of Sensor Raw value.
- **_id** –Sensor Property ID.

Returns 3-octet MPID value for sensor data with Format B.

Type Definitions

```
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,  
esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,  
esp_ble_mesh_sensor_server_cb_param_t *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

Values:

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_RMS**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED**

enumerator **ESP_BLE_MESH_SAMPLE_FUNC_COUNT**

enum **esp_ble_mesh_sensor_server_cb_event_t**

This enum value is the event of Sensor Server Model

Values:

enumerator **ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX**

Time and Scenes Client/Server Models

Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

Functions

esp_err_t **esp_ble_mesh_register_time_scene_client_callback** (*esp_ble_mesh_time_scene_client_cb_t* callback)

Register BLE Mesh Time Scene Client Model callback.

Parameters `callback` –[in] Pointer to the callback function.

Returns `ESP_OK` on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_get_state_t
                                                    *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer to time scene get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_set_state_t
                                                    *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer to time scene set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                           callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Unions

```
union esp_ble_mesh_time_scene_client_get_state_t

Structures

struct **esp_ble_mesh_time_set_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_set_t**

Parameters of Time Zone Set

Public Members

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_set_t**

Parameters of TAI-UTC Delta Set

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t **padding**

Always 0b0. Other values are Prohibited.

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_set_t**

Parameter of Time Role Set

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_store_t**

Parameter of Scene Store

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_scene_recall_t**

Parameters of Scene Recall

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **scene_number**

The number of scenes to be recalled

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_scene_delete_t**

Parameter of Scene Delete

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_scheduler_act_get_t**

Parameter of Scheduler Action Get

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_scheduler_act_set_t**

Parameters of Scheduler Action Set

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_status_cb_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

uint8_t **sub_second**

The sub-second time in units of 1/256 second

uint8_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_zone_status_cb_t**

Parameters of Time Zone Status

Public Members

uint8_t **time_zone_offset_curr**

Current local time zone offset

uint8_t **time_zone_offset_new**

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_tai_utc_delta_status_cb_t**

Parameters of TAI-UTC Delta Status

Public Members**uint16_t tai_utc_delta_curr**

Current difference between TAI and UTC in seconds

uint16_t padding_1

Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new

Upcoming difference between TAI and UTC in seconds

uint16_t padding_2

Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_time_role_status_cb_t**

Parameter of Time Role Status

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_scene_status_cb_t**

Parameters of Scene Status

Public Members**bool op_en**

Indicate if optional parameters are included

uint8_t status_code

Status code of the last operation

uint16_t current_scene

Scene Number of the current scene

uint16_t target_scene

Scene Number of the target scene (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_scene_register_status_cb_t**

Parameters of Scene Register Status

Public Members**uint8_t status_code**

Status code for the previous operation

uint16_t current_scene

Scene Number of the current scene

struct net_buf_simple *scenes

A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t

Parameter of Scheduler Status

Public Members**uint16_t schedules**

Bit field indicating defined Actions in the Schedule Register

struct esp_ble_mesh_scheduler_act_status_cb_t

Parameters of Scheduler Action Status

Public Members**uint64_t index**

Enumerates (selects) a Schedule Register entry

uint64_t year

Scheduled year for the action

uint64_t month

Scheduled month for the action

uint64_t day

Scheduled day of the month for the action

uint64_t hour

Scheduled hour for the action

uint64_t minute

Scheduled minute for the action

uint64_t second

Scheduled second for the action

uint64_t day_of_week

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Transition time for this action

struct **esp_ble_mesh_time_scene_client_cb_param_t**

Time Scene Client Model callback parameters

Public Members

int **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t **status_cb**

The scene status message callback values

struct **esp_ble_mesh_time_state_t**

Parameters of Time state

Public Members

uint8_t **tai_seconds**[5]

The value of the TAI Seconds state

uint8_t **subsecond**

The value of the Subsecond field

uint8_t **uncertainty**

The value of the Uncertainty field

uint8_t **time_zone_offset_curr**

The value of the Time Zone Offset Current field

uint8_t **time_zone_offset_new**

The value of the Time Zone Offset New state

uint8_t **tai_zone_change**[5]

The value of the TAI of Zone Chaneg field

uint16_t **time_authority**

The value of the Time Authority bit

uint16_t **tai_utc_delta_curr**

The value of the TAI-UTC Delta Current state

uint16_t **tai_utc_delta_new**

The value of the TAI-UTC Delta New state

uint8_t **tai_delta_change**[5]

The value of the TAI of Delta Change field

struct *esp_ble_mesh_time_state_t*::[anonymous] **time**

Parameters of the Time state

uint8_t **time_role**

The value of the Time Role state

struct **esp_ble_mesh_time_srv_t**

User data of Time Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_time_setup_srv_t**

User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_time_state_t ***state**

Parameters of the Time state

struct **esp_ble_mesh_scene_register_t**

- a. Scene Store is an operation of storing values of a present state of an element.
- b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

Public Members

uint16_t **scene_number**

The value of the Scene Number

uint8_t **scene_type**

The value of the Scene Type

struct net_buf_simple ***scene_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

Public Members

const uint16_t **scene_count**

The Scenes state' s scene count

esp_ble_mesh_scene_register_t ***scenes**

Parameters of the Scenes state

uint16_t **current_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t target_scene

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t status_code

The status code of the last scene operation

bool in_progress

Indicate if the scene transition is in progress

struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scene Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scenes_state_t ***state**

Parameters of the Scenes state

struct **esp_ble_mesh_schedule_register_t**

Parameters of Scheduler Register state

Public Members

bool **in_use**

Indicate if the registered schedule is in use

uint64_t **year**

The value of Scheduled year for the action

uint64_t **month**

The value of Scheduled month for the action

uint64_t **day**

The value of Scheduled day of the month for the action

uint64_t **hour**

The value of Scheduled hour for the action

uint64_t **minute**

The value of Scheduled minute for the action

uint64_t **second**

The value of Scheduled second for the action

uint64_t **day_of_week**

The value of Schedule days of the week for the action

uint64_t **action**

The value of Action to be performed at the scheduled time

uint64_t **trans_time**

The value of Transition time for this action

uint16_t **scene_number**

The value of Scene Number to be used for some actions

struct **esp_ble_mesh_scheduler_state_t**

Parameters of Scheduler state

Public Members

const uint8_t **schedule_count**

Scheduler count

esp_ble_mesh_schedule_register_t ***schedules**

Up to 16 scheduled entries

struct **esp_ble_mesh_scheduler_srv_t**

User data of Scheduler Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_scheduler_setup_srv_t**

User data of Scheduler Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_scheduler_state_t ***state**

Parameters of the Scheduler state

struct **esp_ble_mesh_state_change_time_set_t**

Parameters of Time Set state change event

Public Members

uint8_t **tai_seconds**[5]

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_status_t`

Parameters of Time Status state change event

Public Members

`uint8_t tai_seconds[5]`

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_zone_set_t`

Parameters of Time Zone Set state change event

Public Members

`uint8_t time_zone_offset_new`

Upcoming local time zone offset

uint8_t **tai_zone_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_state_change_tai_utc_delta_set_t**

Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t **tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint8_t **tai_delta_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_state_change_time_role_set_t**

Parameter of Time Role Set state change event

Public Members

uint8_t **time_role**

The Time Role for the element

struct **esp_ble_mesh_state_change_scene_store_t**

Parameter of Scene Store state change event

Public Members

uint16_t **scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_state_change_scene_recall_t**

Parameter of Scene Recall state change event

Public Members

uint16_t **scene_number**

The number of scenes to be recalled

struct **esp_ble_mesh_state_change_scene_delete_t**

Parameter of Scene Delete state change event

Public Members

uint16_t **scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_state_change_scheduler_act_set_t**

Parameter of Scheduler Action Set state change event

Public Members

uint64_t **index**

Index of the Schedule Register entry to set

uint64_t **year**

Scheduled year for the action

uint64_t **month**

Scheduled month for the action

uint64_t **day**

Scheduled day of the month for the action

uint64_t **hour**

Scheduled hour for the action

uint64_t **minute**

Scheduled minute for the action

uint64_t **second**

Scheduled second for the action

uint64_t **day_of_week**

Schedule days of the week for the action

uint64_t **action**

Action to be performed at the scheduled time

uint64_t **trans_time**

Transition time for this action

uint16_t **scene_number**

Scene number to be used for some actions

struct **esp_ble_mesh_server_rcv_scheduler_act_get_t**

Context of the received Scheduler Action Get message

Public Members

uint8_t **index**

Index of the Schedule Register entry to get

struct **esp_ble_mesh_server_rcv_time_set_t**

Context of the received Time Set message

Public Members**uint8_t tai_seconds[5]**

The current TAI time in seconds

uint8_t subsecond

The sub-second time in units of 1/256 second

uint8_t uncertainty

The estimated uncertainty in 10-millisecond steps

uint16_t time_authority

0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta

Current difference between TAI and UTC in seconds

uint8_t time_zone_offset

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_server_rcv_time_zone_set_t**

Context of the received Time Zone Set message

Public Members**uint8_t time_zone_offset_new**

Upcoming local time zone offset

uint8_t tai_zone_change[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp_ble_mesh_server_rcv_tai_utc_delta_set_t**

Context of the received TAI UTC Delta Set message

Public Members**uint16_t tai_utc_delta_new**

Upcoming difference between TAI and UTC in seconds

uint16_t padding

Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp_ble_mesh_server_rcv_time_role_set_t**

Context of the received Time Role Set message

Public Members**uint8_t time_role**

The Time Role for the element

struct **esp_ble_mesh_server_rcv_scene_store_t**

Context of the received Scene Store message

Public Members**uint16_t scene_number**

The number of scenes to be stored

struct **esp_ble_mesh_server_rcv_scene_recall_t**

Context of the received Scene Recall message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t scene_number

The number of scenes to be recalled

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_scene_delete_t**

Context of the received Scene Delete message

Public Members**uint16_t scene_number**

The number of scenes to be deleted

struct **esp_ble_mesh_server_rcv_scheduler_act_set_t**

Context of the received Scheduler Action Set message

Public Members**uint64_t index**

Index of the Schedule Register entry to set

uint64_t year

Scheduled year for the action

uint64_t month

Scheduled month for the action

uint64_t day

Scheduled day of the month for the action

uint64_t hour

Scheduled hour for the action

uint64_t minute

Scheduled minute for the action

uint64_t second

Scheduled second for the action

uint64_t day_of_week

Schedule days of the week for the action

uint64_t action

Action to be performed at the scheduled time

uint64_t trans_time

Transition time for this action

uint16_t scene_number

Scene number to be used for some actions

struct **esp_ble_mesh_server_rcv_time_status_t**

Context of the received Time Status message

Public Members**uint8_t tai_seconds[5]**

The current TAI time in seconds

uint8_t subsecond

The sub-second time in units of 1/256 second

uint8_t uncertainty

The estimated uncertainty in 10-millisecond steps

uint16_t **time_authority**

0 = No Time Authority, 1 = Time Authority

uint16_t **tai_utc_delta**

Current difference between TAI and UTC in seconds

uint8_t **time_zone_offset**

The local time zone offset in 15-minute increments

struct **esp_ble_mesh_time_scene_server_cb_param_t**

Time Scene Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Time and Scenes Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_time_scene_server_cb_value_t **value**

Value of the received Time and Scenes Messages

Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)

Define a new Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Time Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Time Client Model instance.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)

Define a new Scene Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scene Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Scene Client Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)

Define a new Scheduler Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Scheduler Client Model instance.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)

Time Scene Server Models related context.

Define a new Time Server Model.

Note: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_srv_t*.

Returns New Time Server Model instance.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)

Define a new Time Setup Server Model.

Note: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

- a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
 - b. This model does not support subscribing nor publishing.
-

Parameters

- **srv_data** –Pointer to the unique struct *esp_ble_mesh_time_setup_srv_t*.

Returns New Time Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)

Define a new Scene Server Model.

Note: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_srv_t*.

Returns New Scene Server Model instance.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)

Define a new Scene Setup Server Model.

Note: 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scene_setup_srv_t*.

Returns New Scene Setup Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)

Define a new Scheduler Server Model.

Note: 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model may be present only on the Primary element of a node.
 - c. The model requires the Time Server model shall be present on the element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_srv_t*.

Returns New Scheduler Server Model instance.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)

Define a new Scheduler Setup Server Model.

Note: 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

- a. This model shall support model subscription.
 - b. The model may be present only on the Primary element of a node.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_scheduler_setup_srv_t*.

Returns New Scheduler Setup Server Model instance.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS

Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE

Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE

Unknown TAI of Delta Change

ESP_BLE_MESH_TAI.UTC_DELTA_MAX_VALUE

Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI.SECONDS_LEN

Length of TAI Seconds

ESP_BLE_MESH_TAI.OF_ZONE_CHANGE_LEN

Length of TAI of Zone Change

ESP_BLE_MESH_TAI.OF_DELTA_CHANGE_LEN

Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER

Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN

Length of the Scene Number

ESP_BLE_MESH_SCHEDULE.YEAR_ANY_YEAR

Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE.DAY_ANY_DAY

Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE.HOUR_ANY_HOUR

Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.HOUR_ONCE_A_DAY

Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE.SEC_ANY_OF_HOUR

Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC EVERY 15 MIN

Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC EVERY 20 MIN

Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC ONCE AN HOUR

Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE.SEC ANY OF MIN

Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE.SEC EVERY 15 SEC

Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC EVERY_20_SEC

Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC ONCE_AN_MIN

Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF

Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON

Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL

Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION

Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE

Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX

Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE

Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY

Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY

Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET

Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS

Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL

Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND

Scene operation - Scene Not Found

Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

Values:

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

Lighting Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t **esp_ble_mesh_register_light_client_callback** (*esp_ble_mesh_light_client_cb_t* callback)

Register BLE Mesh Light Client Model callback.

Parameters **callback** –[in] pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_get_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_get_state_t* *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get_state** –[in] Pointer of light get message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_light_client_set_state** (*esp_ble_mesh_client_common_param_t* *params, *esp_ble_mesh_light_client_set_state_t* *set_state)

Set the value of Light Server Model states using the Light Client Model set messages.

Note: If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set_state** –[in] Pointer of light set message value. Shall not be set to NULL.

Returns ESP_OK on success or error code otherwise.

esp_err_t **esp_ble_mesh_register_lighting_server_callback** (*esp_ble_mesh_lighting_server_cb_t* callback)

Register BLE Mesh Lighting Server Model callback.

Parameters **callback** –[in] Pointer to the callback function.

Returns ESP_OK on success or error code otherwise.

Structures

struct **esp_ble_mesh_light_lightness_set_t**

Bluetooth Mesh Light Lightness Client Model Get and Set parameters structure.

Parameters of Light Lightness Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness actual state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lightness_linear_set_t**

Parameters of Light Lightness Linear Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light lightness linear state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lightness_default_set_t**

Parameter of Light Lightness Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_light_lightness_range_set_t**

Parameters of Light Lightness Range Set

Public Members**uint16_t range_min**

Value of range min field of light lightness range state

uint16_t range_max

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_set_t**

Parameters of Light CTL Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_lightness

Target value of light ctl lightness state

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature Set

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t ctl_temperatrue

Target value of light ctl temperature state

int16_t ctl_delta_uv

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range Set

Public Members

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_set_t**

Parameters of Light CTL Default Set

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_set_t**

Parameters of Light HSL Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness**

Target value of light hsl lightness state

uint16_t **hsl_hue**

Target value of light hsl hue state

uint16_t **hsl_saturation**

Target value of light hsl saturation state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_hue_set_t**

Parameters of Light HSL Hue Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hue**

Target value of light hsl hue state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_hsl_saturation_set_t**

Parameters of Light HSL Saturation Set

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **saturation**

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_hsl_default_set_t`

Parameters of Light HSL Default Set

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_light_hsl_range_set_t`

Parameters of Light HSL Range Set

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_light_xyl_set_t`

Parameters of Light xyL Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xy1_lightness**

The target value of the Light xyL Lightness state

uint16_t **xy1_x**

The target value of the Light xyL x state

uint16_t **xy1_y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_xy1_default_set_t**

Parameters of Light xyL Default Set

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xy1_x**

The value of the Light xyL x Default state

uint16_t **xy1_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xy1_range_set_t**

Parameters of Light xyL Range Set

Public Members

uint16_t **xy1_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xy1_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xy1_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xy1_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_set_t**

Parameter of Light LC Mode Set

Public Members

uint8_t **mode**

The target value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_set_t**

Parameter of Light LC OM Set

Public Members

uint8_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_set_t**

Parameters of Light LC Light OnOff Set

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **light_onoff**

The target value of the Light LC Light OnOff state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_light_lc_property_get_t**

Parameter of Light LC Property Get

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_light_lc_property_set_t**

Parameters of Light LC Property Set

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_lightness_status_cb_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness actual state

uint16_t target_lightness

Target value of light lightness actual state (optional)

uint8_t remain_time

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_linear_status_cb_t**

Parameters of Light Lightness Linear Status

Public Membersbool **op_en**

Indicate if optional parameters are included

uint16_t present_lightness

Current value of light lightness linear state

uint16_t **target_lightness**

Target value of light lightness linear state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lightness_last_status_cb_t**

Parameter of Light Lightness Last Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Last state

struct **esp_ble_mesh_light_lightness_default_status_cb_t**

Parameter of Light Lightness Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness default State

struct **esp_ble_mesh_light_lightness_range_status_cb_t**

Parameters of Light Lightness Range Status

Public Members

uint8_t **status_code**

Status Code for the request message

uint16_t **range_min**

Value of range min field of light lightness range state

uint16_t **range_max**

Value of range max field of light lightness range state

struct **esp_ble_mesh_light_ctl_status_cb_t**

Parameters of Light CTL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_lightness**

Current value of light ctl lightness state

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **target_ctl_lightness**

Target value of light ctl lightness state (optional)

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_status_cb_t**

Parameters of Light CTL Temperature Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_ctl_temperature**

Current value of light ctl temperature state

uint16_t **present_ctl_delta_uv**

Current value of light ctl delta UV state

uint16_t **target_ctl_temperature**

Target value of light ctl temperature state (optional)

uint16_t **target_ctl_delta_uv**

Target value of light ctl delta UV state (C.1)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_ctl_temperature_range_status_cb_t**

Parameters of Light CTL Temperature Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_light_ctl_default_status_cb_t**

Parameters of Light CTL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_light_hsl_status_cb_t**

Parameters of Light HSL Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness**

Current value of light hsl lightness state

uint16_t **hsl_hue**

Current value of light hsl hue state

uint16_t **hsl_saturation**

Current value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_target_status_cb_t**

Parameters of Light HSL Target Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **hsl_lightness_target**

Target value of light hsl lightness state

uint16_t **hsl_hue_target**

Target value of light hsl hue state

uint16_t **hsl_saturation_target**

Target value of light hsl saturation state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_hsl_hue_status_cb_t**

Parameters of Light HSL Hue Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_hue**

Current value of light hsl hue state

uint16_t **target_hue**

Target value of light hsl hue state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_saturation_status_cb_t**

Parameters of Light HSL Saturation Status

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **present_saturation**

Current value of light hsl saturation state

uint16_t **target_saturation**

Target value of light hsl saturation state (optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_hsl_default_status_cb_t**

Parameters of Light HSL Default Status

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **hue**

Value of light hue default state

uint16_t **saturation**

Value of light saturation default state

struct **esp_ble_mesh_light_hsl_range_status_cb_t**

Parameters of Light HSL Range Status

Public Members

uint8_t **status_code**

Status code for the request message

uint16_t **hue_range_min**

Value of hue range min field of light hsl hue range state

uint16_t **hue_range_max**

Value of hue range max field of light hsl hue range state

uint16_t **saturation_range_min**

Value of saturation range min field of light hsl saturation range state

uint16_t **saturation_range_max**

Value of saturation range max field of light hsl saturation range state

struct **esp_ble_mesh_light_xyl_status_cb_t**

Parameters of Light xyL Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **xyl_lightness**

The present value of the Light xyL Lightness state

uint16_t **xyl_x**

The present value of the Light xyL x state

uint16_t **xyl_y**

The present value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_target_status_cb_t**

Parameters of Light xyL Target Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **target_xyl_lightness**

The target value of the Light xyL Lightness state

uint16_t **target_xyl_x**

The target value of the Light xyL x state

uint16_t **target_xyl_y**

The target value of the Light xyL y state

uint8_t **remain_time**

Time to complete state transition (optional)

struct **esp_ble_mesh_light_xyl_default_status_cb_t**

Parameters of Light xyL Default Status

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **xyl_x**

The value of the Light xyL x Default state

uint16_t **xyl_y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_light_xyl_range_status_cb_t**

Parameters of Light xyL Range Status

Public Members

uint8_t **status_code**

Status Code for the requesting message

uint16_t **xy1_x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xy1_x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xy1_y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xy1_y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_light_lc_mode_status_cb_t**

Parameter of Light LC Mode Status

Public Members

uint8_t **mode**

The present value of the Light LC Mode state

struct **esp_ble_mesh_light_lc_om_status_cb_t**

Parameter of Light LC OM Status

Public Members

uint8_t **mode**

The present value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_light_lc_light_onoff_status_cb_t**

Parameters of Light LC Light OnOff Status

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **present_light_onoff**

The present value of the Light LC Light OnOff state

uint8_t **target_light_onoff**

The target value of the Light LC Light OnOff state (Optional)

uint8_t **remain_time**

Time to complete state transition (C.1)

struct **esp_ble_mesh_light_lc_property_status_cb_t**

Parameters of Light LC Property Status

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_light_client_cb_param_t**

Lighting Client Model callback parameters

Public Membersint **error_code**

Appropriate error code

esp_ble_mesh_client_common_param_t ***params**

The client common parameters.

esp_ble_mesh_light_client_status_cb_t **status_cb**

The light status message callback values

struct **esp_ble_mesh_light_lightness_state_t**

Parameters of Light Lightness state

Public Membersuint16_t **lightness_linear**

The present value of Light Lightness Linear state

uint16_t **target_lightness_linear**

The target value of Light Lightness Linear state

uint16_t **lightness_actual**

The present value of Light Lightness Actual state

uint16_t **target_lightness_actual**

The target value of Light Lightness Actual state

uint16_t **lightness_last**

The value of Light Lightness Last state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint8_t **status_code**

The status code of setting Light Lightness Range state

uint16_t **lightness_range_min**

The minimum value of Light Lightness Range state

uint16_t **lightness_range_max**

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_light_lightness_srv_t**

User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t ***state**

Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **actual_transition**

Parameters of state transition

esp_ble_mesh_state_transition_t **linear_transition**

Parameters of state transition

int32_t **tt_delta_lightness_actual**

Delta change value of lightness actual state transition

int32_t **tt_delta_lightness_linear**

Delta change value of lightness linear state transition

struct **esp_ble_mesh_light_lightness_setup_srv_t**

User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state

Parameters of the Light Lightness state

struct **esp_ble_mesh_light_ctl_state_t**

Parameters of Light CTL state

Public Members

uint16_t **lightness**

The present value of Light CTL Lightness state

uint16_t **target_lightness**

The target value of Light CTL Lightness state

uint16_t **temperature**

The present value of Light CTL Temperature state

uint16_t **target_temperature**

The target value of Light CTL Temperature state

int16_t **delta_uv**

The present value of Light CTL Delta UV state

int16_t **target_delta_uv**

The target value of Light CTL Delta UV state

uint8_t **status_code**

The statue code of setting Light CTL Temperature Range state

uint16_t **temperature_range_min**

The minimum value of Light CTL Temperature Range state

uint16_t **temperature_range_max**

The maximum value of Light CTL Temperature Range state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **temperature_default**

The value of Light CTL Temperature Default state

int16_t **delta_uv_default**

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_light_ctl_srv_t**

User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_lightness**

Delta change value of lightness state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_ctl_setup_srv_t**

User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

struct **esp_ble_mesh_light_ctl_temp_srv_t**

User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t ***state**

Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_temperature**

Delta change value of temperature state transition

int32_t **tt_delta_delta_uv**

Delta change value of delta uv state transition

struct **esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

Public Members

uint16_t **lightness**

The present value of Light HSL Lightness state

uint16_t **target_lightness**

The target value of Light HSL Lightness state

uint16_t **hue**

The present value of Light HSL Hue state

uint16_t **target_hue**

The target value of Light HSL Hue state

uint16_t **saturation**

The present value of Light HSL Saturation state

uint16_t **target_saturation**

The target value of Light HSL Saturation state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **hue_default**

The value of Light HSL Hue Default state

`uint16_t saturation_default`
The value of Light HSL Saturation Default state

`uint8_t status_code`
The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
The minimum value of Light HSL Saturation state

`uint16_t saturation_range_max`
The maximum value of Light HSL Saturation state

struct `esp_ble_mesh_light_hsl_srv_t`
User data of Light HSL Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_lightness`
Delta change value of lightness state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

struct `esp_ble_mesh_light_hsl_setup_srv_t`
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

struct **esp_ble_mesh_light_hsl_hue_srv_t**

User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_hue**

Delta change value of hue state transition

struct **esp_ble_mesh_light_hsl_sat_srv_t**

User data of Light HSL Saturation Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t ***state**

Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

int32_t **tt_delta_saturation**

Delta change value of saturation state transition

struct **esp_ble_mesh_light_xyL_state_t**

Parameters of Light xyL state

Public Members

uint16_t **lightness**

The present value of Light xyL Lightness state

uint16_t **target_lightness**

The target value of Light xyL Lightness state

uint16_t **x**

The present value of Light xyL x state

uint16_t **target_x**

The target value of Light xyL x state

uint16_t **y**

The present value of Light xyL y state

uint16_t **target_y**

The target value of Light xyL y state

uint16_t **lightness_default**

The value of Light Lightness Default state

uint16_t **x_default**

The value of Light xyL x Default state

uint16_t **y_default**

The value of Light xyL y Default state

uint8_t **status_code**

The status code of setting Light xyL x & y Range state

uint16_t **x_range_min**

The minimum value of Light xyL x Range state

`uint16_t x_range_max`

The maximum value of Light xyL x Range state

`uint16_t y_range_min`

The minimum value of Light xyL y Range state

`uint16_t y_range_max`

The maximum value of Light xyL y Range state

struct `esp_ble_mesh_light_xyl_srv_t`

User data of Light xyL Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Lighting xyL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`

Response control of the server model received messages

`esp_ble_mesh_light_xyl_state_t *state`

Parameters of the Light xyL state

`esp_ble_mesh_last_msg_info_t last`

Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`

Parameters of state transition

`int32_t tt_delta_lightness`

Delta change value of lightness state transition

`int32_t tt_delta_x`

Delta change value of x state transition

`int32_t tt_delta_y`

Delta change value of y state transition

struct `esp_ble_mesh_light_xyl_setup_srv_t`

User data of Light xyL Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t ***state**

Parameters of the Light xyL state

struct **esp_ble_mesh_light_lc_state_t**

Parameters of Light LC states

Public Members

uint32_t **mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t **occupancy_mode**

The value of Light LC Occupancy Mode state

uint32_t **light_onoff**

The present value of Light LC Light OnOff state

uint32_t **target_light_onoff**

The target value of Light LC Light OnOff state

uint32_t **occupancy**

The value of Light LC Occupancy state

uint32_t **ambient_luxlevel**

The value of Light LC Ambient LuxLevel state

uint16_t **linear_output**

- Light LC Linear Output = $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct **esp_ble_mesh_light_lc_property_state_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t

Parameters of Light LC state machine

Public Members**uint8_t fade_on**

The value of transition time of Light LC Time Fade On

uint8_t fade

The value of transition time of Light LC Time Fade

uint8_t **fade_standby_auto**

The value of transition time of Light LC Time Fade Standby Auto

uint8_t **fade_standby_manual**

The value of transition time of Light LC Time Fade Standby Manual

struct *esp_ble_mesh_light_lc_state_machine_t*::[anonymous] **trans_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t **state**

The value of Light LC state machine state

struct k_delayed_work **timer**

Timer of Light LC state machine

struct **esp_ble_mesh_light_control_t**

Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t **state**

Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t **prop_state**

Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t **state_machine**

Parameters of Light LC state machine

struct **esp_ble_mesh_light_lc_srv_t**

User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

esp_ble_mesh_last_msg_info_t **last**

Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition**

Parameters of state transition

struct **esp_ble_mesh_light_lc_setup_srv_t**

User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t ***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**

Response control of the server model received messages

esp_ble_mesh_light_control_t ***lc**

Parameters of the Light controller

struct **esp_ble_mesh_state_change_light_lightness_set_t**

Parameter of Light Lightness Actual state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Actual state

struct **esp_ble_mesh_state_change_light_lightness_linear_set_t**

Parameter of Light Lightness Linear state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Linear state

struct **esp_ble_mesh_state_change_light_lightness_default_set_t**

Parameter of Light Lightness Default state change event

Public Members

uint16_t **lightness**

The value of Light Lightness Default state

struct **esp_ble_mesh_state_change_light_lightness_range_set_t**

Parameters of Light Lightness Range state change event

Public Members**uint16_t range_min**

The minimum value of Light Lightness Range state

uint16_t range_max

The maximum value of Light Lightness Range state

struct **esp_ble_mesh_state_change_light_ctl_set_t**

Parameters of Light CTL state change event

Public Members**uint16_t lightness**

The value of Light CTL Lightness state

uint16_t temperature

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_set_t**

Parameters of Light CTL Temperature state change event

Public Members**uint16_t temperature**

The value of Light CTL Temperature state

int16_t delta_uv

The value of Light CTL Delta UV state

struct **esp_ble_mesh_state_change_light_ctl_temperature_range_set_t**

Parameters of Light CTL Temperature Range state change event

Public Members**uint16_t range_min**

The minimum value of Light CTL Temperature Range state

uint16_t range_max

The maximum value of Light CTL Temperature Range state

struct **esp_ble_mesh_state_change_light_ctl_default_set_t**

Parameters of Light CTL Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

uint16_t temperature

The value of Light CTL Temperature Default state

int16_t delta_uv

The value of Light CTL Delta UV Default state

struct **esp_ble_mesh_state_change_light_hsl_set_t**

Parameters of Light HSL state change event

Public Members**uint16_t lightness**

The value of Light HSL Lightness state

uint16_t hue

The value of Light HSL Hue state

uint16_t saturation

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_hue_set_t**

Parameter of Light HSL Hue state change event

Public Members**uint16_t hue**

The value of Light HSL Hue state

struct **esp_ble_mesh_state_change_light_hsl_saturation_set_t**

Parameter of Light HSL Saturation state change event

Public Members**uint16_t saturation**

The value of Light HSL Saturation state

struct **esp_ble_mesh_state_change_light_hsl_default_set_t**

Parameters of Light HSL Default state change event

Public Members**uint16_t lightness**

The value of Light HSL Lightness Default state

uint16_t hue

The value of Light HSL Hue Default state

uint16_t saturation

The value of Light HSL Saturation Default state

struct **esp_ble_mesh_state_change_light_hsl_range_set_t**

Parameters of Light HSL Range state change event

Public Members**uint16_t hue_range_min**

The minimum hue value of Light HSL Range state

uint16_t hue_range_max

The maximum hue value of Light HSL Range state

uint16_t saturation_range_min

The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max

The maximum saturation value of Light HSL Range state

struct **esp_ble_mesh_state_change_light_xyL_set_t**

Parameters of Light xyL state change event

Public Members**uint16_t lightness**

The value of Light xyL Lightness state

uint16_t x

The value of Light xyL x state

uint16_t y

The value of Light xyL y state

struct **esp_ble_mesh_state_change_light_xyL_default_set_t**

Parameters of Light xyL Default state change event

Public Members**uint16_t lightness**

The value of Light Lightness Default state

uint16_t x

The value of Light xyL x Default state

uint16_t y

The value of Light xyL y Default state

struct **esp_ble_mesh_state_change_light_xyl_range_set_t**

Parameters of Light xyL Range state change event

Public Members**uint16_t x_range_min**

The minimum value of Light xyL x Range state

uint16_t x_range_max

The maximum value of Light xyL x Range state

uint16_t y_range_min

The minimum value of Light xyL y Range state

uint16_t y_range_max

The maximum value of Light xyL y Range state

struct **esp_ble_mesh_state_change_light_lc_mode_set_t**

Parameter of Light LC Mode state change event

Public Members**uint8_t mode**

The value of Light LC Mode state

struct **esp_ble_mesh_state_change_light_lc_om_set_t**

Parameter of Light LC Occupancy Mode state change event

Public Members**uint8_t mode**

The value of Light LC Occupancy Mode state

struct **esp_ble_mesh_state_change_light_lc_light_onoff_set_t**

Parameter of Light LC Light OnOff state change event

Public Members**uint8_t onoff**

The value of Light LC Light OnOff state

struct **esp_ble_mesh_state_change_light_lc_property_set_t**

Parameters of Light LC Property state change event

Public Members**uint16_t property_id**

The property id of Light LC Property state

struct net_buf_simple ***property_value**

The property value of Light LC Property state

struct **esp_ble_mesh_state_change_sensor_status_t**

Parameters of Sensor Status state change event

Public Members**uint16_t property_id**

The value of Sensor Property ID

uint8_t occupancy

The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay

The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel

The value of Light LC Ambient Luxlevel state

union *esp_ble_mesh_state_change_sensor_status_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp_ble_mesh_server_rcv_light_lc_property_get_t**

Context of the received Light LC Property Get message

Public Members**uint16_t property_id**

Property ID identifying a Light LC Property

struct **esp_ble_mesh_server_rcv_light_lightness_set_t**

Context of the received Light Lightness Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light lightness actual state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_lightness_linear_set_t**

Context of the received Light Lightness Linear Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light lightness linear state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_lightness_default_set_t**

Context of the received Light Lightness Default Set message

Public Members**uint16_t lightness**

The value of the Light Lightness Default state

struct **esp_ble_mesh_server_rcv_light_lightness_range_set_t**

Context of the received Light Lightness Range Set message

Public Members**uint16_t range_min**

Value of range min field of light lightness range state

uint16_t range_max

Value of range max field of light lightness range state

struct **esp_ble_mesh_server_recv_light_ctl_set_t**

Context of the received Light CTL Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t lightness

Target value of light ctl lightness state

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t tid

Transaction ID

uint8_t trans_time

Time to complete state transition (optional)

uint8_t delay

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_ctl_temperature_set_t**

Context of the received Light CTL Temperature Set message

Public Members**bool op_en**

Indicate if optional parameters are included

uint16_t temperature

Target value of light ctl temperature state

int16_t delta_uv

Target value of light ctl delta UV state

uint8_t **tid**

Transaction ID

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_ctl_temperature_range_set_t**

Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t **range_min**

Value of temperature range min field of light ctl temperature range state

uint16_t **range_max**

Value of temperature range max field of light ctl temperature range state

struct **esp_ble_mesh_server_rcv_light_ctl_default_set_t**

Context of the received Light CTL Default Set message

Public Members

uint16_t **lightness**

Value of light lightness default state

uint16_t **temperature**

Value of light temperature default state

int16_t **delta_uv**

Value of light delta UV default state

struct **esp_ble_mesh_server_rcv_light_hsl_set_t**

Context of the received Light HSL Set message

Public Members

bool **op_en**

Indicate if optional parameters are included

uint16_t **lightness**

Target value of light hsl lightness state

`uint16_t hue`

Target value of light hsl hue state

`uint16_t saturation`

Target value of light hsl saturation state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_hue_set_t`

Context of the received Light HSL Hue Set message

Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t hue`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_saturation_set_t`

Context of the received Light HSL Saturation Set message

Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t saturation`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_default_set_t`

Context of the received Light HSL Default Set message

Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_server_rcv_light_hsl_range_set_t`

Context of the received Light HSL Range Set message

Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_server_rcv_light_xyl_set_t`

Context of the received Light xyL Set message

Public Members

bool **op_en**

Indicate whether optional parameters included

uint16_t **lightness**

The target value of the Light xyL Lightness state

uint16_t **x**

The target value of the Light xyL x state

uint16_t **y**

The target value of the Light xyL y state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_rcv_light_xyl_default_set_t**

Context of the received Light xyL Default Set message

Public Members

uint16_t **lightness**

The value of the Light Lightness Default state

uint16_t **x**

The value of the Light xyL x Default state

uint16_t **y**

The value of the Light xyL y Default state

struct **esp_ble_mesh_server_rcv_light_xyl_range_set_t**

Context of the received Light xyl Range Set message

Public Members

uint16_t **x_range_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **x_range_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **y_range_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **y_range_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp_ble_mesh_server_recv_light_lc_mode_set_t**

Context of the received Light LC Mode Set message

Public Members

uint8_t **mode**

The target value of the Light LC Mode state

struct **esp_ble_mesh_server_recv_light_lc_om_set_t**

Context of the received Light OM Set message

Public Members

uint8_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**

Context of the received Light LC Light OnOff Set message

Public Members

bool **op_en**

Indicate whether optional parameters included

uint8_t **light_onoff**

The target value of the Light LC Light OnOff state

uint8_t **tid**

Transaction Identifier

uint8_t **trans_time**

Time to complete state transition (optional)

uint8_t **delay**

Indicate message execution delay (C.1)

struct **esp_ble_mesh_server_recv_light_lc_property_set_t**

Context of the received Light LC Property Set message

Public Members

uint16_t **property_id**

Property ID identifying a Light LC Property

struct net_buf_simple ***property_value**

Raw value for the Light LC Property

struct **esp_ble_mesh_server_recv_sensor_status_t**

Context of the received Sensor Status message

Public Members

struct net_buf_simple ***data**

Value of sensor data state (optional)

struct **esp_ble_mesh_lighting_server_cb_param_t**

Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t ***model**

Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t **ctx**

Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t **value**

Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)

Define a new Light Lightness Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light Lightness Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI (cli_pub, cli_data)

Define a new Light CTL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light CTL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI (cli_pub, cli_data)

Define a new Light HSL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light HSL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI (cli_pub, cli_data)

Define a new Light xyL Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light xyL Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_CLI (cli_pub, cli_data)

Define a new Light LC Client Model.

Note: This API needs to be called for each element on which the application needs to have a Light LC Client Model.

Parameters

- **cli_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **cli_data** –Pointer to the unique struct *esp_ble_mesh_client_t*.

Returns New Light LC Client Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

Note: 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_srv_t*.

Returns New Light Lightness Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

Note: 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lightness_setup_srv_t*.

Returns New Light Lightness Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)

Define a new Light CTL Server Model.

Note: 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_srv_t*.

Returns New Light CTL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

Note: 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_setup_srv_t*.

Returns New Light CTL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

Note: 1. The Light CTL Temperature Server model extends the Generic Level Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_ctl_temp_srv_t*.

Returns New Light CTL Temperature Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)

Define a new Light HSL Server Model.

Note: 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- This model shall support model publication and model subscription.
 - The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_srv_t*.

Returns New Light HSL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)

Define a new Light HSL Setup Server Model.

Note: 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_setup_srv_t*.

Returns New Light HSL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

Note: 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_hue_srv_t*.

Returns New Light HSL Hue Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

Note: 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_hsl_sat_srv_t*.

Returns New Light HSL Saturation Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)

Define a new Light xyL Server Model.

Note: 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_srv_t*.

Returns New Light xyL Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

Note: 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_xyl_setup_srv_t*.

Returns New Light xyL Setup Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)

Define a new Light LC Server Model.

Note: 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_srv_t*.

Returns New Light LC Server Model instance.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)

Define a new Light LC Setup Server Model.

Note: 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

- a. This model shall support model publication and model subscription.
 - b. This model may be used to configure setup parameters for the Light LC Server model.
-

Parameters

- **srv_pub** –Pointer to the unique struct *esp_ble_mesh_model_pub_t*.
- **srv_data** –Pointer to the unique struct *esp_ble_mesh_light_lc_setup_srv_t*.

Returns New Light LC Setup Server Model instance.

Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,  
esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

Param event Event type

Param param Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,  
esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

Param event Event type

Param param Pointer to callback parameter

Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

Values:

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT**

enumerator **ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX**

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

Values:

enumerator **ESP_BLE_MESH_LC_OFF**

enumerator **ESP_BLE_MESH_LC_STANDBY**

enumerator **ESP_BLE_MESH_LC_FADE_ON**

enumerator **ESP_BLE_MESH_LC_RUN**

enumerator **ESP_BLE_MESH_LC_FADE**

enumerator **ESP_BLE_MESH_LC_PROLONG**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_AUTO**

enumerator **ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL**

enum **esp_ble_mesh_lighting_server_cb_event_t**

This enum value is the event of Lighting Server Model

Values:

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX**

2.3.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features

of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- [components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h](#)

Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Returns

- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note: This function should be called after the NimBLE host is deinitialized.

Returns

- ESP_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

Macros

`BLE_HCI_UART_H4_NONE`

`BLE_HCI_UART_H4_CMD`

`BLE_HCI_UART_H4_ACL`

`BLE_HCI_UART_H4_SCO`

`BLE_HCI_UART_H4_EVT`

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)
- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

`ESP_FAIL` (-1): Generic `esp_err_t` code indicating failure

`ESP_OK` (0): `esp_err_t` value indicating success (no error)

ESP_ERR_NO_MEM (**0x101**): Out of memory

ESP_ERR_INVALID_ARG (**0x102**): Invalid argument

ESP_ERR_INVALID_STATE (**0x103**): Invalid state

ESP_ERR_INVALID_SIZE (**0x104**): Invalid size

ESP_ERR_NOT_FOUND (**0x105**): Requested resource not found

ESP_ERR_NOT_SUPPORTED (**0x106**): Operation or feature not supported

ESP_ERR_TIMEOUT (**0x107**): Operation timed out

ESP_ERR_INVALID_RESPONSE (**0x108**): Received response was invalid

ESP_ERR_INVALID_CRC (**0x109**): CRC or checksum was invalid

ESP_ERR_INVALID_VERSION (**0x10a**): Version was invalid

ESP_ERR_INVALID_MAC (**0x10b**): MAC address was invalid

ESP_ERR_NOT_FINISHED (**0x10c**): There are items remained to retrieve

ESP_ERR_NVS_BASE (**0x1100**): Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED (**0x1101**): The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND (**0x1102**): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH (**0x1103**): The type of set or get operation doesn't match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY (**0x1104**): Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE (**0x1105**): There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME (**0x1106**): Namespace name doesn't satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE (**0x1107**): Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED (**0x1108**): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

ESP_ERR_NVS_KEY_TOO_LONG (**0x1109**): Key name is too long

ESP_ERR_NVS_PAGE_FULL (**0x110a**): Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE (**0x110b**): NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

ESP_ERR_NVS_INVALID_LENGTH (**0x110c**): String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES (**0x110d**): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

ESP_ERR_NVS_VALUE_TOO_LONG (**0x110e**): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND (**0x110f**): Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND (**0x1110**): NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED (**0x1111**): XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED (**0x1112**): XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED (**0x1113**): XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND (**0x1114**): XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED (0x1116): NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

ESP_ERR_NVS_WRONG_ENCRYPTION (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn't fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

ESP_ERR_EFUSE (0x1600): Base error code for efuse api.

ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING (0x1604): Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS (0x1605): Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

ESP_ERR_IMAGE_BASE (0x2000)

ESP_ERR_IMAGE_FLASH_FAIL (0x2001)

ESP_ERR_IMAGE_INVALID (0x2002)

ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes

ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF (**0x3004**): WiFi interface error

ESP_ERR_WIFI_MODE (**0x3005**): WiFi mode error

ESP_ERR_WIFI_STATE (**0x3006**): WiFi internal state error

ESP_ERR_WIFI_CONN (**0x3007**): WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS (**0x3008**): WiFi internal NVS module error

ESP_ERR_WIFI_MAC (**0x3009**): MAC address is invalid

ESP_ERR_WIFI_SSID (**0x300a**): SSID is invalid

ESP_ERR_WIFI_PASSWORD (**0x300b**): Password is invalid

ESP_ERR_WIFI_TIMEOUT (**0x300c**): Timeout error

ESP_ERR_WIFI_WAKE_FAIL (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK (**0x300e**): The caller would block

ESP_ERR_WIFI_NOT_CONNECT (**0x300f**): Station still in disconnect status

ESP_ERR_WIFI_POST (**0x3012**): Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE (**0x3013**): Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE (**0x3014**): Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC (**0x3015**): The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW (**0x3016**): The WiFi TX is disallowed

ESP_ERR_WIFI_DISCARD (**0x3017**): Discard frame

ESP_ERR_WIFI_REGISTRAR (**0x3033**): WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE (**0x3034**): WPS type error

ESP_ERR_WIFI_WPS_SM (**0x3035**): WPS state machine is not initialized

ESP_ERR_ESPNOW_BASE (**0x3064**): ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT (**0x3065**): ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG (**0x3066**): Invalid argument

ESP_ERR_ESPNOW_NO_MEM (**0x3067**): Out of memory

ESP_ERR_ESPNOW_FULL (**0x3068**): ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND (**0x3069**): ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL (**0x306a**): Internal error

ESP_ERR_ESPNOW_EXIST (**0x306b**): ESPNOW peer has existed

ESP_ERR_ESPNOW_IF (**0x306c**): Interface error

ESP_ERR_DPP_FAILURE (**0x3097**): Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE (**0x3098**): DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR (**0x3099**): Encountered invalid DPP Attribute

ESP_ERR_MESH_BASE (**0x4000**): Starting number of MESH error codes

ESP_ERR_ESP_NETIF_DHCP_START_FAILED (0x500d)
ESP_ERR_FLASH_BASE (0x6000): Starting number of flash error codes
ESP_ERR_FLASH_OP_FAIL (0x6001)
ESP_ERR_FLASH_OP_TIMEOUT (0x6002)
ESP_ERR_FLASH_NOT_INITIALISED (0x6003)

ESP_ERR_FLASH_UNSUPPORTED_HOST (0x6004)

ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)

ESP_ERR_FLASH_PROTECTED (0x6006)

ESP_ERR_HTTP_BASE (0x7000): Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn't been established yet

ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008): Read FIN from peer and the connection closed

ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn't be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8006): new connection in esp_tls_low_level_conn connection timed out

ESP_ERR_ESP_TLS_SE_FAILED (0x8007)

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN (0x8008)

ESP_ERR_MBEDTLS_CERT_PARTLY_OK (0x8010): mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED (0x8011): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED (0x8012): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED (0x8013): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8014): mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED (0x8015): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED (0x8016): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED (0x8017): mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED (0x8018): mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED (0x8019): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED (0x801a): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED (0x801b): mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED (0x801c): mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED (0x8031): wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8032): wolfSSL api returned error

ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED (0x8033): wolfSSL api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED (0x8034): wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED (0x8035): wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED (0x8036): wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED (0x8037): wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x8038): wolfSSL api returned failed

ESP_ERR_HTTPS_OTA_BASE (0x9000)

ESP_ERR_HTTPS_OTA_IN_PROGRESS (0x9001)

ESP_ERR_PING_BASE (0xa000)

ESP_ERR_PING_INVALID_PARAMS (0xa001)

ESP_ERR_PING_NO_MEM (0xa002)

ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated

ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread

ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes

ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem

ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)

ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)

ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)

ESP_ERR_MEMPROT_BASE (0xd000): Starting number of Memory Protection API error codes

ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)

ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)

ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)

ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)

ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)

ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)

ESP_ERR_MEMPROT_AREA_INVALID (0xd007)

ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)

ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes

ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out

ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)

ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer

ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed

2.5 Networking APIs

2.5.1 Wi-Fi

ESP-NOW

Overview ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.

- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

Add Paired Device Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Config ESP-NOW Rate Call `esp_wifi_config_espnow_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

Config ESP-NOW Power-saving Parameter Sleep is supported only when ESP32-C3 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnow](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW](#) repository.

API Reference

Header File

- [components/esp_wifi/include/esp_now.h](#)

Functions

esp_err_t **esp_now_init** (void)

Initialize ESPNOW function.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error

esp_err_t **esp_now_deinit** (void)

De-initialize ESPNOW function.

Returns

- ESP_OK : succeed

esp_err_t **esp_now_get_version** (uint32_t *version)

Get the version of ESPNOW.

Parameters *version* –ESPNOW version

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_register_recv_cb** (*esp_now_recv_cb_t* cb)

Register callback function of receiving ESPNOW data.

Parameters *cb* –callback function of receiving ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_recv_cb** (void)

Unregister callback function of receiving ESPNOW data.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

esp_err_t **esp_now_register_send_cb** (*esp_now_send_cb_t* cb)

Register callback function of sending ESPNOW data.

Parameters *cb* –callback function of sending ESPNOW data

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

esp_err_t **esp_now_unregister_send_cb** (void)

Unregister callback function of sending ESPNOW data.

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized

esp_err_t **esp_now_send** (const uint8_t *peer_addr, const uint8_t *data, size_t len)

Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr

Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list

Attention 3. The maximum length of data must be less than `ESP_NOW_MAX_DATA_LEN`

Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Parameters

- **peer_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

esp_err_t **esp_now_add_peer** (const *esp_now_peer_info_t* *peer)

Add a peer to peer list.

Parameters **peer** –peer information

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

esp_err_t **esp_now_del_peer** (const uint8_t *peer_addr)

Delete a peer from peer list.

Parameters **peer_addr** –peer MAC address

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

esp_err_t **esp_now_mod_peer** (const *esp_now_peer_info_t* *peer)

Modify a peer.

Parameters **peer** –peer information

Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

esp_err_t **esp_wifi_config_espnw_rate** (*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config ESPNOW rate of specified interface.

Attention 1. This API should be called after `esp_wifi_start()`.

Parameters

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_now_get_peer** (const uint8_t *peer_addr, *esp_now_peer_info_t* *peer)

Get a peer whose MAC address matches peer_addr from peer list.

Parameters

- **peer_addr** –peer MAC address
- **peer** –peer information

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

esp_err_t **esp_now_fetch_peer** (bool from_head, *esp_now_peer_info_t* *peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Parameters

- **from_head** –fetch from head of list or not
- **peer** –peer information

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

bool **esp_now_is_peer_exist** (const uint8_t *peer_addr)

Peer exists or not.

Parameters **peer_addr** –peer MAC address

Returns

- true : peer exists
- false : peer not exists

esp_err_t **esp_now_get_peer_num** (*esp_now_peer_num_t* *num)

Get the number of peers.

Parameters **num** –number of peers

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_pmk** (const uint8_t *pmk)

Set the primary master key.

Attention 1. primary master key is used to encrypt local master key

Parameters **pmk** –primary master key

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

esp_err_t **esp_now_set_wake_window** (uint16_t window)

Set wake window for esp_now to wake up in interval unit.

Attention 1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

Attention 2. Default value is the maximum.

Parameters **window** –Milliseconds would the chip keep waked each interval, from 0 to 65535.

Returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Structures

struct **esp_now_peer_info**

ESPNOW peer information parameters.

Public Members

uint8_t **peer_addr**[ESP_NOW_ETH_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8_t **lmk**[ESP_NOW_KEY_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void ***priv**

ESPNOW peer private data

struct **esp_now_peer_num**

Number of ESPNOW peers which exist currently.

Public Members

int **total_num**

Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int **encrypt_num**

Number of encrypted ESPNOW peers, maximum value is `ESP_NOW_MAX_ENCRYPT_PEER_NUM`

struct **esp_now_rcv_info**

ESPNOW packet information.

Public Members

uint8_t ***src_addr**

Source address of ESPNOW packet

uint8_t ***des_addr**

Destination address of ESPNOW packet

wifi_pkt_rx_ctrl_t ***rx_ctrl**

Rx control info of ESPNOW packet

Macros

ESP_ERR_ESPNOW_BASE

ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT

ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG

Invalid argument

ESP_ERR_ESPNOW_NO_MEM

Out of memory

ESP_ERR_ESPNOW_FULL

ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND

ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL

Internal error

ESP_ERR_ESPNOW_EXIST

ESPNOW peer has existed

ESP_ERR_ESPNOW_IF

Interface error

ESP_NOW_ETH_ALEN

Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN

Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM

Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM

Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN

Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct *esp_now_peer_info* **esp_now_peer_info_t**

ESPNOW peer information parameters.

typedef struct *esp_now_peer_num* **esp_now_peer_num_t**

Number of ESPNOW peers which exist currently.

typedef struct *esp_now_recv_info* **esp_now_recv_info_t**

ESPNOW packet information.

typedef void (***esp_now_recv_cb_t**)(const *esp_now_recv_info_t* *esp_now_info, const uint8_t *data, int data_len)

Callback function of receiving ESPNOW data.

Attention `esp_now_info` is a local variable, it can only be used in the callback.

Param `esp_now_info` received ESPNOW packet information

Param `data` received data

Param `data_len` length of received data

typedef void (***esp_now_send_cb_t**)(const uint8_t *mac_addr, *esp_now_send_status_t* status)

Callback function of sending ESPNOW data.

Param `mac_addr` peer MAC address

Param `status` status of sending ESPNOW data (succeed or fail)

Enumerations

enum **esp_now_send_status_t**

Status of sending ESPNOW data .

Values:

enumerator **ESP_NOW_SEND_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP_NOW_SEND_FAIL**

Send ESPNOW data fail

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-WIFI-MESH Programming Model*
2. *Writing an ESP-WIFI-MESH Application*
3. *Self Organized Networking*
4. *Application Examples*
5. *API Reference*

For documentation regarding the ESP-WIFI-MESH protocol, please see the [ESP-WIFI-MESH API Guide](#). For more information about ESP-WIFI-MESH Development Framework, please see [ESP-WIFI-MESH Development Framework](#).

ESP-WIFI-MESH Programming Model

Software Stack The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

Fig. 2: ESP-WIFI-MESH Software Stack

System Events An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

Fig. 3: ESP-WIFI-MESH System Events Delivery

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

Warning: When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

LwIP & ESP-WIFI-MESH The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```
ESP_ERROR_CHECK(esp_netif_init());

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. [Initialize Mesh](#)
2. [Configuring an ESP-WIFI-MESH Network](#)
3. [Start Mesh](#)

Initialize Mesh The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```

/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));

```

Configuring an ESP-WIFI-MESH Network ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code>
Router	Router Configuration, see <code>mesh_router_t</code>
Mesh AP	Mesh AP Configuration, see <code>mesh_ap_cfg_t</code>
Crypto Functions	Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```

/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
       strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
       strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

Start Mesh The following code snippet demonstrates how to start ESP-WIFI-MESH.

```

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.**

Toggle Self Organized Networking Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking  
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> Nodes already connected to a parent node will remain connected. Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.
	Y	<ul style="list-style-type: none"> A root node already connected to router will stay connected. A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.
Y	N	<ul style="list-style-type: none"> Nodes without a parent node will automatically select a preferred parent and connect. Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.
	Y	<ul style="list-style-type: none"> For a root node to connect to a parent node, it must give up it's role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.

The following code snippet demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

Calling Wi-Fi API There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using

ESP-WIFI-MESH.

```
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples ESP-IDF contains these ESP-WIFI-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- [components/esp_wifi/include/esp_mesh.h](#)

Functions

esp_err_t **esp_mesh_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

Attention This API shall be called after Wi-Fi is started.

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_deinit** (void)

Mesh de-initialization.

- Release resources **and** stop the mesh

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

Attention This API shall be called after mesh initialization and configuration.

Returns

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

esp_err_t **esp_mesh_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_send** (const *mesh_addr_t* *to, const *mesh_data_t* *data, int flag, const *mesh_opt_t* opt[], int opt_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

Parameters

- **to** –[in] the address of the final destination of the packet
 - If the packet is to the root, set this parameter to NULL.
 - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
 - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
 - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
 - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
 - Speed up the route search
 - * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
 - * If the packet is to an internal device, MESH_DATA_P2P should be set.
 - * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
 - * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
 - Specify whether this API is block or non-block, block by default
 - * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
 - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_rcv_toDS().
Generally, we suggest esp_mesh_rcv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_rcv_toDS() which avoids unnecessary memory copy.
- **opt** –[in] options
 - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
 - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **opt_count** –[in] option count
 - Currently, this API only takes one option, so opt_count is only supported to be 1.

Returns

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

esp_err_t esp_mesh_send_block_time (uint32_t time_ms)

Set blocking time of `esp_mesh_send()`

Attention This API shall be called before mesh is started.

Parameters `time_ms` –[in] blocking time of `esp_mesh_send()`, unit:ms

Returns

- ESP_OK

`esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

Parameters

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
 - Field proto is the data protocol in use. Should follow it to parse the received data.
 - Field tos is the transmission tos (type of service) in use.
- **timeout_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[out] bitmap for data received
 - MESH_DATA_FROMDS represents data from external IP network
 - MESH_DATA_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
 - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count** –[in] option count desired to receive
 - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Parameters

- **from** –[**out**] the address of the original source of the packet
- **to** –[**out**] the address contains remote IP address and port (IPv4:PORT)
- **data** –[**out**] pointer to the received packet
 - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** –[**in**] wait time if a packet isn't immediately available (0:no wait, port-MAX_DELAY:wait forever)
- **flag** –[**out**] bitmap for data received
 - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[**out**] options desired to receive
- **opt_count** –[**in**] option count desired to receive

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

esp_err_t **esp_mesh_set_config** (const *mesh_cfg_t* *config)

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

Attention This API shall be called before mesh is started after mesh is initialized.

Parameters **config** –[**in**] pointer to mesh stack configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_get_config** (*mesh_cfg_t* *config)

Get mesh stack configuration.

Parameters `config` –[out] pointer to mesh stack configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_router` (const *mesh_router_t* *router)

Get router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Parameters `router` –[in] pointer to router configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_get_router` (*mesh_router_t* *router)

Get router configuration.

Parameters `router` –[out] pointer to router configuration

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_id` (const *mesh_addr_t* *id)

Set mesh network ID.

Attention This API is used to dynamically modify the mesh network ID.

Parameters `id` –[in] pointer to mesh network ID

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

esp_err_t `esp_mesh_get_id` (*mesh_addr_t* *id)

Get mesh network ID.

Parameters `id` –[out] pointer to mesh network ID

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_set_type` (*mesh_type_t* type)

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Parameters `type` –[in] device type

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

mesh_type_t **esp_mesh_get_type** (void)

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Returns mesh type

esp_err_t **esp_mesh_set_max_layer** (int max_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Parameters **max_layer** –[in] max layer value

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

int **esp_mesh_get_max_layer** (void)

Get max layer value.

Returns max layer value

esp_err_t **esp_mesh_set_ap_password** (const uint8_t *pwd, int len)

Set mesh softAP password.

Attention This API shall be called before mesh is started.

Parameters

- **pwd** –[in] pointer to the password
- **len** –[in] password length

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_set_ap_authmode** (*wifi_auth_mode_t* authmode)

Set mesh softAP authentication mode.

Attention This API shall be called before mesh is started.

Parameters **authmode** –[in] authentication mode

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

wifi_auth_mode_t **esp_mesh_get_ap_authmode** (void)

Get mesh softAP authentication mode.

Returns authentication mode

esp_err_t **esp_mesh_set_ap_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

Parameters **connections** –[in] the number of max connections

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

int **esp_mesh_get_ap_connections** (void)

Get mesh max connection configuration.

Returns the number of mesh max connections

int **esp_mesh_get_non_mesh_connections** (void)

Get non-mesh max connection configuration.

Returns the number of non-mesh max connections

int **esp_mesh_get_layer** (void)

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Returns layer value

esp_err_t **esp_mesh_get_parent_bssid** (*mesh_addr_t* *bssid)

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Parameters **bssid** –[out] pointer to parent BSSID

Returns

- ESP_OK
- ESP_FAIL

bool **esp_mesh_is_root** (void)

Return whether the device is the root node of the network.

Returns true/false

esp_err_t **esp_mesh_set_self_organized** (bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

Attention This API is used to dynamically modify whether to enable the self organizing.

Parameters

- **enable** –[in] enable or disable self-organized networking
- **select_parent** –[in] Only valid when self-organized networking is enabled.
 - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

Returns

- ESP_OK
- ESP_FAIL

bool **esp_mesh_get_self_organized** (void)

Return whether enable self-organized networking or not.

Returns true/false

esp_err_t **esp_mesh_waive_root** (const *mesh_vote_t* *vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Parameters

- **vote** –[in] vote configuration
 - If this parameter is set NULL, the vote will perform the default 15 times.
 - Field percentage threshold is 0.9 by default.
 - Field `is_rc_specified` shall be false.
 - Field `attempts` shall be at least 15 times.
- **reason** –[in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

Returns

- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

esp_err_t **esp_mesh_set_vote_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Parameters `percentage` **–[in]** vote percentage threshold

Returns

- ESP_OK
- ESP_FAIL

float `esp_mesh_get_vote_percentage` (void)

Get vote percentage threshold for approval of being a root.

Returns percentage threshold

esp_err_t `esp_mesh_set_ap_assoc_expire` (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Parameters `seconds` **–[in]** the expired time

Returns

- ESP_OK
- ESP_FAIL

int `esp_mesh_get_ap_assoc_expire` (void)

Get mesh softAP associate expired time.

Returns seconds

int `esp_mesh_get_total_node_num` (void)

Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Returns total number of devices (including the root)

int `esp_mesh_get_routing_table_size` (void)

Get the number of devices in this device's sub-network (including self)

Returns the number of devices over this device's sub-network (including self)

esp_err_t `esp_mesh_get_routing_table` (*mesh_addr_t* *mac, int len, int *size)

Get routing table of this device's sub-network (including itself)

Parameters

- `mac` **–[out]** pointer to routing table
- `len` **–[in]** routing table size(in bytes)
- `size` **–[out]** pointer to the number of devices in routing table (including itself)

Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

esp_err_t `esp_mesh_post_toDS_state` (bool reachable)

Post the toDS state to the mesh stack.

Attention This API is only for the root.

Parameters **reachable** –[in] this state represents whether the root is able to access external IP network

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_tx_pending** (*mesh_tx_pending_t* *pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Parameters **pending** –[out] pointer to the TX pending

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_rx_pending** (*mesh_rx_pending_t* *pending)

Return the number of packets available in the queue waiting to be received by applications.

Parameters **pending** –[out] pointer to the RX pending

Returns

- ESP_OK
- ESP_FAIL

int **esp_mesh_available_txupQ_num** (const *mesh_addr_t* *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

Parameters

- **addr** –[in] self address or an associate children address
- **xseqno_in** –[out] sequence number of the last received packet from the specified address

Returns the number of upQ for a certain address

esp_err_t **esp_mesh_set_xon_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: $wnd = xon_qsize / (2 * max_connection + 1)$. However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

Attention This API shall be called before mesh is started.

Parameters **qsize** –[in] default:32 (min:16)

Returns

- ESP_OK
- ESP_FAIL

int **esp_mesh_get_xon_qsize** (void)

Get queue size.

Returns the number of queue

esp_err_t **esp_mesh_allow_root_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

Parameters **allowed** –[in] allow or not

Returns

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

bool **esp_mesh_is_root_conflicts_allowed** (void)

Check whether allow more than one root to exist in one network.

Returns true/false

esp_err_t **esp_mesh_set_group_id** (const *mesh_addr_t* *addr, int num)

Set group ID addresses.

Parameters

- **addr** –[in] pointer to new group ID addresses
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_delete_group_id** (const *mesh_addr_t* *addr, int num)

Delete group ID addresses.

Parameters

- **addr** –[in] pointer to deleted group ID address
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_group_num** (void)

Get the number of group ID addresses.

Returns the number of group ID addresses

esp_err_t **esp_mesh_get_group_list** (*mesh_addr_t* *addr, int num)

Get group ID addresses.

Parameters

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

bool **esp_mesh_is_my_group** (const *mesh_addr_t* *addr)

Check whether the specified group address is my group.

Returns true/false

esp_err_t **esp_mesh_set_capacity_num** (int num)

Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

Parameters **num** –[in] mesh network capacity

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

int **esp_mesh_get_capacity_num** (void)

Get mesh network capacity.

Returns mesh network capacity

esp_err_t **esp_mesh_set_ie_crypto_funcs** (const mesh_crypto_funcs_t *crypto_funcs)

Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

Parameters **crypto_funcs** –[in] crypto functions for mesh IE

- If **crypto_funcs** is set to NULL, mesh IE is no longer encrypted.

Returns

- ESP_OK

esp_err_t **esp_mesh_set_ie_crypto_key** (const char *key, int len)

Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Parameters

- **key** –[in] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_get_ie_crypto_key** (char *key, int len)

Get mesh IE crypto key.

Parameters

- **key** –[out] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

esp_err_t **esp_mesh_set_root_healing_delay** (int delay_ms)

Set delay time before starting root healing.

Parameters **delay_ms** –[in] delay time in milliseconds

Returns

- ESP_OK

int **esp_mesh_get_root_healing_delay** (void)

Get delay time before network starts root healing.

Returns delay time in milliseconds

esp_err_t **esp_mesh_fix_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters **enable** –[in] enable or not

Returns

- ESP_OK

bool **esp_mesh_is_root_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Returns true/false

esp_err_t **esp_mesh_set_parent** (const *wifi_config_t* *parent, const *mesh_addr_t* *parent_mesh_id, *mesh_type_t* my_type, int my_layer)

Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Parameters

- **parent** –[in] parent configuration, the SSID and the channel of the parent are mandatory.
 - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent_mesh_id** –[in] parent mesh ID,
 - If this value is not set, the original mesh ID is used.
- **my_type** –[in] mesh type
 - MESH_STA is not supported.
 - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- **my_layer** –[in] mesh layer
 - my_layer of the device may change after joining the network.
 - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
 - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

Returns

- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

esp_err_t **esp_mesh_scan_get_ap_ie_len** (int *len)

Get mesh networking IE length of one AP.

Parameters len –[out] mesh networking IE length

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_scan_get_ap_record** (*wifi_ap_record_t* *ap_record, void *buffer)

Get AP record.

Attention Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual_networking” example.

Parameters

- **ap_record** –[out] pointer to one AP record
- **buffer** –[out] pointer to the mesh networking IE of this AP

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG
- ESP_ERR_WIFI_FAIL

esp_err_t **esp_mesh_flush_upstream_packets** (void)

Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Returns

- ESP_OK

esp_err_t **esp_mesh_get_subnet_nodes_num** (const *mesh_addr_t* *child_mac, int *nodes_num)

Get the number of nodes in the subnet of a specific child.

Parameters

- **child_mac** –[in] an associated child address of this device
- **nodes_num** –[out] pointer to the number of nodes in the subnet of a specific child

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_get_subnet_nodes_list** (const *mesh_addr_t* *child_mac, *mesh_addr_t* *nodes, int nodes_num)

Get nodes in the subnet of a specific child.

Parameters

- **child_mac** –[in] an associated child address of this device
- **nodes** –[out] pointer to nodes in the subnet of a specific child
- **nodes_num** –[in] the number of nodes in the subnet of a specific child

Returns

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

esp_err_t **esp_mesh_disconnect** (void)

Disconnect from current parent.

Returns

- ESP_OK

esp_err_t **esp_mesh_connect** (void)

Connect to current parent.

Returns

- ESP_OK

esp_err_t **esp_mesh_flush_scan_result** (void)

Flush scan result.

Returns

- ESP_OK

esp_err_t **esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

Attention This API is only called by the root.

Parameters

- **new_bssid** **-[in]** the new router BSSID if the router changes
- **csa_newchan** **-[in]** the new channel number to which the whole network is moving
- **csa_count** **-[in]** channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

Returns

- ESP_OK

esp_err_t **esp_mesh_get_router_bssid** (uint8_t *router_bssid)

Get the router BSSID.

Parameters **router_bssid** **-[out]** pointer to the router BSSID

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG

int64_t **esp_mesh_get_tsf_time** (void)

Get the TSF time.

Returns the TSF time

esp_err_t **esp_mesh_set_topology** (*esp_mesh_topology_t* topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Parameters **topo** **-[in]** MESH_TOPO_TREE or MESH_TOPO_CHAIN

Returns

- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

esp_mesh_topology_t **esp_mesh_get_topology** (void)

Get mesh topology.

Returns MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_err_t **esp_mesh_enable_ps** (void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

esp_err_t **esp_mesh_disable_ps** (void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Returns

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

bool **esp_mesh_is_ps_enabled** (void)

Check whether the mesh Power Save function is enabled.

Returns true/false

bool **esp_mesh_is_device_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Returns true/false

esp_err_t **esp_mesh_set_active_duty_cycle** (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Parameters

- **dev_duty** **–[in]** device duty cycle
- **dev_duty_type** **–[in]** device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_active_duty_cycle** (int *dev_duty, int *dev_duty_type)

Get device duty cycle and type.

Parameters

- **dev_duty** **–[out]** device duty cycle
- **dev_duty_type** **–[out]** device PS duty cycle type

Returns

- ESP_OK

esp_err_t **esp_mesh_set_network_duty_cycle** (int nwk_duty, int duration_mins, int applied_rule)

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.

- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `(-1)`.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to `(-1)`; (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

Parameters

- **`nwk_duty`** `-[in]` network duty cycle
- **`duration_mins`** `-[in]` duration (unit: minutes)
- **`applied_rule`** `-[in]` only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

Returns

- ESP_OK
- ESP_FAIL

esp_err_t **esp_mesh_get_network_duty_cycle** (int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)

Get the network duty cycle, duration, type and rule.

Parameters

- **`nwk_duty`** `-[out]` current network duty cycle
- **`duration_mins`** `-[out]` the duration of current `nwk_duty`
- **`dev_duty_type`** `-[out]` if it includes `MESH_PS_DEVICE_DUTY_MASTER`, this device is the current NWK-DUTY-MASTER.
- **`applied_rule`** `-[out]` `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

Returns

- ESP_OK

int **esp_mesh_get_running_active_duty_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons,

and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Returns the running active duty cycle

esp_err_t **esp_mesh_ps_duty_signaling** (int fwd_times)

Duty signaling.

Parameters **fwd_times** –[in] the times of forwarding duty signaling packets

Returns

- ESP_OK

Unions

union **mesh_addr_t**

#include <esp_mesh.h> Mesh address.

Public Members

uint8_t **addr**[6]

mac address

mip_t **mip**

mip address

union **mesh_event_info_t**

#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t **channel_switch**

channel switch

mesh_event_child_connected_t **child_connected**

child connected

mesh_event_child_disconnected_t **child_disconnected**

child disconnected

mesh_event_routing_table_change_t **routing_table**

routing table change

mesh_event_connected_t **connected**

parent connected

mesh_event_disconnected_t **disconnected**

parent disconnected

mesh_event_no_parent_found_t **no_parent**

no parent found

mesh_event_layer_change_t **layer_change**

layer change

mesh_event_toDS_state_t **toDS_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t **vote_started**

vote started

mesh_event_root_address_t **root_addr**

root address

mesh_event_root_switch_req_t **switch_req**

root switch request

mesh_event_root_conflict_t **root_conflict**

other powerful root

mesh_event_root_fixed_t **root_fixed**

fixed root

mesh_event_scan_done_t **scan_done**

scan done

mesh_event_network_state_t **network_state**

network state, such as whether current mesh network has a root.

mesh_event_find_network_t **find_network**

network found that can join

mesh_event_router_switch_t **router_switch**

new router information

mesh_event_ps_duty_t **ps_duty**

PS duty information

union **mesh_rc_config_t**

#include <esp_mesh.h> Vote address configuration.

Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t **rc_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

Structures

struct **mip_t**

IP address and port.

Public Members

ip4_addr_t **ip4**

IP address

uint16_t **port**

port

struct **mesh_event_channel_switch_t**

Channel switch information.

Public Members

uint8_t **channel**

new channel

struct **mesh_event_connected_t**

Parent connected information.

Public Members

wifi_event_sta_connected_t **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16_t **self_layer**

layer

uint8_t **duty**

parent duty

struct **mesh_event_no_parent_found_t**

No parent found information.

Public Members

int **scan_times**

scan times being through

struct **mesh_event_layer_change_t**

Layer change information.

Public Members

uint16_t **new_layer**

new layer

struct **mesh_event_vote_started_t**

vote started information

Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

mesh_addr_t **rc_addr**

root address specified by users via API `esp_mesh_waive_root()`

struct **mesh_event_find_network_t**

find a mesh network that this device can join

Public Members

uint8_t **channel**

channel number of the new found network

uint8_t **router_bssid**[6]

router BSSID

struct **mesh_event_root_switch_req_t**

Root switch request information.

Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

mesh_addr_t **rc_addr**

the address of root switch requester

struct **mesh_event_root_conflict_t**

Other powerful root address.

Public Members

int8_t **rss_i**

rss_i with router

uint16_t **capacity**

the number of devices in current network

uint8_t **addr**[6]

other powerful root address

struct **mesh_event_routing_table_change_t**

Routing table change.

Public Members

uint16_t **rt_size_new**

the new value

uint16_t **rt_size_change**

the changed value

struct **mesh_event_root_fixed_t**

Root fixed.

Public Members

bool **is_fixed**

status

struct **mesh_event_scan_done_t**

Scan done event information.

Public Members

uint8_t **number**

the number of APs scanned

struct **mesh_event_network_state_t**

Network state information.

Public Members

bool **is_rootless**

whether current mesh network has a root

struct **mesh_event_ps_duty_t**

PS duty information.

Public Members

uint8_t **duty**

parent or child duty

[*mesh_event_child_connected_t*](#) **child_connected**

child info

struct **mesh_opt_t**

Mesh option.

Public Members

uint8_t **type**

option type

uint16_t **len**

option length

uint8_t ***val**

option value

struct **mesh_data_t**

Mesh data for esp_mesh_send() and esp_mesh_rcv()

Public Members

uint8_t ***data**

data

uint16_t **size**

data size

[*mesh_proto_t*](#) **proto**

data protocol

[*mesh_tos_t*](#) **tos**

data type of service

struct **mesh_router_t**

Router configuration.

Public Members

uint8_t **ssid**[32]
SSID

uint8_t **ssid_len**
length of SSID

uint8_t **bssid**[6]
BSSID, if this value is specified, users should also specify “allow_router_switch” .

uint8_t **password**[64]
password

bool **allow_router_switch**

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh_ap_cfg_t**
Mesh softAP configuration.

Public Members

uint8_t **password**[64]
mesh softAP password

uint8_t **max_connection**
max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t **nonmesh_max_connection**
max non-mesh connections

struct **mesh_cfg_t**
Mesh initialization configuration.

Public Members

uint8_t **channel**
channel, the mesh network on

bool **allow_channel_switch**
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t **mesh_id**

mesh network identification

mesh_router_t **router**

router configuration

mesh_ap_cfg_t **mesh_ap**

mesh softAP configuration

const *mesh_crypto_funcs_t* ***crypto_funcs**

crypto functions

struct **mesh_vote_t**

Vote.

Public Members

float **percentage**

vote percentage threshold for approval of being a root

bool **is_rc_specified**

if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t **config**

vote address configuration

struct **mesh_tx_pending_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int **to_parent**

to parent queue

int **to_parent_p2p**

to parent (P2P) queue

int **to_child**

to child queue

int **to_child_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh_rx_pending_t**

The number of packets available in the queue waiting to be received by applications.

Public Members

int **toDS**

to external DS

int **toSelf**

to self

Macros

MESH_ROOT_LAYER

root layer value

MESH_MTU

max transmit unit(in bytes)

MESH_MPS

max payload size(in bytes)

ESP_ERR_MESH_WIFI_NOT_START

Mesh error code definition.

Wi-Fi isn't started

ESP_ERR_MESH_NOT_INIT

mesh isn't initialized

ESP_ERR_MESH_NOT_CONFIG

mesh isn't configured

ESP_ERR_MESH_NOT_START

mesh isn't started

ESP_ERR_MESH_NOT_SUPPORT

not supported yet

ESP_ERR_MESH_NOT_ALLOWED

operation is not allowed

ESP_ERR_MESH_NO_MEMORY

out of memory

ESP_ERR_MESH_ARGUMENT

illegal argument

ESP_ERR_MESH_EXCEED_MTU

packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT

timeout

ESP_ERR_MESH_DISCONNECTED

disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL

queue fail

ESP_ERR_MESH_QUEUE_FULL

queue full

ESP_ERR_MESH_NO_PARENT_FOUND

no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND

no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL

no option found

ESP_ERR_MESH_OPTION_UNKNOWN

unknown option

ESP_ERR_MESH_XON_NO_WINDOW

no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE

low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_rcv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_rcv()

data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for esp_mesh_send() and esp_mesh_rcv()

data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR

return a remote IP address; used with esp_mesh_send() and esp_mesh_rcv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS

Flag of mesh networking IE.

vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE

no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND

root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED

fixed root

MESH_PS_DEVICE_DUTY_REQUEST

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND

requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**MESH_INIT_CONFIG_DEFAULT ()**

Type Definitions

typedef *mesh_addr_t* **mesh_event_root_address_t**

Root address.

typedef *wifi_event_sta_disconnected_t* **mesh_event_disconnected_t**

Parent disconnected information.

typedef *wifi_event_ap_staconnected_t* **mesh_event_child_connected_t**

Child connected information.

typedef *wifi_event_ap_stadisconnected_t* **mesh_event_child_disconnected_t**

Child disconnected information.

typedef *wifi_event_sta_connected_t* **mesh_event_router_switch_t**

New router information.

Enumerations

enum **mesh_event_id_t**

Enumerated list of mesh event id.

Values:

enumerator **MESH_EVENT_STARTED**

mesh is started

enumerator **MESH_EVENT_STOPPED**

mesh is stopped

enumerator **MESH_EVENT_CHANNEL_SWITCH**

channel switch

enumerator **MESH_EVENT_CHILD_CONNECTED**

a child is connected on softAP interface

enumerator **MESH_EVENT_CHILD_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH_EVENT_ROUTING_TABLE_ADD**

routing table is changed by adding newly joined children

enumerator **MESH_EVENT_ROUTING_TABLE_REMOVE**

routing table is changed by removing leave children

enumerator **MESH_EVENT_PARENT_CONNECTED**

parent is connected on station interface

enumerator **MESH_EVENT_PARENT_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH_EVENT_NO_PARENT_FOUND**

no parent found

enumerator **MESH_EVENT_LAYER_CHANGE**

layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator **MESH_EVENT_VOTE_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**

the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH_EVENT_PS_PARENT_DUTY**

parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**

child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**

device duty

enumerator **MESH_EVENT_MAX**enum **mesh_type_t**

Device type.

Values:

enumerator **MESH_IDLE**

hasn't joined the mesh network yet

enumerator **MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH_LEAF**

has no forwarding ability

enumerator **MESH_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**

Protocol of transmitted application data.

Values:

enumerator **MESH_PROTO_BIN**

binary

enumerator **MESH_PROTO_HTTP**

HTTP protocol

enumerator **MESH_PROTO_JSON**

JSON format

enumerator **MESH_PROTO_MQTT**

MQTT protocol

enumerator **MESH_PROTO_AP**

IP network mesh communication of node's AP interface

enumerator **MESH_PROTO_STA**

IP network mesh communication of node's STA interface

enum **mesh_tos_t**

For reliable transmission, mesh stack provides three type of services.

Values:

enumerator **MESH_TOS_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH_TOS_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH_TOS_DEF**

no retransmission on mesh stack

enum **mesh_vote_reason_t**

Vote reason.

Values:

enumerator **MESH_VOTE_REASON_ROOT_INITIATED**

vote is initiated by the root

enumerator **MESH_VOTE_REASON_CHILD_INITIATED**

vote is initiated by children

enum **mesh_disconnect_reason_t**

Mesh disconnect reason code.

Values:

enumerator **MESH_REASON_CYCLIC**

cyclic is detected

enumerator **MESH_REASON_PARENT_IDLE**

parent is idle

enumerator **MESH_REASON_LEAF**

the connected device is changed to a leaf

enumerator **MESH_REASON_DIFF_ID**

in different mesh ID

enumerator **MESH_REASON_ROOTS**

root conflict is detected

enumerator **MESH_REASON_PARENT_STOPPED**

parent has stopped the mesh

enumerator **MESH_REASON_SCAN_FAIL**

scan fail

enumerator **MESH_REASON_IE_UNKNOWN**

unknown IE

enumerator **MESH_REASON_WAIVE_ROOT**

waive root

enumerator **MESH_REASON_PARENT_WORSE**

parent with very poor RSSI

enumerator **MESH_REASON_EMPTY_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH_REASON_PARENT_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp_mesh_topology_t**

Mesh topology.

Values:

enumerator **MESH_TOPO_TREE**

tree topology

enumerator **MESH_TOPO_CHAIN**

chain topology

enum **mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

Values:

enumerator **MESH_TODS_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH_TODS_REACHABLE**

the root is able to access external IP network

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C3 devices, check [Provisioning API](#).

Application Example Connect ESP32-C3 to target AP using SmartConfig: [wifi/smart_config](#).

API Reference

Header File

- [components/esp_wifi/include/esp_smartconfig.h](#)

Functions

const char ***esp_smartconfig_get_version** (void)

Get the version of SmartConfig.

Returns

- SmartConfig version const char.

esp_err_t **esp_smartconfig_start** (const *smartconfig_start_config_t* *config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.

Attention 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

Parameters **config** –pointer to smartconfig start configure structure

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_esptouch_set_timeout** (uint8_t time_s)

Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Parameters `time_s` –range 15s~255s, offset:45s.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_set_type** (*smartconfig_type_t* type)

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

Parameters `type` –Choose from the `smartconfig_type_t`.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_fast_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API `esp_smartconfig_start`.

Attention 2. Fast mode have corresponding APP(phone).

Attention 3. Two mode is compatible.

Parameters `enable` –false-disable(default); true-enable;

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_smartconfig_get_rvd_data** (uint8_t *rvd_data, uint8_t len)

Get reserved data of ESPTouch v2.

Parameters

- `rvd_data` –reserved data
- `len` –length of reserved data

Returns

- ESP_OK: succeed
- others: fail

Structures

struct **smartconfig_event_got_ssid_pswd_t**

Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid_set**

whether set MAC address of target AP or not.

uint8_t **bssid**[6]

MAC address of target AP.

smartconfig_type_t **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8_t **cellphone_ip**[4]

IP address of cellphone.

struct **smartconfig_start_config_t**

Configure structure for esp_smartconfig_start

Public Members

bool **enable_log**

Enable smartconfig logs.

bool **esp_touch_v2_enable_crypt**

Enable ESPTouch v2 crypt.

char ***esp_touch_v2_key**

ESPTouch v2 crypt key, len should be 16.

Macros

SMARTCONFIG_START_CONFIG_DEFAULT ()

Enumerations

enum **smartconfig_type_t**

Values:

enumerator **SC_TYPE_ESPTOUCH**

protocol: ESPTouch

enumerator **SC_TYPE_AIRKISS**

protocol: AirKiss

enumerator **SC_TYPE_ESPTOUCH_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC_TYPE_ESPTOUCH_V2**

protocol: ESPTouch v2

enum **smartconfig_event_t**

Smartconfig event declarations

Values:

enumerator **SC_EVENT_SCAN_DONE**

ESP32 station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**

ESP32 station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**

ESP32 station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**

ESP32 station smartconfig has sent ACK to cellphone

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C3.
- Station/AP-coexistence mode (ESP32-C3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples The `wifi` directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple [esp-idf-template](#) application to demonstrate a minimal IDF project structure.

API Reference

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t **esp_wifi_init** (const *wifi_init_config_t* *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called

Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into *wifi_init_config_t* in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of *wifi_init_config_t* should always be WIFI_INIT_CONFIG_MAGIC!

Parameters **config** –pointer to WiFi initialized configuration structure; can point to a temporary variable.

Returns

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

esp_err_t **esp_wifi_deinit** (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_mode** (*wifi_mode_t* mode)

Set the WiFi operating mode.

Set the WiFi operating mode **as** station, soft-AP **or** station+soft-AP,
The default mode **is** station mode.

Parameters **mode** –WiFi operating mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_get_mode** (*wifi_mode_t* *mode)

Get current operating mode of WiFi.

Parameters **mode** –[out] store current WiFi mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_start** (void)

Start WiFi according to current configuration. If mode is WIFI_MODE_STA, it creates station control block and starts station. If mode is WIFI_MODE_AP, it creates soft-AP control block and starts soft-AP. If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and starts soft-AP and station.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_stop** (void)

Stop WiFi. If mode is WIFI_MODE_STA, it stops station and frees station control block. If mode is WIFI_MODE_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI_MODE_APSTA, it stops station/soft-AP and frees station/soft-AP control block.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_connect** (void)

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impacts WIFI_MODE_STA or WIFI_MODE_APSTA mode.

Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.

Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE.

Attention 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure_retry_cnt' feature in the '*wifi_sta_config_t*'. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

esp_err_t **esp_wifi_disconnect** (void)

Disconnect the ESP32 WiFi station from the AP.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

esp_err_t **esp_wifi_clear_fast_connect** (void)

Currently this API is just an stub API.

Returns

- ESP_OK: succeed
- others: fail

esp_err_t **esp_wifi_deauth_sta** (uint16_t aid)

deauthenticate all stations or associated id equals to aid

Parameters **aid** –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

esp_err_t **esp_wifi_scan_start** (const *wifi_scan_config_t* *config, bool block)

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Parameters

- **config** –configuration settings for scanning, if set to NULL default settings will be used of which default values are show_hidden:false, scan_type:active, scan_time.active.min:0, scan_time.active.max:120 miliseconds, scan_time.passive:360 miliseconds
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

esp_err_t **esp_wifi_scan_stop** (void)

Stop the scan in process.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_scan_get_ap_num** (uint16_t *number)

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Parameters **number** –[out] store number of APs found in last scan

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_scan_get_ap_records** (uint16_t *number, *wifi_ap_record_t* *ap_records)

Get AP list found in last scan.

Parameters

- **number** –[inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- **ap_records** –*wifi_ap_record_t* array to hold the found APs

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

esp_err_t **esp_wifi_clear_ap_list** (void)

Clear AP list found in last scan.

Attention When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_sta_get_ap_info** (*wifi_ap_record_t* *ap_info)

Get information of AP which the ESP32 station is associated with.

Attention When the obtained country information is empty, it means that the AP does not carry country information

Parameters **ap_info** –the *wifi_ap_record_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the *wifi_ap_record_t* struct. For example, phy_11b = 1 imply that ap support 802.11b mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don't initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

esp_err_t **esp_wifi_set_ps** (*wifi_ps_type_t* type)

Set current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Parameters **type** –power save type

Returns ESP_OK: succeed

esp_err_t **esp_wifi_get_ps** (*wifi_ps_type_t* *type)

Get current WiFi power save type.

Attention Default power save type is WIFI_PS_MIN_MODEM.

Parameters **type** –[out] store current power save type

Returns ESP_OK: succeed

esp_err_t **esp_wifi_set_protocol** (*wifi_interface_t* ifx, uint8_t protocol_bitmap)

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

Attention Support 802.11b or 802.11bg or 802.11bgn or LR mode

Parameters

- **ifx** –interfaces
- **protocol_bitmap** –WiFi protocol bitmap

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_protocol** (*wifi_interface_t* ifx, uint8_t *protocol_bitmap)

Get the current protocol bitmap of the specified interface.

Parameters

- **ifx** –interface
- **protocol_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_set_bandwidth** (*wifi_interface_t* ifx, *wifi_bandwidth_t* bw)

Set the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to configure an interface that is not enabled

Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

Parameters

- **ifx** –interface to be configured
- **bw** –bandwidth

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_bandwidth** (*wifi_interface_t* ifx, *wifi_bandwidth_t* *bw)

Get the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to get a interface that is not enable

Parameters

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_channel** (uint8_t primary, *wifi_second_chan_t* second)

Set primary/secondary channel of ESP32.

Attention 1. This API should be called after esp_wifi_start() and before esp_wifi_stop()

Attention 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

Attention 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs

Attention 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

Attention 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp_wifi_set_config() to store the channel info in NVS.

Parameters

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

esp_err_t **esp_wifi_get_channel** (uint8_t *primary, *wifi_second_chan_t* *second)

Get the primary/secondary channel of ESP32.

Attention 1. API return false if try to get a interface that is not enable

Parameters

- **primary** –store current primary channel
- **second** –[out] store current second channel

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_country** (const *wifi_country_t* *country)

configure country info

Attention 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

Attention 2. The default country is "01" (world safe mode) {.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}.

Attention 3. The third octet of country code string is one of the following: '0', 'O', 'I', 'X', otherwise it is considered as '0'.

Attention 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="US", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

Attention 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

Attention 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beamcon of the soft-AP is also changed.

Attention 7. The country configuration is stored into flash.

Attention 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Parameters **country** –the configured country info

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_get_country** (*wifi_country_t* *country)

get the current country info

Parameters **country** –country info

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_set_mac** (*wifi_interface_t* ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled

Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

Parameters

- **ifx** –interface
- **mac** –the MAC address

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

- others: refer to error codes in esp_err.h

esp_err_t **esp_wifi_get_mac** (*wifi_interface_t* ifx, uint8_t mac[6])

Get mac of specified interface.

Parameters

- **ifx** –interface
- **mac** –[out] store mac of the interface ifx

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

esp_err_t **esp_wifi_set_promiscuous_rx_cb** (*wifi_promiscuous_cb_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Parameters **cb** –callback

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_promiscuous** (bool en)

Enable the promiscuous mode.

Parameters **en** –false - disable, true - enable

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous** (bool *en)

Get the promiscuous mode.

Parameters **en** –[out] store the current status of promiscuous mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable the promiscuous mode packet type filter.

Note: The default filter is to filter all packets except WIFI_PKT_MISC

Parameters **filter** –the packet type filtered in promiscuous mode.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_filter** (*wifi_promiscuous_filter_t* *filter)

Get the promiscuous filter.

Parameters **filter** –[out] store the current status of promiscuous filter

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_promiscuous_ctrl_filter** (const *wifi_promiscuous_filter_t* *filter)

Enable subtype filter of the control packet in promiscuous mode.

Note: The default filter is to filter none control packet.

Parameters **filter** –the subtype of the control packet filtered in promiscuous mode.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_get_promiscuous_ctrl_filter** (*wifi_promiscuous_filter_t* *filter)

Get the subtype filter of the control packet in promiscuous mode.

Parameters **filter** –[out] store the current status of subtype filter of the control packet in promiscuous mode

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_set_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail

Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Attention 4. The configuration will be stored in NVS

Parameters

- **interface** –interface
- **conf** –station or soft-AP configuration

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

esp_err_t **esp_wifi_get_config** (*wifi_interface_t* interface, *wifi_config_t* *conf)

Get configuration of specified interface.

Parameters

- **interface** –interface
- **conf** –[out] station or soft-AP configuration

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

`esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)`

Get STAs associated with soft-AP.

Attention SSC only API

Parameters `sta` –[`out`] station list ap can get the connected sta's phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_lr` in the `wifi_sta_info_t` struct. For example, `phy_11b = 1` imply that sta support 802.11b mode

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)`

Get AID of STA connected with soft-AP.

Parameters

- `mac` –STA's mac address
- `aid` –[`out`] Store the AID corresponding to STA mac

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: Requested resource not found
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage (wifi_storage_t storage)`

Set the WiFi API configuration storage type.

Attention 1. The default value is `WIFI_STORAGE_FLASH`

Parameters `storage` –: storage type

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

`esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

Parameters

- `enable` –If true, specified IE is enabled. If false, specified IE is removed.
- `type` –Information Element type. Determines the frame type to associate with the IE.
- `idx` –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `wifi_vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init()`
- `ESP_ERR_INVALID_ARG`: Invalid argument, including if first byte of `vnd_ie` is not `WIFI_VENDOR_IE_ELEMENT_ID` (0xDD) or second byte is an invalid length.

- `ESP_ERR_NO_MEM`: Out of memory

esp_err_t **esp_wifi_set_vendor_ie_cb** (*esp_vendor_ie_cb_t* cb, void *ctx)

Register Vendor-Specific Information Element monitoring callback.

Parameters

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_set_max_tx_power** (int8_t power)

Set maximum transmitting power after WiFi start.

Attention 1. Maximum power before wifi startup is limited by PHY init data bin.

Attention 2. The value set by this API will be mapped to the `max_tx_power` of the structure *wifi_country_t* variable.

Attention 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

Attention 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

Attention 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

Parameters **power** –Maximum WiFi transmitting power.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is out of range

esp_err_t **esp_wifi_get_max_tx_power** (int8_t *power)

Get maximum transmitting power after WiFi start.

Parameters **power** –Maximum WiFi transmitting power, unit is 0.25dBm.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t **esp_wifi_set_event_mask** (uint32_t mask)

Set mask to enable or disable some WiFi events.

Attention 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

Attention 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRECVED`.

Attention 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

Parameters **mask** –WiFi event mask.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

esp_err_t **esp_wifi_get_event_mask** (uint32_t *mask)

Get mask of WiFi events.

Parameters *mask* –WiFi event mask.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_80211_tx** (*wifi_interface_t* ifx, const void *buffer, int len, bool en_sys_seq)

Send raw ieee80211 data.

Attention Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

Parameters

- **ifx** –interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** –raw ieee80211 buffer
- **len** –the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** –indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_INVALID_ARG is returned.

Returns

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

esp_err_t **esp_wifi_set_csi_rx_cb** (*wifi_csi_cb_t* cb, void *ctx)

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

Parameters

- **cb** –callback
- **ctx** –context argument, passed to callback function

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t **esp_wifi_set_csi_config** (const *wifi_csi_config_t* *config)

Set CSI data configuration.

return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled

- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters `config` –configuration

`esp_err_t esp_wifi_set_csi` (bool `en`)

Enable or disable CSI.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

Parameters `en` –true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio` (const `wifi_ant_gpio_config_t` *`config`)

Set antenna GPIO configuration.

Parameters `config` –Antenna GPIO configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

`esp_err_t esp_wifi_get_ant_gpio` (`wifi_ant_gpio_config_t` *`config`)

Get current antenna GPIO configuration.

Parameters `config` –Antenna GPIO configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`esp_err_t esp_wifi_set_ant` (const `wifi_ant_config_t` *`config`)

Set antenna configuration.

Parameters `config` –Antenna configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

`esp_err_t esp_wifi_get_ant` (`wifi_ant_config_t` *`config`)

Get current antenna configuration.

Parameters `config` –Antenna configuration.

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`int64_t esp_wifi_get_tsf_time` (`wifi_interface_t` `interface`)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Parameters **interface** –The interface whose tsf_time is to be retrieved.

Returns 0 or the TSF time

`esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)`

Set the inactive time of the ESP32 STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force death the STA. Default is 300s.

Attention 3. The inactive time configuration is not stored into flash

Parameters

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

`esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)`

Get inactive time of specified interface.

Parameters

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_stats_dump (uint32_t modules)`

Dump WiFi statistics.

Parameters **modules** –statistic modules to be dumped

Returns

- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)`

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

Attention If the user wants to receive another WIFI_EVENT_STA_BSS_RSSI_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

Parameters **rssi** –threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

esp_err_t **esp_wifi_ftm_initiate_session** (*wifi_ftm_initiator_cfg_t* *cfg)

Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention 1. Use this API only in Station mode.

Attention 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

Parameters **cfg** –FTM Initiator session configuration

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_end_session** (void)

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_ftm_resp_set_offset** (int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

Parameters **offset_cm** –T1 Offset to be added in centimeters

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_config_11b_rate** (*wifi_interface_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Attention 2. Only when really need to disable 11b rate call this API otherwise don't call this.

Parameters

- **ifx** –Interface to be configured.
- **disable** –true means disable 11b rate while false means enable 11b rate.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_connectionless_module_set_wake_interval** (uint16_t wake_interval)

Set wake interval for connectionless modules to wake up periodically.

Attention 1. Only one wake interval for all connectionless modules.

Attention 2. This configuration could work at connected status. When `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work at disconnected status.

Attention 3. Event `WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START` would be posted each time wake interval starts.

Attention 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)

Attention 5. Recommend to configure interval to `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE` to get stable performance at coexistence mode.

Parameters `wake_interval` –Milliseconds after would the chip wake up, from 1 to 65535.

esp_err_t `esp_wifi_set_country_code` (const char *country, bool ieee80211d_enabled)

configure country

Attention 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

Attention 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 4. The country configuration is stored into flash.

Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Attention 6. Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

Attention 8. The default country is “01” (world safe mode) and `ieee80211d_enabled` is TRUE.

Attention 9. The third octet of country code string is one of the following: ‘,’ , ‘O’ , ‘I’ , ‘X’ , otherwise it is considered as ‘.’.

Parameters

- **country** –the configured country ISO code
- **ieee80211d_enabled** –802.11d is enabled or not

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t `esp_wifi_get_country_code` (char *country)

get the current country code

Parameters `country` –country code

Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

esp_err_t `esp_wifi_config_80211_tx_rate` (*wifi_interface_t* ifx, *wifi_phy_rate_t* rate)

Config 80211 tx rate of specified interface.

Attention 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

Parameters

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_disable_pmf_config** (*wifi_interface_t* ifx)

Disable PMF configuration for specified interface.

Attention This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

Parameters **ifx** –Interface to be configured.

Returns

- ESP_OK: succeed
- others: failed

esp_err_t **esp_wifi_sta_get_aid** (uint16_t *aid)

Get the Association id assigned to STA by AP.

Attention aid = 0 if station is not connected to AP.

Parameters **aid** –[out] store the aid

Returns

- ESP_OK: succeed

esp_err_t **esp_wifi_sta_get_negotiated_phymode** (*wifi_phy_mode_t* *phymode)

Get the negotiated phymode after connection.

Parameters **phymode** –[out] store the negotiated phymode.

Returns

- ESP_OK: succeed

esp_err_t **esp_wifi_sta_get_rssi** (int *rssi)

Get the rssi info after station connected to AP.

Attention This API should be called after station connected to AP.

Parameters **rssi** –store the rssi info received from last beacon.

Returns

- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

Structures

struct **wifi_init_config_t**

WiFi stack configuration parameters passed to `esp_wifi_init` call.

Public Members

wifi_osi_funcs_t ***osi_funcs**

WiFi OS functions

wpa_crypto_funcs_t **wpa_crypto_funcs**

WiFi station crypto functions when connect

int **static_rx_buf_num**

WiFi static RX buffer number

int **dynamic_rx_buf_num**

WiFi dynamic RX buffer number

int **tx_buf_type**

WiFi TX buffer type

int **static_tx_buf_num**

WiFi static TX buffer number

int **dynamic_tx_buf_num**

WiFi dynamic TX buffer number

int **rx_mgmt_buf_type**

WiFi RX MGMT buffer type

int **rx_mgmt_buf_num**

WiFi RX MGMT buffer number

int **cache_tx_buf_num**

WiFi TX cache buffer number

int **csi_enable**

WiFi channel state information enable flag

int **ampdu_rx_enable**

WiFi AMPDU RX feature enable flag

int **ampdu_tx_enable**

WiFi AMPDU TX feature enable flag

int **amsdu_tx_enable**

WiFi AMSDU TX feature enable flag

int **nvs_enable**

WiFi NVS flash enable flag

int **nano_enable**

Nano option for printf/scan family enable flag

int **rx_ba_win**

WiFi Block Ack RX window size

int **wifi_task_core_id**

WiFi Task Core ID

int **beacon_max_len**

WiFi softAP maximum length of the beacon

int **mgmt_sbuf_num**

WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t **feature_caps**

Enables additional WiFi features and capabilities

bool **sta_disconnected_pm**

WiFi Power Management for station at disconnected status

int **espnow_max_encrypt_num**

Maximum encrypt number of peers supported by espnow

int **magic**

WiFi init magic number, it should be the last field

Macros

ESP_ERR_WIFI_NOT_INIT

WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED

WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED

WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF

WiFi interface error

ESP_ERR_WIFI_MODE

WiFi mode error

ESP_ERR_WIFI_STATE

WiFi internal state error

ESP_ERR_WIFI_CONN

WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS

WiFi internal NVS module error

ESP_ERR_WIFI_MAC

MAC address is invalid

ESP_ERR_WIFI_SSID

SSID is invalid

ESP_ERR_WIFI_PASSWORD

Password is invalid

ESP_ERR_WIFI_TIMEOUT

Timeout error

ESP_ERR_WIFI_WAKE_FAIL

WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK

The caller would block

ESP_ERR_WIFI_NOT_CONNECT

Station still in disconnect status

ESP_ERR_WIFI_POST

Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE

Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE

Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC

The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW

The WiFi TX is disallowed

ESP_ERR_WIFI_DISCARD

Discard frame

WIFI_STATIC_TX_BUFFER_NUM

WIFI_CACHE_TX_BUFFER_NUM

WIFI_DYNAMIC_TX_BUFFER_NUM

WIFI_RX_MGMT_BUF_NUM_DEF

WIFI_CSI_ENABLED

WIFI_AMPDU_RX_ENABLED

WIFI_AMPDU_TX_ENABLED

WIFI_AMSDU_TX_ENABLED

WIFI_NVS_ENABLED

WIFI_NANO_FORMAT_ENABLED

WIFI_DEFAULT_RX_BA_WIN

WIFI_TASK_CORE_ID

WIFI_SOFTAP_BEACON_MAX_LEN

WIFI_MGMT_SBUF_NUM

WIFI_STA_DISCONNECTED_PM_ENABLED

CONFIG_FEATURE_WPA3_SAE_BIT

CONFIG_FEATURE_CACHE_TX_BUF_BIT

CONFIG_FEATURE_FTM_INITIATOR_BIT

CONFIG_FEATURE_FTM_RESPONDER_BIT

WIFI_INIT_CONFIG_DEFAULT()

ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE

Type Definitions

typedef void (***wifi_promiscuous_cb_t**)(void *buf, *wifi_promiscuous_pkt_type_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (*wifi_promiscuous_pkt_t* or *wifi_pkt_rx_ctrl_t*) indicated by 'type' parameter.

Param type promiscuous packet type.

typedef void (***esp_vendor_ie_cb_t**)(void *ctx, *wifi_vendor_ie_type_t* type, const uint8_t sa[6], const *vendor_ie_data_t* *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.

Param vnd_ie Pointer to the vendor specific element data received.

Param rssi Received signal strength indication.

```
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data **is** received, the callback function will be called.

Param ctx context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.

Param data CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- [components/esp_wifi/include/esp_wifi_types.h](#)

Unions

```
union wifi_config_t
```

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t **ap**

configuration of AP

wifi_sta_config_t **sta**

configuration of STA

Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

Public Members

char **cc**[3]

country code string

uint8_t **schan**

start channel

uint8_t **nchan**

total channel number

int8_t **max_tx_power**

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

wifi_country_policy_t **policy**

country policy

struct **wifi_active_scan_time_t**

Range of active scan times per channel.

Public Members

uint32_t **min**

minimum active scan time per channel, units: millisecond

uint32_t **max**

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_time_t**

Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t **active**

active scan time per channel, units: millisecond.

uint32_t **passive**

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct **wifi_scan_config_t**

Parameters for an SSID scan.

Public Members

uint8_t ***ssid**

SSID of AP

uint8_t ***bssid**

MAC address of AP

uint8_t **channel**

channel, scan the specific channel

bool **show_hidden**

enable to scan AP whose SSID is hidden

wifi_scan_type_t **scan_type**

scan type, active or passive

wifi_scan_time_t **scan_time**

scan time per channel

uint8_t **home_chan_dwell_time**

time spent at home channel between scanning consecutive channels.

struct **wifi_ap_record_t**

Description of a WiFi AP.

Public Members

uint8_t **bssid**[6]

MAC address of AP

uint8_t **ssid**[33]

SSID of AP

uint8_t **primary**

channel of AP

wifi_second_chan_t **second**

secondary channel of AP

int8_t **rsqi**

signal strength of AP. Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive

wifi_auth_mode_t **authmode**

authmode of AP

wifi_cipher_type_t **pairwise_cipher**

pairwise cipher of AP

wifi_cipher_type_t **group_cipher**

group cipher of AP

wifi_ant_t **ant**

antenna used to receive beacon from AP

uint32_t **phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **wps**

bit: 4 flag to identify if WPS is supported or not

uint32_t **ftm_responder**

bit: 5 flag to identify if FTM is supported in responder mode

uint32_t **ftm_initiator**

bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t **reserved**

bit: 7..31 reserved

wifi_country_t **country**

country information of AP

struct **wifi_scan_threshold_t**

Structure describing parameters for a WiFi fast scan.

Public Members

int8_t **rss**

The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t **authmode**

The weakest authmode to accept in the fast scan mode Note: In case this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

struct **wifi_pmf_config_t**

Configuration structure for Protected Management Frame

Public Members

bool **capable**

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool **required**

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct **wifi_ap_config_t**

Soft-AP configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]

SSID of ESP32 soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

uint8_t **password**[64]

Password of ESP32 soft-AP.

uint8_t **ssid_len**

Optional length of SSID field.

uint8_t **channel**

Channel of soft-AP

wifi_auth_mode_t **authmode**

Auth mode of soft-AP. Do not support AUTH_WEP, AUTH_WAPI_PSK and AUTH_OWE in soft-AP mode. When the auth mode is set to WPA2_PSK, WPA2_WPA3_PSK or WPA3_PSK, the pairwise cipher will be overwritten with WIFI_CIPHER_TYPE_CCMP.

uint8_t **ssid_hidden**

Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**

Max number of stations allowed to connect in

uint16_t **beacon_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t **pairwise_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool **ftm_responder**

Enable FTM Responder mode

wifi_pmf_config_t **pmf_cfg**

Configuration for Protected Management Frame

struct **wifi_sta_config_t**

STA configuration settings for the ESP32.

Public Members

uint8_t **ssid**[32]

SSID of target AP.

uint8_t **password**[64]

Password of target AP.

wifi_scan_method_t **scan_method**

do all channel scan or fast scan

bool **bssid_set**

whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t **bssid**[6]

MAC address of target AP

uint8_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t **listen_interval**

Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t **sort_method**

sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t **threshold**

When scan_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t **pmf_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t **rm_enabled**

Whether Radio Measurements are enabled for the connection

uint32_t **btm_enabled**

Whether BSS Transition Management is enabled for the connection

uint32_t **mbo_enabled**

Whether MBO is enabled for the connection

uint32_t **ft_enabled**

Whether FT is enabled for the connection

uint32_t **owe_enabled**

Whether OWE is enabled for the connection

uint32_t **transition_disable**

Whether to enable transition disable feature

uint32_t **reserved**

Reserved for future feature set

wifi_sae_pwe_method_t **sae_pwe_h2e**

Configuration for SAE PWE derivation method

uint8_t **failure_retry_cnt**

Number of connection retries station will do before moving to next AP. `scan_method` should be set as `WIFI_ALL_CHANNEL_SCAN` to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

struct **wifi_sta_info_t**

Description of STA associated with AP.

Public Members

uint8_t **mac**[6]

mac address

int8_t **rssi**

current average rssi of sta connected

uint32_t **phy_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32_t **phy_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32_t **phy_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32_t **phy_lr**

bit: 3 flag to identify if low rate is enabled or not

uint32_t **is_mesh_child**

bit: 4 flag to identify mesh child

uint32_t **reserved**

bit: 5..31 reserved

struct **wifi_sta_list_t**

List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t **sta**[ESP_WIFI_MAX_CONN_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor_ie_data_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t **element_id**

Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8_t **vendor_oui**[3]

Vendor identifier (OUI).

uint8_t **vendor_oui_type**

Vendor-specific OUI type.

uint8_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi_pkt_rx_ctrl_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed **rssi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **__pad0__**

reserved

unsigned **sig_mode**

0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **__pad1__**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **__pad2__**

reserved

unsigned **smoothing**

reserved

unsigned **not_sounding**

reserved

unsigned **__pad3__**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec_coding**

Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **__pad4__**

reserved

unsigned **ampdu_cnt**

ampdu cnt

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **__pad5__**
reserved

unsigned **timestamp**
timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad6__**
reserved

signed **noise_floor**
noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **__pad7__**
reserved

unsigned **__pad8__**
reserved

unsigned **__pad9__**
reserved

unsigned **ant**
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **__pad10__**
reserved

unsigned **__pad11__**
reserved

unsigned **__pad12__**
reserved

unsigned **sig_len**
length of packet including Frame Check Sequence(FCS)

unsigned **__pad13__**
reserved

unsigned **rx_state**
state of the packet. 0: no error; others: error numbers which are not public

struct **wifi_promiscuous_pkt_t**
Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

metadata header

uint8_t **payload**[0]

Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct **wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t **filter_mask**

OR of one or more filter values WIFI_PROMIS_FILTER_*

struct **wifi_csi_config_t**

Channel state information(CSI) configuration type.

Public Members

bool **lltf_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc_htltf2_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf_merge_en**

enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool **channel_filter_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct **wifi_csi_info_t**

CSI data type.

Public Members

wifi_pkt_rx_ctrl_t **rx_ctrl**

received packet radio metadata header of the CSI data

uint8_t **mac**[6]

source MAC address of the CSI data

uint8_t **dmac**[6]

destination MAC address of the CSI data

bool **first_word_invalid**

first four bytes of the CSI data is invalid or not

int8_t ***buf**

buffer of CSI data

uint16_t **len**

length of CSI data

struct **wifi_ant_gpio_t**

WiFi GPIO configuration for antenna selection.

Public Members

uint8_t **gpio_select**

Whether this GPIO is connected to external antenna switch

uint8_t **gpio_num**

The GPIO number that connects to external antenna switch

struct **wifi_ant_gpio_config_t**

WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t **gpio_cfg**[4]

The configurations of GPIOs that connect to external antenna switch

struct **wifi_ant_config_t**

WiFi antenna configuration.

Public Members

wifi_ant_mode_t **rx_ant_mode**

WiFi antenna mode for receiving

wifi_ant_t rx_ant_default

Default antenna mode for receiving, it's ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode

WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t enabled_ant0

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1

Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct **wifi_action_tx_req_t**

Action Frame Tx Request.

Public Members**wifi_interface_t ifx**

WiFi interface to send request to

uint8_t dest_mac[6]

Destination MAC address

bool no_ack

Indicates no ack required

wifi_action_rx_cb_t rx_cb

Rx Callback to receive any response

uint32_t data_len

Length of the appended Data

uint8_t data[0]

Appended Data payload

struct **wifi_ftm_initiator_cfg_t**

FTM Initiator configuration.

Public Members**uint8_t resp_mac[6]**

MAC address of the FTM Responder

uint8_t channel

Primary channel of the FTM Responder

`uint8_t frm_count`

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

`uint16_t burst_period`

Requested time period between consecutive FTM bursts in 100['] s of milliseconds (0 - No pref)

struct `wifi_event_sta_scan_done_t`

Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

`uint32_t status`

status of scanning APs: 0 —success, 1 - failure

`uint8_t number`

number of scan results

`uint8_t scan_id`

scan sequence number, used for block scan

struct `wifi_event_sta_connected_t`

Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

`uint8_t ssid[32]`

SSID of connected AP

`uint8_t ssid_len`

SSID length of connected AP

`uint8_t bssid[6]`

BSSID of connected AP

`uint8_t channel`

channel of connected AP

`wifi_auth_mode_t authmode`

authentication mode used by AP

struct `wifi_event_sta_disconnected_t`

Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t **ssid**[32]

SSID of disconnected AP

uint8_t **ssid_len**

SSID length of disconnected AP

uint8_t **bssid**[6]

BSSID of disconnected AP

uint8_t **reason**

reason of disconnection

int8_t **rssi**

rssi of disconnection

struct **wifi_event_sta_authmode_change_t**

Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t **old_mode**

the old auth mode of AP

wifi_auth_mode_t **new_mode**

the new auth mode of AP

struct **wifi_event_sta_wps_er_pin_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_sta_wps_er_success_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t **ap_cred_cnt**

Number of AP credentials received

uint8_t **ssid**[MAX_SSID_LEN]

SSID of AP

uint8_t **passphrase**[MAX_PASSPHRASE_LEN]

Passphrase for the AP

struct *wifi_event_sta_wps_er_success_t*::[anonymous] **ap_cred**[MAX_WPS_AP_CRED]

All AP credentials received from WPS handshake

struct **wifi_event_ap_staconnected_t**

Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station connected to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gives to the station connected to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_stadisconnected_t**

Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t **mac**[6]

MAC address of the station disconnects to ESP32 soft-AP

uint8_t **aid**

the aid that ESP32 soft-AP gave to the station disconnects to

bool **is_mesh_child**

flag to identify mesh child

struct **wifi_event_ap_probe_req_rx_t**

Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int **rss_i**

Received probe request signal strength

uint8_t **mac**[6]

MAC address of the station which send probe request

struct **wifi_event_bss_rssi_low_t**

Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members**int32_t rssi**

RSSI value of bss

struct **wifi_ftm_report_entry_t**

Argument structure for

Public Members**uint8_t dlog_token**

Dialog Token of the FTM frame

int8_t rssi

RSSI of the FTM frame received

uint32_t rtt

Round Trip Time in pSec with a peer

uint64_t t1

Time of departure of FTM frame from FTM Responder in pSec

uint64_t t2

Time of arrival of FTM frame at FTM Initiator in pSec

uint64_t t3

Time of departure of ACK from FTM Initiator in pSec

uint64_t t4

Time of arrival of ACK at FTM Responder in pSec

struct **wifi_event_ftm_report_t**

Argument structure for WIFI_EVENT_FTM_REPORT event

Public Members**uint8_t peer_mac[6]**

MAC address of the FTM Peer

wifi_ftm_status_t **status**

Status of the FTM operation

uint32_t rtt_raw

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t **dist_est**

Estimated one-way distance in Centi-Meters

wifi_ftm_report_entry_t ***ftm_report_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8_t **ftm_report_num_entries**

Number of entries in the FTM Report data

struct **wifi_event_action_tx_status_t**

Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

Public Members

wifi_interface_t **ifx**

WiFi interface to send request to

uint32_t **context**

Context to identify the request

uint8_t **da**[6]

Destination MAC address

uint8_t **status**

Status of the operation

struct **wifi_event_roc_done_t**

Argument structure for WIFI_EVENT_ROC_DONE event

Public Members

uint32_t **context**

Context to identify the request

struct **wifi_event_ap_wps_rg_pin_t**

Argument structure for WIFI_EVENT_AP_WPS_RG_PIN event

Public Members

uint8_t **pin_code**[8]

PIN code of station in enrollee mode

struct **wifi_event_ap_wps_rg_fail_reason_t**

Argument structure for WIFI_EVENT_AP_WPS_RG_FAILED event

Public Members

wps_fail_reason_t **reason**

WPS failure reason `wps_fail_reason_t`

`uint8_t` **peer_macaddr**[6]

Enrollee mac address

struct **wifi_event_ap_wps_rg_success_t**

Argument structure for `WIFI_EVENT_AP_WPS_RG_SUCCESS` event

Public Members

`uint8_t` **peer_macaddr**[6]

Enrollee mac address

Macros

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL

WIFI_PROTOCOL_11B

WIFI_PROTOCOL_11G

WIFI_PROTOCOL_11N

WIFI_PROTOCOL_LR

ESP_WIFI_MAX_CONN_NUM

max number of stations which can connect to ESP32C3 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL

filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT

filter the packets with type of `WIFI_PKT_MGMT`

WIFI_PROMIS_FILTER_MASK_CTRL

filter the packets with type of `WIFI_PKT_CTRL`

WIFI_PROMIS_FILTER_MASK_DATA

filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC

filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU

filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU

filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL

filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL

filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER

filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR

filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA

filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL

filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS

filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS

filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK

filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND

filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK

filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL

mask all WiFi events

WIFI_EVENT_MASK_NONE

mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED

mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN**MAX_PASSPHRASE_LEN****MAX_WPS_AP_CRED****WIFI_STATIS_BUFFER****WIFI_STATIS_RXTX****WIFI_STATIS_HW****WIFI_STATIS_DIAG****WIFI_STATIS_PS****WIFI_STATIS_ALL**

Type Definitions

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

Param hdr pointer to the IEEE 802.11 Header structure**Param payload** pointer to the Payload following 802.11 Header**Param len** length of the Payload**Param channel** channel number the frame is received on

Enumerations

enum **wifi_mode_t***Values:*enumerator **WIFI_MODE_NULL**

null mode

enumerator **WIFI_MODE_STA**

WiFi station mode

enumerator **WIFI_MODE_AP**

WiFi soft-AP mode

enumerator **WIFI_MODE_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI_MODE_MAX**

enum **wifi_second_chan_t**

Values:

enumerator **WIFI_SECOND_CHAN_NONE**

the channel width is HT20

enumerator **WIFI_SECOND_CHAN_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI_SECOND_CHAN_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi_scan_type_t**

Values:

enumerator **WIFI_SCAN_TYPE_ACTIVE**

active scan

enumerator **WIFI_SCAN_TYPE_PASSIVE**

passive scan

enum **wifi_cipher_type_t**

Values:

enumerator **WIFI_CIPHER_TYPE_NONE**

the cipher type is none

enumerator **WIFI_CIPHER_TYPE_WEP40**

the cipher type is WEP40

enumerator **WIFI_CIPHER_TYPE_WEP104**

the cipher type is WEP104

enumerator **WIFI_CIPHER_TYPE_TKIP**

the cipher type is TKIP

enumerator **WIFI_CIPHER_TYPE_CCMP**

the cipher type is CCMP

enumerator **WIFI_CIPHER_TYPE_TKIP_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI_CIPHER_TYPE_AES_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI_CIPHER_TYPE_SMS4**

the cipher type is SMS4

enumerator **WIFI_CIPHER_TYPE_GCMP**

the cipher type is GCMP

enumerator **WIFI_CIPHER_TYPE_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI_CIPHER_TYPE_AES_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI_CIPHER_TYPE_AES_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI_CIPHER_TYPE_UNKNOWN**

the cipher type is unknown

enum **wifi_ant_t**

WiFi antenna.

Values:

enumerator **WIFI_ANT_ANT0**

WiFi antenna 0

enumerator **WIFI_ANT_ANT1**

WiFi antenna 1

enumerator **WIFI_ANT_MAX**

Invalid WiFi antenna

enum **wifi_scan_method_t**

Values:

enumerator **WIFI_FAST_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI_ALL_CHANNEL_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi_sort_method_t**

Values:

enumerator **WIFI_CONNECT_AP_BY_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI_CONNECT_AP_BY_SECURITY**

Sort match AP in scan list by security mode

enum **wifi_ps_type_t**

Values:

enumerator **WIFI_PS_NONE**

No power save

enumerator **WIFI_PS_MIN_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi_sta_config_t](#)

enum **wifi_bandwidth_t**

Values:

enumerator **WIFI_BW_HT20**

enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**

Configuration for SAE PWE derivation

Values:

enumerator **WPA3_SAE_PWE_UNSPECIFIED**

enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**

enumerator **WPA3_SAE_PWE_HASH_TO_ELEMENT**

enumerator **WPA3_SAE_PWE_BOTH**

enum **wifi_storage_t**

Values:

enumerator **WIFI_STORAGE_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI_STORAGE_RAM**

all configuration will only store in the memory

enum **wifi_vendor_ie_type_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

enumerator **WIFI_VND_IE_TYPE_BEACON**

enumerator **WIFI_VND_IE_TYPE_PROBE_REQ**

enumerator **WIFI_VND_IE_TYPE_PROBE_RESP**

enumerator **WIFI_VND_IE_TYPE_ASSOC_REQ**

enumerator **WIFI_VND_IE_TYPE_ASSOC_RESP**

enum **wifi_vendor_ie_id_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

enumerator **WIFI_VND_IE_ID_0**

enumerator **WIFI_VND_IE_ID_1**

enum **wifi_phy_mode_t**

Operation Phymode.

Values:

enumerator **WIFI_PHY_MODE_LR**

PHY mode for Low Rate

enumerator **WIFI_PHY_MODE_11B**

PHY mode for 11b

enumerator **WIFI_PHY_MODE_11G**

PHY mode for 11g

enumerator **WIFI_PHY_MODE_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI_PHY_MODE_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI_PHY_MODE_HE20**

PHY mode for Bandwidth HE20

enum **wifi_promiscuous_pkt_type_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator **WIFI_PKT_MGMT**

Management frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_CTRL**

Control frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_DATA**

Data frame, indicates 'buf' argument is *wifi_promiscuous_pkt_t*

enumerator **WIFI_PKT_MISC**

Other type, such as MIMO etc. 'buf' argument is *wifi_promiscuous_pkt_t* but the payload is zero length.

enum **wifi_ant_mode_t**

WiFi antenna mode.

Values:

enumerator **WIFI_ANT_MODE_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI_ANT_MODE_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI_ANT_MODE_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI_ANT_MODE_MAX**

Invalid WiFi enabled antenna

enum **wifi_phy_rate_t**

WiFi PHY rate encodings.

Values:

enumerator **WIFI_PHY_RATE_1M_L**

1 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_L**

2 Mbps with long preamble

enumerator **WIFI_PHY_RATE_5M_L**

5.5 Mbps with long preamble

enumerator **WIFI_PHY_RATE_11M_L**

11 Mbps with long preamble

enumerator **WIFI_PHY_RATE_2M_S**

2 Mbps with short preamble

enumerator **WIFI_PHY_RATE_5M_S**

5.5 Mbps with short preamble

enumerator **WIFI_PHY_RATE_11M_S**

11 Mbps with short preamble

enumerator **WIFI_PHY_RATE_48M**

48 Mbps

enumerator **WIFI_PHY_RATE_24M**

24 Mbps

enumerator **WIFI_PHY_RATE_12M**

12 Mbps

enumerator **WIFI_PHY_RATE_6M**

6 Mbps

enumerator **WIFI_PHY_RATE_54M**

54 Mbps

enumerator **WIFI_PHY_RATE_36M**

36 Mbps

enumerator **WIFI_PHY_RATE_18M**

18 Mbps

enumerator **WIFI_PHY_RATE_9M**

9 Mbps

enumerator **WIFI_PHY_RATE_MCS0_LGI**

MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_LGI**

MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_LGI**

MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_LGI**

MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_LGI**

MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_LGI**

MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_LGI**

MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_LGI**

MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS0_SGI**

MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS1_SGI**

MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS2_SGI**

MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS3_SGI**

MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS4_SGI**

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS5_SGI**

MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS6_SGI**

MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_MCS7_SGI**

MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

enumerator **WIFI_PHY_RATE_LORA_250K**

250 Kbps

enumerator **WIFI_PHY_RATE_LORA_500K**

500 Kbps

enumerator **WIFI_PHY_RATE_MAX**

enum **wifi_event_t**

WiFi event declarations

Values:

enumerator **WIFI_EVENT_WIFI_READY**

ESP32 WiFi ready

enumerator **WIFI_EVENT_SCAN_DONE**

ESP32 finish scanning AP

enumerator **WIFI_EVENT_STA_START**

ESP32 station start

enumerator **WIFI_EVENT_STA_STOP**

ESP32 station stop

enumerator **WIFI_EVENT_STA_CONNECTED**

ESP32 station connected to AP

enumerator **WIFI_EVENT_STA_DISCONNECTED**

ESP32 station disconnected from AP

enumerator **WIFI_EVENT_STA_AUTHMODE_CHANGE**

the auth mode of AP connected by ESP32 station changed

enumerator **WIFI_EVENT_STA_WPS_ER_SUCCESS**

ESP32 station wps succeeds in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_FAILED**

ESP32 station wps fails in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_TIMEOUT**

ESP32 station wps timeout in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PIN**

ESP32 station wps pin code in enrollee mode

enumerator **WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP**

ESP32 station wps overlap in enrollee mode

enumerator **WIFI_EVENT_AP_START**

ESP32 soft-AP start

enumerator **WIFI_EVENT_AP_STOP**

ESP32 soft-AP stop

enumerator **WIFI_EVENT_AP_STA_CONNECTED**

a station connected to ESP32 soft-AP

enumerator **WIFI_EVENT_AP_STA_DISCONNECTED**

a station disconnected from ESP32 soft-AP

enumerator **WIFI_EVENT_AP_PROBREQ_RECVED**

Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**

Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**

AP' s RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**

Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**

Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**

ESP32 station beacon timeout

enumerator **WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START**

ESP32 connectionless module wake interval start

enumerator **WIFI_EVENT_AP_WPS_RG_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PBC_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI_EVENT_MAX**

Invalid WiFi event ID

enum **wifi_event_sta_wps_fail_reason_t**

Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

enumerator **WPS_FAIL_REASON_NORMAL**

ESP32 WPS normal fail reason

enumerator **WPS_FAIL_REASON_RECV_M2D**

ESP32 WPS receive M2D frame

enumerator **WPS_FAIL_REASON_MAX**

enum **wifi_ftm_status_t**

FTM operation status types.

Values:

enumerator **FTM_STATUS_SUCCESS**

FTM exchange is successful

enumerator **FTM_STATUS_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM_STATUS_CONF_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM_STATUS_NO_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM_STATUS_FAIL**

Unknown error during FTM exchange

enum **wps_fail_reason_t**

Values:

enumerator **WPS_AP_FAIL_REASON_NORMAL**

WPS normal fail reason

enumerator **WPS_AP_FAIL_REASON_CONFIG**

WPS failed due to incorrect config

enumerator **WPS_AP_FAIL_REASON_AUTH**

WPS failed during auth

enumerator **WPS_AP_FAIL_REASON_MAX**

Header File

- [components/wpa_supplicant/esp_supplicant/include/esp_eap_client.h](#)

Functions

esp_err_t **esp_wifi_sta_enterprise_enable** (void)

Enable EAP authentication(WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

Note: Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

Returns

- **ESP_OK**: EAP authentication enabled successfully.
- **ESP_ERR_NO_MEM**: Failed to enable EAP authentication due to memory allocation failure.

esp_err_t **esp_wifi_sta_enterprise_disable** (void)

Disable EAP authentication(WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

Note: Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using `esp_wifi_set_config()`.

Returns

- **ESP_OK**: EAP authentication disabled successfully.
- **ESP_ERR_INVALID_STATE**: EAP client is in an invalid state for disabling.

esp_err_t **esp_eap_client_set_identity** (const unsigned char *identity, int len)

Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

Parameters

- **identity** –[in] Pointer to the identity data.
- **len** –[in] Length of the identity data (limited to 1~127 bytes).

Returns

- ESP_OK: The identity was set successfully.
- ESP_ERR_INVALID_ARG: Invalid argument (len <= 0 or len >= 128).
- ESP_ERR_NO_MEM: Memory allocation failure.

void **esp_eap_client_clear_identity** (void)

Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

esp_err_t **esp_eap_client_set_username** (const unsigned char *username, int len)

Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

Parameters

- **username** –[in] Pointer to the username data.
- **len** –[in] Length of the username data (limited to 1~127 bytes).

Returns

- ESP_OK: The username was set successfully.
- ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
- ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void **esp_eap_client_clear_username** (void)

Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

esp_err_t **esp_eap_client_set_password** (const unsigned char *password, int len)

Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

Parameters

- **password** –[in] Pointer to the password data.
- **len** –[in] Length of the password data (len > 0).

Returns

- ESP_OK: The password was set successfully.
- ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
- ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void **esp_eap_client_clear_password** (void)

Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

esp_err_t **esp_eap_client_set_new_password** (const unsigned char *new_password, int len)

Set a new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR_PASSWD_EXPIRED is received.

Parameters

- **new_password** –[in] Pointer to the new password data.
- **len** –[in] Length of the new password data.

Returns

- ESP_OK: The new password was set successfully.
- ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
- ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void **esp_eap_client_clear_new_password** (void)

Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

esp_err_t **esp_eap_client_set_ca_cert** (const unsigned char *ca_cert, int ca_cert_len)

Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

Parameters

- **ca_cert** –[in] Pointer to the CA certificate data.
- **ca_cert_len** –[in] Length of the CA certificate data.

Returns

- ESP_OK: The CA certificate was set successfully.

void **esp_eap_client_clear_ca_cert** (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

esp_err_t **esp_eap_client_set_certificate_and_key** (const unsigned char *client_cert, int client_cert_len, const unsigned char *private_key, int private_key_len, const unsigned char *private_key_password, int private_key_passwd_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

Attention 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

Attention 2. The client_cert, private_key, and private_key_password should be zero-terminated.

Parameters

- **client_cert** –[in] Pointer to the client certificate data.
- **client_cert_len** –[in] Length of the client certificate data.
- **private_key** –[in] Pointer to the private key data.
- **private_key_len** –[in] Length of the private key data (limited to 1~4096 bytes).
- **private_key_password** –[in] Pointer to the private key password data (optional).
- **private_key_passwd_len** –[in] Length of the private key password data (can be 0 for no password).

Returns

- ESP_OK: The certificate, private key, and password (if provided) were set successfully.

void **esp_eap_client_clear_certificate_and_key** (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

esp_err_t **esp_eap_client_set_disable_time_check** (bool disable)

Set EAP client certificates time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

Parameters **disable** –[in] True to disable EAP client certificates time check, false to enable it.

Returns

- ESP_OK: The EAP client certificates time check setting was updated successfully.

esp_err_t **esp_eap_client_get_disable_time_check** (bool *disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

Parameters **disable** –[out] Pointer to a boolean variable to store the disable status.

Returns

- ESP_OK: The status of EAP client certificates time check was retrieved successfully.

esp_err_t **esp_eap_client_set_ttls_phase2_method** (*esp_eap_ttls_phase2_types* type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.

Parameters **type** –[in] The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

Returns

- ESP_OK: The EAP-TTLS phase 2 method was set successfully.

esp_err_t **esp_eap_client_set_suiteb_192bit_certification** (bool enable)

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

Parameters **enable** –[in] True to enable 192-bit Suite-B certification checks, false to disable it.

Returns

- ESP_OK: The 192-bit Suite-B certification checks were set successfully.

esp_err_t **esp_eap_client_set_pac_file** (const unsigned char *pac_file, int pac_file_len)

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client's credentials.

Attention 1. For files read from the file system, length has to be decremented by 1 byte.

Attention 2. Disabling the WPA_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

Parameters

- **pac_file** –[in] Pointer to the PAC file buffer.
- **pac_file_len** –[in] Length of the PAC file buffer.

Returns

- ESP_OK: The PAC file for EAP-FAST authentication was set successfully.

esp_err_t **esp_eap_client_set_fast_params** (*esp_eap_fast_config* config)

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

Attention 1. Disabling the WPA_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

Parameters **config** –[in] Configuration structure with Fast Provisioning parameters.

Returns

- ESP_OK: The parameters for EAP-FAST Phase 1 authentication were set successfully.

esp_err_t **esp_eap_client_use_default_cert_bundle** (bool use_default_bundle)

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

Parameters **use_default_bundle** **–[in]** True to use the default certificate bundle, false to use a custom bundle.

Returns

- ESP_OK: The option to use the default certificate bundle was set successfully.

Structures

struct **esp_eap_fast_config**

Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).

This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

Public Members

int **fast_provisioning**

Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int **fast_max_pac_list_len**

Maximum length of the PAC (Protected Access Credential) list

bool **fast_pac_format_binary**

Set to true for binary format PAC, false for ASCII format PAC

Enumerations

enum **esp_eap_tls_phase2_types**

Enumeration of phase 2 authentication types for EAP-TTLS.

This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.

Values:

enumerator **ESP_EAP_TTLS_PHASE2_EAP**

EAP (Extensible Authentication Protocol)

enumerator **ESP_EAP_TTLS_PHASE2_MSCHAPV2**

MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

enumerator **ESP_EAP_TTLS_PHASE2_MSCHAP**

MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

enumerator **ESP_EAP_TTLS_PHASE2_PAP**

PAP (Password Authentication Protocol)

enumerator **ESP_EAP_TTLS_PHASE2_CHAP**

CHAP (Challenge Handshake Authentication Protocol)

Header File

- [components/wpa_supplicant/esp_supplicant/include/esp_wps.h](#)

Functions

esp_err_t **esp_wifi_wps_enable** (const *esp_wps_config_t* *config)

Enable Wi-Fi WPS function.

Parameters *config* –: WPS config to be used in connection

Returns

- **ESP_OK** : succeed
- **ESP_ERR_WIFI_WPS_TYPE** : wps type is invalid
- **ESP_ERR_WIFI_WPS_MODE** : wifi is not in station mode or sniffer mode is on
- **ESP_FAIL** : wps initialization fails

esp_err_t **esp_wifi_wps_disable** (void)

Disable Wi-Fi WPS function and release resource it taken.

Returns

- **ESP_OK** : succeed
- **ESP_ERR_WIFI_WPS_MODE** : wifi is not in station mode or sniffer mode is on

esp_err_t **esp_wifi_wps_start** (int timeout_ms)

Start WPS session.

Attention WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

Parameters *timeout_ms* –: deprecated: This argument' s value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See *wifi_event_t* enum for more info.

Returns

- **ESP_OK** : succeed
- **ESP_ERR_WIFI_WPS_TYPE** : wps type is invalid
- **ESP_ERR_WIFI_WPS_MODE** : wifi is not in station mode or sniffer mode is on
- **ESP_ERR_WIFI_WPS_SM** : wps state machine is not initialized
- **ESP_FAIL** : wps initialization fails

esp_err_t **esp_wifi_ap_wps_enable** (const *esp_wps_config_t* *config)

Enable Wi-Fi AP WPS function.

Attention WPS can only be used when softAP is enabled.

Parameters *config* –wps configuration to be used.

Returns

- **ESP_OK** : succeed
- **ESP_ERR_WIFI_WPS_TYPE** : wps type is invalid
- **ESP_ERR_WIFI_WPS_MODE** : wifi is not in station mode or sniffer mode is on
- **ESP_FAIL** : wps initialization fails

esp_err_t **esp_wifi_ap_wps_disable** (void)

Disable Wi-Fi SoftAP WPS function and release resource it taken.

Returns

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on

esp_err_t **esp_wifi_ap_wps_start** (const unsigned char *pin)

WPS starts to work.

Attention WPS can only be used when softAP is enabled.

Parameters **pin** –: Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during *esp_wifi_ap_wps_enable()* and reported in WIFI_EVENT_AP_WPS_RG_PIN

Returns

- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wps type is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM : wps state machine is not initialized
- ESP_FAIL : wps initialization fails

Structures

struct **wps_factory_information_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

Public Members

char **manufacturer**[WPS_MAX_MANUFACTURER_LEN]

Manufacturer of the device. If empty, the default manufacturer is used.

char **model_number**[WPS_MAX_MODEL_NUMBER_LEN]

Model number of the device. If empty, the default model number is used.

char **model_name**[WPS_MAX_MODEL_NAME_LEN]

Model name of the device. If empty, the default model name is used.

char **device_name**[WPS_MAX_DEVICE_NAME_LEN]

Device name. If empty, the default device name is used.

struct **esp_wps_config_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

Public Members

wps_type_t **wps_type**

The type of WPS to be used (PBC or PIN).

wps_factory_information_t **factory_info**

Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

char **pin**[PIN_LEN]

WPS PIN (Personal Identification Number) used when `wps_type` is set to `WPS_TYPE_PIN`.

Macros

ESP_ERR_WIFI_REGISTRAR

WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE

WPS type error

ESP_ERR_WIFI_WPS_SM

WPS state machine is not initialized

WPS_MAX_MANUFACTURER_LEN

Maximum length of the manufacturer name in WPS information

WPS_MAX_MODEL_NUMBER_LEN

Maximum length of the model number in WPS information

WPS_MAX_MODEL_NAME_LEN

Maximum length of the model name in WPS information

WPS_MAX_DEVICE_NAME_LEN

Maximum length of the device name in WPS information

PIN_LEN

The length of the WPS PIN (Personal Identification Number).

WPS_CONFIG_INIT_DEFAULT (type)

Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a *esp_wps_config_t* structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

Parameters

- **type** –The WPS type to be used (PBC or PIN).

Returns An initialized *esp_wps_config_t* structure with the specified WPS type and default values.

Type Definitions

typedef enum *wps_type* **wps_type_t**

Enumeration of WPS (Wi-Fi Protected Setup) types.

Enumerations

enum **wps_type**

Enumeration of WPS (Wi-Fi Protected Setup) types.

Values:

enumerator **WPS_TYPE_DISABLE**

WPS is disabled

enumerator **WPS_TYPE_PBC**

WPS Push Button Configuration method

enumerator **WPS_TYPE_PIN**

WPS PIN (Personal Identification Number) method

enumerator **WPS_TYPE_MAX**

Maximum value for WPS type enumeration

Header File

- [components/wpa_supplicant/esp_supplicant/include/esp_rrm.h](#)

Functions

int **esp_rrm_send_neighbor_rep_request** (*neighbor_rep_request_cb* cb, void *cb_ctx)

Send Radio measurement neighbor report request to connected AP.

Parameters

- **cb** –callback function for neighbor report
- **cb_ctx** –callback context

Returns

- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

bool **esp_rrm_is_rrm_supported_connection** (void)

Check RRM capability of connected AP.

Returns

- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

Type Definitions

typedef void (***neighbor_rep_request_cb**)(void *ctx, const uint8_t *report, size_t report_len)

Callback function type to get neighbor report.

Param ctx neighbor report context

Param report neighbor report

Param report_len neighbor report length

Return

- void

Header File

- [components/wpa_supplicant/esp_supplicant/include/esp_wnm.h](#)

Functions

int **esp_wmm_send_bss_transition_mgmt_query** (enum *btm_query_reason* query_reason, const char *btm_candidates, int cand_list)

Send bss transition query to connected AP.

Parameters

- **query_reason** –reason for sending query
- **btm_candidates** –btm candidates list if available
- **cand_list** –whether candidate list to be included from scan results available in supplicant's cache.

Returns

- 0: success
- -1: AP does not support BTM
- -2: station not connected to AP

bool **esp_wmm_is_btm_supported_connection** (void)

Check bss transition capability of connected AP.

Returns

- true: AP supports BTM
- false: AP does not support BTM or station not connected to AP

Enumerations

enum **btm_query_reason**

enum btm_query_reason: Reason code for sending btm query

Values:

enumerator **REASON_UNSPECIFIED**

enumerator **REASON_FRAME_LOSS**

enumerator **REASON_DELAY**

enumerator **REASON_BANDWIDTH**

enumerator **REASON_LOAD_BALANCE**

enumerator **REASON_RSSI**

enumerator **REASON_RETRANSMISSIONS**

enumerator **REASON_INTERFERENCE**

enumerator **REASON_GRAY_ZONE**

enumerator **REASON_PREMIUM_AP**

Header File

- `components/wpa_supplicant/esp_supplicant/include/esp_mbo.h`

Functions

int **esp_mbo_update_non_pref_chan** (struct *non_pref_chan_s* *non_pref_chan)

Update channel preference for MBO IE.

Parameters *non_pref_chan* –Non preference channel list

Returns

- 0: success else failure

Structures

struct **non_pref_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

Public Members

enum *non_pref_chan_reason* **reason**

Reason for the channel being non-preferred

uint8_t **oper_class**

Operating class of the channel

uint8_t **chan**

Channel number

uint8_t **preference**

Preference level of the channel

struct **non_pref_chan_s**

Structure representing a list of non-preferred channels in a wireless network.

This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

Public Members

size_t **non_pref_chan_num**

Number of non-preferred channels in the list

struct *non_pref_chan* **chan** []

Array of structures representing individual non-preferred channels

Enumerations

enum **non_pref_chan_reason**

Enumeration of reasons for a channel being non-preferred in a wireless network.

This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

Values:

enumerator **NON_PREF_CHAN_REASON_UNSPECIFIED**

Unspecified reason for non-preference

enumerator **NON_PREF_CHAN_REASON_RSSI**

Non-preferred due to low RSSI (Received Signal Strength Indication)

enumerator **NON_PREF_CHAN_REASON_EXT_INTERFERENCE**

Non-preferred due to external interference

enumerator **NON_PREF_CHAN_REASON_INT_INTERFERENCE**

Non-preferred due to internal interference

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-C3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

Application Example Example on how to provision ESP32-C3 using a supported smartphone: [wifi/wifi_easy_connect/dpp-enrollee](#).

API Reference

Header File

- [components/wpa_supplicant/esp_supplicant/include/esp_dpp.h](#)

Functions

`esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)`

Initialize DPP Supplicant.

Starts DPP Supplicant and initializes related Data Structures.

return

- ESP_OK: Success
- ESP_FAIL: Failure

Parameters `evt_cb` –Callback function to receive DPP related events

void `esp_supp_dpp_deinit` (void)

De-initialize DPP Supplicant.

Frees memory **from** DPP Supplicant Data Structures.

esp_err_t `esp_supp_dpp_bootstrap_gen` (const char *chan_list, *esp_supp_dpp_bootstrap_t* type, const char *key, const char *info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information **as** an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Parameters

- **chan_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

Returns

- ESP_OK: Success
- ESP_FAIL: Failure

esp_err_t `esp_supp_dpp_start_listen` (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel **from** Channel List **for** a pre-defined wait time.

Returns

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)

Stop listening on Channels.

Stops listening on Channels **and** cancels ongoing listen operation.

Macros

ESP_ERR_DPP_FAILURE

Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE

DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR

Encountered invalid DPP Attribute

Type Definitionstypedef enum *dpp_bootstrap_type* **esp_supp_dpp_bootstrap_t**

Types of Bootstrap Methods for DPP.

typedef void (***esp_supp_dpp_event_cb_t**)(*esp_supp_dpp_event_t* evt, void *data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called **with** DPP related information.

Param evt DPP event ID**Param data** Event data payload**Enumerations**enum **dpp_bootstrap_type**

Types of Bootstrap Methods for DPP.

*Values:*enumerator **DPP_BOOTSTRAP_QR_CODE**

QR Code Method

enumerator **DPP_BOOTSTRAP_PKEX**

Proof of Knowledge Method

enumerator **DPP_BOOTSTRAP_NFC_URI**

NFC URI record Method

enum **esp_supp_dpp_event_t**

Types of Callback Events received from DPP Supplicant.

*Values:*enumerator **ESP_SUPP_DPP_URI_READY**

URI is ready through Bootstrapping

enumerator **ESP_SUPP_DPP_CFG_RECVD**

Config received via DPP Authentication

enumerator **ESP_SUPP_DPP_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.Code examples for ESP-WIFI-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

2.5.2 Ethernet

Ethernet

Overview ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc control of Ethernet driver*

Basic Ethernet Concepts Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

Fig. 4: Ethernet Data Frame Format

Preamble and Start-of-Frame Delimiter The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

Destination Address The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

Source Address The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

Type / Length The type/length field is a 2-byte field, if the value in this field is ≤ 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is ≥ 1536 , it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

Payload The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

Padding and FCS The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and

CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

Note: Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They're not supported in ESP-IDF.

Configure MAC and PHY Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

Create MAC and PHY Instance Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default_
↪common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY_
↪configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY_
↪address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO_
↪used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
```

(continues on next page)

(continued from previous page)

```

gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

```

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don't have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's spec and the examples in `esp-idf`.

Install Driver To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```

esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↳configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the_
↳handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver

```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```

/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that running in
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↳// register Ethernet event handler (to deal with user specific stuffs when event
↳like link up/down happened)

```

Start Ethernet Driver After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

Connect Driver to TCP/IP Stack Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can't obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to [LwIP](#).

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to [Network Interface](#).

```

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)

```

(continues on next page)

(continued from previous page)

```

{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

```

Warning: It is recommended to fully initialize the Ethernet driver and network interface prior registering user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user's handlers.

Misc control of Ethernet driver The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
↳addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

Flow control Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with

the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

Application Examples

- Ethernet basic example: [ethernet/basic](#).
- Ethernet iperf example: [ethernet/iperf](#).
- Ethernet to Wi-Fi AP “router” : [ethernet/eth2ap](#).
- Most of protocol examples should also work for Ethernet: [protocols](#).

Advanced Topics

Custom PHY Driver There are multiple PHY manufactures with their wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies user’s actual needs due to either price, features, stock availability etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in 22.2.4 Management functions section. It defines provisions of so called “MII Management Interface” for the purposes of controlling the PHY and gathering status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration etc. This basic management functionality is addressed by [esp_eth/src/esp_eth_phy_802_3.c](#) in ESP-IDF and so it makes a creation of new custom PHY chip driver quite a simple task.

Note: Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

Majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp_eth/src/esp_eth_phy_802_3.c](#) however, the following may require developing chip specific management functions:

- link status which is almost always chip specific,
- chip initialization, even though it is not strictly required, should be customized to at least ensure that expected chip is used and
- chip specific features configuration.

Steps to create custom PHY driver:

1. Define vendor specific registry layout based on PHY datasheet. See [esp_eth/src/esp_eth_phy_ip101.c](#) as an example.
2. Prepare derived PHY management object infostructure which
 - must contain at least parent IEEE 802.3 [phy_802_3_t](#) object and
 - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp_eth/src/esp_eth_phy_ksz80xx.c](#) as an example.
3. Define chip specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among with other users via [IDF Component Registry](#).

API Reference

Header File

- `components/esp_eth/include/esp_eth.h`

Header File

- `components/esp_eth/include/esp_eth_driver.h`

Functions

esp_err_t **esp_eth_driver_install** (const *esp_eth_config_t* *config, *esp_eth_handle_t* *out_hdl)

Install Ethernet driver.

Parameters

- **config** –[in] configuration of the Ethernet driver
- **out_hdl** –[out] handle of Ethernet driver

Returns

- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there's no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_driver_uninstall** (*esp_eth_handle_t* hdl)

Uninstall Ethernet driver.

Note: It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_start** (*esp_eth_handle_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

Note: This API will start driver state machine and internal software timer (for checking link status).

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

esp_err_t **esp_eth_stop** (*esp_eth_handle_t* hdl)

Stop Ethernet driver.

Note: This function does the oppsite operation of `esp_eth_start`.

Parameters **hdl** –[in] handle of Ethernet driver

Returns

- `ESP_OK`: stop `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: stop `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: stop `esp_eth` driver failed because driver has not started yet
- `ESP_FAIL`: stop `esp_eth` driver failed because some other error occurred

esp_err_t **esp_eth_update_input_path** (*esp_eth_handle_t* hdl, *esp_err_t* (*stack_input)(*esp_eth_handle_t* hdl, *uint8_t* *buffer, *uint32_t* length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note: After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **stack_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

Returns

- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

esp_err_t **esp_eth_transmit** (*esp_eth_handle_t* hdl, void *buf, *size_t* length)

General Transmit.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

Returns

- `ESP_OK`: transmit frame buffer successfully
- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

esp_err_t **esp_eth_transmit_vargs** (*esp_eth_handle_t* hdl, *uint32_t* argc, ...)

Special Transmit with variable number of arguments.

Parameters

- **hdl** –[in] handle of Ethernet driver
- **argc** –[in] number variable arguments
- ... –variable arguments

Returns

- `ESP_OK`: transmit successfull

- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_ioctl (esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)`

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- `ETH_CMD_S_MAC_ADDR` sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- `ETH_CMD_G_MAC_ADDR` gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- `ETH_CMD_S_PHY_ADDR` sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- `ETH_CMD_G_PHY_ADDR` gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- `ETH_CMD_S_AUTONEGO` enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- `ETH_CMD_G_AUTONEGO` gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.
- `ETH_CMD_S_SPEED` sets the Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_SPEED` gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- `ETH_CMD_S_PROMISCUOUS` sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_FLOW_CTRL` sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- `ETH_CMD_S_DUPLEX_MODE` sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

Parameters

- `hdl` –[in] handle of Ethernet driver
- `cmd` –[in] IO control command
- `data` –[inout] address of data for `set` command or address where to store the data when used with `get` command

Returns

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

`esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)`

Increase Ethernet driver reference.

Note: Ethernet driver handle can be obtained by `os_timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

Parameters `hdl` –[in] handle of Ethernet driver

Returns

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

esp_err_t `esp_eth_decrease_reference` (*esp_eth_handle_t* hdl)

Decrease Ethernet driver reference.

Parameters `hdl` –[in] handle of Ethernet driver

Returns

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

Structures

struct `esp_eth_config_t`

Configuration of Ethernet driver.

Public Members

esp_eth_mac_t *`mac`

Ethernet MAC object.

esp_eth_phy_t *`phy`

Ethernet PHY object.

uint32_t `check_link_period_ms`

Period time of checking Ethernet link status.

esp_err_t (**stack_input*)(*esp_eth_handle_t* eth_handle, uint8_t *buffer, uint32_t length, void *priv)

Input frame buffer to user's stack.

Param `eth_handle` [in] handle of Ethernet driver

Param `buffer` [in] frame buffer that will get input to upper stack

Param `length` [in] length of the frame buffer

Return

- `ESP_OK`: input frame buffer to upper stack successfully
- `ESP_FAIL`: error occurred when inputting buffer to upper stack

esp_err_t (**on_lowlevel_init_done*)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel initialization is finished.

Param `eth_handle` [in] handle of Ethernet driver

Return

- `ESP_OK`: process extra lowlevel initialization successfully
- `ESP_FAIL`: error occurred when processing extra lowlevel initialization

esp_err_t (***on_lowlevel_deinit_done**)(*esp_eth_handle_t* eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

Param eth_handle [in] handle of Ethernet driver

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

esp_err_t (***read_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_handle_t* eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Note: Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

Param eth_handle [in] handle of Ethernet driver

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Macros

ETH_DEFAULT_CONFIG (emac, ephy)

Default configuration for Ethernet driver.

Type Definitions

typedef void ***esp_eth_handle_t**

Handle of Ethernet driver.

Enumerations

enum **esp_eth_io_cmd_t**

Command list for ioctl API.

Values:

enumerator **ETH_CMD_G_MAC_ADDR**

Get MAC address

enumerator **ETH_CMD_S_MAC_ADDR**

Set MAC address

enumerator **ETH_CMD_G_PHY_ADDR**

Get PHY address

enumerator **ETH_CMD_S_PHY_ADDR**

Set PHY address

enumerator **ETH_CMD_G_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH_CMD_S_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH_CMD_G_SPEED**

Get Speed

enumerator **ETH_CMD_S_SPEED**

Set Speed

enumerator **ETH_CMD_S_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH_CMD_S_FLOW_CTRL**

Set flow control

enumerator **ETH_CMD_G_DUPLEX_MODE**

Get Duplex mode

enumerator **ETH_CMD_S_DUPLEX_MODE**

Set Duplex mode

enumerator **ETH_CMD_S_PHY_LOOPBACK**

Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

Header File

- `components/esp_eth/include/esp_eth_com.h`

Structures

struct **esp_eth_mediator_s**

Ethernet mediator.

Public Members

esp_err_t (***phy_reg_read**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

esp_err_t (***phy_reg_write**)(*esp_eth_mediator_t* *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param eth [in] mediator of Ethernet driver

Param phy_addr [in] PHY Chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

esp_err_t (***stack_input**)(*esp_eth_mediator_t* *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.

Param eth [in] mediator of Ethernet driver

Param buffer [in] packet buffer

Param length [in] length of the packet

Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

esp_err_t (***on_state_changed**)(*esp_eth_mediator_t* *eth, *esp_eth_state_t* state, void *args)

Callback on Ethernet state changed.

Param eth [in] mediator of Ethernet driver

Param state [in] new state

Param args [in] optional argument for the new state

Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

Type Definitions

typedef struct *esp_eth_mediator_s* **esp_eth_mediator_t**
Ethernet mediator.

Enumerations

enum **esp_eth_state_t**

Ethernet driver state.

Values:

enumerator **ETH_STATE_LLINIT**

Lowlevel init done

enumerator **ETH_STATE_DEINIT**

Deinit done

enumerator **ETH_STATE_LINK**

Link status changed

enumerator **ETH_STATE_SPEED**

Speed updated

enumerator **ETH_STATE_DUPLEX**

Duplex updated

enumerator **ETH_STATE_PAUSE**

Pause ability updated

enum **eth_event_t**

Ethernet event declarations.

Values:

enumerator **ETHERNET_EVENT_START**

Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**

Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**

Ethernet lost a valid link

Ethernet MAC.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_mac_t* *mac, *esp_eth_mediator_t* *eth)

Set mediator for Ethernet MAC.

Param mac [in] Ethernet MAC instance

Param eth [in] Ethernet mediator

Return

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

esp_err_t (***init**)(*esp_eth_mac_t* *mac)

Initialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

esp_err_t (***deinit**)(*esp_eth_mac_t* *mac)

Deinitialize Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

esp_err_t (***start**)(*esp_eth_mac_t* *mac)

Start Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

esp_err_t (***stop**)(*esp_eth_mac_t* *mac)

Stop Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

esp_err_t (***transmit**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t length)

Transmit packet from Ethernet MAC.

Note: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance

Param buf [in] packet buffer to transmit

Param length [in] length of packet

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***transmit_vargs**)(*esp_eth_mac_t* *mac, uint32_t argc, va_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

Note: Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

Note: Returned error codes may differ for each specific MAC chip.

Param mac [in] Ethernet MAC instance

Param argc [in] number variable arguments

Param args [in] variable arguments

Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

esp_err_t (***receive**)(*esp_eth_mac_t* *mac, uint8_t *buf, uint32_t *length)

Receive packet from Ethernet MAC.

Note: Memory of buf is allocated in the Layer2, make sure it get free after process.

Note: Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Param mac [in] Ethernet MAC instance

Param buf [out] packet buffer which will preserve the received frame

Param length [out] length of the received packet

Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

esp_err_t (***read_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)

Read PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [out] PHY register value

Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

esp_err_t (***write_phy_reg**)(*esp_eth_mac_t* *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)

Write PHY register.

Param mac [in] Ethernet MAC instance

Param phy_addr [in] PHY chip address (0~31)

Param phy_reg [in] PHY register index code

Param reg_value [in] PHY register value

Return

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

esp_err_t (***set_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Set MAC address.

Param mac [in] Ethernet MAC instance

Param addr [in] MAC address

Return

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

esp_err_t (***get_addr**)(*esp_eth_mac_t* *mac, uint8_t *addr)

Get MAC address.

Param mac [in] Ethernet MAC instance

Param addr [out] MAC address

Return

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

esp_err_t (***set_speed**)(*esp_eth_mac_t* *mac, eth_speed_t speed)

Set speed of MAC.

Param ma:c [in] Ethernet MAC instance

Param speed [in] MAC speed

Return

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

esp_err_t (***set_duplex**)(*esp_eth_mac_t* *mac, eth_duplex_t duplex)

Set duplex mode of MAC.

Param mac [in] Ethernet MAC instance

Param duplex [in] MAC duplex

Return

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

esp_err_t (***set_link**)(*esp_eth_mac_t* *mac, eth_link_t link)

Set link status of MAC.

Param mac [in] Ethernet MAC instance

Param link [in] Link status

Return

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

esp_err_t (***set_promiscuous**)(*esp_eth_mac_t* *mac, bool enable)

Set promiscuous of MAC.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode

Return

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (***enable_flow_ctrl**)(*esp_eth_mac_t* *mac, bool enable)

Enable flow control on MAC layer or not.

Param mac [in] Ethernet MAC instance

Param enable [in] set true to enable flow control; set false to disable flow control

Return

- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

esp_err_t (**set_peer_pause_ability**)(*esp_eth_mac_t* *mac, uint32_t ability)

Set the PAUSE ability of peer node.

Param mac [in] Ethernet MAC instance

Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

Return

- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (**custom_ioctl**)(*esp_eth_mac_t* *mac, uint32_t cmd, void *data)

Custom IO function of MAC driver. This function is intended to extend common options of *esp_eth_ioctl* to cover specifics of MAC chip.

Note: This function may not be assigned when the MAC chip supports only most common set of configuration options.

Param mac [in] Ethernet MAC instance

Param cmd [in] IO control command

Param data [inout] address of data for *set* command or address where to store the data when used with *get* command

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (**del**)(*esp_eth_mac_t* *mac)

Free memory of Ethernet MAC.

Param mac [in] Ethernet MAC instance

Return

- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth_mac_config_t**

Configuration of Ethernet MAC object.

Public Members

uint32_t **sw_reset_timeout_ms**

Software reset timeout value (Unit: ms)

uint32_t **rx_task_stack_size**

Stack size of the receive task

uint32_t **rx_task_prio**

Priority of the receive task

uint32_t **flags**

Flags that specify extra capability for mac driver

Macros

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE

MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE

Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()

Default configuration for Ethernet MAC object.

Type Definitions

typedef struct *esp_eth_mac_s* **esp_eth_mac_t**

Ethernet MAC.

Enumerations

enum **emac_rmii_clock_mode_t**

RMII Clock Mode Options.

Values:

enumerator **EMAC_CLK_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC_CLK_EXT_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

Note: MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_CLK_OUT**

Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac_rmii_clock_gpio_t**

RMII Clock GPIO number Options.

Values:

enumerator **EMAC_CLK_IN_GPIO**

MAC will get RMII clock from outside at this GPIO.

Note: ESP32 only supports GPIO0 to input the RMII clock.

enumerator **EMAC_APPL_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO0.

Note: GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with

EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMI clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

enumerator **EMAC_CLK_OUT_GPIO**

Output RMI Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMI Clock from internal APLL Clock available at GPIO17.

Header File

- [components/esp_eth/include/esp_eth_phy.h](#)

Functions

esp_eth_phy_t ***esp_eth_phy_new_ip101** (const *eth_phy_config_t* *config)

Create a PHY instance of IP101.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_rt18201** (const *eth_phy_config_t* *config)

Create a PHY instance of RTL8201.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_lan87xx** (const *eth_phy_config_t* *config)

Create a PHY instance of LAN87xx.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_dp83848** (const *eth_phy_config_t* *config)

Create a PHY instance of DP83848.

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

esp_eth_phy_t ***esp_eth_phy_new_ksz80xx** (const *eth_phy_config_t* *config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Parameters *config* –[in] configuration of PHY

Returns

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

struct **esp_eth_phy_s**

Ethernet PHY.

Public Members

esp_err_t (***set_mediator**)(*esp_eth_phy_t* *phy, *esp_eth_mediator_t* *mediator)

Set mediator for PHY.

Param phy [in] Ethernet PHY instance

Param mediator [in] mediator of Ethernet driver

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

esp_err_t (***reset**)(*esp_eth_phy_t* *phy)

Software Reset Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***reset_hw**)(*esp_eth_phy_t* *phy)

Hardware Reset Ethernet PHY.

Note: Hardware reset is mostly done by pull down and up PHY' s nRST pin

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

esp_err_t (***init**)(*esp_eth_phy_t* *phy)

Initialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

esp_err_t (***deinit**)(*esp_eth_phy_t* *phy)

Deinitialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

esp_err_t (***autonego_ctrl**)(*esp_eth_phy_t* *phy, *eth_phy_autoneg_cmd_t* cmd, bool *autonego_en_stat)

Configure auto negotiation.

- Param phy [in]** Ethernet PHY instance
- Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
- Param autonego_en_stat [out]** Address where to store current status of auto negotiation configuration
- Return**
- ESP_OK: restart auto negotiation successfully
 - ESP_FAIL: restart auto negotiation failed because some error occurred
 - ESP_ERR_INVALID_ARG: invalid command

esp_err_t (***get_link**)(*esp_eth_phy_t* *phy)

Get Ethernet PHY link status.

- Param phy [in]** Ethernet PHY instance
- Return**
- ESP_OK: get Ethernet PHY link status successfully
 - ESP_FAIL: get Ethernet PHY link status failed because some error occurred

esp_err_t (***pwrctrl**)(*esp_eth_phy_t* *phy, bool enable)

Power control of Ethernet PHY.

- Param phy [in]** Ethernet PHY instance
- Param enable [in]** set true to power on Ethernet PHY; ser false to power off Ethernet PHY
- Return**
- ESP_OK: control Ethernet PHY power successfully
 - ESP_FAIL: control Ethernet PHY power failed because some error occurred

esp_err_t (***set_addr**)(*esp_eth_phy_t* *phy, uint32_t addr)

Set PHY chip address.

- Param phy [in]** Ethernet PHY instance
- Param addr [in]** PHY chip address
- Return**
- ESP_OK: set Ethernet PHY address successfully
 - ESP_FAIL: set Ethernet PHY address failed because some error occurred

esp_err_t (***get_addr**)(*esp_eth_phy_t* *phy, uint32_t *addr)

Get PHY chip address.

- Param phy [in]** Ethernet PHY instance
- Param addr [out]** PHY chip address
- Return**
- ESP_OK: get Ethernet PHY address successfully
 - ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

esp_err_t (***advertise_pause_ability**)(*esp_eth_phy_t* *phy, uint32_t ability)

Advertise pause function supported by MAC layer.

- Param phy [in]** Ethernet PHY instance
- Param addr [out]** Pause ability
- Return**
- ESP_OK: Advertise pause ability successfully
 - ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

esp_err_t (***loopback**)(*esp_eth_phy_t* *phy, bool enable)

Sets the PHY to loopback mode.

Param phy [in] Ethernet PHY instance
Param enable [in] enables or disables PHY loopback

Return

- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

esp_err_t (***set_speed**)(*esp_eth_phy_t* *phy, eth_speed_t speed)

Sets PHY speed mode.

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance
Param speed [in] Speed mode to be set

Return

- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

esp_err_t (***set_duplex**)(*esp_eth_phy_t* *phy, eth_duplex_t duplex)

Sets PHY duplex mode.

Note: Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Param phy [in] Ethernet PHY instance
Param duplex [in] Duplex mode to be set

Return

- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

esp_err_t (***custom_ioctl**)(*esp_eth_phy_t* *phy, uint32_t cmd, void *data)

Custom IO function of PHY driver. This function is intended to extend common options of `esp_eth_ioctl` to cover specifics of PHY chip.

Note: This function may not be assigned when the PHY chip supports only most common set of configuration options.

Param phy [in] Ethernet PHY instance
Param cmd [in] IO control command
Param data [inout] address of data for `set` command or address where to store the data when used with `get` command

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

esp_err_t (*del)(*esp_eth_phy_t* *phy)

Free memory of Ethernet PHY instance.

Param phy [in] Ethernet PHY instance

Return

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

struct **eth_phy_config_t**

Ethernet PHY configuration.

Public Members

int32_t **phy_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Macros

ESP_ETH_PHY_ADDR_AUTO

ETH_PHY_DEFAULT_CONFIG ()

Default configuration for Ethernet PHY object.

Type Definitions

typedef struct *esp_eth_phy_s* **esp_eth_phy_t**

Ethernet PHY.

Enumerations

enum **eth_phy_autoneg_cmd_t**

Auto-negotiation controll commands.

Values:

enumerator **ESP_ETH_PHY_AUTONEGO_RESTART**

enumerator **ESP_ETH_PHY_AUTONEGO_EN**

enumerator **ESP_ETH_PHY_AUTONEGO_DIS**

enumerator **ESP_ETH_PHY_AUTONEGO_G_STAT**

Header File

- `components/esp_eth/include/esp_eth_phy_802_3.h`

Functions

`esp_err_t esp_eth_phy_802_3_reset_hw` (`phy_802_3_t` *phy_802_3, `uint32_t` reset_assert_us)

Performs hardware reset with specific reset pin assertion time.

Parameters

- `phy_802_3` –IEEE 802.3 PHY object infostructure
- `reset_assert_us` –Hardware reset pin assertion time

Returns

- `ESP_OK`: reset Ethernet PHY successfully

`esp_err_t esp_eth_phy_802_3_detect_phy_addr` (`esp_eth_mediator_t` *eth, `int` *detected_addr)

Detect PHY address.

Parameters

- `eth` –Mediator of Ethernet driver
- `detected_addr` –[out] a valid address after detection

Returns

- `ESP_OK`: detect phy address successfully
- `ESP_ERR_INVALID_ARG`: invalid parameter
- `ESP_ERR_NOT_FOUND`: can't detect any PHY device
- `ESP_FAIL`: detect phy address failed because some error occurred

`esp_err_t esp_eth_phy_802_3_basic_phy_init` (`phy_802_3_t` *phy_802_3)

Performs basic PHY chip initialization.

Note: It should be called as the first function in PHY specific driver instance

Parameters `phy_802_3` –IEEE 802.3 PHY object infostructure

Returns

- `ESP_OK`: initialized Ethernet PHY successfully
- `ESP_FAIL`: initialization of Ethernet PHY failed because some error occurred
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: PHY device not detected
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_basic_phy_deinit` (`phy_802_3_t` *phy_802_3)

Performs basic PHY chip de-initialization.

Note: It should be called as the last function in PHY specific driver instance

Parameters `phy_802_3` –IEEE 802.3 PHY object infostructure

Returns

- `ESP_OK`: de-initialized Ethernet PHY successfully
- `ESP_FAIL`: de-initialization of Ethernet PHY failed because some error occurred
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

`esp_err_t esp_eth_phy_802_3_read_oui` (`phy_802_3_t` *phy_802_3, `uint32_t` *oui)

Reads raw content of OUI field.

Parameters

- `phy_802_3` –IEEE 802.3 PHY object infostructure

- **oui** **–[out]** OUI value

Returns

- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid `oui` argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

esp_err_t **esp_eth_phy_802_3_read_manufac_info** (*phy_802_3_t* *phy_802_3, uint8_t *model, uint8_t *rev)

Reads manufacturer's model and revision number.

Parameters

- **phy_802_3** –IEEE 802.3 PHY object infostructure
- **model** **–[out]** Manufacturer's model number (can be NULL when not required)
- **rev** **–[out]** Manufacturer's revision number (can be NULL when not required)

Returns

- ESP_OK: Manufacturer's info read successfully
- ESP_FAIL: Manufacturer's info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

phy_802_3_t ***esp_eth_phy_into_phy_802_3** (*esp_eth_phy_t* *phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

Parameters **phy** –Ethernet PHY instance

Returns *phy_802_3_t**

- address to parent IEEE 802.3 PHY object infostructure

esp_err_t **esp_eth_phy_802_3_obj_config_init** (*phy_802_3_t* *phy_802_3, const *eth_phy_config_t* *config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

Parameters

- **phy_802_3** –Address to IEEE 802.3 PHY object infostructure
- **config** –Configuration of the IEEE 802.3 PHY object

Returns

- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid `config` argument

Structures

struct **phy_802_3_t**

IEEE 802.3 PHY object infostructure.

Public Members

esp_eth_phy_t **parent**

Parent Ethernet PHY instance

esp_eth_mediator_t ***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32_t **reset_timeout_ms**

Reset timeout value (Unit: ms)

uint32_t **autonego_timeout_ms**

Auto-negotiation timeout value (Unit: ms)

eth_link_t **link_status**

Current Link status

int **reset_gpio_num**

Reset GPIO number, -1 means no hardware reset

Header File

- [components/esp_eth/include/esp_eth_netif_glue.h](#)

Functions

[esp_eth_netif_glue_handle_t](#) **esp_eth_new_netif_glue** ([esp_eth_handle_t](#) eth_hdl)

Create a netif glue for Ethernet driver.

Note: netif glue is used to attach io driver to TCP/IP netif

Parameters **eth_hdl** –Ethernet driver handle

Returns glue object, which inherits esp_netif_driver_base_t

[esp_err_t](#) **esp_eth_del_netif_glue** ([esp_eth_netif_glue_handle_t](#) eth_netif_glue)

Delete netif glue of Ethernet driver.

Parameters **eth_netif_glue** –netif glue

Returns -ESP_OK: delete netif glue successfully

Type Definitions

typedef struct esp_eth_netif_glue_t ***esp_eth_netif_glue_handle_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

2.5.3 Thread

Thread

Introduction [Thread](#) is a IP-based mesh networking protocol. It' s based on the 802.15.4 physical and MAC layer.

Application Examples The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot_cli](#).
- The Thread border router [openthread/ot_br](#).
- The Thread radio co-processor [openthread/ot_rcp](#).

API Reference For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- [components/openthread/include/esp_openthread.h](#)

Functions

esp_err_t **esp_openthread_init** (const *esp_openthread_platform_config_t* *init_config)

Initializes the full OpenThread stack.

Note: The OpenThread instance will also be initialized in this function.

Parameters *init_config* –[in] The initialization configuration.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

esp_err_t **esp_openthread_launch_mainloop** (void)

Launches the OpenThread main loop.

Note: This function will not return unless error happens when running the OpenThread stack.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t **esp_openthread_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

otInstance ***esp_openthread_get_instance** (void)

This function acquires the underlying OpenThread instance.

Note: This function can be called on other tasks without lock.

Returns The OpenThread instance pointer

Header File

- [components/openthread/include/esp_openthread_types.h](#)

Structures

struct **esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

Public Members

fd_set **read_fds**

The read file descriptors

fd_set **write_fds**

The write file descriptors

fd_set **error_fds**

The error file descriptors

int **max_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp_openthread_uart_config_t**

The uart port config for OpenThread.

Public Members

uart_port_t **port**

UART port number

uart_config_t **uart_config**

UART configuration, see *uart_config_t* docs

int **rx_pin**

UART RX pin

int **tx_pin**

UART TX pin

struct **esp_openthread_radio_config_t**

The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t **radio_mode**

The radio mode

esp_openthread_uart_config_t **radio_uart_config**

The uart configuration to RCP

struct **esp_openthread_host_connection_config_t**

The OpenThread host connection configuration.

Public Members

esp_openthread_host_connection_mode_t **host_connection_mode**

The host connection mode

esp_openthread_uart_config_t **host_uart_config**

The uart configuration to host

struct **esp_openthread_port_config_t**

The OpenThread port specific configuration.

Public Members

const char ***storage_partition_name**

The partition for storing OpenThread dataset

uint8_t **netif_queue_size**

The packet queue size for the network interface

uint8_t **task_queue_size**

The task queue size

struct **esp_openthread_platform_config_t**

The OpenThread platform configuration.

Public Members

esp_openthread_radio_config_t **radio_config**

The radio configuration

esp_openthread_host_connection_config_t **host_config**

The host connection configuration

esp_openthread_port_config_t **port_config**

The port configuration

Type Definitions

typedef void (***esp_openthread_rcp_failure_handler**)(void)

Enumerations

enum **esp_openthread_event_t**

OpenThread event declarations.

Values:

enumerator **OPENTHREAD_EVENT_START**

OpenThread stack start

enumerator **OPENTHREAD_EVENT_STOP**

OpenThread stack stop

enumerator **OPENTHREAD_EVENT_IF_UP**

OpenThread network interface up

enumerator **OPENTHREAD_EVENT_IF_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD_EVENT_GOT_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD_EVENT_LOST_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD_EVENT_TREL_ADD_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_REMOVE_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enum **esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**

Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enum **esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**

Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**

CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**

RCP UART connection to the host

Header File

- [components/openthread/include/esp_openthread_lock.h](#)

Functions

esp_err_t **esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void **esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp_openthread_lock_acquire** (TickType_t block_ticks)

This functions acquires the OpenThread API lock.

Note: Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Parameters **block_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.

Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

Header File

- [components/openthread/include/esp_openthread_netif_glue.h](#)

Functions

void ***esp_openthread_netif_glue_init** (const *esp_openthread_platform_config_t* *config)

This function initializes the OpenThread network interface glue.

Parameters **config** –[in] The platform configuration.

Returns

- glue pointer on success
- NULL on failure

void **esp_openthread_netif_glue_deinit** (void)

This function deinitializes the OpenThread network interface glue.

esp_netif_t ***esp_openthread_get_netif** (void)

This function acquires the OpenThread netif.

Returns The OpenThread netif or NULL if not initialized.

Macros

ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD ()

Default configuration reference of OT esp-netif.

ESP_NETIF_DEFAULT_OPENTHREAD ()

Header File

- [components/openthread/include/esp_openthread_border_router.h](#)

Functions

void **esp_openthread_set_backbone_netif** (*esp_netif_t* *backbone_netif)

Sets the backbone interface used for border routing.

Note: This function must be called before `esp_openthread_init`

Parameters **backbone_netif** –[in] The backbone network interface (WiFi or ethernet)

esp_err_t **esp_openthread_border_router_init** (void)

Initializes the border router features of OpenThread.

Note: Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

esp_err_t **esp_openthread_border_router_deinit** (void)

Deinitializes the border router features of OpenThread.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

`esp_netif_t *esp_openthread_get_backbone_netif` (void)

Gets the backbone interface of OpenThread border router.

Returns The backbone interface or NULL if border router not initialized.

void `esp_openthread_register_rcp_failure_handler` (*esp_openthread_rcp_failure_handler* handler)

Registers the callback for RCP failure.

void `esp_openthread_rcp_deinit` (void)

Deinitializes the conneciton to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the `openthread` directory of ESP-IDF examples.

2.5.4 ESP-NETIF

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

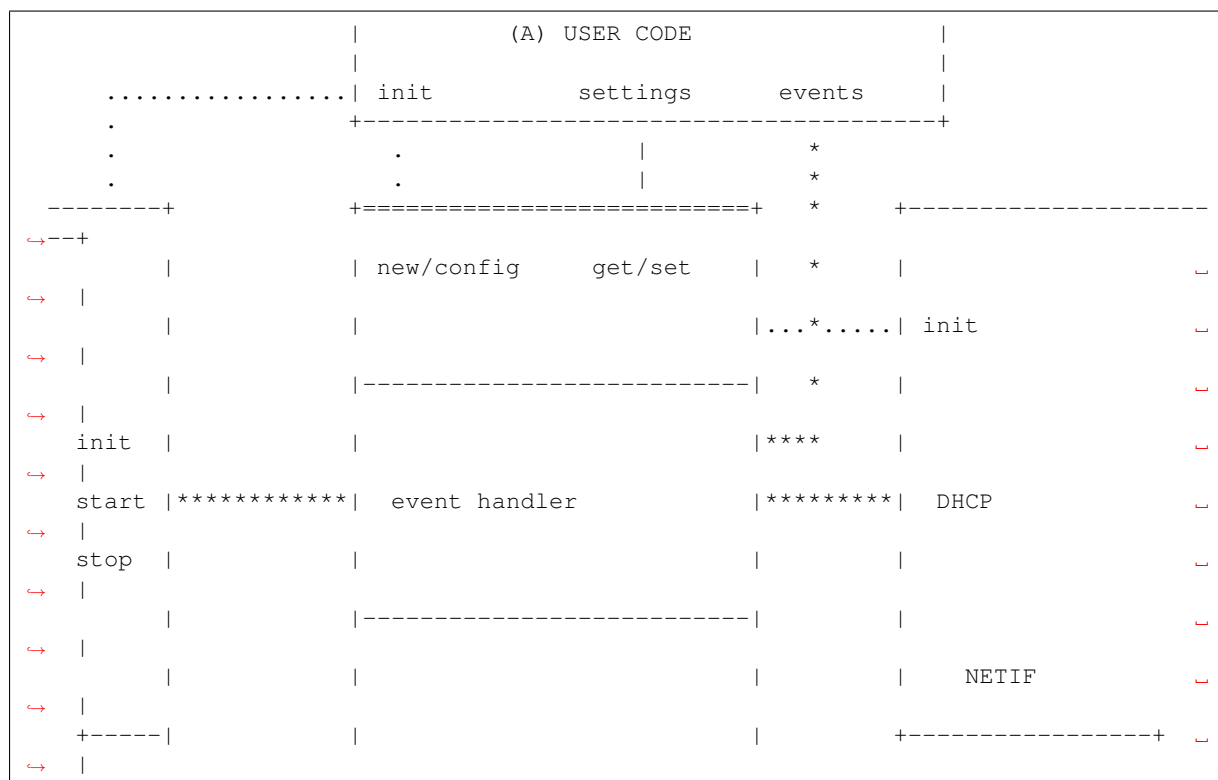

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

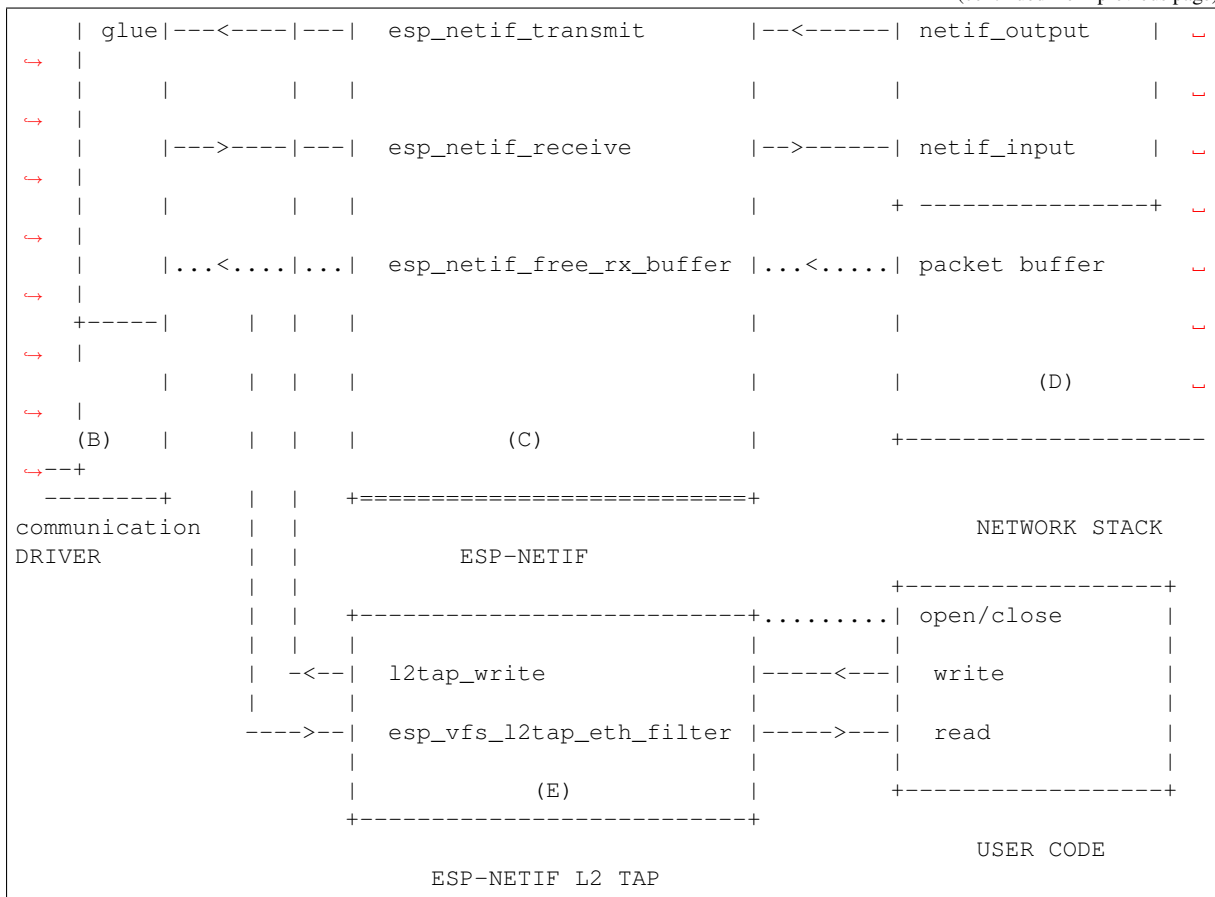

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF architecture

(continues on next page)

(continued from previous page)

Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- ***** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
 - ESP-NETIF specific options (flags, behaviour, name)
 - Network stack options (netif init and input functions, not publicly available)
 - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
 - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
 - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
 - Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
 - Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
 - Used for network interface lifecycle management
 - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
 - Set interface up or down
 - DHCP server and client API
 - DNS API
- 6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to [Virtual filesystem component](#) to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by [CONFIG_ESP_NETIF_L2_TAP](#) first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

open() Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path name can be opened multiple times up to [CONFIG_ESP_NETIF_L2_TAP_MAX_FDS](#) and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

ioctl() The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp_netif/include/esp_netif_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

Warning: The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

Note: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

Note: `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

EACCES - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.

ENOSYS - unsupported operation, passed configuration option does not exists.

fcntl() `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

ENOSYS - unsupported command.

read() Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

write() A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

EBADMSG - Ethernet type of the frame is different then file descriptor configured filter.

EIO - Network interface not available or busy.

close() Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

EBADF - not a valid file descriptor.

select() Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

ESP-NETIF programmer's manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)
- L2 TAP: [protocols/l2tap/main/l2tap_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- [components/esp_netif/include/esp_netif.h](#)

Functions

esp_err_t **esp_netif_init** (void)

Initialize the underlying TCP/IP stack.

Note: This function should be called exactly once from application code, when the application starts up.

Returns

- ESP_OK on success
- ESP_FAIL if initializing failed

esp_err_t **esp_netif_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization **is not** supported yet

Returns

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

esp_netif_t ***esp_netif_new** (const *esp_netif_config_t* *esp_netif_config)

Creates an instance of new esp-netif object based on provided config.

Parameters **esp_netif_config** –pointer esp-netif configuration

Returns

- pointer to esp-netif object on success
- NULL otherwise

void **esp_netif_destroy** (*esp_netif_t* *esp_netif)

Destroys the esp_netif object.

Parameters **esp_netif** –[in] pointer to the object to be deleted

esp_err_t **esp_netif_set_driver_config** (*esp_netif_t* *esp_netif, const *esp_netif_driver_ifconfig_t* *driver_config)

Configures driver related options of esp_netif object.

Parameters

- **esp_netif** –[inout] pointer to the object to be configured
- **driver_config** –[in] pointer esp-netif io driver related configuration

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

esp_err_t **esp_netif_attach** (*esp_netif_t* *esp_netif, *esp_netif_io_driver_handle_t* driver_handle)

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

Parameters

- **esp_netif** –[inout] pointer to esp_netif object to be attached
- **driver_handle** –[in] pointer to the driver handle

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver' s pot_attach callback failed

esp_err_t **esp_netif_receive** (*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Received data
- **len** –[in] Length of the data frame
- **eb** –[in] Pointer to internal buffer (used in Wi-Fi driver)

Returns

- ESP_OK

void **esp_netif_action_start** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_stop** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver stop event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_connected** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver connected event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_disconnected** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_got_ip** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_join_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_leave_ip6_multicast_group** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_add_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

void **esp_netif_action_remove_ip6_address** (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note: This API can be directly used as event handler

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **base** –
- **event_id** –
- **data** –

esp_err_t **esp_netif_set_default_netif** (*esp_netif_t* *esp_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns ESP_OK on success

esp_err_t **esp_netif_join_ip6_multicast_group** (*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* *addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to join

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

esp_err_t **esp_netif_leave_ip6_multicast_group** (*esp_netif_t* *esp_netif, const *esp_ip6_addr_t* *addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to leave

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

esp_err_t **esp_netif_set_mac** (*esp_netif_t* *esp_netif, uint8_t mac[])

Set the mac address for the interface instance.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance

- **mac** –[in] Desired mac address for the related network interface

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_get_mac** (*esp_netif_t* *esp_netif, uint8_t mac[])

Get the mac address for the interface instance.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **mac** –[out] Resultant mac address for the related network interface

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

esp_err_t **esp_netif_set_hostname** (*esp_netif_t* *esp_netif, const char *hostname)

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **hostname** –[in] New hostname for the interface. Maximum length 32 bytes.

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

esp_err_t **esp_netif_get_hostname** (*esp_netif_t* *esp_netif, const char **hostname)

Get interface hostname.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **hostname** –[out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

Returns

- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

bool **esp_netif_is_netif_up** (*esp_netif_t* *esp_netif)

Test if supplied interface is up or down.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns

- true - Interface is up
- false - Interface is down

esp_err_t **esp_netif_get_ip_info** (*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_old_ip_info** (*esp_netif_t* *esp_netif, *esp_netif_ip_info_t* *ip_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[out] If successful, IP information will be returned in this argument.

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_set_ip_info** (*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

Note: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] IP information to set on the specified interface

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

esp_err_t **esp_netif_set_old_ip_info** (*esp_netif_t* *esp_netif, const *esp_netif_ip_info_t* *ip_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **ip_info** –[in] Store the old IP information for the specified interface

Returns

- ESP_OK

- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

int `esp_netif_get_netif_impl_index` (*esp_netif_t* *esp_netif)

Get net interface index from network stack implementation.

Note: This index could be used in `setsockopt()` to bind socket with multicast interface

Parameters `esp_netif` –[in] Handle to esp-netif instance

Returns implementation specific index of interface represented with supplied `esp_netif`

esp_err_t `esp_netif_get_netif_impl_name` (*esp_netif_t* *esp_netif, char *name)

Get net interface name from network stack implementation.

Note: This name could be used in `setsockopt()` to bind socket with appropriate interface

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `name` –[out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

esp_err_t `esp_netif_dhcps_option` (*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP server option.

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `opt_op` –[in] `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- `opt_id` –[in] Option index to get or set, must be one of the supported enum values.
- `opt_val` –[inout] Pointer to the option parameter.
- `opt_len` –[in] Length of the option parameter.

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

esp_err_t `esp_netif_dhcpc_option` (*esp_netif_t* *esp_netif, *esp_netif_dhcp_option_mode_t* opt_op, *esp_netif_dhcp_option_id_t* opt_id, void *opt_val, uint32_t opt_len)

Set or Get DHCP client option.

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `opt_op` –[in] `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- `opt_id` –[in] Option index to get or set, must be one of the supported enum values.
- `opt_val` –[inout] Pointer to the option parameter.
- `opt_len` –[in] Length of the option parameter.

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`

- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

esp_err_t **esp_netif_dhcpc_start** (*esp_netif_t* *esp_netif)

Start DHCP client (only if enabled in interface object)

Note: The default event handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events call this function.

Parameters *esp_netif* –[in] Handle to esp-netif instance

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`
- `ESP_ERR_ESP_NETIF_DHCPC_START_FAILED`

esp_err_t **esp_netif_dhcpc_stop** (*esp_netif_t* *esp_netif)

Stop DHCP client (only if enabled in interface object)

Note: Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

Parameters *esp_netif* –[in] Handle to esp-netif instance

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_IF_NOT_READY`

esp_err_t **esp_netif_dhcpc_get_status** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP client status.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *status* –[out] If successful, the status of DHCP client will be returned in this argument.

Returns

- `ESP_OK`

esp_err_t **esp_netif_dhcps_get_status** (*esp_netif_t* *esp_netif, *esp_netif_dhcp_status_t* *status)

Get DHCP Server status.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *status* –[out] If successful, the status of the DHCP server will be returned in this argument.

Returns

- `ESP_OK`

esp_err_t **esp_netif_dhcps_start** (*esp_netif_t* *esp_netif)

Start DHCP server (only if enabled in interface object)

Parameters *esp_netif* –[in] Handle to esp-netif instance

Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

esp_err_t **esp_netif_dhcps_stop** (*esp_netif_t* *esp_netif)

Stop DHCP server (only if enabled in interface object)

Parameters `esp_netif` –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

esp_err_t `esp_netif_dhcps_get_clients_by_mac` (*esp_netif_t* *esp_netif, int num, *esp_netif_pair_mac_ip_t* *mac_ip_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `num` –[in] Number of clients with specified MAC addresses in the array of pairs
- `mac_ip_pair` –[inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
- ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

esp_err_t `esp_netif_set_dns_info` (*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `type` –[in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` –[in] DNS Server address to set

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t `esp_netif_get_dns_info` (*esp_netif_t* *esp_netif, *esp_netif_dns_type_t* type, *esp_netif_dns_info_t* *dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface' s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Parameters

- `esp_netif` –[in] Handle to esp-netif instance
- `type` –[in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` –[out] DNS Server result is written here on success

Returns

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

esp_err_t **esp_netif_create_ip6_linklocal** (*esp_netif_t* *esp_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

Parameters *esp_netif* –[in] Handle to esp-netif instance

Returns

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t **esp_netif_get_ip6_linklocal** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *if_ip6* –[out] IPv6 information will be returned in this argument if successful.

Returns

- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

esp_err_t **esp_netif_get_ip6_global** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* *if_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *if_ip6* –[out] IPv6 information will be returned in this argument if successful.

Returns

- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp_netif_get_all_ip6** (*esp_netif_t* *esp_netif, *esp_ip6_addr_t* if_ip6[])

Get all IPv6 addresses of the specified interface.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *if_ip6* –[out] Array of IPv6 addresses will be copied to the argument

Returns number of returned IPv6 addresses

void **esp_netif_set_ip4_addr** (*esp_ip4_addr_t* *addr, *uint8_t* a, *uint8_t* b, *uint8_t* c, *uint8_t* d)

Sets IPv4 address to the specified octets.

Parameters

- *addr* –[out] IP address to be set
- *a* –the first octet (127 for IP 127.0.0.1)
- *b* –
- *c* –
- *d* –

char ***esp_ip4addr_ntoa** (const *esp_ip4_addr_t* *addr, char *buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

Parameters

- **addr** –ip address in network order to convert
- **buf** –target buffer where the string is stored
- **buflen** –length of buf

Returns either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32_t **esp_ip4addr_aton** (const char *addr)

Ascii internet address interpretation routine The value returned is in network order.

Parameters **addr** –IP address in ascii representation (e.g. “127.0.0.1”)

Returns ip address in network order

esp_err_t **esp_netif_str_to_ip4** (const char *src, *esp_ip4_addr_t* *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Parameters

- **src** –[in] IPv4 address in ascii representation (e.g. “127.0.0.1”)
- **dst** –[out] Address of the target esp_ip4_addr_t structure to receive converted address

Returns

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_err_t **esp_netif_str_to_ip6** (const char *src, *esp_ip6_addr_t* *dst)

Converts Ascii internet IPv6 address into esp_ip4_addr_t Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”)

Parameters

- **src** –[in] IPv6 address in ascii representation (e.g. “2001:db8:85a3:0000:0000:0000:0002:0001”)
- **dst** –[out] Address of the target esp_ip6_addr_t structure to receive converted address

Returns

- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

esp_netif_iodriver_handle **esp_netif_get_io_driver** (*esp_netif_t* *esp_netif)

Gets media driver handle for this esp-netif instance.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns opaque pointer of related IO driver

esp_netif_t ***esp_netif_get_handle_from_ifkey** (const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

Parameters **if_key** –Textual description of network interface

Returns Handle to esp-netif instance

esp_netif_flags_t **esp_netif_get_flags** (*esp_netif_t* *esp_netif)

Returns configured flags for this interface.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns Configuration flags

const char ***esp_netif_get_ifkey** (*esp_netif_t* *esp_netif)

Returns configured interface key for this esp-netif instance.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns Textual description of related interface

const char ***esp_netif_get_desc** (*esp_netif_t* *esp_netif)

Returns configured interface type for this esp-netif instance.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns Enumerated type of this interface, such as station, AP, ethernet

int **esp_netif_get_route_prio** (*esp_netif_t* *esp_netif)

Returns configured routing priority number.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns Integer representing the instance's route-prio, or -1 if invalid paramters

int32_t **esp_netif_get_event_id** (*esp_netif_t* *esp_netif, *esp_netif_ip_event_type_t* event_type)

Returns configured event for this esp-netif instance and supplied event type.

Parameters

- **esp_netif** –[in] Handle to esp-netif instance
- **event_type** –(either get or lost IP)

Returns specific event id which is configured to be raised if the interface lost or acquired IP address
-1 if supplied event_type is not known

esp_netif_t ***esp_netif_next** (*esp_netif_t* *esp_netif)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Parameters **esp_netif** –[in] Handle to esp-netif instance

Returns First netif from the list if supplied parameter is NULL, next one otherwise

size_t **esp_netif_get_nr_of_ifs** (void)

Returns number of registered esp_netif objects.

Returns Number of esp_netifs

void **esp_netif_netstack_buf_ref** (void *netstack_buf)

increase the reference counter of net stack buffer

Parameters **netstack_buf** –[in] the net stack buffer

void **esp_netif_netstack_buf_free** (void *netstack_buf)

free the netstack buffer

Parameters **netstack_buf** –[in] the net stack buffer

esp_err_t **esp_netif_tcpip_exec** (*esp_netif_callback_fn* fn, void *ctx)

Utility to execute the supplied callback in TCP/IP context.

Parameters

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

Returns The error code (esp_err_t) returned by the callback

Type Definitions

typedef *esp_err_t* (***esp_netif_callback_fn**)(void *ctx)

TCPIP thread safe callback used with *esp_netif_tcpip_exec()*

Header File

- components/esp_netif/include/esp_netif_types.h

Structures

struct **esp_netif_dns_info_t**

DNS server info.

Public Members

esp_ip_addr_t **ip**

IPV4 address of DNS server

struct **esp_netif_ip_info_t**

Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

Public Members

esp_ip4_addr_t **ip**

Interface IPV4 address

esp_ip4_addr_t **netmask**

Interface IPV4 netmask

esp_ip4_addr_t **gw**

Interface IPV4 gateway address

struct **esp_netif_ip6_info_t**

IPV6 IP address information.

Public Members

esp_ip6_addr_t **ip**

Interface IPV6 address

struct **ip_event_got_ip_t**

Event structure for IP_EVENT_GOT_IP event.

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip_info_t **ip_info**

IP address, netmask, gateway IP address

bool **ip_changed**

Whether the assigned IP has changed or not

struct **ip_event_got_ip6_t**

Event structure for IP_EVENT_GOT_IP6 event

Public Members

esp_netif_t ***esp_netif**

Pointer to corresponding esp-netif object

esp_netif_ip6_info_t **ip6_info**

IPv6 address of the interface

int **ip_index**

IPv6 address index

struct **ip_event_add_ip6_t**

Event structure for ADD_IP6 event

Public Members

esp_ip6_addr_t **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip_event_ap_staipassigned_t**

Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

esp_netif_t ***esp_netif**

Pointer to the associated netif handle

esp_ip4_addr_t **ip**

IP address which was assigned to the station

uint8_t **mac**[6]

MAC address of the connected client

struct **bridgeif_config**

LwIP bridge configuration

Public Members

uint16_t **max_fdb_dyn_entries**

maximum number of entries in dynamic forwarding database

uint16_t **max_fdb_sta_entries**

maximum number of entries in static forwarding database

uint8_t **max_ports**

maximum number of ports the bridge can consist of

struct **esp_netif_inherent_config**

ESP-netif inherent config parameters.

Public Members

esp_netif_flags_t **flags**

flags that define esp-netif behavior

uint8_t **mac**[6]

initial mac address for this interface

const *esp_netif_ip_info_t* ***ip_info**

initial ip address for this interface

uint32_t **get_ip_event**

event id to be raised when interface gets an IP

uint32_t **lost_ip_event**

event id to be raised when interface loses its IP

const char ***if_key**

string identifier of the interface

const char ***if_desc**

textual description of the interface

int **route_prio**

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route_prio indicates a higher priority

bridgeif_config_t ***bridge_info**

LwIP bridge configuration

struct **esp_netif_driver_base_s**

ESP-netif driver base handle.

Public Members

esp_err_t (**post_attach**)(*esp_netif_t* *netif, *esp_netif_io_driver_handle* h)

post attach function pointer

esp_netif_t ***netif**

netif handle

struct **esp_netif_driver_ifconfig**

Specific IO driver configuration.

Public Members

esp_netif_io_driver_handle **handle**

io-driver handle

esp_err_t (***transmit**)(void *h, void *buffer, size_t len)

transmit function pointer

esp_err_t (***transmit_wrap**)(void *h, void *buffer, size_t len, void *netstack_buffer)

transmit wrap function pointer

void (***driver_free_rx_buffer**)(void *h, void *buffer)

free rx buffer function pointer

struct **esp_netif_config**

Generic esp_netif configuration.

Public Members

const *esp_netif_inherent_config_t* ***base**

base config

const *esp_netif_driver_ifconfig_t* ***driver**

driver config

const *esp_netif_netstack_config_t* ***stack**

stack config

struct **esp_netif_pair_mac_ip_t**

DHCP client's addr info (pair of MAC and IP address)

Public Members

uint8_t **mac**[6]

Clients MAC address

esp_ip4_addr_t **ip**

Clients IP address

Macros

ESP_ERR_ESP_NETIF_BASE

Definition of ESP-NETIF based errors.

typedef struct *esp_netif_netstack_config* **esp_netif_netstack_config_t**

Specific L3 network stack configuration.

typedef *esp_err_t* (***esp_netif_receive_t**)(*esp_netif_t* *esp_netif, void *buffer, size_t len, void *eb)

ESP-NETIF Receive function type.

Enumerations

enum **esp_netif_dns_type_t**

Type of DNS server.

Values:

enumerator **ESP_NETIF_DNS_MAIN**

DNS main server address

enumerator **ESP_NETIF_DNS_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP_NETIF_DNS_MAX**

enum **esp_netif_dhcp_status_t**

Status of DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_DHCP_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP_NETIF_DHCP_STARTED**

DHCP client/server has been started

enumerator **ESP_NETIF_DHCP_STOPPED**

DHCP client/server has been stopped

enumerator **ESP_NETIF_DHCP_STATUS_MAX**

enum **esp_netif_dhcp_option_mode_t**

Mode for DHCP client or DHCP server option functions.

Values:

enumerator **ESP_NETIF_OP_START**

enumerator **ESP_NETIF_OP_SET**

Set option

enumerator **ESP_NETIF_OP_GET**

Get option

enumerator **ESP_NETIF_OP_MAX**

enum **esp_netif_dhcp_option_id_t**

Supported options for DHCP client or DHCP server.

Values:

enumerator **ESP_NETIF_SUBNET_MASK**

Network mask

enumerator **ESP_NETIF_DOMAIN_NAME_SERVER**

Domain name server

enumerator **ESP_NETIF_ROUTER_SOLICITATION_ADDRESS**

Solicitation router address

enumerator **ESP_NETIF_REQUESTED_IP_ADDRESS**

Request specific IP address

enumerator **ESP_NETIF_IP_ADDRESS_LEASE_TIME**

Request IP address lease time

enumerator **ESP_NETIF_IP_REQUEST_RETRY_TIME**

Request IP address retry counter

enumerator **ESP_NETIF_VENDOR_CLASS_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP_NETIF_VENDOR_SPECIFIC_INFO**

Vendor Specific Information of a DHCP server

enum **ip_event_t**

IP event declarations

Values:

enumerator **IP_EVENT_STA_GOT_IP**

station got IP from connected AP

enumerator **IP_EVENT_STA_LOST_IP**

station lost IP and the IP is reset to 0

enumerator **IP_EVENT_AP_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP_EVENT_GOT_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP_EVENT_ETH_GOT_IP**

ethernet got IP from connected AP

enumerator **IP_EVENT_ETH_LOST_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP_EVENT_PPP_GOT_IP**

PPP interface got IP

enumerator **IP_EVENT_PPP_LOST_IP**

PPP interface lost IP

enum **esp_netif_flags**

Values:

enumerator **ESP_NETIF_DHCP_CLIENT**

enumerator **ESP_NETIF_DHCP_SERVER**

enumerator **ESP_NETIF_FLAG_AUTOUP**

enumerator **ESP_NETIF_FLAG_GARP**

enumerator **ESP_NETIF_FLAG_EVENT_IP_MODIFIED**

enumerator **ESP_NETIF_FLAG_IS_PPP**

enumerator **ESP_NETIF_FLAG_IS_BRIDGE**

enumerator **ESP_NETIF_FLAG_MLDV6_REPORT**

enum **esp_netif_ip_event_type**

Values:

enumerator **ESP_NETIF_IP_EVENT_GOT_IP**

enumerator **ESP_NETIF_IP_EVENT_LOST_IP**

Header File

- `components/esp_netif/include/esp_netif_ip_addr.h`

Functions

`esp_ip6_addr_type_t esp_netif_ip6_get_addr_type (esp_ip6_addr_t *ip6_addr)`

Get the IPv6 address type.

Parameters `ip6_addr` –[in] IPv6 type

Returns IPv6 type in form of enum `esp_ip6_addr_type_t`

static inline void `esp_netif_ip_addr_copy (esp_ip_addr_t *dest, const esp_ip_addr_t *src)`

Copy IP addresses.

Parameters

- `dest` –[out] destination IP
- `src` –[in] source IP

Structures

struct `esp_ip6_addr`

IPv6 address.

Public Members

uint32_t `addr`[4]

IPv6 address

Header File

- [components/esp_netif/include/esp_vfs_l2tap.h](#)

Functions

esp_err_t **esp_vfs_l2tap_intf_register** (*l2tap_vfs_config_t* *config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

Parameters **config** –L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this parameter is NULL.

Returns *esp_err_t*

- ESP_OK on success

esp_err_t **esp_vfs_l2tap_intf_unregister** (const char *base_path)

Removes L2 TAP virtual filesystem driver.

Parameters **base_path** –Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

Returns *esp_err_t*

- ESP_OK on success

esp_err_t **esp_vfs_l2tap_eth_filter** (*l2tap_iodriver_handle* driver_handle, void *buff, size_t *size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

Parameters

- **driver_handle** –handle of driver at which the frame was received
- **buff** –received L2 frame
- **size** –input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

Returns *esp_err_t*

- ESP_OK is always returned

Structures

struct **l2tap_vfs_config_t**

L2Tap VFS config parameters.

Public Members

const char ***base_path**

vfs base path

Macros

L2TAP_VFS_DEFAULT_PATH

L2TAP_VFS_CONFIG_DEFAULT ()

Type Definitions

typedef void ***l2tap_iodriver_handle**

Enumerations

WiFi default API reference

Header File

- `components/esp_wifi/include/esp_wifi_default.h`

Functions

esp_err_t **esp_netif_attach_wifi_station** (*esp_netif_t* *esp_netif)

Attaches wifi station interface to supplied netif.

Parameters `esp_netif` –instance to attach the wifi station to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_netif_attach_wifi_ap** (*esp_netif_t* *esp_netif)

Attaches wifi soft AP interface to supplied netif.

Parameters `esp_netif` –instance to attach the wifi AP to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed

esp_err_t **esp_wifi_set_default_wifi_sta_handlers** (void)

Sets default wifi event handlers for STA interface.

Returns

- ESP_OK on success, error returned from `esp_event_handler_register` if failed

esp_err_t **esp_wifi_set_default_wifi_ap_handlers** (void)

Sets default wifi event handlers for AP interface.

Returns

- ESP_OK on success, error returned from `esp_event_handler_register` if failed

esp_err_t **esp_wifi_clear_default_wifi_driver_and_handlers** (void *esp_netif)

Clears default wifi event handlers for supplied network interface.

Parameters `esp_netif` –instance of corresponding if object

Returns

- ESP_OK on success, error returned from `esp_event_handler_register` if failed

esp_netif_t ***esp_netif_create_default_wifi_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

Note: The API creates `esp_netif` object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

Returns pointer to esp-netif instance

esp_netif_t ***esp_netif_create_default_wifi_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

Note: The API creates `esp_netif` object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

Returns pointer to esp-netif instance

void **esp_netif_destroy_default_wifi** (void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_...() API.

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

Parameters **esp_netif** –[in] object to detach from WiFi and destroy

esp_netif_t ***esp_netif_create_wifi** (*wifi_interface_t* wifi_if, *esp_netif_inherent_config_t* *esp_netif_config)

Creates esp_netif WiFi object based on the custom configuration.

Attention This API DOES NOT register default handlers!

Parameters

- **wifi_if** –[in] type of wifi interface
- **esp_netif_config** –inherent esp-netif configuration pointer

Returns pointer to esp-netif instance

esp_err_t **esp_netif_create_default_wifi_mesh_netifs** (*esp_netif_t* **p_netif_sta, *esp_netif_t* **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

Parameters

- **p_netif_sta** –[out] pointer where the resultant STA interface is saved (if non NULL)
- **p_netif_ap** –[out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success

2.5.5 IP Network Layer

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver' s lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- *esp_netif_transmit()*
- *esp_netif_free_rx_buffer()*
- *esp_netif_receive()*

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver' s code simply calls *esp_netif_receive()* on a new data received event.

Post attach callback A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as
↳esp-netif driver */
    driver_impl          *h;               /*!< handle of driver
↳implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

Default handlers I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↳netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↳EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↳EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should

be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

Header File

- [components/esp_netif/include/esp_netif_net_stack.h](#)

Functions

esp_netif_t ***esp_netif_get_handle_from_netif_impl** (void *dev)

Returns esp-netif handle.

Parameters *dev* –[in] opaque ptr to network interface of specific TCP/IP stack

Returns handle to related esp-netif instance

void ***esp_netif_get_netif_impl** (*esp_netif_t* *esp_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Parameters *esp_netif* –[in] Handle to esp-netif instance

Returns handle to related network stack netif handle

esp_err_t **esp_netif_set_link_speed** (*esp_netif_t* *esp_netif, uint32_t speed)

Set link-speed for the specified network interface.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *speed* –[in] Link speed in bit/s

Returns ESP_OK on success

esp_err_t **esp_netif_transmit** (*esp_netif_t* *esp_netif, void *data, size_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *data* –[in] Data to be transmitted
- *len* –[in] Length of the data frame

Returns ESP_OK on success, an error passed from the I/O driver otherwise

esp_err_t **esp_netif_transmit_wrap** (*esp_netif_t* *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Parameters

- *esp_netif* –[in] Handle to esp-netif instance
- *data* –[in] Data to be transmitted
- *len* –[in] Length of the data frame
- *netstack_buf* –[in] net stack buffer

Returns ESP_OK on success, an error passed from the I/O driver otherwise

void **esp_netif_free_rx_buffer** (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters

- *esp_netif* –[in] Handle to esp-netif instance

- **buffer** –[in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

2.6 Peripherals API

2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from dedicated analog IO pads.

The ADC on ESP32-C3 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC oneshot mode conversion.

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- [Resource Allocation](#) - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- [Unit Configuration](#) - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- [Read Conversion Result](#) - covers how to get ADC conversion raw result.
- [Hardware Limitations](#) - describes the ADC related hardware limitations.
- [Power Management](#) - covers power management related.
- [IRAM Safe](#) - describes tips on how to read ADC conversion raw result when cache is disabled.
- [Thread Safety](#) - lists which APIs are guaranteed to be thread safe by the driver.
- [Kconfig Options](#) - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation The ADC oneshot mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP chips might have different number of independent ADCs. From oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the [datasheet](#) to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under super low power mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle, if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

Create an ADC Unit Handle under Normal Oshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

Unit Configuration After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IO to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in [TRM](#).
- `adc_oneshot_chan_cfg_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

Note: For the IO corresponding ADC channel number. Check [datasheet](#) to know the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with above configuration structure. Especially, this `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. Driver will save these per channel configurations internally.

Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .channel = EXAMPLE_ADC1_CHAN0,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));

config.channel = EXAMPLE_ADC1_CHAN1;
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, &config));
```

Read Conversion Result After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safer. ADC(s) are shared by some other drivers / peripherals, see [Hardware Limitations](#). This function takes some mutexes, to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers / peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

These two functions will both fail due to invalid arguments.

The ADC conversion results read from these two functions are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM .
Dmax	Maximum of the output ADC raw digital reading result, which is 2^{bitwidth} , where bitwidth is the <code>:cpp.member::adc_oneshot_chan_cfg_t.bitwidth</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator uses ADC as a input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.
- ADC2 oneshot mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in [ESP32C3 Errata](#). For compatibility, you can enable `CONFIG_ADC_ONESHOT_FORCE_USE_ADC2_ON_C3` to force use ADC2.

Power Management When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides won't be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled (Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc.). If these APIs executes when the Cache is disabled, you will probably see errors like Illegal Instruction or Load/Store Prohibited.

Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread safe. Besides, concurrently calling this function may result in thread-safe APIs fail.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

Application Examples

- ADC oneshot mode example: [peripherals/adc/oneshot_read](#).

API Reference

Structures

struct **adc_digi_pattern_config_t**
ADC digital controller pattern configuration.

Public Members

uint8_t **atten**
Attenuation of this ADC channel.

uint8_t **channel**
ADC channel.

uint8_t **unit**
ADC unit.

uint8_t **bit_width**
ADC output bit width.

struct **adc_digi_output_data_t**
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t **data**
ADC real output data info. Resolution: 12 bit.

uint32_t **reserved12**
Reserved12.

uint32_t **channel**

ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t **unit**

ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t **reserved17_31**

Reserved17.

struct *adc_digi_output_data_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit.

uint32_t **val**

Raw data value

Enumerations

enum **adc_unit_t**

ADC unit.

Values:

enumerator **ADC_UNIT_1**

SAR ADC 1.

enumerator **ADC_UNIT_2**

SAR ADC 2.

enum **adc_channel_t**

ADC channels.

Values:

enumerator **ADC_CHANNEL_0**

ADC channel.

enumerator **ADC_CHANNEL_1**

ADC channel.

enumerator **ADC_CHANNEL_2**

ADC channel.

enumerator **ADC_CHANNEL_3**

ADC channel.

enumerator **ADC_CHANNEL_4**

ADC channel.

enumerator **ADC_CHANNEL_5**

ADC channel.

enumerator **ADC_CHANNEL_6**

ADC channel.

enumerator **ADC_CHANNEL_7**

ADC channel.

enumerator **ADC_CHANNEL_8**

ADC channel.

enumerator **ADC_CHANNEL_9**

ADC channel.

enum **adc_atten_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator **ADC_ATTEN_DB_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC_ATTEN_DB_2_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC_ATTEN_DB_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC_ATTEN_DB_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC_ATTEN_DB_11**

This is deprecated, it behaves the same as `ADC_ATTEN_DB_12`

enum **adc_bitwidth_t**

Values:

enumerator **ADC_BITWIDTH_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC_BITWIDTH_9**

ADC output width is 9Bit.

enumerator **ADC_BITWIDTH_10**

ADC output width is 10Bit.

enumerator **ADC_BITWIDTH_11**

ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**

ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**

ADC output width is 13Bit.

enum **adc_ulp_mode_t**

Values:

enumerator **ADC_ULP_MODE_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC_ULP_MODE_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**

ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**

ADC digital controller (DMA mode) work mode.

Values:

enumerator **ADC_CONV_SINGLE_UNIT_1**

Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**

Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum **adc_digi_output_format_t**

ADC digital controller (DMA mode) output data format option.

Values:

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**

See `adc_digi_output_data_t.type2`

Header File

- [components/esp_adc/include/esp_adc/adc_oneshot.h](#)

Functions

esp_err_t **adc_oneshot_new_unit** (const *adc_oneshot_unit_init_cfg_t* *init_config,
adc_oneshot_unit_handle_t *ret_unit)

Create a handle to a specific ADC unit.

Note: This API is thread-safe. For more details, see ADC programming guide

Parameters

- **init_config** –[in] Driver initial configurations
- **ret_unit** –[out] ADC unit handle

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use

esp_err_t **adc_oneshot_config_channel** (*adc_oneshot_unit_handle_t* handle, *adc_channel_t* channel,
const *adc_oneshot_chan_cfg_t* *config)

Set ADC oneshot mode required configurations.

Note: This API is thread-safe. For more details, see ADC programming guide

Parameters

- **handle** –[in] ADC handle
- **channel** –[in] ADC channel to be configured
- **config** –[in] ADC configurations

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

esp_err_t **adc_oneshot_read** (*adc_oneshot_unit_handle_t* handle, *adc_channel_t* chan, int *out_raw)

Get one ADC conversion raw result.

Note: This API is thread-safe. For more details, see ADC programming guide

Note: This API should NOT be called in an ISR context

Parameters

- **handle** –[in] ADC handle
- **chan** –[in] ADC channel
- **out_raw** –[out] ADC conversion raw result

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

esp_err_t **adc_oneshot_del_unit** (*adc_oneshot_unit_handle_t* handle)

Delete the ADC unit handle.

Note: This API is thread-safe. For more details, see ADC programming guide

Parameters `handle` `-[in]` ADC handle

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_NOT_FOUND`: The ADC peripheral to be disclaimed isn't in use

`esp_err_t adc_oneshot_io_to_channel` (int `io_num`, `adc_unit_t` *`unit_id`, `adc_channel_t` *`channel`)

Get ADC channel from the given GPIO number.

Parameters

- `io_num` `-[in]` GPIO number
- `unit_id` `-[out]` ADC unit
- `channel` `-[out]` ADC channel

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: The IO is not a valid ADC pad

`esp_err_t adc_oneshot_channel_to_io` (`adc_unit_t` `unit_id`, `adc_channel_t` `channel`, int *`io_num`)

Get GPIO number from the given ADC channel.

Parameters

- `unit_id` `-[in]` ADC unit
- `channel` `-[in]` ADC channel
- `io_num` `-[out]` GPIO number
- `--ESP_OK`: On success
- `- ESP_ERR_INVALID_ARG`: Invalid argument

Structures

struct `adc_oneshot_unit_init_cfg_t`

ADC oneshot driver initial configurations.

Public Members

`adc_unit_t` `unit_id`

ADC unit.

`adc_ulp_mode_t` `ulp_mode`

ADC controlled by ULP, see `adc_ulp_mode_t`

struct `adc_oneshot_chan_cfg_t`

ADC channel configurations.

Public Members

`adc_atten_t` `atten`

ADC attenuation.

`adc_bitwidth_t` `bitwidth`

ADC conversion result bits.

Type Definitions

```
typedef struct adc_oneshot_unit_ctx_t *adc_oneshot_unit_handle_t
```

Type of ADC unit handle for oneshot mode.

2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

The ADC on ESP32-C3 can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

Driver Concepts ADC continuous mode conversion is made up with multiple Conversion Frames. - Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes. - Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- *Resource Allocation* - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- *ADC Configurations* - describes how to configure the ADC(s) to make it work under continuous mode.
- *ADC Control* - describes ADC control functions.
- *Register Event Callbacks* - describes how to hook user specific code to an ADC continuous mode event callback function.
- *Read Conversion Result* - covers how to get ADC conversion result.
- *Hardware Limitations* - describes the ADC related hardware limitations.
- *Power Management* - covers power management related.
- *IRAM Safe* - covers the IRAM safe functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation The ADC continuous mode driver is implemented based on ESP32-C3 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means there is no free GDMA channel.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

ADC Configurations After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

Note: For the IO corresponding ADC channel number. Check [datasheet](#) to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't call this API at this moment.

See ADC continuous mode example [peripherals/adc/continuous_read](#) to see configuration codes.

ADC Control

Start and Stop Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

Register Event Callbacks By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t` - `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes. - `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren't in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't add callback at this moment.

Conversion Done Event The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

Note: It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

Note: When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

Pool Overflow Event The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won't fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

Read Conversion Result After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn't reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in TRM .
Dmax	Maximum of the output ADC raw digital reading result, which is 2^{bitwidth} , where bitwidth is the <code>adc_digi_pattern_config_1.bit_width</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. [adc_continuous_start\(\)](#) has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 continuous mode is no longer supported, due to hardware limitation. The results are not stable. This issue can be found in [ESP32C3 Errata](#). For compatibility, you can enable [CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3](#) to force use ADC2.

Power Management When power management is enabled (i.e. [CONFIG_PM_ENABLE](#) is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type [ESP_PM_APB_FREQ_MAX](#). The lock is acquired after the continuous conversion is started by [adc_continuous_start\(\)](#). Similarly, the lock will be released after [adc_continuous_stop\(\)](#). Therefore, [adc_continuous_start\(\)](#) and [adc_continuous_stop\(\)](#) should appear in pairs, otherwise the power management will be out of action.

IRAM Safe All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option [CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE](#), driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

Thread Safety ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See [Hardware Limitations](#) for more details.

Application Examples

- ADC continuous mode example: [peripherals/adc/continuous_read](#).

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`

Functions

`esp_err_t adc_continuous_new_handle` (const `adc_continuous_handle_cfg_t` *hdl_config, `adc_continuous_handle_t` *ret_handle)

Initialize ADC continuous driver and get a handle to it.

Parameters

- **hdl_config** `-[in]` Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- **ret_handle** `-[out]` ADC continuous mode driver handle

Returns

- `ESP_ERR_INVALID_ARG` If the combination of arguments is invalid.
- `ESP_ERR_NOT_FOUND` No free interrupt found with the specified flags
- `ESP_ERR_NO_MEM` If out of memory
- `ESP_OK` On success

`esp_err_t adc_continuous_config` (`adc_continuous_handle_t` handle, const `adc_continuous_config_t` *config)

Set ADC continuous mode required configurations.

Parameters

- **handle** `-[in]` ADC continuous mode driver handle
- **config** `-[in]` Refer to `adc_digi_config_t`.

Returns

- `ESP_ERR_INVALID_STATE`: Driver state is invalid, you shouldn't call this API at this moment
- `ESP_ERR_INVALID_ARG`: If the combination of arguments is invalid.
- `ESP_OK`: On success

`esp_err_t adc_continuous_register_event_callbacks` (`adc_continuous_handle_t` handle, const `adc_continuous_evt_cbs_t` *cbs, void *user_data)

Register callbacks.

Note: User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to `NULL`.

Note: When `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in `IRAM`. Involved variables (including `user_data`) should be in internal `RAM` as well.

Note: You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

Parameters

- **handle** `-[in]` ADC continuous mode driver handle
- **cbs** `-[in]` Group of callback functions
- **user_data** `-[in]` User data, which will be delivered to the callback functions directly

Returns

- `ESP_OK`: On success

- `ESP_ERR_INVALID_ARG`: Invalid arguments
- `ESP_ERR_INVALID_STATE`: Driver state is invalid, you shouldn't call this API at this moment

`esp_err_t adc_continuous_start (adc_continuous_handle_t handle)`

Start the ADC under continuous mode. After this, the hardware starts working.

Parameters `handle` –[in] ADC continuous mode driver handle

Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

`esp_err_t adc_continuous_read (adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)`

Read bytes from ADC under continuous mode.

Parameters

- `handle` –[in] ADC continuous mode driver handle
- `buf` –[out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.
- `length_max` –[in] Expected length of the Conversion Results read from the ADC, in bytes.
- `out_length` –[out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- `timeout_ms` –[in] Time to wait for data via this API, in millisecond.

Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- `ESP_ERR_TIMEOUT` Operation timed out
- `ESP_OK` On success

`esp_err_t adc_continuous_stop (adc_continuous_handle_t handle)`

Stop the ADC. After this, the hardware stops working.

Parameters `handle` –[in] ADC continuous mode driver handle

Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

`esp_err_t adc_continuous_deinit (adc_continuous_handle_t handle)`

Deinitialize the ADC continuous driver.

Parameters `handle` –[in] ADC continuous mode driver handle

Returns

- `ESP_ERR_INVALID_STATE` Driver state is invalid.
- `ESP_OK` On success

`esp_err_t adc_continuous_io_to_channel (int io_num, adc_unit_t *unit_id, adc_channel_t *channel)`

Get ADC channel from the given GPIO number.

Parameters

- `io_num` –[in] GPIO number
- `unit_id` –[out] ADC unit
- `channel` –[out] ADC channel

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_FOUND`: The IO is not a valid ADC pad

`esp_err_t adc_continuous_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *io_num)`

Get GPIO number from the given ADC channel.

Parameters

- **unit_id** –[in] ADC unit
- **channel** –[in] ADC channel
- **io_num** –[out] GPIO number
- – **ESP_OK**: On success
- **ESP_ERR_INVALID_ARG**: Invalid argument

Structures

struct **adc_continuous_handle_cfg_t**

ADC continuous mode driver initial configurations.

Public Members

uint32_t **max_store_buf_size**

Max length of the conversion Results that driver can store, in bytes.

uint32_t **conv_frame_size**

Conversion frame size, in bytes. This should be in multiples of `SOC_ADC_DIGI_DATA_BYTES_PER_CONV`.

struct **adc_continuous_config_t**

ADC continuous mode driver configurations.

Public Members

uint32_t **pattern_num**

Number of ADC channels that will be used.

[*adc_digi_pattern_config_t*](#) ***adc_pattern**

List of configs for each ADC channel that will be used.

uint32_t **sample_freq_hz**

The expected ADC sampling frequency in Hz. Please refer to `soc/soc_caps.h` to know available sampling frequency range

[*adc_digi_convert_mode_t*](#) **conv_mode**

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

[*adc_digi_output_format_t*](#) **format**

ADC DMA conversion output format, see `adc_digi_output_format_t`.

struct **adc_continuous_evt_data_t**

Event data structure.

Note: The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

Public Members

uint8_t ***conv_frame_buffer**

Pointer to conversion result buffer for one conversion frame.

uint32_t **size**

Conversion frame size.

struct **adc_continuous_evt_cbs_t**

Group of ADC continuous mode callbacks.

Note: These callbacks are all running in an ISR environment.

Note: When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

Public Members

[*adc_continuous_callback_t*](#) **on_conv_done**

Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

[*adc_continuous_callback_t*](#) **on_pool_ovf**

Event callback, invoked when the internal pool is full.

Macros

ADC_MAX_DELAY

Driver Backgrounds.

Type Definitions

typedef struct adc_continuous_ctx_t ***adc_continuous_handle_t**

Type of adc continuous mode driver handle.

typedef bool (***adc_continuous_callback_t**)([*adc_continuous_handle_t*](#) handle, const [*adc_continuous_evt_data_t*](#) *edata, void *user_data)

Prototype of ADC continuous mode event callback.

Param handle [in] ADC continuous mode driver handle

Param edata [in] Pointer to ADC continuous mode event data

Param user_data [in] User registered context, registered when in `adc_continuous_register_event_callbacks()`

Return Whether a high priority task is woken up by this function

2.6.3 Analog to Digital Converter (ADC) Calibration Driver

Introduction

Based on series of comparisons with the reference voltage, ESP32-C3 ADC determines each bit of the output digital result. Per design the ESP32-C3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide will introduce an ADC calibration driver to minimize this difference.

Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Calibration Configuration* - covers how to configure the calibration driver to calculate necessary characteristics used for calibration.
- *Result Conversion* - covers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

Calibration Scheme Creation The ADC calibration driver provides ADC calibration scheme(s). From calibration driver's point of view, an ADC calibration scheme is created to an ADC calibration handle `adc_cali_handle_t`.

`adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. For those users who are already aware of the supported scheme, this step can be skipped. Just call the corresponding function to create the scheme handle.

For those users who use their custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

ADC Calibration Curve Fitting Scheme ESP32-C3 supports `ADC_CALI_SCHEME_VER_CURVE_FITTING` scheme. To create this scheme, set up `adc_cali_curve_fitting_config_t` first.

- `adc_cali_curve_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_curve_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_curve_fitting_config_t::bitwidth`, the ADC raw result bitwidth.

After setting up the configuration structure, call `adc_cali_create_scheme_curve_fitting()` to create a Curve Fitting calibration scheme handle. This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function return `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burnt on your board.

Create Curve Fitting Scheme

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Curve Fitting");
adc_cali_curve_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_curve_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme driver from the calibration handle by calling `adc_cali_delete_scheme_curve_fitting()`.

Delete Curve Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Curve Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_curve_fitting(handle));
```

Note: For users who want to use their custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

Result Conversion After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme isn't created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

Thread Safety The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread safe, you should avoid calling them from multiple tasks.

Minimize Noise The ESP32-C3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- [components/esp_adc/include/esp_adc/adc_cali.h](#)

Functions

`esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

Parameters `scheme_mask` –[out] Supported ADC calibration scheme(s)

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

`esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

Convert ADC raw data to calibrated voltage.

Parameters

- `handle` –[in] ADC calibration handle
- `raw` –[in] ADC raw data
- `voltage` –[out] Calibrated ADC voltage (in mV)

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

- `ESP_ERR_INVALID_STATE`: Invalid state, scheme didn't registered

Type Definitions

```
typedef struct adc_cali_scheme_t *adc_cali_handle_t
    ADC calibration handle.
```

Enumerations

```
enum adc_cali_scheme_ver_t
    ADC calibration scheme.
```

Values:

```
enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
    Line fitting scheme.
```

```
enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
    Curve fitting scheme.
```

Header File

- `components/esp_adc/include/esp_adc/adc_cali_scheme.h`

2.6.4 Clock Tree

This section lists definitions of the ESP32-C3's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help user select a proper source clock for the peripheral.

Root Clocks

Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), WIFI, BT, the RTC, and the peripherals.

ESP32-C3's root clocks are listed in `soc_root_clk_t`:

- Internal 17.5MHz RC Oscillator (`RC_FAST`)
This RC oscillator generates a ~17.5MHz clock signal output as the `RC_FAST_CLK`. The ~17.5MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`. The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.
- External 40MHz Crystal (`XTAL`)
- Internal 136kHz RC Oscillator (`RC_SLOW`)
This RC oscillator generates a ~136kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.
- External 32kHz Crystal - optional (`XTAL32K`)
The clock source for this `XTAL32K_CLK` can be either a 32kHz crystal connecting to the `XTAL_32K_P` and `XTAL_32K_N` pins or a 32kHz clock signal generated by an external circuit. The external signal must be connected to the `XTAL_32K_P` pin. `XTAL32K_CLK` can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from a RC oscillator circuit is less accurate and more sensitive to environment comparing to the signal generated from a crystal. ESP32-C3 provides several clock source options for the RTC_SLOW_CLK, and users can make the choice based on the requirements for system time accuracy and power consumption (refer to *RTC Timer Clock Sources* for more details).

Module Clocks

ESP32-C3's available module clocks are listed in *soc_module_clk_t*. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

API Reference

Header File

- [components/soc/esp32c3/include/soc/clk_tree_defs.h](#)

Macros

SOC_CLK_RC_FAST_FREQ_APPROX

Approximate RC_FAST_CLK frequency in Hz

SOC_CLK_RC_SLOW_FREQ_APPROX

Approximate RC_SLOW_CLK frequency in Hz

SOC_CLK_RC_FAST_D256_FREQ_APPROX

Approximate RC_FAST_D256_CLK frequency in Hz

SOC_CLK_XTAL32K_FREQ_APPROX

Approximate XTAL32K_CLK frequency in Hz

SOC_GPTIMER_CLKS

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

SOC_RMT_CLKS

Array initializer for all supported clock sources of RMT.

SOC_TEMP_SENSOR_CLKS

Array initializer for all supported clock sources of Temperature Sensor.

SOC_I2S_CLKS

Array initializer for all supported clock sources of I2S.

SOC_I2C_CLKS

Array initializer for all supported clock sources of I2C.

SOC_SDM_CLKS

Array initializer for all supported clock sources of SDM.

Enumerations

enum **soc_root_clk_t**

Root clock.

Values:

enumerator **SOC_ROOT_CLK_INT_RC_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC_ROOT_CLK_INT_RC_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC_ROOT_CLK_EXT_XTAL**

External 40MHz crystal

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**

External 32kHz crystal/clock signal

enum **soc_cpu_clk_src_t**

CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_CPU_CLK_SRC_XTAL**

Select XTAL_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_PLL**

Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

enumerator **SOC_CPU_CLK_SRC_RC_FAST**

Select RC_FAST_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_INVALID**

Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**

RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**

Select RC_SLOW_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**

Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**

Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**

Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**

RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.

Note: Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D2**

Select XTAL_D2_CLK (may referred as XTAL_CLK_DIV_2) as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**

Alias name for SOC_RTC_FAST_CLK_SRC_XTAL_D2

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**

Select RC_FAST_CLK as RTC_FAST_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**

Invalid RTC_FAST_CLK source

enum **soc_module_clk_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

Note: enum starts from 1, to save 0 for special purpose

Values:

enumerator **SOC_MOD_CLK_CPU**

CPU_CLK can be sourced from XTAL, PLL, or RC_FAST by configuring soc_cpu_clk_src_t

enumerator **SOC_MOD_CLK_RTC_FAST**

RTC_FAST_CLK can be sourced from XTAL_D2 or RC_FAST by configuring soc_rtc_fast_clk_src_t

enumerator **SOC_MOD_CLK_RTC_SLOW**

RTC_SLOW_CLK can be sourced from RC_SLOW, XTAL32K, or RC_FAST_D256 by configuring soc_rtc_slow_clk_src_t

enumerator **SOC_MOD_CLK_APB**

APB_CLK is highly dependent on the CPU_CLK source

enumerator **SOC_MOD_CLK_PLL_F80M**

PLL_F80M_CLK is derived from PLL, and has a fixed frequency of 80MHz

enumerator **SOC_MOD_CLK_PLL_F160M**

PLL_F160M_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator **SOC_MOD_CLK_PLL_D2**

PLL_D2_CLK is derived from PLL, it has a fixed divider of 2

enumerator **SOC_MOD_CLK_XTAL32K**

XTAL32K_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**

RC_FAST_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST_D256**

RC_FAST_D256_CLK comes from the internal 20MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_XTAL**

XTAL_CLK comes from the external 40MHz crystal

enum **soc_periph_gptimer_clk_src_t**

Type of GPTimer clock source.

Values:

enumerator **GPTIMER_CLK_SRC_APB**

Select APB as the source clock

enumerator **GPTIMER_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**

Select APB as the default choice

enum **soc_periph_tg_clk_src_legacy_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

Values:

enumerator **TIMER_SRC_CLK_APB**

Timer group clock source is APB

enumerator **TIMER_SRC_CLK_XTAL**

Timer group clock source is XTAL

enumerator **TIMER_SRC_CLK_DEFAULT**

Timer group clock source default choice is APB

enum **soc_periph_rmt_clk_src_t**

Type of RMT clock source.

Values:

enumerator **RMT_CLK_SRC_APB**

Select APB as the source clock

enumerator **RMT_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **RMT_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **RMT_CLK_SRC_DEFAULT**

Select APB as the default choice

enum **soc_periph_rmt_clk_src_legacy_t**

Type of RMT clock source, reserved for the legacy RMT driver.

Values:

enumerator **RMT_BASECLK_APB**

RMT source clock is APB

enumerator **RMT_BASECLK_XTAL**

RMT source clock is XTAL

enumerator **RMT_BASECLK_DEFAULT**

RMT source clock default choice is APB

enum **soc_periph_temperature_sensor_clk_src_t**

Type of Temp Sensor clock source.

Values:

enumerator **TEMPERATURE_SENSOR_CLK_SRC_XTAL**

Select XTAL as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_RC_FAST**

Select RC_FAST as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_DEFAULT**

Select XTAL as the default choice

enum **soc_periph_uart_clk_src_legacy_t**

Type of UART clock source, reserved for the legacy UART driver.

Values:

enumerator **UART_SCLK_APB**

UART source clock is APB CLK

enumerator **UART_SCLK_RTC**

UART source clock is RC_FAST

enumerator **UART_SCLK_XTAL**

UART source clock is XTAL

enumerator **UART_SCLK_DEFAULT**

UART source clock default choice is APB

enum **soc_periph_i2s_clk_src_t**

I2S clock source enum.

Values:

enumerator **I2S_CLK_SRC_DEFAULT**

Select PLL_F160M as the default source clock

enumerator **I2S_CLK_SRC_PLL_160M**

Select PLL_F160M as the source clock

enum **soc_periph_i2c_clk_src_t**

Type of I2C clock source.

Values:

enumerator **I2C_CLK_SRC_XTAL**

enumerator **I2C_CLK_SRC_RC_FAST**

enumerator **I2C_CLK_SRC_DEFAULT**

enum **soc_periph_sdm_clk_src_t**

Sigma Delta Modulator clock source.

Values:

enumerator **SDM_CLK_SRC_APB**

Select APB as the source clock

enumerator **SDM_CLK_SRC_DEFAULT**

Select APB as the default clock choice

2.6.5 GPIO & RTC GPIO

Overview

The ESP32-C3 chip features 22 physical GPIO pins (GPIO0 ~ GPIO21). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-C3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	Comment
GPIO0	ADC1_CH0	RTC
GPIO1	ADC1_CH1	RTC
GPIO2	ADC1_CH2	Strapping pin; RTC
GPIO3	ADC1_CH3	RTC
GPIO4	ADC1_CH4	RTC
GPIO5	ADC2_CH0	RTC
GPIO6		
GPIO7		
GPIO8		Strapping pin
GPIO9		Strapping pin
GPIO10		
GPIO11		
GPIO12		SPI0/1
GPIO13		SPI0/1
GPIO14		SPI0/1
GPIO15		SPI0/1
GPIO16		SPI0/1
GPIO17		SPI0/1
GPIO18		USB-JTAG
GPIO19		USB-JTAG
GPIO20		
GPIO21		

Note:

- Strapping pin: GPIO2, GPIO8 and GPIO9 are strapping pins. For more information, please refer to [ESP32-C3 datasheet](#).
- SPI0/1: GPIO12-17 are usually used for SPI flash and PSRAM and are not recommended for other uses.
- USB-JTAG: GPIO 18 and 19 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
- RTC: GPIO0-5 can be used when in Deep-sleep mode.

Application Example

GPIO output and input interrupt example: [peripherals/gpio/generic_gpio](#).

API Reference - Normal GPIO

Header File

- [components/driver/include/driver/gpio.h](#)

Functions

esp_err_t **gpio_config** (const *gpio_config_t* *pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

Parameters *pGPIOConfig* –Pointer to GPIO configure struct

Returns

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_reset_pin** (*gpio_num_t* gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note: This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Parameters *gpio_num* –GPIO number.

Returns Always return ESP_OK.

esp_err_t **gpio_set_intr_type** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

GPIO set interrupt trigger type.

Parameters

- **gpio_num** –GPIO number. If you want to set the trigger type of e.g. of GPIO16, *gpio_num* should be GPIO_NUM_16 (16);
- **intr_type** –Interrupt type, select from *gpio_int_type_t*

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_enable** (*gpio_num_t* gpio_num)

Enable GPIO module interrupt signal.

Note: ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

Parameters *gpio_num* –GPIO number. If you want to enable an interrupt on e.g. GPIO16, *gpio_num* should be GPIO_NUM_16 (16);

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_intr_disable** (*gpio_num_t* gpio_num)

Disable GPIO module interrupt signal.

Note: This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

Parameters `gpio_num` –GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

Returns

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t `gpio_set_level` (*gpio_num_t* `gpio_num`, *uint32_t* `level`)

GPIO set output level.

Note: This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

Parameters

- `gpio_num` –GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level` –Output level. 0: low ; 1: high

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO number error

int `gpio_get_level` (*gpio_num_t* `gpio_num`)

GPIO get input level.

Warning: If the pad is not configured for input (or input and output) the returned value is always 0.

Parameters `gpio_num` –GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

Returns

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

esp_err_t `gpio_set_direction` (*gpio_num_t* `gpio_num`, *gpio_mode_t* `mode`)

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

Parameters

- `gpio_num` –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` –GPIO direction

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

esp_err_t `gpio_set_pull_mode` (*gpio_num_t* `gpio_num`, *gpio_pull_mode_t* `pull`)

Configure GPIO pull-up/pull-down resistors.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters

- `gpio_num` –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` –GPIO pull up/down mode.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_int_type_t* intr_type)

Enable GPIO wake-up function.

Parameters

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO wake-up function.

Parameters **gpio_num** –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *gpio_isr_handle_t* *handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

Parameters

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

esp_err_t **gpio_pullup_en** (*gpio_num_t* gpio_num)

Enable pull-up on GPIO.

Parameters **gpio_num** –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

Parameters **gpio_num** –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pulldown_en** (*gpio_num_t* gpio_num)

Enable pull-down on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_pullup_dis** (*gpio_num_t* gpio_num)

Disable pull-up on GPIO.

Parameters `gpio_num` –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_install_isr_service** (int intr_alloc_flags)

Install the GPIO driver's `ETS_GPIO_INTR_SOURCE` ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

Parameters `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

Returns

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

void **gpio_uninstall_isr_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

esp_err_t **gpio_isr_handler_add** (*gpio_num_t* gpio_num, *gpio_isr_t* isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Parameters

- `gpio_num` –GPIO number
- `isr_handler` –ISR handler function for the corresponding GPIO number.
- `args` –parameter for ISR handler.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_isr_handler_remove** (*gpio_num_t* gpio_num)

Remove ISR handler for the corresponding GPIO pin.

Parameters `gpio_num` –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_set_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* strength)

Set GPIO pad drive capability.

Parameters

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Drive capability of the pad

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_get_drive_capability** (*gpio_num_t* gpio_num, *gpio_drive_cap_t* *strength)

Get GPIO pad drive capability.

Parameters

- **gpio_num** –GPIO number, only support output GPIOs
- **strength** –Pointer to accept drive capability of the pad

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_hold_en** (*gpio_num_t* gpio_num)

Enable gpio pad hold function.

When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). It can be used to retain the pin state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: input read value can still reflect the changes of the input signal.

The state of the digital gpio cannot be held during Deep-sleep, and it will resume to hold at its default pin state when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Parameters **gpio_num** –GPIO number, only support output-capable GPIOs

Returns

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

esp_err_t **gpio_hold_dis** (*gpio_num_t* gpio_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

Parameters **gpio_num** –GPIO number, only support output-capable GPIOs

Returns

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

void **gpio_deep_sleep_hold_en** (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void **gpio_deep_sleep_hold_dis** (void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio_iomux_in** (uint32_t gpio_num, uint32_t signal_idx)

Set pad input to a peripheral signal through the IOMUX.

Parameters

- **gpio_num** –GPIO number of the pad.
- **signal_idx** –Peripheral signal id to input. One of the *_IN_IDX signals in `soc/gpio_sig_map.h`.

void **gpio_iomux_out** (uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- **gpio_num** –gpio_num GPIO number of the pad.
- **func** –The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in `soc/io_mux_reg.h`.
- **oen_inv** –True if the output enable needs to be inverted, otherwise False.

esp_err_t **gpio_force_hold_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

Warning: This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), MUST be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

esp_err_t **gpio_force_unhold_all** (void)

Force unhold all digital and rtc gpio pads.

esp_err_t **gpio_sleep_sel_en** (*gpio_num_t* gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters **gpio_num** –GPIO number of the pad.

Returns

- ESP_OK Success

esp_err_t **gpio_sleep_sel_dis** (*gpio_num_t* gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters **gpio_num** –GPIO number of the pad.

Returns

- ESP_OK Success

esp_err_t **gpio_sleep_set_direction** (*gpio_num_t* gpio_num, *gpio_mode_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output_only,input_only,output_and_input

Parameters

- **gpio_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode** –GPIO direction

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t **gpio_sleep_set_pull_mode** (*gpio_num_t* gpio_num, *gpio_pull_mode_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters

- **gpio_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull** –GPIO pull up/down mode.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t **gpio_deep_sleep_wakeup_enable** (*gpio_num_t* gpio_num, *gpio_intr_type_t* intr_type)

Enable GPIO deep-sleep wake-up function.

Note: Called by the SDK. User shouldn't call this directly in the APP.

Parameters

- **gpio_num** –GPIO number.
- **intr_type** –GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **gpio_deep_sleep_wakeup_disable** (*gpio_num_t* gpio_num)

Disable GPIO deep-sleep wake-up function.

Parameters **gpio_num** –GPIO number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **gpio_config_t**

Configuration parameters of GPIO pad for gpio_config function.

2.6.6 General Purpose Timer (GPTimer)

Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-C3 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- [Resource Allocation](#) - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- [Set and Get Count Value](#) - covers how to force the timer counting from a start point and how to get the count value at anytime.
- [Set up Alarm Action](#) - covers the parameters that should be set up to enable the alarm event.
- [Register Event Callbacks](#) - covers how to hook user specific code to the alarm event callback function.
- [Enable and Disable Timer](#) - covers how to enable and disable the timer.
- [Start and Stop Timer](#) - shows some typical use cases that start the timer with different alarm behavior.
- [Power Management](#) - describes how different source clock selections can affect power consumption.

- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.¹

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to $1 / \text{resolution_hz}$ seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

Set and Get Count Value When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

¹ Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to *ESP32-C3 Technical Reference Manual* > Chapter *Timer Group (TIMG)* [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).

Set up Alarm Action For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

Note: If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

Register Event Callbacks After the timer starts up, it can generate a specific event (e.g. the “Alarm Event”) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

Enable and Disable Timer Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from **init** to **enable**.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

Start and Stop Timer The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event. Calling `gptimer_start()` will transit the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the “start protection” state (i.e. `gptimer_start()` is called but not finished).

Start Timer as a Wall Clock

```

ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));

```

Trigger Period Events

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {

```

(continues on next page)

(continued from previous page)

```

        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

Dynamic Alarm Update Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

Power Management There're some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver will increase the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

IRAM Safe By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
- Place all functions that used by the ISR into IRAM²
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Thread Safety All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash), see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Examples

- Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.

² `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

API Reference

Header File

- `components/driver/include/driver/gptimer.h`

Functions

esp_err_t **gptimer_new_timer** (const *gptimer_config_t* *config, *gptimer_handle_t* *ret_timer)

Create a new General Purpose Timer, and return the handle.

Note: The newly created timer is put in the “init” state.

Parameters

- **config** –[in] GPTimer configuration
- **ret_timer** –[out] Returned timer handle

Returns

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

esp_err_t **gptimer_del_timer** (*gptimer_handle_t* timer)

Delete the GPTimer handle.

Note: A timer must be in the “init” state before it can be deleted.

Parameters **timer** –[in] Timer handle created by `gptimer_new_timer()`

Returns

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
- ESP_FAIL: Delete GPTimer failed because of other error

esp_err_t **gptimer_set_raw_count** (*gptimer_handle_t* timer, *uint64_t* value)

Set GPTimer raw count value.

Note: When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **value** –[in] Count value to be set

Returns

- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

esp_err_t **gptimer_get_raw_count** (*gptimer_handle_t* timer, uint64_t *value)

Get GPTimer raw count value.

Note: With the raw count value and the resolution set in the *gptimer_config_t*, you can convert the count value into seconds.

Note: This function is allowed to run within ISR context

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters

- **timer** –[in] Timer handle created by *gptimer_new_timer()*
- **value** –[out] Returned GPTimer count value

Returns

- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

esp_err_t **gptimer_register_event_callbacks** (*gptimer_handle_t* timer, const *gptimer_event_callbacks_t* *cbs, void *user_data)

Set callbacks for GPTimer.

Note: User registered callbacks are expected to be runnable within ISR context

Note: The first call to this function needs to be before the call to *gptimer_enable*

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the *cbs* structure to NULL.

Parameters

- **timer** –[in] Timer handle created by *gptimer_new_timer()*
- **cbs** –[in] Group of callback functions
- **user_data** –[in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

esp_err_t **gptimer_set_alarm_action** (*gptimer_handle_t* timer, const *gptimer_alarm_config_t* *config)

Set alarm event actions for GPTimer.

Note: This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

Note: If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer()`
- **config** –[in] Alarm configuration, especially, set config to NULL means disabling the alarm function

Returns

- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

esp_err_t **gptimer_enable** (*gptimer_handle_t* timer)

Enable GPTimer.

Note: This function will transit the timer state from “init” to “enable” .

Note: This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

Note: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while CONFIG_PM_ENABLE is enabled.

Note: Enable a timer doesn't mean to start it. See also `gptimer_start()` for how to make the timer start counting.

Parameters **timer** –[in] Timer handle created by `gptimer_new_timer()`

Returns

- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

esp_err_t **gptimer_disable** (*gptimer_handle_t* timer)

Disable GPTimer.

Note: This function will transit the timer state from “enable” to “init” .

Note: This function will disable the interrupt service if it's installed.

Note: This function will release the PM lock if it's acquired in the `gptimer_enable`.

Note: Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

Parameters `timer` –[in] Timer handle created by `gptimer_new_timer()`

Returns

- `ESP_OK`: Disable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Disable GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable GPTimer failed because the timer is not enabled yet
- `ESP_FAIL`: Disable GPTimer failed because of other error

esp_err_t `gptimer_start` (*gptimer_handle_t* timer)

Start GPTimer (internal counter starts counting)

Note: This function will transit the timer state from “enable” to “run” .

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters `timer` –[in] Timer handle created by `gptimer_new_timer()`

Returns

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

esp_err_t `gptimer_stop` (*gptimer_handle_t* timer)

Stop GPTimer (internal counter stops counting)

Note: This function will transit the timer state from “run” to “enable” .

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters `timer` –[in] Timer handle created by `gptimer_new_timer()`

Returns

- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct **gptimer_alarm_event_data_t**

GPTimer alarm event data.

Public Members

uint64_t **count_value**

Current count value

uint64_t **alarm_value**

Current alarm value

struct **gptimer_event_callbacks_t**

Group of supported GPTimer callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gptimer_alarm_cb_t **on_alarm**

Timer alarm callback

struct **gptimer_config_t**

General Purpose Timer configuration.

Public Members

gptimer_clock_source_t **clk_src**

GPTimer clock source

gptimer_count_direction_t **direction**

Count direction

uint32_t **resolution_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

int **intr_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **intr_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer_config_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer_alarm_config_t**

General Purpose Timer alarm configuration.

Public Members

uint64_t **alarm_count**

Alarm target count value

uint64_t **reload_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32_t **auto_reload_on_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer_alarm_config_t*::[anonymous] **flags**

Alarm config flags

Type Definitions

typedef struct gptimer_t ***gptimer_handle_t**

Type of General Purpose Timer handle.

typedef bool (***gptimer_alarm_cb_t**)(*gptimer_handle_t* timer, const *gptimer_alarm_event_data_t* *edata, void *user_ctx)

Timer alarm callback prototype.

Param timer [in] Timer handle created by `gptimer_new_timer()`

Param edata [in] Alarm event data, fed by driver

Param user_ctx [in] User data, passed from `gptimer_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

Header File

- [components/hal/include/hal/timer_types.h](#)

Type Definitions

typedef *soc_periph_gptimer_clk_src_t* **gptimer_clock_source_t**

GPTimer clock source.

Note: User should select the clock source based on the power and resolution requirement

Enumerations

enum `gptimer_count_direction_t`

GPTimer count direction.

Values:

enumerator `GPTIMER_COUNT_DOWN`

Decrease count value

enumerator `GPTIMER_COUNT_UP`

Increase count value

2.6.7 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’ s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’ s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’ s impossible to control GPIOA.

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
 - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
 - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
```

(continues on next page)

(continued from previous page)

```

    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));

```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

Note: `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that output from the given GPIO bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that input to the given GPIO bundle	<code>dedic_gpio_bundle_read_in()</code>

Note: Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try [Manipulate GPIOs by Writing Assembly Code](#) instead to reduce the overhead but should take care of the thread safety by themselves.

Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:
 - Set bits of GPIO: `csrrsi rd, csr, imm[4:0]`
 - Clear bits of GPIO: `csrrci rd, csr, imm[4:0]`
 - Note: Can only control the lowest 4 GPIO channels

For details of supported dedicated GPIO instructions, please refer to [ESP32-C3 Technical Reference Manual > ESP-RISC-V CPU \[PDF\]](#).

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

Note: Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

API Reference

Header File

- `components/driver/include/driver/dedic_gpio.h`

Functions

`esp_err_t dedic_gpio_get_out_mask (dedic_gpio_bundle_handle_t bundle, uint32_t *mask)`

Get allocated channel mask.

Note: Each bundle should have at least one mask (in or/and out), based on bundle configuration.

Note: With the returned mask, user can directly invoke LL function like “`dedic_gpio_cpu_ll_write_mask`” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “`dedic_gpio_new_bundle`”
- **mask** –[out] Returned mask value for on specific direction (in or out)

Returns

- `ESP_OK`: Get channel mask successfully
- `ESP_ERR_INVALID_ARG`: Get channel mask failed because of invalid argument
- `ESP_FAIL`: Get channel mask failed because of other error

`esp_err_t dedic_gpio_get_in_mask (dedic_gpio_bundle_handle_t bundle, uint32_t *mask)`

`esp_err_t dedic_gpio_new_bundle (const dedic_gpio_bundle_config_t *config, dedic_gpio_bundle_handle_t *ret_bundle)`

Create GPIO bundle and return the handle.

Note: One has to enable at least input or output mode in “`config`” parameter.

Parameters

- **config** –[in] Configuration of GPIO bundle
- **ret_bundle** –[out] Returned handle of the new created GPIO bundle

Returns

- `ESP_OK`: Create GPIO bundle successfully
- `ESP_ERR_INVALID_ARG`: Create GPIO bundle failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create GPIO bundle failed because of no capable memory
- `ESP_ERR_NOT_FOUND`: Create GPIO bundle failed because of no enough continuous dedicated channels
- `ESP_FAIL`: Create GPIO bundle failed because of other error

`esp_err_t dedic_gpio_del_bundle (dedic_gpio_bundle_handle_t bundle)`

Destory GPIO bundle.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “`dedic_gpio_new_bundle`”

Returns

- `ESP_OK`: Destory GPIO bundle successfully

- `ESP_ERR_INVALID_ARG`: Destory GPIO bundle failed because of invalid argument
- `ESP_FAIL`: Destory GPIO bundle failed because of other error

void **dedic_gpio_bundle_write** (*dedic_gpio_bundle_handle_t* bundle, uint32_t mask, uint32_t value)

Write value to GPIO bundle.

Note: The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** –[in] Mask of the GPIOs to be written in the given bundle
- **value** –[in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_out** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that output from the given GPIO bundle.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

Returns Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32_t **dedic_gpio_bundle_read_in** (*dedic_gpio_bundle_handle_t* bundle)

Read the value that input to the given GPIO bundle.

Note: For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

Parameters **bundle** –[in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

Returns Value that input to the GPIO bundle, low bit represents low member in the bundle

Structures

struct **dedic_gpio_bundle_config_t**

Type of Dedicated GPIO bundle configuration.

Public Members

const int ***gpio_array**

Array of GPIO numbers, `gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num`

size_t **array_size**
Number of GPIOs in `gpio_array`

unsigned int **in_en**
Enable input

unsigned int **in_invert**
Invert input signal

unsigned int **out_en**
Enable output

unsigned int **out_invert**
Invert output signal

struct *dedic_gpio_bundle_config_t*::[anonymous] **flags**
Flags to control specific behaviour of GPIO bundle

Type Definitions

typedef struct *dedic_gpio_bundle_t* ***dedic_gpio_bundle_handle_t**
Type of Dedicated GPIO bundle.

2.6.8 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

HMAC on the ESP32-C3

On the ESP32-C3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use

2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called *Upstream* mode, while the last two modes are called *Downstream* modes.

eFuse Keys for HMAC Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter `key_purpose` determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the `key_purpose` (see *ESP32-C3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

HMAC Generation for Software Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length and the eFuse key block ID which contains the secret and has eFuse key purpose set to Upstream mode.

HMAC for Digital Signature Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

HMAC for Enabling JTAG Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.
3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit/bits on ESP32-C3. This will permanently disable JTAG unless the correct key value is provided by software.

Note: The API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)` can be used to burn “soft JTAG disable” bits on ESP32-C3.

Note: If `DIS_PAD_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-C3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP` (8) means that this key can only be used for HMAC generation for software usage:

```
#include "esp32c3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
                                     ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
                                     key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32c3/esp_hmac.h`

Functions

esp_err_t **esp_hmac_calculate** (*hmac_key_id_t* key_id, const void *message, size_t message_len, uint8_t *hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message_len*. SHA256 is used for the calculation (fixed on ESP32S2).

Note: Uses the HMAC peripheral in “upstream” mode.

Parameters

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message_len** –message length return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** –[out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

Returns

- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

esp_err_t **esp_hmac_jtag_enable** (*hmac_key_id_t* key_id, const uint8_t *token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

Note: Return value of the API does not indicate the JTAG status.

Parameters

- **key_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

Returns

- ESP_OK, if the key_purpose of the key_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP_FAIL, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

esp_err_t **esp_hmac_jtag_disable** (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

Returns

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

enum **hmac_key_id_t**

The possible efuse keys for the HMAC peripheral

Values:

enumerator **HMAC_KEY0**

enumerator **HMAC_KEY1**

enumerator **HMAC_KEY2**

enumerator **HMAC_KEY3**

enumerator **HMAC_KEY4**

enumerator **HMAC_KEY5**

enumerator **HMAC_KEY_MAX**

2.6.9 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C3 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-C3 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the `esp-secure-cert-tool`.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the `esp_secure_cert_mgr` component. Please refer the `component/README`. for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through *ESP-MQTT*) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with *ESP-TLS*. See `example README` for more details.

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32c3/esp_ds.h`

Functions

`esp_err_t esp_ds_sign` (const void *message, const `esp_ds_data_t` *data, `hmac_key_id_t` key_id, void *signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: $Z = XY \text{ mod } M$ where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

Note: This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

Parameters

- **message** –the message to be signed; its length should be $(\text{data} \rightarrow \text{rsa_length} + 1) * 4$ bytes
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** –the destination of the signature, should be $(\text{data} \rightarrow \text{rsa_length} + 1) * 4$ bytes long

Returns

- ESP_OK if successful, the signature was written to the parameter `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data` \rightarrow `rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTODS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTODS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

`esp_err_t esp_ds_start_sign` (const void *message, const `esp_ds_data_t` *data, `hmac_key_id_t` key_id, `esp_ds_context_t` **esp_ds_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: $Z = XY \text{ mod } M$ where, Z is the signature, X is the input message, Y and M are the RSA private key parameters.

Note: This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

Parameters

- **message** –the message to be signed; its length should be $(\text{data} \rightarrow \text{rsa_length} + 1) * 4$ bytes
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data

- **esp_ds_ctx** –the context object which is needed for finishing the signing process later

Returns

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTODS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn't been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTODS_INVALID_KEY if there's a problem with passing the HMAC key to the DS component

bool **esp_ds_is_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

Note: Only valid if `esp_ds_start_sign()` was called before.

esp_err_t **esp_ds_finish_sign** (void *signature, *esp_ds_context_t* *esp_ds_ctx)

Finish the signing process.

Parameters

- **signature** –the destination of the signature, should be $(data->rsa_length + 1)*4$ bytes long
- **esp_ds_ctx** –the context object retrieved by `esp_ds_start_sign()`

Returns

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTODS_INVALID_DIGEST if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- ESP_ERR_HW_CRYPTODS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

esp_err_t **esp_ds_encrypt_params** (*esp_ds_data_t* *data, const void *iv, const *esp_ds_p_data_t* *p_data, const void *key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

Parameters

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it's filled by DMA. Both is asserted at run time.
- **iv** –Pointer to 16 byte IV buffer, will be copied into 'data'. Should be randomly generated bytes each time.
- **p_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and 'data' is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Returns

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `p_data->rsa_length` is too long

Structures

struct **esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

esp_digital_signature_length_t **rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 3072).

This value must match the length field encrypted and stored in 'c', or invalid results will be returned. (The DS peripheral will always use the value in 'c', not this value, so an attacker can't alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

Note: In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

uint32_t **iv**[ESP_DS_IV_BIT_LEN / 32]

IV value used to encrypt 'c'

uint8_t **c**[ESP_DS_C_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp_ds_p_data_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

Public Members

uint32_t **E**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA exponent.

uint32_t **M**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA modulus.

uint32_t **Rb**[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA r inverse operand.

uint32_t **M_prime**

RSA M prime operand.

uint32_t **length**

RSA length in words (32 bit)

Macros

ESP32C3_ERR_HW_CRYPT0_DS_HMAC_FAIL

HMAC peripheral problem

ESP32C3_ERR_HW_CRYPT0_DS_INVALID_KEY

given HMAC key isn't correct, HMAC peripheral problem

ESP32C3_ERR_HW_CRYPT0_DS_INVALID_DIGEST

message digest check failed, result is invalid

ESP32C3_ERR_HW_CRYPT0_DS_INVALID_PADDING

padding check failed, but result is produced anyway and can be read

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN

ESP_DS_SIGNATURE_MAX_BIT_LEN

ESP_DS_SIGNATURE_MD_BIT_LEN

ESP_DS_SIGNATURE_M_PRIME_BIT_LEN

ESP_DS_SIGNATURE_L_BIT_LEN

ESP_DS_SIGNATURE_PADDING_BIT_LEN

ESP_DS_C_LEN

Type Definitions

typedef struct esp_ds_context **esp_ds_context_t**

typedef struct *esp_digital_signature_data* **esp_ds_data_t**

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

enum **esp_digital_signature_length_t**

Values:

enumerator **ESP_DS_RSA_1024**

enumerator **ESP_DS_RSA_2048**

enumerator **ESP_DS_RSA_3072**

2.6.10 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C3 has 1 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
 - a) *Communication as Master* - handle communications (master)
 - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver*- release resources used by the I2C driver when communication ends

Configuration To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master or slave from `i2c_mode_t`
- Configure **communication pins**
 - Assign GPIO pins for SDA and SCL signals
 - Set whether to enable ESP32-C3's internal pull-ups
- (Master only) Set I2C **clock speed**

- (Slave only) Configure the following
 - Whether to enable **10 bit address mode**
 - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,    // select frequency specific to your_
↳project
    .clk_flags = 0,                            // you can use I2C_SCLK_SRC_FLAG_*_
↳flags to choose i2c source clock here
};
```

Configuration example (slave):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select GPIO specific to your_
↳project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select GPIO specific to your_
↳project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // address of your project
    .clk_flags = 0,
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

Source Clock Configuration **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

Note: A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

Table 2: Characteristics of ESP32-C3 clock sources

Clock name	MAX freq for SCL frequency	Clock capabilities
XTAL	2 MHz	/
RTC	1 MHz	I2C_SCLK_SRC_FLAG_AWARE_DFS , I2C_SCLK_SRC_FLAG_LIGHT_SLEEP

Explanations for `i2c_config_t::clk_flags` are as follows:

1. [I2C_SCLK_SRC_FLAG_AWARE_DFS](#): Clock's baud rate will not change while APB clock is changing.
2. [I2C_SCLK_SRC_FLAG_LIGHT_SLEEP](#): It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C3, reading technical reference manual before using it.

Note: The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

Note: The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

Install Driver After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

Communication as Master After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

ESP32-C3's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a "command link", that should be populated with a sequence of commands and then passed to the I2C controller for execution.

Master Write The example below shows how to build a command link for an I2C master to send n bytes to a slave.

The following describes how a command link for a "master write" is set up and what comes inside:

Fig. 5: I2C command link - master write example

1. Create a command link with `i2c_cmd_link_create()`. Then, populate it with the series of data to be sent to the slave:
 - a) **Start bit** - `i2c_master_start()`
 - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
 - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
 - d) **Stop bit** - `i2c_master_stop()`
 Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

Master Read The example below shows how to build a command link for an I2C master to read n bytes from a slave.

Fig. 6: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` func-

tions but with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

Indicating Write or Read After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave's address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

Communication as Slave After installing the I2C driver, ESP32-C3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.
- `i2c_slave_write_buffer()`
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

Interrupt Handling During driver installation, an interrupt handler is installed by default.

Customized Configuration As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

Table 3: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of start signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of stop signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

Note: ESP32-C3's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see [TI Application Note](#)

Error Handling The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

Delete Driver When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

Application Example

I2C examples: [peripherals/i2c](#).

API Reference

Header File

- `components/driver/include/driver/i2c.h`

Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

Note: Not all Espressif chips can support slave mode (e.g. ESP32C2)

Note: In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

Parameters

- **i2c_num** –I2C port number
- **mode** –I2C mode (either master or slave).
- **slv_rx_buf_len** –Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv_tx_buf_len** –Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

esp_err_t **i2c_driver_delete** (*i2c_port_t* i2c_num)

Delete I2C driver.

Note: This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

Parameters **i2c_num** –I2C port to delete

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_param_config** (*i2c_port_t* i2c_num, const *i2c_config_t* *i2c_conf)

Configure an I2C bus with the given configuration.

Parameters

- **i2c_num** –I2C port to configure
- **i2c_conf** –Pointer to the I2C configuration

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_reset_tx_fifo** (*i2c_port_t* i2c_num)

reset I2C tx hardware fifo

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_reset_rx_fifo** (*i2c_port_t* i2c_num)

reset I2C rx fifo

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_pin** (*i2c_port_t* i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, *i2c_mode_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

Parameters

- **i2c_num** –I2C port number
- **sda_io_num** –GPIO number for I2C SDA signal
- **scl_io_num** –GPIO number for I2C SCL signal

- **sda_pullup_en** –Enable the internal pullup for SDA pin
- **scl_pullup_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_master_write_to_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_read_from_device** (*i2c_port_t* i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer
- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

esp_err_t **i2c_master_write_read_device** (*i2c_port_t* i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

Parameters

- **i2c_num** –I2C port number to perform the transfer on
- **device_address** –I2C device's 7-bit address
- **write_buffer** –Bytes to send on the bus
- **write_size** –Size, in bytes, of the write buffer
- **read_buffer** –Buffer to store the bytes received on the bus
- **read_size** –Size, in bytes, of the read buffer

- **ticks_to_wait** –Maximum ticks to wait before issuing a timeout.

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_FAIL** Sending command error, slave hasn't ACK the transfer.
- **ESP_ERR_INVALID_STATE** I2C driver not installed or not in master mode.
- **ESP_ERR_TIMEOUT** Operation timeout because the bus is busy.

i2c_cmd_handle_t **i2c_cmd_link_create_static** (uint8_t *buffer, uint32_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

Note: It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

Parameters

- **buffer** –Buffer to use for commands allocations
- **size** –Size in bytes of the buffer

Returns Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

i2c_cmd_handle_t **i2c_cmd_link_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Returns Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void **i2c_cmd_link_delete_static** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

Parameters **cmd_handle** –I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c_cmd_link_delete** (*i2c_cmd_handle_t* cmd_handle)

Free the I2C commands list.

Parameters **cmd_handle** –I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

esp_err_t **i2c_master_start** (*i2c_cmd_handle_t* cmd_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Parameters **cmd_handle** –I2C commands list

Returns

- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_ERR_NO_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP_FAIL** No more memory left on the heap

esp_err_t **i2c_master_write_byte** (*i2c_cmd_handle_t* cmd_handle, uint8_t data, bool ack_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list

- **data** –Byte to send on the port
- **ack_en** –Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_write** (*i2c_cmd_handle_t* cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data_len** –Length, in bytes, of the data buffer
- **ack_en** –Enable ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_read_byte** (*i2c_cmd_handle_t* cmd_handle, uint8_t *data, *i2c_ack_type_t* ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_read** (*i2c_cmd_handle_t* cmd_handle, uint8_t *data, size_t data_len, *i2c_ack_type_t* ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Parameters

- **cmd_handle** –I2C commands list
- **data** –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data_len** –Size, in bytes, of the data buffer
- **ack** –ACK signal

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

esp_err_t **i2c_master_stop** (*i2c_cmd_handle_t* cmd_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode.

Call `i2c_master_cmd_begin()` to send all the queued commands.

Parameters `cmd_handle` –I2C commands list

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

Parameters

- `i2c_num` –I2C port number
- `cmd_handle` –I2C commands list
- `ticks_to_wait` –Maximum ticks to wait before issuing a timeout.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave hasn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

Note: This function shall only be called in I2C slave mode.

Parameters

- `i2c_num` –I2C port number
- `data` –Bytes to write into internal buffer
- `size` –Size, in bytes, of `data` buffer
- `ticks_to_wait` –Maximum ticks to wait.

Returns

- `ESP_FAIL` (-1) Parameter error
- Other (≥ 0) The number of data bytes pushed to the I2C slave buffer.

`int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)`

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the `data` user buffer.

Note: This function shall only be called in I2C slave mode.

Parameters

- `i2c_num` –I2C port number
- `data` –Buffer to fill with ringbuffer's bytes
- `max_size` –Maximum bytes to read
- `ticks_to_wait` –Maximum waiting ticks

Returns

- `ESP_FAIL`(-1) Parameter error

- Others(>=0) The number of data bytes read from I2C slave buffer.

esp_err_t **i2c_set_period** (*i2c_port_t* i2c_num, int high_period, int low_period)

Set I2C master clock period.

Parameters

- **i2c_num** –I2C port number
- **high_period** –Clock cycle number during SCL is high level, high_period is a 14 bit value
- **low_period** –Clock cycle number during SCL is low level, low_period is a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_period** (*i2c_port_t* i2c_num, int *high_period, int *low_period)

Get I2C master clock period.

Parameters

- **i2c_num** –I2C port number
- **high_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_enable** (*i2c_port_t* i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note: Enable filter will slow down the SCL clock.

Parameters

- **i2c_num** –I2C port number to filter
- **cyc_num** –the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_filter_disable** (*i2c_port_t* i2c_num)

Disable filter on I2C bus.

Parameters **i2c_num** –I2C port number

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_start_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master start signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_start_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master start signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time
- **hold_time** –pointer to get hold time

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_stop_timing** (*i2c_port_t* i2c_num, int setup_time, int hold_time)

set I2C master stop signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_stop_timing** (*i2c_port_t* i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

Parameters

- **i2c_num** –I2C port number
- **setup_time** –pointer to get setup time.
- **hold_time** –pointer to get hold time.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_timing** (*i2c_port_t* i2c_num, int sample_time, int hold_time)

set I2C data signal timing

Parameters

- **i2c_num** –I2C port number
- **sample_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value
- **hold_time** –clock number I2C used to hold the data after the falling-edge of SCL, it' s a 10-bit value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_timing** (*i2c_port_t* i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

Parameters

- **i2c_num** –I2C port number
- **sample_time** –pointer to get sample time
- **hold_time** –pointer to get hold time

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_timeout** (*i2c_port_t* i2c_num, int timeout)

set I2C timeout value

Parameters

- **i2c_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_timeout** (*i2c_port_t* i2c_num, int *timeout)

get I2C timeout value

Parameters

- **i2c_num** –I2C port number
- **timeout** –pointer to get timeout value

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_set_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* tx_trans_mode, *i2c_trans_mode_t* rx_trans_mode)

set I2C data transfer mode

Parameters

- **i2c_num** –I2C port number
- **tx_trans_mode** –I2C sending data mode
- **rx_trans_mode** –I2C receiving data mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **i2c_get_data_mode** (*i2c_port_t* i2c_num, *i2c_trans_mode_t* *tx_trans_mode, *i2c_trans_mode_t* *rx_trans_mode)

get I2C data transfer mode

Parameters

- **i2c_num** –I2C port number
- **tx_trans_mode** –pointer to get I2C sending data mode
- **rx_trans_mode** –pointer to get I2C receiving data mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Structures

struct **i2c_config_t**

I2C initialization parameters.

Public Members

i2c_mode_t **mode**

I2C mode

int **sda_io_num**

GPIO number for I2C sda signal

int **scl_io_num**
GPIO number for I2C scl signal

bool **sda_pullup_en**
Internal GPIO pull mode for I2C sda signal

bool **scl_pullup_en**
Internal GPIO pull mode for I2C scl signal

uint32_t **clk_speed**
I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c_config_t*::[anonymous]::[anonymous] **master**
I2C master config

uint8_t **addr_10bit_en**
I2C 10bit address mode enable for slave mode

uint16_t **slave_addr**
I2C address for slave mode

uint32_t **maximum_speed**
I2C expected clock speed from SCL.

struct *i2c_config_t*::[anonymous]::[anonymous] **slave**
I2C slave config

uint32_t **clk_flags**
Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros

I2C_APB_CLK_FREQ

I2C source clock is APB clock, 80MHz

I2C_NUM_MAX

I2C port max

I2C_NUM_0

I2C port 0

I2C_SCLK_SRC_FLAG_FOR_NOMAL

Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_DFS

For REF tick clock, it won't change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP

For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

Type Definitions

```
typedef void *i2c_cmd_handle_t  
I2C command handle
```

Header File

- [components/hal/include/hal/i2c_types.h](#)

Type Definitions

```
typedef int i2c_port_t  
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).  
  
typedef soc\_periph\_i2c\_clk\_src\_t i2c_clock_source_t  
I2C group clock source.
```

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**

2.6.11 Inter-IC Sound (I2S)

Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-C3 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK:** PDM clock line.
- **DIN/DOUT:** Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller has separate RX and TX channels. That means they are able to work under different clocks and slot configurations with separate GPIO pins. Note that although the internal MCLKs of TX channel and RX channel are separate on a controller, the output MCLK signal can only be attached to one channel. If independent MCLK output is required for each channel, they must be allocated on different I2S controllers.

I2S File Structure

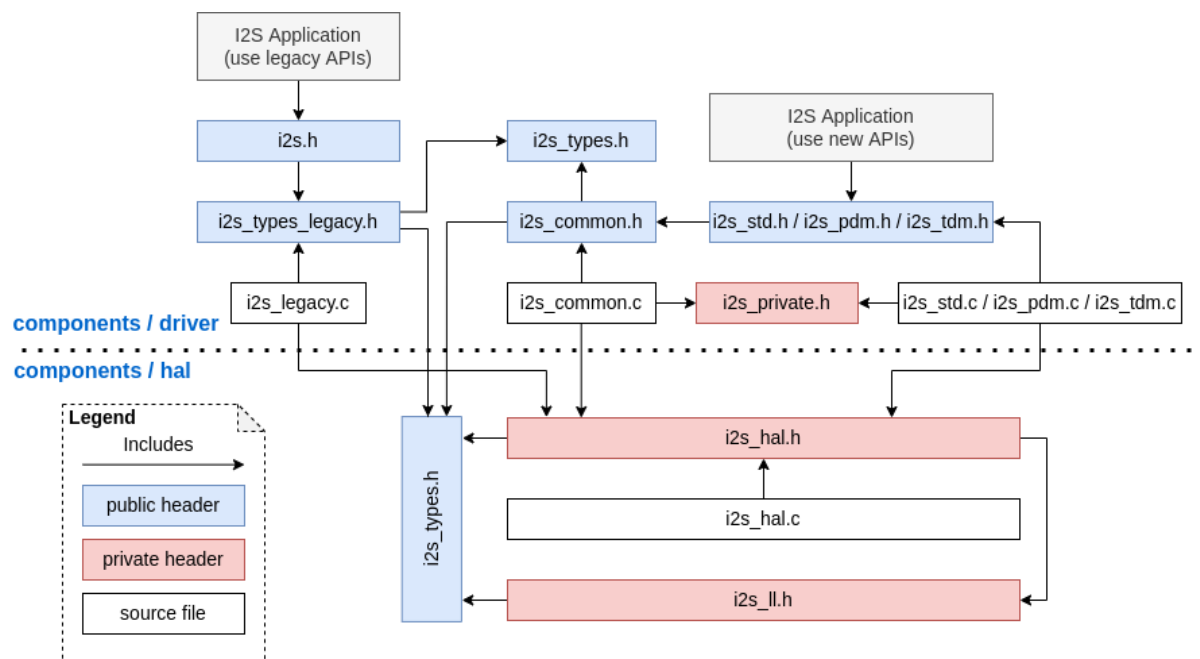

Fig. 7: I2S File Structure

Public headers that need to be included in the I2S application are as follows:

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).

- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

Note: The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

Public headers that have been included in the headers above are as follows:

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

I2S Clock

Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.
- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.

Clock Terminology

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

Note: Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

I2S Communication Mode

Overview of All Modes

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP-32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none

Standard Mode In standard mode, there are always two sound channels, i.e., the left and right channels, which are called “slots”. These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

- **Philips Format**: Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

Standard Philips Timing Diagram

- **MSB Format:** Basically the same as Philips format, but without data shift.

Standard MSB Timing Diagram

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

Standard PCM Timing Diagram

PDM Mode (TX) PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by $\text{up_sample_rate} = \text{i2s_pdm_tx_clk_config_t::up_sample_fp} / \text{i2s_pdm_tx_clk_config_t::up_sample_fs}$. There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency:** In this mode, the up-sampling rate changes according to the sample rate. Setting $\text{fp} = 960$ and $\text{fs} = \text{sample_rate} / 100$, then the clock frequency (F_{pdm}) on CLK pin will be fixed to $128 * 48 \text{ KHz} = 6.144 \text{ MHz}$. Note that this frequency is not equal to the sample rate (F_{pcm}).
- **Fixed Up-sampling Rate:** In this mode, the up-sampling rate is fixed to 2. Setting $\text{fp} = 960$ and $\text{fs} = 480$, then the clock frequency (F_{pdm}) on CLK pin will be $128 * \text{sample_rate}$.

TDM Mode TDM (Time Division Multiplexing) mode supports up to 16 slots. These slots can be enabled by `i2s_tdm_slot_config_t::slot_mask`. But due to the hardware limitation, only up to 4 slots are supported while the slot is set to 32 bit-width, and 8 slots for 16 bit-width, 16 slots for 8 bit-width. The slot communication format of TDM is almost the same as the standard mode, yet with some small differences.

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal. And no matter how many slots are contained in one frame, the duty of WS signal always keeps 50%.

- **MSB Format:** Basically the same as the Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and the WS signal becomes a pulse lasting one BCLK cycle for every frame.

- **PCM Long Format:** Data has one-bit shift and the WS signal lasts one-slot bit width for every frame. For example, the duty of WS will be 25% if there are four slots enabled, and 20% if there are five slots.

Functional Overview

The I2S driver offers the following services:

Resource Management There are three levels of resources in the I2S driver:

- platform level: Resources of all I2S controllers in the current target.
- controller level: Resources in one I2S controller.
- channel level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

Power Management When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

Finite State Machine There are three states for an I2S channel, namely, `registered`, `ready`, and `running`. Their relationship is shown in the following diagram:

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the [I2S Communication Mode](#) section.

Data Transport The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Fig. 8: I2S Finite State Machine

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keep waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

Configuration Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding ‘reconfig’ functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

IRAM Safe By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Keep the interrupt being serviced even when the cache is disabled.
2. Place driver object into DRAM (in case it is linked to PSRAM by accident).

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

Thread Safety All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

Standard TX/RX Usage Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to [driver/include/driver/i2s_std.h](#).

STD TX Mode Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left		0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		right		0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		both		0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	stereo	left		0x0001	0x0000	0x0003	0x0000	0x0005	0x0000	0x0007	0x0000
		right		0x0000	0x0002	0x0000	0x0004	0x0000	0x0006	0x0000	0x0008
		both		0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

Note: Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in 'i2s_common.h' and shared by all the I2S_
 * communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_

/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can_
↳be generated by the macros
 * These two helper macros are defined in 'i2s_std.h' which can only be used in_
↳STD mode.
 * They can help to specify the slot and clock configurations for initialization_
↳or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
```

(continues on next page)

(continued from previous page)

```

        .mclk_inv = false,
        .bclk_inv = false,
        .ws_inv = false,
    },
},
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↪wait);

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↪resources */
i2s_del_channel(tx_handle);

```

STD RX Mode Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data bit width	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit	mono	left	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		right	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	stereo	any	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

Note: 8-bit, 24-bit, and 32-bit are similar as 16-bit, the data bit-width in the receiving buffer is equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```

#include "driver/i2s_std.h"

        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before reading data, start the RX channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel
↳resources */
i2s_del_channel(rx_handle);

```

PDM TX Usage For PDM mode in TX channel, the slot configuration helper macro is:

- `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

The clock configuration helper macro is:

- `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

Please refer to [PDM Mode](#) for information about PDM TX API. And for more details, please refer to [driver/include/driver/i2s_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data in an `int16_t` writing buffer is:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_pdm_tx_slot_config_t::slot_mode` and `i2s_pdm_tx_slot_config_t::line_mode` (The PDM format on the line is transferred to PCM format for easier comprehension).

line mode	slot mode	line	left	right	left	right	left	right	left	right
one-line Codec	mono	dout	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	stereo	dout	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008
one-line DAC	mono	dout	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
two-line DAC	mono	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000
	stereo	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007

Note: There are three line modes for PDM TX mode, i.e., `I2S_PDM_TX_ONE_LINE_CODEC`, `I2S_PDM_TX_ONE_LINE_DAC`, and `I2S_PDM_TX_TWO_LINE_DAC`. One-line codec is for the PDM codecs that require clock signal. The PDM codec can differentiate the left and right slots by the clock level. The other two modes are used to drive power amplifiers directly with a low-pass filter. They do not need the clock signal, so there are two lines to differentiate the left and right slots. Additionally, for the mono mode of one-line codec, users can force change the slot to the right by setting the clock invert flag in GPIO configuration.

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...
```

TDM TX/RX Usage Different slot communication formats can be generated by the following helper macros for TDM mode. As described above, there are four formats in TDM mode, and their helper macros are:

- `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_TDM_CLK_DEFAULT_CONFIG`

Please refer to *TDM Mode* for information about TDM API. And for more details, please refer to `driver/include/driver/i2s_tdm.h`.

TDM TX Mode

```

#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,

```
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
...
```

Full-duplex Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↳duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to
↳be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...
```

Simplex Mode To allocate a channel in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-C3 are independent, so they can be configured with different modes and clocks, and are able to coexist on the same I2S port in simplex mode. PDM duplex can be realized by registering PDM TX simplex and PDM RX simplex on the same I2S port. But in this way, PDM TX/RX might work with different clocks, so take care when configuring the GPIO pins and clocks.

The following example offers a use case for the simplex mode, but note that although the internal MCLK signals for TX and RX channel are separate, the output MCLK can only be bound to one of them if they are from the same

controller. If MCLK has been initialized by both channels, it will be bound to the channel that initializes later.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit_
↳found
 * it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle); // Both RX and TX channel will be_
↳registered on I2S0, but they can work with different configurations.
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

Application Notes

How to Prevent Data Lost For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t_
↪handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

```

dma_desc_num > polling_cycle / interrupt_interval

```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

```

recv_buffer_size > dma_desc_num * dma_buffer_size

```

For example, if there is an I2S application, and the known values are:

```

sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms

```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```

dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↪549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↪= 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes

```

API Reference

Standard Mode

Header File

- [components/driver/include/driver/i2s_std.h](#)

Functions

esp_err_t **i2s_channel_init_std_mode** (*i2s_chan_handle_t* handle, const *i2s_std_config_t* *std_cfg)

Initialize i2s channel to standard mode.

Note: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters

- **handle** –[in] I2S channel handler
- **std_cfg** –[in] Configurations for standard mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_STD_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_STD_PCM_SLOT_DEFAULT_CONFIG or I2S_STD_MSB_SLOT_DEFAULT_CONFIG

Returns

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_std_clock** (*i2s_chan_handle_t* handle, const *i2s_std_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., 'i2s_channel_init_std_mode' has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **clk_cfg** –[in] Standard mode clock configuration, can be generated by I2S_STD_CLK_DEFAULT_CONFIG

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_std_slot** (*i2s_chan_handle_t* handle, const *i2s_std_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for standard mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., 'i2s_channel_init_std_mode'

has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **slot_cfg** –[in] Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_NO_MEM` No memory for DMA buffer
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_std_gpio` (`i2s_chan_handle_t` handle, const `i2s_std_gpio_config_t` *gpio_cfg)

Reconfigure the I2S gpio for standard mode.

Note: Only allowed to be called when the channel state is `READY`, i.e., channel has been initialized, but not started this function won't change the state. `'i2s_channel_disable'` should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to standard mode, i.e., `'i2s_channel_init_std_mode'` has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **gpio_cfg** –[in] Standard mode gpio configuration, specified by user

Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

Structures

struct `i2s_std_slot_config_t`

I2S slot configuration for standard mode.

Public Members

`i2s_data_bit_width_t data_bit_width`

I2S sample data bit width (valid data bits per sample)

`i2s_slot_bit_width_t slot_bit_width`

I2S slot bit width (total bits per slot)

`i2s_slot_mode_t slot_mode`

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

i2s_std_slot_mask_t **slot_mask**

Select the left, right or both slot

uint32_t **ws_width**

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool **ws_pol**

WS signal polarity, set true to enable high lever first

bool **bit_shift**

Set to enable bit shift in Philips mode

bool **left_align**

Set to enable left alignment

bool **big_endian**

Set to enable big endian

bool **bit_order_lsb**

Set to enable lsb first

struct **i2s_std_clk_config_t**

I2S clock configuration for standard mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of '3' (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s_std_gpio_config_t**

I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**

MCK pin, output

gpio_num_t **bclk**

BCK pin, input in slave role, output in master role

gpio_num_t **ws**

WS pin, input in slave role, output in master role

gpio_num_t **dout**

DATA pin, output

gpio_num_t **din**

DATA pin, input

uint32_t **mclk_inv**

Set 1 to invert the mclk output

uint32_t **bclk_inv**

Set 1 to invert the bclk input/output

uint32_t **ws_inv**

Set 1 to invert the ws input/output

struct *i2s_std_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_std_config_t**

I2S standard mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_std_clk_config_t **clk_cfg**

Standard mode clock configuration, can be generated by macro I2S_STD_CLK_DEFAULT_CONFIG

i2s_std_slot_config_t **slot_cfg**

Standard mode slot configuration, can be generated by macros I2S_STD_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

i2s_std_gpio_config_t **gpio_cfg**

Standard mode gpio configuration, specified by user

Macros

I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

Parameters

- **bits_per_sample** -i2s data bit width
- **mono_or_stereo** -I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_PCM_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

PCM(short) format in 2 slots.

Note: PCM(long) is same as philips in 2 slots

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)

MSB format in 2 slots.

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

I2S_STD_CLK_DEFAULT_CONFIG (rate)

i2s default standard clock configuration

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

Parameters

- **rate** –sample rate

PDM Mode**Header File**

- [components/driver/include/driver/i2s_pdm.h](#)

Functions

esp_err_t **i2s_channel_init_pdm_tx_mode** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_config_t* *pdm_tx_cfg)

Initialize i2s channel to PDM TX mode.

Note: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters

- **handle** –[in] I2S tx channel handler
- **pdm_tx_cfg** –[in] Configurations for PDM TX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_PDM_TX_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

Returns

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_pdm_tx_clock** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for PDM TX mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

Parameters

- **handle** –[in] I2S tx channel handler
- **clk_cfg** –[in] PDM TX mode clock configuration, can be generated by I2S_PDM_TX_CLK_DEFAULT_CONFIG

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_slot** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for PDM TX mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

Parameters

- **handle** –[in] I2S tx channel handler
- **slot_cfg** –[in] PDM TX mode slot configuration, can be generated by I2S_PDM_TX_SLOT_DEFAULT_CONFIG

Returns

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_pdm_tx_gpio** (*i2s_chan_handle_t* handle, const *i2s_pdm_tx_gpio_config_t* *gpio_cfg)

Reconfigure the I2S gpio for PDM TX mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s_channel_init_pdm_tx_mode' has been called before reconfiguring

Parameters

- **handle** –[in] I2S tx channel handler
- **gpio_cfg** –[in] PDM TX mode gpio configuration, specified by user

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not PDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct **i2s_pdm_tx_slot_config_t**

I2S slot configuration for pdm tx mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

i2s_slot_mode_t **slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

uint32_t **sd_prescale**

Sigma-delta filter prescale

i2s_pdm_sig_scale_t **sd_scale**

Sigma-delta filter scaling value

i2s_pdm_sig_scale_t **hp_scale**

High pass filter scaling value

i2s_pdm_sig_scale_t **lp_scale**

Low pass filter scaling value

i2s_pdm_sig_scale_t **sinc_scale**

Sinc filter scaling value

i2s_pdm_tx_line_mode_t **line_mode**

PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

bool **hp_en**

High pass filter enable

float **hp_cut_off_freq_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32_t **sd_dither**

Sigma-delta filter dither

uint32_t **sd_dither2**

Sigma-delta filter dither2

struct **i2s_pdm_tx_clk_config_t**

I2S clock configuration for pdm tx mode.

Public Members

uint32_t **sample_rate_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

i2s_clock_src_t **clk_src**

Choose clock source

i2s_mclk_multiple_t **mclk_multiple**

The multiple of mclk to the sample rate

uint32_t **up_sample_fp**

Up-sampling param fp

uint32_t **up_sample_fs**

Up-sampling param fs, not allowed to be greater than 480

struct **i2s_pdm_tx_gpio_config_t**

I2S PDM tx mode GPIO pins configuration.

Public Members

gpio_num_t **clk**

PDM clk pin, output

gpio_num_t **dout**

DATA pin, output

gpio_num_t **dout2**

The second data pin for the DAC dual-line mode, only take effect when the line mode is I2S_PDM_TX_TWO_LINE_DAC

uint32_t **clk_inv**

Set 1 to invert the clk output

```
struct i2s_pdm_tx_gpio_config_t::[anonymous] invert_flags
```

GPIO pin invert flags

```
struct i2s_pdm_tx_config_t
```

I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

Public Members

```
i2s_pdm_tx_clk_config_t clk_cfg
```

PDM TX clock configurations, can be generated by macro I2S_PDM_TX_CLK_DEFAULT_CONFIG

```
i2s_pdm_tx_slot_config_t slot_cfg
```

PDM TX slot configurations, can be generated by macro I2S_PDM_TX_SLOT_DEFAULT_CONFIG

```
i2s_pdm_tx_gpio_config_t gpio_cfg
```

PDM TX gpio configurations, specified by user

Macros

```
I2S_PDM_TX_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo)
```

PDM style in 2 slots(TX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
- Data bit width only support 16 bits

Parameters

- **bits_per_sample** –i2s data bit width, only support 16 bits for PDM mode
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

```
I2S_PDM_TX_CLK_DEFAULT_CONFIG (rate)
```

i2s default pdm tx clock configuration

Note: TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample_rate_hz / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate_hz If the pdm receiver do not care the pdm serial clock, it' s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be adopted.

Parameters

- **rate** –sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

TDM Mode

Header File

- [components/driver/include/driver/i2s_tdm.h](#)

Functions

esp_err_t **i2s_channel_init_tdm_mode** (*i2s_chan_handle_t* handle, const *i2s_tdm_config_t* *tdm_cfg)

Initialize i2s channel to TDM mode.

Note: Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

Parameters

- **handle** –[in] I2S channel handler
- **tdm_cfg** –[in] Configurations for TDM mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S_TDM_CLK_DEFAULT_CONFIG The slot configuration can be generated by the helper macro I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG or I2S_TDM_MSB_SLOT_DEFAULT_CONFIG

Returns

- ESP_OK Initialize successfully
- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

esp_err_t **i2s_channel_reconfig_tdm_clock** (*i2s_chan_handle_t* handle, const *i2s_tdm_clk_config_t* *clk_cfg)

Reconfigure the I2S clock for TDM mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to TDM mode, i.e., 'i2s_channel_init_tdm_mode' has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **clk_cfg** –[in] Standard mode clock configuration, can be generated by I2S_TDM_CLK_DEFAULT_CONFIG

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_tdm_slot** (*i2s_chan_handle_t* handle, const *i2s_tdm_slot_config_t* *slot_cfg)

Reconfigure the I2S slot for TDM mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s_channel_disable' should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to TDM mode, i.e., ‘i2s_channel_init_tdm_mode’ has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **slot_cfg** –[in] Standard mode slot configuration, can be generated by I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG, I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG or I2S_TDM_MSB_SLOT_DEFAULT_CONFIG.

Returns

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

esp_err_t **i2s_channel_reconfig_tdm_gpio** (*i2s_chan_handle_t* handle, const *i2s_tdm_gpio_config_t* *gpio_cfg)

Reconfigure the I2S gpio for TDM mode.

Note: Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s_channel_disable’ should be called before calling this function if i2s has started.

Note: The input channel handle has to be initialized to TDM mode, i.e., ‘i2s_channel_init_tdm_mode’ has been called before reconfiguring

Parameters

- **handle** –[in] I2S channel handler
- **gpio_cfg** –[in] Standard mode gpio configuration, specified by user

Returns

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not TDM mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

Structures

struct **i2s_tdm_slot_config_t**

I2S slot configuration for tdm mode.

Public Members

i2s_data_bit_width_t **data_bit_width**

I2S sample data bit width (valid data bits per sample)

i2s_slot_bit_width_t **slot_bit_width**

I2S slot bit width (total bits per slot)

***i2s_slot_mode_t* slot_mode**

Set mono or stereo mode with I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

***i2s_tdm_slot_mask_t* slot_mask**

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

uint32_t ws_width

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool ws_pol

WS signal polarity, set true to enable high level first

bool bit_shift

Set true to enable bit shift in Philips mode

bool left_align

Set true to enable left alignment

bool big_endian

Set true to enable big endian

bool bit_order_lsb

Set true to enable lsb first

bool skip_mask

Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32_t total_slot

I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct i2s_tdm_clk_config_t

I2S clock configuration for tdm mode.

Public Members**uint32_t sample_rate_hz**

I2S sample rate

***i2s_clock_src_t* clk_src**

Choose clock source

***i2s_mclk_multiple_t* mclk_multiple**

The multiple of mclk to the sample rate

struct i2s_tdm_gpio_config_t

I2S TDM mode GPIO pins configuration.

Public Members

gpio_num_t **mclk**

MCK pin, output

gpio_num_t **bclk**

BCK pin, input in slave role, output in master role

gpio_num_t **ws**

WS pin, input in slave role, output in master role

gpio_num_t **dout**

DATA pin, output

gpio_num_t **din**

DATA pin, input

uint32_t **mclk_inv**

Set 1 to invert the mclk output

uint32_t **bclk_inv**

Set 1 to invert the bclk input/output

uint32_t **ws_inv**

Set 1 to invert the ws input/output

struct *i2s_tdm_gpio_config_t*::[anonymous] **invert_flags**

GPIO pin invert flags

struct **i2s_tdm_config_t**

I2S TDM mode major configuration that including clock/slot/gpio configuration.

Public Members

i2s_tdm_clk_config_t **clk_cfg**

TDM mode clock configuration, can be generated by macro I2S_TDM_CLK_DEFAULT_CONFIG

i2s_tdm_slot_config_t **slot_cfg**

TDM mode slot configuration, can be generated by macros I2S_TDM_[mode]_SLOT_DEFAULT_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM_SHORT/PCM_LONG

i2s_tdm_gpio_config_t **gpio_cfg**

TDM mode gpio configuration, specified by user

Macros

I2S_TDM_AUTO_SLOT_NUM

This file is specified for I2S TDM communication mode Features:

- More than 2 slots

I2S_TDM_AUTO_WS_WIDTH**I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo, mask)

Philips format in active slot that enabled by mask.

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_MSB_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

MSB format in active slot enabled that by mask.

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

PCM(short) format in active slot that enabled by mask.

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG (bits_per_sample, mono_or_stereo, mask)

PCM(long) format in active slot that enabled by mask.

Parameters

- **bits_per_sample** –i2s data bit width
- **mono_or_stereo** –I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO
- **mask** –active slot mask

I2S_TDM_CLK_DEFAULT_CONFIG (rate)

i2s default tdm clock configuration

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while the data width in slot configuration is set to 24 bits Otherwise the sample rate might be imprecise since the bclk division is not a integer

Parameters

- **rate** –sample rate

I2S Driver**Header File**

- [components/driver/include/driver/i2s_common.h](#)

Functions**esp_err_t i2s_new_channel** (const *i2s_chan_config_t* *chan_cfg, *i2s_chan_handle_t* *ret_tx_handle, *i2s_chan_handle_t* *ret_rx_handle)

Allocate new I2S channel(s)

Note: The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

Note: When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

Note: If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

Note: If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

Parameters

- **chan_cfg** –[in] I2S controller channel configurations
- **ret_tx_handle** –[out] I2S channel handler used for managing the sending channel(optional)
- **ret_rx_handle** –[out] I2S channel handler used for managing the receiving channel(optional)

Returns

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in *i2s_chan_config_t*
- ESP_ERR_NOT_FOUND No available I2S channel found

esp_err_t **i2s_del_channel** (*i2s_chan_handle_t* handle)

Delete the i2s channel.

Note: Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

Note: Resource will be free automatically if all channels in one port are deleted

Parameters **handle** –[in] I2S channel handler

- ESP_OK Delete successfully
- ESP_ERR_INVALID_ARG NULL pointer

esp_err_t **i2s_channel_get_info** (*i2s_chan_handle_t* handle, *i2s_chan_info_t* *chan_info)

Get I2S channel information.

Parameters

- **handle** –[in] I2S channel handler
- **chan_info** –[out] I2S channel basic information

Returns

- ESP_OK Get i2s channel information success
- ESP_ERR_NOT_FOUND The input handle doesn't match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

esp_err_t **i2s_channel_enable** (*i2s_chan_handle_t* handle)

Enable the i2s channel.

Note: Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

Note: Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

Parameters **handle** –[in] I2S channel handler

- **ESP_OK** Start successfully
- **ESP_ERR_INVALID_ARG** NULL pointer
- **ESP_ERR_INVALID_STATE** This channel has not initialized or already started

esp_err_t **i2s_channel_disable** (*i2s_chan_handle_t* handle)

Disable the i2s channel.

Note: Only allowed to be called when the channel state is READY / RUNNING, (i.e., channel has been initialized) the channel will enter READY state once it is disabled successfully.

Note: Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

Parameters **handle** –[in] I2S channel handler

Returns

- **ESP_OK** Stop successfully
- **ESP_ERR_INVALID_ARG** NULL pointer
- **ESP_ERR_INVALID_STATE** This channel has not stated

esp_err_t **i2s_channel_write** (*i2s_chan_handle_t* handle, const void *src, size_t size, size_t *bytes_written, uint32_t timeout_ms)

I2S write data.

Note: Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

Parameters

- **handle** –[in] I2S channel handler
- **src** –[in] The pointer of sent data buffer
- **size** –[in] Max data buffer length
- **bytes_written** –[out] Byte number that actually be sent
- **timeout_ms** –[in] Max block time

Returns

- **ESP_OK** Write successfully
- **ESP_ERR_INVALID_ARG** NULL pointer or this handle is not tx handle
- **ESP_ERR_TIMEOUT** Writing timeout, no writing event received from ISR within ticks_to_wait
- **ESP_ERR_INVALID_STATE** I2S is not ready to write

esp_err_t **i2s_channel_read** (*i2s_chan_handle_t* handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)

I2S read data.

Note: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

Parameters

- **handle** –[in] I2S channel handler
- **dest** –[in] The pointer of receiving data buffer
- **size** –[in] Max data buffer length
- **bytes_read** –[out] Byte number that actually be read
- **timeout_ms** –[in] Max block time

Returns

- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not rx handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

esp_err_t **i2s_channel_register_event_callback** (*i2s_chan_handle_t* handle, const *i2s_event_callbacks_t* *callbacks, void *user_data)

Set event callbacks for I2S channel.

Note: Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

Parameters

- **handle** –[in] I2S channel handler
- **callbacks** –[in] Group of callback functions
- **user_data** –[in] User data, which will be passed to callback functions directly

Returns

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

Structures

struct **i2s_event_callbacks_t**

Group of I2S callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2s_isr_callback_t **on_recv**

Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data

i2s_isr_callback_t **on_recv_q_ovf**

Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten

i2s_isr_callback_t **on_sent**

Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data

i2s_isr_callback_t **on_send_q_ovf**

Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten

struct **i2s_chan_config_t**

I2S controller channel configuration.

Public Members

i2s_port_t **id**

I2S port id

i2s_role_t **role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t **dma_desc_num**

I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t **dma_frame_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of '3' when the data bit width is 24.

bool **auto_clear**

Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct **i2s_chan_info_t**

I2S channel information.

Public Members

i2s_port_t **id**

I2S port id

i2s_role_t **role**

I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

i2s_dir_t **dir**

I2S channel direction

i2s_comm_mode_t **mode**

I2S channel communication mode

i2s_chan_handle_t **pair_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

I2S_CHANNEL_DEFAULT_CONFIG (*i2s_num*, *i2s_role*)

get default I2S property

I2S_GPIO_UNUSED

Used in *i2s_gpio_config_t* for signals which are not used

I2S Types

Header File

- [components/driver/include/driver/i2s_types.h](#)

Structures

struct **i2s_event_data_t**

Event structure used in I2S event queue.

Public Members

void ***data**

The pointer of DMA buffer that just finished sending or receiving for *on_recv* and *on_sent* callback
NULL for *on_recv_q_ovf* and *on_send_q_ovf* callback

size_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the *dma_frame_num* and *data_bit_width*, typically it is fixed when *data_bit_width* is not changed.

Type Definitions

typedef struct i2s_channel_obj_t ***i2s_chan_handle_t**

i2s channel object handle, the control unit of the i2s driver

typedef bool (***i2s_isr_callback_t**)(*i2s_chan_handle_t* handle, *i2s_event_data_t* *event, void *user_ctx)

I2S event callback.

Param handle [in] I2S channel handle, created from `i2s_new_channel()`

Param event [in] I2S event data

Param user_ctx [in] User registered context, passed from `i2s_channel_register_event_callback()`

Return Whether a high priority task has been waken up by this callback function

Enumerations

enum **i2s_port_t**

I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator **I2S_NUM_0**

I2S controller port 0

enumerator **I2S_NUM_AUTO**

Select whichever port is available

enum **i2s_comm_mode_t**

I2S controller communication mode.

Values:

enumerator **I2S_COMM_MODE_STD**

I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator **I2S_COMM_MODE_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S_COMM_MODE_TDM**

I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S_COMM_MODE_NONE**

Unspecified I2S controller mode

enum **i2s_mclk_multiple_t**

The multiple of mclk to sample rate.

Values:

enumerator **I2S_MCLK_MULTIPLE_128**

mclk = sample_rate * 128

enumerator **I2S_MCLK_MULTIPLE_256**

mclk = sample_rate * 256

enumerator **I2S_MCLK_MULTIPLE_384**

mclk = sample_rate * 384

enumerator **I2S_MCLK_MULTIPLE_512**

mclk = sample_rate * 512

Header File

- [components/hal/include/hal/i2s_types.h](#)

Type Definitions

typedef *soc_periph_i2s_clk_src_t* **i2s_clock_src_t**

I2S clock source

Enumerations

enum **i2s_slot_mode_t**

I2S channel slot mode.

Values:

enumerator **I2S_SLOT_MODE_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s_dir_t**

I2S channel direction.

Values:

enumerator **I2S_DIR_RX**

I2S channel direction RX

enumerator **I2S_DIR_TX**

I2S channel direction TX

enum **i2s_role_t**

I2S controller role.

Values:

enumerator **I2S_ROLE_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S_ROLE_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**

Available data bit width in one slot.

Values:

enumerator **I2S_DATA_BIT_WIDTH_8BIT**

I2S channel data bit-width: 8

enumerator **I2S_DATA_BIT_WIDTH_16BIT**

I2S channel data bit-width: 16

enumerator **I2S_DATA_BIT_WIDTH_24BIT**

I2S channel data bit-width: 24

enumerator **I2S_DATA_BIT_WIDTH_32BIT**

I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**

Total slot bit width in one slot.

Values:

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S_SLOT_BIT_WIDTH_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S_SLOT_BIT_WIDTH_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S_SLOT_BIT_WIDTH_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S_SLOT_BIT_WIDTH_32BIT**

I2S channel slot bit-width: 32

enum **i2s_pcm_compress_t**

A/U-law decompress or compress configuration.

Values:

enumerator **I2S_PCM_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S_PCM_A_DECOMPRESS**

A-law decompress

enumerator **I2S_PCM_A_COMPRESS**

A-law compress

enumerator **I2S_PCM_U_DECOMPRESS**

U-law decompress

enumerator **I2S_PCM_U_COMPRESS**

U-law compress

enum **i2s_pdm_sig_scale_t**

pdm tx signal scaling mode

Values:

enumerator **I2S_PDM_SIG_SCALING_DIV_2**

I2S TX PDM signal scaling: /2

enumerator **I2S_PDM_SIG_SCALING_MUL_1**

I2S TX PDM signal scaling: x1

enumerator **I2S_PDM_SIG_SCALING_MUL_2**

I2S TX PDM signal scaling: x2

enumerator **I2S_PDM_SIG_SCALING_MUL_4**

I2S TX PDM signal scaling: x4

enum **i2s_pdm_tx_line_mode_t**

PDM TX line mode.

Note: For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn't need the clock signal.

Values:

enumerator **I2S_PDM_TX_ONE_LINE_CODEC**

Standard PDM format output, left and right slot data on a single line

enumerator **I2S_PDM_TX_ONE_LINE_DAC**

PDM DAC format output, left or right slot data on a single line

enumerator **I2S_PDM_TX_TWO_LINE_DAC**

PDM DAC format output, left and right slot data on separated lines

enum **i2s_std_slot_mask_t**

I2S slot select in standard mode.

Note: It has different meanings in tx/rx/mono/stereo mode, and it may have differen behaviors on different targets For the details, please refer to the I2S API reference

Values:

enumerator **I2S_STD_SLOT_LEFT**

I2S transmits or receives left slot

enumerator **I2S_STD_SLOT_RIGHT**

I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**

I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**

I2S slot select in PDM mode.

Values:

enumerator **I2S_PDM_SLOT_RIGHT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**

I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**

I2S PDM transmits or receives both two slots

enum **i2s_tdm_slot_mask_t**

tdm slot number

Note: Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if ‘skip_msk’ is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1<<total_slot_num). e.g: slot_mask = (I2S_TDM_SLOT0 | I2S_TDM_SLOT3), here the active slot number is 2 and total_slot is not supposed to be smaller than 4.

Values:

enumerator **I2S_TDM_SLOT0**

I2S slot 0 enabled

enumerator **I2S_TDM_SLOT1**

I2S slot 1 enabled

2.6.12 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g. ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the *Espressif Component Registry* <<https://components.espressif.com/>>.
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver will use this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
```

(continues on next page)

(continued from previous page)

```
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↳panel_handle));
```

I2C Interfaced LCD

1. Create I2C bus. Please refer to [I2C API doc](#) for more details.

```
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0,
↳0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
```

(continues on next page)

(continued from previous page)

```
.lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t) I2C_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to `-1`.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↳panel_handle));
```

More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- Use `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen (different from LCD backlight).
- `esp_lcd_panel_draw_bitmap()` is the most significant function, that will do the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

Application Example

Macros

`LCD_RGB_ENDIAN_RGB`

LCD_RGB_ENDIAN_BGR

Type Definitions

typedef *lcd_rgb_element_order_t* **lcd_color_rgb_endian_t**
for backward compatible

Enumerations

enum **lcd_rgb_element_order_t**

RGB color endian.

Values:

enumerator **LCD_RGB_ELEMENT_ORDER_RGB**

RGB element order: RGB

enumerator **LCD_RGB_ELEMENT_ORDER_BGR**

RGB element order: BGR

enum **lcd_rgb_data_endian_t**

RGB data endian.

Values:

enumerator **LCD_RGB_DATA_ENDIAN_BIG**

RGB data endian: MSB first

enumerator **LCD_RGB_DATA_ENDIAN_LITTLE**

RGB data endian: LSB first

enum **lcd_color_space_t**

LCD color space.

Values:

enumerator **LCD_COLOR_SPACE_RGB**

Color space: RGB

enumerator **LCD_COLOR_SPACE_YUV**

Color space: YUV

enum **lcd_color_range_t**

LCD color range.

Values:

enumerator **LCD_COLOR_RANGE_LIMIT**

Limited color range

enumerator **LCD_COLOR_RANGE_FULL**

Full color range

enum **lcd_yuv_sample_t**

YUV sampling method.

Values:

enumerator **LCD_YUV_SAMPLE_422**

YUV 4:2:2 sampling

enumerator **LCD_YUV_SAMPLE_420**

YUV 4:2:0 sampling

enumerator **LCD_YUV_SAMPLE_411**

YUV 4:1:1 sampling

enum **lcd_yuv_conv_std_t**

The standard used for conversion between RGB and YUV.

Values:

enumerator **LCD_YUV_CONV_STD_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD_YUV_CONV_STD_BT709**

YUV<->RGB conversion standard: BT.709

Functions

esp_err_t esp_lcd_panel_io_rx_param (*esp_lcd_panel_io_handle_t* io, int lcd_cmd, void *param, size_t param_size)

Transmit LCD command and receive corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **param** **-[out]** Buffer for the command data
- **param_size** **-[in]** Size of `param` buffer

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

esp_err_t `esp_lcd_panel_io_tx_param`(*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *param, size_t param_size)

Transmit LCD command and corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** **-[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **param** **-[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** **-[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t `esp_lcd_panel_io_tx_color`(*esp_lcd_panel_io_handle_t* io, int lcd_cmd, const void *color, size_t color_size)

Transmit LCD RGB data.

Note: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

Parameters

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **color** **-[in]** Buffer that holds the RGB color data
- **color_size** **-[in]** Size of `color` in memory, in bytes

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t `esp_lcd_panel_io_del`(*esp_lcd_panel_io_handle_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

Parameters **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_panel_io_register_event_callbacks** (*esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_io_callbacks_t* *cbs, void *user_ctx)

Register LCD panel IO callbacks.

Parameters

- **io** **–[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** **–[in]** structure with all LCD panel IO callbacks
- **user_ctx** **–[in]** User private data, passed directly to callback's `user_ctx`

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_spi** (*esp_lcd_spi_bus_handle_t* bus, const *esp_lcd_panel_io_spi_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for SPI interface.

Parameters

- **bus** **–[in]** SPI bus handle
- **io_config** **–[in]** IO configuration, for SPI interface
- **ret_io** **–[out]** Returned IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_io_i2c** (*esp_lcd_i2c_bus_handle_t* bus, const *esp_lcd_panel_io_i2c_config_t* *io_config, *esp_lcd_panel_io_handle_t* *ret_io)

Create LCD panel IO handle, for I2C interface.

Parameters

- **bus** **–[in]** I2C bus handle
- **io_config** **–[in]** IO configuration, for I2C interface
- **ret_io** **–[out]** Returned IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_io_event_data_t**

Type of LCD panel IO event data.

struct **esp_lcd_panel_io_callbacks_t**

Type of LCD panel IO callbacks.

Public Members

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

struct **esp_lcd_panel_io_spi_config_t**

Panel IO configuration structure, for SPI interface.

Public Members

int **cs_gpio_num**

GPIO used for CS line

int **dc_gpio_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi_mode**

Traditional SPI mode (0~3)

unsigned int **pclk_hz**

Frequency of pixel clock

size_t **trans_queue_depth**

Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb_first**

transmit LSB bit first

unsigned int **cs_high_active**

CS line is high active

struct *esp_lcd_panel_io_spi_config_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**

Panel IO configuration structure, for I2C interface.

Public Members

uint32_t **dev_addr**

I2C device address

esp_lcd_panel_io_color_trans_done_cb_t **on_color_trans_done**

Callback invoked when color data transfer has finished

void ***user_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

size_t **control_phase_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**

Offset of the D/C selection bit in control phase

int **lcd_cmd_bits**

Bit-width of LCD command

int **lcd_param_bits**

Bit-width of LCD parameter

unsigned int **dc_low_on_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**

If this flag is enabled, the control phase isn't used

struct *esp_lcd_panel_io_i2c_config_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

Type Definitions

typedef void ***esp_lcd_spi_bus_handle_t**

Type of LCD SPI bus handle

typedef void ***esp_lcd_i2c_bus_handle_t**

Type of LCD I2C bus handle

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,  
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Param panel_io [in] LCD panel IO handle, which is created by factory API like

```
esp_lcd_new_panel_io_spi()
```

Param edata [in] Panel IO event data, fed by driver

Param user_ctx [in] User data, passed from `esp_lcd_panel_io_xxx_config_t`

Return Whether a high priority task has been waken up by this function

Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

Functions

```
esp_err_t esp_lcd_panel_reset(esp_lcd_panel_handle_t panel)
```

Reset LCD panel.

Note: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

Parameters panel **[in]** LCD panel handle, which is created by other factory API like

```
esp_lcd_new_panel_st7789()
```

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)
```

Initialize LCD panel.

Note: Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

Parameters panel **[in]** LCD panel handle, which is created by other factory API like

```
esp_lcd_new_panel_st7789()
```

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)
```

Deinitialize the LCD panel.

Parameters panel **[in]** LCD panel handle, which is created by other factory API like

```
esp_lcd_new_panel_st7789()
```

Returns

- ESP_OK on success

```
esp_err_t esp_lcd_panel_draw_bitmap(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end,  
int y_end, const void *color_data)
```

Draw bitmap on LCD panel.

Parameters

- **panel** **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

- **x_start** –[in] Start index on x-axis (x_start included)
- **y_start** –[in] Start index on y-axis (y_start included)
- **x_end** –[in] End index on x-axis (x_end not included)
- **y_end** –[in] End index on y-axis (y_end not included)
- **color_data** –[in] RGB color data that will be dumped to the specific window range

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_mirror** (*esp_lcd_panel_handle_t* panel, bool mirror_x, bool mirror_y)

Mirror the LCD panel on specific axis.

Note: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

Parameters

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror_x** –[in] Whether the panel will be mirrored about the x axis
- **mirror_y** –[in] Whether the panel will be mirrored about the y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_swap_xy** (*esp_lcd_panel_handle_t* panel, bool swap_axes)

Swap/Exchange x and y axis.

Note: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

Parameters

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** –[in] Whether to swap the x and y axis

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_set_gap** (*esp_lcd_panel_handle_t* panel, int x_gap, int y_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

Note: Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

Parameters

- **panel** –[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** –[in] Extra gap on x axis, in pixels
- **y_gap** –[in] Extra gap on y axis, in pixels

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_invert_color** (*esp_lcd_panel_handle_t* panel, bool invert_color_data)

Invert the color (bit-wise invert the color data line)

Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** **–[in]** Whether to invert the color data

Returns

- ESP_OK on success

esp_err_t **esp_lcd_panel_disp_on_off** (*esp_lcd_panel_handle_t* panel, bool on_off)

Turn on or off the display.

Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** **–[in]** True to turns on display, False to turns off display

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

esp_err_t **esp_lcd_panel_disp_off** (*esp_lcd_panel_handle_t* panel, bool off)

Turn off the display.

Parameters

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** **–[in]** Whether to turn off the screen

Returns

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

Functions

esp_err_t **esp_lcd_new_panel_st7789** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model ST7789.

Parameters

- **io** **–[in]** LCD panel IO handle
- **panel_dev_config** **–[in]** general panel device configuration
- **ret_panel** **–[out]** Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_nt35510** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model NT35510.

Parameters

- **io** **–[in]** LCD panel IO handle
- **panel_dev_config** **–[in]** general panel device configuration

- **ret_panel** *–[out]* Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **esp_lcd_new_panel_ssd1306** (const *esp_lcd_panel_io_handle_t* io, const *esp_lcd_panel_dev_config_t* *panel_dev_config, *esp_lcd_panel_handle_t* *ret_panel)

Create LCD panel for model SSD1306.

Parameters

- **io** *–[in]* LCD panel IO handle
- **panel_dev_config** *–[in]* general panel device configuration
- **ret_panel** *–[out]* Returned LCD panel handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Structures

struct **esp_lcd_panel_dev_config_t**

Configuration structure for panel device.

Public Members

int **reset_gpio_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

lcd_rgb_element_order_t **color_space**

Deprecated:

Set RGB color space, please use *rgb_ele_order* instead

lcd_rgb_element_order_t **rgb_endian**

Deprecated:

Set RGB data endian, please use *rgb_ele_order* instead

lcd_rgb_element_order_t **rgb_ele_order**

Set RGB element order, RGB or BGR

lcd_rgb_data_endian_t **data_endian**

Set the data endian for color data larger than 1 byte

unsigned int **bits_per_pixel**

Color depth, in bpp

unsigned int **reset_active_high**

Setting this if the panel reset is high level active

```
struct esp_lcd_panel_dev_config_t:[anonymous] flags
    LCD panel config flags

void *vendor_config
    vendor specific configuration, optional, left as NULL if not used
```

2.6.13 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C3 only supports configuring channels in “low speed” mode.

1. *Timer Configuration* by specifying the PWM signal’s frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 9: Key Settings of LED PWM Controller’s API

Timer Configuration Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 4: Characteristics of ESP32-C3 LEDC source clocks

Clock name	Clock freq	Clock capabilities
APB_CLK	80 MHz	/
RTC20M_CLK	~20 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
XTAL_CLK	40 MHz	Dynamic Frequency Scaling compatible

Note:

1. On ESP32-C3, if `RTCxM_CLK` is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.
 2. For ESP32-C3, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.
-

Channel Configuration When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

Note: All the timers and channels in the ESP32-C3's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

Change PWM Duty Cycle Using Software To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to $(2 ** \text{duty_resolution})$. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~ 0.1%.

Warning: On ESP32-C3, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to $(2 ** \text{duty_resolution})$. Otherwise, the internal duty counter in the hardware will overflow and be messed up.

Change PWM Duty Cycle using Hardware The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

Change PWM Frequency The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

More Control Over PWM There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

Use Interrupts When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ($2^{13} = 8192$ discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the *ESP32-C3 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

Application Example

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc_fade](#).

The LEDC basic example: [peripherals/ledc/ledc_basic](#).

API Reference

Header File

- [components/driver/include/driver/ledc.h](#)

Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` *ledc_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Parameters `ledc_conf` –Pointer of LEDC channel configure struct

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_timer_config** (const *ledc_timer_config_t* *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Parameters **timer_conf** –Pointer of LEDC timer configure struct

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

esp_err_t **ledc_update_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC update channel parameters.

Note: Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_pin** (int gpio_num, *ledc_mode_t* speed_mode, *ledc_channel_t* ledc_channel)

Set LEDC output gpio.

Note: This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

Parameters

- **gpio_num** –The LEDC output gpio
- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **idle_level** –Set output idle level after LEDC stops.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_set_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from *ledc_timer_t*
- **freq_hz** –Set the LEDC frequency

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

uint32_t **ledc_get_freq** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_num)

LEDC get channel frequency (Hz)

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_num** –LEDC timer index (0-3), select from *ledc_timer_t*

Returns

- 0 error
- Others Current LEDC frequency

esp_err_t **ledc_set_duty_with_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling *ledc_update_duty* will the duty update.

Note: *ledc_set_duty*, *ledc_set_duty_with_hpoint* and *ledc_update_duty* are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is *ledc_set_duty_and_update*

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int **ledc_get_hpoint** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t **ledc_set_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call `ledc_set_duty_with_hpoint`. only after calling `ledc_update_duty` will the duty update.

Note: `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t **ledc_get_duty** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling `ledc_update_duty`, because duty update doesn't take effect until the next cycle.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

Returns

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

esp_err_t **ledc_set_fade** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t duty, *ledc_duty_direction_t* fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution)]
- **fade_direction** –Set the direction of the gradient
- **step_num** –Set the number of the gradient
- **duty_cycle_num** –Set how many LEDC tick each time the gradient lasts
- **duty_scale** –Set gradient change amplitude

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **ledc_isr_register** (void (*fn)(void*), void *arg, int intr_alloc_flags, *ledc_isr_handle_t* *handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Parameters

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source

esp_err_t **ledc_timer_set** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel, uint32_t clock_divider, uint32_t duty_resolution, *ledc_clk_src_t* clk_src)

Configure LEDC settings.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** –Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** –Resolution of duty setting in number of bits. The range is [1, SOC_LEDC_TIMER_BIT_WIDTH]
- **clk_src** –Select LEDC source clock.

Returns

- (-1) Parameter error
- Other Current LEDC duty

esp_err_t **ledc_timer_rst** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Reset LEDC timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t **ledc_timer_pause** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Pause LEDC timer counter.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **ledc_timer_resume** (*ledc_mode_t* speed_mode, *ledc_timer_t* timer_sel)

Resume LEDC timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **ledc_bind_channel_timer** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_timer_t* timer_sel)

Bind LEDC channel with the selected timer.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **timer_sel** –LEDC timer index (0-3), select from `ledc_timer_t`

Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success

esp_err_t **ledc_set_fade_with_step** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, `uint32_t` target_duty, `uint32_t` scale, `uint32_t` cycle_num)

Set LEDC fade function.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every `cycle_num` cycles

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_with_time** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

Note: `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_fade_func_install** (int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

Parameters **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source
- ESP_ERR_INVALID_STATE Fade function already installed

void **ledc_fade_func_uninstall** (void)

Uninstall LEDC fade function.

esp_err_t **ledc_fade_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_fade_mode_t* fade_mode)

Start LEDC fading.

Note: Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

Note: Starting fade operation with this API is not thread-safe, use with care.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade_mode** –Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

esp_err_t **ledc_fade_stop** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel)

Stop LEDC fading. Duty of the channel will stay at its present vlaue.

Note: This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

Note: Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

Note: If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards is no use in stopping the fade. Fade will continue until it reaches the target duty.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

esp_err_t **ledc_set_duty_and_update** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, `uint32_t` duty, `uint32_t` hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** –Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_time_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t max_fade_time_ms, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

Note: Call `ledc_fade_func_install()` once, before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **max_fade_time_ms** –The maximum time of the fading (ms).
- **fade_mode** –choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_set_fade_step_and_start** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, *ledc_fade_mode_t* fade_mode)

A thread-safe API to set and start LEDC fade function.

Note: Call `ledc_fade_func_install()` once before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`

- **target_duty** –Target duty of fading [0, (2**duty_resolution)]
- **scale** –Controls the increase or decrease step scale.
- **cycle_num** –increase or decrease the duty every cycle_num cycles
- **fade_mode** –choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

esp_err_t **ledc_cb_register** (*ledc_mode_t* speed_mode, *ledc_channel_t* channel, *ledc_cbs_t* *cbs, void *user_arg)

LEDC callback registration function.

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Parameters

- **speed_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from *ledc_channel_t*
- **cbs** –Group of LEDC callback functions
- **user_arg** –user registered data for the callback function

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

Structures

struct **ledc_channel_config_t**

Configuration parameters of LEDC channel for *ledc_channel_config* function.

Public Members

int **gpio_num**

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_channel_t **channel**

LEDC channel (0 - 7)

ledc_intr_type_t **intr_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t **timer_sel**

Select the timer source of channel (0 - 3)

uint32_t **duty**

LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2**duty_resolution)-1]

unsigned int **output_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc_channel_config_t*::[anonymous] **flags**

LEDC flags

struct **ledc_timer_config_t**

Configuration parameters of LEDC Timer timer for ledc_timer_config function.

Public Members

ledc_mode_t **speed_mode**

LEDC speed speed_mode, high-speed mode (only exists on esp32) or low-speed mode

ledc_timer_bit_t **duty_resolution**

LEDC channel duty resolution

ledc_timer_t **timer_num**

The timer source of channel (0 - 3)

uint32_t **freq_hz**

LEDC timer frequency (Hz)

ledc_clk_cfg_t **clk_cfg**

Configure LEDC source clock from ledc_clk_cfg_t. Note that LEDC_USE_RTC8M_CLK and LEDC_USE_XTAL_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RTC8M_CLK as the clock source and have another LEDC timer uses XTAL_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct **ledc_cb_param_t**

LEDC callback parameter.

Public Members

ledc_cb_event_t **event**

Event name

uint32_t **speed_mode**

Speed mode of the LEDC channel group

uint32_t **channel**

LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

struct **ledc_cbs_t**

Group of supported LEDC callbacks.

Note: The callbacks are all running under ISR environment

Public Members

ledc_cb_t **fade_cb**

LEDC fade_end callback function

Macros

LEDC_APB_CLK_HZ

Frequency of one of the LEDC peripheral clock sources, APB_CLK.

Note: This macro should have no use in your application, we keep it here only for backward compatible

LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions

typedef *intr_handle_t* **ledc_isr_handle_t**

typedef bool (***ledc_cb_t**)(const *ledc_cb_param_t* *param, void *user_arg)

Type of LEDC event callback.

Param param LEDC callback parameter

Param user_arg User registered data

Return Whether a high priority task has been waken up by this function

Enumerations

enum **ledc_cb_event_t**

LEDC callback event type.

Values:

enumerator **LEDC_FADE_END_EVT**

LEDC fade end event

Header File

- [components/hal/include/hal/ledc_types.h](#)

Enumerations

enum **ledc_mode_t**

Values:

enumerator **LEDC_LOW_SPEED_MODE**

LEDC low speed speed_mode

enumerator **LEDC_SPEED_MODE_MAX**

LEDC speed limit

enum **ledc_intr_type_t**

Values:

enumerator **LEDC_INTR_DISABLE**

Disable LEDC interrupt

enumerator **LEDC_INTR_FADE_END**

Enable LEDC interrupt

enumerator **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

Values:

enumerator **LEDC_DUTY_DIR_DECREASE**

LEDC duty decrease direction

enumerator **LEDC_DUTY_DIR_INCREASE**

LEDC duty increase direction

enumerator **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

Values:

enumerator **LEDC_SLOW_CLK_RTC8M**

LEDC low speed timer clock source is 8MHz RTC clock

enumerator **LEDC_SLOW_CLK_APB**

LEDC low speed timer clock source is 80MHz APB clock

enumerator **LEDC_SLOW_CLK_XTAL**

LEDC low speed timer clock source XTAL clock

enum **ledc_clk_cfg_t**

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

enumerator **LEDC_AUTO_CLK**

The driver will automatically select the source clock based on the giving resolution and duty parameter when init the timer

enumerator **LEDC_USE_APB_CLK**

LEDC timer select APB clock as source clock

enumerator **LEDC_USE_RTC8M_CLK**

LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

enumerator **LEDC_USE_XTAL_CLK**

LEDC timer select XTAL clock as source clock

enum **ledc_clk_src_t**

Values:

enumerator **LEDC_APB_CLK**

LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_APB_CLK_SEL`

enum **ledc_timer_t**

Values:

enumerator **LEDC_TIMER_0**

LEDC timer 0

enumerator **LEDC_TIMER_1**

LEDC timer 1

enumerator **LEDC_TIMER_2**

LEDC timer 2

enumerator **LEDC_TIMER_3**

LEDC timer 3

enumerator **LEDC_TIMER_MAX**

enum **ledc_channel_t**

Values:

enumerator **LEDC_CHANNEL_0**

LEDC channel 0

enumerator **LEDC_CHANNEL_1**

LEDC channel 1

enumerator **LEDC_CHANNEL_2**

LEDC channel 2

enumerator **LEDC_CHANNEL_3**

LEDC channel 3

enumerator **LEDC_CHANNEL_4**

LEDC channel 4

enumerator **LEDC_CHANNEL_5**

LEDC channel 5

enumerator **LEDC_CHANNEL_MAX**

enum **ledc_timer_bit_t**

Values:

enumerator **LEDC_TIMER_1_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC_TIMER_2_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC_TIMER_3_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC_TIMER_4_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC_TIMER_5_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC_TIMER_6_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC_TIMER_7_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC_TIMER_8_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC_TIMER_9_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC_TIMER_10_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC_TIMER_11_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC_TIMER_12_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC_TIMER_13_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC_TIMER_14_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC_TIMER_BIT_MAX**

enum **ledc_fade_mode_t**

Values:

enumerator **LEDC_FADE_NO_WAIT**

LEDC fade function will return immediately

enumerator **LEDC_FADE_WAIT_DONE**

LEDC fade function will block until fading to the target duty

enumerator **LEDC_FADE_MAX**

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-C3 contains multiple channels in the RMT peripheral¹. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times

¹ Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation*.

- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols The RMT hardware defines data in its own pattern –the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal’s duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal’s logic level, i.e., high or low.

Fig. 10: Structure of RMT symbols (L - signal level)

RMT Transmitter Overview The data path and control path of an RMT TX channel is illustrated in the figure below:

Fig. 11: RMT Transmitter Overview

The driver encodes the user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

RMT Receiver Overview The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

Functional Overview

The description of the RMT functionality is divided into the following sections:

Fig. 12: RMT Receiver Overview

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

Resource Allocation Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

Install RMT TX Channel To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
 - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
 - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.

- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,          // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,        // do not invert output signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

Install RMT RX Channel To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
 - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
 - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.

- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                    // GPIO number
    .flags.invert_in = false,         // do not invert input signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

Note: Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

Note: For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz,

instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,                // duty cycle 33%
    .frequency_hz = 38000,            // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
    ↪level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,                // duty cycle 33%
    .frequency_hz = 25000,            // 25 KHz carrier, should be smaller than_
    ↪the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid during the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

Enable and Disable Channel `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to *RMT Encoder*.

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
 - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
 - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

Note: The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

Note: There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
 - Customize an encoder and construct an infinite loop in the encoding function. See also *RMT Encoder*.
-

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

Multiple Channels Simultaneous Transmission In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT

driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

Fig. 13: RMT TX Sync

Install RMT Sync Manager To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

Start Transmission Simultaneously For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        // can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
```

(continues on next page)

(continued from previous page)

```

}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↳num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for_
↳tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↳num * 3, &transmit_config));

```

Initiate RX Transaction As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver notifies the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

```

static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {

```

(continues on next page)

```

        .on_rcv_done = example_rmt_rx_done_callback,
    };
    ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

    // the following timing requirement is based on NEC protocol
    rmt_receive_config_t receive_config = {
        .signal_range_min_ns = 1250, // the shortest duration for NEC signal is
        ↪ 560 μs, 1250 ns < 560 μs, valid signal is not treated as noise
        .signal_range_max_ns = 12000000, // the longest duration for NEC signal is
        ↪ 9000 μs, 12000000 ns > 9000 μs, the receive does not stop early
    };

    rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a
    ↪ standard NEC frame
    // ready to receive
    ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
    ↪ config));
    // wait for the RX-done signal
    rmt_rx_done_event_data_t rx_data;
    xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
    // parse the received symbols
    example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

```

RMT Encoder An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
 - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
 - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
 - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
 - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
 - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

Copy Encoder A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling

`rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

Bytes Encoder A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

Fig. 14: RMT Encoder Chain

Customize RMT Encoder for NEC Protocol This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is $562.5 \mu\text{s}$ in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a $562.5 \mu\text{s}$ pulse burst followed by a $562.5 \mu\text{s}$ space, with a total transmit time of 1.125 ms
- Logical 1: a $562.5 \mu\text{s}$ pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

Fig. 15: IR NEC Frame

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5 μs pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard_
    ↪encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading_
    ↪and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address_
    ↪and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT_
    ↪representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT_
    ↪representation
    int state; // record the current encoding state, i.e., we are in which_
    ↪encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t_
    ↪channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
    ↪state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
    ↪t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
            ↪encoder->nec_leading_symbol,
            sizeof(rmt_symbol_word_t), &
            ↪session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when_
            ↪the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding_
            ↪artifacts
            }
            // fall-through
            case 1: // send address
                encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
                ↪code->address, sizeof(uint16_t), &session_state);
```

(continues on next page)

(continued from previous page)

```

        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 2; // we can only switch to the next state when
↳the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
↳artifacts
        }
        // fall-through
        case 2: // send command
            encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
↳code->command, sizeof(uint16_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 3; // we can only switch to the next state when
↳the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding
↳artifacts
            }
            // fall-through
            case 3: // send ending code
                encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
↳encoder->nec_ending_symbol,
                                                                    sizeof(rmt_symbol_word_t), &
↳session_state);
                if (session_state & RMT_ENCODING_COMPLETE) {
                    nec_encoder->state = RMT_ENCODING_RESET; // back to the initial
↳encoding session
                    state |= RMT_ENCODING_COMPLETE; // telling the caller the NEC encoding
↳has finished
                }
                if (session_state & RMT_ENCODING_MEM_FULL) {
                    state |= RMT_ENCODING_MEM_FULL;
                    goto out; // yield if there is no free space to put other encoding
↳artifacts
                }
            }
        }
out:
    *ret_state = state;
    return encoded_symbols;
}

```

A full sample code can be found in [peripherals/rmt/ir_nec_transceiver](#). In the above snippet, we use a switch-case and several goto statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

Power Management When power management is enabled, i.e., [CONFIG_PM_ENABLE](#) is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type [ESP_PM_APB_FREQ_MAX](#). Whenever the user creates an RMT channel that has selected [RMT_CLK_SRC_APB](#) as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by [rmt_enable\(\)](#). Likewise, the driver releases the lock after [rmt_disable\(\)](#) is called for the same channel. This also reveals that the [rmt_enable\(\)](#) and [rmt_disable\(\)](#) should appear in pairs.

If the channel clock source is selected to others like [RMT_CLK_SRC_XTAL](#), then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide

sufficient resolution.

IRAM Safe By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM²
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option `CONFIG_RMT_RECV_FUNC_IN_IRAM` can place `rmt_receive()` into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

Thread Safety The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- `rmt_receive()`

Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` controls where to place the RMT receive function (IRAM or Flash), see *IRAM Safe* for more information.

FAQ

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes **faster** than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

² The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 48.
- Place the encoding function in the IRAM.
- Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

API Reference

Header File

- `components/driver/include/driver/rmt_tx.h`

Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t` *config, `rmt_channel_handle_t` *ret_chan)

Create a RMT TX channel.

Parameters

- **config** –[in] TX channel configurations
- **ret_chan** –[out] Returned generic RMT channel handle

Returns

- `ESP_OK`: Create RMT TX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT TX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT TX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT TX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT TX channel failed because of other error

`esp_err_t rmt_transmit` (`rmt_channel_handle_t` tx_channel, `rmt_encoder_handle_t` encoder, const void *payload, `size_t` payload_bytes, const `rmt_transmit_config_t` *config)

Transmit data by RMT TX channel.

Note: This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there's another one under processing. Based on the setting of `rmt_transmit_config_t::queue_nonblocking`, if there're too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

Note: The data to be transmitted will be encoded into RMT symbols by the specific encoder.

Parameters

- **tx_channel** –[in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** –[in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** –[in] The raw data to be encoded into RMT symbols
- **payload_bytes** –[in] Size of the payload in bytes
- **config** –[in] Transmission specific configuration

Returns

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Transmit data failed because channel is not enabled
- `ESP_ERR_NOT_SUPPORTED`: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- `ESP_FAIL`: Transmit data failed because of other error

esp_err_t **rmt_tx_wait_all_done** (*rmt_channel_handle_t* tx_channel, int timeout_ms)

Wait for all pending TX transactions done.

Note: This function will block forever if the pending transaction can't be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

Parameters

- **tx_channel** –[in] RMT TX channel that created by `rmt_new_tx_channel()`
- **timeout_ms** –[in] Wait timeout, in ms. Specially, -1 means to wait forever.

Returns

- **ESP_OK**: Flush transactions successfully
- **ESP_ERR_INVALID_ARG**: Flush transactions failed because of invalid argument
- **ESP_ERR_TIMEOUT**: Flush transactions failed because of timeout
- **ESP_FAIL**: Flush transactions failed because of other error

esp_err_t **rmt_tx_register_event_callbacks** (*rmt_channel_handle_t* tx_channel, const *rmt_tx_event_callbacks_t* *cbs, void *user_data)

Set event callbacks for RMT TX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Note: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- **tx_channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()`
- **cbs** –[in] Group of callback functions
- **user_data** –[in] User data, which will be passed to callback functions directly

Returns

- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_FAIL**: Set event callbacks failed because of other error

esp_err_t **rmt_new_sync_manager** (const *rmt_sync_manager_config_t* *config, *rmt_sync_manager_handle_t* *ret_syncro)

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

Note: All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

Parameters

- **config** –[in] Synchronization manager configuration
- **ret_syncro** –[out] Returned synchronization manager handle

Returns

- **ESP_OK**: Create sync manager successfully
- **ESP_ERR_INVALID_ARG**: Create sync manager failed because of invalid argument
- **ESP_ERR_NOT_SUPPORTED**: Create sync manager failed because it is not supported by hardware

- `ESP_ERR_INVALID_STATE`: Create sync manager failed because not all channels are enabled
- `ESP_ERR_NO_MEM`: Create sync manager failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create sync manager failed because all sync controllers are used up and no more free one
- `ESP_FAIL`: Create sync manager failed because of other error

esp_err_t **rmt_del_sync_manager** (*rmt_sync_manager_handle_t* synchro)

Delete synchronization manager.

Parameters **synchro** `-[in]` Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- `ESP_OK`: Delete the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Delete the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Delete the synchronization manager failed because of other error

esp_err_t **rmt_sync_reset** (*rmt_sync_manager_handle_t* synchro)

Reset synchronization manager.

Parameters **synchro** `-[in]` Synchronization manager handle returned from `rmt_new_sync_manager()`

Returns

- `ESP_OK`: Reset the synchronization manager successfully
- `ESP_ERR_INVALID_ARG`: Reset the synchronization manager failed because of invalid argument
- `ESP_FAIL`: Reset the synchronization manager failed because of other error

Structures

struct **rmt_tx_event_callbacks_t**

Group of RMT TX callbacks.

Note: The callbacks are all running under ISR environment

Note: When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_tx_done_callback_t **on_trans_done**

Event callback, invoked when transmission is finished

struct **rmt_tx_channel_config_t**

RMT TX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT TX channel. Set to -1 if unused

***rmt_clock_source_t* clk_src**

Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t resolution_hz

Channel clock resolution, in Hz

size_t mem_block_symbols

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size_t trans_queue_depth

Depth of internal transfer queue, increase this value can support more transfers pending in the background

int intr_priority

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t invert_out

Whether to invert the RMT channel signal before output to GPIO pad

uint32_t with_dma

If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back

The signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode

Configure the GPIO as open-drain mode

struct *rmt_tx_channel_config_t*::[anonymous] flags

TX channel config flags

struct *rmt_transmit_config_t*

RMT transmit specific configuration.

Public Members**int loop_count**

Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level

Set the output level for the “End Of Transmission”

uint32_t queue_nonblocking

If set, when the transaction queue is full, driver will not block the thread but return directly

```
struct rmt_transmit_config_t::[anonymous] flags
```

Transmit specific config flags

```
struct rmt_sync_manager_config_t
```

Synchronous manager configuration.

Public Members

```
const rmt_channel_handle_t*tx_channel_array
```

Array of TX channels that are about to be managed by a synchronous controller

```
size_t array_size
```

Size of the `tx_channel_array`

Header File

- `components/driver/include/driver/rmt_rx.h`

Functions

```
esp_err_t rmt_new_rx_channel (const rmt_rx_channel_config_t*config, rmt_channel_handle_t*ret_chan)
```

Create a RMT RX channel.

Parameters

- **config** –[in] RX channel configurations
- **ret_chan** –[out] Returned generic RMT channel handle

Returns

- `ESP_OK`: Create RMT RX channel successfully
- `ESP_ERR_INVALID_ARG`: Create RMT RX channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create RMT RX channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create RMT RX channel failed because all RMT channels are used up and no more free one
- `ESP_ERR_NOT_SUPPORTED`: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- `ESP_FAIL`: Create RMT RX channel failed because of other error

```
esp_err_t rmt_receive (rmt_channel_handle_t rx_channel, void*buffer, size_t buffer_size, const rmt_receive_config_t*config)
```

Initiate a receive job for RMT RX channel.

Note: This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

Note: This function can also be called in ISR context.

Note: If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

Parameters

- **rx_channel** –[in] RMT RX channel that created by `rmt_new_rx_channel()`

- **buffer** –[in] The buffer to store the received RMT symbols
- **buffer_size** –[in] size of the `buffer`, in bytes
- **config** –[in] Receive specific configurations

Returns

- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

esp_err_t **rmt_rx_register_event_callbacks** (*rmt_channel_handle_t* rx_channel, const *rmt_rx_event_callbacks_t* *cbs, void *user_data)

Set callbacks for RMT RX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- **rx_channel** –[in] RMT generic channel that created by `rmt_new_rx_channel()`
- **cbs** –[in] Group of callback functions
- **user_data** –[in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

Structures

struct **rmt_rx_event_callbacks_t**

Group of RMT RX callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_rx_done_callback_t **on_recv_done**

Event callback, invoked when one RMT channel receiving transaction completes

struct **rmt_rx_channel_config_t**

RMT RX channel specific configuration.

Public Members

gpio_num_t **gpio_num**

GPIO number used by RMT RX channel. Set to -1 if unused

rmt_clock_source_t **clk_src**

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32_t **resolution_hz**

Channel clock resolution, in Hz

size_t **mem_block_symbols**

Size of memory block, in number of *rmt_symbol_word_t*, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

uint32_t **invert_in**

Whether to invert the incoming RMT channel signal

uint32_t **with_dma**

If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *rmt_rx_channel_config_t*::[anonymous] **flags**

RX channel config flags

int **intr_priority**

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct **rmt_receive_config_t**

RMT receive specific configuration.

Public Members

uint32_t **signal_range_min_ns**

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t **signal_range_max_ns**

RMT will stop receiving if one symbol level has kept more than `signal_range_max_ns`

Header File

- [components/driver/include/driver/rmt_common.h](#)

Functions

esp_err_t **rmt_del_channel** (*rmt_channel_handle_t* channel)

Delete an RMT channel.

Parameters **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

esp_err_t **rmt_apply_carrier** (*rmt_channel_handle_t* channel, const *rmt_carrier_config_t* *config)

Apply modulation feature for TX channel or demodulation feature for RX channel.

Parameters

- **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- **config** –[in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

Returns

- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

esp_err_t **rmt_enable** (*rmt_channel_handle_t* channel)

Enable the RMT channel.

Note: This function will acquire a PM lock that might be installed during channel allocation

Parameters **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it's enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

esp_err_t **rmt_disable** (*rmt_channel_handle_t* channel)

Disable the RMT channel.

Note: This function will release a PM lock that might be installed during channel allocation

Parameters **channel** –[in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns

- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it's not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

Structures

struct **rmt_carrier_config_t**

RMT carrier wave configuration (for either modulation or demodulation)

Public Members

uint32_t **frequency_hz**

Carrier wave frequency, in Hz, 0 means disabling the carrier

float **duty_cycle**

Carrier wave duty cycle (0~100%)

uint32_t **polarity_active_low**

Specify the polarity of carrier, by default it's modulated to base signal's high level

uint32_t **always_on**

If set, the carrier can always exist even there's not transfer undergoing

struct *rmt_carrier_config_t*::[anonymous] **flags**

Carrier config flags

Header File

- [components/driver/include/driver/rmt_encoder.h](#)

Functions

esp_err_t **rmt_new_bytes_encoder** (const *rmt_bytes_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

Parameters

- **config** –[in] Bytes encoder configuration
- **ret_encoder** –[out] Returned encoder handle

Returns

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

esp_err_t **rmt_new_copy_encoder** (const *rmt_copy_encoder_config_t* *config, *rmt_encoder_handle_t* *ret_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

Parameters

- **config** –[in] Copy encoder configuration
- **ret_encoder** –[out] Returned encoder handle

Returns

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

esp_err_t **rmt_del_encoder** (*rmt_encoder_handle_t* encoder)

Delete RMT encoder.

Parameters **encoder** –[in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

Returns

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

esp_err_t **rmt_encoder_reset** (*rmt_encoder_handle_t* encoder)

Reset RMT encoder.

Parameters **encoder** **–[in]** RMT encoder handle, created by `e.g rmt_new_bytes_encoder()`

Returns

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

Structures

struct **rmt_encoder_t**

Interface of RMT encoder.

Public Members

size_t (***encode**)(*rmt_encoder_t* *encoder, *rmt_channel_handle_t* tx_channel, const void *primary_data, *size_t* data_size, *rmt_encode_state_t* *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

Note: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

Note: It's recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle

Param tx_channel [in] RMT TX channel handle, returned from `rmt_new_tx_channel()`

Param primary_data [in] App data to be encoded into RMT symbols

Param data_size [in] Size of primary_data, in bytes

Param ret_state [out] Returned current encoder's state

Return Number of RMT symbols that the primary data has been encoded into

esp_err_t (***reset**)(*rmt_encoder_t* *encoder)

Reset encoding state.

Param encoder [in] Encoder handle

Return

- ESP_OK: reset encoder successfully
- ESP_FAIL: reset encoder failed

esp_err_t (***del**)(*rmt_encoder_t* *encoder)

Delete encoder object.

Param encoder [in] Encoder handle

Return

- ESP_OK: delete encoder successfully

- `ESP_FAIL`: delete encoder failed

struct **rmt_bytes_encoder_config_t**

Bytes encoder configuration.

Public Members

rmt_symbol_word_t **bit0**

How to represent BIT0 in RMT symbol

rmt_symbol_word_t **bit1**

How to represent BIT1 in RMT symbol

uint32_t **msb_first**

Whether to encode MSB bit first

struct *rmt_bytes_encoder_config_t*::[anonymous] **flags**

Encoder config flag

struct **rmt_copy_encoder_config_t**

Copy encoder configuration.

Type Definitions

typedef struct *rmt_encoder_t* **rmt_encoder_t**

Type of RMT encoder.

Enumerations

enum **rmt_encode_state_t**

RMT encoding state.

Values:

enumerator **RMT_ENCODING_RESET**

The encoding session is in reset state

enumerator **RMT_ENCODING_COMPLETE**

The encoding session is finished, the caller can continue with subsequent encoding

enumerator **RMT_ENCODING_MEM_FULL**

The encoding artifact memory is full, the caller should return from current encoding session

Header File

- [components/driver/include/driver/rmt_types.h](#)

Structures

struct **rmt_tx_done_event_data_t**

Type of RMT TX done event data.

Public Members

size_t **num_symbols**

The number of transmitted RMT symbols (only one round is counted if it's a loop transmission)

struct **rmt_rx_done_event_data_t**

Type of RMT RX done event data.

Public Members

rmt_symbol_word_t ***received_symbols**

Point to the received RMT symbols

size_t **num_symbols**

The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t ***rmt_channel_handle_t**

Type of RMT channel handle.

typedef struct rmt_sync_manager_t ***rmt_sync_manager_handle_t**

Type of RMT synchronization manager handle.

typedef struct *rmt_encoder_t* ***rmt_encoder_handle_t**

Type of RMT encoder handle.

typedef bool (***rmt_tx_done_callback_t**)(*rmt_channel_handle_t* tx_chan, const *rmt_tx_done_event_data_t* *edata, void *user_ctx)

Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from `rmt_new_tx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_tx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this callback function

typedef bool (***rmt_rx_done_callback_t**)(*rmt_channel_handle_t* rx_chan, const *rmt_rx_done_event_data_t* *edata, void *user_ctx)

Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from `rmt_new_rx_channel()`

Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

Param user_ctx [in] User registered context, passed from `rmt_rx_register_event_callbacks()`

Return Whether a high priority task has been waken up by this function

Header File

- [components/hal/include/hal/rmt_types.h](#)

Unions

union **rmt_symbol_word_t**

#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

uint16_t **duration0**

Duration of level0

uint16_t **level0**

Level of the first part

uint16_t **duration1**

Duration of level1

uint16_t **level1**

Level of the second part

struct *rmt_symbol_word_t*::[anonymous] [**anonymous**]

uint32_t **val**

Equivalent unsigned value for the RMT symbol

Type Definitions

typedef *soc_periph_rmt_clk_src_t* **rmt_clock_source_t**

RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement

2.6.15 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an *sdspi_dev_handle_t* `spi_handle` returned when attaching the device to an SPI bus by calling *sdspi_host_init_device*. The bus should be already initialized before (by *spi_bus_initialize*).

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro *SDSPI_DEVICE_CONFIG_DEFAULT* to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call *sdspi_host_init_device* to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [the SD/SDIO/MMC Driver](#).

Note: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

<p>Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI bus among SD card and other SPI devices.</p>
--

Related Docs

Sharing the SPI bus among SD card and other SPI devices The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

Pin loading of other devices When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC loading SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it's the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it's not as obvious as with an oscilloscope.

2. Try to use slower clock frequency.

If the lower frequency can work while the higher frequency can't, it's an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

DC loading The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

Initialization sequence

Note: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (`SDMMC_FREQ_PROBING = 400 KHz` for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also [storage/sd_card](#))

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
 2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
 3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.

This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.

If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.

4. Now you can talk to other SPI devices freely!

API Reference

Header File

- [components/driver/include/driver/sdspi_host.h](#)

Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

Note: This function is not thread safe

Returns

- `ESP_OK` on success
- other error codes may be returned in future versions

esp_err_t **sdspi_host_init_device** (const *sdspi_device_config_t* *dev_config, *sdspi_dev_handle_t* *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

Note: This function is not thread safe

Note: Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

Note: The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

Parameters

- **dev_config** –pointer to device configuration structure
- **out_handle** –Output of the handle to the sdspi device.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

esp_err_t **sdspi_host_remove_device** (*sdspi_dev_handle_t* handle)

Remove an SD SPI device.

Parameters **handle** –Handle of the SD SPI device

Returns Always ESP_OK

esp_err_t **sdspi_host_do_transaction** (*sdspi_dev_handle_t* handle, *sdmmc_command_t* *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note: This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

Parameters

- **handle** –Handle of the sdspi device
- **cmdinfo** –pointer to structure describing command and data to transfer

Returns

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

esp_err_t **sdspi_host_set_card_clk** (*sdspi_dev_handle_t* host, *uint32_t* freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note: This function is not thread safe

Parameters

- **host** –Handle of the sdspi device
- **freq_khz** –card clock frequency, in kHz

Returns

- ESP_OK on success
- other error codes may be returned in the future

esp_err_t **sdspi_host_deinit** (void)

Release resources allocated using sdspi_host_init.

Note: This function is not thread safe

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

esp_err_t **sdspi_host_io_int_enable** (*sdspi_dev_handle_t* handle)

Enable SDIO interrupt.

Parameters **handle** –Handle of the sdspi device

Returns

- ESP_OK on success

esp_err_t **sdspi_host_io_int_wait** (*sdspi_dev_handle_t* handle, TickType_t timeout_ticks)

Wait for SDIO interrupt until timeout.

Parameters

- **handle** –Handle of the sdspi device
- **timeout_ticks** –Ticks to wait before timeout.

Returns

- ESP_OK on success

Structures

struct **sdspi_device_config_t**

Extra configuration for SD SPI device.

Public Members

spi_host_device_t **host_id**

SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t **gpio_cs**

GPIO number of CS signal.

gpio_num_t **gpio_cd**

GPIO number of card detect signal.

gpio_num_t **gpio_wp**

GPIO number of write protect signal.

gpio_num_t **gpio_int**

GPIO number of interrupt line (input) for SDIO card.

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT()

Default *sdmmc_host_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an *sdspi* device initialized by *sdspi_host_init_device()*.

SDSPI_SLOT_NO_CS

indicates that card select line is not used

SDSPI_SLOT_NO_CD

indicates that card detect line is not used

SDSPI_SLOT_NO_WP

indicates that write protect line is not used

SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT()

Macro defining default configuration of SD SPI device.

Type Definitions

typedef int **sdspi_dev_handle_t**

Handle representing an SD SPI device.

2.6.16 Sigma-Delta Modulation (SDM)

Introduction

ESP32-C3 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.¹

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- *Resource Allocation* - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- *Enable and Disable Channel* - covers how to enable and disable the channel.

¹ Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter [GPIO and IOMUX](#) in ESP32-C3 Technical Reference Manual for more details. The driver won't forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. *sdm_new_channel()*).

- *Set Equivalent Duty Cycle* - describes how to set the equivalent duty cycle of the PDM pulses.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - lists which functions are supposed to work even when the cache is disabled.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don't need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

Creating a SDM Channel with Sample Rate of 1MHz

```
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from **init** to **enable**
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also *Power management* for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the **init** state and release the power management lock.

Set Equivalent Duty Cycle For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$. Thus the range of the `duty` input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal's duty will be about 50%.

Power Management When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

IRAM Safe There's a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

Thread Safety The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don't have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following [Sallen-Key topology Low Pass Filter](#) as a reference.

Application Example

- LED driven by a GPIO that is modulated with Sigma-Delta: [peripherals/sigma_delta](#).

API Reference

Header File

- `components/driver/include/driver/sdm.h`

Fig. 16: Sallen-Key Low Pass Filter

Functions

`esp_err_t sdm_new_channel` (const `sdm_config_t` *config, `sdm_channel_handle_t` *ret_chan)

Create a new Sigma Delta channel.

Parameters

- **config** –[in] SDM configuration
- **ret_chan** –[out] Returned SDM channel handle

Returns

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

`esp_err_t sdm_del_channel` (`sdm_channel_handle_t` chan)

Delete the Sigma Delta channel.

Parameters **chan** –[in] SDM channel created by `sdm_new_channel`

Returns

- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

`esp_err_t sdm_channel_enable` (`sdm_channel_handle_t` chan)

Enable the Sigma Delta channel.

Note: This function will transit the channel state from init to enable.

Note: This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the

sdm_config_t, while `CONFIG_PM_ENABLE` is enabled.

Parameters `chan` –[in] SDM channel created by `sdm_new_channel`

Returns

- `ESP_OK`: Enable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Enable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable SDM channel failed because the channel is already enabled
- `ESP_FAIL`: Enable SDM channel failed because of other error

esp_err_t `sdm_channel_disable` (*sdm_channel_handle_t* chan)

Disable the Sigma Delta channel.

Note: This function will do the opposite work to the `sdm_channel_enable()`

Parameters `chan` –[in] SDM channel created by `sdm_new_channel`

Returns

- `ESP_OK`: Disable SDM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable SDM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable SDM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable SDM channel failed because of other error

esp_err_t `sdm_channel_set_duty` (*sdm_channel_handle_t* chan, *int8_t* duty)

Set the duty cycle of the PDM output signal.

Note: For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$

Note: If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around (`sample_rate_hz / 4`).

Note: The duty is proportional to the equivalent output voltage after a low-pass-filter.

Note: This function is allowed to run within ISR context

Note: This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

Parameters

- `chan` –[in] SDM channel created by `sdm_new_channel`
- `duty` –[in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

Returns

- `ESP_OK`: Set duty cycle successfully
- `ESP_ERR_INVALID_ARG`: Set duty cycle failed because of invalid argument
- `ESP_FAIL`: Set duty cycle failed because of other error

Structures

struct **sdm_config_t**

Sigma Delta channel configuration.

Public Members

int **gpio_num**

GPIO number

sdm_clock_source_t **clk_src**

Clock source

uint32_t **sample_rate_hz**

Sample rate in Hz, it determines how frequent the modulator outputs a pulse

uint32_t **invert_out**

Whether to invert the output signal

uint32_t **io_loop_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *sdm_config_t*::[anonymous] **flags**

Extra flags

Type Definitions

typedef struct sdm_channel_t ***sdm_channel_handle_t**

Type of Sigma Delta channel handle.

Header File

Type Definitions

typedef *soc_periph_sdm_clk_src_t* **sdm_clock_source_t**

2.6.17 SPI Master Driver

SPI Master driver is a program that controls ESP32-C3's SPI peripherals while they function as masters.

Overview of ESP32-C3's SPI peripherals

ESP32-C3 integrates 3 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C3's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral inside ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
De-vice	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
QUADHD	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
DATA4	Data4 signal in Octal/OPI mode.
DATA5	Data5 signal in Octal/OPI mode.
DATA6	Data6 signal in Octal/OPI mode.
DATA7	Data7 signal in Octal/OPI mode.
As- ser- tion	The action of activating a line.
De- asser- tion	The action of returning the line back to inactive (back to idle) status.
Trans- ac- tion	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

Warning: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using [xSemaphoreCreateMutex](#).

SPI Features

SPI Master

SPI Bus Lock To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after device releases the lock. No devices on SPI1 is allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled.
The SPI Master driver hasn't supported SPI1 bus. Only SPI Flash driver can attach to the bus.
- For other buses, the driver may register its ISR as the BG. When a device task requests for exclusive use of the bus, the bus lock will block the task and try to disable ISR. After ISR is successfully disabled, the bus lock will then unblock the device task and allow it to exclusively use the bus. When the task releases the lock, the lock will also try to resume ISR if there are pending transactions in ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
Com-mand	In this phase, a command (0-16 bit) is written to the bus by the Host.
Ad-dress	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
Write	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
Dummy	This phase is configurable and is used to meet the timing requirements.
Read	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

Interrupt Transactions Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

Polling Transactions Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

Transaction Line Mode Supported line modes for ESP32-C3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	<code>SPI_TRANS_MODE_DIO</code>	<code>SPICOMMON_BUSFLAG_DUAL</code>
Dual I/O	1	2	2	<code>SPI_TRANS_MODE_DIO</code> <code>SPI_TRANS_MULTILINE_ADDR</code>	
Quad Output	1	1	4	<code>SPI_TRANS_MODE_QIO</code>	<code>SPICOMMON_BUSFLAG_QUAD</code>
Quad I/O	1	4	4	<code>SPI_TRANS_MODE_QIO</code> <code>SPI_TRANS_MULTILINE_ADDR</code>	

Command and Address Phases During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or

`SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see [Transaction Line Mode](#).

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in [Transaction Line Mode](#).

Note: Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
 - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
 - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi_master](#) directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-C3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 μs.
- Interrupt Transaction via CPU: 27 μs.
- Polling Transaction via DMA: 10 μs.
- Polling Transaction via CPU: 9 μs.

SPI Clock Frequency Transferring each byte takes eight times the clock period $8/f_{spi}$.

Cache Miss The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select [CONFIG_SPI_MASTER_IN_IRAM](#) to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz]$ [us] for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable [CONFIG_SPI_MASTER_ISR_IN_IRAM](#) and set [ESP_INTR_FLAG_IRAM](#) in the member [spi_bus_config_t::intr_flags](#). In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi_master/hd_eeprom](#) directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- [components/hal/include/hal/spi_types.h](#)

Structures

struct **spi_line_mode_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t **cmd_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t **addr_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8_t **data_lines**

The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum **spi_host_device_t**

Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator **SPI1_HOST**

SPI1.

enumerator **SPI2_HOST**

SPI2.

enumerator **SPI_HOST_MAX**

invalid host value

enum **spi_clock_source_t**

Values:

enumerator **SPI_CLK_APB**

Select APB as the source clock.

enumerator **SPI_CLK_XTAL**

Select XTAL as the source clock.

enum **spi_event_t**

SPI Events.

Values:

enumerator **SPI_EV_BUF_TX**

The buffer has sent data to master.

enumerator **SPI_EV_BUF_RX**

The buffer has received data from master.

enumerator **SPI_EV_SEND_DMA_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI_EV_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI_EV_RECV_DMA_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**

Received CMD9 from master.

enumerator **SPI_EV_CMDA**

Received CMDA from master.

enumerator **SPI_EV_TRANS**

A transaction has done.

enum **spi_command_t**

SPI command.

Values:

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

Header File

Functions

`esp_err_t spi_bus_initialize` (`spi_host_device_t` host_id, const `spi_bus_config_t` *bus_config, `spi_dma_chan_t` dma_chan)

Initialize a SPI bus.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host_id** –SPI peripheral that controls this bus
- **bus_config** –Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

`esp_err_t spi_bus_free` (`spi_host_device_t` host_id)

Free a SPI bus.

Warning: In order for this to succeed, all devices have to be removed first.

Parameters **host_id** –SPI peripheral to free

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

Structures

struct `spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi_bus_config_t* referring to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int **mosi_io_num**

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int **data0_io_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso_io_num**

GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int **data1_io_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk_io_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp_io_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2_io_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd_io_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3_io_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4_io_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5_io_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6_io_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7_io_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32_t flags

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int intr_flags

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros**SPI_MAX_DMA_LEN****SPI_SWAP_DATA_TX** (DATA, LEN)

Transform unsigned integer of length ≤ 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

Parameters

- **DATA** –Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)

Transform received data of length ≤ 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA** –Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** –Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE

Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER

Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK

Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO

Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI

Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

SPICOMMON_BUSFLAG_OCTAL

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

SPICOMMON_BUSFLAG_NATIVE_PINS**Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

Enumerations

```
enum spi_common_dma_t
```

SPI DMA channels.

Values:

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master**Header File**

- [components/driver/include/driver/spi_master.h](#)

Functions

esp_err_t **spi_bus_add_device** (*spi_host_device_t* host_id, const *spi_device_interface_config_t* *dev_config, *spi_device_handle_t* *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note: While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Parameters

- **host_id** –SPI peripheral to allocate device on
- **dev_config** –SPI interface protocol config for the device
- **handle** –Pointer to variable to hold the device handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn't have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

esp_err_t **spi_bus_remove_device** (*spi_device_handle_t* handle)

Remove a device from the SPI bus.

Parameters **handle** –Device handle to free

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

esp_err_t **spi_device_queue_trans** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

esp_err_t **spi_device_get_trans_result** (*spi_device_handle_t* handle, *spi_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

esp_err_t **spi_device_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t **spi_device_polling_start** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc, `TickType_t` ticks_to_wait)

Immediately start a polling transaction.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute
- **ticks_to_wait** –Ticks to wait until there's room in the queue; currently only `portMAX_DELAY` is supported.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

esp_err_t **spi_device_polling_end** (*spi_device_handle_t* handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

esp_err_t **spi_device_polling_transmit** (*spi_device_handle_t* handle, *spi_transaction_t* *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters

- **handle** –Device handle obtained using `spi_host_add_dev`
- **trans_desc** –Description of transaction to execute

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions of same device are not finished
- `ESP_OK` on success

esp_err_t **spi_device_acquire_bus** (*spi_device_handle_t* device, TickType_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

Note: The function will wait until all the existing transactions have been sent.

Parameters

- **device** –The device to occupy the bus.
- **wait** –Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

Returns

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi_device_release_bus** (*spi_device_handle_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters **dev** –The device to release the bus.

int **spi_get_actual_clock** (int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

Parameters

- **apb** –The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** –Desired working frequency
- **duty_cycle** –Duty cycle of the spi clock

Returns Actual working frequency that most fit.

```
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int
                    *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

Note: If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters

- **gpio_is_used** –True if using GPIO matrix, or False if iomux pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.
- **eff_clk** –Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy_o** –Address of dummy bits used output. Set to NULL if not needed.
- **cycles_remain_o** –Address of cycles remaining (after dummy bits are used) output.
 - -1 If too many cycles remaining, suggest to compensate half a clock.
 - 0 If no remaining cycles or dummy bits are not used.
 - positive value: cycles suggest to compensate.

```
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Parameters

- **gpio_is_used** –True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** –Input delay from SCLK launch edge to MISO data valid.

Returns Frequency limit of current configurations.

```
esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)
```

Get max length (in bytes) of one transaction.

Parameters

- **host_id** –SPI peripheral
- **max_bytes** –[out] Max length of one transaction, in bytes

Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

Structures

```
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

```
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t dummy_bits

Amount of dummy bits to insert between address and data phase.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz

Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

int input_delay_ns

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

int spics_io_num

CS GPIO pin for this device, or -1 if not used.

uint32_t flags

Bitwise OR of `SPI_DEVICE_*` flags.

int queue_size

Transaction queue size. This sets how many transactions can be 'in the air' (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

***transaction_cb_t* pre_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

***transaction_cb_t* post_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct spi_transaction_t

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members**uint32_t flags**

Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd

Command data, of which the length is set in the `command_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr

Address data, of which the length is set in the `address_bits` of *spi_device_interface_config_t*.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length

Total data length, in bits.

size_t rxlength

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void *user

User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct *spi_transaction_t* **base**

Transaction data, so that pointer to *spi_transaction_t* can be converted into *spi_transaction_ext_t*.

uint8_t **command_bits**

The command length in this transaction, in bits.

uint8_t **address_bits**

The address length in this transaction, in bits.

uint8_t **dummy_bits**

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz). 8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_DEVICE_3WIRE

Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS

Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX

Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS

Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK**SPI_TRANS_MODE_DIO**

Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO

Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA

Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA

Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR

Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD

Use the `command_bits` in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

SPI_TRANS_VARIABLE_ADDR

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_VARIABLE_DUMMY

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

SPI_TRANS_CS_KEEP_ACTIVE

Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT

Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

```
typedef struct spi_transaction_t spi_transaction_t
```

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

2.6.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C3's SPI peripherals while they function as slaves.

Overview of ESP32-C3's SPI peripherals

ESP32-C3 integrates one general purpose SPI controller which can be used as a slave node driven by an off-chip SPI master. The controller is called SPI2 and has an independent signal bus with the same name.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-C3 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

Note: A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `cpp:func:spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

Speed and Timing Considerations

Transaction Interval The ESP32-C3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi_slave](#).

SCLK Frequency Requirements The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

Application Example

The code example for Device/Host communication can be found in the [peripherals/spi_slave](#) directory of ESP-IDF examples.

API Reference

Header File

- [components/driver/include/driver/spi_slave.h](#)

Functions

esp_err_t **spi_slave_initialize** (*spi_host_device_t* host, const *spi_bus_config_t* *bus_config, const *spi_slave_interface_config_t* *slave_config, *spi_dma_chan_t* dma_chan)

Initialize a SPI bus as a slave interface.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters

- **host** –SPI peripheral to use as a SPI slave interface
- **bus_config** –Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- **slave_config** –Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
 - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
 - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
 - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

esp_err_t **spi_slave_free** (*spi_host_device_t* host)

Free a SPI bus claimed as a SPI slave interface.

Parameters **host** –SPI peripheral to free

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

esp_err_t spi_slave_queue_trans (*spi_host_device_t* host, const *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Parameters

- **host** –SPI peripheral that is acting as a slave
- **trans_desc** –Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t spi_slave_get_trans_result (*spi_host_device_t* host, *spi_slave_transaction_t* **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –[out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

esp_err_t spi_slave_transmit (*spi_host_device_t* host, *spi_slave_transaction_t* *trans_desc, TickType_t ticks_to_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

Parameters

- **host** –SPI peripheral to that is acting as a slave
- **trans_desc** –Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** –Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Structures

struct **spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

Public Members

int **spics_io_num**

CS GPIO pin for this device.

uint32_t **flags**

Bitwise OR of SPI_SLAVE_* flags.

int **queue_size**

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

uint8_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

slave_transaction_cb_t **post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

slave_transaction_cb_t **post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

struct **spi_slave_transaction_t**

This structure describes one SPI transaction

Public Members

size_t **length**

Total data length, in bits.

size_t **trans_len**

Transaction data length, in bits.

const void ***tx_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

void ***rx_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

void ***user**

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

Type Definitions

```
typedef struct spi_slave_transaction_t spi_slave_transaction_t
```

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

2.6.19 Temperature Sensor

Introduction

The ESP32-C3 has a built-in sensor used to measure the chip's internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta ADC and a DAC to compensate for the temperature offset.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

predefined range (°C)	error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

Note: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The temperature value depends on factors like microcontroller clock frequency or I/O load. Generally, the chip's internal temperature might be higher than the ambient temperature.

Functional Overview

- *Resource Allocation* - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when temperature sensor finishes working.
- *Enable and Disable Temperature Sensor* - covers how to enable and disable the temperature sensor.
- *Get Temperature Value* - covers how to get the real-time temperature value.

- *Power Management* - covers how temperature sensor is affected when changing power mode (i.e. light sleep).
- *Thread Safety* - covers how to make the driver to be thread safe.

Resource Allocation The ESP32-C3 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. It would always be the parameter of the temperature APIs with the information of hardware and configurations, so user can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment (For example: if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C). Based on that, the following configuration structure should be defined in advance: `temperature_sensor_config_t`:

- `range_min`. The minimum value of testing range you have evaluated.
- `range_max`. The maximum value of testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. The user doesn't need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

Creating a Temperature Sensor Handle

- Step1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step2: Configure the range and obtain a handle

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

Get Temperature Value After the temperature sensor is enabled by `temperature_sensor_enable()`, user can get the current temperature by calling `temperature_sensor_get_celsius()`.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it's not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

Power Management When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), temperature sensor will still keep working because it uses XTAL clock (on ESP32-C3) or RTC clock (on ESP32-S2/S3).

Thread Safety In temperature sensor we don't add any protection to keep the thread safe. Because from the common usage, temperature sensor should only be called in one task. If you must use this driver in different tasks, please add extra locks to protect it.

Unexpected Behaviors

1. The value user gets from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver gives a 'the boundary you gave cannot meet the range of internal temperature sensor' error feedback. It is because the built-in temperature sensor has testing limit. The error due to setting `temperature_sensor_config_t`:
 - (1) Totally out of range, like 200 °C ~ 300 °C.
 - (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

Application Example

- Temperature sensor reading example: [peripherals/temp_sensor](#).

API Reference

Header File

- [components/driver/include/driver/temperature_sensor.h](#)

Functions

`esp_err_t temperature_sensor_install` (const `temperature_sensor_config_t` *tsens_config, `temperature_sensor_handle_t` *ret_tsens)

Install temperature sensor driver.

Parameters

- `tsens_config` –Pointer to config structure.
- `ret_tsens` –Return the pointer of temperature sensor handle.

Returns

- ESP_OK if succeed

`esp_err_t temperature_sensor_uninstall` (`temperature_sensor_handle_t` tsens)

Uninstall the temperature sensor driver.

Parameters `tsens` –The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK if succeed.

`esp_err_t temperature_sensor_enable` (`temperature_sensor_handle_t` tsens)

Enable the temperature sensor.

Parameters `tsens` –The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

`esp_err_t temperature_sensor_disable` (`temperature_sensor_handle_t` tsens)

Disable temperature sensor.

Parameters `tsens` –The handle created by `temperature_sensor_install()`.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

esp_err_t **temperature_sensor_get_celsius** (*temperature_sensor_handle_t* tsens, float *out_celsius)

Read temperature sensor data that is converted to degrees Celsius.

Note: Should not be called from interrupt.

Parameters

- **tsens** –The handle created by `temperature_sensor_install()`.
- **out_celsius** –The measure output value.

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` invalid arguments
- `ESP_ERR_INVALID_STATE` Temperature sensor is not enabled yet.
- `ESP_FAIL` Parse the sensor data into ambient temperature failed (e.g. out of the range).

Structures

struct **temperature_sensor_config_t**

Configuration of measurement range for the temperature sensor.

Note: If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc `api-reference/peripherals/Temperature sensor`.

Public Members

int **range_min**

the minimum value of the temperature you want to test

int **range_max**

the maximum value of the temperature you want to test

temperature_sensor_clk_src_t **clk_src**

the clock source of the temperature sensor.

Macros

TEMPERATURE_SENSOR_CONFIG_DEFAULT (min, max)

temperature_sensor_config_t default constructure

Type Definitions

typedef struct temperature_sensor_obj_t ***temperature_sensor_handle_t**

Type of temperature sensor driver handle.

2.6.20 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format

(11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-C3's peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- *Two-Wire Automotive Interface (TWAI)*
 - *Overview*
 - *TWAI Protocol Summary*
 - *Signals Lines and Transceiver*
 - *Driver Configuration*
 - *Driver Operation*
 - *Examples*
 - *API Reference*

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the **Transmit Error Counter (TEC)** and the **Receive Error Counter (REC)**. The two error counters are incremented and decremented according to a set of rules (where the

counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node's **error state**, namely **Error Active**, **Error Passive**, and **Bus-Off**.

Error Active: A node is Error Active when **both TEC and REC are less than 128** and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

Error Passive: A node is Error Passive when **either the TEC or REC becomes greater than or equal to 128**. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

Bus-Off: A node becomes Bus-Off when the **TEC becomes greater than or equal to 256**. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain a integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, **an external transceiver is required**. The type of external transceiver used should depend on the application's physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller's interface consists of 4 signal lines known as **TX**, **RX**, **BUS-OFF**, and **CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-C3's GPIO pads.

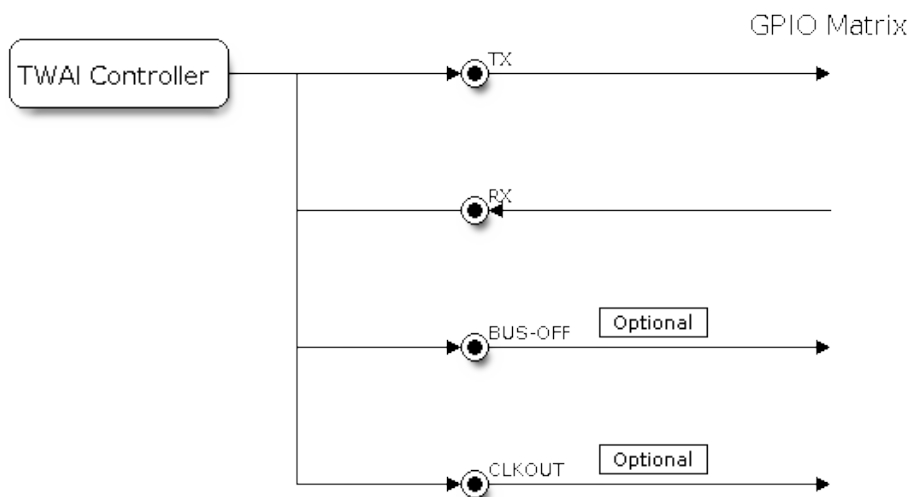

Fig. 17: Signal lines of the TWAI controller

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is **optional** and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

CLKOUT: The CLKOUT signal line is **optional** and outputs a prescaled version of the controller's source clock (APB Clock).

Note: An external transceiver **must internally loopback the TX to RX** such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

Table 5: TWAI Driver Alerts

Alert Flag	Description
TWAI_ALERT_TX_IDLE	No more messages queued for transmission
TWAI_ALERT_TX_SUCCESS	The previous transmission was successful
TWAI_ALERT_RX_DATA	A frame has been received and added to the RX queue
TWAI_ALERT_BELOW_ERR_WARN	Both error counters have dropped below error warning limit
TWAI_ALERT_ERR_ACTIVE	TWAI controller has become error active
TWAI_ALERT_RECOVERY_IN_PROGRESS	TWAI controller is undergoing bus recovery
TWAI_ALERT_BUS_RECOVERED	TWAI controller has successfully completed bus recovery
TWAI_ALERT_ARB_LOST	The previous transmission lost arbitration
TWAI_ALERT_ABOVE_ERR_WARN	One of the error counters have exceeded the error warning limit
TWAI_ALERT_BUS_ERROR	A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus
TWAI_ALERT_TX_FAILED	The previous transmission has failed
TWAI_ALERT_RX_QUEUE_FULL	The RX queue is full causing a received frame to be lost
TWAI_ALERT_ERR_PASS	TWAI controller has become error passive
TWAI_ALERT_BUS_OFF	Bus-off condition occurred. TWAI controller can no longer influence bus

Note: The TWAI controller's **error warning limit** is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the **error warning limit** to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

Note: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see *Placing ISR into IRAM*).

Note: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts

during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller's source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller's source clock (80 MHz APB clock). On the ESP32-C3, the `brp` can be **any even number from 2 to 16384**.

Fig. 18: Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

Note: Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay, node information processing time, and phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
- `TWAI_TIMING_CONFIG_100KBITS()`
- `TWAI_TIMING_CONFIG_50KBITS()`
- `TWAI_TIMING_CONFIG_25KBITS()`
- `TWAI_TIMING_CONFIG_20KBITS()`
- `TWAI_TIMING_CONFIG_16KBITS()`
- `TWAI_TIMING_CONFIG_12_5KBITS()`
- `TWAI_TIMING_CONFIG_10KBITS()`
- `TWAI_TIMING_CONFIG_5KBITS()`
- `TWAI_TIMING_CONFIG_1KBITS()`

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the

node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message's ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame's 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 19: Bit layout of single filter mode (Right side MSBit)

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID's to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 20: Bit layout of dual filter mode (Right side MSBit)

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM The TWAI driver's ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver's functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver's RX queue.
- Load messages pending transmission from the driver's TX queue and write them into the TX buffer.

To place the TWAI driver's ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 21: State transition diagram of the TWAI driver (see table below)

Label	Transition	Action/Condition
A	Uninstalled -> Stopped	<code>twai_driver_install()</code>
B	Stopped -> Uninstalled	<code>twai_driver_uninstall()</code>
C	Stopped -> Running	<code>twai_start()</code>
D	Running -> Stopped	<code>twai_stop()</code>
E	Running -> Bus-Off	Transmit Error Counter \geq 256
F	Bus-Off -> Uninstalled	<code>twai_driver_uninstall()</code>
G	Bus-Off -> Recovering	<code>twai_initiate_recovery()</code>
H	Recovering -> Stopped	128 occurrences of 11 consecutive recessive bits.

Driver States **Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

Stopped: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

Running: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

Bus-Off: The bus-off state is automatically entered when the TWAI controller's Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

Message Flag	Description
TWAI_MSG_FLAG_EXTD	Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR	Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS	Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF	Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON	Message's Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE	Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_
    ↪NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Message Transmission The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"

...
```

(continues on next page)

(continued from previous page)

```

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

```

Message Reception The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```

#include "driver/twai.h"

...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

```

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```

#include "driver/twai.h"

...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

```

(continues on next page)

(continued from previous page)

```

}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

```

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```

#include "driver/twai.h"

...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}

```

Multiple ID Filter Configuration The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```

ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101

```

Application Examples **Network Example:** The TWAI Network example demonstrates communication between two ESP32-C3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via [peripherals/twai/twai_network](#).

Alert and Recovery Example: This example demonstrates how to use the TWAI driver's alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via [peripherals/twai/twai_alert_and_recovery](#).

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via [peripherals/twai/twai_self_test](#).

API Reference

Header File

- [components/hal/include/hal/twai_types.h](#)

Structures

struct **twai_message_t**

Structure to store a TWAI message.

Note: The flags member is deprecated

Public Members

uint32_t **extd**

Extended Frame Format (29bit ID)

uint32_t **rtr**

Message is a Remote Frame

uint32_t **ss**

Transmit as a Single Shot Transmission. Unused for received.

uint32_t **self**

Transmit as a Self Reception Request. Unused for received.

uint32_t **dlc_non_comp**

Message's Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t **reserved**

Reserved bits

uint32_t **flags**

Deprecated: Alternate way to set bits using message flags

uint32_t **identifier**

11 or 29 bit identifier

uint8_t **data_length_code**

Data length code

uint8_t **data**[TWAI_FRAME_MAX_DLC]

Data bytes (not relevant in RTR frame)

struct **twai_timing_config_t**

Structure for bit timing configuration of the TWAI driver.

Note: Macro initializers are available for this structure

Public Members

uint32_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note: Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK

Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC

Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES

EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES

SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH

Error counter threshold for error passive

Enumerationsenum **twai_mode_t**

TWAI Controller operating modes.

Values:

enumerator **TWAI_MODE_NORMAL**

Normal operating mode where TWAI controller can send/receive/acknowledge messages

enumerator **TWAI_MODE_NO_ACK**

Transmission does not require acknowledgment. Use this mode for self testing

enumerator **TWAI_MODE_LISTEN_ONLY**

The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- [components/driver/include/driver/twai.h](#)

Functions

esp_err_t twai_driver_install (const *twai_general_config_t* *g_config, const *twai_timing_config_t* *t_config, const *twai_filter_config_t* *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note: Macro initializers are available for the configuration structures (see documentation)

Note: To reinstall the TWAI driver, call `twai_driver_uninstall()` first

Parameters

- **g_config** –[in] General configuration structure
- **t_config** –[in] Timing configuration structure
- **f_config** –[in] Filter configuration structure

Returns

- **ESP_OK**: Successfully installed TWAI driver
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_NO_MEM**: Insufficient memory
- **ESP_ERR_INVALID_STATE**: Driver is already installed

esp_err_t **twai_driver_uninstall** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning: The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Returns

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t **twai_start** (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Returns

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t **twai_stop** (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Returns

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t **twai_transmit** (const *twai_message_t* *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note: This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Parameters

- **message** –[in] Message to transmit
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block on the TX queue

Returns

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

esp_err_t twai_receive (*twai_message_t* *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning: The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters

- **message** –[out] Received message
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block on RX queue

Returns

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

Note: Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Parameters

- **alerts** –[out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** –[in] Number of FreeRTOS ticks to block for alert

Returns

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Parameters

- **alerts_enabled** –[in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** –[out] Bit field of currently raised alerts. Set to NULL if unused

Returns

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_initiate_recovery** (void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Returns

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t **twai_get_status_info** (*twai_status_info_t* *status_info)

Get current status information of the TWAI driver.

Parameters *status_info* –[out] Status information

Returns

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t **twai_clear_transmit_queue** (void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

Note: The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

esp_err_t **twai_clear_receive_queue** (void)

Clear the receive queue.

This function will clear the receive queue of all messages.

Note: The receive queue is automatically cleared when `twai_start()` is called.

Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

struct **twai_general_config_t**

Structure for general configuration of the TWAI driver.

Note: Macro initializers are available for this structure

Public Members

twai_mode_t mode

Mode of TWAI controller

gpio_num_t tx_io

Transmit GPIO number

gpio_num_t rx_io

Receive GPIO number

gpio_num_t clkout_io

CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io

Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t tx_queue_len

Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t rx_queue_len

Number of messages RX queue can hold

uint32_t alerts_enabled

Bit field of alerts to enable (see documentation)

uint32_t clkout_divider

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags

Interrupt flags to set the priority of the driver' s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t

Structure to store status information of TWAI driver.

Public Members

twai_state_t state

Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx

Number of messages queued for transmission or awaiting transmission completion

uint32_t **msgs_to_rx**

Number of messages in RX queue waiting to be read

uint32_t **tx_error_counter**

Current value of Transmit Error Counter

uint32_t **rx_error_counter**

Current value of Receive Error Counter

uint32_t **tx_failed_count**

Number of messages that failed transmissions

uint32_t **rx_missed_count**

Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t **rx_overrun_count**

Number of messages that were lost due to a RX FIFO overrun

uint32_t **arb_lost_count**

Number of instances arbitration was lost

uint32_t **bus_error_count**

Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED

Marks GPIO as unused in TWAI configuration

Enumerations

enum **twai_state_t**

TWAI driver states.

Values:

enumerator **TWAI_STATE_STOPPED**

Stopped state. The TWAI controller will not participate in any TWAI bus activities

enumerator **TWAI_STATE_RUNNING**

Running state. The TWAI controller can transmit and receive messages

enumerator **TWAI_STATE_BUS_OFF**

Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

enumerator **TWAI_STATE_RECOVERING**

Recovering state. The TWAI controller is undergoing bus recovery

2.6.21 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C3 chip has two UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32-C3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. *Setting Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Setting Communication Pins* - Assigning pins for connection to a device.
3. *Driver Installation* - Allocating ESP32-C3's resources for the UART driver.
4. *Running UART Communication* - Sending / receiving data
5. *Using Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Setting Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart_echo](#).

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 6: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

Driver Installation Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Running UART Communication Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

Transmitting After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-C3 Technical Reference Manual > UART Controller*

(UART) > *UART Interrupts and UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Driver Installation*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
 - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
 - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
 - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the 'pattern') added at the end of the command string. The following functions are available:
 - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
 - Disable the interrupt using `uart_disable_pattern_det_intr()`

Macros The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

Note: The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-C3 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C3's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is

supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32-C3's RS485 interface connection.

Note:

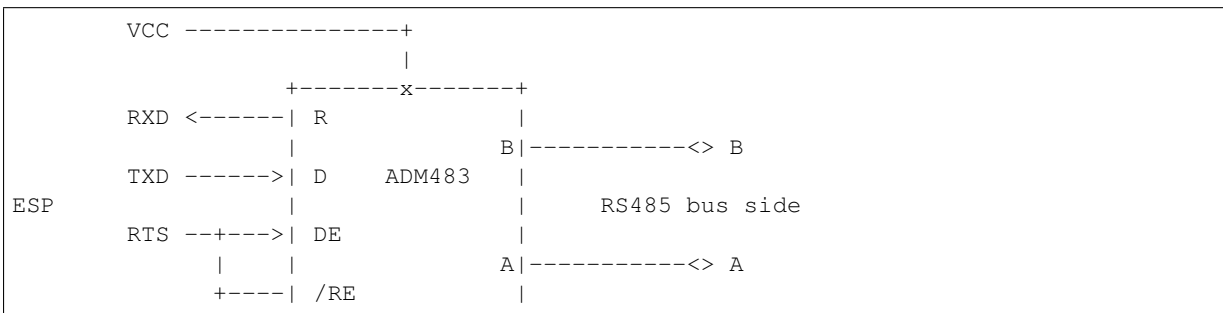

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

(continues on next page)

(continued from previous page)

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
peripherals/uart/uart_echo	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
peripherals/uart/uart_events	Reporting various communication events, using pattern detection interrupts.
peripherals/uart/uart_async_rxtxtasks	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
peripherals/uart/uart_select	Using synchronous I/O multiplexing for UART file descriptors.
peripherals/uart/uart_echo_rs485	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to peripherals/uart/uart_echo but allows communication through an RS485 interface chip connected to ESP32-C3 pins.
peripherals/uart/nmea0183_parser	Obtaining GPS information by parsing NMEA0183 statements received from GPS via the UART peripheral.

API Reference

Header File

- [components/driver/include/driver/uart.h](#)

Functions

esp_err_t **uart_driver_install** (*uart_port_t* uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, *QueueHandle_t* *uart_queue, int intr_alloc_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

Note: Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** –UART RX ring buffer size.
- **tx_buffer_size** –UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** –UART event queue size/depth.
- **uart_queue** –UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver's ISR handler is not located in IRAM)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_driver_delete** (*uart_port_t* uart_num)

Uninstall UART driver.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

bool **uart_is_driver_installed** (*uart_port_t* uart_num)

Checks whether the driver is installed or not.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- true driver is installed
- false driver is not installed

esp_err_t **uart_set_word_length** (*uart_port_t* uart_num, *uart_word_length_t* data_bit)

Set UART data bits.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** –UART data bits

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_word_length** (*uart_port_t* uart_num, *uart_word_length_t* *data_bit)

Get the UART data bit configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

- **data_bit** –Pointer to accept value of UART data bits.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

esp_err_t **uart_set_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* stop_bits)

Set UART stop bits.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –UART stop bits

Returns

- ESP_OK Success
- ESP_FAIL Fail

esp_err_t **uart_get_stop_bits** (*uart_port_t* uart_num, *uart_stop_bits_t* *stop_bits)

Get the UART stop bit configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits** –Pointer to accept value of UART stop bits.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

esp_err_t **uart_set_parity** (*uart_port_t* uart_num, *uart_parity_t* parity_mode)

Set UART parity mode.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –the enum of uart parity configuration

Returns

- ESP_FAIL Parameter error
- ESP_OK Success

esp_err_t **uart_get_parity** (*uart_port_t* uart_num, *uart_parity_t* *parity_mode)

Get the UART parity mode configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **parity_mode** –Pointer to accept value of UART parity mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

esp_err_t **uart_get_sclk_freq** (*uart_sclk_t* sclk, uint32_t *out_freq_hz)

Get the frequency of a clock source for the UART.

Parameters

- **sclk** –Clock source
- **out_freq_hz** –[out] Output of frequency, in Hz

Returns

- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

esp_err_t **uart_set_baudrate** (*uart_port_t* uart_num, uint32_t baudrate)

Set UART baud rate.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –UART baud rate.

Returns

- ESP_FAIL Parameter error

- ESP_OK Success

esp_err_t **uart_get_baudrate** (*uart_port_t* uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **baudrate** –Pointer to accept value of UART baud rate

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

esp_err_t **uart_set_line_inverse** (*uart_port_t* uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **inverse_mask** –Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Hardware flow control mode
- **rx_thresh** –Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_sw_flow_ctrl** (*uart_port_t* uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

Parameters

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable** –switch on or off
- **rx_thresh_xon** –low water mark
- **rx_thresh_xoff** –high water mark

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_hw_flow_ctrl** (*uart_port_t* uart_num, *uart_hw_flowcontrol_t* *flow_ctrl)

Get the UART hardware flow control configuration.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** –Option for different flow control mode.

Returns

- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t **uart_clear_intr_status** (*uart_port_t* uart_num, uint32_t clr_mask)

Clear UART interrupt status.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** –Bit mask of the interrupt status to be cleared.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_intr_mask** (*uart_port_t* uart_num, uint32_t enable_mask)

Set UART interrupt enable.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** –Bit mask of the enable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_intr_mask** (*uart_port_t* uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** –Bit mask of the disable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_rx_intr** (*uart_port_t* uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_rx_intr** (*uart_port_t* uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_disable_tx_intr** (*uart_port_t* uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters **uart_num** –UART port number

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_tx_intr** (*uart_port_t* uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** –1: enable; 0: disable
- **thresh** –Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_set_pin** (*uart_port_t* uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)

Assign signals of a UART peripheral to GPIO pins.

Note: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **tx_io_num** –UART TX pin GPIO number.
- **rx_io_num** –UART RX pin GPIO number.
- **rts_io_num** –UART RTS pin GPIO number.
- **cts_io_num** –UART CTS pin GPIO number.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_rts` (*uart_port_t* uart_num, int level)

Manually set the UART RTS pin level.

Note: UART must be configured with hardware flow control disabled.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: RTS output low (active); 0: RTS output high (block)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_dtr` (*uart_port_t* uart_num, int level)

Manually set the UART DTR pin level.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **level** –1: DTR output low; 0: DTR output high

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t `uart_set_tx_idle_num` (*uart_port_t* uart_num, uint16_t idle_num)

Set UART idle interval after tx FIFO is empty.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** –idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

Returns

- ESP_OK Success

- ESP_FAIL Parameter error

esp_err_t **uart_param_config** (*uart_port_t* uart_num, const *uart_config_t* *uart_config)

Set UART configuration parameters.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** –UART parameter settings

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_intr_config** (*uart_port_t* uart_num, const *uart_intr_config_t* *intr_conf)

Configure UART interrupts.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** –UART interrupt settings

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_wait_tx_done** (*uart_port_t* uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** –Timeout, count in RTOS ticks

Returns

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

int **uart_tx_chars** (*uart_port_t* uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note: This function should only be used when UART TX buffer is not enabled.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** –data buffer address
- **len** –data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes** (*uart_port_t* uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address

- **size** –data length to send

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_write_bytes_with_break** (*uart_port_t* uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx_buffer_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx_buffer_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **src** –data buffer address
- **size** –data length to send
- **brk_len** –break signal duration(unit: the time it takes to send one bit at current baudrate)

Returns

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart_read_bytes** (*uart_port_t* uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **buf** –pointer to the buffer.
- **length** –data length
- **ticks_to_wait** –sTimeout, count in RTOS ticks

Returns

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

esp_err_t **uart_flush** (*uart_port_t* uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_flush_input** (*uart_port_t* uart_num)

Clear input buffer, discard all the data is in the ring-buffer.

Note: In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_buffered_data_len** (*uart_port_t* uart_num, size_t *size)

UART get RX ring buffer cached data length.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of size_t to accept cached data length

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_get_tx_buffer_free_size** (*uart_port_t* uart_num, size_t *size)

UART get TX ring buffer free space size.

Parameters

- **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).
- **size** –Pointer of size_t to accept the free space size

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_disable_pattern_det_intr** (*uart_port_t* uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

Parameters **uart_num** –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

esp_err_t **uart_enable_pattern_det_baud_intr** (*uart_port_t* uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

Parameters

- **uart_num** –UART port number.
- **pattern_chr** –character of the pattern.
- **chr_num** –number of the character, 8bit value.
- **chr_tout** –timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** –idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** –idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

int **uart_pattern_pop_pos** (*uart_port_t* uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`int uart_pattern_get_pos (uart_port_t uart_num)`

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos` It is the application' s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)`

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters

- `uart_num` –UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` –Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

`esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)`

UART set communication mode.

Note: This function must be executed after `uart_driver_install()`, when the driver object is initialized.

Parameters

- `uart_num` –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` –UART UART mode to set

Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

esp_err_t **uart_set_rx_full_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold value for RX fifo full.

Note: If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Parameters

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** –Threshold value above which RX fifo full interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_tx_empty_threshold** (*uart_port_t* uart_num, int threshold)

Set uart threshold values for TX fifo empty.

Parameters

- **uart_num** –UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** –Threshold value below which TX fifo empty interrupt is generated

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_set_rx_timeout** (*uart_port_t* uart_num, const uint8_t tout_thresh)

UART set threshold timeout for TOUT feature.

Parameters

- **uart_num** –Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** –This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

esp_err_t **uart_get_collision_flag** (*uart_port_t* uart_num, bool *collision_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Parameters

- **uart_num** –Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** –Pointer to variable of type bool to return collision flag.

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

esp_err_t **uart_set_wakeup_threshold** (*uart_port_t* uart_num, int wakeup_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set `wakeup_threshold=3`.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select `UART_SCLK_REF_TICK` or `UART_SCLK_XTAL` as UART clock source in [uart_config_t::source_clk](#).

Note: in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as `function_1` to wake up UART0, GPIO9 should be configured as `function_5` to wake up UART1), UART2 does not support light sleep wakeup feature.

Parameters

- **uart_num** –UART number, the max port number is (`UART_NUM_MAX -1`).
- **wakeup_threshold** –number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `uart_num` is incorrect or `wakeup_threshold` is outside of [3, 0x3ff] range.

esp_err_t **uart_get_wakeup_threshold** (*uart_port_t* uart_num, int *out_wakeup_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Parameters

- **uart_num** –UART number, the max port number is (`UART_NUM_MAX -1`).
- **out_wakeup_threshold** –[out] output, set to the current value of wakeup threshold for the given UART.

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if `out_wakeup_threshold` is NULL

esp_err_t **uart_wait_tx_idle_polling** (*uart_port_t* uart_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

Parameters **uart_num** –UART number

esp_err_t **uart_set_loop_back** (*uart_port_t* uart_num, bool loop_back_en)

Configure TX signal loop back to RX module, just for the test usage.

•

Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver not installed

Parameters

- **uart_num** –UART number
- **loop_back_en** –Set ture to enable the loop back function, else set it false.

void **uart_set_always_rx_timeout** (*uart_port_t* uart_num, bool always_rx_timeout_en)

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- **uart_num** –UART number
- **always_rx_timeout_en** –Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

struct **uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

uint32_t **intr_enable_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8_t **rx_timeout_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t **txfifo_empty_intr_thresh**

UART TX empty interrupt threshold.

uint8_t **rxfifo_full_thresh**

UART RX full interrupt threshold.

struct **uart_event_t**

Event structure used in UART event queue.

Public Members

uart_event_type_t **type**

UART event type

size_t **size**

UART data size for `UART_DATA` event

bool **timeout_flag**

UART data read timeout flag for `UART_DATA` event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_NUM_0

UART port 0

UART_NUM_1

UART port 1

UART_NUM_MAX

UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN

Length of the UART HW FIFO.

UART_BITRATE_MAX

Maximum configurable bitrate.

Type Definitions

typedef *intr_handle_t* **uart_isr_handle_t**

Enumerations

enum **uart_event_type_t**

UART event types used in the ring buffer.

Values:

enumerator **UART_DATA**

UART data event

enumerator **UART_BREAK**

UART break event

enumerator **UART_BUFFER_FULL**

UART RX buffer full event

enumerator **UART_FIFO_OVF**

UART FIFO overflow event

enumerator **UART_FRAME_ERR**

UART RX frame error event

enumerator **UART_PARITY_ERR**

UART RX parity event

enumerator **UART_DATA_BREAK**

UART TX data and break event

enumerator **UART_PATTERN_DET**

UART pattern detected

enumerator **UART_WAKEUP**

UART wakeup event

enumerator **UART_EVENT_MAX**

UART event max index

Header File

- [components/hal/include/hal/uart_types.h](#)

Structures

struct **uart_at_cmd_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t **cmd_char**

UART AT cmd char

uint8_t **char_num**

AT cmd char repeat number

uint32_t **gap_tout**

gap time(in baud-rate) between AT cmd char

uint32_t **pre_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32_t **post_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**

UART software flow control configuration parameters.

Public Members

uint8_t **xon_char**

Xon flow control char

uint8_t **xoff_char**

Xoff flow control char

uint8_t **xon_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t **xoff_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct **uart_config_t**

UART configuration parameters for uart_param_config function.

Public Members

int **baud_rate**

UART baud rate

uart_word_length_t **data_bits**

UART byte size

uart_parity_t **parity**

UART parity mode

uart_stop_bits_t **stop_bits**

UART stop bits

uart_hw_flowcontrol_t **flow_ctrl**

UART HW flow control mode (cts/rts)

uint8_t **rx_flow_ctrl_thresh**

UART HW RTS threshold

uart_sclk_t **source_clk**

UART source clock selection

Type Definitions

typedef int **uart_port_t**

UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

typedef *soc_periph_uart_clk_src_legacy_t* **uart_sclk_t**

UART source clock.

Enumerations

enum **uart_mode_t**

UART mode selection.

Values:

enumerator **UART_MODE_UART**

mode: regular UART mode

enumerator **UART_MODE_RS485_HALF_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART_MODE_IRDA**

mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**

UART word length constants.

Values:

enumerator **UART_DATA_5_BITS**

word length: 5bits

enumerator **UART_DATA_6_BITS**

word length: 6bits

enumerator **UART_DATA_7_BITS**

word length: 7bits

enumerator **UART_DATA_8_BITS**

word length: 8bits

enumerator **UART_DATA_BITS_MAX**

enum **uart_stop_bits_t**

UART stop bits number.

Values:

enumerator **UART_STOP_BITS_1**

stop bit: 1bit

enumerator **UART_STOP_BITS_1_5**

stop bit: 1.5bits

enumerator **UART_STOP_BITS_2**

stop bit: 2bits

enumerator **UART_STOP_BITS_MAX**

enum **uart_parity_t**

UART parity constants.

Values:

enumerator **UART_PARITY_DISABLE**

Disable UART parity

enumerator **UART_PARITY_EVEN**

Enable UART even parity

enumerator **UART_PARITY_ODD**

Enable UART odd parity

enum **uart_hw_flowcontrol_t**

UART hardware flow control modes.

Values:

enumerator **UART_HW_FLOWCTRL_DISABLE**

disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**

enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**

enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**

enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**

UART signal bit map.

Values:

enumerator **UART_SIGNAL_INV_DISABLE**

Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**

inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**

inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**

inverse the UART rxd signal

enumerator **UART_SIGNAL_CTS_INV**

inverse the UART cts signal

enumerator **UART_SIGNAL_DSR_INV**

inverse the UART dsr signal

enumerator **UART_SIGNAL_TXD_INV**

inverse the UART txd signal

enumerator **UART_SIGNAL_RTS_INV**

inverse the UART rts signal

enumerator **UART_SIGNAL_DTR_INV**

inverse the UART dtr signal

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

Note: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is `UART_NUM_0`). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- [components/soc/esp32c3/include/soc/uart_channel.h](#)

Macros

`UART_GPIO21_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO20_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_TXD_GPIO21_DIRECT_CHANNEL`

`UART_RXD_GPIO20_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses `kconfiglib` which is a Python-based extension to the `Kconfig` system which provides a compile-time project configuration mechanism. `Kconfig` is based around options of several types: integer, string, boolean. `Kconfig` files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see `Kconfig` and `kconfiglib` extentions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sd-kconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

2.7.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for `git`). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see *Custom `sdkconfig` defaults*.

2.7.4 `Kconfig` Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

Format checker

`tools/ci/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example,

indentations will be corrected if there isn't some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.7.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.make`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. *Deprecated options and their replacements* are automatically generated by `confgen.py`.

2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from `Kconfig` files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

`CONFIG_APP_BUILD_TYPE`

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the `.elf` file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A `gdbinit` file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main th
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in `tools/test_apps/system/gdb_loadable_elf/`

Recommended `sdkconfig.defaults` for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (`APP_BUILD_TYPE_APP_2NDBOOT`)
- ELF file, loadable into RAM (EXPERIMENTAL)) (`APP_BUILD_TYPE_ELF_RAM`)

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: [Build type](#)

If enabled, all date, time, and path information would be eliminated. A `.gdbinit` file would be create automatically. (or will be append if you have one already)

Default value:

- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

Default value:

- No (disabled)

Bootloader config

Contains:

- [CONFIG_BOOTLOADER_LOG_LEVEL](#)
- [CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION](#)
- [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)
- [CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE](#)
- [CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT](#)
- [CONFIG_BOOTLOADER_APP_TEST](#)
- [CONFIG_BOOTLOADER_FACTORY_RESET](#)
- [CONFIG_BOOTLOADER_HOLD_TIME_GPIO](#)
- [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS](#)
- [CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON](#)

- [CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP](#)
- [CONFIG_BOOTLOADER_WDT_ENABLE](#)
- [CONFIG_BOOTLOADER_VDDSDIO_BOOST](#)

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

Found in: [Bootloader config](#)

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

Found in: [Bootloader config](#)

Specify how much output to see in bootloader logs.

Available options:

- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

Found in: [Bootloader config](#)

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

Found in: [Bootloader config](#)

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Default value:

- 4 if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_FACTORY_RESET](#)

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

Default value:

- “nvs” if [CONFIG_BOOTLOADER_FACTORY_RESET](#)

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: [Bootloader config](#)

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

Default value:

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_APP_TEST`

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

Range:

- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

Default value:

- 18 if `CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_APP_TEST`

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (`BOOTLOADER_APP_TEST_PIN_LOW`)
- Enter test app on GPIO high (`BOOTLOADER_APP_TEST_PIN_HIGH`)

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: [Bootloader config](#)

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Default value:

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE

Enable protection for unmapped memory regions

Found in: [Bootloader config](#)

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

Found in: [Bootloader config](#)

Tracks the execution time of startup code. If the execution time is exceeded, the `RTC_WDT` will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE:

Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for `slow_clk` - and ends calling `app_main`. Re-set timeout is needed due to WDT uses a `SLOW_CLK` clock source. After changing a frequency `slow_clk` a time of WDT needs to re-set for new frequency. `slow_clk` depends on `RTC_CLK_SRC` (`INTERNAL_RC` or `EXTERNAL_CRYSTAL`).

Default value:

- Yes (enabled)

CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE

Allows RTC watchdog disable in user code

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_WDT_ENABLE](#)

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the `rtc_wdt` in the app's own code. If this option is not set (default), then `rtc_wdt` will be disabled by ESP-IDF before calling the `app_main()` function.

Use function `rtc_wdt_feed()` for resetting counter of `rtc_wdt`. Use function `rtc_wdt_disable()` for disabling `rtc_wdt`.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_WDT_ENABLE](#)

Verify that this parameter is correct and more than the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: `RTC_WDT` will reset while encryption operations will be performed.

Range:

- from 0 to 120000

Default value:

- 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

Found in: [Bootloader config](#)

After updating the app, the bootloader runs a new app with the “`ESP_OTA_IMG_PENDING_VERIFY`” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

Default value:

- No (disabled) if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

Found in: `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with `ota_0 + ota_1` (without factory).

Default value:

- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

Found in: `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

Range:

- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

Default value:

- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version(only test)

Found in: `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

Default value:

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

Found in: `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:

- No (disabled) if (`CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE`) || `CONFIG_SECURE_BOOT`

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: [Bootloader config](#)

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

Reserve RTC FAST memory for custom purposes

Found in: [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

Default value:

- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE

Size in bytes for custom purposes

Found in: [Bootloader config](#) > [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

Default value:

- 0 if [CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC](#)

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

Found in: [Bootloader config](#)

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON' T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

Default value:

- Yes (enabled)

Security features

Contains:

- [CONFIG_SECURE_BOOT_INSECURE](#)
- [CONFIG_SECURE_SIGNED_APPS_SCHEME](#)

- [CONFIG_SECURE_UART_ROM_DL_MODE](#)
- [CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT](#)

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: [Security features](#)

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can

be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
 - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
 - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
 - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (SECURE_SIGNED_APPS_RSA_SCHEME)
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

Found in: Security features

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

Found in: Security features

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

Default value:

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

Found in: [Security features](#)

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:

- Yes (enabled) if [CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT](#)

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

Found in: [Security features](#)

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Default value:

- No (disabled)

CONFIG_SECURE_BOOT_VERSION

Select secure boot version

Found in: [Security features](#) > [CONFIG_SECURE_BOOT](#)

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (`SECURE_BOOT_V1_ENABLED`)
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`SECURE_BOOT_V2_ENABLED`)
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

Found in: Security features

Available options:

- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

Found in: Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

Default value:

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

Found in: Security features

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE

Enable Aggressive key revoke strategy

Found in: Security features

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

Found in: Security features

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

Found in: Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT`

CONFIG_SECURE_FLASH_ENC_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

Found in: Security features

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

Default value:

- No (disabled)

CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated AES-XTS key

Found in: *Security features* > *CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated AES-XTS key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

Found in: *Security features* > *CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:

- *CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS*
- *CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION*
- *CONFIG_SECURE_BOOT_ALLOW_JTAG*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC*
- *CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE*
- *CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS*
- *CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED*

CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

Found in: Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

Found in: Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a `BLOCK` is read-protected, the application will read all zeros from that block

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

Found in: Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

Found in: Security features > Potentially insecure options

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

Default value:

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

Found in: Security features

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

Found in: *Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (*get_security_info*).
Secure Download mode is not compatible with the esptool.py flasher stub feature, espefuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: *Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

Default value:

- Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: Application manager

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: Application manager

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER_FROM_CONFIG

Get the project version from Kconfig

Found in: Application manager

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

Default value:

- No (disabled)

CONFIG_APP_PROJECT_VER

Project version

Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG

Project version

Default value:

- 1 if *CONFIG_APP_PROJECT_VER_FROM_CONFIG*

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM(chars)

Found in: Application manager

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

Range:

- from 8 to 64

Default value:

- 16

Boot ROM Behavior

Contains:

- [*CONFIG_BOOT_ROM_LOG_SCHEME*](#)

CONFIG_BOOT_ROM_LOG_SCHEME

Permanently change Boot ROM output

Found in: [Boot ROM Behavior](#)

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (BOOT_ROM_LOG_ALWAYS_ON)
Always print ROM logs, this is the default behavior.
- Permanently disable logging (BOOT_ROM_LOG_ALWAYS_OFF)
Don't print ROM logs.
- Log on GPIO High (BOOT_ROM_LOG_ON_GPIO_HIGH)
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (BOOT_ROM_LOG_ON_GPIO_LOW)
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- [*CONFIG_ESPTOOLPY_AFTER*](#)
- [*CONFIG_ESPTOOLPY_BEFORE*](#)
- [*CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE*](#)
- [*CONFIG_ESPTOOLPY_NO_STUB*](#)
- [*CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE*](#)
- [*CONFIG_ESPTOOLPY_FLASHSIZE*](#)
- [*CONFIG_ESPTOOLPY_FLASHMODE*](#)
- [*CONFIG_ESPTOOLPY_FLASHFREQ*](#)

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

Found in: [Serial flasher config](#)

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

Default value:

- No (disabled)

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

Found in: [Serial flasher config](#)

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (ESPTOOLPY_FLASHMODE_QIO)

- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

Found in: Serial flasher config

Available options:

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

Found in: Serial flasher config

Available options:

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
- 15 MHz (ESPTOOLPY_FLASHFREQ_15M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

Found in: Serial flasher config

SPI flash size, in megabytes

Available options:

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE

Detect flash size when flashing bootloader

Found in: Serial flasher config

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

Default value:

- No (disabled)

CONFIG_ESPTOOLPY_BEFORE

Before flashing

Found in: [Serial flasher config](#)

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

Found in: [Serial flasher config](#)

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:

- [CONFIG_PARTITION_TABLE_CUSTOM_FILENAME](#)
- [CONFIG_PARTITION_TABLE_MD5](#)
- [CONFIG_PARTITION_TABLE_OFFSET](#)
- [CONFIG_PARTITION_TABLE_TYPE](#)

CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it's expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large.csv`
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota.csv`
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)
Specify the path to the partition table CSV to use for your project.
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_encr_nvs.csv`
- Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_singleapp_large_encr_nvs.csv`
- Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is `components/partition_table/partitions_two_ota_encr_nvs.csv`

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

Default value:

- “partitions.csv”

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

Found in: [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition

offsets blank in the CSV file.

Default value:

- “0x8000”

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

Found in: Partition Table

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

Default value:

- Yes (enabled)

Compiler options

Contains:

- *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*
- *CONFIG_COMPILER_FLOAT_LIB_FROM*
- *CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT*
- *CONFIG_COMPILER_DUMP_RTL_FILES*
- *CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS*
- *CONFIG_COMPILER_WARN_WRITE_STRINGS*
- *CONFIG_COMPILER_CXX_EXCEPTIONS*
- *CONFIG_COMPILER_CXX_RTTI*
- *CONFIG_COMPILER_OPTIMIZATION*
- *CONFIG_COMPILER_HIDE_PATHS_MACROS*
- *CONFIG_COMPILER_STACK_CHECK_MODE*

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the `BOOTLOADER_COMPILER_OPTIMIZATION` setting.

Available options:

- Debug (-Og) (`COMPILER_OPTIMIZATION_DEFAULT`)
- Optimize for size (-Os) (`COMPILER_OPTIMIZATION_SIZE`)
- Optimize for performance (-O2) (`COMPILER_OPTIMIZATION_PERF`)

- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: [Compiler options](#)

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

Found in: [Compiler options](#)

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast” , but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: [Compiler options](#)

If enabled, the error messages will be discarded in following check macros: - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

Default value:

- No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS

Replace ESP-IDF and project paths in binaries

Found in: [Compiler options](#)

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF” , and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

Default value:

- Yes (enabled)

CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

Found in: [Compiler options](#)

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Default value:

- No (disabled)

Contains:

- [CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE](#)

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

Found in: [Compiler options](#) > [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

Default value:

- 0 if [CONFIG_COMPILER_CXX_EXCEPTIONS](#)

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

Found in: [Compiler options](#)

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

Default value:

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

Found in: [Compiler options](#)

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable `-Wwrite-strings` warning flag

Found in: [Compiler options](#)

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

Default value:

- No (disabled)

CONFIG_COMPILER_SAVE_RESTORE_LIBCALLS

Enable `-msave-restore` flag to reduce code size

Found in: [Compiler options](#)

Adds `-msave-restore` to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

Found in: [Compiler options](#)

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (`APPTRACE_DEST_JTAG`)
- None (`APPTRACE_DEST_NONE`)

CONFIG_APPTRACE_DESTINATION2

Data Destination 2

Found in: Component config > Application Level Tracing

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (`APPTRACE_DEST_UART0`)
- UART1 (`APPTRACE_DEST_UART1`)
- UART2 (`APPTRACE_DEST_UART2`)
- USB_CDC (`APPTRACE_DEST_USB_CDC`)
- None (`APPTRACE_DEST_UART_NONE`)

CONFIG_APPTRACE_UART_TX_GPIO

UART TX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART TX pin.

CONFIG_APPTRACE_UART_RX_GPIO

UART RX on GPIO#

Found in: Component config > Application Level Tracing

This GPIO is used for UART RX pin.

CONFIG_APPTRACE_UART_BAUDRATE

UART baud rate

Found in: Component config > Application Level Tracing

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided

from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

CONFIG_APPTRACE_UART_RX_BUFF_SIZE

UART RX ring buffer size

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

CONFIG_APPTRACE_UART_TX_BUFF_SIZE

UART TX ring buffer size

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

Found in: [Component config](#) > [Application Level Tracing](#)

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PPIO

UART Task Priority

Found in: [Component config](#) > [Application Level Tracing](#)

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:

- from 1 to 32

Default value:

- 1

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: [Component config](#) > [Application Level Tracing](#)

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: [Component config](#) > [Application Level Tracing](#)

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the apptrace buffer

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the memory buffer for trace data in bytes.

CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

Found in: [Component config](#) > [Application Level Tracing](#)

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

FreeRTOS SystemView Tracing

 Contains:

- [CONFIG_APPTRACE_SV_CPU](#)
- [CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE](#)
- [CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE](#)
- [CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE](#)

- [CONFIG_APPTRACE_SV_TS_SOURCE](#)
- [CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE](#)
- [CONFIG_APPTRACE_SV_BUF_WAIT_TMO](#)

CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_DEST

SystemView destination

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG_APPTRACE_SV_ENABLE](#)

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG (APPTRACE_SV_DEST_JTAG)
Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE_SV_DEST_UART)
Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU

CPU to trace

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Define the CPU to trace by SystemView.

Available options:

- CPU0 (APPTRACE_SV_DEST_CPU_0)
Send SEGGER SystemView events for Pro CPU.
- CPU1 (APPTRACE_SV_DEST_CPU_1)
Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APPTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE

ISR Enter Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE

ISR Exit Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE

ISR Exit to Scheduler Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

Found in: Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE

Gcov dump task stack size

Found in: Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE

Configures stack size of Gcov dump task

Default value:

- 2048 if *CONFIG_APPTRACE_GCOV_ENABLE*

Bluetooth Contains:

- *Bluedroid Options*
- *CONFIG_BT_ENABLED*
- *Controller Options*
- *NimBLE Options*
- *CONFIG_BT_RELEASE_IRAM*

CONFIG_BT_ENABLED

Bluetooth

Found in: Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

Found in: *Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)**
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (BT_NIMBLE_ENABLED)**
This option is recommended for BLE only usecases to save on memory
- **Disabled (BT_CONTROLLER_ONLY)**
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

CONFIG_BT_CONTROLLER

Controller

Found in: *Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (BT_CONTROLLER_ENABLED)**
This option is recommended for Bluetooth controller usecases
- **Disabled (BT_CONTROLLER_DISABLED)**
This option is recommended for Bluetooth Host only usecases

Bluedroid Options

 Contains:

- *CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK*
- *CONFIG_BT_BLUEDROID_MEM_DEBUG*

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select btc task stack size

Default value:

- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select btu task stack size

Default value:

- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_MEM_DEBUG

Bluedroid memory debug

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Bluedroid memory debug

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This enables Bluetooth Low Energy

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [CONFIG_BT_BLE_ENABLED](#)

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if [CONFIG_BT_BLE_ENABLED](#) && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 8 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_ATTRIBUTES

Max GATT Service Attributes

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Service Attributes Count

Range:

- from 1 to 500 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 100 if *CONFIG_BT_GATTS_ENABLE* && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATTS Service Change Mode

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
Manually send service change indication through API
`esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
Let Bluetooth handle the service change indication internally

CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED

Enable Robust Caching on Server Side

Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

This option enable gatt robust caching feature on server

Default value:

- No (disabled) if [CONFIG_BT_GATTS_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE

Allow to write device name by GATT clients

Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

Enabling this option allows remote GATT clients to write device name

Default value:

- No (disabled) if [CONFIG_BT_GATTS_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTS_APPEARANCE_WRITABLE

Allow to write appearance by GATT clients

Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTS_ENABLE](#)

Enabling this option allows remote GATT clients to write appearance

Default value:

- No (disabled) if [CONFIG_BT_GATTS_ENABLE](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG_BT_BLE_ENABLED](#)

This option can be close when the app work only on gatt server mode

Default value:

- Yes (enabled) if [CONFIG_BT_BLE_ENABLED](#) && [BT_BLUEDROID_ENABLED](#)

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

Found in: [Component config](#) > [Bluetooth](#) > [Bluetooth Options](#) > [CONFIG_BT_BLE_ENABLED](#) > [CONFIG_BT_GATTC_ENABLE](#)

Maximum GATTC cache characteristic count

Range:

- from 1 to 500 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

Default value:

- 40 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_NOTIF_REG_MAX

Max gattc notify(indication) register number

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC notify(indication) register number

Range:

- from 1 to 64 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

Default value:

- 5 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

Default value:

- No (disabled) if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

Range:

- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

Default value:

- 3 if `CONFIG_BT_GATTC_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

Default value:

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

Default value:

- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

Found in: Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

Default value:

- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

BT DEBUG LOG LEVEL Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

- NONE (`BT_LOG_HCI_TRACE_LEVEL_NONE`)
- ERROR (`BT_LOG_HCI_TRACE_LEVEL_ERROR`)
- WARNING (`BT_LOG_HCI_TRACE_LEVEL_WARNING`)
- API (`BT_LOG_HCI_TRACE_LEVEL_API`)
- EVENT (`BT_LOG_HCI_TRACE_LEVEL_EVENT`)
- DEBUG (`BT_LOG_HCI_TRACE_LEVEL_DEBUG`)
- VERBOSE (`BT_LOG_HCI_TRACE_LEVEL_VERBOSE`)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for L2CAP layer

Available options:

- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for RFCOMM layer

Available options:

- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SDP layer

Available options:

- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GAP layer

Available options:

- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BNEP layer

Available options:

- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
- EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for PAN layer

Available options:

- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for A2D layer

Available options:

- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)

- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVDT layer

Available options:

- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVCT layer

Available options:

- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVRC layer

Available options:

- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for MCA layer

Available options:

- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for HID layer

Available options:

- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for APPL layer

Available options:

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for GATT layer

Available options:

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for SMP layer

Available options:

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTIF layer

Available options:

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BTC layer

Available options:

- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for OSI layer

Available options:

- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)

- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for BLUFI layer

Available options:

- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:

- from 1 to 9 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-connections

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Enable this option if there are multiple connections

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select can save the internal RAM if there have the PSRAM

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY

Use dynamic memory allocation in BT/BLE stack

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This select can make the allocation of memory will become more flexible

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

Memory reserved at start of DRAM for Bluetooth stack

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && [CONFIG_BT_BLE_ENABLED](#) && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

Range:

- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

Range:

- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_TIMEOUT

Timeout of resolvable private address

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

Range:

- from 1 to 3600 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:

- 900 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This enables BLE 4.2 features.

Default value:

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER

Enable BLE periodic advertising sync transfer feature

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)

This enables BLE periodic advertising sync transfer feature

Default value:

- No (disabled) if `BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH

Enable periodic adv enhancements(adi support)

Found in: Component config > Bluetooth > Bluedroid Options

Enable the periodic advertising enhancements

Default value:

- No (disabled) if `BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL

Enable BLE high duty advertising interval feature

Found in: Component config > Bluetooth > Bluedroid Options

This enable BLE high duty advertising interval feature

Default value:

- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

NimBLE Options Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`

- [CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS](#)
- [CONFIG_BT_NIMBLE_NVS_PERSIST](#)
- [CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU](#)
- [CONFIG_BT_NIMBLE_RPA_TIMEOUT](#)
- [CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE](#)
- [CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST](#)

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
Allows to use IRAM memory region as 8bit accessible region.
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config → Log output → Default log verbosity” .

Available options:

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

Range:

- from 1 to 9 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of bonds to save for peer security and our security

Default value:

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of CCC descriptors to save

Default value:

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM

Maximum number of connection oriented channels

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

Range:

- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE

The CPU core on which NimBLE host will run

Found in: Component config > Bluetooth > NimBLE Options

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE

NimBLE Host task stack size

Found in: Component config > Bluetooth > NimBLE Options

This configures stack size of NimBLE host task

Default value:

- 5120 if `CONFIG_BLE_MESH` && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_CENTRAL

Enable BLE Central role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enables central role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL

Enable BLE Peripheral role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable peripheral role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_BROADCASTER

Enable BLE Broadcaster role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enables broadcaster role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enables observer role

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST

Persist the BLE Bonding keys in NVS

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this flag to make bonding persistent across device reboots

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable BLE SM feature

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE sm feature

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

- *CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION*
- *CONFIG_BT_NIMBLE_SM_LEGACY*
- *CONFIG_BT_NIMBLE_SM_SC*

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager legacy pairing

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:

- No (disabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && *CONFIG_BT_NIMBLE_SM_SC* && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

Default value:

- Yes (enabled) if *CONFIG_BT_NIMBLE_SECURITY_ENABLE* && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

Default value:

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

Found in: Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

Default value:

- “nimble” if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

Found in: Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

Default value:

- 31 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

Found in: Component config > Bluetooth > NimBLE Options

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

Default value:

- 256 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

Found in: Component config > Bluetooth > NimBLE Options

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

Default value:

- 0 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Memory Settings Contains:

- `CONFIG_BT_NIMBLE_ACL_BUF_COUNT`
- `CONFIG_BT_NIMBLE_ACL_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`
- `CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

Default value:

- 24 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 12 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory size of block 1

Default value:

- 128 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 256 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory count

Default value:

- 24 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

Dynamic memory size of block 2

Default value:

- 320 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

The number of ACL data buffers.

Default value:

- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

Default value:

- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

Default value:

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

Default value:

- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT

Low Priority HCI Event Buffer count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [Memory Settings](#)

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

Default value:

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GATT_MAX_PROCS

Maximum number of GATT client procedures

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Maximum number of GATT client procedures that can be executed.

Default value:

- 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable Host Flow control

Default value:

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_HS_FLOW_CTRL](#)

Host flow control interval in msec

Default value:

- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_HS_FLOW_CTRL](#)

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

Default value:

- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_HS_FLOW_CTRL](#)

Enable this option to send number-of-completed-packets event to controller after disconnection

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Time interval between RPA address change. This is applicable in case of Host based RPA

Range:

- from 1 to 41400 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Default value:

- 900 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/./esp32/api-guides/esp-ble-mesh/ble-mesh-index`

Default value:

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:

- [CONFIG_BT_NIMBLE_MESH_PROVISIONER](#)
- [CONFIG_BT_NIMBLE_MESH_PROV](#)
- [CONFIG_BT_NIMBLE_MESH_GATT_PROXY](#)
- [CONFIG_BT_NIMBLE_MESH_FRIEND](#)
- [CONFIG_BT_NIMBLE_MESH_LOW_POWER](#)
- [CONFIG_BT_NIMBLE_MESH_PROXY](#)
- [CONFIG_BT_NIMBLE_MESH_RELAY](#)
- [CONFIG_BT_NIMBLE_MESH_DEVICE_NAME](#)
- [CONFIG_BT_NIMBLE_MESH_NODE_COUNT](#)

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable mesh provisioning

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_MESH](#) && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#) > [CONFIG_BT_NIMBLE_MESH_PROV](#)

Enable this option to allow the device to be provisioned over the advertising bearer

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_MESH_PROV](#) && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#) > [CONFIG_BT_NIMBLE_MESH_PROV](#)

Enable this option to allow the device to be provisioned over the GATT bearer

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_MESH_PROV](#) && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

Default value:

- Yes (enabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Support for acting as a Mesh Relay Node

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER

Enable mesh low power mode

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable this option to be able to act as a Low Power Node

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND

Enable mesh friend functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable this option to be able to act as a Friend Node

Default value:

- No (disabled) if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME

Set mesh device name

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

This value defines Bluetooth Mesh device/node name

Default value:

- “nimble-mesh-node” if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT

Set mesh node count

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Defines mesh node count.

Default value:

- 1 if [CONFIG_BT_NIMBLE_MESH](#) && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER

Enable BLE mesh provisioner

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_MESH](#)

Enable mesh provisioner.

Default value:

- 0 if [CONFIG_BT_NIMBLE_MESH](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

Default value:

- Yes (enabled) if [BT_NIMBLE_ENABLED](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS

BLE host stop timeout in msec

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE Host stop procedure timeout in milliseconds.

Default value:

- 2000 if [BT_NIMBLE_ENABLED](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Enable connection reattempts on connection establishment error

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

Default value:

- Yes (enabled) if [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT

Maximum number connection reattempts

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#)

Defines maximum number of connection reattempts.

Range:

- from 1 to 7 if [BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#) && [BT_NIMBLE_ENABLED](#)

Default value:

- 3 if [BT_NIMBLE_ENABLED](#) && [CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT](#) && [BT_NIMBLE_ENABLED](#)

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable BLE 5 feature

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

Default value:

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Contains:

- [CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY](#)
- [CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY](#)
- [CONFIG_BT_NIMBLE_EXT_ADV](#)
- [CONFIG_BT_NIMBLE_BLE_POWER_CONTROL](#)
- [CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNC](#)

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable 2M-PHY

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable coded-PHY

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

Default value:

- No (disabled) if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#) > [CONFIG_BT_NIMBLE_EXT_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

Range:

- from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

Default value:

- 1 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE

Maximum length of the advertising data.

Found in: `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Defines the length of the extended adv data. The value should not exceed 1650.

Range:

- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

Default value:

- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

Enable periodic advertisement.

Found in: `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Enable this option to start periodic advertisement.

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transer Sync Events

Found in: `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV`

This enables controller transfer periodic sync events to host

Default value:

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNC

Maximum number of periodic advertising syncs

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:

- from 0 to 8 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

Default value:

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT](#)

Set this option to enable the Power Control feature

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

Range:

- from 1 to 15 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

Default value:

- 12 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable the throughput test mode

Default value:

- No (disabled) if `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to enable blufi functionality.

Default value:

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_USE_ESP_TIMER

Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:

- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER

Blob transfer

Found in: Component config > Bluetooth > NimBLE Options

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT_NIMBLE_MSYS_1_BLOCK_COUNT needs to be increased according to the need.

CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL

Enable BLE high duty advertising interval feature

Found in: Component config > Bluetooth > NimBLE Options

This enable BLE high duty advertising interval feature

CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

Found in: Component config > Bluetooth > NimBLE Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:

- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Controller Options

 Contains:

- *CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*
- *CONFIG_BT_BLE_CCA_MODE*
- *CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL*
- *CONFIG_BT_CTRL_BLE_MAX_ACT*
- *CONFIG_BT_CTRL_BLE_SCAN_DUPL*
- *CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB*
- *CONFIG_BT_CTRL_HW_CCA_VAL*
- *CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM*
- *CONFIG_BT_CTRL_CE_LENGTH_TYPE*
- *CONFIG_BT_CTRL_RX_ANTENNA_INDEX*
- *CONFIG_BT_CTRL_TX_ANTENNA_INDEX*
- *CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX*
- *CONFIG_BT_CTRL_AGC_RECORRECT_EN*
- *CONFIG_BT_CTRL_HCI_MODE_CHOICE*
- *MODEM_SLEEP Options*
- *CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE*
- *CONFIG_BT_CTRL_ADV_DUP_FILT_MAX*

CONFIG_BT_CTRL_BLE_MAX_ACT

BLE Max Instances

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

BLE maximum activities of bluetooth controller, both of connections, scan, sync and adv(periodic adv, multi-adv). Each instance needs to consume 828 bytes, you can save RAM by modifying the instance value according to actual needs.

Range:

- from 1 to 10 if BT_CONTROLLER_ENABLED

Default value:

- 6 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB

BLE static ACL TX buffer numbers

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

Range:

- from 0 to 12 if BT_CONTROLLER_ENABLED

Default value:

- 0 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE

The cpu core which bluetooth controller run

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (BT_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_CTRL_PINNED_TO_CORE_1)

CONFIG_BT_CTRL_HCI_MODE_CHOICE

HCI mode

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

Specify HCI mode as VHCI or UART(H4)

Available options:

- VHCI (BT_CTRL_HCI_MODE_VHCI)
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3 or ESP32C3.
- UART(H4) (BT_CTRL_HCI_MODE_UART_H4)
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

CONFIG_BT_CTRL_ADV_DUP_FILTER_MAX

The maximum number of 5.0 extend duplicate scan filter

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

The maximum number of duplicate scan filter

Range:

- from 1 to 500 if BT_CONTROLLER_ENABLED

Default value:

- 30 if BT_CONTROLLER_ENABLED

CONFIG_BT_BLE_CCA_MODE

BLE CCA mode

Found in: Component config > Bluetooth > Controller Options

Define BT BLE CCA mode

Available options:

- NONE (BT_BLE_CCA_MODE_NONE)
- Hardware (BT_BLE_CCA_MODE_HW)
- Software (BT_BLE_CCA_MODE_SW)

CONFIG_BT_CTRL_HW_CCA_VAL

CCA threshold value

Found in: Component config > Bluetooth > Controller Options

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

Range:

- from 20 to 100 if BT_CONTROLLER_ENABLED

Default value:

- 20 if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_CE_LENGTH_TYPE

Connection event length determination method

Found in: Component config > Bluetooth > Controller Options

Specify connection event length determination

Available options:

- ORIGINAL (BT_CTRL_CE_LENGTH_TYPE_ORIG)
- Use CE parameter for HCI command (BT_CTRL_CE_LENGTH_TYPE_CE)
- Use Espressif self-defined method (BT_CTRL_CE_LENGTH_TYPE_SD)

CONFIG_BT_CTRL_TX_ANTENNA_INDEX

default Tx antenna used

Found in: Component config > Bluetooth > Controller Options

Specify default Tx antenna used for bluetooth

Available options:

- Antenna 0 (BT_CTRL_TX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_TX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_RX_ANTENNA_INDEX

default Rx antenna used

Found in: Component config > Bluetooth > Controller Options

Specify default Rx antenna used for bluetooth

Available options:

- Antenna 0 (BT_CTRL_RX_ANTENNA_INDEX_0)
- Antenna 1 (BT_CTRL_RX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL

BLE default Tx power level

Found in: Component config > Bluetooth > Controller Options

Specify default Tx power level

Available options:

- -24dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N24)
- -21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N21)
- -18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N18)
- -15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N15)
- -12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N12)
- **-9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N9)
- **-6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N6)
- **-3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_N3)
- 0dBm (BT_CTRL_DFT_TX_POWER_LEVEL_N0)
- **+3dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P3)
- **+6dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P6)
- **+9dBm** (BT_CTRL_DFT_TX_POWER_LEVEL_P9)
- +12dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P12)
- +15dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P15)
- +18dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P18)
- +21dBm (BT_CTRL_DFT_TX_POWER_LEVEL_P21)

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

Found in: Component config > Bluetooth > Controller Options

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

Default value:

- Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

Range:

- from 50 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

Default value:

- 100 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` &&
BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD

BLE adv lost event threshold value

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP](#)

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

Range:

- from 1 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` &&
BT_CONTROLLER_ENABLED

Default value:

- 20 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` &&
BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_SCAN_DUPL

BLE Scan Duplicate Options

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

This select enables parameters setting of BLE scan duplicate.

Default value:

- Yes (enabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_DUPL_TYPE

Scan Duplicate Type

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#)

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data” . This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data” . This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (`BT_CTRL_SCAN_DUPL_TYPE_DEVICE`)
Advertising packets with the same address, address type, and advertising type are reported once.
- Scan Duplicate By Advertising Data (`BT_CTRL_SCAN_DUPL_TYPE_DATA`)
Advertising packets with identical advertising data, address type, and advertising type are reported only once, even if they originate from different devices.
- Scan Duplicate By Device Address And Advertising Data (`BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE`)
Advertising packets with the same address, advertising data, address type, and advertising type are reported only once.

CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#)

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) && BT_CONTROLLER_ENABLED

Default value:

- 100 if [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_DUPL_SCAN_CACHE_REFRESH_PERIOD

Duplicate scan list refresh period (seconds)

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#)

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

Range:

- from 0 to 1000 if [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) && BT_CONTROLLER_ENABLED

Default value:

- 0 if [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN

Special duplicate scan mechanism for BLE Mesh scan

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#)

This enables the BLE scan duplicate for special BLE Mesh scan.

Default value:

- No (disabled) if [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG_BT_CTRL_BLE_SCAN_DUPL](#) > [CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN](#)

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

Range:

- from 10 to 1000 if [CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN](#) && BT_CONTROLLER_ENABLED

Default value:

- 100 if [CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN](#) && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
Disable the limitation on max tx/rx time for Coded-PHY connection

MODEM_SLEEP Options

 Contains:

- [CONFIG_BT_CTRL_MODEM_SLEEP](#)
- [CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP](#)

CONFIG_BT_CTRL_MODEM_SLEEP

Bluetooth modem sleep

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM_SLEEP Options](#)

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

Default value:

- No (disabled) if BT_CTRL_HCI_MODE_UART_H4 &&
BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1

Bluetooth Modem sleep Mode 1

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM_SLEEP Options](#) > [CONFIG_BT_CTRL_MODEM_SLEEP](#)

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

Default value:

- Yes (enabled) if CONFIG_BT_CTRL_MODEM_SLEEP &&
BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [MODEM_SLEEP Options](#) > [CONFIG_BT_CTRL_MODEM_SLEEP](#) > [CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1](#)

Select the low power clock source for bluetooth controller

Available options:

- Main crystal (BT_CTRL_LPCLK_SEL_MAIN_XTAL)
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.

- External 32kHz crystal (BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)
External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT_CTRL_LPCLK_SEL_RTC_SLOW)
Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP

power up main XTAL during light sleep

Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

Default value:

- No (disabled) if (BT_CTRL_LPCLK_SEL_MAIN_XTAL || BT_CTRL_LPCLK_SEL_EXT_32K_XTAL) && CONFIG_FREERTOS_USE_TICKLESS_IDLE && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable HW AGC recorrect

Found in: Component config > Bluetooth > Controller Options

Enable uncoded phy AGC recorrect

Default value:

- No (disabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_CODED_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_AGC_RECORRECT_EN

Enable coded phy AGC recorrect

Default value:

- No (disabled) if CONFIG_BT_CTRL_AGC_RECORRECT_EN && BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX

Disable active scan backoff

Found in: Component config > Bluetooth > Controller Options

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

Default value:

- No (disabled) if BT_CONTROLLER_ENABLED

CONFIG_BT_RELEASE_IRAM

Release Bluetooth text (READ DOCS FIRST)

Found in: *Component config > Bluetooth*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when esp_bt_mem_release is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (ESP_SYSTEM_PMP_IDRAM_SPLIT)

Default value:

- No (disabled) if *CONFIG_BT_ENABLED* && BT_LE_RELEASE_IRAM_SUPPORTED

CONFIG_BLE_MESH

ESP BLE Mesh Support

Found in: *Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG_BLE_MESH_GATT_PROXY_CLIENT*
- *CONFIG_BLE_MESH_GATT_PROXY_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*
- *CONFIG_BLE_MESH_PROV*
- *CONFIG_BLE_MESH_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG_BLE_MESH_NO_LOG*
- *CONFIG_BLE_MESH_IVU_DIVIDER*
- *CONFIG_BLE_MESH_FAST_PROV*
- *CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*
- *CONFIG_BLE_MESH_CRPL*
- *CONFIG_BLE_MESH_RX_SDU_MAX*
- *CONFIG_BLE_MESH_MODEL_KEY_COUNT*
- *CONFIG_BLE_MESH_APP_KEY_COUNT*
- *CONFIG_BLE_MESH_MODEL_GROUP_COUNT*
- *CONFIG_BLE_MESH_LABEL_COUNT*
- *CONFIG_BLE_MESH_SUBNET_COUNT*
- *CONFIG_BLE_MESH_TX_SEG_MAX*
- *CONFIG_BLE_MESH_RX_SEG_MSG_COUNT*
- *CONFIG_BLE_MESH_TX_SEG_MSG_COUNT*
- *CONFIG_BLE_MESH_MEM_ALLOC_MODE*
- *CONFIG_BLE_MESH_MSG_CACHE_SIZE*
- *CONFIG_BLE_MESH_ADV_BUF_COUNT*
- *CONFIG_BLE_MESH_PB_GATT*
- *CONFIG_BLE_MESH_PB_ADV*
- *CONFIG_BLE_MESH_IVU_RECOVERY_IVI*
- *CONFIG_BLE_MESH_RELAY*
- *CONFIG_BLE_MESH_SETTINGS*
- *CONFIG_BLE_MESH_DEINIT*
- *CONFIG_BLE_MESH_USE_DUPLICATE_SCAN*
- *Support for BLE Mesh Client/Server models*
- *Support for BLE Mesh Foundation models*
- *CONFIG_BLE_MESH_NODE*

- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

Found in: Component config > CONFIG_BLE_MESH

It is a temporary solution and needs further modifications.

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data” .

Default value:

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > CONFIG_BLE_MESH

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (`BLE_MESH_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BLE_MESH_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BLE_MESH_MEM_ALLOC_MODE_DEFAULT`)
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (`BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT`)
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:

- No (disabled) if `ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY` && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG_BLE_MESH* > *CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (*BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL*)
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when `SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` is enabled. See the SPIRAM options for more details.
- Internal IRAM (*BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT*)
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG_BLE_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if *CONFIG_BLE_MESH*

BLE Mesh and BLE coexistence support

 Contains:

- *CONFIG_BLE_MESH_SUPPORT_BLE_SCAN*
- *CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

Found in: *Component config* > *CONFIG_BLE_MESH* > *BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

Default value:

- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh and BLE coexistence support](#) > [CONFIG_BLE_MESH_SUPPORT_BLE_ADV](#)

Number of advertising buffers for BLE packets available.

Range:

- from 1 to 255 if [CONFIG_BLE_MESH_SUPPORT_BLE_ADV](#) && [CONFIG_BLE_MESH](#)

Default value:

- 3 if [CONFIG_BLE_MESH_SUPPORT_BLE_ADV](#) && [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: [Component config](#) > [CONFIG_BLE_MESH](#) > [BLE Mesh and BLE coexistence support](#)

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

Default value:

- No (disabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:

- No (disabled) if [CONFIG_BLE_MESH](#)

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

Found in: [Component config](#) > [CONFIG_BLE_MESH](#)

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue
