

# ESP32-C6

## ESP-IDF Programming Guide

Release v5.1.2  
Espressif Systems  
Nov 10, 2023

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	4
1.3 Installation	4
1.3.1 IDE	4
1.3.2 Manual Installation	5
1.4 Build Your First Project	35
1.5 Uninstall ESP-IDF	35
<b>2 API Reference</b>	<b>37</b>
2.1 API Conventions	37
2.1.1 Error Handling	37
2.1.2 Configuration Structures	37
2.1.3 Private APIs	39
2.1.4 Components in Example Projects	39
2.1.5 API Stability	39
2.2 Application Protocols	40
2.2.1 ASIO port	40
2.2.2 ESP-Modbus	40
2.2.3 ESP-MQTT	41
2.2.4 ESP-TLS	59
2.2.5 ESP HTTP Client	74
2.2.6 ESP Local Control	91
2.2.7 ESP Serial Slave Link	100
2.2.8 ESP x509 Certificate Bundle	117
2.2.9 HTTP Server	119
2.2.10 HTTPS Server	147
2.2.11 ICMP Echo	150
2.2.12 mDNS Service	155
2.2.13 Mbed TLS	156
2.2.14 IP Network Layer	157
2.3 Bluetooth API	158
2.3.1 BT COMMON	158
2.3.2 BT LE	166
2.3.3 Controller && VHCI	295
2.3.4 ESP-BLE-MESH	304
2.3.5 NimBLE-based host APIs	586
2.4 Error Codes Reference	588
2.5 Networking APIs	595
2.5.1 Wi-Fi	595
2.5.2 Ethernet	723
2.5.3 Thread	752
2.5.4 ESP-NETIF	761

2.5.5	IP Network Layer	796
2.5.6	Application Layer	798
2.6	Peripherals API	798
2.6.1	Analog to Digital Converter (ADC) Oneshot Mode Driver	798
2.6.2	Analog to Digital Converter (ADC) Continuous Mode Driver	808
2.6.3	Analog to Digital Converter (ADC) Calibration Driver	816
2.6.4	Clock Tree	819
2.6.5	Event Task Matrix (ETM)	831
2.6.6	GPIO & RTC GPIO	840
2.6.7	General Purpose Timer (GPTimer)	862
2.6.8	Dedicated GPIO	877
2.6.9	Hash-based Message Authentication Code (HMAC)	881
2.6.10	Digital Signature (DS)	885
2.6.11	Inter-Integrated Circuit (I2C)	891
2.6.12	Inter-IC Sound (I2S)	909
2.6.13	LCD	949
2.6.14	LED Control (LEDC)	963
2.6.15	Motor Control Pulse Width Modulator (MCPWM)	985
2.6.16	Parallel IO	1035
2.6.17	Pulse Counter (PCNT)	1041
2.6.18	Remote Control Transceiver (RMT)	1056
2.6.19	SD Pull-up Requirements	1082
2.6.20	SD SPI Host Driver	1083
2.6.21	SDIO Card Slave Driver	1088
2.6.22	Sigma-Delta Modulation (SDM)	1098
2.6.23	SPI Flash API	1103
2.6.24	SPI Master Driver	1132
2.6.25	SPI Slave Driver	1154
2.6.26	SPI Slave Half Duplex	1161
2.6.27	Temperature Sensor	1169
2.6.28	Two-Wire Automotive Interface (TWAI)	1175
2.6.29	Universal Asynchronous Receiver/Transmitter (UART)	1193
2.7	Project Configuration	1217
2.7.1	Introduction	1217
2.7.2	Project Configuration Menu	1217
2.7.3	Using sdkconfig.defaults	1217
2.7.4	Kconfig Format Rules	1217
2.7.5	Backward Compatibility of Kconfig Options	1218
2.7.6	Configuration Options Reference	1218
2.8	Provisioning API	1512
2.8.1	Protocol Communication	1512
2.8.2	Unified Provisioning	1527
2.8.3	Wi-Fi Provisioning	1534
2.9	Storage API	1552
2.9.1	FAT Filesystem Support	1553
2.9.2	Manufacturing Utility	1561
2.9.3	Non-volatile Storage Library	1565
2.9.4	NVS Partition Generator Utility	1588
2.9.5	NVS Partition Parser Utility	1592
2.9.6	SD/SDIO/MMC Driver	1593
2.9.7	Partitions API	1606
2.9.8	SPIFFS Filesystem	1615
2.9.9	Virtual filesystem component	1619
2.9.10	Wear Levelling API	1634
2.10	System API	1637
2.10.1	App Image Format	1637
2.10.2	Application Level Tracing	1643
2.10.3	Call function with external stack	1648

2.10.4	Chip Revision	1649
2.10.5	Console	1652
2.10.6	eFuse Manager	1661
2.10.7	Error Codes and Helper Functions	1692
2.10.8	ESP HTTPS OTA	1694
2.10.9	Event Loop Library	1701
2.10.10	FreeRTOS (Overview)	1714
2.10.11	FreeRTOS (ESP-IDF)	1716
2.10.12	FreeRTOS (Supplemental Features)	1837
2.10.13	Heap Memory Allocation	1861
2.10.14	Memory Management for MMU Supported Memory	1874
2.10.15	Heap Memory Debugging	1881
2.10.16	High Resolution Timer (ESP Timer)	1893
2.10.17	Internal and Unstable APIs	1900
2.10.18	Interrupt allocation	1901
2.10.19	Logging library	1907
2.10.20	Miscellaneous System APIs	1914
2.10.21	Over The Air Updates (OTA)	1930
2.10.22	Power Management	1942
2.10.23	POSIX Threads Support	1949
2.10.24	Random Number Generation	1954
2.10.25	Sleep Modes	1956
2.10.26	SoC Capabilities	1969
2.10.27	System Time	1986
2.10.28	The Async memcpy API	1992
2.10.29	Watchdogs	1996
<b>3</b>	<b>Hardware Reference</b>	<b>2003</b>
<b>4</b>	<b>API Guides</b>	<b>2005</b>
4.1	Application Level Tracing library	2005
4.1.1	Overview	2005
4.1.2	Modes of Operation	2005
4.1.3	Configuration Options and Dependencies	2006
4.1.4	How to Use This Library	2007
4.2	Application Startup Flow	2015
4.2.1	First stage bootloader	2015
4.2.2	Second stage bootloader	2016
4.2.3	Application startup	2016
4.3	BluFi	2017
4.3.1	Overview	2018
4.3.2	The BluFi Flow	2018
4.3.3	The Flow Chart of BluFi	2018
4.3.4	The Frame Formats Defined in BluFi	2018
4.3.5	The Security Implementation of ESP32-C6	2024
4.3.6	GATT Related Instructions	2025
4.4	Bootloader	2025
4.4.1	Bootloader Compatibility	2026
4.4.2	Log Level	2026
4.4.3	Factory Reset	2026
4.4.4	Boot from Test Firmware	2027
4.4.5	Rollback	2027
4.4.6	Watchdog	2028
4.4.7	Bootloader Size	2028
4.4.8	Fast Boot from Deep-Sleep	2028
4.4.9	Custom Bootloader	2028
4.5	Build System	2029
4.5.1	Overview	2029

4.5.2	Using the Build System	2029
4.5.3	Example Project	2031
4.5.4	Project CMakeLists File	2032
4.5.5	Component CMakeLists Files	2033
4.5.6	Component Configuration	2035
4.5.7	Preprocessor Definitions	2036
4.5.8	Component Requirements	2036
4.5.9	Overriding Parts of the Project	2040
4.5.10	Configuration-Only Components	2041
4.5.11	Debugging CMake	2041
4.5.12	Example Component CMakeLists	2042
4.5.13	Custom Sdkconfig Defaults	2046
4.5.14	Flash Arguments	2046
4.5.15	Building the Bootloader	2047
4.5.16	Writing Pure CMake Components	2047
4.5.17	Using Third-Party CMake Projects with Components	2047
4.5.18	Using Prebuilt Libraries with Components	2048
4.5.19	Using ESP-IDF in Custom CMake Projects	2048
4.5.20	ESP-IDF CMake Build System API	2049
4.5.21	File Globbing & Incremental Builds	2053
4.5.22	Build System Metadata	2054
4.5.23	Build System Internals	2054
4.5.24	Migrating from ESP-IDF GNU Make System	2056
4.6	RF Coexistence	2057
4.6.1	Overview	2057
4.6.2	Supported Coexistence Scenario for ESP32-C6	2057
4.6.3	Coexistence Mechanism and Policy	2058
4.6.4	How to Use the Coexistence Feature	2059
4.7	Core Dump	2060
4.7.1	Overview	2060
4.7.2	Configurations	2060
4.7.3	Core Dump to Flash	2061
4.7.4	Core Dump to UART	2061
4.7.5	Core Dump Commands	2063
4.7.6	ROM Functions in Backtraces	2063
4.7.7	Dumping Variables on Demand	2063
4.7.8	Running <code>idf.py coredump-info</code> and <code>idf.py coredump-debug</code>	2064
4.8	C++ Support	2064
4.8.1	<code>esp-idf-cxx</code> Component	2066
4.8.2	C++ language standard	2066
4.8.3	Multithreading	2067
4.8.4	Exception Handling	2067
4.8.5	Runtime Type Information (RTTI)	2067
4.8.6	Developing in C++	2067
4.8.7	Limitations	2069
4.8.8	What to Avoid	2069
4.9	Deep Sleep Wake Stubs	2069
4.9.1	Rules for Wake Stubs	2069
4.9.2	Implementing A Stub	2070
4.9.3	Loading Code Into RTC Memory	2070
4.9.4	Loading Data Into RTC Memory	2070
4.9.5	CRC Check For Wake Stubs	2071
4.9.6	Example	2071
4.10	Error Handling	2071
4.10.1	Overview	2071
4.10.2	Error codes	2072
4.10.3	Converting error codes to error messages	2072
4.10.4	<code>ESP_ERROR_CHECK</code> macro	2072

4.10.5	ESP_ERROR_CHECK_WITHOUT_ABORT macro	2073
4.10.6	ESP_RETURN_ON_ERROR macro	2073
4.10.7	ESP_GOTO_ON_ERROR macro	2073
4.10.8	ESP_RETURN_ON_FALSE macro	2073
4.10.9	ESP_GOTO_ON_FALSE macro	2073
4.10.10	CHECK MACROS Examples	2073
4.10.11	Error handling patterns	2074
4.10.12	C++ Exceptions	2074
4.11	ESP-BLE-MESH	2075
4.11.1	Getting Started with ESP-BLE-MESH	2075
4.11.2	ESP-BLE-MESH Examples	2082
4.11.3	ESP-BLE-MESH Demo Videos	2082
4.11.4	ESP-BLE-MESH FAQ	2083
4.11.5	Related Documents	2083
4.12	ESP-WIFI-MESH	2112
4.12.1	Overview	2112
4.12.2	Introduction	2112
4.12.3	ESP-WIFI-MESH Concepts	2113
4.12.4	Building a Network	2119
4.12.5	Managing a Network	2124
4.12.6	Data Transmission	2127
4.12.7	Channel Switching	2129
4.12.8	Performance	2132
4.12.9	Further Notes	2133
4.13	Fatal Errors	2133
4.13.1	Overview	2133
4.13.2	Panic Handler	2133
4.13.3	Register Dump and Backtrace	2134
4.13.4	GDB Stub	2137
4.13.5	RTC Watchdog Timeout	2137
4.13.6	Guru Meditation Errors	2138
4.13.7	Other Fatal Errors	2139
4.14	Flash Encryption	2141
4.14.1	Introduction	2142
4.14.2	Relevant eFuses	2142
4.14.3	Flash Encryption Process	2143
4.14.4	Flash Encryption Configuration	2143
4.14.5	Possible Failures	2149
4.14.6	ESP32-C6 Flash Encryption Status	2150
4.14.7	Reading and Writing Data in Encrypted Flash	2150
4.14.8	Updating Encrypted Flash	2151
4.14.9	Disabling Flash Encryption	2152
4.14.10	Key Points About Flash Encryption	2152
4.14.11	Limitations of Flash Encryption	2153
4.14.12	Flash Encryption and Secure Boot	2153
4.14.13	Advanced Features	2153
4.14.14	Technical Details	2155
4.15	Hardware Abstraction	2155
4.15.1	Architecture	2155
4.15.2	LL (Low Level) Layer	2156
4.15.3	HAL (Hardware Abstraction Layer)	2157
4.16	JTAG Debugging	2158
4.16.1	Introduction	2158
4.16.2	How it Works?	2159
4.16.3	Selecting JTAG Adapter	2159
4.16.4	Setup of OpenOCD	2160
4.16.5	Configuring ESP32-C6 Target	2160
4.16.6	Launching Debugger	2163

4.16.7	Debugging Examples	2163
4.16.8	Building OpenOCD from Sources	2164
4.16.9	Tips and Quirks	2168
4.16.10	Related Documents	2173
4.17	Linker Script Generation	2198
4.17.1	Overview	2199
4.17.2	Quick Start	2199
4.17.3	Linker Script Generation Internals	2202
4.18	lwIP	2208
4.18.1	Supported APIs	2208
4.18.2	BSD Sockets API	2209
4.18.3	Netconn API	2212
4.18.4	lwIP FreeRTOS Task	2213
4.18.5	IPv6 Support	2213
4.18.6	esp-lwip custom modifications	2214
4.18.7	Performance Optimization	2215
4.19	Memory Types	2216
4.19.1	DRAM (Data RAM)	2216
4.19.2	IRAM (Instruction RAM)	2217
4.19.3	IROM (code executed from flash)	2218
4.19.4	DROM (data stored in flash)	2218
4.19.5	RTC FAST memory	2218
4.19.6	DMA Capable Requirement	2218
4.19.7	DMA Buffer in the Stack	2219
4.20	OpenThread	2219
4.20.1	Modes of the OpenThread stack	2219
4.20.2	How to Write an OpenThread Application	2220
4.20.3	The OpenThread Border Router	2221
4.21	Partition Tables	2221
4.21.1	Overview	2221
4.21.2	Built-in Partition Tables	2222
4.21.3	Creating Custom Tables	2222
4.21.4	Generating Binary Partition Table	2225
4.21.5	Partition Size Checks	2225
4.21.6	Flashing the Partition Table	2225
4.21.7	Partition Tool (parttool.py)	2226
4.22	Performance	2227
4.22.1	How to Optimize Performance	2227
4.22.2	Guides	2227
4.23	Reproducible Builds	2245
4.23.1	Introduction	2245
4.23.2	Reasons for non-reproducible builds	2245
4.23.3	Enabling reproducible builds in ESP-IDF	2245
4.23.4	How reproducible builds are achieved	2245
4.23.5	Reproducible builds and debugging	2246
4.23.6	Factors which still affect reproducible builds	2246
4.24	RF Calibration	2246
4.24.1	Partial Calibration	2246
4.24.2	Full Calibration	2246
4.24.3	No Calibration	2247
4.24.4	PHY Initialization Data	2247
4.24.5	API Reference	2247
4.25	Security	2254
4.25.1	Goals	2254
4.25.2	Platform Security	2255
4.25.3	Network Security	2256
4.25.4	Product Security	2257
4.25.5	Security Policy	2258

4.26	Secure Boot V2	2259
4.26.1	Background	2259
4.26.2	Advantages	2259
4.26.3	Secure Boot V2 Process	2259
4.26.4	Signature Block Format	2260
4.26.5	Secure Padding	2261
4.26.6	Verifying a Signature Block	2262
4.26.7	Verifying an Image	2262
4.26.8	Bootloader Size	2262
4.26.9	eFuse usage	2262
4.26.10	How To Enable Secure Boot V2	2263
4.26.11	Restrictions after Secure Boot is enabled	2264
4.26.12	Generating Secure Boot Signing Key	2264
4.26.13	Remote Signing of Images	2264
4.26.14	Secure Boot Best Practices	2265
4.26.15	Key Management	2265
4.26.16	Multiple Keys	2266
4.26.17	Key Revocation	2266
4.26.18	Technical Details	2267
4.26.19	Secure Boot & Flash Encryption	2267
4.26.20	Signed App Verification Without Hardware Secure Boot	2267
4.26.21	Advanced Features	2268
4.27	Thread Local Storage	2268
4.27.1	Overview	2268
4.27.2	FreeRTOS Native APIs	2268
4.27.3	Pthread APIs	2269
4.27.4	C11 Standard	2269
4.28	Tools	2269
4.28.1	IDF Frontend - idf.py	2269
4.28.2	IDF Docker Image	2273
4.28.3	IDF Windows Installer	2275
4.28.4	IDF Component Manager	2276
4.28.5	IDF Clang Tidy	2278
4.28.6	Downloadable Tools	2278
4.29	Unit Testing in ESP32-C6	2292
4.29.1	Normal Test Cases	2292
4.29.2	Multi-device Test Cases	2293
4.29.3	Multi-stage Test Cases	2294
4.29.4	Tests For Different Targets	2294
4.29.5	Building Unit Test App	2295
4.29.6	Running Unit Tests	2295
4.29.7	Timing Code with Cache Compensated Timer	2296
4.29.8	Mocks	2297
4.30	Running Applications on Host	2299
4.30.1	Introduction	2299
4.30.2	Requirements	2300
4.30.3	Build and Run	2301
4.30.4	Component Linux/Mock Support Overview	2301
4.31	USB Serial/JTAG Controller Console	2301
4.31.1	Hardware Requirements	2302
4.31.2	Software Configuration	2302
4.31.3	Uploading the Application	2302
4.31.4	Limitations	2302
4.32	Wi-Fi Driver	2303
4.32.1	ESP32-C6 Wi-Fi Feature List	2303
4.32.2	How To Write a Wi-Fi Application	2303
4.32.3	ESP32-C6 Wi-Fi API Error Code	2304
4.32.4	ESP32-C6 Wi-Fi API Parameter Initialization	2305

4.32.5	ESP32-C6 Wi-Fi Programming Model	2305
4.32.6	ESP32-C6 Wi-Fi Event Description	2305
4.32.7	ESP32-C6 Wi-Fi Station General Scenario	2308
4.32.8	ESP32-C6 Wi-Fi AP General Scenario	2311
4.32.9	ESP32-C6 Wi-Fi Scan	2311
4.32.10	ESP32-C6 Wi-Fi Station Connecting Scenario	2318
4.32.11	ESP32-C6 Wi-Fi Station Connecting When Multiple APs Are Found	2325
4.32.12	Wi-Fi Reconnect	2325
4.32.13	Wi-Fi Beacon Timeout	2325
4.32.14	ESP32-C6 Wi-Fi Configuration	2326
4.32.15	Wi-Fi Easy Connect™ (DPP)	2332
4.32.16	Wireless Network Management	2332
4.32.17	Radio Resource Measurement	2333
4.32.18	Fast BSS Transition	2333
4.32.19	ESP32-C6 Wi-Fi Power-saving Mode	2333
4.32.20	ESP32-C6 Wi-Fi Throughput	2335
4.32.21	Wi-Fi 80211 Packet Send	2335
4.32.22	Wi-Fi Sniffer Mode	2337
4.32.23	Wi-Fi Multiple Antennas	2338
4.32.24	Wi-Fi Channel State Information	2339
4.32.25	Wi-Fi Channel State Information Configure	2341
4.32.26	Wi-Fi HT20/40	2341
4.32.27	Wi-Fi QoS	2341
4.32.28	Wi-Fi AMSDU	2342
4.32.29	Wi-Fi Fragment	2342
4.32.30	WPS Enrollee	2342
4.32.31	Wi-Fi Buffer Usage	2342
4.32.32	How to Improve Wi-Fi Performance	2343
4.32.33	Wi-Fi Menuconfig	2345
4.32.34	Troubleshooting	2348
4.33	Wi-Fi Security	2351
4.33.1	ESP32-C6 Wi-Fi Security Features	2351
4.33.2	Protected Management Frames (PMF)	2354
4.33.3	WiFi Enterprise	2355
4.33.4	WPA3-Personal	2355
4.33.5	Wi-Fi Enhanced Open™	2356
<b>5</b>	<b>Migration Guides</b>	<b>2359</b>
5.1	ESP-IDF 5.x Migration Guide	2359
5.1.1	Migration from 4.4 to 5.0	2359
5.1.2	Migration from 5.0 to 5.1	2390
<b>6</b>	<b>Libraries and Frameworks</b>	<b>2393</b>
6.1	Cloud Frameworks	2393
6.1.1	ESP RainMaker	2393
6.1.2	AWS IoT	2393
6.1.3	Azure IoT	2393
6.1.4	Google IoT Core	2393
6.1.5	Aliyun IoT	2393
6.1.6	Joylink IoT	2393

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#), [ESP32-C](#) and [ESP32-H Series SoCs](#).

This document describes using ESP-IDF with the ESP32-C6 SoC.

		
<a href="#">Get Started</a>	<a href="#">API Reference</a>	<a href="#">API Guides</a>

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C6 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C6 board.

---

**Note:** This is documentation for stable version v5.1.2 of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-C6 is a system on a chip that integrates the following features:

- Wi-Fi 6 (2.4 GHz band)
- Bluetooth Low Energy
- 802.15.4 Thread/Zigbee
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Built-in security hardware

Powered by 40 nm technology, ESP32-C6 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C6 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An **ESP32-C6** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

---

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

---

If you have one of ESP32-C6 official development boards listed below, you can click on the link to learn more about the hardware.

## 1.2.2 Software

To start using ESP-IDF on **ESP32-C6**, install the following software:

- **Toolchain** to compile code for ESP32-C6
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C6
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C6 and scripts to operate the **Toolchain**

## 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

### 1.3.1 IDE

---

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

## 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

### Standard Setup of Toolchain for Windows

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

---

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

---

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#).

**Components of the installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- [CMake](#) and [Ninja](#) build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (`cmd.exe`). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 1: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (`cmd.exe`):

**Using the Command Prompt** For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (`cmd.exe`) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7
Using Git in c:/Program Files/Git/cmd/

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 4: ESP-IDF Command Prompt

**First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C6 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-C6. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-C6 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C6](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-C6 as the target, and run the project configuration utility `menuconfig`.

## Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c6
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c6`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “hello\_word”, since this example runs with default configuration.

```

[F] Toggle show-help mode [C] Toggle show-name mode [A] Toggle show-all mode
[Q] Quit (prompts for save) [D] Save minimal config (advanced)

```

Fig. 5: Project configuration - Home window

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_esp component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build will finish by generating the firmware binary `.bin` files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-C6 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-C6 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See this [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-C6](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool esp32c6 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↪reset --no-stub write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB↪
↪0x0 bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↪partition-table.bin
esptool.py v4.3

```

(continues on next page)

(continued from previous page)

```
Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
This is esp32c6 chip with 1 CPU core(s), WiFi/BLE, 802.15.4 (Zigbee/Thread), ↵
↪silicon revision v0.0, 2 MB external flash
Minimum free heap size: 473816 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

**That’s all that you need to get started with ESP32-C6!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C6 because required hardware is not included in ESP32-C6 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C6 target, or the table does not exist at all, the example will work on ESP32-C6.

## Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C6. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents** For advanced users who want to customize the install process:

- [Updating ESP-IDF tools on Windows](#)
- [Establish Serial Connection with ESP32-C6](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

## Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is C:\Users\username\.espressif.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt” . This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export .ps1`:

```
cd ~/esp/esp-idf
export .ps1
```

When this is done, the tools will be available in this command prompt.

### Establish Serial Connection with ESP32-C6

Establishing a serial connection with the ESP32-C6 target device could be done using USB-to-UART bridge or USB peripheral supported in ESP32-C6.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**Supported USB Peripheral** The ESP32-C6 supports the USB peripheral. In this case, the USB-to-UART bridge is not needed and the device can be flashed directly.

Fig. 6: SoC with Supported USB

Apart from the USB peripheral, some development boards also include the USB-to-UART bridge.

**USB-to-UART Bridge on Development Board** For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-C6 is UART.

**External USB-to-UART Bridge** Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

**Flash using USB** For the ESP32-C6, the USB peripheral is available, allowing you to flash the binaries without the need for an external USB-to-UART bridge.

The USB on the ESP32-C6 uses the **GPIO13** for **D+** and **GPIO12** for **D-**.

---

**Note:** The ESP32-C6 supports only *USB CDC* and *JTAG*.

---

If you are flashing for the first time, you need to get the ESP32-C6 into the download mode manually. To do so, press and hold the `BOOT` button and then press the `RESET` button once. After that release the `BOOT` button.

Fig. 7: Development Board with USB-to-UART Bridge

Fig. 8: External USB-to-UART Bridge

**Flash using UART** This section provides guidance on how to establish a serial connection between ESP32-C6 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-C6 to PC** Connect the ESP32-C6 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-C6 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-C6 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing `BAUD` with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the `BOOT` button and then press the `RESET` button once. After that release the `BOOT` button.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C6 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

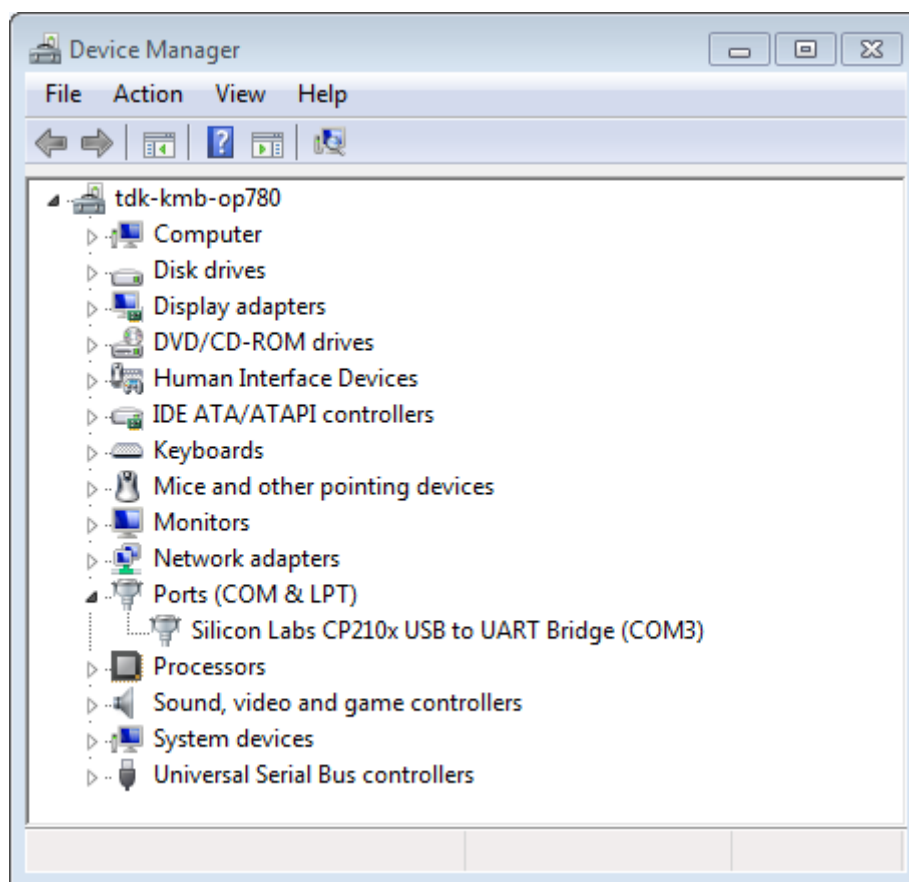

Fig. 9: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

**Check port on Linux and macOS** To check the device name for the serial port of your ESP32-C6 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

**Note:** macOS users: if you don't see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-C6 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

**Adding user to dialout on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

Fig. 10: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection** Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C6.

The default console baud rate on ESP32-C6 is 115200.

**Windows and Linux** In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 11: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-C6. The log contents will depend on application loaded to ESP32-C6, see [Example Output](#).

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

Fig. 12: Setting Serial Communication in PuTTY on Linux

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in [Check port on Linux and macOS](#), run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-C6, see [Example Output](#). To exit the **screen** session type Ctrl-A + \.

---

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TGWDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-C6.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C6 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from [Step 5. First Steps on ESP-IDF](#) when installing s/w for ESP32-C6 development, then you can continue with [Step 5. First Steps on ESP-IDF](#).

## Flashing Troubleshooting

**Failed to Connect** If you run the given command and see errors such as “Failed to connect” , there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called

by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the [esptool troubleshooting](#) page.

`esptool.py` resets ESP32-C6 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C6](#)). The DTR and RTS control lines are in turn connected to `GPIO9` and `CHIP_PU (EN)` pins of ESP32-C6, thus changes in the voltage levels of DTR and RTS will boot ESP32-C6 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C6 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the `BOOT` button (`GPIO9`) and press the `EN` button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO9` down.

### **IDF Monitor**

IDF Monitor uses the [esp-idf-monitor](#) package as a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	
Ctrl+C	Interrupt running application	Pauses IDF Monitor and runs GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### IDF-specific features

**Automatic Address Decoding** Whenever the chip outputs a hexadecimal address that points to executable code, IDF monitor looks up the location in the source code (file name and line number) and prints the location on the next line in yellow.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```

abort() was called at PC 0x42067cd5 on core 0

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

If an address is not matched in the app source code, IDF monitor also checks the ROM code. Instead of printing the source file name and line number, only the function name followed by in ROM is displayed:

```

The ROM ELF file is automatically loaded from a location based on the `IDF_PATH` and `ESP_ROM_ELF_DIR` environment variables. This can be overridden by calling `esp_idf_monitor` and providing a path to a specific ROM ELF file: `python -m esp_idf_monitor --rom-elf-file [path to ROM ELF file]`.

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `esp_idf_monitor` with specific command line option: `python -m esp_idf_monitor --disable-address-decoding` to disable address decoding.

**Target Reset on Connection** By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf.py monitor --no-reset`).

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

**Launching GDB with GDBStub** GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board's Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↵interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for *logging*.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

---

**Note:** Use primary logging to disable at compilation the outputs you do not need through the [logging library](#). Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

---

Your app tags must not contain spaces, asterisks \*, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- \* can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for \*.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## Known Issues with IDF Monitor

### Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

## Standard Toolchain Setup for Linux and macOS

**Installation Step by Step** This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment** These are the steps for setting up the ESP-IDF for your ESP32-C6.

- *Step 1. Install Prerequisites*
- *Step 2. Get ESP-IDF*
- *Step 3. Set up the tools*
- *Step 4. Set up the environment variables*
- *Step 5. First Steps on ESP-IDF*

**Step 1. Install Prerequisites** In order to use ESP-IDF with the ESP32-C6, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

**For Linux Users** To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja ccache dfu-util libusb
```

---

### Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf\_tools.py install cmake” to install a suitable version if your OS versions doesn’ t have one.
  - If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
-

**For macOS Users** ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),  
↳missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is  
↳present, but tool was not found  
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to  
↳install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-  
↳patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-C6, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b v5.1.1.2 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-C6.

```
cd ~/esp/esp-idf
./install.sh esp32c6
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c6
```

The above commands install tools for ESP32-C6 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

---

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable_
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

---

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the `esp-idf` environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C6 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-C6. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-C6 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C6](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-C6 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32c6
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c6`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for “`hello_world`”, since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-C6 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-C6 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See this [Flashing Troubleshooting](#) page or [Establish Serial Connection with](#)

[ESP32-C6](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool esp32c6 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↳reset --no-stub write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB_
↳0x0 bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↳partition-table.bin
esptool.py v4.3
Serial port /dev/ttyUSB0
Connecting....
Chip is ESP32-C6 (revision v0.0)
Features: WiFi 6, BT 5
Crystal is 40MHz

Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCoDe Extension](#).

**Monitor the Output** To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...

↪silicon revision v0.0, 2 MB external flash
Minimum free heap size: 473816 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

---

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

---

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

### That’s all that you need to get started with ESP32-C6!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-C6 because required hardware is not included in ESP32-C6 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C6 target, or the table does not exist at all, the example will work on ESP32-C6.

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C6. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

## 1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

## 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

# Chapter 2

## API Reference

### 2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the [ESP-IDF CMake Build System API](#).
- *Kconfig* options can be used in code and in the build system (`CMakeLists.txt`) files.
- *Host tools* and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components will contain an “ESP-IDF specific” wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF’s features. In other cases, third-party components will present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

#### 2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Codes Reference](#) contains the list of error codes returned by ESP-IDF components.

#### 2.1.2 Configuration Structures

---

**Important:** Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.

---

Most initialization, configuration, and installation functions in ESP-IDF (typically named `..._init()`, `..._config()`, and `..._install()`) take a configuration structure pointer as an argument. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
↳ initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

/**/
/* Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see [Designated Initializers](#). Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

## Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are_
↳ set to the default values, and any field can still be modified: */
config.server_port = 8081;
```

(continues on next page)

```
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as *hal* only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [Versioning Scheme](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system's [backward compatibility](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.

## Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration Structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

## Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that don't fall into the categories below.

- [Private APIs](#).
- [Components in Example Projects](#).
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of [Kconfig](#) options in `menuconfig`.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO port

Asio is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`

### Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

### 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESP-Modbus component on GitHub](#)

### Hosted Documentation

The documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

### Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example README.md for details.

### Protocol References

- <https://modbus.org/specs.php>: Modbus Organization with protocol specifications.

## 2.2.3 ESP-MQTT

### Overview

ESP-MQTT is an implementation of [MQTT](#) protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports [MQTT v5.0](#).

### Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

### Application Examples

- [protocols/mqtt/tcp](#): MQTT over TCP, default port 1883
- [protocols/mqtt/ssl](#): MQTT over TLS, default port 8883
- [protocols/mqtt/ssl\\_ds](#): MQTT over TLS using digital signature peripheral for authentication, default port 8883
- [protocols/mqtt/ssl\\_mutual\\_auth](#): MQTT over TLS using certificates for authentication, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over TLS using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over WebSocket, default port 80
- [protocols/mqtt/wss](#): MQTT over WebSocket Secure, default port 443
- [protocols/mqtt5](#): Uses ESP-MQTT library to connect to broker with MQTT v5.0

## MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`.

Messages with QoS 0 will be sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

## Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

## Broker

**Address** Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`.

- Currently support `mqtt`, `mqtt`s, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtt`s://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
  - `mqtt`s://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
```

(continues on next page)

(continued from previous page)

```
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, \
↪client);
esp_mqtt_client_start(client);
```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification** For secure connections with TLS used, and to guarantee Broker' s identity, the *verification* struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent *certificate\_len* field must be set. Otherwise, a null-terminated string in PEM format should be provided to *certificate* field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

```
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↪null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- Check the sample application: [protocols/mqtt/ssl](#)
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};
```

For details about other fields, please check the [API Reference](#) and [TLS Server verification](#).

**Client Credentials** All client related credentials are under the *credentials* field.

- *username*: pointer to the username used for connecting to the broker, can also be set by URI
- *client\_id*: pointer to the client ID, defaults to ESP32\_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It' s possible to set authentication parameters through the *authentication* field. The client supports the following authentication methods:

- *password*: use a password by setting
- *certificate* and *key*: mutual authentication with TLS, and both can be provided in PEM or DER format
- *use\_secure\_element*: use secure element available in ESP32-WROOM-32SE
- *ds\_data*: use Digital Signature Peripheral available in some Espressif devices

**Session** For MQTT session related configurations, *session* fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the *last\_will* struct.

- *topic*: pointer to the LWT message topic
- *msg*: pointer to the LWT message
- *msg\_len*: length of the LWT message, required if *msg* is not null-terminated
- *qos*: quality of service for the LWT message
- *retain*: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component `config>ESP-MQTT Configuration`.

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: enable 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL` and `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: disable default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. The field `error_handle` in the event data contains `error_type` that can be used to identify the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` \*config)

Creates *MQTT* client handle based on the configuration.

**Parameters** `config` –*MQTT* configuration structure

**Returns** `mqtt_client_handle` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char \*uri)

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Parameters**

- `client` –*MQTT* client handle
- `uri` –

**Returns** `ESP_FAIL` if URI parse error, `ESP_OK` on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts *MQTT* client with already created client handle.

**Parameters** `client` –*MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

*esp\_err\_t* **esp\_mqtt\_client\_reconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force reconnection upon a specific event.

**Parameters** **client** –MQTT client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

*esp\_err\_t* **esp\_mqtt\_client\_disconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force disconnection from the broker.

**Parameters** **client** –MQTT client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_client\_stop** (*esp\_mqtt\_client\_handle\_t* client)

Stops MQTT client tasks.

- Notes:
- Cannot be called from the MQTT event handler

**Parameters** **client** –MQTT client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

int **esp\_mqtt\_client\_subscribe\_single** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

**Parameters**

- **client** –MQTT client handle
- **topic** –topic filter to subscribe
- **qos** –Max qos level of the subscription

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_subscribe\_multiple** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_topic\_t* \*topic\_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

**Parameters**

- **client** –MQTT client handle
- **topic\_list** –List of topics to subscribe
- **size** –size of topic\_list

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

#### Parameters

- **client** –MQTT client handle
- **topic** –

**Returns** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

#### Parameters

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag

**Returns** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure, -2 in case of full outbox.

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

#### Parameters

- **client** –MQTT client handle
- **topic** –topic string
- **data** –payload string (set to NULL, sending empty payload message)
- **len** –data length, if set to 0, length is calculated from payload string
- **qos** –QoS of publish message
- **retain** –retain flag
- **store** –if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message\_id if queued successfully, -1 on failure, -2 in case of full outbox.

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the MQTT event handler

**Parameters** `client` –MQTT client handle

**Returns** ESP\_OK ESP\_ERR\_INVALID\_ARG on wrong initialization

`esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`

Set configuration structure, typically used when updating the config (i.e. on “before\_connect” event).

**Parameters**

- `client` –MQTT client handle
- `config` –MQTT configuration structure

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

`esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`

Registers MQTT event.

**Parameters**

- `client` –MQTT client handle
- `event` –event type
- `event_handler` –handler callback
- `event_handler_arg` –handlers context

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_OK on success

`esp_err_t esp_mqtt_client_unregister_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)`

Unregisters mqtt event.

**Parameters**

- `client` –mqtt client handle
- `event` –event ID
- `event_handler` –handler to unregister

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on invalid event ID ESP\_OK on success

`int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)`

Get outbox size.

**Parameters** `client` –MQTT client handle

**Returns** outbox size 0 on wrong initialization

`esp_err_t esp_mqtt_dispatch_custom_event(esp_mqtt_client_handle_t client, esp_mqtt_event_t *event)`

Dispatch user event to the mqtt internal event loop.

**Parameters**

- `client` –MQTT client handle
- `event` –MQTT event handle structure

**Returns** ESP\_OK on success ESP\_ERR\_TIMEOUT if the event couldn't be queued (ref also CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE)

## Structures

struct `esp_mqtt_error_codes`

MQTT error code structure to be passed as a contextual information into ERROR event

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from `tcp_transport/esp-tls` | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from *MQTT* broker on connection |

### Public Members

*esp\_err\_t* `esp_tls_last_esp_err`

last `esp_err` code reported from `esp-tls` component

int `esp_tls_stack_err`

tls specific error code reported from underlying tls stack

int `esp_tls_cert_verify_flags`

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* `error_type`

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* `connect_return_code`

connection refused error code reported from MQTT\* broker on connection

int `esp_transport_sock_errno`

errno from the underlying socket

struct `esp_mqtt_event_t`

*MQTT* event configuration structure

### Public Members

*esp\_mqtt\_event\_id\_t* `event_id`

*MQTT* event type

*esp\_mqtt\_client\_handle\_t* `client`

*MQTT* client handle for this event

char \*`data`

Data associated with this event

int `data_len`

Length of the data for this event

int `total_data_len`

Total length of the data (longer data are supplied with multiple events)

int `current_data_offset`

Actual offset for the data associated with this event

char **\*topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

*MQTT* message id of message

int **session\_present**

*MQTT* session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* **\*error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection, defaults to value from menuconfig

struct **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t* **broker**

Broker address and security verification

struct *esp\_mqtt\_client\_config\_t::credentials\_t* **credentials**

User credentials for broker

struct *esp\_mqtt\_client\_config\_t::session\_t* **session**

*MQTT* session configuration.

struct *esp\_mqtt\_client\_config\_t::network\_t* **network**

Network configuration

struct *esp\_mqtt\_client\_config\_t::task\_t* **task**

FreeRTOS task configuration.

struct *esp\_mqtt\_client\_config\_t::buffer\_t* **buffer**

Buffer size configuration.

struct *esp\_mqtt\_client\_config\_t::outbox\_config\_t* **outbox**

Outbox configuration.

struct **broker\_t**

Broker related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t::address\_t* **address**

Broker address configuration

struct *esp\_mqtt\_client\_config\_t::broker\_t::verification\_t* **verification**

Security verification of the broker

struct **address\_t**

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

### Public Members

const char \***uri**

Complete *MQTT* broker URI

const char \***hostname**

Hostname, to set ipv4 pass it as string)

*esp\_mqtt\_transport\_t* **transport**

Selects transport

const char \***path**

Path in the URI

uint32\_t **port**

*MQTT* server port

struct **verification\_t**

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

### Public Members

bool **use\_global\_ca\_store**

Use a global ca\_store, look esp-tls documentation for details.

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char \***certificate**

Certificate data, default is NULL, not required to verify the server.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const struct *psk\_key\_hint* \***psk\_hint\_key**

Pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char \*\***alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip\_cert\_common\_name\_check=true.

struct **buffer\_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

### Public Members

int **size**

size of *MQTT* send/receive buffer

int **out\_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials\_t**

Client related credentials for authentication.

### Public Members

const char \***username**

*MQTT* username

const char \***client\_id**

Set *MQTT* client identifier. Ignored if `set_null_client_id == true` If NULL set the default client id. Default client id is `ESP32_CHIPID%` where `CHIPID%` are last 3 bytes of MAC address in hex format

bool **set\_null\_client\_id**

Selects a NULL client id

struct *esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t* **authentication**

Client authentication

struct **authentication\_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

### Public Members

const char \***password**

*MQTT* password

const char \***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const char \***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided.

size\_t **key\_len**

Length of the buffer pointed to by key.

const char \***key\_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key\_password\_len**

Length of the password pointed to by `key_password`

bool **use\_secure\_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void **\*ds\_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct **network\_t**

Network related configuration

### Public Members

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

bool **disable\_auto\_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

esp\_transport\_handle\_t **transport**

Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when `esp_mqtt_client_destroy` is called.

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

struct **outbox\_config\_t**

Client outbox configuration options.

### Public Members

uint64\_t **limit**

Size limit for the outbox in bytes.

struct **session\_t**

*MQTT* Session related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::session\_t::last\_will\_t* **last\_will**

Last will configuration

bool **disable\_clean\_session**

*MQTT* clean session, default clean\_session is true

int **keepalive**

*MQTT* keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection.

int **message\_retransmit\_timeout**

timeout for retransmitting of failed packet

struct **last\_will\_t**

Last Will and Testament message configuration.

### Public Members

const char **\*topic**

LWT (Last Will and Testament) message topic

const char **\*msg**

LWT message, may be NULL terminated

int **msg\_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**

LWT retained message flag

struct **task\_t**

Client task configuration

### Public Members

int **priority**

*MQTT* task priority

int **stack\_size**  
*MQTT* task stack size

struct **topic\_t**  
Topic definition struct

### Public Members

const char \***filter**  
Topic filter to subscribe

int **qos**  
Max QoS level of the subscription

### Macros

#### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

**MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT** error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from **MQTT\_ERROR\_TYPE\_ESP\_TLS** layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**esp\_mqtt\_client\_subscribe** (client\_handle, topic\_type, qos\_or\_size)

Convenience macro to select subscribe function to use.

Notes:

- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

#### Parameters

- **client\_handle** –*MQTT* client handle
- **topic\_type** –Needs to be char\* for single subscription or `esp_mqtt_topic_t` for multiple topics
- **qos\_or\_size** –It's either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

### Type Definitions

typedef struct esp\_mqtt\_client \***esp\_mqtt\_client\_handle\_t**

typedef enum *esp\_mqtt\_event\_id\_t* **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

typedef enum *esp\_mqtt\_connect\_return\_code\_t* **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_error\_type\_t* **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_transport\_t* **esp\_mqtt\_transport\_t**

typedef enum *esp\_mqtt\_protocol\_ver\_t* **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

typedef struct *esp\_mqtt\_error\_codes* **esp\_mqtt\_error\_codes\_t**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

| `error_type` | related member variables | note | | `MQTT_ERROR_TYPE_TCP_TRANSPORT` | `esp_tls_last_esp_err`, `esp_tls_stack_err`, `esp_tls_cert_verify_flags`, `sock_errno` | Error reported from `tcp_transport/esp-tls` | | `MQTT_ERROR_TYPE_CONNECTION_REFUSED` | `connect_return_code` | Internal error reported from *MQTT* broker on connection |

typedef struct *esp\_mqtt\_event\_t* **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

typedef *esp\_mqtt\_event\_t* \***esp\_mqtt\_event\_handle\_t**

typedef struct *esp\_mqtt\_client\_config\_t* **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via `menuconfig`
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related `len` field set to 0. DER format requires a related `len` field set to the correct length.

typedef struct *topic\_t* **esp\_mqtt\_topic\_t**

Topic definition struct

## Enumerations

enum **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

Values:

enumerator **MQTT\_EVENT\_ANY**

enumerator **MQTT\_EVENT\_ERROR**

on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

enumerator **MQTT\_EVENT\_CONNECTED**

connected event, additional context: session\_present flag

enumerator **MQTT\_EVENT\_DISCONNECTED**

disconnected event

enumerator **MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- msg\_id message id
- error\_handle `error_type` in case subscribing failed
- data pointer to broker response, check for errors.
- data\_len length of the data for this event

enumerator **MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event, additional context: msg\_id

enumerator **MQTT\_EVENT\_PUBLISHED**

published event, additional context: msg\_id

enumerator **MQTT\_EVENT\_DATA**

data event, additional context:

- msg\_id message id
- topic pointer to the received topic
- topic\_len length of the topic
- data pointer to the received data
- data\_len length of the data for this event
- current\_data\_offset offset of the current data for this event
- total\_data\_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple MQTT\_EVENT\_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

enumerator **MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: msg\_id (id of the deleted message).

enumerator **MQTT\_USER\_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

enum **esp\_mqtt\_connect\_return\_code\_t**

MQTT connection error codes propagated via ERROR event

Values:

enumerator **MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

enumerator **MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

*MQTT* connection refused reason: Wrong protocol

enumerator **MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

*MQTT* connection refused reason: ID rejected

enumerator **MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

*MQTT* connection refused reason: Server unavailable

enumerator **MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

*MQTT* connection refused reason: Wrong user

enumerator **MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

*MQTT* connection refused reason: Wrong username or password

enum **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

enumerator **MQTT\_ERROR\_TYPE\_NONE**

enumerator **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT**

enumerator **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED**

enumerator **MQTT\_ERROR\_TYPE\_SUBSCRIBE\_FAILED**

enum **esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

*MQTT* over TCP, using scheme: *MQTT*

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

*MQTT* over SSL, using scheme: *MQTTS*

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

*MQTT* over WebSocket, using scheme: *ws*

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

*MQTT* over WebSocket Secure, using scheme: *wss*

enum **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

enumerator **MQTT\_PROTOCOL\_V\_5**

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

```

├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h

```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

## TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **ca\_cert\_buf** and **ca\_cert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `ca_cert_buf` - pointer to the buffer which contains the CA cert.
  - `ca_cert_bytes` - size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key**: To use pre-shared keys for server verification, [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#) should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling [CONFIG\\_ESP\\_TLS\\_INSECURE](#) and [CONFIG\\_ESP\\_TLS\\_SKIP\\_SERVER\\_CERT\\_VERIFY](#) in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

## ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the mbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc). To enable this feature, please enable [CONFIG\\_ESP\\_TLS\\_SERVER\\_CERT\\_SELECT\\_HOOK](#) in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

## Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**Note:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

---

**Note:** *These values are subject to change with change in configuration options and version of respective libraries.*

---

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-C6. Use of the DS for TLS is supported only when ESP-TLS is used with mbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature Documentation](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in [ESP32-C6 Technical Reference Manual > Digital Signature \(DS\) \[PDF\]](#). The DS peripheral must be configured before it can be used to perform Digital Signature, see [Configure the DS Peripheral](#) in [Digital Signature](#).

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```

#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
↳the nvs or
provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};

```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (*clientcert\_buf*) and the DS params (*ds\_data*) are required and the client key (*clientkey\_buf*) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at [ssl mutual auth](#) which internally uses (ESP-TLS) for the TLS connection.

## API Reference

### Header File

- [components/esp-tls/esp\\_tls.h](#)

### Functions

*esp\_tls\_t* \***esp\_tls\_init** (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns** *tls* Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp\_tls\_t* \***esp\_tls\_conn\_http\_new** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is *esp\_tls\_conn\_http\_new\_sync* (and its asynchronous version *esp\_tls\_conn\_http\_new\_async*)

#### Parameters

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.

**Returns** pointer to *esp\_tls\_t*, or NULL if connection couldn’t be opened.

int **esp\_tls\_conn\_new\_sync** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### Parameters

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to *esp\_tls\_cfg\_t*. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_http\_new\_sync** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new_sync()` API. However this API accepts host’s url.

**Parameters**

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘*esp\_tls\_cfg\_t*’. At a minimum, this structure should be zero-initialized.
- **tls** –[in] Pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_new\_async** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Parameters**

- **hostname** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*. `non_block` member of this structure should be set to be true.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp\_tls\_conn\_http\_new\_async** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host’s url.

**Parameters**

- **url** –[in] url of host.
- **cfg** –[in] TLS configuration as *esp\_tls\_cfg\_t*.
- **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer ‘data’ into specified tls connection.

**Parameters**

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer from which data will be written.
- **datalen** –[in] Length of data buffer.

**Returns**

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

`ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)`

Read from specified tls connection into the buffer 'data' .

#### Parameters

- **tls** –[in] pointer to esp-tls as esp-tls handle.
- **data** –[in] Buffer to hold read data.
- **datalen** –[in] Length of data buffer.

#### Returns

- $> 0$  if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- $0$  if read operation was not successful. The underlying connection was closed.
- $< 0$  if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

`int esp_tls_conn_destroy(esp_tls_t *tls)`

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

**Parameters** **tls** –[in] pointer to esp-tls as esp-tls handle.

**Returns** -  $0$  on success

- $-1$  if socket error or an invalid argument

`ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)`

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls' `s_mbedtls_ssl_get_bytes_avail()` API.

**Parameters** **tls** –[in] pointer to esp-tls as esp-tls handle.

#### Returns

- $-1$  in case of invalid arg
- bytes available in the application data record read buffer

`esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)`

Returns the connection socket file descriptor from esp\_tls session.

#### Parameters

- **tls** –[in] handle to esp\_tls context
- **sockfd** –[out] int pointer to sockfd value.

**Returns** - `ESP_OK` on success and value of sockfd will be updated with socket file descriptor for connection

- `ESP_ERR_INVALID_ARG` if  $(tls == NULL \parallel sockfd == NULL)$

`esp_err_t esp_tls_set_conn_sockfd(esp_tls_t *tls, int sockfd)`

Sets the connection socket file descriptor for the esp\_tls session.

#### Parameters

- **tls** –[in] handle to esp\_tls context
- **sockfd** –[in] sockfd value to set.

**Returns** - `ESP_OK` on success and value of sockfd for the tls connection shall updated withthe provided value

- `ESP_ERR_INVALID_ARG` if  $(tls == NULL \parallel sockfd < 0)$

*esp\_err\_t* **esp\_tls\_get\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* \*conn\_state)

Gets the connection state for the esp\_tls session.

**Parameters**

- **tls** –[in] handle to esp\_tls context
- **conn\_state** –[out] pointer to the connection state value.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

*esp\_err\_t* **esp\_tls\_set\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* conn\_state)

Sets the connection state for the esp\_tls session.

**Parameters**

- **tls** –[in] handle to esp\_tls context
- **conn\_state** –[in] connection state value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

void **esp\_tls\_get\_ssl\_context** (*esp\_tls\_t* \*tls)

Returns the ssl context.

**Parameters** **tls** –[in] handle to esp\_tls context

**Returns** - ssl\_ctx pointer to ssl context of underlying TLS layer on success

- NULL in case of error

*esp\_err\_t* **esp\_tls\_init\_global\_ca\_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp\_tls\_set\_global\_ca\_store(). To be effective, this function must be called before any call to esp\_tls\_set\_global\_ca\_store().

**Returns**

- ESP\_OK if creating global CA store was successful.
- ESP\_ERR\_NO\_MEM if an error occurred when allocating the mbedTLS resources.

*esp\_err\_t* **esp\_tls\_set\_global\_ca\_store** (const unsigned char \*cacert\_pem\_buf, const unsigned int cacert\_pem\_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp\_tls\_init\_global\_ca\_store() if it has not already been called. The application must call this function before calling esp\_tls\_conn\_new().

**Parameters**

- **cacert\_pem\_buf** –[in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- **cacert\_pem\_bytes** –[in] Length of the buffer.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_tls\_free\_global\_ca\_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_last\_error** (*esp\_tls\_error\_handle\_t* h, int \*esp\_tls\_code, int \*esp\_tls\_flags)

Returns last error in `esp_tls` with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- **h** –[in] esp-tls error handle.
- **esp\_tls\_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`
- **esp\_tls\_flags** –[out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

**Returns**

- `ESP_ERR_INVALID_STATE` if invalid parameters
- `ESP_OK` (0) if no error occurred
- specific error code (based on `ESP_ERR_ESP_TLS_BASE`) otherwise

*esp\_err\_t* **esp\_tls\_get\_and\_clear\_error\_type** (*esp\_tls\_error\_handle\_t* h, *esp\_tls\_error\_type\_t* err\_type, int \*error\_code)

Returns the last error captured in `esp_tls` of a specific type The error information is cleared internally upon return.

**Parameters**

- **h** –[in] esp-tls error handle.
- **err\_type** –[in] specific error type
- **error\_code** –[out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about `esp_tls_code`

**Returns**

- `ESP_ERR_INVALID_STATE` if invalid parameters
- `ESP_OK` if a valid error returned and was cleared

*esp\_err\_t* **esp\_tls\_get\_error\_handle** (*esp\_tls\_t* \*tls, *esp\_tls\_error\_handle\_t* \*error\_handle)

Returns the ESP-TLS error\_handle.

**Parameters**

- **tls** –[in] handle to `esp_tls` context
- **error\_handle** –[out] pointer to the error handle.

**Returns**

- `ESP_OK` on success and `error_handle` will be updated with the ESP-TLS error handle.
- `ESP_ERR_INVALID_ARG` if (`tls == NULL` || `error_handle == NULL`)

`mbedtls_x509_crt` \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

---

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

**Returns**

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

*esp\_err\_t* **esp\_tls\_plain\_tcp\_connect** (const char \*host, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_error\_handle\_t* error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**

- **host** –[in] Hostname of the host.
- **hostlen** –[in] Length of hostname.
- **port** –[in] Port number of the host.

- **cfg** –[in] ESP-TLS configuration as `esp_tls_cfg_t`.
  - **error\_handle** –[out] ESP-TLS error handle holding potential errors occurred during connection
  - **sockfd** –[out] Socket descriptor if successfully connected on TCP layer
- Returns** `ESP_OK` on success `ESP_ERR_INVALID_ARG` if invalid output parameters ESP-TLS based error codes on failure

## Structures

struct **psk\_key\_hint**

ESP-TLS preshared key and hint structure.

### Public Members

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

struct **tls\_keep\_alive\_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time (second)

int **keep\_alive\_interval**

Keep-alive interval time (second)

int **keep\_alive\_count**

Keep-alive packet retry send count

struct **esp\_tls\_cfg**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).

- Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

## Public Members

const char **\*\*alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char **\*cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char **\*clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char **\*clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char **\*clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char \***clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

*esp\_tls\_addr\_family\_t* **addr\_family**

The address family to use when connecting to a host.

### Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp\_tls\_addr\_family* **esp\_tls\_addr\_family\_t**

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef struct esp\_tls **esp\_tls\_t**

### Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

enum **esp\_tls\_addr\_family**

*Values:*

enumerator **ESP\_TLS\_AF\_UNSPEC**

Unspecified address family.

enumerator **ESP\_TLS\_AF\_INET**

IPv4 address family.

enumerator **ESP\_TLS\_AF\_INET6**

IPv6 address family.

## Header File

- [components/esp-tls/esp\\_tls\\_errors.h](#)

## Structures

struct **esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

## Public Members

*esp\_err\_t* **last\_error**

error code (based on ESP\_ERR\_ESP\_TLS\_BASE) of the last occurred error

int **esp\_tls\_error\_code**

esp\_tls error code from last esp\_tls failed api

int **esp\_tls\_flags**

last certification verification flags

## Macros

### **ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

### **ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

### **ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

### **ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

### **ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

### **ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set/get socket option

### **ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

### **ESP\_ERR\_ESP\_TLS\_SE\_FAILED**

### **ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN**

### **ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

### **ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp\_tls\_conn\_read()
- esp\_tls\_conn\_write()

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE**

**ESP\_TLS\_ERR\_SSL\_TIMEOUT**

## Type Definitions

typedef struct *esp\_tls\_last\_error* \***esp\_tls\_error\_handle\_t**

typedef struct *esp\_tls\_last\_error* **esp\_tls\_last\_error\_t**

Error structure containing relevant errors in case tls error occurred.

## Enumerations

enum **esp\_tls\_error\_type\_t**

Definition of different types/sources of error codes reported from different components

*Values:*

enumerator **ESP\_TLS\_ERR\_TYPE\_UNKNOWN**

enumerator **ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error &#8212; errno

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type &#8212; esp\_err\_t

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type &#8212; invalid entry

## 2.2.5 ESP HTTP Client

### Overview

`esp_http_client` component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_handle_t` instance, i.e., an HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.

- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at [protocols/esp\\_http\\_client](#).

### Basic HTTP Request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

### Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

### HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

---

**Note:** While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in the `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

---

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example for implementation details of the above note.

### HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle.
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional).
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection.
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`.

- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

### ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one `perform` operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two `perform` operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

### Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

### ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with *the Event Loop library*. This feature has been added by keeping in mind the *ESP Insights* framework which collects the diagnostic information. However, this

feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

## API Reference

### Header File

- `components/esp_http_client/include/esp_http_client.h`

### Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` \*config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters** `config` –[in] The configurations, see `http_client_config_t`

**Returns**

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

---

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

---

**Parameters** **client** –The esp\_http\_client handle

**Returns**

- ESP\_OK on successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_http\_client\_cancel\_request** (*esp\_http\_client\_handle\_t* client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same esp\_http\_client context.

**Parameters** **client** –The esp\_http\_client handle

**Returns**

- ESP\_OK on successful
- ESP\_FAIL on error
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_INVALID\_STATE

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **url** –[in] The url

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_post\_field** (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before esp\_http\_client\_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **data** –[in] post data pointer
- **len** –[in] post length

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_get\_post\_field** (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Parameters**

- **client** –[in] The client
- **data** –[out] Point to post data pointer

**Returns** Size of post data

*esp\_err\_t* **esp\_http\_client\_set\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after esp\_http\_client\_init and before any perform function.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The header key
- **value** –[in] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp\_http\_client\_init.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The header key
- **value** –[out] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **value** –[out] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **username** –[in] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **value** –[out] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **password** –[in] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **auth\_type** –[in] The esp\_http\_client auth type

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*\*data)

Get http request user\_data. The value stored from the *esp\_http\_client\_config\_t* will be written to the address passed into data.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **data** –[out] A pointer to the pointer that will be set to user\_data.

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*data)

Set http request user\_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user' s behalf.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **data** –[in] The pointer to the user data

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session errno.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **method** –[in] The method

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **timeout\_ms** –[in] The timeout value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **key** –[in] The key

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **write\_len** –[in] HTTP Content length need to write to the server

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

**Returns**

- (-1) if any errors
- Length of data written

int64\_t **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* client)

This function need to call after esp\_http\_client\_open, it will read from http stream, process all receive headers.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp\_http\_client\_is\_chunked response)
- (-1: ESP\_FAIL) if any errors
- (-ESP\_ERR\_HTTP\_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns** true or false

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

---

**Note:** (-ESP\_ERR\_HTTP\_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

---

**Parameters**

- **client** –[in] The esp\_http\_client handle
- **buffer** –The buffer
- **len** –[in] The length

**Returns**

- (-1) if any errors
- Length of data was read

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after esp\_http\_client\_perform

**Parameters** **client** –[in] The esp\_http\_client handle

**Returns** Status code

`int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)`

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- (-1) Chunked transfer
- Content-Length value as bytes

`esp_err_t esp_http_client_close (esp_http_client_handle_t client)`

Close http connection, still kept all http request resources.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)`

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)`

Get transport type.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

`esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`void esp_http_client_add_auth (esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

---

**Parameters** `client` –[in] The `esp_http_client` handle

`bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

**Parameters** `client` –[in] The `esp_http_client` handle

**Returns**

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Parameters**

- **client** –[in] The `esp_http_client` handle
- **buffer** –The buffer
- **len** –[in] The buffer length

**Returns**

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Parameters**

- **client** –[in] The `esp_http_client` handle
- **len** –Length of data discarded

**Returns**

- ESP\_OK If successful, len will have discarded length
- ESP\_FAIL If failed to read response
- ESP\_ERR\_INVALID\_ARG If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

**Parameters**

- **client** –[in] The `esp_http_client` handle
- **url** –[inout] The buffer to store URL
- **len** –[in] The buffer length

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

**Parameters**

- **client** –[in] The `esp_http_client` handle
- **len** –[out] Variable to store length

**Returns**

- ESP\_OK If successful, len will have length of current chunk
- ESP\_FAIL If the server is not a chunked server
- ESP\_ERR\_INVALID\_ARG If the client or len are NULL

**Structures**

struct **esp\_http\_client\_event**

HTTP Client events data.

**Public Members**

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

esp\_http\_client\_handle\_t context

void **\*data**

data of the event

int **data\_len**

data length of data

void **\*user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char **\*header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header key

char **\*header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header value

struct **esp\_http\_client\_on\_data**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int64\_t **data\_process**

Total data processed

struct **esp\_http\_client\_redirect\_event\_data**

Argument structure for HTTP\_EVENT\_REDIRECT event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int **status\_code**

Status Code

struct **esp\_http\_client\_config\_t**

HTTP configuration.

**Public Members****const char \*url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

**const char \*host**

Domain or IP as string

**int port**

Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

**const char \*username**

Using for Http authentication

**const char \*password**

Using for Http authentication

***esp\_http\_client\_auth\_type\_t* auth\_type**

Http authentication type, see esp\_http\_client\_auth\_type\_t

**const char \*path**

HTTP Path, if not set, default is /

**const char \*query**

HTTP query

**const char \*cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

**size\_t cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

**const char \*client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

**size\_t client\_cert\_len**

Length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem

**const char \*client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

**size\_t client\_key\_len**

Length of the buffer pointed to by client\_key\_pem. May be 0 for null-terminated pem

**const char \*client\_key\_password**

Client key decryption password string

**size\_t client\_key\_password\_len**

String length of the password pointed to by client\_key\_password

const char \***user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see *esp\_http\_client\_transport\_t*

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void \***user\_data**

HTTP user\_data context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to *esp\_cert\_bundle\_attach*. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

void **\*ds\_data**

Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

## Type Definitions

typedef struct esp\_http\_client \***esp\_http\_client\_handle\_t**

typedef struct *esp\_http\_client\_event* \***esp\_http\_client\_event\_handle\_t**

typedef struct *esp\_http\_client\_event* **esp\_http\_client\_event\_t**

HTTP Client events data.

typedef struct *esp\_http\_client\_on\_data* **esp\_http\_client\_on\_data\_t**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

typedef struct *esp\_http\_client\_redirect\_event\_data* **esp\_http\_client\_redirect\_event\_data\_t**

Argument structure for HTTP\_EVENT\_REDIRECT event.

typedef *esp\_err\_t* (\***http\_event\_handle\_cb**)(*esp\_http\_client\_event\_t* \*evt)

## Enumerations

enum **esp\_http\_client\_event\_id\_t**

HTTP Client events id.

*Values:*

enumerator **HTTP\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_EVENT\_ON\_CONNECTED**

Once the HTTP has been connected to the server, no data exchange has been performed

enumerator **HTTP\_EVENT\_HEADERS\_SENT**

After sending all the headers to the server

enumerator **HTTP\_EVENT\_HEADER\_SENT**

This header has been kept for backward compatability and will be deprecated in future versions esp-idf

enumerator **HTTP\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the server

enumerator **HTTP\_EVENT\_ON\_DATA**

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_EVENT\_REDIRECT**

Intercepting HTTP redirects to handle them manually

enum **esp\_http\_client\_transport\_t**

HTTP Client transport.

*Values:*

enumerator **HTTP\_TRANSPORT\_UNKNOWN**

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator **HttpStatus\_Ok**

enumerator **HttpStatus\_MultipleChoices**

enumerator **HttpStatus\_MovedPermanently**

enumerator **HttpStatus\_Found**

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (`esp_local_ctrl`) component in ESP-IDF provides capability to control an ESP device over HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the `esp_local_ctrl` service over BLE transport is performed as follows:

```

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <-----
                * -----> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

```

(continues on next page)

(continued from previous page)

```

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[]  asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvkey_pem_start[] asm("_binary_prvkey_pem_
↪start");
extern const unsigned char prvkey_pem_end[]  asm("_binary_prvkey_pem_
↪end");
https_conf.prvkey_pem = prvkey_pem_start;
https_conf.prvkey_len = prvkey_pem_end - prvkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. **PROTCOM\_SEC2**: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. **PROTCOM\_SEC1**: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. **PROTCOM\_SEC0**: specifies that data will be exchanged as a plain text (no security).
4. **PROTCOM\_SEC\_CUSTOM**: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t \** in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to

the Enabling protocol security version section in *Protocol Communication* for more details.

### Creating a property

Now that we know how to start the `esp_local_ctrl` service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines `TYPE_TIMESTAMP` and `READONLY`, which are used for setting the *type* and *flags* fields here.

```
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name      = "timestamp",
    .type      = TYPE_TIMESTAMP,
    .size      = sizeof(int32_t),
    .flags     = READONLY,
    .ctx       = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a *ctx* field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```
static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                   const esp_local_ctrl_prop_t *props,
                                   const esp_local_ctrl_prop_val_t *
                                   ↪ *prop_values,
                                   void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", ↪
            ↪ props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

### Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the **esp\_local\_ctrl** service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the **esp\_local\_ctrl** service:

1. *get\_prop\_count* : This should simply return the total number of properties supported by the service
2. *get\_prop\_values* : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. *set\_prop\_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get\_prop\_count* and then *get\_prop\_values*, hence form an index to name mapping for all properties. Now when calling *set\_prop\_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS Server + mDNS)	Description
esp_local_ctrl	https://<hostname>.local/esp_local_ctrl/version	Endpoint used for retrieving version string
esp_local_ctrl	https://<hostname>.local/esp_local_ctrl/control	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- `components/esp_local_ctrl/include/esp_local_ctrl.h`

### Functions

`const esp_local_ctrl_transport_t*esp_local_ctrl_get_transport_ble` (void)

Function for obtaining BLE transport mode.

`const esp_local_ctrl_transport_t*esp_local_ctrl_get_transport_httpd` (void)

Function for obtaining HTTPD transport mode.

`esp_err_t esp_local_ctrl_start` (const `esp_local_ctrl_config_t` \*config)

Start local control service.

**Parameters** `config` –[in] Pointer to configuration structure

**Returns**

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

`esp_err_t esp_local_ctrl_stop` (void)

Stop local control service.

`esp_err_t esp_local_ctrl_add_property` (const `esp_local_ctrl_prop_t` \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

**Parameters** `prop` –[in] Property description structure

**Returns**

- `ESP_OK` : Success
- `ESP_FAIL` : Failure

`esp_err_t esp_local_ctrl_remove_property` (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** `name` –[in] Name of the property to remove

**Returns**

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Failure

`const esp_local_ctrl_prop_t*esp_local_ctrl_get_property` (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure `esp_local_ctrl_prop_t` when its name is known

**Parameters** `name` –[in] Name of the property to find

**Returns**

- Pointer to property
- `NULL` if not found

`esp_err_t esp_local_ctrl_set_handler` (const char \*ep\_name, `protocomm_req_handler_t` handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**Note:** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

---

#### Parameters

- **ep\_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user\_ctx** –[in] User data

#### Returns

- ESP\_OK : Success
- ESP\_FAIL : Failure

### Unions

union **esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

#### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \*ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \*httpd

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

### Structures

struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

#### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

**uint32\_t flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

**void \*ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

**void (\*ctx\_free\_fn)(void \*ctx)**

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members****void \*data**

Pointer to memory holding property value

**size\_t size**

Size of property value

**void (\*free\_fn)(void \*data)**

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp\_local\_ctrl\_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

*esp\_err\_t* (\***get\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for retrieving current values of properties.

---

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

*esp\_err\_t* (\***set\_prop\_values**)(size\_t props\_count, const *esp\_local\_ctrl\_prop\_t* props[], const *esp\_local\_ctrl\_prop\_val\_t* prop\_values[], void \*usr\_ctx)

Handler function to be implemented for changing values of properties.

---

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

void \***usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (\***usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

## Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via `proto_sec_custom_handle` below

void \***custom\_handle**

Custom security handle if security is set custom via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void \***pop**

Proof of possession to be used for local control. Could be NULL.

const void \***sec\_params**

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for protocomm security 1 and `esp_local_ctrl_security2_params_t` for protocomm security 2 respectively. Could be NULL.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* \***transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

### Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

### Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

typedef enum *esp\_local\_ctrl\_proto\_sec* **esp\_local\_ctrl\_proto\_sec\_t**

Security types for `esp_local_control`.

typedef *protocomm\_security1\_params\_t* **esp\_local\_ctrl\_security1\_params\_t**

typedef *protocomm\_security2\_params\_t* **esp\_local\_ctrl\_security2\_params\_t**

typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* **esp\_local\_ctrl\_proto\_sec\_cfg\_t**

Protocom security configs

typedef struct *esp\_local\_ctrl\_config* **esp\_local\_ctrl\_config\_t**

Configuration structure to pass to `esp_local_ctrl_start()`

## Enumerations

enum **esp\_local\_ctrl\_proto\_sec**

Security types for `esp_local_control`.

*Values:*

enumerator **PROTOCOL\_SEC0**

enumerator **PROTOCOL\_SEC1**

enumerator **PROTOCOL\_SEC2**

enumerator **PROTOCOL\_SEC\_CUSTOM**

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

## Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

**Communication with ESP SDIO Slave** This document describes the process of initialization of an ESP SDIO Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to Functions 1-7) without any details regarding the underlying hardware implementation.

**SDIO Slave Capabilities of Espressif chips** The services provided by the SDIO Slave peripheral of the ESP32-C6 chip are listed in the table below:

Services	ESP32-C6
SDIO slave	Y
<i>Tohost intr</i>	8
<i>Frhost intr</i>	8
<i>TX DMA</i>	Y
<i>RX DMA</i>	Y
<i>Shared registers</i>	56*

- \* Not including the interrupt registers

**ESP SDIO Slave Initialization** The host should initialize the ESP32-C6 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of [SDIO Simplified Specification](#)). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

- SDIO reset** CMD52 (Write 0x6=0x8)
- SD reset** CMD0
- Check whether IO card (optional)** CMD8
- Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000  
 CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)  
**Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFF00.  
 Keep sending CMD5 with arg=0x00FFFF00 until the R4 shows card ready (arg bit 31=1).
- Set address** CMD3
- Select card** CMD7 (arg address according to CMD3 response)  
**Example:** Arg of R6 after CMD3 is 0x0001xxxx.  
 Arg of CMD7 should be 0x00010000.
- Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
- Enable func1** CMD52 (Write 0x02=0x02)
- Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
- Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)  
 CMD52/53 (Write 0x10=0x00)  
 CMD52/53 (Write 0x11=0x02)  
 CMD52/53 (Read 0x10~0x11, read to check the final value)
- Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)  
 CMD52/53 (Write 0x110=0x00)  
 CMD52/53 (Write 0x111=0x02)  
 CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO Slave Protocol** The ESP SDIO Slave protocol is based on the SDIO Specification's I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO

- 52 8-bit R/W registers shared by host and slave (For details, see *ESP32-C6 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers* [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example [peripherals/sdio](#).

The *ESP Serial Slave Link* component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

## Slave register table

### 32-bit

- 0x044 (TOKEN\_RDATA): in which bit 27-16 holds the number of the receiving buffer.
- 0x058 (INT\_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT\_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT\_CLR): write 1 to clear interrupt bits corresponding to INT\_ST.
- 0x0DC (INT\_ENA): mask bits for interrupts from slave to host.

### 8-bit Shared general purpose registers:

- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE\_INT): bits for host to interrupt slave. auto clear.

### FIFO (sending and receiving) 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

$$\text{requested length} = 0x1F800 - \text{address}$$

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the *requested length*, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

---

**Note:** The function number should be set to 1, OP Code should be set to 1 (for CMD53).

In order to achieve higher efficiency when accessing the FIFO by an arbitrary length, the block and byte modes of CMD53 can be used in combination. For example, given that the block size is set to 512 by default, you can write/get 1031 bytes of data from the FIFO by doing the following:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-**1031**.
  2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-**7**.
- 

**Interrupts** SDIO interrupts are “level sensitive” . For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT\_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT\_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the

INT\_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32-C6, the corresponding host\_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE\_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

**Receiving FIFO** To write to the slave's receiving FIFO, the host should complete the following steps:

1. **Read the TOKEN1 field (bits 27-16) of the register TOKEN\_RDATA (0x044).** The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. **Make sure the buffer number is sufficient** ( $buffer\_size \times buffer\_num$  is greater than the data to write,  $buffer\_size$  is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. **Write to the FIFO address with CMD53.** Note that the *requested length* should not exceed the length calculated at Step 2, and the FIFO address is related to *requested length*.
4. **Calculate used buffers.** Note that a partially used buffer at the tail is counted as used.

**Sending FIFO** To read the slave's sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT\_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT\_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT\_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT\_LEN.
4. **Read from the FIFO using CMD53.** Note that the *requested length* should not be greater than calculated at Step 3, and the FIFO address is related to *requested length*.
5. **Update the read length.**

## ESP SPI Slave HD (Half Duplex) Mode Protocol

### SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2
SPI Slave HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N
Frhost intr		2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y
Shared registers		72	64	64	64	64	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave  
This phase determines the rest phases of the transactions. See *Supported Commands*.
- **Address:** 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- **Dummy:** 8-bit, floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- **Data:** variable length, the direction is also determined by the command.

This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See [Supported Commands](#)), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

---

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

---

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave

3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SDIO Slave Capabilities of Espressif chips* and *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the *sdmmc* component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a *sdmmc* card (see [:doc:` Document of SDMMC driver </api-reference/storage/sdmmc>`](#)) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

### Application Example

The example below shows how ESP32-C6 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- `components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

### Functions

`esp_err_t` **essl\_init** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Initialize the slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (*essl\_handle\_t* handle, uint32\_t \*out\_tx\_num, uint32\_t wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** –Handle of a ESSL device.
- **out\_tx\_num** –Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_rx\_size** –Output of data size to read from slave, in bytes
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** –Handle of an ESSL device.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP\_ERR\_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready for receiving.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** –[out] Output of length the data actually received from slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success: All the data has been read from the slave.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP\_ERR\_NOT\_FINISHED: Read was successful, but there is still data remaining.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready to send data.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value\_o** –Output of the returned written value.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t add, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** –Handle of a `essl` device.
- **add** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** –Output value read from the register.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_wait\_int** (`essl_handle_t` handle, `uint32_t` wait\_ms)

wait for an interrupt of the slave

**Parameters**

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: If interrupt is triggered.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- ESP\_ERR\_TIMEOUT: No interrupts before timeout.

`esp_err_t` **essl\_clear\_intr** (`essl_handle_t` handle, `uint32_t` intr\_mask, `uint32_t` wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Parameters**

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to clear.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr** (`essl_handle_t` handle, `uint32_t` \*intr\_raw, `uint32_t` \*intr\_st, `uint32_t` wait\_ms)

Get interrupt bits of ESSL slave.

**Parameters**

- **handle** –Handle of an ESSL device.
- **intr\_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr\_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_INVALID\_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, `uint32_t` ena\_mask, `uint32_t` wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** –Handle of an ESSL device.
- **ena\_mask** –Mask of the interrupt bits to enable.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **ena\_mask\_o** –Output of interrupt bit enable mask.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

#### Parameters

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to send to slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

## Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

## Functions

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)

Initialize the ESSL SDIO device and get its handle.

#### Parameters

- **out\_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** –Handle of the ESSL SDIO device to deinit.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

## Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- `components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

### Parameters

- **out\_handle** –[out] Output of the handle
- **init\_config** –Configuration for the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** –Handle of the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

### Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE, registers for M/S sync are reserved, see note1).
- **out\_value** –[out] Read buffer for the shared registers.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.
- ESP\_ERR\_INVALID\_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** –[out] Output data address
- **size** –The size of the output data.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out\_value** –[out] Not supported, should be set to `NULL`.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** –Context of the component. (Member **arg** from **essl\_handle\_t**)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf\_polling** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

*esp\_err\_t* **essl\_spi\_rddma** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.2.8 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C6 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

## Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

## Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

## API Reference

### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**Parameters** **conf** –[in] The config struct for the SSL connection.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** **conf** –[in] The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

- **x509\_bundle** –[in] A pointer to the certificate bundle.
- **bundle\_size** –[in] Size of the certificate bundle in bytes.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

## 2.2.9 HTTP Server

## Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C6. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri name`, `method type` (eg. `HTTPD_GET/HTTPD_POST/HTTPD_PUT` etc.), `function pointer of type esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

## Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, rcv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */

```

(continues on next page)

(continued from previous page)

```
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
```

**Simple HTTP Server Example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

### Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↳data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↳context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

### WebSocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http\\_server/ws\\_echo\\_server](#) example which demonstrates usage of the websocket feature.

### Event Handling

ESP HTTP server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

## API Reference

### Header File

- components/esp\_http\_server/include/esp\_http\_server.h

### Functions

*esp\_err\_t* **httpd\_register\_uri\_handler** (*httpd\_handle\_t* handle, const *httpd\_uri\_t* \*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

---

**Note:** URI handlers can be registered in real time as long as the server handle is valid.

---

#### Parameters

- **handle** –[in] handle to HTTPD server instance
- **uri\_handler** –[in] pointer to handler that needs to be registered

#### Returns

- ESP\_OK : On successfully registering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_HANDLERS\_FULL : If no slots left for new handler
- ESP\_ERR\_HTTPD\_HANDLER\_EXISTS : If handler with same URI and method is already registered

*esp\_err\_t* **httpd\_unregister\_uri\_handler** (*httpd\_handle\_t* handle, const char \*uri, *httpd\_method\_t* method)

Unregister a URI handler.

**Parameters**

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] URI string
- **method** –[in] HTTP method

**Returns**

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

**Parameters**

- **handle** –[in] handle to HTTPD server instance
- **uri** –[in] uri string specifying all handlers that need to be deregistered

**Returns**

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **recv\_func** –[in] The receive function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using `httpd_req_to_sockfd()`
- 

**Parameters**

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **send\_func** –[in] The send function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

#### Parameters

- **hd** –[in] HTTPD instance handle
- **sockfd** –[in] Session socket FD
- **pending\_func** –[in] The receive function to be set for this session

#### Returns

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd\_sess\_get\_ctx(), httpd\_sess\_trigger\_close(), httpd\_sess\_update\_lru\_counter().

---

**Note:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.

---

**Parameters** **r** –[in] The request whose socket descriptor should be found

#### Returns

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content\_len provided in httpd\_req\_t structure to know the length of data to be fetched. If content\_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

#### Parameters

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that the data will be read into
- **buf\_len** –[in] Length of the buffer

**Returns**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it' s value.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - Once httpd\_resp\_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The header field to be searched in the request

**Returns**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

esp\_err\_t **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - Once httpd\_resp\_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  - Use httpd\_req\_get\_hdr\_value\_len() to know the right buffer length
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The field to be searched in the header
- **val** –[out] Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** –[in] Size of the user buffer “val”

**Returns**

- ESP\_OK : Field found in the request header and value string copied
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

---

**Note:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid

---

**Parameters** **r** **–[in]** The request being responded to

**Returns**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**Note:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**Parameters**

- **r** **–[in]** The request being responded to
- **buf** **–[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** **–[in]** Length of output buffer

**Returns**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**Note:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
  - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
- 

**Parameters**

- **qry** **–[in]** Pointer to query string
- **key** **–[in]** The key to be searched in the query string
- **val** **–[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** **–[in]** Size of the user buffer “val”

**Returns**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

#### Parameters

- **req** –[in] Pointer to the HTTP request
- **cookie\_name** –[in] The cookie name to be searched in the request
- **val** –[out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** –[inout] Pointer to size of the user buffer “val” . This variable will contain cookie length if ESP\_OK is returned and required buffer length incase ESP\_ERR\_HTTPD\_RESULT\_TRUNC is returned.

#### Returns

- ESP\_OK : Key is found in the cookie string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
- ESP\_ERR\_NO\_MEM : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “\*” for a wildcard match, and “?\*” to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “\*” anywhere else in the template will be taken literally.

#### Parameters

- **uri\_template** –[in] URI template (pattern)
- **uri\_to\_match** –[in] URI to be matched
- **match\_upto** –[in] how many characters of the URI buffer to test (there may be trailing query string etc.)

**Returns** true if a match was found

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the content is to be fetched
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[in] Pointer to a buffer that stores the data
- **buf\_len** –[in] Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet chunk
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

static inline *esp\_err\_t* **httpd\_resp\_sendstr\_chunk** (*httpd\_req\_t* \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### Parameters

- **r** –[in] The request being responded to
- **str** –[in] String to be sent as response body (NULL to finish response packet)

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

*esp\_err\_t* **httpd\_resp\_set\_status** (*httpd\_req\_t* \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the status string is valid till send function is called.
- 

#### Parameters

- **r** –[in] The request being responded to
- **status** –[in] The HTTP status code of this response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_type** (*httpd\_req\_t* \*r, const char \*type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the type string is valid till send function is called.
- 

#### Parameters

- **r** –[in] The request being responded to
- **type** –[in] The Content Type of the response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of *max\_resp\_headers* in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.
- 

**Parameters**

- **r** –[in] The request being responded to
- **field** –[in] The field name of the HTTP header
- **value** –[in] The value of this HTTP header

**Returns**

- *ESP\_OK* : On successfully appending new header
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_HDR* : Total additional headers exceed max allowed
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** –[in] Pointer to the HTTP request for which the response needs to be sent
- **error** –[in] Error type to send
- **msg** –[in] Error message string (pass NULL for default message)

**Returns**

- *ESP\_OK* : On successfully sending the response packet
- *ESP\_ERR\_INVALID\_ARG* : Null arguments
- *ESP\_ERR\_HTTPD\_RESP\_SEND* : Error in raw send
- *ESP\_ERR\_HTTPD\_INVALID\_REQ* : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_404** (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_408` (`httpd_req_t` \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_500` (`httpd_req_t` \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` –[in] The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

int `httpd_send` (`httpd_req_t` \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
- 

**Parameters**

- **r** –[in] The request being responded to
- **buf** –[in] Buffer from where the fully constructed packet is to be read
- **buf\_len** –[in] Length of the buffer

**Returns**

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_send` (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**Parameters**

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf\_len** –[in] data size
- **flags** –[in] flags for the send() function

**Returns**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

**Parameters**

- **hd** –[in] server instance
- **sockfd** –[in] session socket file descriptor
- **buf** –[in] buffer with bytes to send
- **buf\_len** –[in] data size
- **flags** –[in] flags for the send() function

**Returns**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd\_err\_code\_t*. See prototype *httpd\_err\_handler\_func\_t* above for details.

**Parameters**

- **handle** –[in] HTTP server handle
- **error** –[in] Error type
- **handler\_fn** –[in] User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**

- ESP\_OK : handler registered successfully
- ESP\_ERR\_INVALID\_ARG : invalid error code or server handle

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Parameters**

- **config** –[in] Configuration for new instance of the server
- **handle** –[out] Handle to newly created instance of the server. NULL on error

**Returns**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)

- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Parameters** **handle** –[in] Handle to server returned by `httpd_start`

**Returns**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD' s context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **work** –[in] Pointer to the function to be executed in the HTTPD' s context
- **arg** –[in] Pointer to the arguments that should be passed to this function

**Returns**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the `httpd_req_t` structure. But, there are cases where the web server' s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the context

void \***httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**

httpd\_sess\_get\_ctx()

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session ‘transport’ context by socket descriptor.

**See also:**

httpd\_sess\_set\_ctx()

**Parameters**

- **handle** –[in] Handle to server returned by httpd\_start
- **sockfd** –[in] The socket descriptor for which the context should be extracted.
- **ctx** –[in] Transport context object to assign to the session
- **free\_fn** –[in] Function that should be called to free the transport context

void \***httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

**Parameters** **handle** –[in] Handle to server returned by httpd\_start

**Returns** global user context

void \***httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters** **handle** –[in] Handle to server returned by httpd\_start

**Returns** global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session to be closed

**Returns**

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **sockfd** –[in] The socket descriptor of the session for which LRU counter is to be updated

**Returns**

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

---

**Parameters**

- **handle** –[in] Handle to server returned by `httpd_start`
- **fds** –[inout] In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client\_fds** –[out] Array of client fds

**Returns**

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

**Structures**

struct **esp\_http\_server\_event\_data**

Argument structure for `HTTP_SERVER_EVENT_ON_DATA` and `HTTP_SERVER_EVENT_SENT_DATA` event

**Public Members**

int **fd**

Session socket file descriptor

int **data\_len**

Data length

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

### Public Members

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge “Least Recently Used” connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_transport_ctx_free_fn`

Free function for global transport context

`bool enable_so_linger`

bool to enable/disable linger

`int linger_timeout`

linger timeout (in seconds)

`bool keep_alive_enable`

Enable keep-alive timeout

`int keep_alive_idle`

Keep-alive idle time. Default is 5 (second)

`int keep_alive_interval`

Keep-alive interval time. Default is 5 (second)

`int keep_alive_count`

Keep-alive packet retry send count. Default is 3 counts

[\*httpd\\_open\\_func\\_t\*](#) `open_fn`

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

***httpd\_close\_func\_t* close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

***httpd\_uri\_match\_func\_t* uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct httpd\_req**

HTTP Request Data Structure.

**Public Members*****httpd\_handle\_t* handle**

Handle to server instance

**int method**

The type of HTTP request, -1 if unsupported method

**const char uri[HTTPD\_MAX\_URI\_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size\_t content\_len**

Length of the request body

**void \*aux**

Internally used members

**void \*user\_ctx**

User context pointer passed during URI registration.

**void \*sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

#### *httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

#### bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

#### struct **httpd\_uri**

Structure for URI handler.

#### **Public Members**

##### const char \***uri**

The URI to handle

##### *httpd\_method\_t* **method**

Method supported by the URI

##### *esp\_err\_t* (\***handler**)(*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

##### void \***user\_ctx**

Pointer to user context data which will be available to handler

#### **Macros**

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD\_SOCK\_ERR\_FAIL**

**HTTPD\_SOCK\_ERR\_INVALID**

**HTTPD\_SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**ESP\_HTTPD\_DEF\_CTRL\_PORT**

HTTP Server control socket port

**HTTPD\_DEFAULT\_CONFIG ()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN**

### Type Definitions

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

---

**Note:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param `buf_len` [in]** data size

**Param `flags` [in]** flags for the `send()` function

**Return**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level `recv` function.

---

**Note:** User specified `recv` function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param buf\_len [in]** data size

**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level “get pending bytes” function.

---

**Note:** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD\_SOCK\_ERR\_ codes, which will be handled accordingly in the server task.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd\_resp\_send\_err() must be invoked inside this function if user wishes to generate HTTP error responses.
  - When invoked, the validity of uri, method, content\_len and user\_ctx fields of the httpd\_req\_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return ESP\_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD\_500\_INTERNAL\_SERVER\_ERROR and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- ESP\_OK : error handled successful
- ESP\_FAIL : failure indicates that the underlying socket needs to be closed

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over “enum http\_method” available in “http\_parser” library.

typedef void (\***httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef *esp\_err\_t* (\***httpd\_open\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- ESP\_OK : On success
- Any value other than ESP\_OK will signal the server to close the socket immediately

typedef void (\***httpd\_close\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for closing a session.

---

**Note:** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

typedef bool (\***httpd\_uri\_match\_func\_t**)(const char \*reference\_uri, const char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

typedef struct *httpd\_config* **httpd\_config\_t**

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (\***httpd\_work\_fn\_t**)(void \*arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

## Enumerations

enum **httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD\_500\_INTERNAL\_SERVER\_ERROR**

enumerator **HTTPD\_501\_METHOD\_NOT\_IMPLEMENTED**

enumerator **HTTPD\_505\_VERSION\_NOT\_SUPPORTED**

enumerator **HTTPD\_400\_BAD\_REQUEST**

enumerator **HTTPD\_401\_UNAUTHORIZED**

enumerator **HTTPD\_403\_FORBIDDEN**

enumerator **HTTPD\_404\_NOT\_FOUND**

enumerator **HTTPD\_405\_METHOD\_NOT\_ALLOWED**

enumerator **HTTPD\_408\_REQ\_TIMEOUT**

enumerator **HTTPD\_411\_LENGTH\_REQUIRED**

enumerator **HTTPD\_414\_URI\_TOO\_LONG**

enumerator **HTTPD\_431\_REQ\_HDR\_FIELDS\_TOO\_LARGE**

enumerator **HTTPD\_ERR\_CODE\_MAX**

enum **esp\_http\_server\_event\_id\_t**

HTTP Server events id.

*Values:*

enumerator **HTTP\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_SERVER\_EVENT\_START**

This event occurs when HTTP Server is started

enumerator **HTTP\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP\_SERVER\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP\_SERVER\_EVENT\_HEADERS\_SENT**

After sending all the headers to the client

enumerator **HTTP\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTP\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_SERVER\_EVENT\_STOP**

This event occurs when HTTP Server is stopped

## 2.2.10 HTTPS Server

### Overview

This component is built on top of *HTTP Server*. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for *HTTP Server* applies also to a server you create this way.

### Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send” , “receive” and “pending” callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_rcv_override()`
  - `httpd_sess_set_pending_override()`
- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

### Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- [components/esp\\_https\\_server/include/esp\\_https\\_server.h](#)

### Functions

*esp\_err\_t* **httpd\_ssl\_start** (*httpd\_handle\_t* \*handle, *httpd\_ssl\_config\_t* \*config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

#### Parameters

- **config** –[inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** –[out] - storage for the server handle, must be a valid pointer

**Returns** success

*esp\_err\_t* **httpd\_ssl\_stop** (*httpd\_handle\_t* handle)

Stop the server. Blocks until the server is shut down.

**Parameters** **handle** –[in]

#### Returns

- ESP\_OK: Server stopped successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_FAIL: Failure to shut down server

### Structures

struct **esp\_https\_server\_user\_cb\_arg**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

### Public Members

*httpd\_ssl\_user\_cb\_state\_t* **user\_cb\_state**

State of user callback

*esp\_tls\_t* \***tls**

ESP-TLS connection handle

struct **httpd\_ssl\_config**

HTTPS server config struct

Please use HTTPD\_SSL\_CONFIG\_DEFAULT() to initialize it.

### Public Members

*httpd\_config\_t* **httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8\_t \***servercert**

Server certificate

size\_t **servercert\_len**

Server certificate byte length

const uint8\_t \***cacert\_pem**

CA certificate ((CA used to sign clients, or client cert itself)

size\_t **cacert\_len**

CA certificate byte length

const uint8\_t \***prvtkey\_pem**

Private key

size\_t **prvtkey\_len**

Private key byte length

*httpd\_ssl\_transport\_mode\_t* **transport\_mode**

Transport Mode (default secure)

uint16\_t **port\_secure**

Port used when transport mode is secure (default 443)

uint16\_t **port\_insecure**

Port used when transport mode is insecure (default 80)

bool **session\_tickets**

Enable tls session tickets

bool **use\_secure\_element**

Enable secure element for server session

*esp\_https\_server\_user\_cb* \***user\_cb**

User callback for esp\_https\_server

void \***ssl\_userdata**

user data to add to the ssl context

esp\_tls\_handshake\_callback **cert\_select\_cb**

Certificate selection callback to use

const char \*\***alpn\_protos**

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

## Macros

**HTTPD\_SSL\_CONFIG\_DEFAULT** ()

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

## Type Definitions

typedef struct *esp\_https\_server\_user\_cb\_arg* **esp\_https\_server\_user\_cb\_arg\_t**

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void **esp\_https\_server\_user\_cb** (*esp\_https\_server\_user\_cb\_arg\_t* \*user\_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

typedef struct *httpd\_ssl\_config* **httpd\_ssl\_config\_t**

## Enumerations

enum **httpd\_ssl\_transport\_mode\_t**

*Values:*

enumerator **HTTPD\_SSL\_TRANSPORT\_SECURE**

enumerator **HTTPD\_SSL\_TRANSPORT\_INSECURE**

enum **httpd\_ssl\_user\_cb\_state\_t**

Indicates the state at which the user callback is executed, i.e at session creation or session close.

*Values:*

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CREATE**

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CLOSE**

## 2.2.11 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called `Echo Reply`.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
        recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), ↵
↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, ↵
↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↵
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
```

(continues on next page)

(continued from previous page)

```

struct addrinfo hint;
struct addrinfo *res = NULL;
memset(&hint, 0, sizeof(hint));
memset(&target_addr, 0, sizeof(target_addr));
getaddrinfo("www.espressif.com", NULL, &hint, &res);
struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
freeaddrinfo(res);

esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
ping_config.target_addr = target_addr;           // target IP address
ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↳ping_stop can stop it

/* set callback functions */
esp_ping_callbacks_t cbs;
cbs.on_ping_success = test_on_ping_success;
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
↳can be NULL
cbs.cb_args = eth_event_group;

esp_ping_handle_t ping;
esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- `components/lwip/include/apps/ping/ping_sock.h`

### Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` \*config, const `esp_ping_callbacks_t` \*cbs, `esp_ping_handle_t` \*hdl\_out)

Create a ping session.

#### Parameters

- `config` –ping configuration

- **cbs** –a bunch of callback functions invoked by internal ping task
- **hdl\_out** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_FAIL: other internal error (e.g. socket error)
- ESP\_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

*esp\_err\_t* **esp\_ping\_delete\_session** (*esp\_ping\_handle\_t* hdl)

Delete a ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Parameters** **hdl** –handle of ping session

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

**Parameters**

- **hdl** –handle of ping session
- **profile** –type of profile
- **data** –profile data
- **size** –profile data size

**Returns**

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the “size” parameter
- ESP\_OK: get profile successfully

## Structures

struct **esp\_ping\_callbacks\_t**

Type of “ping” callback functions.

## Public Members

void \***cb\_args**

arguments for callback functions

void (\***on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)  
Invoked by internal ping thread when received ICMP echo reply packet.

void (\***on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)  
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (\***on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)  
Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**  
Type of “ping” configuration.

### Public Members

uint32\_t **count**  
A “ping” session contains count procedures

uint32\_t **interval\_ms**  
Milliseconds between each ping procedure

uint32\_t **timeout\_ms**  
Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**  
Size of the data next to ICMP packet header

int **tos**  
Type of Service, a field specified in the IP header

int **ttl**  
Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**  
Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**  
Stack size of internal ping task

uint32\_t **task\_prio**  
Priority of internal ping task

uint32\_t **interface**  
Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()  
Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**  
Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of “ping” session handle.

### Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

enumerator **ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

enumerator **ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

enumerator **ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

enumerator **ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

enumerator **ESP\_PING\_PROF\_REPLY**

Number of reply packets received

enumerator **ESP\_PING\_PROF\_IPADDR**

IP address of replied target

enumerator **ESP\_PING\_PROF\_SIZE**

Size of received packet

enumerator **ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

### 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component *mDNS* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run *idf.py add-dependency espressif/mdns*.

## Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

### 2.2.13 Mbed TLS

[Mbed TLS](#) is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**Note:** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

---

**Note:** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](#) .

---

### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF [here](#).

---

**Note:** Please refer the [ESP-IDF Migration Guide](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

## Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration
- `CONFIG_MBEDTLS_HARDWARE_ECC`: Support for hardware ECC acceleration

**Note:** Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

## Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed Test	TLS	Related Configs	Heap Usage (approx.)
Default		NA	42196 B
Enable Variable Length	SSL	<code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code>	42120 B
Disable Peer Certificate	Keep Peer Certificate	<code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code>	38533 B
Enable Buffer	Dy-namic TX/RX	<code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code> <code>FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code> <code>FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</code>	<code>CON-</code> <code>CON-</code> 22013 B

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

**Reducing Binary Size** Under `Component Config -> mbedTLS`, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

### 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.3 Bluetooth API

### 2.3.1 BT COMMON

#### BT GENERIC DEFINES

##### API Reference

##### Header File

- `components/bt/host/bluedroid/api/include/api/esp_bt_defs.h`

##### Structures

struct **esp\_bt\_uuid\_t**

UUID type.

##### Public Members

uint16\_t **len**

UUID length, 16bit, 32bit or 128bit

uint16\_t **uuid16**

16bit UUID

uint32\_t **uuid32**

32bit UUID

uint8\_t **uuid128**[ESP\_UUID\_LEN\_128]

128bit UUID

union *esp\_bt\_uuid\_t*::[anonymous] **uuid**

UUID

##### Macros

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_STATUS\_BASE\_FOR\_HCI\_ERR**

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTET8\_LEN**

**ESP\_DEFAULT\_GATT\_IF**

Default GATT interface id.

**ESP\_BLE\_PRIM\_ADV\_INT\_MIN**

Minimum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_PRIM\_ADV\_INT\_MAX**

Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_CONN\_INT\_MIN**

relate to BTM\_BLE\_CONN\_INT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_INT\_MAX**

relate to BTM\_BLE\_CONN\_INT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_LATENCY\_MAX**

relate to ESP\_BLE\_CONN\_LATENCY\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**

relate to BTM\_BLE\_CONN\_SUP\_TOUT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**

relate to ESP\_BLE\_CONN\_SUP\_TOUT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)

Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**

Bluetooth address length.

**ESP\_BLE\_ENC\_KEY\_MASK**

Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**

Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**

Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**

Minimum of the application id.

**ESP\_APP\_ID\_MAX**

Maximum of the application id.

**ESP\_BD\_ADDR\_STR**

**ESP\_BD\_ADDR\_HEX** (addr)

**Type Definitions**

typedef uint8\_t **esp\_bt\_octet16\_t**[ESP\_BT\_OCTET16\_LEN]

typedef uint8\_t **esp\_bt\_octet8\_t**[ESP\_BT\_OCTET8\_LEN]

typedef uint8\_t **esp\_link\_key**[ESP\_BT\_OCTET16\_LEN]

typedef uint8\_t **esp\_bd\_addr\_t**[ESP\_BD\_ADDR\_LEN]

Bluetooth device address.

typedef uint8\_t **esp\_ble\_key\_mask\_t**

**Enumerations**

enum **esp\_bt\_status\_t**

Status Return Value.

*Values:*

enumerator **ESP\_BT\_STATUS\_SUCCESS**

enumerator **ESP\_BT\_STATUS\_FAIL**

enumerator **ESP\_BT\_STATUS\_NOT\_READY**

enumerator **ESP\_BT\_STATUS\_NOMEM**

enumerator **ESP\_BT\_STATUS\_BUSY**

enumerator **ESP\_BT\_STATUS\_DONE**

enumerator **ESP\_BT\_STATUS\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_PARM\_INVALID**

enumerator **ESP\_BT\_STATUS\_UNHANDLED**

enumerator **ESP\_BT\_STATUS\_AUTH\_FAILURE**

enumerator **ESP\_BT\_STATUS\_RMT\_DEV\_DOWN**

enumerator **ESP\_BT\_STATUS\_AUTH\_REJECTED**

enumerator **ESP\_BT\_STATUS\_INVALID\_STATIC\_RAND\_ADDR**

enumerator **ESP\_BT\_STATUS\_PENDING**

enumerator **ESP\_BT\_STATUS\_UNACCEPT\_CONN\_INTERVAL**

enumerator **ESP\_BT\_STATUS\_PARAM\_OUT\_OF\_RANGE**

enumerator **ESP\_BT\_STATUS\_TIMEOUT**

enumerator **ESP\_BT\_STATUS\_PEER\_LE\_DATA\_LEN\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_CONTROL\_LE\_DATA\_LEN\_UNSUPPORTED**

enumerator **ESP\_BT\_STATUS\_ERR\_ILLEGAL\_PARAMETER\_FMT**

enumerator **ESP\_BT\_STATUS\_MEMORY\_FULL**

enumerator **ESP\_BT\_STATUS\_EIR\_TOO\_LARGE**

enumerator **ESP\_BT\_STATUS\_HCI\_SUCCESS**

enumerator **ESP\_BT\_STATUS\_HCI\_ILLEGAL\_COMMAND**

enumerator **ESP\_BT\_STATUS\_HCI\_NO\_CONNECTION**

enumerator **ESP\_BT\_STATUS\_HCI\_HW\_FAILURE**

enumerator **ESP\_BT\_STATUS\_HCI\_PAGE\_TIMEOUT**

enumerator **ESP\_BT\_STATUS\_HCI\_AUTH\_FAILURE**

enumerator **ESP\_BT\_STATUS\_HCI\_KEY\_MISSING**

enumerator **ESP\_BT\_STATUS\_HCI\_MEMORY\_FULL**

enumerator **ESP\_BT\_STATUS\_HCI\_CONNECTION\_TOUT**

enumerator **ESP\_BT\_STATUS\_HCI\_MAX\_NUM\_OF\_CONNECTIONS**

enumerator **ESP\_BT\_STATUS\_HCI\_MAX\_NUM\_OF\_SCOS**

enumerator **ESP\_BT\_STATUS\_HCI\_CONNECTION\_EXISTS**

enumerator **ESP\_BT\_STATUS\_HCI\_COMMAND\_DISALLOWED**

enumerator **ESP\_BT\_STATUS\_HCI\_HOST\_REJECT\_RESOURCES**

enumerator **ESP\_BT\_STATUS\_HCI\_HOST\_REJECT\_SECURITY**

enumerator **ESP\_BT\_STATUS\_HCI\_HOST\_REJECT\_DEVICE**

enumerator **ESP\_BT\_STATUS\_HCI\_HOST\_TIMEOUT**

enumerator **ESP\_BT\_STATUS\_HCI\_UNSUPPORTED\_VALUE**

enumerator **ESP\_BT\_STATUS\_HCI\_ILLEGAL\_PARAMETER\_FMT**

enumerator **ESP\_BT\_STATUS\_HCI\_PEER\_USER**

enumerator **ESP\_BT\_STATUS\_HCI\_PEER\_LOW\_RESOURCES**

enumerator **ESP\_BT\_STATUS\_HCI\_PEER\_POWER\_OFF**

enumerator **ESP\_BT\_STATUS\_HCI\_CHAN\_CLASSIF\_NOT\_SUPPORTED**

enumerator **ESP\_BT\_STATUS\_HCI\_INSUFFICIENT\_SECURITY**

enumerator **ESP\_BT\_STATUS\_HCI\_PARAM\_OUT\_OF\_RANGE**

enumerator **ESP\_BT\_STATUS\_HCI\_UNDEFINED\_0x31**

enumerator **ESP\_BT\_STATUS\_HCI\_ROLE\_SWITCH\_PENDING**

enumerator **ESP\_BT\_STATUS\_HCI\_UNDEFINED\_0x33**

enumerator **ESP\_BT\_STATUS\_HCI\_RESERVED\_SLOT\_VIOLATION**

enumerator **ESP\_BT\_STATUS\_HCI\_ROLE\_SWITCH\_FAILED**

enumerator **ESP\_BT\_STATUS\_HCI\_INQ\_RSP\_DATA\_TOO\_LARGE**

enumerator **ESP\_BT\_STATUS\_HCI\_SIMPLE\_PAIRING\_NOT\_SUPPORTED**

enumerator **ESP\_BT\_STATUS\_HCI\_HOST\_BUSY\_PAIRING**

enumerator **ESP\_BT\_STATUS\_HCI\_REJ\_NO\_SUITABLE\_CHANNEL**

enumerator **ESP\_BT\_STATUS\_HCI\_CONTROLLER\_BUSY**

enumerator **ESP\_BT\_STATUS\_HCI\_UNACCEPT\_CONN\_INTERVAL**

enumerator **ESP\_BT\_STATUS\_HCI\_DIRECTED\_ADVERTISING\_TIMEOUT**

enumerator **ESP\_BT\_STATUS\_HCI\_CONN\_TOUT\_DUE\_TO\_MIC\_FAILURE**

enumerator **ESP\_BT\_STATUS\_HCI\_CONN\_FAILED\_ESTABLISHMENT**

enumerator **ESP\_BT\_STATUS\_HCI\_MAC\_CONNECTION\_FAILED**

enum **esp\_bt\_dev\_type\_t**

Bluetooth device type.

*Values:*

enumerator **ESP\_BT\_DEVICE\_TYPE\_BREDR**

enumerator **ESP\_BT\_DEVICE\_TYPE\_BLE**

enumerator **ESP\_BT\_DEVICE\_TYPE\_DUMO**

enum **esp\_ble\_addr\_type\_t**

BLE device address type.

*Values:*

enumerator **BLE\_ADDR\_TYPE\_PUBLIC**

Public Device Address

enumerator **BLE\_ADDR\_TYPE\_RANDOM**

Random Device Address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enumerator **BLE\_ADDR\_TYPE\_RPA\_PUBLIC**

Resolvable Private Address (RPA) with public identity address

enumerator **BLE\_ADDR\_TYPE\_RPA\_RANDOM**

Resolvable Private Address (RPA) with random identity address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enum **esp\_ble\_wl\_addr\_type\_t**

white list address type

*Values:*

enumerator **BLE\_WL\_ADDR\_TYPE\_PUBLIC**

enumerator **BLE\_WL\_ADDR\_TYPE\_RANDOM**

## BT MAIN API

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

#### Functions

*esp\_bluedroid\_status\_t* **esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

**Returns** Bluetooth stack status

*esp\_err\_t* **esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init().

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit().

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Returns**

- ESP\_OK : Succeed
- Other : Failed

#### Enumerations

enum **esp\_bluedroid\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

*Values:*

enumerator **ESP\_BLUEDROID\_STATUS\_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP\_BLUEDROID\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP\_BLUEDROID\_STATUS\_ENABLED**

Bluetooth initialized and enabled

## BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_device.h](#)

#### Functions

const uint8\_t \***esp\_bt\_dev\_get\_address** (void)

Get bluetooth device address. Must use after “esp\_bluedroid\_enable” .

**Returns** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp\_err\_t* **esp\_bt\_dev\_set\_device\_name** (const char \*name)

Set bluetooth device name. This function should be called after esp\_bluedroid\_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Parameters** **name** **–[in]** : device name to be set

#### Returns

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

## 2.3.2 BT LE

### GAP API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_client](#)
  - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_server](#)
  - [GATT Security Server Example Walkthrough](#)

### API Reference

#### Header File

## Functions

*esp\_err\_t* **esp\_ble\_gap\_register\_callback** (*esp\_gap\_ble\_cb\_t* callback)

This function is called to occur gap event, such as scan result.

**Parameters** **callback** –[in] callback function

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data** (*esp\_ble\_adv\_data\_t* \*adv\_data)

This function is called to override the BTA default ADV parameters.

**Parameters** **adv\_data** –[in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of config\_adv\_data is received.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_scan\_params** (*esp\_ble\_scan\_params\_t* \*scan\_params)

This function is called to set scan parameters.

**Parameters** **scan\_params** –[in] Pointer to User defined scan\_params data structure. This memory space can not be freed until callback of set\_scan\_params

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_scanning** (uint32\_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

**Parameters** **duration** –[in] Keeping the scanning time, the unit is second.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**Parameters** **adv\_params** –[in] pointer to User defined adv\_params data structure.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**Parameters** **params** –[in] - connection update parameters

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, uint16\_t tx\_data\_length)

This function is to set maximum LE data packet size.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

**Parameters** **rand\_addr** –[in] The address to be configured. Refer to the table below for possible address subtypes:

address [47:46]	Address Type
0b00	Non-Resolvable Private Address
0b11	Static Random Address

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy (including address resolution) on the local device.

**Parameters** **privacy\_enable** –[in] - enable/disable privacy on remote device.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t icon)

set local gap appearance icon

**Parameters** **icon** –[in] - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/assigned-numbers/>

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_whitelist** (bool add\_remove, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_wl\_addr\_type\_t* wl\_addr\_type)

Add or remove device from white list.

**Parameters**

- **add\_remove** –[in] the value is true if added the ble device to the white list, and false remove to the white list.
- **remote\_bda** –[in] the remote device address add/remove from the white list.
- **wl\_addr\_type** –[in] whitelist address type

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_whitelist** (void)

Clear all white list.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_whitelist\_size** (uint16\_t \*length)

Get the whitelist size in the controller.

**Parameters** **length** –[out] the white list length.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_prefer\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, uint16\_t min\_conn\_int, uint16\_t max\_conn\_int, uint16\_t slave\_latency, uint16\_t supervision\_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Parameters**

- **bd\_addr** –[in] BD address of the peripheral
- **min\_conn\_int** –[in] minimum preferred connection interval
- **max\_conn\_int** –[in] maximum preferred connection interval
- **slave\_latency** –[in] preferred slave latency
- **supervision\_tout** –[in] preferred supervision timeout

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_device\_name** (const char \*name)

Set device name to the local device Note: This API don't affect the advertising data.

**Parameters** **name** –[in] - device name.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_device\_name** (void)

Get device name of the local device.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_local\_used\_addr** (*esp\_bd\_addr\_t* local\_used\_addr, uint8\_t \*addr\_type)

This function is called to get local used address and address type. uint8\_t \*esp\_bt\_dev\_get\_address(void) get the public address.

**Parameters**

- **local\_used\_addr** –[in] - current local used ble address (six bytes)
- **addr\_type** –[in] - ble address type

**Returns** - ESP\_OK : success

- other : failed

uint8\_t \***esp\_ble\_resolve\_adv\_data** (uint8\_t \*adv\_data, uint8\_t type, uint8\_t \*length)

This function is called to get ADV data for a specific type.

**Parameters**

- **adv\_data** –[in] - pointer of ADV data which to be resolved
- **type** –[in] - finding ADV data type
- **length** –[out] - return the length of ADV data not including type

**Returns** pointer of ADV data

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

**Parameters**

- **raw\_data** –[in] : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2] ...
- **raw\_data\_len** –[in] : raw advertising data length , less than 31 bytes

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_scan\_rsp\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

**Parameters**

- **raw\_data** –[in] : raw scan response data
- **raw\_data\_len** –[in] : raw scan response data length , less than 31 bytes

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_rssi** (*esp\_bd\_addr\_t* remote\_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

**Parameters** **remote\_addr** –[in] : The remote connection device address.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_add\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to add a device info into the duplicate scan exceptional list.

**Parameters**

- **type** –[in] device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- **device\_info** –[in] the device information.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_remove\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to remove a device info from the duplicate scan exceptional list.

**Parameters**

- **type** –[in] device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- **device\_info** –[in] the device information.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clean\_duplicate\_scan\_exceptional\_list** (*esp\_duplicate\_scan\_exceptional\_list\_type\_t* list\_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Parameters** **list\_type** –[in] duplicate scan exceptional list type, the value can be one or more of `esp_duplicate_scan_exceptional_list_type_t`.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_security\_param** (*esp\_ble\_sm\_param\_t* param\_type, void \*value, uint8\_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only `secure connection mode`, it is necessary do as following:

1. Set bit `ESP\_LE\_AUTH\_REQ\_SC\_ONLY` (`param\_type` is `ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE`), bit `ESP\_LE\_AUTH\_BOND` and bit `ESP\_LE\_AUTH\_REQ\_MITM` is optional as required.
2. Set to `ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE` (`param\_type` is `ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH`).

**Parameters**

- **param\_type** –[in] : the type of the param which to be set
- **value** –[in] : the param value
- **len** –[in] : the length of the param value

**Returns** - `ESP_OK` : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_security\_rsp** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Grant security request access.

**Parameters**

- **bd\_addr** –[in] : BD address of the peer
- **accept** –[in] : accept the security request or not

**Returns** - `ESP_OK` : success

- other : failed

*esp\_err\_t* **esp\_ble\_set\_encryption** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_sec\_act\_t* sec\_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Parameters**

- **bd\_addr** –[in] : the address of the peer device need to encryption
- **sec\_act** –[in] : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**Returns** - `ESP_OK` : success

- other : failed

*esp\_err\_t* **esp\_ble\_passkey\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept, uint32\_t passkey)

Reply the key value to the peer device in the legacy connection stage.

**Parameters**

- **bd\_addr** –[in] : BD address of the peer
  - **accept** –[in] : passkey entry successful or declined.
  - **passkey** –[in] : passkey value, must be a 6 digit number, can be lead by 0.
- Returns** - ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**

- **bd\_addr** –[in] : BD address of the peer device
- **accept** –[in] : numbers to compare are the same or different.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* bd\_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters** **bd\_addr** –[in] : BD address of the peer device

**Returns** - ESP\_OK : success

- other : failed

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns** - >= 0 : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*dev\_num, *esp\_ble\_bond\_dev\_t* \*dev\_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**

- **dev\_num** –[inout] Indicate the dev\_list array(buffer) size as input. If dev\_num is large enough, it means the actual number as output. Suggest that dev\_num value equal to esp\_ble\_get\_bond\_device\_num().
- **dev\_list** –[out] an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The dev\_list should be allocated by who call this API.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* bd\_addr, uint8\_t \*TK, uint8\_t len)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**Parameters**

- **bd\_addr** –[in] BD address of the peer device.
- **TK** –[in] Temporary Key value, the TK value shall be a 128-bit random number
- **len** –[in] length of temporary key, should always be 128-bit

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_sc\_oob\_req\_reply** (*esp\_bd\_addr\_t* bd\_addr, uint8\_t p\_c[16], uint8\_t p\_r[16])

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_SC\_OOB\_REQ\_EVT.

**Parameters**

- **bd\_addr** –[in] BD address of the peer device.
- **p\_c** –[in] Confirmation value, it shall be a 128-bit random number
- **p\_r** –[in] Randomizer value, it should be a 128-bit random number

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_create\_sc\_oob\_data** (void)

This function is called to create the OOB data for SMP when secure connection.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* remote\_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app\_id registered. `esp_ble_gattc_close` (`esp_gatt_if_t` gattc\_if, `uint16_t` conn\_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. `esp_ble_gap_disconnect`(*esp\_bd\_addr\_t* remote\_device) disconnect the physical connection directly.

**Parameters** **remote\_device** –[in] : BD address of the peer device  
**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**Parameters**  
• **bd\_addr** –[in] BD address of the peer device.  
• **conn\_params** –[out] the connection parameters information  
**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels* channels)

BLE set channels.

**Parameters** **channels** –[in] : The n<sup>th</sup> such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.  
**Returns** - ESP\_OK : success  
• ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled  
• other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Parameters**  
• **bd\_addr** –[in] BD address of the peer device.  
• **authorize** –[out] Authorized the link or not.  
**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_phy** (*esp\_bd\_addr\_t* bd\_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Parameters** **bd\_addr** –[in] : BD address of the peer device  
**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_preferred\_default\_phy** (*esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Parameters**  
• **tx\_phy\_mask** –[in] : indicates the transmitter PHYs that the Host prefers the Controller to use

- **rx\_phy\_mask** –[in] : indicates the receiver PHYs that the Host prefers the Controller to use

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_preferred\_phy** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_gap\_all\_phys\_t* all\_phys\_mask, *esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask, *esp\_ble\_gap\_prefer\_phy\_options\_t* phy\_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

#### Parameters

- **bd\_addr** –[in] : remote address
- **all\_phys\_mask** –[in] : a bit field that allows the Host to specify
- **tx\_phy\_mask** –[in] : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx\_phy\_mask** –[in] : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy\_options** –[in] : a bit field that allows the Host to specify options for PHYs

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_rand\_addr** (uint8\_t instance, *esp\_bd\_addr\_t* rand\_addr)

This function is used by the Host to set the random device address specified by the Random\_Address parameter.

#### Parameters

- **instance** –[in] : Used to identify an advertising set
- **rand\_addr** –[in] : Random Device Address

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_params** (uint8\_t instance, const *esp\_ble\_gap\_ext\_adv\_params\_t* \*params)

This function is used by the Host to set the advertising parameters.

#### Parameters

- **instance** –[in] : identifies the advertising set whose parameters are being configured.
- **params** –[in] : advertising parameters

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_ext\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in advertising PDUs that have a data field.

#### Parameters

- **instance** –[in] : identifies the advertising set whose data are being configured
- **length** –[in] : data length
- **data** –[in] : data information

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_ext\_scan\_rsp\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*scan\_rsp\_data)

This function is used to provide scan response data used in scanning response PDUs.

#### Parameters

- **instance** –[in] : identifies the advertising set whose response data are being configured.
- **length** –[in] : responsedata length
- **scan\_rsp\_data** –[in] : response data information

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_start** (uint8\_t num\_adv, const *esp\_ble\_gap\_ext\_adv\_t* \*ext\_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num\_adv** –[in] : Number of advertising sets to enable or disable
- **ext\_adv** –[in] : adv parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_stop** (uint8\_t num\_adv, const uint8\_t \*ext\_adv\_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num\_adv** –[in] : Number of advertising sets to enable or disable
- **ext\_adv\_inst** –[in] : ext adv instance

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_remove** (uint8\_t instance)

This function is used to remove an advertising set from the Controller.

**Parameters** **instance** –[in] : Used to identify an advertising set

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_params** (uint8\_t instance, const *esp\_ble\_gap\_periodic\_adv\_params\_t* \*params)

This function is used by the Host to set the parameters for periodic advertising.

**Parameters**

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** –[in] : periodic adv parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_periodic\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in periodic advertising PDUs.

**Parameters**

- **instance** –[in] : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** –[in] : the length of periodic data
- **data** –[in] : periodic data information

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_start** (uint8\_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Parameters** **instance** –[in] : Used to identify an advertising set

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_stop** (uint8\_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Parameters** **instance** –[in] : Used to identify an advertising set

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_ext\_scan\_params** (const *esp\_ble\_ext\_scan\_params\_t* \*params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Parameters** **params** –[in] : scan parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_ext\_scan** (uint32\_t duration, uint16\_t period)

This function is used to enable scanning.

**Parameters**

- **duration** –[in] : Scan duration
- **period** –[in] : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_ext\_scan** (void)

This function is used to disable scanning.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_create\_sync** (const *esp\_ble\_gap\_periodic\_adv\_sync\_params\_t* \*params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Parameters** **params** –[in] : sync parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_cancel** (void)

This function is used to cancel the LE\_Periodic\_Advertising\_Create\_Sync command while it is pending.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_terminate** (uint16\_t sync\_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Parameters** **sync\_handle** –[in] : identify the periodic advertiser

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_add\_dev\_to\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Parameters**

- **addr\_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_remove\_dev\_from\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Parameters**

- **addr\_type** –[in] : address type
- **addr** –[in] : Device Address
- **sid** –[in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_clear\_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Returns** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_prefer\_ext\_connect\_params\_set** (*esp\_bd\_addr\_t* addr, *esp\_ble\_gap\_phy\_mask\_t* phy\_mask, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_1m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_2m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_coded\_conn\_params)

This function is used to set aux connection parameters.

**Parameters**

- **addr** –[in] : device address
- **phy\_mask** –[in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy\_1m\_conn\_params** –[in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy\_2m\_conn\_params** –[in] : Connection parameters for the LE 2M PHY are provided.
- **phy\_coded\_conn\_params** –[in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_rcv\_enable** (uint16\_t sync\_handle, uint8\_t enable)

This function is used to set periodic advertising receive enable.

**Parameters**

- **sync\_handle** –[in] : Handle of periodic advertising sync
- **enable** –[in] : Determines whether reporting and duplicate filtering are enabled or disabled

**Returns** - ESP\_OK : success  
 • other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_trans** (*esp\_bd\_addr\_t* addr, uint16\_t service\_data, uint16\_t sync\_handle)

This function is used to transfer periodic advertising sync.

**Parameters**

- **addr** –[in] : Peer device address

- **service\_data** –[in] : Service data used by Host
- **sync\_handle** –[in] : Handle of periodic advertising sync

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_info\_trans** (*esp\_bd\_addr\_t* addr, uint16\_t service\_data, uint8\_t adv\_handle)

This function is used to transfer periodic advertising set info.

#### Parameters

- **addr** –[in] : Peer device address
- **service\_data** –[in] : Service data used by Host
- **adv\_handle** –[in] : Handle of advertising set

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_periodic\_adv\_sync\_trans\_params** (*esp\_bd\_addr\_t* addr, const *esp\_ble\_gap\_past\_params\_t* \*params)

This function is used to set periodic advertising sync transfer params.

#### Parameters

- **addr** –[in] : Peer device address
- **params** –[in] : Params of periodic advertising sync transfer

**Returns** - ESP\_OK : success

- other : failed

## Unions

struct *esp\_ble\_gap\_cb\_param\_t::ble\_scan\_rsp\_data\_raw\_cmpl\_evt\_param* **scan\_rsp\_data\_raw\_cmpl**

Event parameter of ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_adv\_start\_cmpl\_evt\_param* **adv\_start\_cmpl**

Event parameter of ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_scan\_start\_cmpl\_evt\_param* **scan\_start\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT

*esp\_ble\_sec\_t* **ble\_security**  
ble gap security union type

struct *esp\_ble\_gap\_cb\_param\_t::ble\_scan\_stop\_cmpl\_evt\_param* **scan\_stop\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_adv\_stop\_cmpl\_evt\_param* **adv\_stop\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_set\_rand\_cmpl\_evt\_param* **set\_rand\_addr\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_update\_conn\_params\_evt\_param* **update\_conn\_params**  
Event parameter of ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_pkt\_data\_length\_cmpl\_evt\_param* **pkt\_data\_length\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_local\_privacy\_cmpl\_evt\_param* **local\_privacy\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_remove\_bond\_dev\_cmpl\_evt\_param* **remove\_bond\_dev\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_clear\_bond\_dev\_cmpl\_evt\_param* **clear\_bond\_dev\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_get\_bond\_dev\_cmpl\_evt\_param* **get\_bond\_dev\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_read\_rssi\_cmpl\_evt\_param* **read\_rssi\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_update\_whitelist\_cmpl\_evt\_param* **update\_whitelist\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param* **update\_duplicate\_exceptional\_list\_cmpl**  
Event parameter of ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_set\_channels\_evt\_param* **ble\_set\_channels**  
Event parameter of ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_read\_phy\_cmpl\_evt\_param* **read\_phy**  
Event parameter of ESP\_GAP\_BLE\_READ\_PHY\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_set\_perf\_def\_phy\_cmpl\_evt\_param* **set\_perf\_def\_phy**  
Event parameter of ESP\_GAP\_BLE\_SET\_PREFERRED\_DEFAULT\_PHY\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_set\_perf\_phy\_cmpl\_evt\_param* **set\_perf\_phy**  
Event parameter of ESP\_GAP\_BLE\_SET\_PREFERRED\_PHY\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_set\_rand\_addr\_cmpl\_evt\_param*  
**ext\_adv\_set\_rand\_addr**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_SET\_RAND\_ADDR\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_set\_params\_cmpl\_evt\_param* **ext\_adv\_set\_params**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_SET\_PARAMS\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_data\_set\_cmpl\_evt\_param* **ext\_adv\_data\_set**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_DATA\_SET\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_scan\_rsp\_set\_cmpl\_evt\_param* **scan\_rsp\_set**  
Event parameter of ESP\_GAP\_BLE\_EXT\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_start\_cmpl\_evt\_param* **ext\_adv\_start**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_START\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_stop\_cmpl\_evt\_param* **ext\_adv\_stop**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_STOP\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_set\_remove\_cmpl\_evt\_param* **ext\_adv\_remove**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_SET\_REMOVE\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_set\_clear\_cmpl\_evt\_param* **ext\_adv\_clear**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_SET\_CLEAR\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_set\_params\_cmpl\_param* **period\_adv\_set\_params**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_PARAMS\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_data\_set\_cmpl\_param* **period\_adv\_data\_set**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_DATA\_SET\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_start\_cmpl\_param* **period\_adv\_start**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_START\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_stop\_cmpl\_param* **period\_adv\_stop**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_STOP\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_create\_sync\_cmpl\_param* **period\_adv\_create\_sync**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_CREATE\_SYNC\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_sync\_cancel\_cmpl\_param* **period\_adv\_sync\_cancel**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_CANCEL\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_sync\_terminate\_cmpl\_param* **period\_adv\_sync\_term**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TERMINATE\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_add\_dev\_cmpl\_param* **period\_adv\_add\_dev**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_ADD\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_remove\_dev\_cmpl\_param* **period\_adv\_remove\_dev**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_REMOVE\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_period\_adv\_clear\_dev\_cmpl\_param* **period\_adv\_clear\_dev**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_CLEAR\_DEV\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_set\_ext\_scan\_params\_cmpl\_param* **set\_ext\_scan\_params**  
Event parameter of ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_scan\_start\_cmpl\_param* **ext\_scan\_start**  
Event parameter of ESP\_GAP\_BLE\_EXT\_SCAN\_START\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_scan\_stop\_cmpl\_param* **ext\_scan\_stop**  
Event parameter of ESP\_GAP\_BLE\_EXT\_SCAN\_STOP\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_conn\_params\_set\_cmpl\_param* **ext\_conn\_params\_set**  
Event parameter of ESP\_GAP\_BLE\_PREFER\_EXT\_CONN\_PARAMS\_SET\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_adv\_terminate\_param* **adv\_terminate**  
Event parameter of ESP\_GAP\_BLE\_ADV\_TERMINATED\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_scan\_req\_received\_param* **scan\_req\_received**  
Event parameter of ESP\_GAP\_BLE\_SCAN\_REQ\_RECEIVED\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_channel\_sel\_alg\_param* **channel\_sel\_alg**  
Event parameter of ESP\_GAP\_BLE\_CHANNEL\_SELECT\_ALGORITHM\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_sync\_lost\_param* **periodic\_adv\_sync\_lost**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_LOST\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_sync\_estab\_param* **periodic\_adv\_sync\_estab**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_ESTAB\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_phy\_update\_cmpl\_param* **phy\_update**  
Event parameter of ESP\_GAP\_BLE\_PHY\_UPDATE\_COMPLETE\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_ext\_adv\_report\_param* **ext\_adv\_report**  
Event parameter of ESP\_GAP\_BLE\_EXT\_ADV\_REPORT\_EVT

struct *esp\_ble\_gap\_cb\_param\_t::ble\_periodic\_adv\_report\_param* **period\_adv\_report**  
Event parameter of ESP\_GAP\_BLE\_PERIODIC\_ADV\_REPORT\_EVT

```

scanner address

struct **ble\_scan\_result\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

### Public Members

*esp\_gap\_search\_evt\_t* **search\_evt**

Search event type

*esp\_bd\_addr\_t* **bda**

Bluetooth device address which has been searched

*esp\_bt\_dev\_type\_t* **dev\_type**

Device type

*esp\_ble\_addr\_type\_t* **ble\_addr\_type**

Ble device address type

*esp\_ble\_evt\_type\_t* **ble\_evt\_type**

Ble scan result event type

int **rssi**

Searched device' s RSSI

uint8\_t **ble\_adv**[ESP\_BLE\_ADV\_DATA\_LEN\_MAX +  
ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX]

Received EIR

int **flag**

Advertising data flag bit

int **num\_resps**

Scan result number

uint8\_t **adv\_data\_len**

Adv data length

uint8\_t **scan\_rsp\_len**

Scan response length

uint32\_t **num\_dis**

The number of discard packets

```
struct ble_scan_rsp_data_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate the set scan response data operation success status

```
struct ble_scan_rsp_data_raw_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate the set raw advertising data operation success status

```
struct ble_scan_start_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate scan start operation success status

```
struct ble_scan_stop_cmpl_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**

Indicate scan stop operation success status

```
struct ble_set_channels_evt_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.
```

### Public Members

*esp\_bt\_status\_t* **stat**

BLE set channel status

```
struct ble_set_ext_scan_params_cmpl_param  
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.
```

### Public Members

#### *esp\_bt\_status\_t* status

Indicate extend advertising parameters set status

struct **ble\_set\_past\_params\_cmpl\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_PAST\_PARAMS\_COMPLETE\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Set periodic advertising sync transfer params status

#### *esp\_bd\_addr\_t* bda

The remote device address

struct **ble\_set\_perf\_def\_phy\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_PREFERRED\_DEFAULT\_PHY\_COMPLETE\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Indicate perf default phy set status

struct **ble\_set\_perf\_phy\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_PREFERRED\_PHY\_COMPLETE\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Indicate perf phy set status

struct **ble\_set\_rand\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Indicate set static rand address operation success status

struct **ble\_update\_conn\_params\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT.

### Public Members

#### *esp\_bt\_status\_t* **status**

Indicate update connection parameters success status

#### *esp\_bd\_addr\_t* **bda**

Bluetooth device address

#### uint16\_t **min\_int**

Min connection interval

#### uint16\_t **max\_int**

Max connection interval

#### uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

#### uint16\_t **conn\_int**

Current connection interval

#### uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec

struct **ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param**

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```

### Public Members

#### *esp\_bt\_status\_t* **status**

Indicate update duplicate scan exceptional list operation success status

#### uint8\_t **subcode**

Define in `esp_bt_duplicate_exceptional_subcode_type_t`

#### uint16\_t **length**

The length of `device_info`

#### *esp\_duplicate\_info\_t* **device\_info**

device information, when subcode is `ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN`, the value is invalid

struct **ble\_update\_whitelist\_cmpl\_evt\_param**

```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

### Public Members

***esp\_bt\_status\_t* status**

Indicate the add or remove whitelist operation success status

***esp\_ble\_wl\_operation\_t* wl\_operation**

The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

**Structures**

struct **esp\_ble\_adv\_params\_t**

Advertising parameters.

**Public Members**

uint16\_t **adv\_int\_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

uint16\_t **adv\_int\_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec Advertising max interval

*esp\_ble\_adv\_type\_t* **adv\_type**

Advertising type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner bluetooth device address type

*esp\_bd\_addr\_t* **peer\_addr**

Peer device bluetooth device address

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**

Peer device bluetooth device address type, only support public address type and random address type

*esp\_ble\_adv\_channel\_t* **channel\_map**

Advertising channel map

*esp\_ble\_adv\_filter\_t* **adv\_filter\_policy**

Advertising filter policy

struct **esp\_ble\_adv\_data\_t**

Advertising data content, according to “Supplement to the Bluetooth Core Specification” .

**Public Members**

bool **set\_scan\_rsp**

Set this advertising data as scan response or not

bool **include\_name**

Advertising data include device name or not

bool **include\_txpower**

Advertising data include TX power

int **min\_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$  Conn\_Interval\_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max\_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$  Conn\_Interval\_Max range: 0x0006 to 0x0C80 Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**

External appearance of device

uint16\_t **manufacturer\_len**

Manufacturer data length

uint8\_t \***p\_manufacturer\_data**

Manufacturer data point

uint16\_t **service\_data\_len**

Service data length

uint8\_t \***p\_service\_data**

Service data point

uint16\_t **service\_uuid\_len**

Service uuid length

uint8\_t \***p\_service\_uuid**

Service uuid array point

uint8\_t **flag**

Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

struct **esp\_ble\_scan\_params\_t**

Ble scan parameters.

## Public Members

[\*esp\\_ble\\_scan\\_type\\_t\*](#) **scan\_type**

Scan type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner address type

*esp\_ble\_scan\_filter\_t* **scan\_filter\_policy**

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp\_gap\_conn\_params\_t**

connection parameters information

### **Public Members**

uint16\_t **interval**

connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_conn\_update\_params\_t**

Connection update parameters.

### **Public Members**

*esp\_bd\_addr\_t* **bda**

Bluetooth device address

uint16\_t **min\_int**

Min connection interval

uint16\_t **max\_int**

Max connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16\_t **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_pkt\_data\_length\_params\_t**

BLE pkt data length keys.

### Public Members

uint16\_t **rx\_len**

pkt rx data length value

uint16\_t **tx\_len**

pkt tx data length value

struct **esp\_ble\_penc\_keys\_t**

BLE encryption keys.

### Public Members

*esp\_bt\_octet16\_t* **ltk**

The long term key

*esp\_bt\_octet8\_t* **rand**

The random number

uint16\_t **ediv**

The ediv value

uint8\_t **sec\_level**

The security level of the security link

uint8\_t **key\_size**

The key size(7~16) of the security link

struct **esp\_ble\_pcsrkeys\_t**

BLE CSRK keys.

### Public Members

uint32\_t **counter**

The counter

*esp\_bt\_octet16\_t* **csrk**

The csrk key

uint8\_t **sec\_level**

The security level

struct **esp\_ble\_pid\_keys\_t**

BLE pid keys.

### **Public Members**

*esp\_bt\_octet16\_t* **irk**

The irk value

*esp\_ble\_addr\_type\_t* **addr\_type**

The address type

*esp\_bd\_addr\_t* **static\_addr**

The static address

struct **esp\_ble\_lenc\_keys\_t**

BLE Encryption reproduction keys.

### **Public Members**

*esp\_bt\_octet16\_t* **ltk**

The long term key

uint16\_t **div**

The div value

uint8\_t **key\_size**

The key size of the security link

uint8\_t **sec\_level**

The security level of the security link

struct **esp\_ble\_lcsrk\_keys**

BLE SRK keys.

### **Public Members**

uint32\_t **counter**

The counter value

uint16\_t **div**

The div value

uint8\_t **sec\_level**

The security level of the security link

*esp\_bt\_octet16\_t* **csrkey**

The csrkey value

struct **esp\_ble\_sec\_key\_notif\_t**

Structure associated with ESP\_KEY\_NOTIF\_EVT.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

uint32\_t **passkey**

the numeric value for comparison. If just\_works, do not show this number to UI

struct **esp\_ble\_sec\_req\_t**

Structure of the security request.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

struct **esp\_ble\_bond\_key\_info\_t**

struct type of the bond key information value

### Public Members

*esp\_ble\_key\_mask\_t* **key\_mask**

the key mask to indicate which key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**

received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrkey**

received peer device SRK

*esp\_ble\_pid\_keys\_t* **pid\_key**

peer device ID key

struct **esp\_ble\_bond\_dev\_t**

struct type of the bond device value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**

the bond key information

struct **esp\_ble\_key\_t**

union type of the security key value

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_key\_type\_t* **key\_type**

key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**

the pointer to the key value

struct **esp\_ble\_local\_id\_keys\_t**

structure type of the ble local id keys value

### Public Members

*esp\_bt\_octet16\_t* **ir**

the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**

the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**

the 16 bits of the dh key value

struct **esp\_ble\_local\_oob\_data\_t**

structure type of the ble local oob data value

**Public Members**

*esp\_bt\_octet16\_t* **oob\_c**

the 128 bits of confirmation value

*esp\_bt\_octet16\_t* **oob\_r**

the 128 bits of randomizer value

struct **esp\_ble\_auth\_cmpl\_t**

Structure associated with ESP\_AUTH\_CMPL\_EVT.

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**

BD address peer device.

bool **key\_present**

Valid link key value in key element

*esp\_link\_key* **key**

Link key associated with peer device.

uint8\_t **key\_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**

The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**

Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**

Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**

authentication mode

struct **esp\_ble\_gap\_ext\_adv\_params\_t**

ext adv parameters

**Public Members**

*esp\_ble\_ext\_adv\_type\_mask\_t* **type**

ext adv type

uint32\_t **interval\_min**  
ext adv minimum interval

uint32\_t **interval\_max**  
ext adv maximum interval

*esp\_ble\_adv\_channel\_t* **channel\_map**  
ext adv channel map

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
ext adv own address type

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**  
ext adv peer address type

*esp\_bd\_addr\_t* **peer\_addr**  
ext adv peer address

*esp\_ble\_adv\_filter\_t* **filter\_policy**  
ext adv filter policy

int8\_t **tx\_power**  
ext adv tx power

*esp\_ble\_gap\_pri\_phy\_t* **primary\_phy**  
ext adv primary phy

uint8\_t **max\_skip**  
ext adv maximum skip

*esp\_ble\_gap\_phy\_t* **secondary\_phy**  
ext adv secondary phy

uint8\_t **sid**  
ext adv sid

bool **scan\_req\_notif**  
ext adv scan request event notify

struct **esp\_ble\_ext\_scan\_cfg\_t**  
ext scan config

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**  
ext scan type

uint16\_t **scan\_interval**

ext scan interval

uint16\_t **scan\_window**

ext scan window

struct **esp\_ble\_ext\_scan\_params\_t**

ext scan parameters

### Public Members

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

ext scan own address type

*esp\_ble\_scan\_filter\_t* **filter\_policy**

ext scan filter policy

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

ext scan duplicate scan

*esp\_ble\_ext\_scan\_cfg\_mask\_t* **cfg\_mask**

ext scan config mask

*esp\_ble\_ext\_scan\_cfg\_t* **uncoded\_cfg**

ext scan uncoded config parameters

*esp\_ble\_ext\_scan\_cfg\_t* **coded\_cfg**

ext scan coded config parameters

struct **esp\_ble\_gap\_conn\_params\_t**

create extend connection parameters

### Public Members

uint16\_t **scan\_interval**

init scan interval

uint16\_t **scan\_window**

init scan window

uint16\_t **interval\_min**

minimum interval

uint16\_t **interval\_max**

maximum interval

uint16\_t **latency**

ext scan type

uint16\_t **supervision\_timeout**

connection supervision timeout

uint16\_t **min\_ce\_len**

minimum ce length

uint16\_t **max\_ce\_len**

maximum ce length

struct **esp\_ble\_gap\_ext\_adv\_t**

extend adv enable parameters

### Public Members

uint8\_t **instance**

advertising handle

int **duration**

advertising duration

int **max\_events**

maximum number of extended advertising events

struct **esp\_ble\_gap\_periodic\_adv\_params\_t**

periodic adv parameters

### Public Members

uint16\_t **interval\_min**

periodic advertising minimum interval

uint16\_t **interval\_max**

periodic advertising maximum interval

uint8\_t **properties**

periodic advertising properties

struct **esp\_ble\_gap\_periodic\_adv\_sync\_params\_t**

periodic adv sync parameters

### Public Members

*esp\_ble\_gap\_sync\_t* **filter\_policy**  
periodic advertising sync filter policy

uint8\_t **sid**  
periodic advertising sid

*esp\_ble\_addr\_type\_t* **addr\_type**  
periodic advertising address type

*esp\_bd\_addr\_t* **addr**  
periodic advertising address

uint16\_t **skip**  
the maximum number of periodic advertising events that can be skipped

uint16\_t **sync\_timeout**  
synchronization timeout

struct **esp\_ble\_gap\_ext\_adv\_reprot\_t**  
extend adv report parameters

### Public Members

*esp\_ble\_gap\_adv\_type\_t* **event\_type**  
extend advertising type

uint8\_t **addr\_type**  
extend advertising address type

*esp\_bd\_addr\_t* **addr**  
extend advertising address

*esp\_ble\_gap\_pri\_phy\_t* **primary\_phy**  
extend advertising primary phy

*esp\_ble\_gap\_phy\_t* **secondly\_phy**  
extend advertising secondary phy

uint8\_t **sid**  
extend advertising sid

uint8\_t **tx\_power**  
extend advertising tx power

int8\_t **rssi**  
extend advertising rssi

uint16\_t **per\_adv\_interval**

periodic advertising interval

uint8\_t **dir\_addr\_type**

direct address type

*esp\_ble\_addr\_t* **dir\_addr**

direct address

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

data type

uint8\_t **adv\_data\_len**

extend advertising data length

uint8\_t **adv\_data**[251]

extend advertising data

struct **esp\_ble\_gap\_periodic\_adv\_report\_t**

periodic adv report parameters

### Public Members

uint16\_t **sync\_handle**

periodic advertising train handle

uint8\_t **tx\_power**

periodic advertising tx power

int8\_t **rssi**

periodic advertising rssi

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

periodic advertising data type

uint8\_t **data\_length**

periodic advertising data length

uint8\_t **data**[251]

periodic advertising data

struct **esp\_ble\_gap\_periodic\_adv\_sync\_estab\_t**

periodic adv sync establish parameters

### Public Members

`uint8_t status`

periodic advertising sync status

`uint16_t sync_handle`

periodic advertising train handle

`uint8_t sid`

periodic advertising sid

`esp_ble_addr_type_t addr_type`

periodic advertising address type

`esp_bd_addr_t adv_addr`

periodic advertising address

`esp_ble_gap_phy_t adv_phy`

periodic advertising adv phy type

`uint16_t period_adv_interval`

periodic advertising interval

`uint8_t adv_clk_accuracy`

periodic advertising clock accuracy

struct `esp_ble_gap_past_params_t`

periodic adv sync transfer parameters

### Public Members

`esp_ble_gap_past_mode_t mode`

periodic advertising sync transfer mode

`uint16_t skip`

the number of periodic advertising packets that can be skipped

`uint16_t sync_timeout`

synchronization timeout for the periodic advertising train

`uint8_t cte_type`

periodic advertising sync transfer CET type

### Macros

`ESP_BLE_ADV_FLAG_LIMIT_DISC`

`BLE_ADV_DATA_FLAG` data flag bit definition used for advertising data flag.

`ESP_BLE_ADV_FLAG_GEN_DISC`

**ESP\_BLE\_ADV\_FLAG\_BREDR\_NOT\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_CONTROLLER\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_HOST\_SPT**

**ESP\_BLE\_ADV\_FLAG\_NON\_LIMIT\_DISC**

**ESP\_LE\_KEY\_NONE**

relate to BTM\_LE\_KEY\_XXX in stack/btm\_api.h

No encryption key

**ESP\_LE\_KEY\_PENC**

encryption key, encryption information of peer device

**ESP\_LE\_KEY\_PID**

identity key of the peer device

**ESP\_LE\_KEY\_PCSRK**

peer SRK

**ESP\_LE\_KEY\_PLK**

Link key

**ESP\_LE\_KEY\_LLK**

peer link key

**ESP\_LE\_KEY\_LENC**

master role security information:div

**ESP\_LE\_KEY\_LID**

master device ID key

**ESP\_LE\_KEY\_LCSRK**

local CSRK has been deliver to peer

**ESP\_LE\_AUTH\_NO\_BOND**

relate to BTM\_LE\_AUTH\_XXX in stack/btm\_api.h

0 no bondingv

**ESP\_LE\_AUTH\_BOND**

1 << 0 device in the bonding with peer

**ESP\_LE\_AUTH\_REQ\_MITM**

1 << 2 man in the middle attack

**ESP\_LE\_AUTH\_REQ\_BOND\_MITM**

0101 banding with man in the middle attack

**ESP\_LE\_AUTH\_REQ\_SC\_ONLY**

1 << 3 secure connection

**ESP\_LE\_AUTH\_REQ\_SC\_BOND**

1001 secure connection with bond

**ESP\_LE\_AUTH\_REQ\_SC\_MITM**

1100 secure conn with MITM

**ESP\_LE\_AUTH\_REQ\_SC\_MITM\_BOND**

1101 SC with MITM and Bonding

**ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_DISABLE**

authentication disable

**ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE**

authentication enable

**ESP\_BLE\_OOB\_DISABLE**

disbale the out of bond

**ESP\_BLE\_OOB\_ENABLE**

enable the out of bond

**ESP\_IO\_CAP\_OUT**

relate to BTM\_IO\_CAP\_xxx in stack/btm\_api.h

DisplayOnly

**ESP\_IO\_CAP\_IO**

DisplayYesNo

**ESP\_IO\_CAP\_IN**

KeyboardOnly

**ESP\_IO\_CAP\_NONE**

NoInputNoOutput

**ESP\_IO\_CAP\_KBDISP**

Keyboard display

**ESP\_BLE\_APPEARANCE\_UNKNOWN**

relate to BTM\_BLE\_APPEARANCE\_UNKNOWN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PHONE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PHONE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_COMPUTER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_COMPUTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WATCH**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WATCH in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_SPORTS\_WATCH**

relate to BTM\_BLE\_APPEARANCE\_SPORTS\_WATCH in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CLOCK**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CLOCK in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_DISPLAY**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_DISPLAY in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_REMOTE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_REMOTE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_EYEGLASSES**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_EYEGLASSES in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_TAG**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_TAG in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_KEYRING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_KEYRING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_MEDIA\_PLAYER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_MEDIA\_PLAYER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_BARCODE\_SCANNER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_BARCODE\_SCANNER in stack/btm\_ble\_api.h

relate to BTM\_BLE\_APPEARANCE\_HID\_CARD\_READER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_DIGITAL\_PEN**

relate to BTM\_BLE\_APPEARANCE\_HID\_DIGITAL\_PEN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_BARCODE\_SCANNER**

relate to BTM\_BLE\_APPEARANCE\_HID\_BARCODE\_SCANNER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_GLUCOSE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_GLUCOSE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WALKING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WALKING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_IN\_SHOE**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_IN\_SHOE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_ON\_SHOE**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_ON\_SHOE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_ON\_HIP**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_ON\_HIP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CYCLING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CYCLING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_COMPUTER**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_COMPUTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_SPEED**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_SPEED in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_CADENCE**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_CADENCE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_POWER**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_POWER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_SPEED\_CADENCE**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_SPEED\_CADENCE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PULSE\_OXIMETER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PULSE\_OXIMETER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_FINGERTIP**

relate to BTM\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_FINGERTIP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_WRIST**

relate to BTM\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_WRIST in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WEIGHT**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WEIGHT in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PERSONAL\_MOBILITY\_DEVICE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PERSONAL\_MOBILITY\_DEVICE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_POWERED\_WHEELCHAIR**

relate to BTM\_BLE\_APPEARANCE\_POWERED\_WHEELCHAIR in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_MOBILITY\_SCOOTER**

relate to BTM\_BLE\_APPEARANCE\_MOBILITY\_SCOOTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CONTINUOUS\_GLUCOSE\_MONITOR**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CONTINUOUS\_GLUCOSE\_MONITOR in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_INSULIN\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_INSULIN\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PUMP\_DURABLE\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PUMP\_DURABLE\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PUMP\_PATCH\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PUMP\_PATCH\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PEN**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PEN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_MEDICATION\_DELIVERY**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_MEDICATION\_DELIVERY in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_OUTDOOR\_SPORTS**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_OUTDOOR\_SPORTS in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_AND\_NAV**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_AND\_NAV in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD\_AND\_NAV**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD\_AND\_NAV in stack/btm\_ble\_api.h

**ESP\_GAP\_BLE\_CHANNELS\_LEN**

channel length

**ESP\_GAP\_BLE\_ADD\_WHITELIST\_COMPLETE\_EVT**

This is the old name, just for backwards compatibility.

**ESP\_BLE\_ADV\_DATA\_LEN\_MAX**

Advertising data maximum length.

**ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX**

Scan response data maximum length.

**BLE\_BIT** (n)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_NONCONN\_NONSCANNABLE\_UNDIRECTED**

Non-Connectable and Non-Scannable Undirected advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_CONNECTABLE**

Connectable advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_SCANNABLE**

Scannable advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_DIRECTED**

Directed advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_HD\_DIRECTED**

High Duty Cycle Directed Connectable advertising (<= 3.75 ms Advertising Interval)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY**

Use legacy advertising PDUs

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_ANON\_ADV**

Omit advertiser's address from all PDUs ( "anonymous advertising" )

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_INCLUDE\_TX\_PWR**

Include TxPower in the extended header of the advertising PDU

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_MASK**

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising (<= 3.75 ms advertising interval) shall not be used (bit 3 = 0) ADV\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_IND**

ADV\_DIRECT\_IND (low duty cycle)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_LD\_DIR**

ADV\_DIRECT\_IND (high duty cycle)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_HD\_DIR**

ADV\_SCAN\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_SCAN**

ADV\_NONCONN\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_NONCONN**

**ESP\_BLE\_GAP\_PHY\_1M**

Secondary Advertisement PHY is LE1M

**ESP\_BLE\_GAP\_PHY\_2M**

Secondary Advertisement PHY is LE2M

**ESP\_BLE\_GAP\_PHY\_CODED**

Secondary Advertisement PHY is LE Coded

**ESP\_BLE\_GAP\_NO\_PREFER\_TRANSMIT\_PHY**

No Prefer TX PHY supported by controller

**ESP\_BLE\_GAP\_NO\_PREFER\_RECEIVE\_PHY**

No Prefer RX PHY supported by controller

**ESP\_BLE\_GAP\_PRI\_PHY\_1M**

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

**ESP\_BLE\_GAP\_PRI\_PHY\_CODED**

Primary Phy is LE CODED

**ESP\_BLE\_GAP\_PHY\_1M\_PREF\_MASK**

The Host prefers use the LE1M transmitter or reciever PHY

**ESP\_BLE\_GAP\_PHY\_2M\_PREF\_MASK**

The Host prefers use the LE2M transmitter or reciever PHY

**ESP\_BLE\_GAP\_PHY\_CODED\_PREF\_MASK**

The Host prefers use the LE CODED transmitter or reciever PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_NO\_PREF**

The Host has no preferred coding when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_PREF\_S2\_CODING**

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_PREF\_S8\_CODING**

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_EXT\_SCAN\_CFG\_UNCODE\_MASK**

Scan Advertisements on the LE1M PHY

**ESP\_BLE\_GAP\_EXT\_SCAN\_CFG\_CODE\_MASK**

Scan advertisements on the LE coded PHY

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_COMPLETE**

Advertising data.

extended advertising data compete

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_INCOMPLETE**

extended advertising data incomplete

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_TRUNCATED**

extended advertising data truncated mode

**ESP\_BLE\_GAP\_SYNC\_POLICY\_BY\_ADV\_INFO**

Advertising SYNC policy.

sync policy by advertising info

**ESP\_BLE\_GAP\_SYNC\_POLICY\_BY\_PERIODIC\_LIST**

periodic advertising sync policy

**ESP\_BLE\_ADV\_REPORT\_EXT\_ADV\_IND**

Advertising report.

advertising report with extended advertising indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_SCAN\_IND**

advertising report with extended scan indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_DIRECT\_ADV**

advertising report with extended direct advertising indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_SCAN\_RSP**

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_IND**

advertising report with legacy advertising indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_DIRECT\_IND**

advertising report with legacy direct indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_IND**

advertising report with legacy scan indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_NONCON\_IND**

advertising report with legacy non connectable indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_RSP\_TO\_ADV\_IND**

advertising report with legacy scan response indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_RSP\_TO\_ADV\_SCAN\_IND**

advertising report with legacy advertising with scan response indication type

**EXT\_ADV\_TX\_PWR\_NO\_PREFERENCE**

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

**ESP\_BLE\_GAP\_PAST\_MODE\_NO\_SYNC\_EVT**

Periodic advertising sync trans mode.

No attempt is made to sync and no periodic adv sync transfer received event

**ESP\_BLE\_GAP\_PAST\_MODE\_NO\_REPORT\_EVT**

An periodic adv sync transfer received event and no periodic adv report events

**ESP\_BLE\_GAP\_PAST\_MODE\_DUP\_FILTER\_DISABLED**

Periodic adv report events will be enabled with duplicate filtering disabled

**ESP\_BLE\_GAP\_PAST\_MODE\_DUP\_FILTER\_ENABLED**

Periodic adv report events will be enabled with duplicate filtering enabled

**Type Definitions**

```
typedef uint8_t esp_ble_key_type_t
```

typedef uint8\_t **esp\_ble\_auth\_req\_t**

combination of the above bit pattern

typedef uint8\_t **esp\_ble\_io\_cap\_t**

combination of the io capability

typedef uint8\_t **esp\_gap\_ble\_channels**[ESP\_GAP\_BLE\_CHANNELS\_LEN]

typedef uint8\_t **esp\_duplicate\_info\_t**[ESP\_BD\_ADDR\_LEN]

typedef uint16\_t **esp\_ble\_ext\_adv\_type\_mask\_t**

typedef uint8\_t **esp\_ble\_gap\_phy\_t**

typedef uint8\_t **esp\_ble\_gap\_all\_phys\_t**

typedef uint8\_t **esp\_ble\_gap\_pri\_phy\_t**

typedef uint8\_t **esp\_ble\_gap\_phy\_mask\_t**

typedef uint16\_t **esp\_ble\_gap\_prefer\_phy\_options\_t**

typedef uint8\_t **esp\_ble\_ext\_scan\_cfg\_mask\_t**

typedef uint8\_t **esp\_ble\_gap\_ext\_adv\_data\_status\_t**

typedef uint8\_t **esp\_ble\_gap\_sync\_t**

typedef uint8\_t **esp\_ble\_gap\_adv\_type\_t**

typedef uint8\_t **esp\_ble\_gap\_past\_mode\_t**

typedef void (\***esp\_gap\_ble\_cb\_t**)(*esp\_gap\_ble\_cb\_event\_t* event, *esp\_ble\_gap\_cb\_param\_t* \*param)

GAP callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

### Enumerations

enum **esp\_gap\_ble\_cb\_event\_t**

GAP BLE callback event type.

*Values:*

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_SET\_COMPLETE\_EVT**

When advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

When scan response data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_PARAM\_SET\_COMPLETE\_EVT**

When scan parameters set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT**

When one scan result ready, the event comes each time

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw scan response data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT**

When start advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT**

When start scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_AUTH\_CMPL\_EVT**

Authentication complete indication.

enumerator **ESP\_GAP\_BLE\_KEY\_EVT**

BLE key event for peer device keys

enumerator **ESP\_GAP\_BLE\_SEC\_REQ\_EVT**

BLE security request

enumerator **ESP\_GAP\_BLE\_PASSKEY\_NOTIF\_EVT**

passkey notification event

enumerator **ESP\_GAP\_BLE\_PASSKEY\_REQ\_EVT**

passkey request event

enumerator **ESP\_GAP\_BLE\_OOB\_REQ\_EVT**

OOB request event

enumerator **ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**

BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP\_GAP\_BLE\_NC\_REQ\_EVT**

Numeric Comparison request event

enumerator **ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**

When stop adv complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**

When stop scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT**

When set the static rand address complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**

When update connection parameters complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**

When set pkt length complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**

When remove the bond device complete, the event comes

enumerator **ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**

When get the bond device list complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**

When read the rssi complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_PHY\_COMPLETE\_EVT**

when reading phy complete, this event comes

enumerator **ESP\_GAP\_BLE\_SET\_PREFERRED\_DEFAULT\_PHY\_COMPLETE\_EVT**

when preferred default phy complete, this event comes

enumerator **ESP\_GAP\_BLE\_SET\_PREFERRED\_PHY\_COMPLETE\_EVT**

when preferred phy complete , this event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_RAND\_ADDR\_COMPLETE\_EVT**

when extended set random address complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

when extended advertising parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_DATA\_SET\_COMPLETE\_EVT**

when extended advertising data complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

when extended scan response data complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_START\_COMPLETE\_EVT**

when extended advertising start complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_STOP\_COMPLETE\_EVT**

when extended advertising stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_REMOVE\_COMPLETE\_EVT**

when extended advertising set remove complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_CLEAR\_COMPLETE\_EVT**

when extended advertising set clear complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

when periodic advertising parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_DATA\_SET\_COMPLETE\_EVT**

when periodic advertising data complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_START\_COMPLETE\_EVT**

when periodic advertising start complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_STOP\_COMPLETE\_EVT**

when periodic advertising stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CREATE\_SYNC\_COMPLETE\_EVT**

when periodic advertising create sync complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_CANCEL\_COMPLETE\_EVT**

when extended advertising sync cancel complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TERMINATE\_COMPLETE\_EVT**

when extended advertising sync terminate complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_ADD\_DEV\_COMPLETE\_EVT**

when extended advertising add device complete , the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REMOVE\_DEV\_COMPLETE\_EVT**  
when extended advertising remove device complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CLEAR\_DEV\_COMPLETE\_EVT**  
when extended advertising clear device, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\_EVT**  
when extended scan parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_START\_COMPLETE\_EVT**  
when extended scan start complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_STOP\_COMPLETE\_EVT**  
when extended scan stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_PREFER\_EXT\_CONN\_PARAMS\_SET\_COMPLETE\_EVT**  
when extended prefer connection parameter set complete, the event comes

enumerator **ESP\_GAP\_BLE\_PHY\_UPDATE\_COMPLETE\_EVT**  
when ble phy update complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_REPORT\_EVT**  
when extended advertising report complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_TIMEOUT\_EVT**  
when scan timeout complete, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_TERMINATED\_EVT**  
when advertising terminate data complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_REQ\_RECEIVED\_EVT**  
when scan req received complete, the event comes

enumerator **ESP\_GAP\_BLE\_CHANNEL\_SELECT\_ALGORITHM\_EVT**  
when channel select algorithm complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REPORT\_EVT**  
when periodic report advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_LOST\_EVT**  
when periodic advertising sync lost complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_ESTAB\_EVT**  
when periodic advertising sync establish complete, the event comes

enumerator **ESP\_GAP\_BLE\_SC\_OOB\_REQ\_EVT**  
Secure Connection OOB request event

enumerator **ESP\_GAP\_BLE\_SC\_CR\_LOC\_OOB\_EVT**

Secure Connection create OOB data complete event

enumerator **ESP\_GAP\_BLE\_GET\_DEV\_NAME\_COMPLETE\_EVT**

When getting BT device name complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_RECV\_ENABLE\_COMPLETE\_EVT**

when set periodic advertising receive enable complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TRANS\_COMPLETE\_EVT**

when periodic advertising sync transfer complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_INFO\_TRANS\_COMPLETE\_EVT**

when periodic advertising set info transfer complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PAST\_PARAMS\_COMPLETE\_EVT**

when set periodic advertising sync transfer params complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TRANS\_RECV\_EVT**

when periodic advertising sync transfer received, the event comes

enumerator **ESP\_GAP\_BLE\_EVT\_MAX**

when maximum advertising event complete, the event comes

enum **esp\_ble\_adv\_data\_type**

The type of advertising data(not adv\_type)

*Values:*

enumerator **ESP\_BLE\_AD\_TYPE\_FLAG**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_32SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_32SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_128SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_128SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_NAME\_SHORT**

enumerator **ESP\_BLE\_AD\_TYPE\_128SOL\_SRV\_UUID**

enumerator **ESP\_BLE\_AD\_TYPE\_SERVICE\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_PUBLIC\_TARGET**

enumerator **ESP\_BLE\_AD\_TYPE\_RANDOM\_TARGET**

enumerator **ESP\_BLE\_AD\_TYPE\_APPEARANCE**

enumerator **ESP\_BLE\_AD\_TYPE\_ADV\_INT**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_DEV\_ADDR**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_ROLE**

enumerator **ESP\_BLE\_AD\_TYPE\_SPAIR\_C256**

enumerator **ESP\_BLE\_AD\_TYPE\_SPAIR\_R256**

enumerator **ESP\_BLE\_AD\_TYPE\_32SOL\_SRV\_UUID**

enumerator **ESP\_BLE\_AD\_TYPE\_32SERVICE\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_128SERVICE\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SECURE\_CONFIRM**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SECURE\_RANDOM**

enumerator **ESP\_BLE\_AD\_TYPE\_URI**

enumerator **ESP\_BLE\_AD\_TYPE\_INDOOR\_POSITION**

enumerator **ESP\_BLE\_AD\_TYPE\_TRANS\_DISC\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SUPPORT\_FEATURE**

enumerator **ESP\_BLE\_AD\_TYPE\_CHAN\_MAP\_UPDATE**

enumerator **ESP\_BLE\_AD\_MANUFACTURER\_SPECIFIC\_TYPE**

enum **esp\_ble\_adv\_type\_t**

Advertising mode.

*Values:*

enumerator **ADV\_TYPE\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_HIGH**

enumerator **ADV\_TYPE\_SCAN\_IND**

enumerator **ADV\_TYPE\_NONCONN\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_LOW**

enum **esp\_ble\_adv\_channel\_t**

Advertising channel mask.

*Values:*

enumerator **ADV\_CHNL\_37**

enumerator **ADV\_CHNL\_38**

enumerator **ADV\_CHNL\_39**

enumerator **ADV\_CHNL\_ALL**

enum **esp\_ble\_adv\_filter\_t**

*Values:*

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_WLST**

Allow scan and connection requests from White List devices only.

enum **esp\_ble\_sec\_act\_t**

*Values:*

enumerator **ESP\_BLE\_SEC\_ENCRYPT**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT** in `bta/bta_api.h`. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will use the default authentication request used in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_NO\_MITM**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT\_NO\_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_MITM**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT\_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enum **esp\_ble\_sm\_param\_t**

*Values:*

enumerator **ESP\_BLE\_SM\_PASSKEY**

Authentication requirements of local device

enumerator **ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE**

The IO capability of local device

enumerator **ESP\_BLE\_SM\_IOCAP\_MODE**

Initiator Key Distribution/Generation

enumerator **ESP\_BLE\_SM\_SET\_INIT\_KEY**

Responder Key Distribution/Generation

enumerator **ESP\_BLE\_SM\_SET\_RSP\_KEY**

Maximum Encryption key size to support

enumerator **ESP\_BLE\_SM\_MAX\_KEY\_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP\_BLE\_SM\_MIN\_KEY\_SIZE**

Set static Passkey

enumerator **ESP\_BLE\_SM\_SET\_STATIC\_PASSKEY**

Reset static Passkey

enumerator **ESP\_BLE\_SM\_CLEAR\_STATIC\_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH**

Enable/Disable OOB support

enumerator **ESP\_BLE\_SM\_OOB\_SUPPORT**

Appl encryption key size

enumerator **ESP\_BLE\_APP\_ENC\_KEY\_SIZE**

authentication max param

enumerator **ESP\_BLE\_SM\_MAX\_PARAM**

enum **esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

enumerator **BLE\_SCAN\_TYPE\_PASSIVE**

Passive scan

enumerator **BLE\_SCAN\_TYPE\_ACTIVE**

Active scan

enum **esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:*

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_RPA\_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:*

enumerator **BLE\_SCAN\_DUPLICATE\_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE\_SCAN\_DUPLICATE\_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE\_SCAN\_DUPLICATE\_MAX**

0x02 –0xFF, Reserved for future use

enum **esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:*

enumerator **ESP\_GAP\_SEARCH\_INQ\_RES\_EVT**

Inquiry result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT**

Inquiry complete.

enumerator **ESP\_GAP\_SEARCH\_DISC\_RES\_EVT**

Discovery result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT**

Search cancelled

enumerator **ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT**

The number of pkt discarded by flow control

enum **esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

enumerator **ESP\_BLE\_EVT\_CONN\_ADV**

Connectable undirected advertising (ADV\_IND)

enumerator **ESP\_BLE\_EVT\_CONN\_DIR\_ADV**  
Connectable directed advertising (ADV\_DIRECT\_IND)

enumerator **ESP\_BLE\_EVT\_DISC\_ADV**  
Scannable undirected advertising (ADV\_SCAN\_IND)

enumerator **ESP\_BLE\_EVT\_NON\_CONN\_ADV**  
Non connectable undirected advertising (ADV\_NONCONN\_IND)

enumerator **ESP\_BLE\_EVT\_SCAN\_RSP**  
Scan Response (SCAN\_RSP)

enum **esp\_ble\_wl\_operation\_t**

*Values:*

enumerator **ESP\_BLE\_WHITELIST\_REMOVE**  
remove mac from whitelist

enumerator **ESP\_BLE\_WHITELIST\_ADD**  
add address to whitelist

enumerator **ESP\_BLE\_WHITELIST\_CLEAR**  
clear all device in whitelist

enum **esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD**  
Add device info into duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**  
Remove device info from duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**  
Clean duplicate scan exceptional list

enum **esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR**  
BLE advertising address , device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**  
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**  
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ... |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ... |

enum **esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST**

duplicate scan exceptional addr list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST**

duplicate scan exceptional all list

## GATT DEFINES

### API Reference

#### Header File

- `components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h`

#### Unions

union **esp\_gatt\_rsp\_t**

*#include <esp\_gatt\_defs.h>* GATT remote read request response type.

#### Public Members

*esp\_gatt\_value\_t* **attr\_value**

Gatt attribute structure

uint16\_t **handle**

Gatt attribute handle

## Structures

struct **esp\_gatt\_id\_t**

Gatt id, include uuid and instance id.

### Public Members

*esp\_bt\_uuid\_t* **uuid**

UUID

uint8\_t **inst\_id**

Instance id

struct **esp\_gatt\_srvc\_id\_t**

Gatt service id, include id (uuid and instance id) and primary flag.

### Public Members

*esp\_gatt\_id\_t* **id**

Gatt id, include uuid and instance

bool **is\_primary**

This service is primary or not

struct **esp\_attr\_desc\_t**

Attribute description (used to create database)

### Public Members

uint16\_t **uuid\_length**

UUID length

uint8\_t \***uuid\_p**

UUID value

uint16\_t **perm**

Attribute permission

uint16\_t **max\_length**

Maximum length of the element

uint16\_t **length**

Current length of the element

uint8\_t \***value**

Element value array

struct **esp\_attr\_control\_t**

attribute auto response flag

### Public Members

uint8\_t **auto\_rsp**

if `auto_rsp` set to `ESP_GATT_RSP_BY_APP`, means the response of Write/Read operation will be replied by application. if `auto_rsp` set to `ESP_GATT_AUTO_RSP`, means the response of Write/Read operation will be replied by GATT stack automatically.

struct **esp\_gatts\_attr\_db\_t**

attribute type added to the gatt server database

### Public Members

*esp\_attr\_control\_t* **attr\_control**

The attribute control type

*esp\_attr\_desc\_t* **att\_desc**

The attribute type

struct **esp\_attr\_value\_t**

set the attribute value type

### Public Members

uint16\_t **attr\_max\_len**

attribute max value length

uint16\_t **attr\_len**

attribute current value length

uint8\_t \***attr\_value**

the pointer to attribute value

struct **esp\_gatts\_incl\_svc\_desc\_t**

Gatt include service entry element.

### Public Members

uint16\_t **start\_hdl**

Gatt start handle value of included service

uint16\_t **end\_hdl**

Gatt end handle value of included service

uint16\_t **uuid**

Gatt attribute value UUID of included service

struct **esp\_gatts\_incl128\_svc\_desc\_t**

Gatt include 128 bit service entry element.

**Public Members****uint16\_t start\_hdl**

Gatt start handle value of included 128 bit service

**uint16\_t end\_hdl**

Gatt end handle value of included 128 bit service

struct **esp\_gatt\_value\_t**

Gatt attribute value.

**Public Members****uint8\_t value**[ESP\_GATT\_MAX\_ATTR\_LEN]

Gatt attribute value

**uint16\_t handle**

Gatt attribute handle

**uint16\_t offset**

Gatt attribute value offset

**uint16\_t len**

Gatt attribute value length

**uint8\_t auth\_req**

Gatt authentication request

struct **esp\_gatt\_conn\_params\_t**

Connection parameters information.

**Public Members****uint16\_t interval**

connection interval

**uint16\_t latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 secondsstruct **esp\_gattc\_multi\_t**

read multiple attribute

**Public Members****uint8\_t num\_attr**

The number of the attribute

**uint16\_t handles**[ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES]

The handles list

struct **esp\_gattc\_db\_elem\_t**

data base attribute element

**Public Members***esp\_gatt\_db\_attr\_type\_t* **type**

The attribute type

**uint16\_t attribute\_handle**

The attribute handle, it' s valid for all of the type

**uint16\_t start\_handle**

The service start handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

**uint16\_t end\_handle**

The service end handle, it' s valid only when the type = ESP\_GATT\_DB\_PRIMARY\_SERVICE or ESP\_GATT\_DB\_SECONDARY\_SERVICE

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties, it' s valid only when the type = ESP\_GATT\_DB\_CHARACTERISTIC

*esp\_bt\_uuid\_t* **uuid**

The attribute uuid, it' s valid for all of the type

struct **esp\_gattc\_service\_elem\_t**

service element

**Public Members****bool is\_primary**

The service flag, true if the service is primary service, else is secondary service

**uint16\_t start\_handle**

The start handle of the service

**uint16\_t end\_handle**

The end handle of the service

*esp\_bt\_uuid\_t* **uuid**

The uuid of the service

struct **esp\_gattc\_char\_elem\_t**  
characteristic element

### **Public Members**

uint16\_t **char\_handle**

The characteristic handle

*esp\_gatt\_char\_prop\_t* **properties**

The characteristic properties

*esp\_bt\_uuid\_t* **uuid**

The characteristic uuid

struct **esp\_gattc\_descr\_elem\_t**  
descriptor element

### **Public Members**

uint16\_t **handle**

The characteristic descriptor handle

*esp\_bt\_uuid\_t* **uuid**

The characteristic descriptor uuid

struct **esp\_gattc\_incl\_svc\_elem\_t**  
include service element

### **Public Members**

uint16\_t **handle**

The include service current attribute handle

uint16\_t **incl\_srvc\_s\_handle**

The start handle of the service which has been included

uint16\_t **incl\_srvc\_e\_handle**

The end handle of the service which has been included

*esp\_bt\_uuid\_t* **uuid**

The include service uuid

## Macros

**ESP\_GATT\_UUID\_IMMEDIATE\_ALERT\_SVC**

All “ESP\_GATT\_UUID\_XXX” is attribute types

**ESP\_GATT\_CHAR\_PROP\_BIT\_NOTIFY**

**ESP\_GATT\_CHAR\_PROP\_BIT\_INDICATE**

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

**ESP\_GATT\_MAX\_ATTR\_LEN**

GATT maximum attribute length.

**ESP\_GATT\_RSP\_BY\_APP**

**ESP\_GATT\_AUTO\_RSP**

**ESP\_GATT\_IF\_NONE**

If callback report `gatt_if/gatts_if` as this macro, means this event is not correspond to any app

### Type Definitions

```
typedef uint16_t esp_gatt_perm_t
```

```
typedef uint8_t esp_gatt_char_prop_t
```

```
typedef uint8_t esp_gatt_if_t
```

Gatt interface type, different application on GATT client use different `gatt_if`

### Enumerations

```
enum esp_gatt_prep_write_type
```

Attribute write data type from the client.

*Values:*

```
enumerator ESP_GATT_PREP_WRITE_CANCEL
```

Prepare write cancel

```
enumerator ESP_GATT_PREP_WRITE_EXEC
```

Prepare write execute

```
enum esp_gatt_status_t
```

GATT success code and error codes.

*Values:*

enumerator **ESP\_GATT\_OK**

enumerator **ESP\_GATT\_INVALID\_HANDLE**

enumerator **ESP\_GATT\_READ\_NOT\_PERMIT**

enumerator **ESP\_GATT\_WRITE\_NOT\_PERMIT**

enumerator **ESP\_GATT\_INVALID\_PDU**

enumerator **ESP\_GATT\_INSUF\_AUTHENTICATION**

enumerator **ESP\_GATT\_REQ\_NOT\_SUPPORTED**

enumerator **ESP\_GATT\_INVALID\_OFFSET**

enumerator **ESP\_GATT\_INSUF\_AUTHORIZATION**

enumerator **ESP\_GATT\_PREPARE\_Q\_FULL**

enumerator **ESP\_GATT\_NOT\_FOUND**

enumerator **ESP\_GATT\_NOT\_LONG**

enumerator **ESP\_GATT\_INSUF\_KEY\_SIZE**

enumerator **ESP\_GATT\_INVALID\_ATTR\_LEN**

enumerator **ESP\_GATT\_ERR\_UNLIKELY**

enumerator **ESP\_GATT\_INSUF\_ENCRYPTION**

enumerator **ESP\_GATT\_UNSUPPORT\_GRP\_TYPE**

enumerator **ESP\_GATT\_INSUF\_RESOURCE**

enumerator **ESP\_GATT\_NO\_RESOURCES**

enumerator **ESP\_GATT\_INTERNAL\_ERROR**

enumerator **ESP\_GATT\_WRONG\_STATE**

enumerator **ESP\_GATT\_DB\_FULL**

enumerator **ESP\_GATT\_BUSY**

enumerator **ESP\_GATT\_ERROR**

enumerator **ESP\_GATT\_CMD\_STARTED**

enumerator **ESP\_GATT\_ILLEGAL\_PARAMETER**

enumerator **ESP\_GATT\_PENDING**

enumerator **ESP\_GATT\_AUTH\_FAIL**

enumerator **ESP\_GATT\_MORE**

enumerator **ESP\_GATT\_INVALID\_CFG**

enumerator **ESP\_GATT\_SERVICE\_STARTED**

enumerator **ESP\_GATT\_ENCRYPTED\_MITM**

enumerator **ESP\_GATT\_ENCRYPTED\_NO\_MITM**

enumerator **ESP\_GATT\_NOT\_ENCRYPTED**

enumerator **ESP\_GATT\_CONGESTED**

enumerator **ESP\_GATT\_DUP\_REG**

enumerator **ESP\_GATT\_ALREADY\_OPEN**

enumerator **ESP\_GATT\_CANCEL**

enumerator **ESP\_GATT\_STACK\_RSP**

enumerator **ESP\_GATT\_APP\_RSP**

enumerator **ESP\_GATT\_UNKNOWN\_ERROR**

enumerator **ESP\_GATT\_CCC\_CFG\_ERR**

enumerator **ESP\_GATT\_PRC\_IN\_PROGRESS**

enumerator **ESP\_GATT\_OUT\_OF\_RANGE**

enum **esp\_gatt\_conn\_reason\_t**

Gatt Connection reason enum.

*Values:*

enumerator **ESP\_GATT\_CONN\_UNKNOWN**

Gatt connection unknown

enumerator **ESP\_GATT\_CONN\_L2C\_FAILURE**

General L2cap failure

enumerator **ESP\_GATT\_CONN\_TIMEOUT**

Connection timeout

enumerator **ESP\_GATT\_CONN\_TERMINATE\_PEER\_USER**

Connection terminate by peer user

enumerator **ESP\_GATT\_CONN\_TERMINATE\_LOCAL\_HOST**

Connection terminated by local host

enumerator **ESP\_GATT\_CONN\_FAIL\_ESTABLISH**

Connection fail to establish

enumerator **ESP\_GATT\_CONN\_LMP\_TIMEOUT**

Connection fail for LMP response tout

enumerator **ESP\_GATT\_CONN\_CONN\_CANCEL**

L2CAP connection cancelled

enumerator **ESP\_GATT\_CONN\_NONE**

No connection to cancel

enum **esp\_gatt\_auth\_req\_t**

Gatt authentication request type.

*Values:*

enumerator **ESP\_GATT\_AUTH\_REQ\_NONE**

enumerator **ESP\_GATT\_AUTH\_REQ\_NO\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_NO\_MITM**

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_MITM**

enum **esp\_service\_source\_t**

*Values:*

enumerator **ESP\_GATT\_SERVICE\_FROM\_REMOTE\_DEVICE**

enumerator **ESP\_GATT\_SERVICE\_FROM\_NVS\_FLASH**

enumerator **ESP\_GATT\_SERVICE\_FROM\_UNKNOWN**

enum **esp\_gatt\_write\_type\_t**

Gatt write type.

*Values:*

enumerator **ESP\_GATT\_WRITE\_TYPE\_NO\_RSP**

Gatt write attribute need no response

enumerator **ESP\_GATT\_WRITE\_TYPE\_RSP**

Gatt write attribute need remote response

enum **esp\_gatt\_db\_attr\_type\_t**

the type of attribute element

*Values:*

enumerator **ESP\_GATT\_DB\_PRIMARY\_SERVICE**

Gattc primary service attribute type in the cache

enumerator **ESP\_GATT\_DB\_SECONDARY\_SERVICE**

Gattc secondary service attribute type in the cache

enumerator **ESP\_GATT\_DB\_CHARACTERISTIC**

Gattc characteristic attribute type in the cache

enumerator **ESP\_GATT\_DB\_DESCRIPTOR**

Gattc characteristic descriptor attribute type in the cache

enumerator **ESP\_GATT\_DB\_INCLUDED\_SERVICE**

Gattc include service attribute type in the cache

enumerator **ESP\_GATT\_DB\_ALL**

Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

## GATT SERVER API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - [bluetooth/bluedroid/ble/gatt\\_server](#)
  - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

### Header File

- `components/bt/host/bluedroid/api/include/api/esp_gatts_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

**Parameters** *gatts\_if* –[in] GATT server access interface

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srv\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

#### Parameters

- **gatts\_if** –[in] GATT server access interface
- **service\_id** –[in] service ID.
- **num\_handle** –[in] number of handle requested for this service.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint16\_t max\_nb\_attr, uint8\_t srv\_inst\_id)

Create a service attribute tab.

#### Parameters

- **gatts\_attr\_db** –[in] the pointer to the service attr tab
- **gatts\_if** –[in] GATT server access interface
- **max\_nb\_attr** –[in] the number of attribute to be added to the service database.
- **srv\_inst\_id** –[in] the instance id of the service

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_included\_service** (uint16\_t service\_handle, uint16\_t included\_service\_handle)

This function is called to add an included service. This function have to be called between 'esp\_ble\_gatts\_create\_service' and 'esp\_ble\_gatts\_add\_char'. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

**Parameters**

- **service\_handle** –[in] service handle to which this included service is to be added.
- **included\_service\_handle** –[in] the service ID to be included.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*char\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_gatt\_char\_prop\_t* property, *esp\_attr\_value\_t* \*char\_val, *esp\_attr\_control\_t* \*control)

This function is called to add a characteristic into a service.

**Parameters**

- **service\_handle** –[in] service handle to which this included service is to be added.
- **char\_uuid** –[in] : Characteristic UUID.
- **perm** –[in] : Characteristic value declaration attribute permission.
- **property** –[in] : Characteristic Properties
- **char\_val** –[in] : Characteristic value
- **control** –[in] : attribute response control byte

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char\_descr** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*descr\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_attr\_value\_t* \*char\_descr\_val, *esp\_attr\_control\_t* \*control)

This function is called to add characteristic descriptor. When it's done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

**Parameters**

- **service\_handle** –[in] service handle to which this characteristic descriptor is to be added.
- **perm** –[in] descriptor access permission.
- **descr\_uuid** –[in] descriptor UUID.
- **char\_descr\_val** –[in] : Characteristic descriptor value
- **control** –[in] : attribute response control byte

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_delete\_service** (uint16\_t service\_handle)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

**Parameters** **service\_handle** –[in] service\_handle to be deleted.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_start\_service** (uint16\_t service\_handle)

This function is called to start a service.

**Parameters** **service\_handle** –[in] the service handle to be started.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_stop\_service** (uint16\_t service\_handle)

This function is called to stop a service.

**Parameters** **service\_handle** –[in] - service to be topped.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_indicate** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint16\_t attr\_handle, uint16\_t value\_len, uint8\_t \*value, bool need\_confirm)

Send indicate or notify to GATT client. Set param need\_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size, see “esp\_ble\_gattc\_send\_mtu\_req”

#### Parameters

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] - connection id to indicate.
- **attr\_handle** –[in] - attribute handle to indicate.
- **value\_len** –[in] - indicate value length.
- **value** –[in] value to indicate.
- **need\_confirm** –[in] - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_response** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint32\_t trans\_id, *esp\_gatt\_status\_t* status, *esp\_gatt\_rsp\_t* \*rsp)

This function is called to send a response to a request.

#### Parameters

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] - connection identifier.
- **trans\_id** –[in] - transfer id
- **status** –[in] - response status
- **rsp** –[in] - response data.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_set\_attr\_value** (uint16\_t attr\_handle, uint16\_t length, const uint8\_t \*value)

This function is called to set the attribute value by the application.

#### Parameters

- **attr\_handle** –[in] the attribute handle which to be set
- **length** –[in] the value length
- **value** –[in] the pointer to the attribute value

#### Returns

- ESP\_OK : success
- other : failed

*esp\_gatt\_status\_t* **esp\_ble\_gatts\_get\_attr\_value** (uint16\_t attr\_handle, uint16\_t \*length, const uint8\_t \*\*value)

Retrieve attribute value.

#### Parameters

- **attr\_handle** –[in] Attribute handle.
- **length** –[out] pointer to the attribute value length
- **value** –[out] Pointer to attribute value payload, the value cannot be modified by user

#### Returns

- ESP\_GATT\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Open a direct open connection or add a background auto connection.

#### Parameters

- **gatts\_if** –[in] GATT server access interface
- **remote\_bda** –[in] remote device bluetooth device address.
- **is\_direct** –[in] direct connection or background auto connection

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_close** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id)

Close a connection a remote device.

**Parameters**

- **gatts\_if** –[in] GATT server access interface
- **conn\_id** –[in] connection ID to be closed.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_service\_change\_indication** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda)

Send service change indication.

**Parameters**

- **gatts\_if** –[in] GATT server access interface
- **remote\_bda** –[in] remote device bluetooth device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_show\_local\_database** (void)

Print local database (GATT service table)

**Returns**

- ESP\_OK : success
- other : failed

**Unions**

union **esp\_ble\_gatts\_cb\_param\_t**

*#include <esp\_gatts\_api.h>* Gatt server callback parameters union.

**Public Members**

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_reg\_evt\_param* **reg**

Gatt server callback param of ESP\_GATTS\_REG\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_read\_evt\_param* **read**

Gatt server callback param of ESP\_GATTS\_READ\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_write\_evt\_param* **write**

Gatt server callback param of ESP\_GATTS\_WRITE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_exec\_write\_evt\_param* **exec\_write**

Gatt server callback param of ESP\_GATTS\_EXEC\_WRITE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_mtu\_evt\_param* **mtu**  
Gatt server callback param of ESP\_GATTS\_MTU\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_conf\_evt\_param* **conf**  
Gatt server callback param of ESP\_GATTS\_CONF\_EVT (confirm)

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_create\_evt\_param* **create**  
Gatt server callback param of ESP\_GATTS\_CREATE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_incl\_srvc\_evt\_param* **add\_incl\_srvc**  
Gatt server callback param of ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_char\_evt\_param* **add\_char**  
Gatt server callback param of ESP\_GATTS\_ADD\_CHAR\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_char\_descr\_evt\_param* **add\_char\_descr**  
Gatt server callback param of ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_delete\_evt\_param* **del**  
Gatt server callback param of ESP\_GATTS\_DELETE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_start\_evt\_param* **start**  
Gatt server callback param of ESP\_GATTS\_START\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_stop\_evt\_param* **stop**  
Gatt server callback param of ESP\_GATTS\_STOP\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_connect\_evt\_param* **connect**  
Gatt server callback param of ESP\_GATTS\_CONNECT\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_disconnect\_evt\_param* **disconnect**  
Gatt server callback param of ESP\_GATTS\_DISCONNECT\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_open\_evt\_param* **open**  
Gatt server callback param of ESP\_GATTS\_OPEN\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_cancel\_open\_evt\_param* **cancel\_open**  
Gatt server callback param of ESP\_GATTS\_CANCEL\_OPEN\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_close\_evt\_param* **close**  
Gatt server callback param of ESP\_GATTS\_CLOSE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_congest\_evt\_param* **congest**  
Gatt server callback param of ESP\_GATTS\_CONGEST\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_rsp\_evt\_param* **rsp**  
Gatt server callback param of ESP\_GATTS\_RESPONSE\_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab  
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT
```

```
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val  
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT
```

```
struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change  
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT
```

```
struct gatts_add_attr_tab_evt_param  
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.
```

### Public Members

*esp\_gatt\_status\_t* **status**  
 Operation status

*esp\_bt\_uuid\_t* **svc\_uuid**  
 Service uuid type

uint8\_t **svc\_inst\_id**  
 Service id

uint16\_t **num\_handle**  
 The number of the attribute handle to be added to the gatts database

uint16\_t **\*handles**  
 The number to the handles

```
struct gatts_add_char_descr_evt_param  
    #include <esp_gatts_api.h> ESP_GATTS_ADD_CHAR_DESCR_EVT.
```

### Public Members

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been written

uint16\_t **handle**

The attribute handle

uint16\_t **offset**

Offset of the value, if the value is too long

bool **need\_rsp**

The write operation need to do response

bool **is\_prep**

This write operation is prepare write

uint16\_t **len**

The write attribute value length

uint8\_t \***value**

The write attribute value

## Macros

**ESP\_GATT\_PREP\_WRITE\_CANCEL**

Prepare write flag to indicate cancel prepare write

**ESP\_GATT\_PREP\_WRITE\_EXEC**

Prepare write flag to indicate execute prepare write

## Type Definitions

typedef void (\***esp\_gatts\_cb\_t**)(*esp\_gatts\_cb\_event\_t* event, *esp\_gatt\_if\_t* gatts\_if, *esp\_ble\_gatts\_cb\_param\_t* \*param)

GATT Server callback function type.

**Param event** : Event type

**Param gatts\_if** : GATT server access interface, normally different gatts\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

## Enumerations

enum **esp\_gatts\_cb\_event\_t**

GATT Server callback function events.

*Values:*

enumerator **ESP\_GATTS\_REG\_EVT**

When register application id, the event comes

enumerator **ESP\_GATTS\_READ\_EVT**

When gatt client request read operation, the event comes

enumerator **ESP\_GATTS\_WRITE\_EVT**

When gatt client request write operation, the event comes

enumerator **ESP\_GATTS\_EXEC\_WRITE\_EVT**

When gatt client request execute write, the event comes

enumerator **ESP\_GATTS\_MTU\_EVT**

When set mtu complete, the event comes

enumerator **ESP\_GATTS\_CONF\_EVT**

When receive confirm, the event comes

enumerator **ESP\_GATTS\_UNREG\_EVT**

When unregister application id, the event comes

enumerator **ESP\_GATTS\_CREATE\_EVT**

When create service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT**

When add included service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_EVT**

When add characteristic complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT**

When add descriptor complete, the event comes

enumerator **ESP\_GATTS\_DELETE\_EVT**

When delete service complete, the event comes

enumerator **ESP\_GATTS\_START\_EVT**

When start service complete, the event comes

enumerator **ESP\_GATTS\_STOP\_EVT**

When stop service complete, the event comes

enumerator **ESP\_GATTS\_CONNECT\_EVT**

When gatt client connect, the event comes

enumerator **ESP\_GATTS\_DISCONNECT\_EVT**

When gatt client disconnect, the event comes

enumerator **ESP\_GATTS\_OPEN\_EVT**

When connect to peer, the event comes

enumerator **ESP\_GATTS\_CANCEL\_OPEN\_EVT**

When disconnect from peer, the event comes

enumerator **ESP\_GATTS\_CLOSE\_EVT**

When gatt server close, the event comes

enumerator **ESP\_GATTS\_LISTEN\_EVT**

When gatt listen to be connected the event comes

enumerator **ESP\_GATTS\_CONGEST\_EVT**

When congest happen, the event comes

enumerator **ESP\_GATTS\_RESPONSE\_EVT**

When gatt send response complete, the event comes

enumerator **ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT**

When gatt create table complete, the event comes

enumerator **ESP\_GATTS\_SET\_ATTR\_VAL\_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT**

When gatt send service change indication complete, the event comes

## GATT CLIENT API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - [bluetooth/bluedroid/ble/gatt\\_client](#)
  - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - [bluetooth/bluedroid/ble/gattc\\_multi\\_connect](#)
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_client](#)

## API Reference

### Functions

*esp\_err\_t* **esp\_ble\_gattc\_register\_callback** (*esp\_gattc\_cb\_t* callback)

This function is called to register application callbacks with GATTC module.

**Parameters** **callback** –[in] : pointer to the application callback function.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_app\_register** (uint16\_t app\_id)

This function is called to register application callbacks with GATTC module.

**Parameters** **app\_id** –[in] : Application Identify (UUID), for different application

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_app\_unregister** (*esp\_gatt\_if\_t* gattc\_if)

This function is called to unregister an application from GATTC module.

**Parameters** **gattc\_if** –[in] Gatt client access interface.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

Open a direct connection or add a background auto connection.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **remote\_bda** –[in] remote device bluetooth device address.
- **remote\_addr\_type** –[in] remote device bluetooth device the address type.
- **is\_direct** –[in] direct connection or background auto connection (by now, background auto connection is not supported).

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_aux\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app\_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp\_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device).

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID to be closed.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp\_ble\_gatt\_set\_local\_mtu() to configure the local MTU size.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*filter\_uuid)

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID.
- **filter\_uuid** –[in] a UUID of the service application is interested in. If Null, discover for all services.

#### Returns

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t
                                           *svc_uuid, esp_gattc_service_elem_t *result, uint16_t
                                           *count, uint16_t offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc\_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp\_ble\_gattc\_cache\_refresh, then call esp\_ble\_gattc\_get\_service again.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **svc\_uuid** –[in] the pointer to the service uuid.
- **result** –[out] The pointer to the service which has been found in the gattc cache.
- **count** –[inout] input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** –[in] Offset of the service position to get.

#### Returns

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                              start_handle, uint16_t end_handle,
                                              esp_gattc_char_elem_t *result, uint16_t *count, uint16_t
                                              offset)
```

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle.
- **end\_handle** –[in] the attribute end handle
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** –[in] Offset of the characteristic position to get.

#### Returns

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                              char_handle, esp_gattc_descr_elem_t *result, uint16_t
                                              *count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.

- **conn\_id** –[in] connection ID which identify the server.
- **char\_handle** –[in] the given characteristic handle
- **result** –[out] The pointer to the descriptor in the characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** –[in] Offset of the descriptor position to get.

**Returns**

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **char\_uuid** –[in] the characteristic uuid
- **result** –[out] The pointer to the characteristic in the service.
- **count** –[inout] input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

**Returns**

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **char\_uuid** –[in] the characteristic uuid.
- **descr\_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

**Returns**

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **char\_handle** –[in] the characteristic handle.
- **descr\_uuid** –[in] the descriptor uuid.
- **result** –[out] The pointer to the descriptor in the given characteristic.
- **count** –[inout] input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_include\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* \*incl\_uuid, *esp\_gattc\_incl\_svc\_elem\_t* \*result, uint16\_t \*count)

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **incl\_uuid** –[in] the include service uuid
- **result** –[out] The pointer to the include service in the given service.
- **count** –[inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_attr\_count** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gatt\_db\_attr\_type\_t* type, uint16\_t start\_handle, uint16\_t end\_handle, uint16\_t char\_handle, uint16\_t \*count)

Find the attribute count with the given service or characteristic in the gattc cache.

#### Parameters

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] connection ID which identify the server.
- **type** –[in] the attribute type.
- **start\_handle** –[in] the attribute start handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **end\_handle** –[in] the attribute end handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **char\_handle** –[in] the characteristic handle, this parameter valid when the type is ESP\_GATT\_DB\_DESCRIPTOR. If the type isn't ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore.
- **count** –[out] output the number of attribute has been found in the gattc cache with the given attribute type.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_db** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_gattc\_db\_elem\_t* \*db, uint16\_t \*count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **start\_handle** –[in] the attribute start handle
- **end\_handle** –[in] the attribute end handle
- **conn\_id** –[in] connection ID which identify the server.
- **db** –[in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** –[in] number of elements in database.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service' s characteristics of the given characteristic handle.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteritic handle to read.
- **auth\_req** –[in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_by\_type** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* \*uuid, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service' s characteristics of the given characteristic UUID.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **start\_handle** –[in] : the attribute start handle.
- **end\_handle** –[in] : the attribute end handle
- **uuid** –[in] : The UUID of attribute which will be read.
- **auth\_req** –[in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_multiple** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gattc\_multi\_t* \*read\_multi, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read multiple characteristic or characteristic descriptors.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **read\_multi** –[in] : pointer to the read multiple parameter.
- **auth\_req** –[in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_multiple\_variable** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gattc\_multi\_t* \*read\_multi, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read multiple variable length characteristic or characteristic descriptors.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.

- **conn\_id** –[in] : connection ID.
- **read\_multi** –[in] : pointer to the read multiple parameter.
- **auth\_req** –[in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a characteristics descriptor.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : descriptor handle to read.
- **auth\_req** –[in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic value.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to write.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write\_type** –[in] : the type of attribute write operation.
- **auth\_req** –[in] : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic descriptor value.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID
- **handle** –[in] : descriptor handle to write.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **write\_type** –[in] : the type of attribute write operation.
- **auth\_req** –[in] : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic value.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.

- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth\_req** –[in] : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic descriptor value.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **handle** –[in] : characteristic descriptor handle to prepare write.
- **offset** –[in] : offset of the write value.
- **value\_len** –[in] length of the value to be written.
- **value** –[in] : the value to be written.
- **auth\_req** –[in] : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_execute\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, bool is\_execute)

This function is called to execute write a prepare write sequence.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **conn\_id** –[in] : connection ID.
- **is\_execute** –[in] : execute or cancel.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_register\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to register for notification of a service.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **server\_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

**Returns**

- ESP\_OK: registration succeeds
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to de-register for notification of a service.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **server\_bda** –[in] : target GATT server.
- **handle** –[in] : GATT characteristic handle.

**Returns**

- ESP\_OK: unregister succeeds

- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* remote\_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Parameters** **remote\_bda** –[in] remote device BD address.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* src\_addr, *esp\_bd\_addr\_t* assoc\_addr, bool is\_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Parameters**

- **gattc\_if** –[in] Gatt client access interface.
- **src\_addr** –[in] the source address which provide the attribute table.
- **assoc\_addr** –[in] the associated device address which went to share the attribute table with the source address.
- **is\_assoc** –[in] true add the associated device address, false remove the associated device address.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* gattc\_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when get address list complete.

**Parameters** **gattc\_if** –[in] Gatt client access interface.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* remote\_bda)

Clean the service cache of this device in the gattc stack,.

**Parameters** **remote\_bda** –[in] remote device BD address.

**Returns**

- ESP\_OK: success
- other: failed

## Unions

union **esp\_ble\_gattc\_cb\_param\_t**

*#include <esp\_gattc\_api.h>* Gatt client callback parameters union.

## Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

*esp\_service\_source\_t* **searched\_service\_source**

The source of the service information

struct **gattc\_search\_res\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SEARCH\_RES\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint16\_t **start\_handle**

Service start handle

uint16\_t **end\_handle**

Service end handle

*esp\_gatt\_id\_t* **srvc\_id**

Service id, include service uuid and other information

bool **is\_primary**

True if this is the primary service

struct **gattc\_set\_assoc\_addr\_cmp\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SET\_ASSOC\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

struct **gattc\_srvc\_chg\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_SRVC\_CHG\_EVT.

### Public Members

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

struct **gattc\_unreg\_for\_notify\_evt\_param**

*#include <esp\_gattc\_api.h>* ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **handle**

The characteristic or descriptor handle

struct **gattc\_write\_evt\_param**

```
#include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT,  
ESP_GATTC_WRITE_DESCR_EVT.
```

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

uint16\_t **handle**

The Characteristic or descriptor handle

uint16\_t **offset**

The prepare write offset, this value is valid only when prepare write

### Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t  
*param)
```

GATT Client callback function type.

**Param event** : Event type

**Param gattc\_if** : GATT client access interface, normally different gattc\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

### Enumerations

enum **esp\_gattc\_cb\_event\_t**

GATT Client callback function events.

*Values:*

enumerator **ESP\_GATTC\_REG\_EVT**

When GATT client is registered, the event comes

enumerator **ESP\_GATTC\_UNREG\_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP\_GATTC\_OPEN\_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP\_GATTC\_READ\_CHAR\_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP\_GATTC\_WRITE\_CHAR\_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP\_GATTC\_CLOSE\_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_CMPL\_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_RES\_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP\_GATTC\_READ\_DESCR\_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP\_GATTC\_WRITE\_DESCR\_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP\_GATTC\_NOTIFY\_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP\_GATTC\_PREP\_WRITE\_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP\_GATTC\_EXEC\_EVT**

When write execution completes, the event comes

enumerator **ESP\_GATTC\_ACL\_EVT**

When ACL connection is up, the event comes

enumerator **ESP\_GATTC\_CANCEL\_OPEN\_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP\_GATTC\_SRVC\_CHG\_EVT**

When “service changed” occurs, the event comes

enumerator **ESP\_GATTC\_ENC\_CMPL\_CB\_EVT**

When encryption procedure completes, the event comes

enumerator **ESP\_GATTC\_CFG\_MTU\_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP\_GATTC\_ADV\_DATA\_EVT**

When advertising of data, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_ENB\_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_UPD\_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DATA\_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DIS\_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP\_GATTC\_CONGEST\_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_ENB\_EVT**

When batch scan is enabled, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_CFG\_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_RD\_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_THR\_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_PARAM\_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP\_GATTC\_ADV\_VSC\_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_CONNECT\_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP\_GATTC\_DISCONNECT\_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP\_GATTC\_READ\_MULTIPLE\_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP\_GATTC\_QUEUE\_FULL\_EVT**

When the gattc command queue full, the event comes

enumerator **ESP\_GATTC\_SET\_ASSOC\_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP\_GATTC\_GET\_ADDR\_LIST\_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT**

When the ble discover service complete, the event comes

enumerator **ESP\_GATTC\_READ\_MULTI\_VAR\_EVT**

When read multiple variable characteristic complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example** Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’ s wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

## API Reference

### Header File

- [components/bt/common/api/include/api/esp\\_blufi\\_api.h](#)

## Functions

*esp\_err\_t* **esp\_blufi\_register\_callbacks** (*esp\_blufi\_callbacks\_t* \*callbacks)

This function is called to receive blufi callback event.

**Parameters** **callbacks** –[in] callback functions

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_init** (void)

This function is called to initialize blufi\_profile.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_deinit** (void)

This function is called to de-initialize blufi\_profile.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_conn\_report** (*wifi\_mode\_t* opmode, *esp\_blufi\_sta\_conn\_state\_t* sta\_conn\_state, *uint8\_t* softap\_conn\_num, *esp\_blufi\_extra\_info\_t* \*extra\_info)

This function is called to send wifi connection report.

### Parameters

- **opmode** –: wifi opmode
- **sta\_conn\_state** –: station is already in connection or not
- **softap\_conn\_num** –: softap connection number
- **extra\_info** –: extra information, such as sta\_ssid, softap\_ssid and etc.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_list** (*uint16\_t* apCount, *esp\_blufi\_ap\_record\_t* \*list)

This function is called to send wifi list.

### Parameters

- **apCount** –: wifi list count
- **list** –: wifi list

**Returns** ESP\_OK - success, other - failed

*uint16\_t* **esp\_blufi\_get\_version** (void)

Get BLUFI profile version.

**Returns** Most 8bit significant is Great version, Least 8bit is Sub version

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* state)

This function is called to send blufi error information.

**Parameters** **state** –: error state

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (*uint8\_t* \*data, *uint32\_t* data\_len)

This function is called to custom data.

### Parameters

- **data** –: custom data value
- **data\_len** –: the length of custom data

**Returns** ESP\_OK - success, other - failed

## Unions

union **esp\_blufi\_cb\_param\_t**

#include <esp\_blufi\_api.h> BLUFI callback parameters union.

## Public Members

- struct *esp\_blufi\_cb\_param\_t::blufi\_init\_finish\_evt\_param* **init\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH
- struct *esp\_blufi\_cb\_param\_t::blufi\_deinit\_finish\_evt\_param* **deinit\_finish**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DEINIT\_FINISH
- struct *esp\_blufi\_cb\_param\_t::blufi\_set\_wifi\_mode\_evt\_param* **wifi\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH
- struct *esp\_blufi\_cb\_param\_t::blufi\_connect\_evt\_param* **connect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_CONNECT
- struct *esp\_blufi\_cb\_param\_t::blufi\_disconnect\_evt\_param* **disconnect**  
Blufi callback param of ESP\_BLUFI\_EVENT\_DISCONNECT
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_bssid\_evt\_param* **sta\_bssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_BSSID
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_ssid\_evt\_param* **sta\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_SSID
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_passwd\_evt\_param* **sta\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_PASSWD
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_ssid\_evt\_param* **softap\_ssid**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_SSID
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_passwd\_evt\_param* **softap\_passwd**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_PASSWD
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_max\_conn\_num\_evt\_param* **softap\_max\_conn\_num**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_MAX\_CONN\_NUM
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_auth\_mode\_evt\_param* **softap\_auth\_mode**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_AUTH\_MODE
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_softap\_channel\_evt\_param* **softap\_channel**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_SOFTAP\_CHANNEL
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_username\_evt\_param* **username**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_USERNAME
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_ca\_evt\_param* **ca**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_CA\_CERT
- struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_client\_cert\_evt\_param* **client\_cert**  
Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_CLIENT\_CERT

```
struct esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param server_cert  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT  
  
struct esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param client_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY  
  
struct esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param server_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY  
  
struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error  
    Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR  
  
struct esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param custom_data  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA  
  
struct blufi_connect_evt_param  
    #include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.
```

is authentication mode of softap interface set

**uint8\_t softap\_max\_conn\_num**

max connection number of softap interface

**bool softap\_max\_conn\_num\_set**

is max connection number of softap interface set

**uint8\_t softap\_channel**

channel of softap interface

**bool softap\_channel\_set**

is channel of softap interface set

uint8\_t **sta\_max\_conn\_retry**  
max retry of sta establish connection

bool **sta\_max\_conn\_retry\_set**  
is max retry of sta establish connection set

uint8\_t **sta\_conn\_end\_reason**  
reason of sta connection end

bool **sta\_conn\_end\_reason\_set**  
is reason of sta connection end set

int8\_t **sta\_conn\_rssi**  
rssi of sta connection

bool **sta\_conn\_rssi\_set**  
is rssi of sta connection set

struct **esp\_blufi\_ap\_record\_t**  
Description of an WiFi AP.

### Public Members

uint8\_t **ssid**[33]  
SSID of AP

int8\_t **rssi**  
signal strength of AP

struct **esp\_blufi\_callbacks\_t**  
BLUFI callback functions type.

### Public Members

*esp\_blufi\_event\_cb\_t* **event\_cb**  
BLUFI event callback

*esp\_blufi\_negotiate\_data\_handler\_t* **negotiate\_data\_handler**  
BLUFI negotiate data function for negotiate share key

*esp\_blufi\_encrypt\_func\_t* **encrypt\_func**  
BLUFI encrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_decrypt\_func\_t* **decrypt\_func**  
BLUFI decrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_checksum\_func\_t* **checksum\_func**  
BLUFI check sum function (FCS)

## Macros

### ESP\_BLUFI\_BD\_ADDR\_LEN

Bluetooth address length.

## Type Definitions

```
typedef uint8_t esp_blufi_bd_addr_t[ESP_BLUFI_BD_ADDR_LEN]
```

Bluetooth device address.

```
typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)
```

BLUFI event callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

```
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
```

BLUFI negotiate data handler.

**Param data** : data from phone

**Param len** : length of data from phone

**Param output\_data** : data want to send to phone

**Param output\_len** : length of data want to send to phone

**Param need\_free** : output reporting if memory needs to be freed or not \*

```
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI encrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt\_data** : plain text and encrypted data, the encrypt function must support autochthonous encrypt

**Param crypt\_len** : length of plain text

**Return** Nonnegative number is encrypted length, if error, return negative number;

```
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param crypt\_data** : encrypted data and plain text, the encrypt function must support autochthonous decrypt

**Param crypt\_len** : length of encrypted text

**Return** Nonnegative number is decrypted length, if error, return negative number;

```
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number

**Param data** : data need to checksum

**Param len** : length of data

## Enumerations

### 2.3.3 Controller & VHCI

#### Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send `Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE` HCI command for BLE advertising - [bluetooth/hci/controller\\_vhci\\_ble\\_adv](#).

#### API Reference

##### Header File

- `components/bt/include/esp32/include/esp_bt.h`

##### Functions

`esp_err_t esp_ble_tx_power_set` (`esp_ble_power_type_t` power\_type, `esp_power_level_t` power\_level)

Set BLE TX power Connection Tx power should only be set after connection created.

##### Parameters

- **power\_type** –: The type of which tx power, could set Advertising/Connection/Default and etc
- **power\_level** –Power level(index) corresponding to absolute value(dbm)

**Returns** ESP\_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get` (`esp_ble_power_type_t` power\_type)

Get BLE TX power Connection Tx power should only be get after connection created.

**Parameters** **power\_type** –: The type of which tx power, could set Advertising/Connection/Default and etc

**Returns**  $\geq 0$  - Power level,  $< 0$  - Invalid

*esp\_err\_t* **esp\_bredr\_tx\_power\_set** (*esp\_power\_level\_t* min\_power\_level, *esp\_power\_level\_t* max\_power\_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

**Parameters**

- **min\_power\_level** –The minimum power level
- **max\_power\_level** –The maximum power level

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bredr\_tx\_power\_get** (*esp\_power\_level\_t* \*min\_power\_level, *esp\_power\_level\_t* \*max\_power\_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Parameters**

- **min\_power\_level** –The minimum power level
- **max\_power\_level** –The maximum power level

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bredr\_sco\_datapath\_set** (*esp\_sco\_data\_path\_t* data\_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Parameters** **data\_path** –SCO data path

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_init** (*esp\_bt\_controller\_config\_t* \*cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Parameters** **cfg** –Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

**Parameters** **mode** –: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of `esp_bt_controller_init()`.

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable BT controller.

**Returns** `ESP_OK` - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Returns** status value

bool **esp\_vhci\_host\_check\_send\_available** (void)

esp\_vhci\_host\_check\_send\_available used for check actively if the host can send packet to controller or not.

**Returns** true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*data, uint16\_t len)

esp\_vhci\_host\_send\_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- **data** –the packet point
- **len** –the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (const *esp\_vhci\_host\_callback\_t* \*callback)

esp\_vhci\_host\_register\_callback register the vhci reference callback struct defined by vhci\_host\_callback structure.

**Parameters** **callback** –*esp\_vhci\_host\_callback* type variable

**Returns** ESP\_OK - success, ESP\_FAIL - failed

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_controller\_mem\_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp\_bt\_controller\_mem\_release(mode) should be called only before esp\_bt\_controller\_init() or after esp\_bt\_controller\_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp\_bt\_controller\_enable(ESP\_BT\_MODE\_BLE) to use BLE only then it is safe to call esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_CLASSIC\_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP\_BT\_MODE\_BTDM, then it may be useful to call API esp\_bt\_mem\_release(ESP\_BT\_MODE\_BTDM) instead, which internally calls esp\_bt\_controller\_mem\_release(ESP\_BT\_MODE\_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp\_bt\_mem\_release() function

**Parameters** **mode** –: the mode want to release memory

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

esp\_bt\_mem\_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp\_bt\_controller\_mem\_release(). Additionally, if the mode is set to ESP\_BT\_MODE\_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation” . In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

---

**Note:** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

---

**Parameters mode** –: the mode whose memory is to be released

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_sleep\_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and “ORIG mode” is selected. In ORIG modem sleep mode, bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “`esp_bt_controller_wakeup_request`” .

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_bt\_sleep\_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

If `esp_bt_sleep_disable()` is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, `esp_bt_controller_wakeup_request()` can be used to shorten the time for wakeup.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in `menuconfig`.

---

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

---

**Returns**

- ESP\_OK : success
- other : failed

void **esp\_wifi\_bt\_power\_domain\_on** (void)

bt Wi-Fi power domain power on

void **esp\_wifi\_bt\_power\_domain\_off** (void)

bt Wi-Fi power domain power off

**Structures**

struct **esp\_bt\_controller\_config\_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

uint16\_t **controller\_task\_stack\_size**

Bluetooth controller task stack size

uint8\_t **controller\_task\_prio**

Bluetooth controller task priority

uint8\_t **hci\_uart\_no**

If use UART1/2 as HCI IO interface, indicate UART number

uint32\_t **hci\_uart\_baudrate**

If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8\_t **scan\_duplicate\_mode**

scan duplicate mode

uint8\_t **scan\_duplicate\_type**

scan duplicate type

uint16\_t **normal\_adv\_size**

Normal adv size for scan duplicate

uint16\_t **mesh\_adv\_size**

Mesh adv size for scan duplicate

uint16\_t **send\_adv\_reserved\_size**

Controller minimum memory value

uint32\_t **controller\_debug\_flag**

Controller debug log flag

uint8\_t **mode**

Controller mode: BR/EDR, BLE or Dual Mode

uint8\_t **ble\_max\_conn**

BLE maximum connection numbers

uint8\_t **bt\_max\_acl\_conn**

BR/EDR maximum ACL connection numbers

uint8\_t **bt\_sco\_datapath**

SCO data path, i.e. HCI or PCM module

bool **auto\_latency**

BLE auto latency, used to enhance classic BT performance

bool **bt\_legacy\_auth\_vs\_evt**

BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8\_t **bt\_max\_sync\_conn**

BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8\_t **ble\_sca**

BLE low power crystal accuracy index

uint8\_t **pcm\_role**

PCM role (master & slave)

uint8\_t **pcm\_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16\_t **dup\_list\_refresh\_period**

Duplicate scan list refresh period

uint32\_t **magic**

Magic number

struct **esp\_vhci\_host\_callback**

*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

void (**\*notify\_host\_send\_available**)(void)

callback used to notify that the host can send packet to controller

int (**\*notify\_host\_rcv**)(uint8\_t \*data, uint16\_t len)

callback used to notify that the controller has a packet to send to the host

## Macros

**ESP\_BT\_CONTROLLER\_CONFIG\_MAGIC\_VAL**  
**BT\_CONTROLLER\_INIT\_CONFIG\_DEFAULT** ()

## Type Definitions

typedef struct *esp\_vhci\_host\_callback* **esp\_vhci\_host\_callback\_t**  
*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

## Enumerations

enum **esp\_bt\_mode\_t**  
Bluetooth mode for controller enable/disable.

*Values:*

enumerator **ESP\_BT\_MODE\_IDLE**  
Bluetooth is not running

enumerator **ESP\_BT\_MODE\_BLE**  
Run BLE mode

enumerator **ESP\_BT\_MODE\_CLASSIC\_BT**  
Run Classic BT mode

enumerator **ESP\_BT\_MODE\_BTDM**  
Run dual mode

enum [**anonymous**]  
BLE sleep clock accuracy(SCA), values for ble\_sca field in *esp\_bt\_controller\_config\_t*, currently only ESP\_BLE\_SCA\_500PPM and ESP\_BLE\_SCA\_250PPM are supported.

*Values:*

enumerator **ESP\_BLE\_SCA\_500PPM**  
BLE SCA at 500ppm

enumerator **ESP\_BLE\_SCA\_250PPM**  
BLE SCA at 250ppm

enumerator **ESP\_BLE\_SCA\_150PPM**  
BLE SCA at 150ppm

enumerator **ESP\_BLE\_SCA\_100PPM**  
BLE SCA at 100ppm

enumerator **ESP\_BLE\_SCA\_75PPM**  
BLE SCA at 75ppm

enumerator **ESP\_BLE\_SCA\_50PPM**  
BLE SCA at 50ppm

enumerator **ESP\_BLE\_SCA\_30PPM**

BLE SCA at 30ppm

enumerator **ESP\_BLE\_SCA\_20PPM**

BLE SCA at 20ppm

enum **esp\_bt\_controller\_status\_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_IDLE**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_INITED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_ENABLED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_NUM**

enum **esp\_ble\_power\_type\_t**

BLE tx power type ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. ESP\_BLE\_PWR\_TYPE\_ADV : for advertising/scan response. ESP\_BLE\_PWR\_TYPE\_SCAN : for scan. ESP\_BLE\_PWR\_TYPE\_DEFAULT : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP\_PWR\_LVL\_P3 as default for ADV/SCAN/CONN0-9.

*Values:*

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0**

For connection handle 0

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL1**

For connection handle 1

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL2**

For connection handle 2

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL3**

For connection handle 3

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4**

For connection handle 4

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5**

For connection handle 5

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6**

For connection handle 6

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7**

For connection handle 7

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8**

For connection handle 8

enumerator **ESP\_BLE\_PWR\_TYPE\_ADV**

For advertising

enumerator **ESP\_BLE\_PWR\_TYPE\_SCAN**

For scan

enumerator **ESP\_BLE\_PWR\_TYPE\_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP\_BLE\_PWR\_TYPE\_NUM**

TYPE numbers

enum **esp\_power\_level\_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

*Values:*

enumerator **ESP\_PWR\_LVL\_N12**

Corresponding to -12dbm

enumerator **ESP\_PWR\_LVL\_N9**

Corresponding to -9dbm

enumerator **ESP\_PWR\_LVL\_N6**

Corresponding to -6dbm

enumerator **ESP\_PWR\_LVL\_N3**

Corresponding to -3dbm

enumerator **ESP\_PWR\_LVL\_N0**

Corresponding to 0dbm

enumerator **ESP\_PWR\_LVL\_P3**

Corresponding to +3dbm

enumerator **ESP\_PWR\_LVL\_P6**

Corresponding to +6dbm

enumerator **ESP\_PWR\_LVL\_P9**

Corresponding to +9dbm

enumerator **ESP\_PWR\_LVL\_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP\_PWR\_LVL\_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP\_PWR\_LVL\_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP\_PWR\_LVL\_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP\_PWR\_LVL\_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP\_PWR\_LVL\_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP\_PWR\_LVL\_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP\_PWR\_LVL\_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

enumerator **ESP\_SCO\_DATA\_PATH\_HCI**

data over HCI transport

enumerator **ESP\_SCO\_DATA\_PATH\_PCM**

data over PCM interface

### 2.3.4 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section [Getting Started with ESP-BLE-MESH](#). If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section [ESP-BLE-MESH Architecture](#).

#### Application Examples and Demos

Please refer to Sections [ESP-BLE-MESH Examples](#) and [ESP-BLE-MESH Demo Videos](#).

## API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- [ESP-BLE-MESH Definitions](#)
- [ESP-BLE-MESH Core API Reference](#)
- [ESP-BLE-MESH Models API Reference](#)

### ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

### Header File

- `components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`

### Unions

union `esp_ble_mesh_prov_cb_param_t`

`#include <esp_ble_mesh_defs.h>` BLE Mesh Node/Provisioner callback parameters union.

### Public Members

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param` **prov\_register\_comp**  
Event parameter of ESP\_BLE\_MESH\_PROV\_REGISTER\_COMP\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param` **node\_set\_unprov\_dev\_name\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param` **node\_prov\_enable\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_ENABLE\_COMP\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param` **node\_prov\_disable\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_DISABLE\_COMP\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param` **node\_prov\_link\_open**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_OPEN\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param` **node\_prov\_link\_close**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_CLOSE\_EVT

struct `esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param` **node\_prov\_output\_num**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_NUMBER\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_output\_str\_evt\_param* **node\_prov\_output\_str**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_STRING\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_input\_evt\_param* **node\_prov\_input**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provision\_complete\_evt\_param* **node\_prov\_complete**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_COMPLETE\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provision\_reset\_param* **node\_prov\_reset**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_set\_oob\_pub\_key\_comp\_param*  
**node\_prov\_set\_oob\_pub\_key\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_input\_number\_comp\_param*  
**node\_prov\_input\_num\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUM\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_input\_string\_comp\_param*  
**node\_prov\_input\_str\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STR\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_proxy\_identity\_enable\_comp\_param*  
**node\_proxy\_identity\_enable\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROXY\_IDENTITY\_ENABLE\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_proxy\_gatt\_enable\_comp\_param*  
**node\_proxy\_gatt\_enable\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_ENABLE\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_proxy\_gatt\_disable\_comp\_param*  
**node\_proxy\_gatt\_disable\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_DISABLE\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_node\_add\_local\_net\_key\_comp\_param*  
**node\_add\_net\_key\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_node\_add\_local\_app\_key\_comp\_param*  
**node\_add\_app\_key\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_node\_bind\_local\_mod\_app\_comp\_param*  
**node\_bind\_app\_key\_to\_model\_comp**  
Event parameter of ESP\_BLE\_MESH\_NODE\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_rcv\_unprov\_adv\_pkt\_param*  
**provisioner\_rcv\_unprov\_adv\_pkt**  
Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_enable\_comp\_param*  
**provisioner\_prov\_enable\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_ENABLE\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_disable\_comp\_param*  
**provisioner\_prov\_disable\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DISABLE\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_link\_open\_evt\_param*  
**provisioner\_prov\_link\_open**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_OPEN\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_read\_oob\_pub\_key\_evt\_param*  
**provisioner\_prov\_read\_oob\_pub\_key**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_input\_evt\_param*  
**provisioner\_prov\_input**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_output\_evt\_param*  
**provisioner\_prov\_output**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_OUTPUT\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_link\_close\_evt\_param*  
**provisioner\_prov\_link\_close**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_CLOSE\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_comp\_param*  
**provisioner\_prov\_complete**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_add\_unprov\_dev\_comp\_param*  
**provisioner\_add\_unprov\_dev\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_ADD\_UNPROV\_DEV\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_dev\_with\_addr\_comp\_param*  
**provisioner\_prov\_dev\_with\_addr\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DEV\_WITH\_ADDR\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_delete\_dev\_comp\_param*  
**provisioner\_delete\_dev\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_DEV\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_set\_dev\_uuid\_match\_comp\_param*  
**provisioner\_set\_dev\_uuid\_match\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_SET\_DEV\_UUID\_MATCH\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_set\_prov\_data\_info\_comp\_param*  
**provisioner\_set\_prov\_data\_info\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_SET\_PROV\_DATA\_INFO\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_static_oob_val_comp_param  
provisioner_set_static_oob_val_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_SET\_STATIC\_OOB\_VALUE\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_primary_elem_addr_comp_param  
provisioner_set_primary_elem_addr_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_SET\_PRIMARY\_ELEM\_ADDR\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_comp_param  
provisioner_prov_read_oob_pub_key_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_num_comp_param  
provisioner_prov_input_num_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_NUMBER\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_str_comp_param  
provisioner_prov_input_str_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_STRING\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_set_node_name_comp_param  
provisioner_set_node_name_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_SET\_NODE\_NAME\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_app_key_comp_param  
provisioner_add_app_key_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_app_key_comp_param  
provisioner_update_app_key_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_APP\_KEY\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_bind_local_mod_app_comp_param  
provisioner_bind_app_key_to_model_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_local_net_key_comp_param  
provisioner_add_net_key_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param  
provisioner_update_net_key_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_NET\_KEY\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param  
provisioner_store_node_comp_data_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_STORE\_NODE\_COMP\_DATA\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param  
provisioner_delete_node_with_uuid_comp
```

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_delete\_node\_with\_addr\_comp\_param*  
**provisioner\_delete\_node\_with\_addr\_comp**

Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT

int **err\_code**

Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner

Indicate the result of setting the heartbeat filter type by the Provisioner

Indicate the result of setting the heartbeat filter address by the Provisioner

Indicate the result of directly erasing settings by the Provisioner

Indicate the result of opening settings with index by the Provisioner

Indicate the result of opening settings with user id by the Provisioner

Indicate the result of closing settings with index by the Provisioner

Indicate the result of closing settings with user id by the Provisioner

Indicate the result of deleting settings with index by the Provisioner

Indicate the result of deleting settings with user id by the Provisioner

bool **enable**

Indicate enabling or disabling receiving heartbeat messages

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]*  
**provisioner\_enable\_heartbeat\_recv\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT

uint8\_t **type**

Type of the filter used for receiving heartbeat messages

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]*  
**provisioner\_set\_heartbeat\_filter\_type\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT

uint8\_t **op**

Operation (add, remove, clean)

uint16\_t **hb\_src**

Heartbeat source address

uint16\_t **hb\_dst**

Heartbeat destination address

struct *esp\_ble\_mesh\_prov\_cb\_param\_t::[anonymous]*  
**provisioner\_set\_heartbeat\_filter\_info\_comp**

ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT.

Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT

**uint8\_t init\_ttl**  
Heartbeat InitTTL

**uint8\_t rx\_ttl**  
Heartbeat RxTTL

**uint8\_t hops**  
Heartbeat hops (InitTTL - RxTTL + 1)

**uint16\_t feature**  
Bit field of currently active features of the node

**int8\_t rssi**  
RSSI of the heartbeat message

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous] **provisioner\_rcv\_heartbeat**  
ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT.  
Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]  
**provisioner\_direct\_erase\_settings\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT.  
Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT

**uint8\_t index**  
Index of Provisioner settings

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]  
**provisioner\_open\_settings\_with\_index\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT.  
Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT

char **uid**[ESP\_BLE\_MESH\_SETTINGS\_UID\_SIZE + 1]  
Provisioner settings user id

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]  
**provisioner\_open\_settings\_with\_uid\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT.  
Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]  
**provisioner\_close\_settings\_with\_index\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT.  
Event parameter of ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT

struct *esp\_ble\_mesh\_prov\_cb\_param\_t*::[anonymous]  
**provisioner\_close\_settings\_with\_uid\_comp**  
ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT.  
Event parameters of ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]  
provisioner_delete_settings_with_index_comp  
    ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.  
    Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
```

```
struct esp_ble_mesh_prov_cb_param_t::[anonymous]  
provisioner_delete_settings_with_uid_comp

### Public Members

int **err\_code**

Indicate the result of BLE Mesh deinitialization

struct **ble\_mesh\_friend\_friendship\_establish\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_ESTABLISH\_EVT.

### Public Members

uint16\_t **lpn\_addr**

Low Power Node unicast address

struct **ble\_mesh\_friend\_friendship\_terminate\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT.

### Public Types

enum [**anonymous**]

This enum value is the reason of friendship termination on the friend node side

*Values:*

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_ESTABLISH\_FAIL**

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_POLL\_TIMEOUT**

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_REQ**

Receive Friend Request from existing Low Power Node

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_RECV\_FRND\_CLEAR**

Receive Friend Clear from other friend node

enumerator **ESP\_BLE\_MESH\_FRND\_FRIENDSHIP\_TERMINATE\_DISABLE**

Friend feature disabled or corresponding NetKey is deleted

### Public Members

uint16\_t **lpn\_addr**

Low Power Node unicast address

enum *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_friend\_friendship\_terminate\_param::*[*anonymous*]  
**reason**

This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

```
struct ble_mesh_heartbeat_msg_rcv_param  
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

### Public Members

uint8\_t **hops**  
Heartbeat hops (InitTTL - RxTTL + 1)

uint16\_t **feature**  
Bit field of currently active features of the node

*esp\_ble\_mesh\_prov\_bearer\_t* **bearer**

Type of the bearer used when Provisioner link is opened

struct **ble\_mesh\_provisioner\_prov\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT.

### Public Members

uint16\_t **node\_idx**

Index of the provisioned device

*esp\_ble\_mesh\_octet16\_t* **device\_uuid**

Device UUID of the provisioned device

uint16\_t **unicast\_addr**

Primary address of the provisioned device

`uint8_t element_num`  
Element count of the provisioned device

`uint16_t netkey_idx`  
NetKey Index of the provisioned device

struct `ble_mesh_provisioner_prov_dev_with_addr_comp_param`  
`#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT.`

### Public Members

int `err_code`  
Indicate the result of Provisioner starting to provision a device

struct `ble_mesh_provisioner_prov_disable_comp_param`  
`#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT.`

### Public Members

int `err_code`  
Indicate the result of disabling BLE Mesh Provisioner

struct `ble_mesh_provisioner_prov_enable_comp_param`  
`#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT.`

### Public Members

int `err_code`  
Indicate the result of enabling BLE Mesh Provisioner

struct `ble_mesh_provisioner_prov_input_evt_param`  
`#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT.`

### Public Members

`esp_ble_mesh_oob_method_t method`  
Method of device Output OOB Authentication

`esp_ble_mesh_output_action_t action`  
Action of device Output OOB Authentication

`uint8_t size`  
Size of device Output OOB Authentication

`uint8_t link_idx`  
Index of the provisioning link

```
struct ble_mesh_provisioner_prov_input_num_comp_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT.
```

### Public Members

int **err\_code**  
 Indicate the result of inputting number by the Provisioner

```
struct ble_mesh_provisioner_prov_input_str_comp_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT.
```

### Public Members

int **err\_code**  
 Indicate the result of inputting string by the Provisioner

```
struct ble_mesh_provisioner_prov_output_evt_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT.
```

### Public Members

*esp\_ble\_mesh\_oob\_method\_t* **method**  
 Method of device Input OOB Authentication

*esp\_ble\_mesh\_input\_action\_t* **action**  
 Action of device Input OOB Authentication

uint8\_t **size**  
 Size of device Input OOB Authentication

uint8\_t **link\_idx**  
 Index of the provisioning link

char **string**[8]  
 String output by the Provisioner

uint32\_t **number**  
 Number output by the Provisioner

union *esp\_ble\_mesh\_prov\_cb\_param\_t::ble\_mesh\_provisioner\_prov\_output\_evt\_param::*[anonymous]  
 **[anonymous]**

```
struct ble_mesh_provisioner_prov_read_oob_pub_key_comp_param  
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT.
```

### Public Members

int **err\_code**

Indicate the result of setting OOB Public Key by the Provisioner

struct **ble\_mesh\_provisioner\_prov\_read\_oob\_pub\_key\_evt\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT.

### Public Members

uint8\_t **link\_idx**

Index of the provisioning link

Indicate the result of setting OOB Public Key

struct **ble\_mesh\_set\_unprov\_dev\_name\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of setting BLE Mesh device name

union **esp\_ble\_mesh\_server\_state\_value\_t**

*#include <esp\_ble\_mesh\_defs.h>* Server model state value union.

### Public Members

uint8\_t **onoff**

The value of the Generic OnOff state

The value of the Light LC Light OnOff state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_onoff**

The Generic OnOff state

int16\_t **level**

The value of the Generic Level state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_level**

The Generic Level state

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_onpowerup**

The Generic OnPowerUp state

uint16\_t **power**

The value of the Generic Power Actual state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **gen\_power\_actual**

The Generic Power Actual state

uint16\_t **lightness**

The value of the Light Lightness Actual state

The value of the Light Lightness Linear state

The value of the Light CTL Lightness state

The value of the Light HSL Lightness state

The value of the Light xyL Lightness state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_lightness\_actual**

The Light Lightness Actual state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_lightness\_linear**

The Light Lightness Linear state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_ctl\_lightness**

The Light CTL Lightness state

uint16\_t **temperature**

The value of the Light CTL Temperature state

int16\_t **delta\_uv**

The value of the Light CTL Delta UV state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_ctl\_temp\_delta\_uv**

The Light CTL Temperature & Delta UV states

uint16\_t **hue**

The value of the Light HSL Hue state

uint16\_t **saturation**

The value of the Light HSL Saturation state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl**

The Light HSL composite state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl\_lightness**

The Light HSL Lightness state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl\_hue**

The Light HSL Hue state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_hsl\_saturation**

The Light HSL Saturation state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_xyl\_lightness**

The Light xyL Lightness state

struct *esp\_ble\_mesh\_server\_state\_value\_t*::[anonymous] **light\_lc\_light\_onoff**

The Light LC Light OnOff state

union **esp\_ble\_mesh\_model\_cb\_param\_t**

*#include <esp\_ble\_mesh\_defs.h>* BLE Mesh model callback parameters union.

### Public Members

struct *esp\_ble\_mesh\_model\_cb\_param\_t*::*ble\_mesh\_model\_operation\_evt\_param* **model\_operation**

Event parameter of ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT

struct *esp\_ble\_mesh\_model\_cb\_param\_t*::*ble\_mesh\_model\_send\_comp\_param* **model\_send\_comp**

Event parameter of ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT

**model\_publish\_update**

Event parameter of ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT

struct *esp\_ble\_mesh\_model\_cb\_param\_t*::*ble\_mesh\_server\_model\_update\_state\_comp\_param*

**server\_model\_update\_state**

Event parameter of ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT

struct **ble\_mesh\_client\_model\_send\_timeout\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT.

### Public Members

uint32\_t **opcode**

Opcode of the previously sent message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which sends the previous message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the previous message

struct **ble\_mesh\_mod\_rcv\_publish\_msg\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT.

### Public Members

uint32\_t **opcode**

Opcode of the unsolicited received message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the message

uint16\_t **length**

Length of the received message

uint8\_t \***msg**

Value of the received message

struct **ble\_mesh\_model\_operation\_evt\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT.

### Public Members

uint32\_t **opcode**

Opcode of the received message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which receives the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Pointer to the context of the received message

uint16\_t **length**

Length of the received message

uint8\_t \***msg**

Value of the received message

struct **ble\_mesh\_model\_publish\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of publishing a message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which publishes the message

struct **ble\_mesh\_model\_publish\_update\_evt\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which is going to update its publish message

struct **ble\_mesh\_model\_send\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of sending a message

uint32\_t **opcode**

Opcode of the message

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model which sends the message

*esp\_ble\_mesh\_msg\_ctx\_t* \***ctx**

Context of the message

struct **ble\_mesh\_server\_model\_update\_state\_comp\_param**

*#include <esp\_ble\_mesh\_defs.h>* ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT.

### Public Members

int **err\_code**

Indicate the result of updating server model state

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the server model which state value is updated

*esp\_ble\_mesh\_server\_state\_type\_t* **type**

Type of the updated server state

## Structures

struct **esp\_ble\_mesh\_deinit\_param\_t**

BLE Mesh deinit parameters

### Public Members

bool **erase\_flash**

Indicate if erasing flash when deinit mesh stack

struct **esp\_ble\_mesh\_elem\_t**

Abstraction that describes a BLE Mesh Element. This structure is associated with struct `bt_mesh_elem` in `mesh_access.h`

### Public Members

uint16\_t **element\_addr**

Element Address, assigned during provisioning.

const uint16\_t **location**

Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8\_t **sig\_model\_count**

SIG Model count

const uint8\_t **vnd\_model\_count**

Vendor Model count

*esp\_ble\_mesh\_model\_t* \***sig\_models**

SIG Models

*esp\_ble\_mesh\_model\_t* \***vnd\_models**

Vendor Models

struct **esp\_ble\_mesh\_model\_pub\_t**

Abstraction that describes a model publication context. This structure is associated with struct `bt_mesh_model_pub` in `mesh_access.h`

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the model to which the context belongs. Initialized by the stack.

uint16\_t **publish\_addr**

Publish Address.

uint16\_t **app\_idx**

Publish AppKey Index.

uint16\_t **cred**

Friendship Credentials Flag.

uint16\_t **send\_rel**

Force reliable sending (segment acks)

uint8\_t **t1**

Publish Time to Live.

uint8\_t **retransmit**

Retransmit Count & Interval Steps.

uint8\_t **period**

Publish Period.

uint8\_t **period\_div**

Divisor for the Period.

uint8\_t **fast\_period**

Use FastPeriodDivisor

uint8\_t **count**

Retransmissions left.

uint32\_t **period\_start**

Start of the current period.

struct net\_buf\_simple \***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the `ESP_BLE_MESH_MODEL_PUB_DEFINE` macro.

```
ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);
```

*esp\_ble\_mesh\_cb\_t* **update**

Callback used to update publish message. Initialized by the stack.

struct k\_delayed\_work **timer**

Publish Period Timer. Initialized by the stack.

uint8\_t **dev\_role**

Role of the device that is going to publish messages

struct **esp\_ble\_mesh\_model\_op\_t**

Abstraction that describes a model operation context. This structure is associated with struct `bt_mesh_model_op` in `mesh_access.h`

### Public Members

const uint32\_t **opcode**

Message opcode

const size\_t **min\_len**

Message minimum length

*esp\_ble\_mesh\_cb\_t* **param\_cb**

Callback used to handle message. Initialized by the stack.

struct **esp\_ble\_mesh\_model\_cbs\_t**

Abstraction that describes a model callback structure. This structure is associated with struct `bt_mesh_model_cb` in `mesh_access.h`.

### Public Members

*esp\_ble\_mesh\_cb\_t* **init\_cb**

Callback used during model initialization. Initialized by the stack.

struct **esp\_ble\_mesh\_model**

Abstraction that describes a Mesh Model instance. This structure is associated with struct `bt_mesh_model` in `mesh_access.h`.

### Public Members

const uint16\_t **model\_id**

16-bit model identifier

uint16\_t **company\_id**

16-bit company identifier

uint16\_t **model\_id**

16-bit model identifier

struct *esp\_ble\_mesh\_model::*[anonymous]*::*[anonymous] **vnd**

Structure encapsulating a model ID with a company ID

union *esp\_ble\_mesh\_model::*[anonymous] **[anonymous]**

Model ID

uint8\_t **element\_idx**

Internal information, mainly for persistent storage Belongs to Nth element

uint8\_t **model\_idx**

Is the Nth model in the element

uint16\_t **flags**

Information about what has changed

*esp\_ble\_mesh\_elem\_t* \***element**

The Element to which this Model belongs

*esp\_ble\_mesh\_model\_pub\_t* \*const **pub**

Model Publication

uint16\_t **keys**[CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT]

AppKey List

uint16\_t **groups**[CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT]

Subscription List (group or virtual addresses)

*esp\_ble\_mesh\_model\_op\_t* \***op**

Model operation context

*esp\_ble\_mesh\_model\_cb\_t* \***cb**

Model callback structure

void \***user\_data**

Model-specific user data

struct **esp\_ble\_mesh\_msg\_ctx\_t**

Message sending context. This structure is associated with struct `bt_mesh_msg_ctx` in `mesh_access.h`

### Public Members

uint16\_t **net\_idx**

NetKey Index of the subnet through which to send the message.

uint16\_t **app\_idx**

AppKey Index for message encryption.

uint16\_t **addr**

Remote address.

uint16\_t **recv\_dst**

Destination address of a received message. Not used for sending.

int8\_t **recv\_rssi**

RSSI of received packet. Not used for sending.

uint8\_t **recv\_ttl**

Received TTL value. Not used for sending.

uint8\_t **send\_rel**

Force sending reliably by using segment acknowledgement

uint8\_t **send\_ttl**

TTL, or ESP\_BLE\_MESH\_TTL\_DEFAULT for default TTL.

uint32\_t **recv\_op**

Opcode of a received message. Not used for sending message.

*esp\_ble\_mesh\_model\_t* \***model**

Model corresponding to the message, no need to be initialized before sending message

bool **srv\_send**

Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct **esp\_ble\_mesh\_prov\_t**

Provisioning properties & capabilities. This structure is associated with struct bt\_mesh\_prov in mesh\_access.h

struct **esp\_ble\_mesh\_comp\_t**

Node Composition data context. This structure is associated with struct bt\_mesh\_comp in mesh\_access.h

### Public Members

uint16\_t **cid**

16-bit SIG-assigned company identifier

uint16\_t **pid**

16-bit vendor-assigned product identifier

uint16\_t **vid**

16-bit vendor-assigned product version identifier

size\_t **element\_count**

Element count

*esp\_ble\_mesh\_elem\_t* \***elements**

A sequence of elements

struct **esp\_ble\_mesh\_unprov\_dev\_add\_t**

Information of the device which is going to be added for provisioning.

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint16\_t **oob\_info**

Device OOB Info ADD\_DEV\_START\_PROV\_NOW\_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

*esp\_ble\_mesh\_prov\_bearer\_t* **bearer**

Provisioning Bearer

struct **esp\_ble\_mesh\_device\_delete\_t**

Information of the device which is going to be deleted.

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Device address type

uint8\_t **uuid**[16]

Device UUID

uint8\_t **flag**

BIT0: device address; BIT1: device UUID

struct **esp\_ble\_mesh\_prov\_data\_info\_t**

Information of the provisioner which is going to be updated.

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **flags**

Flags

uint32\_t **iv\_index**

IV Index

uint8\_t **flag**

BIT0: net\_idx; BIT1: flags; BIT2: iv\_index

struct **esp\_ble\_mesh\_node\_t**

Information of the provisioned node

### Public Members

*esp\_ble\_mesh\_bd\_addr\_t* **addr**

Node device address

*esp\_ble\_mesh\_addr\_type\_t* **addr\_type**

Node device address type

uint8\_t **dev\_uuid**[16]

Device UUID

uint16\_t **oob\_info**

Node OOB information

uint16\_t **unicast\_addr**

Node unicast address

uint8\_t **element\_num**

Node element number

uint16\_t **net\_idx**

Node NetKey Index

uint8\_t **flags**

Node key refresh flag and iv update flag

uint32\_t **iv\_index**

Node IV Index

uint8\_t **dev\_key**[16]

Node device key

char **name**[ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN + 1]

Node name

uint16\_t **comp\_length**

Length of Composition Data

uint8\_t \***comp\_data**

Value of Composition Data

struct **esp\_ble\_mesh\_fast\_prov\_info\_t**

Context of fast provisioning which need to be set.

**Public Members****uint16\_t unicast\_min**

Minimum unicast address used for fast provisioning

**uint16\_t unicast\_max**

Maximum unicast address used for fast provisioning

**uint16\_t net\_idx**

Netkey index used for fast provisioning

**uint8\_t flags**

Flags used for fast provisioning

**uint32\_t iv\_index**

IV Index used for fast provisioning

**uint8\_t offset**

Offset of the UUID to be compared

**uint8\_t match\_len**

Length of the UUID to be compared

**uint8\_t match\_val[16]**

Value of UUID to be compared

struct **esp\_ble\_mesh\_heartbeat\_filter\_info\_t**

Context of Provisioner heartbeat filter information to be set

**Public Members****uint16\_t hb\_src**

Heartbeat source address (unicast address)

**uint16\_t hb\_dst**

Heartbeat destination address (unicast address or group address)

struct **esp\_ble\_mesh\_client\_op\_pair\_t**

BLE Mesh client models related definitions.

Client model Get/Set message opcode and corresponding Status message opcode

**Public Members****uint32\_t cli\_op**

The client message opcode

uint32\_t **status\_op**

The server status opcode corresponding to the client message opcode

struct **esp\_ble\_mesh\_client\_t**

Client Model user data context.

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model. Initialized by the stack.

int **op\_pair\_size**

Size of the op\_pair

const *esp\_ble\_mesh\_client\_op\_pair\_t* \***op\_pair**

Table containing get/set message opcode and corresponding status message opcode

uint32\_t **publish\_status**

Callback used to handle the received unsolicited message. Initialized by the stack.

void \***internal\_data**

Pointer to the internal data of client model

uint8\_t **msg\_role**

Role of the device (Node/Provisioner) that is going to send messages

struct **esp\_ble\_mesh\_client\_common\_param\_t**

Common parameters of the messages sent by Client Model.

### Public Members

*esp\_ble\_mesh\_opcode\_t* **opcode**

Message opcode

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the client model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

The context used to send message

int32\_t **msg\_timeout**

Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8\_t **msg\_role**

Role of the device - Node/Provisioner

struct **esp\_ble\_mesh\_state\_transition\_t**

Parameters of the server model state transition

### Public Functions

**BLE\_MESH\_ATOMIC\_DEFINE** (flag, *ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX*)

Flag used to indicate if the transition timer has been started internally.

If the model which contains *esp\_ble\_mesh\_state\_transition\_t* sets “set\_auto\_rsp” to *ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP*, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

### Public Members

bool **just\_started**

Indicate if the state transition has just started

uint8\_t **trans\_time**

State transition time

uint8\_t **remain\_time**

Remaining time of state transition

uint8\_t **delay**

Delay before starting state transition

uint32\_t **quo\_tt**

Duration of each divided transition step

uint32\_t **counter**

Number of steps which the transition duration is divided

uint32\_t **total\_duration**

State transition total duration

int64\_t **start\_timestamp**

Time when the state transition is started

struct k\_delayed\_work **timer**

Timer used for state transition

struct **esp\_ble\_mesh\_last\_msg\_info\_t**

Parameters of the server model received last same set message.

### Public Members

`uint8_t tid`

Transaction number of the last message

`uint16_t src`

Source address of the last message

`uint16_t dst`

Destination address of the last message

`int64_t timestamp`

Time when the last message is received

struct `esp_ble_mesh_server_rsp_ctrl_t`

Parameters of the Server Model response control

### Public Members

`uint8_t get_auto_rsp`

BLE Mesh Server Response Option.

- i. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Get messages need to be replied by the application;
- ii. If `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Get messages will be replied by the server models;
- iii. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Client Set messages need to be replied by the application;
- iv. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
- v. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
- vi. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

`uint8_t set_auto_rsp`

Response control for Client Set messages

`uint8_t status_auto_rsp`

Response control for Server Status messages

### Macros

`ESP_BLE_MESH_SDU_MAX_LEN`

< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

`ESP_BLE_MESH_MIC_SHORT`

Length of a long Mesh MIC.

`ESP_BLE_MESH_MIC_LONG`

The maximum length of a BLE Mesh provisioned node name

**ESP\_BLE\_MESH\_NODE\_NAME\_MAX\_LEN**

The maximum length of a BLE Mesh unprovisioned device name

**ESP\_BLE\_MESH\_DEVICE\_NAME\_MAX\_LEN**

The maximum length of settings user id

**ESP\_BLE\_MESH\_SETTINGS\_UID\_SIZE**

Invalid settings index

**ESP\_BLE\_MESH\_INVALID\_SETTINGS\_IDX**

Define the BLE Mesh octet 16 bytes size

**ESP\_BLE\_MESH\_OCTET16\_LEN**

**ESP\_BLE\_MESH\_OCTET8\_LEN**

**ESP\_BLE\_MESH\_CID\_NVAL**

Special TTL value to request using configured default TTL

**ESP\_BLE\_MESH\_TTL\_DEFAULT**

Maximum allowed TTL value

**ESP\_BLE\_MESH\_TTL\_MAX**

**ESP\_BLE\_MESH\_ADDR\_UNASSIGNED**

**ESP\_BLE\_MESH\_ADDR\_ALL\_NODES**

**ESP\_BLE\_MESH\_ADDR\_PROXIES**

**ESP\_BLE\_MESH\_ADDR\_FRIENDS**

**ESP\_BLE\_MESH\_ADDR\_RELAYS**

**ESP\_BLE\_MESH\_KEY\_UNUSED**

**ESP\_BLE\_MESH\_KEY\_DEV**

**ESP\_BLE\_MESH\_KEY\_PRIMARY**

**ESP\_BLE\_MESH\_KEY\_ANY**

Primary Network Key index

**ESP\_BLE\_MESH\_NET\_PRIMARY**

Relay state value

**ESP\_BLE\_MESH\_RELAY\_DISABLED**

**ESP\_BLE\_MESH\_RELAY\_ENABLED**

**ESP\_BLE\_MESH\_RELAY\_NOT\_SUPPORTED**

Beacon state value

**ESP\_BLE\_MESH\_BEACON\_DISABLED**

**ESP\_BLE\_MESH\_BEACON\_ENABLED**

GATT Proxy state value

**ESP\_BLE\_MESH\_GATT\_PROXY\_DISABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_ENABLED**

**ESP\_BLE\_MESH\_GATT\_PROXY\_NOT\_SUPPORTED**

Friend state value

**ESP\_BLE\_MESH\_FRIEND\_DISABLED**

**ESP\_BLE\_MESH\_FRIEND\_ENABLED**

**ESP\_BLE\_MESH\_FRIEND\_NOT\_SUPPORTED**

Node identity state value

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_STOPPED**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_RUNNING**

**ESP\_BLE\_MESH\_NODE\_IDENTITY\_NOT\_SUPPORTED**

Supported features

**ESP\_BLE\_MESH\_FEATURE\_RELAY**

**ESP\_BLE\_MESH\_FEATURE\_PROXY**

**ESP\_BLE\_MESH\_FEATURE\_FRIEND**

**ESP\_BLE\_MESH\_FEATURE\_LOW\_POWER**

**ESP\_BLE\_MESH\_FEATURE\_ALL\_SUPPORTED**

**ESP\_BLE\_MESH\_ADDR\_IS\_UNICAST** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_GROUP** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_VIRTUAL** (addr)

**ESP\_BLE\_MESH\_ADDR\_IS\_RFU** (addr)

**ESP\_BLE\_MESH\_INVALID\_NODE\_INDEX****ESP\_BLE\_MESH\_TRANSMIT** (count, int\_ms)

Encode transmission count & interval steps.

---

**Note:** For example, ESP\_BLE\_MESH\_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).

---

**Parameters**

- **count** –Number of retransmissions (first transmission is excluded).
- **int\_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_COUNT** (transmit)

Decode transmit count from a transmit value.

**Parameters**

- **transmit** –Encoded transmit count & interval value.

**Returns** Transmission count (actual transmissions equal to N + 1).

**ESP\_BLE\_MESH\_GET\_TRANSMIT\_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Parameters**

- **transmit** –Encoded transmit count & interval value.

**Returns** Transmission interval in milliseconds.

**ESP\_BLE\_MESH\_PUBLISH\_TRANSMIT** (count, int\_ms)

Encode Publish Retransmit count & interval steps.

**Parameters**

- **count** –Number of retransmissions (first transmission is excluded).
- **int\_ms** –Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**Returns** BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Parameters**

- **transmit** –Encoded Publish Retransmit count & interval value.

**Returns** Retransmission count (actual transmissions equal to N + 1).

**ESP\_BLE\_MESH\_GET\_PUBLISH\_TRANSMIT\_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

**Parameters**

- **transmit** –Encoded Publish Retransmit count & interval value.

**Returns** Transmission interval in milliseconds.

**ESP\_BLE\_MESH\_PROV\_STATIC\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_OUTPUT\_OOB\_MAX\_LEN**

Maximum length of string used by Output OOB authentication

**ESP\_BLE\_MESH\_PROV\_INPUT\_OOB\_MAX\_LEN**

Macros used to define message opcode

**ESP\_BLE\_MESH\_MODEL\_OP\_1** (b0)**ESP\_BLE\_MESH\_MODEL\_OP\_2** (b0, b1)**ESP\_BLE\_MESH\_MODEL\_OP\_3** (b0, cid)

This macro is associated with BLE\_MESH\_MODEL\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_SIG\_MODEL** (\_id, \_op, \_pub, \_user\_data)

This macro is associated with BLE\_MESH\_MODEL\_VND\_CB in mesh\_access.h

**ESP\_BLE\_MESH\_VENDOR\_MODEL** (\_company, \_id, \_op, \_pub, \_user\_data)**ESP\_BLE\_MESH\_ELEMENT** (\_loc, \_mods, \_vnd\_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP\_BLE\_MESH\_MODEL\_NONE can be given instead.

---

**Note:** This macro is associated with BLE\_MESH\_ELEM in mesh\_access.h

---

**Parameters**

- **\_loc** –Location Descriptor.
- **\_mods** –Array of SIG models.
- **\_vnd\_mods** –Array of vendor models.

**ESP\_BLE\_MESH\_PROV** (uuid, sta\_val, sta\_val\_len, out\_size, out\_act, in\_size, in\_act)**BT\_OCTET32\_LEN****BD\_ADDR\_LEN****ESP\_BLE\_MESH\_ADDR\_TYPE\_PUBLIC****ESP\_BLE\_MESH\_ADDR\_TYPE\_RANDOM****ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_PUBLIC****ESP\_BLE\_MESH\_ADDR\_TYPE\_RPA\_RANDOM****ESP\_BLE\_MESH\_MODEL\_PUB\_DEFINE** (\_name, \_msg\_len, \_role)

Define a model publication context.

**Parameters**

- **\_name** –Variable name given to the context.
- **\_msg\_len** –Length of the publication message.
- **\_role** –Role of the device which contains the model.

**ESP\_BLE\_MESH\_MODEL\_OP** (\_opcode, \_min\_len)

Define a model operation context.

**Parameters**

- **\_opcode** –Message opcode.
- **\_min\_len** –Message minimum length.

**ESP\_BLE\_MESH\_MODEL\_OP\_END**

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

**ESP\_BLE\_MESH\_MODEL\_NONE**

Helper to define an empty model array. This structure is associated with BLE\_MESH\_MODEL\_NONE in mesh\_access.h

**ADD\_DEV\_RM\_AFTER\_PROV\_FLAG**

Device will be removed from queue after provisioned successfully

**ADD\_DEV\_START\_PROV\_NOW\_FLAG**

Start provisioning device immediately

**ADD\_DEV\_FLUSHABLE\_DEV\_FLAG**

Device can be remove when queue is full and new device is going to added

**DEL\_DEV\_ADDR\_FLAG****DEL\_DEV\_UUID\_FLAG****PROV\_DATA\_NET\_IDX\_FLAG****PROV\_DATA\_FLAGS\_FLAG****PROV\_DATA\_IV\_INDEX\_FLAG****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ACCEPTLIST****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REJECTLIST**

Provisioner heartbeat filter operation

**ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_ADD****ESP\_BLE\_MESH\_HEARTBEAT\_FILTER\_REMOVE****ESP\_BLE\_MESH\_MODEL\_ID\_CONFIG\_SRV**

BLE Mesh models related Model ID and Opcode definitions.

Response need to be sent in the application

**ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP**

Response will be sent internally

### Type Definitions

typedef uint8\_t **esp\_ble\_mesh\_octet16\_t**[ESP\_BLE\_MESH\_OCTET16\_LEN]

Define the BLE Mesh octet 8 bytes size

typedef uint8\_t **esp\_ble\_mesh\_octet8\_t**[ESP\_BLE\_MESH\_OCTET8\_LEN]

Invalid Company ID

typedef uint32\_t **esp\_ble\_mesh\_cb\_t**

typedef uint8\_t **UINT8**

typedef uint16\_t **UINT16**

typedef uint32\_t **UINT32**

typedef uint64\_t **UINT64**

typedef *UINT8* **BT\_OCTET32**[BT\_OCTET32\_LEN]

typedef uint8\_t **BD\_ADDR**[BD\_ADDR\_LEN]

typedef uint8\_t **esp\_ble\_mesh\_bd\_addr\_t**[BD\_ADDR\_LEN]

typedef uint8\_t **esp\_ble\_mesh\_addr\_type\_t**

BLE device address type.

typedef struct *esp\_ble\_mesh\_model* **esp\_ble\_mesh\_model\_t**

typedef uint8\_t **esp\_ble\_mesh\_dev\_add\_flag\_t**

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_get\_t**

esp\_ble\_mesh\_opcode\_config\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_get\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_client\_set\_t**

esp\_ble\_mesh\_opcode\_config\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_config\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_config\_client\_set\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_config\_status\_t**

esp\_ble\_mesh\_opcode\_config\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model's request messages.

typedef uint8\_t **esp\_ble\_mesh\_cfg\_status\_t**

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_get\_t**

esp\_ble\_mesh\_opcode\_health\_client\_get\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_get\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_get\_state function.

typedef uint32\_t **esp\_ble\_mesh\_opcode\_health\_client\_set\_t**

esp\_ble\_mesh\_opcode\_health\_client\_set\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by esp\_ble\_mesh\_health\_client\_set\_state. The following opcodes will only be used in the esp\_ble\_mesh\_health\_client\_set\_state function.

typedef uint32\_t **esp\_ble\_mesh\_health\_model\_status\_t**

esp\_ble\_mesh\_health\_model\_status\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model's request messages.

typedef uint32\_t **esp\_ble\_mesh\_generic\_message\_opcode\_t**

esp\_ble\_mesh\_generic\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_generic\_client\_get\_state & esp\_ble\_mesh\_generic\_client\_set\_state. Generic OnOff Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_sensor\_message\_opcode\_t**

esp\_ble\_mesh\_sensor\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_sensor\_client\_get\_state & esp\_ble\_mesh\_sensor\_client\_set\_state. Sensor Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_time\_scene\_message\_opcode\_t**

esp\_ble\_mesh\_time\_scene\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate the opcodes used by functions esp\_ble\_mesh\_time\_scene\_client\_get\_state & esp\_ble\_mesh\_time\_scene\_client\_set\_state. Time Message Opcode

typedef uint32\_t **esp\_ble\_mesh\_light\_message\_opcode\_t**

esp\_ble\_mesh\_light\_message\_opcode\_t belongs to esp\_ble\_mesh\_opcode\_t, this typedef is only used to locate

the opcodes used by functions `esp_ble_mesh_light_client_get_state` & `esp_ble_mesh_light_client_set_state`.  
Light Lightness Message Opcode

```
typedef uint32_t esp_ble_mesh_opcode_t
```

End of defines of `esp_ble_mesh_opcode_t`

```
typedef uint8_t esp_ble_mesh_model_status_t
```

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

### Enumerations

```
enum esp_ble_mesh_cb_type_t
```

*Values:*

enumerator `ESP_BLE_MESH_TYPE_PROV_CB`

enumerator `ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB`

enumerator `ESP_BLE_MESH_TYPE_OUTPUT_STR_CB`

enumerator `ESP_BLE_MESH_TYPE_INTPUT_CB`

enumerator `ESP_BLE_MESH_TYPE_LINK_OPEN_CB`

enumerator `ESP_BLE_MESH_TYPE_LINK_CLOSE_CB`

enumerator `ESP_BLE_MESH_TYPE_COMPLETE_CB`

enumerator `ESP_BLE_MESH_TYPE_RESET_CB`

```
enum esp_ble_mesh_oob_method_t
```

*Values:*

enumerator `ESP_BLE_MESH_NO_OOB`

enumerator `ESP_BLE_MESH_STATIC_OOB`

enumerator `ESP_BLE_MESH_OUTPUT_OOB`

enumerator `ESP_BLE_MESH_INPUT_OOB`

```
enum esp_ble_mesh_output_action_t
```

*Values:*

enumerator `ESP_BLE_MESH_NO_OUTPUT`

enumerator `ESP_BLE_MESH_BLINK`

enumerator **ESP\_BLE\_MESH\_BEEP**

enumerator **ESP\_BLE\_MESH\_VIBRATE**

enumerator **ESP\_BLE\_MESH\_DISPLAY\_NUMBER**

enumerator **ESP\_BLE\_MESH\_DISPLAY\_STRING**

enum **esp\_ble\_mesh\_input\_action\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_NO\_INPUT**

enumerator **ESP\_BLE\_MESH\_PUSH**

enumerator **ESP\_BLE\_MESH\_TWIST**

enumerator **ESP\_BLE\_MESH\_ENTER\_NUMBER**

enumerator **ESP\_BLE\_MESH\_ENTER\_STRING**

enum **esp\_ble\_mesh\_prov\_bearer\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_ADV**

enumerator **ESP\_BLE\_MESH\_PROV\_GATT**

enum **esp\_ble\_mesh\_prov\_oob\_info\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_OTHER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_URI**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_2D\_CODE**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_BAR\_CODE**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_NFC**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_NUMBER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_STRING**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_BOX**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_IN\_BOX**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_PAPER**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_IN\_MANUAL**

enumerator **ESP\_BLE\_MESH\_PROV\_OOB\_ON\_DEV**

enum **esp\_ble\_mesh\_dev\_role\_t**

*Values:*

enumerator **ROLE\_NODE**

enumerator **ROLE\_PROVISIONER**

enumerator **ROLE\_FAST\_PROV**

enum **esp\_ble\_mesh\_fast\_prov\_action\_t**

*Values:*

enumerator **FAST\_PROV\_ACT\_NONE**

enumerator **FAST\_PROV\_ACT\_ENTER**

enumerator **FAST\_PROV\_ACT\_SUSPEND**

enumerator **FAST\_PROV\_ACT\_EXIT**

enumerator **FAST\_PROV\_ACT\_MAX**

enum **esp\_ble\_mesh\_proxy\_filter\_type\_t**

*Values:*

enumerator **PROXY\_FILTER\_WHITELIST**

enumerator **PROXY\_FILTER\_BLACKLIST**

enum **esp\_ble\_mesh\_prov\_cb\_event\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_PROV\_REGISTER\_COMP\_EVT**

Initialize BLE Mesh provisioning capabilities and internal data information completion event

enumerator **ESP\_BLE\_MESH\_NODE\_SET\_UNPROV\_DEV\_NAME\_COMP\_EVT**

Set the unprovisioned device name completion event

- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_ENABLE\_COMP\_EVT**  
Enable node provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_DISABLE\_COMP\_EVT**  
Disable node provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_OPEN\_EVT**  
Establish a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_LINK\_CLOSE\_EVT**  
Close a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OOB\_PUB\_KEY\_EVT**  
Generate Node input OOB public key event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_NUMBER\_EVT**  
Generate Node Output Number event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_OUTPUT\_STRING\_EVT**  
Generate Node Output String event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT**  
Event requiring the user to input a number or string
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_COMPLETE\_EVT**  
Provisioning done event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_RESET\_EVT**  
Provisioning reset event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_SET\_OOB\_PUB\_KEY\_COMP\_EVT**  
Node set oob public key completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Node input number completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Node input string completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_IDENTITY\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh Proxy Identity advertising completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_ENABLE\_COMP\_EVT**  
Enable BLE Mesh GATT Proxy Service completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_PROXY\_GATT\_DISABLE\_COMP\_EVT**  
Disable BLE Mesh GATT Proxy Service completion event

- enumerator **ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Node add NetKey locally completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Node add AppKey locally completion event
- enumerator **ESP\_BLE\_MESH\_NODE\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Node bind AppKey to model locally completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_ENABLE\_COMP\_EVT**  
Provisioner enable provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DISABLE\_COMP\_EVT**  
Provisioner disable provisioning functionality completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT**  
Provisioner receives unprovisioned device beacon event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_EVT**  
Provisioner read unprovisioned device OOB public key event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_EVT**  
Provisioner input value for provisioning procedure event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_OUTPUT\_EVT**  
Provisioner output value for provisioning procedure event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_OPEN\_EVT**  
Provisioner establish a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_LINK\_CLOSE\_EVT**  
Provisioner close a BLE Mesh link event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_COMPLETE\_EVT**  
Provisioner provisioning done event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_UNPROV\_DEV\_COMP\_EVT**  
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_DEV\_WITH\_ADDR\_COMP\_EVT**  
Provisioner start to provision an unprovisioned device completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_DEV\_COMP\_EVT**  
Provisioner delete a device from the list, close provisioning link with the device completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_DEV\_UUID\_MATCH\_COMP\_EVT**  
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_PROV\_DATA\_INFO\_COMP\_EVT**  
Provisioner set net\_idx/flags/iv\_index used for provisioning completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_STATIC\_OOB\_VALUE\_COMP\_EVT**  
Provisioner set static oob value used for provisioning completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_PRIMARY\_ELEM\_ADDR\_COMP\_EVT**  
Provisioner set unicast address of primary element completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_READ\_OOB\_PUB\_KEY\_COMP\_EVT**  
Provisioner read unprovisioned device OOB public key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_NUMBER\_COMP\_EVT**  
Provisioner input number completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_PROV\_INPUT\_STRING\_COMP\_EVT**  
Provisioner input string completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_NODE\_NAME\_COMP\_EVT**  
Provisioner set node name completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner add local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_APP\_KEY\_COMP\_EVT**  
Provisioner update local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_BIND\_APP\_KEY\_TO\_MODEL\_COMP\_EVT**  
Provisioner bind local model with local app key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ADD\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner add local network key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_UPDATE\_LOCAL\_NET\_KEY\_COMP\_EVT**  
Provisioner update local network key completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_STORE\_NODE\_COMP\_DATA\_COMP\_EVT**  
Provisioner store node composition data completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_UUID\_COMP\_EVT**  
Provisioner delete node with uuid completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_NODE\_WITH\_ADDR\_COMP\_EVT**  
Provisioner delete node with unicast address completion event
- enumerator **ESP\_BLE\_MESH\_PROVISIONER\_ENABLE\_HEARTBEAT\_RECV\_COMP\_EVT**  
Provisioner start to receive heartbeat message completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_TYPE\_COMP\_EVT**

Provisioner set the heartbeat filter type completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_SET\_HEARTBEAT\_FILTER\_INFO\_COMP\_EVT**

Provisioner set the heartbeat filter information completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_RECV\_HEARTBEAT\_MESSAGE\_EVT**

Provisioner receive heartbeat message event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DIRECT\_ERASE\_SETTINGS\_COMP\_EVT**

Provisioner directly erase settings completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner open settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_OPEN\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner open settings with user id completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner close settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_CLOSE\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner close settings with user id completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_INDEX\_COMP\_EVT**

Provisioner delete settings with index completion event

enumerator **ESP\_BLE\_MESH\_PROVISIONER\_DELETE\_SETTINGS\_WITH\_UID\_COMP\_EVT**

Provisioner delete settings with user id completion event

enumerator **ESP\_BLE\_MESH\_SET\_FAST\_PROV\_INFO\_COMP\_EVT**

Set fast provisioning information (e.g. unicast address range, net\_idx, etc.) completion event

enumerator **ESP\_BLE\_MESH\_SET\_FAST\_PROV\_ACTION\_COMP\_EVT**

Set fast provisioning action completion event

enumerator **ESP\_BLE\_MESH\_HEARTBEAT\_MESSAGE\_RECV\_EVT**

Receive Heartbeat message event

enumerator **ESP\_BLE\_MESH\_LPN\_ENABLE\_COMP\_EVT**

Enable Low Power Node completion event

enumerator **ESP\_BLE\_MESH\_LPN\_DISABLE\_COMP\_EVT**

Disable Low Power Node completion event

enumerator **ESP\_BLE\_MESH\_LPN\_POLL\_COMP\_EVT**

Low Power Node send Friend Poll completion event

enumerator **ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_ESTABLISH\_EVT**

Low Power Node establishes friendship event

enumerator **ESP\_BLE\_MESH\_LPN\_FRIENDSHIP\_TERMINATE\_EVT**

Low Power Node terminates friendship event

enumerator **ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_ESTABLISH\_EVT**

Friend Node establishes friendship event

enumerator **ESP\_BLE\_MESH\_FRIEND\_FRIENDSHIP\_TERMINATE\_EVT**

Friend Node terminates friendship event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_ADV\_PKT\_EVT**

Proxy Client receives Network ID advertising packet event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECTED\_EVT**

Proxy Client establishes connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECTED\_EVT**

Proxy Client terminates connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_RECV\_FILTER\_STATUS\_EVT**

Proxy Client receives Proxy Filter Status event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_CONNECT\_COMP\_EVT**

Proxy Client connect completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_DISCONNECT\_COMP\_EVT**

Proxy Client disconnect completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_SET\_FILTER\_TYPE\_COMP\_EVT**

Proxy Client set filter type completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_ADD\_FILTER\_ADDR\_COMP\_EVT**

Proxy Client add filter address completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_CLIENT\_REMOVE\_FILTER\_ADDR\_COMP\_EVT**

Proxy Client remove filter address completion event

enumerator **ESP\_BLE\_MESH\_PROXY\_SERVER\_CONNECTED\_EVT**

Proxy Server establishes connection successfully event

enumerator **ESP\_BLE\_MESH\_PROXY\_SERVER\_DISCONNECTED\_EVT**

Proxy Server terminates connection successfully event

enumerator **ESP\_BLE\_MESH\_MODEL\_SUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**

Local model subscribes group address completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_UNSUBSCRIBE\_GROUP\_ADDR\_COMP\_EVT**

Local model unsubscribes group address completion event

enumerator **ESP\_BLE\_MESH\_DEINIT\_MESH\_COMP\_EVT**

De-initialize BLE Mesh stack completion event

enumerator **ESP\_BLE\_MESH\_PROV\_EVT\_MAX**

enum **[anonymous]**

BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

enumerator **ESP\_BLE\_MESH\_SERVER\_TRANS\_TIMER\_START**

enumerator **ESP\_BLE\_MESH\_SERVER\_FLAG\_MAX**

enum **esp\_ble\_mesh\_server\_state\_type\_t**

This enum value is the type of server model states

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_ONOFF\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_LEVEL\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_ONPOWERUP\_STATE**

enumerator **ESP\_BLE\_MESH\_GENERIC\_POWER\_ACTUAL\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_ACTUAL\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_LIGHTNESS\_LINEAR\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CTL\_LIGHTNESS\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CTL\_TEMP\_DELTA\_UV\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_HSL\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_HSL\_LIGHTNESS\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_HSL\_HUE\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_HSL\_SATURATION\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_XYL\_LIGHTNESS\_STATE**

enumerator **ESP\_BLE\_MESH\_LIGHT\_LC\_LIGHT\_ONOFF\_STATE**

enumerator **ESP\_BLE\_MESH\_SERVER\_MODEL\_STATE\_MAX**

enum **esp\_ble\_mesh\_model\_cb\_event\_t**

*Values:*

enumerator **ESP\_BLE\_MESH\_MODEL\_OPERATION\_EVT**

User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

enumerator **ESP\_BLE\_MESH\_MODEL\_SEND\_COMP\_EVT**

User-defined models send messages completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_PUBLISH\_COMP\_EVT**

User-defined models publish messages completion event

enumerator **ESP\_BLE\_MESH\_CLIENT\_MODEL\_RECV\_PUBLISH\_MSG\_EVT**

User-defined client models receive publish messages event

enumerator **ESP\_BLE\_MESH\_CLIENT\_MODEL\_SEND\_TIMEOUT\_EVT**

Timeout event for the user-defined client models that failed to receive response from peer server models

enumerator **ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT**

When a model is configured to publish messages periodically, this event will occur during every publish period

enumerator **ESP\_BLE\_MESH\_SERVER\_MODEL\_UPDATE\_STATE\_COMP\_EVT**

Server models update state value completion event

enumerator **ESP\_BLE\_MESH\_MODEL\_EVT\_MAX**

## **ESP-BLE-MESH Core API Reference**

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- *ESP-BLE-MESH Stack Initialization*
- *Reading of Local Data Information*
- *Low Power Operation (Updating)*
- *Send/Publish Messages, add Local AppKey, etc.*
- *ESP-BLE-MESH Node/Provisioner Provisioning*
- *ESP-BLE-MESH GATT Proxy Server*

## **ESP-BLE-MESH Stack Initialization**

## Header File

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_common\\_api.h](#)

## Functions

*esp\_err\_t* **esp\_ble\_mesh\_init** (*esp\_ble\_mesh\_prov\_t* \*prov, *esp\_ble\_mesh\_comp\_t* \*comp)

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

---

**Note:** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

---

### Parameters

- **prov** –[in] Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- **comp** –[in] Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_deinit** (*esp\_ble\_mesh\_deinit\_param\_t* \*param)

De-initialize BLE Mesh module.

---

**Note:** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

---

**Parameters** **param** –[in] Pointer to the structure of BLE Mesh deinit parameters.

**Returns** ESP\_OK on success or error code otherwise.

## Reading of Local Data Information

### Header File

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_local\\_data\\_operation\\_api.h](#)

### Functions

*int32\_t* **esp\_ble\_mesh\_get\_model\_publish\_period** (*esp\_ble\_mesh\_model\_t* \*model)

Get the model publish period, the unit is ms.

**Parameters** **model** –[in] Model instance pointer.

**Returns** Publish period value on success, 0 or (negative) error code from `errno.h` on failure.

*uint16\_t* **esp\_ble\_mesh\_get\_primary\_element\_address** (void)

Get the address of the primary element.

**Returns** Address of the primary element on success, or ESP\_BLE\_MESH\_ADDR\_UNASSIGNED on failure which means the device has not been provisioned.

*uint16\_t* \***esp\_ble\_mesh\_is\_model\_subscribed\_to\_group** (*esp\_ble\_mesh\_model\_t* \*model, *uint16\_t* group\_addr)

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

### Parameters

- **model** –[in] Pointer to the model.
- **group\_addr** –[in] Group address.

**Returns** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

*esp\_ble\_mesh\_elem\_t* \***esp\_ble\_mesh\_find\_element** (uint16\_t element\_addr)

Find the BLE Mesh element pointer via the element address.

**Parameters** **element\_addr** –[in] Element address.

**Returns** Pointer to the element on success, or NULL on failure.

uint8\_t **esp\_ble\_mesh\_get\_element\_count** (void)

Get the number of elements that have been registered.

**Returns** Number of elements.

*esp\_ble\_mesh\_model\_t* \***esp\_ble\_mesh\_find\_vendor\_model** (const *esp\_ble\_mesh\_elem\_t* \*element, uint16\_t company\_id, uint16\_t model\_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Parameters**

- **element** –[in] Element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier assigned by the Bluetooth SIG.
- **model\_id** –[in] A 16-bit vendor-assigned model identifier.

**Returns** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

*esp\_ble\_mesh\_model\_t* \***esp\_ble\_mesh\_find\_sig\_model** (const *esp\_ble\_mesh\_elem\_t* \*element, uint16\_t model\_id)

Find the SIG model with the given element and Model id.

**Parameters**

- **element** –[in] Element to which the model belongs.
- **model\_id** –[in] SIG model identifier.

**Returns** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

const *esp\_ble\_mesh\_comp\_t* \***esp\_ble\_mesh\_get\_composition\_data** (void)

Get the Composition data which has been registered.

**Returns** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

*esp\_err\_t* **esp\_ble\_mesh\_model\_subscribe\_group\_addr** (uint16\_t element\_addr, uint16\_t company\_id, uint16\_t model\_id, uint16\_t group\_addr)

A local model of node or Provisioner subscribes a group address.

---

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

---

**Parameters**

- **element\_addr** –[in] Unicast address of the element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier.
- **model\_id** –[in] A 16-bit model identifier.
- **group\_addr** –[in] The group address to be subscribed.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_model\_unsubscribe\_group\_addr** (uint16\_t element\_addr, uint16\_t company\_id, uint16\_t model\_id, uint16\_t group\_addr)

A local model of node or Provisioner unsubscribes a group address.

---

**Note:** This function shall not be invoked before node is provisioned or Provisioner is enabled.

---

#### Parameters

- **element\_addr** –[in] Unicast address of the element to which the model belongs.
- **company\_id** –[in] A 16-bit company identifier.
- **model\_id** –[in] A 16-bit model identifier.
- **group\_addr** –[in] The subscribed group address.

**Returns** ESP\_OK on success or error code otherwise.

const uint8\_t \***esp\_ble\_mesh\_node\_get\_local\_net\_key** (uint16\_t net\_idx)

This function is called by Node to get the local NetKey.

**Parameters** **net\_idx** –[in] NetKey index.

**Returns** NetKey on success, or NULL on failure.

const uint8\_t \***esp\_ble\_mesh\_node\_get\_local\_app\_key** (uint16\_t app\_idx)

This function is called by Node to get the local AppKey.

**Parameters** **app\_idx** –[in] AppKey index.

**Returns** AppKey on success, or NULL on failure.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_net\_key** (const uint8\_t net\_key[16], uint16\_t net\_idx)

This function is called by Node to add a local NetKey.

---

**Note:** This function can only be called after the device is provisioned.

---

#### Parameters

- **net\_key** –[in] NetKey to be added.
- **net\_idx** –[in] NetKey Index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_add\_local\_app\_key** (const uint8\_t app\_key[16], uint16\_t net\_idx,  
uint16\_t app\_idx)

This function is called by Node to add a local AppKey.

---

**Note:** The net\_idx must be an existing one. This function can only be called after the device is provisioned.

---

#### Parameters

- **app\_key** –[in] AppKey to be added.
- **net\_idx** –[in] NetKey Index.
- **app\_idx** –[in] AppKey Index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_bind\_app\_key\_to\_local\_model** (uint16\_t element\_addr, uint16\_t  
company\_id, uint16\_t model\_id,  
uint16\_t app\_idx)

This function is called by Node to bind AppKey to model locally.

---

**Note:** If going to bind app\_key with local vendor model, the company\_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

---

**Parameters**

- **element\_addr** –[in] Node local element address
- **company\_id** –[in] Node local company id
- **model\_id** –[in] Node local model id
- **app\_idx** –[in] Node local appkey index

**Returns** ESP\_OK on success or error code otherwise.

**Low Power Operation (Updating)****Header File**

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_low\\_power\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_enable** (void)

Enable BLE Mesh device LPN functionality.

---

**Note:** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

---

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_disable** (bool force)

Disable BLE Mesh device LPN functionality.

**Parameters** **force** –[in] when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_lpn\_poll** (void)

LPN tries to poll messages from the Friend Node.

---

**Note:** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

---

**Returns** ESP\_OK on success or error code otherwise.

**Send/Publish Messages, add Local AppKey, etc.****Header File**

- [components/bt/esp\\_ble\\_mesh/api/core/include/esp\\_ble\\_mesh\\_networking\\_api.h](#)

**Functions**

*esp\_err\_t* **esp\_ble\_mesh\_register\_custom\_model\_callback** (*esp\_ble\_mesh\_model\_cb\_t* callback)

Register BLE Mesh callback for user-defined models' operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call `esp_ble_mesh_server/client_model_send`, this callback notifies the application layer of the `send_complete` event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

---

**Note:** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, `esp_ble_mesh_register_config_client_callback` is the register function for Config Client Model.

---

**Parameters** `callback` –[in] Pointer to the callback function.

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_model_msg_opcode_init` (`uint8_t *data`, `uint32_t opcode`)

Add the message opcode to the beginning of the model message before sending or publishing the model message.

---

**Note:** This API is only used to set the opcode of the message.

---

#### Parameters

- `data` –[in] Pointer to the message data.
- `opcode` –[in] The message opcode.

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_client_model_init` (`esp_ble_mesh_model_t *model`)

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the `op_pair_size` and `op_pair` variables within the `user_data` (defined using `esp_ble_mesh_client_t`) of the client model need to be initialized.

**Parameters** `model` –[in] BLE Mesh Client model to which the message belongs.

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_client_model_deinit` (`esp_ble_mesh_model_t *model`)

De-initialize the user-defined client model.

---

**Note:** This function shall be invoked before `esp_ble_mesh_deinit()` is called.

---

**Parameters** `model` –[in] Pointer of the Client model.

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_server_model_send_msg` (`esp_ble_mesh_model_t *model`,  
`esp_ble_mesh_msg_ctx_t *ctx`, `uint32_t opcode`,  
`uint16_t length`, `uint8_t *data`)

Send server model messages (such as server model status messages).

#### Parameters

- `model` –[in] BLE Mesh Server Model to which the message belongs.
- `ctx` –[in] Message context, includes keys, TTL, etc.
- `opcode` –[in] Message opcode.
- `length` –[in] Message length (exclude the message opcode).
- `data` –[in] Parameters of Access Payload (exclude the message opcode) to be sent.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_client\_model\_send\_msg** (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_msg\_ctx\_t* \*ctx, uint32\_t opcode,  
uint16\_t length, uint8\_t \*data, int32\_t  
msg\_timeout, bool need\_rsp,  
*esp\_ble\_mesh\_dev\_role\_t* device\_role)

Send client model message (such as model get, set, etc).

**Parameters**

- **model** –[in] BLE Mesh Client Model to which the message belongs.
- **ctx** –[in] Message context, includes keys, TTL, etc.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **msg\_timeout** –[in] Time to get response to the message (in milliseconds).
- **need\_rsp** –[in] TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **device\_role** –[in] Role of the device (Node/Provisioner) that sends the message.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_model\_publish** (*esp\_ble\_mesh\_model\_t* \*model, uint32\_t opcode, uint16\_t  
length, uint8\_t \*data, *esp\_ble\_mesh\_dev\_role\_t* device\_role)

Send a model publication message.

---

**Note:** Before calling this function, the user needs to ensure that the model publication message (*esp\_ble\_mesh\_model\_pub\_t::msg*) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP\_BLE\_MESH\_MODEL\_PUBLISH\_UPDATE\_EVT with the message updated.

---

**Parameters**

- **model** –[in] Mesh (client) Model publishing the message.
- **opcode** –[in] Message opcode.
- **length** –[in] Message length (exclude the message opcode).
- **data** –[in] Parameters of the Access Payload (exclude the message opcode) to be sent.
- **device\_role** –[in] Role of the device (node/provisioner) publishing the message of the type *esp\_ble\_mesh\_dev\_role\_t*.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_server\_model\_update\_state** (*esp\_ble\_mesh\_model\_t* \*model,  
*esp\_ble\_mesh\_server\_state\_type\_t* type,  
*esp\_ble\_mesh\_server\_state\_value\_t* \*value)

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

---

**Note:** Currently this API is used to update bound state value, not for all server model states.

---

**Parameters**

- **model** –[in] Server model which is going to update the state.
- **type** –[in] Server model state type.
- **value** –[in] Server model state value.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_local\_reset** (void)

Reset the provisioning procedure of the local BLE Mesh node.

**Note:** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

---

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_set\_node\_name** (uint16\_t index, const char \*name)

This function is called to set the node (provisioned device) name.

---

**Note:** index is obtained from the parameters of `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`.

---

#### Parameters

- **index** –[in] Index of the node in the node queue.
- **name** –[in] Name (end by ‘\0’) to be set for the node.

**Returns** `ESP_OK` on success or error code otherwise.

const char \***esp\_ble\_mesh\_provisioner\_get\_node\_name** (uint16\_t index)

This function is called to get the node (provisioned device) name.

---

**Note:** index is obtained from the parameters of `ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT`.

---

**Parameters** **index** –[in] Index of the node in the node queue.

**Returns** Node name on success, or NULL on failure.

uint16\_t **esp\_ble\_mesh\_provisioner\_get\_node\_index** (const char \*name)

This function is called to get the node (provisioned device) index.

**Parameters** **name** –[in] Name of the node (end by ‘\0’).

**Returns** Node index on success, or an invalid value (0xFFFF) on failure.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_store\_node\_comp\_data** (uint16\_t unicast\_addr, uint8\_t \*data, uint16\_t length)

This function is called to store the Composition Data of the node.

#### Parameters

- **unicast\_addr** –[in] Element address of the node
- **data** –[in] Pointer of Composition Data
- **length** –[in] Length of Composition Data

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_uuid** (const uint8\_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

**Parameters** **uuid** –[in] Device UUID of the node

**Returns** Pointer of the node info struct or NULL on failure.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_addr** (uint16\_t unicast\_addr)

This function is called to get the provisioned node information with the node unicast address.

**Parameters** **unicast\_addr** –[in] Unicast address of the node

**Returns** Pointer of the node info struct or NULL on failure.

*esp\_ble\_mesh\_node\_t* \***esp\_ble\_mesh\_provisioner\_get\_node\_with\_name** (const char \*name)

This function is called to get the provisioned node information with the node name.

**Parameters** **name** –[in] Name of the node (end by ‘\0’).

**Returns** Pointer of the node info struct or NULL on failure.

`uint16_t esp_ble_mesh_provisioner_get_prov_node_count` (void)

This function is called by Provisioner to get provisioned node count.

**Returns** Number of the provisioned nodes.

`const esp_ble_mesh_node_t** esp_ble_mesh_provisioner_get_node_table_entry` (void)

This function is called by Provisioner to get the entry of the node table.

---

**Note:** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro `CONFIG_BLE_MESH_MAX_PROV_NODES` to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the `*(esp_ble_mesh_node_t **node)` is NULL. For example: `const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { ... } }`

---

**Returns** Pointer to the start of the node table.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid` (const uint8\_t uuid[16])

This function is called to delete the provisioned node information with the node device uuid.

**Parameters** `uuid` –[in] Device UUID of the node

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr` (uint16\_t unicast\_addr)

This function is called to delete the provisioned node information with the node unicast address.

**Parameters** `unicast_addr` –[in] Unicast address of the node

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_add_local_app_key` (const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is called to add a local AppKey for Provisioner.

---

**Note:** `app_key`: If set to NULL, `app_key` will be generated internally. `net_idx`: Should be an existing one. `app_idx`: If it is going to be generated internally, it should be set to 0xFFFF, and the new `app_idx` will be reported via an event.

---

**Parameters**

- `app_key` –[in] The app key to be set for the local BLE Mesh stack.
- `net_idx` –[in] The network key index.
- `app_idx` –[in] The app key index.

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_provisioner_update_local_app_key` (const uint8\_t app\_key[16], uint16\_t net\_idx, uint16\_t app\_idx)

This function is used to update a local AppKey for Provisioner.

**Parameters**

- `app_key` –[in] Value of the AppKey.
- `net_idx` –[in] Corresponding NetKey Index.
- `app_idx` –[in] The AppKey Index

**Returns** ESP\_OK on success or error code otherwise.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_app_key (uint16_t net_idx, uint16_t
                                                         app_idx)
```

This function is called by Provisioner to get the local app key value.

**Parameters**

- **net\_idx** –[in] Network key index.
- **app\_idx** –[in] Application key index.

**Returns** App key on success, or NULL on failure.

```
esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model (uint16_t element_addr,
                                                                uint16_t app_idx,
                                                                uint16_t model_id,
                                                                uint16_t company_id)
```

This function is called by Provisioner to bind own model with proper app key.

---

**Note:** company\_id: If going to bind app\_key with local vendor model, company\_id should be set to 0xFFFF.

---

**Parameters**

- **element\_addr** –[in] Provisioner local element address
- **app\_idx** –[in] Provisioner local appkey index
- **model\_id** –[in] Provisioner local model id
- **company\_id** –[in] Provisioner local company id

**Returns** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_add_local_net_key (const uint8_t net_key[16], uint16_t
                                                       net_idx)
```

This function is called by Provisioner to add local network key.

---

**Note:** net\_key: If set to NULL, net\_key will be generated internally. net\_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net\_idx will be reported via an event.

---

**Parameters**

- **net\_key** –[in] The network key to be added to the Provisioner local BLE Mesh stack.
- **net\_idx** –[in] The network key index.

**Returns** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_provisioner_update_local_net_key (const uint8_t net_key[16],
                                                         uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Parameters**

- **net\_key** –[in] Value of the NetKey.
- **net\_idx** –[in] The NetKey Index.

**Returns** ESP\_OK on success or error code otherwise.

```
const uint8_t *esp_ble_mesh_provisioner_get_local_net_key (uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

**Parameters** **net\_idx** –[in] Network key index.

**Returns** Network key on success, or NULL on failure.

```
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat (bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

---

**Note:** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

---

**Parameters** `enable` –[in] Enable or disable receiving heartbeat messages.  
**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_heartbeat_filter_type` (uint8\_t type)

This function is called by Provisioner to set the heartbeat filter type.

---

**Note:** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

- a. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.
- 

**Parameters** `type` –[in] Heartbeat filter type (acceptlist or rejectlist).  
**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_heartbeat_filter_info` (uint8\_t op,  
*esp\_ble\_mesh\_heartbeat\_filter\_info\_t* \*info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

- a. If the operation is “REMOVE” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
  - The filter entry with the same SRC or DST will be removed.

---

**Note:** 1. If the operation is “ADD” , the “hb\_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb\_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.

- If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
  - If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
  - If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.
- 

**Parameters**

- `op` –[in] Add or REMOVE
- `info` –[in] Heartbeat filter entry information, including: hb\_src - Heartbeat source address; hb\_dst - Heartbeat destination address;

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_direct_erase_settings` (void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

---

**Note:** This function can be invoked when the mesh stack is not initialized or has been de-initialized.

---

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_index** (uint8\_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

---

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

---

**Parameters** **index** –[in] Settings index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_open\_settings\_with\_uid** (const char \*uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

---

**Note:** Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

---

**Parameters** **uid** –[in] Settings user id.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_index** (uint8\_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

---

**Note:** 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
    - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
    - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
  - b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
  - c. The working process shall be as following:
    - a) Open settings A
    - b) Start to provision and control nodes
    - c) Close settings A
    - d) Open settings B
    - e) Start to provision and control other nodes
    - f) Close settings B
    - g) ... ..
- 

**Parameters**

- **index** –[in] Settings index.

- **erase** –[in] Indicate if erasing mesh information.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_close\_settings\_with\_uid** (const char \*uid, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

---

**Note:** 1. Before closing the nvs namespace, it must be open.

- a. When the function is invoked, the Provisioner functionality will be disabled firstly, and:
    - a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack.
    - b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
  - b. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
  - c. The working process shall be as following:
    - a) Open settings A
    - b) Start to provision and control nodes
    - c) Close settings A
    - d) Open settings B
    - e) Start to provision and control other nodes
    - f) Close settings B
    - g) ... ..
-

**Parameters**

- **uid** –[in] Settings user id.
- **erase** –[in] Indicate if erasing mesh information.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_index** (uint8\_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

---

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

---

**Parameters** **index** –[in] Settings index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_settings\_with\_uid** (const char \*uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

---

**Note:** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

---

**Parameters** **uid** –[in] Settings user id.

**Returns** ESP\_OK on success or error code otherwise.

const char \***esp\_ble\_mesh\_provisioner\_get\_settings\_uid** (uint8\_t index)

This function is called by Provisioner to get settings user id.

**Parameters** **index** –[in] Settings index.

**Returns** Setting user id on success or NULL on failure.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_settings\_index** (const char \*uid)

This function is called by Provisioner to get settings index.

**Parameters** **uid** –[in] Settings user id.

**Returns** Settings index.

uint8\_t **esp\_ble\_mesh\_provisioner\_get\_free\_settings\_count** (void)

This function is called by Provisioner to get the number of free settings user id.

**Returns** Number of free settings user id.

const uint8\_t \***esp\_ble\_mesh\_get\_fast\_prov\_app\_key** (uint16\_t net\_idx, uint16\_t app\_idx)

This function is called to get fast provisioning application key.

**Parameters**

- **net\_idx** –[in] Network key index.
- **app\_idx** –[in] Application key index.

**Returns** Application key on success, or NULL on failure.

**Type Definitions**

```
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event,  
esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events

**ESP-BLE-MESH Node/Provisioner Provisioning**

## Header File

- `components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h`

## Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_prov\_callback** (*esp\_ble\_mesh\_prov\_cb\_t* callback)

Register BLE Mesh provisioning callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

bool **esp\_ble\_mesh\_node\_is\_provisioned** (void)

Check if a device has been provisioned.

**Returns** TRUE if the device is provisioned, FALSE if the device is unprovisioned.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

---

**Note:** PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

---

**Parameters** **bearers** –Bit-wise OR of provisioning bearers.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

**Parameters** **bearers** –Bit-wise OR of provisioning bearers.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_set\_oob\_pub\_key** (uint8\_t pub\_key\_x[32], uint8\_t pub\_key\_y[32],  
uint8\_t private\_key[32])

Unprovisioned device set own oob public key & private key pair.

---

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

---

### Parameters

- **pub\_key\_x** –[in] Unprovisioned device' s Public Key X
- **pub\_key\_y** –[in] Unprovisioned device' s Public Key Y
- **private\_key** –[in] Unprovisioned device' s Private Key

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_number** (uint32\_t number)

Provide provisioning input OOB number.

---

**Note:** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_NUMBER as the action.

---

**Parameters** **number** –[in] Number input by device.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_node\_input\_string** (const char \*string)

Provide provisioning input OOB string.

---

**Note:** This is intended to be called if the user has received ESP\_BLE\_MESH\_NODE\_PROV\_INPUT\_EVT with ESP\_BLE\_MESH\_ENTER\_STRING as the action.

---

**Parameters** **string** –[in] String input by device.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_unprovisioned\_device\_name** (const char \*name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

---

**Note:** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn't apply to PB-ADV mode.

---

**Parameters** **name** –[in] Unprovisioned device name

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_read\_oob\_pub\_key** (uint8\_t link\_idx, uint8\_t pub\_key\_x[32], uint8\_t pub\_key\_y[32])

Provisioner inputs unprovisioned device's oob public key.

---

**Note:** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

---

#### Parameters

- **link\_idx** –[in] The provisioning link index
- **pub\_key\_x** –[in] Unprovisioned device's Public Key X
- **pub\_key\_y** –[in] Unprovisioned device's Public Key Y

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_string** (const char \*string, uint8\_t link\_idx)

Provide provisioning input OOB string.

```

    This is intended to be called after the esp_ble_mesh_prov_t prov_
    ↪input_num
    callback has been called with ESP_BLE_MESH_ENTER_STRING as the_
    ↪action.
  
```

#### Parameters

- **string** –[in] String input by Provisioner.
- **link\_idx** –[in] The provisioning link index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_input\_number** (uint32\_t number, uint8\_t link\_idx)

Provide provisioning input OOB number.

```

    This is intended to be called after the esp_ble_mesh_prov_t prov_
    ↪input_num
    callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the_
    ↪action.

```

**Parameters**

- **number** –[in] Number input by Provisioner.
- **link\_idx** –[in] The provisioning link index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_enable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Enable one or more provisioning bearers.

---

**Note:** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

---

**Parameters** **bearers** –[in] Bit-wise OR of provisioning bearers.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_disable** (*esp\_ble\_mesh\_prov\_bearer\_t* bearers)

Disable one or more provisioning bearers.

---

**Note:** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

---

**Parameters** **bearers** –[in] Bit-wise OR of provisioning bearers.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_add\_unprov\_dev** (*esp\_ble\_mesh\_unprov\_dev\_add\_t*  
   \**add\_dev*, *esp\_ble\_mesh\_dev\_add\_flag\_t*  
   *flags*)

Add unprovisioned device info to the unprov\_dev queue.

---

**Note:** : 1. Currently address type only supports public address and static random address.

- If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
- For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device's advertising packets, it will start provisioning the device internally.
  - In this situation, the Provisioner can set bearers with each one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled, and cannot set flags with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
- Another example is when the Provisioner receives the unprovisioned device's beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function `esp_ble_mesh_register_prov_callback`. And in the callback, the Provisioner can call this API to start provisioning the device.
  - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_ADV enabled and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP\_BLE\_MESH\_PROV\_GATT enabled, and the flags shall be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.

- If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP\_BLE\_MESH\_PROV\_ADV and ESP\_BLE\_MESH\_PROV\_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD\_DEV\_START\_PROV\_NOW\_FLAG enabled.
  - Note: ESP\_BLE\_MESH\_PROV\_ADV, ESP\_BLE\_MESH\_PROV\_GATT and ADD\_DEV\_START\_PROV\_NOW\_FLAG can not be enabled at the same time.
- 

**Parameters**

- **add\_dev** –[in] Pointer to a struct containing the device information
- **flags** –[in] Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr** (const uint8\_t uuid[16],  
*esp\_ble\_mesh\_bd\_addr\_t* addr,  
*esp\_ble\_mesh\_addr\_type\_t*  
addr\_type,  
*esp\_ble\_mesh\_prov\_bearer\_t*  
bearer, uint16\_t oob\_info,  
uint16\_t unicast\_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

---

**Note:** : 1. Currently address type only supports public address and static random address.

- a. Bearer must be equal to ESP\_BLE\_MESH\_PROV\_ADV or ESP\_BLE\_MESH\_PROV\_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP\_BLE\_MESH\_PROVISIONER\_RECV\_UNPROV\_ADV\_PKT\_EVT event.
  - b. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
  - c. Recommend to use only one of the functions “esp\_ble\_mesh\_provisioner\_add\_unprov\_dev” and “esp\_ble\_mesh\_provisioner\_prov\_device\_with\_addr” by a Provisioner.
- 

**Parameters**

- **uuid** –[in] Device UUID of the unprovisioned device
- **addr** –[in] Device address of the unprovisioned device
- **addr\_type** –[in] Device address type of the unprovisioned device
- **bearer** –[in] Provisioning bearer going to be used by Provisioner
- **oob\_info** –[in] OOB info of the unprovisioned device
- **unicast\_addr** –[in] Unicast address going to be allocated for the unprovisioned device

**Returns** Zero on success or (negative) error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_provisioner\_delete\_dev** (*esp\_ble\_mesh\_device\_delete\_t* \*del\_dev)

Delete device from queue, and reset current provisioning link with the device.

---

**Note:** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

---

**Parameters** `del_dev` –[in] Pointer to a struct containing the device information.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_dev_uuid_match` (const uint8\_t \*match\_val, uint8\_t match\_len, uint8\_t offset, bool prov\_after\_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Parameters**

- `match_val` –[in] Value to be compared with the part of the device UUID.
- `match_len` –[in] Length of the compared match value.
- `offset` –[in] Offset of the device UUID to be compared (based on zero).
- `prov_after_match` –[in] Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_prov_data_info` (*esp\_ble\_mesh\_prov\_data\_info\_t* \*prov\_data\_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

**Parameters** `prov_data_info` –[in] Pointer to a struct containing net\_idx or flags or iv\_index.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_static_oob_value` (const uint8\_t \*value, uint8\_t length)

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

---

**Note:** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

---

**Parameters**

- `value` –[in] Pointer to the static oob value.
- `length` –[in] Length of the static oob value.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* `esp_ble_mesh_provisioner_set_primary_elem_addr` (uint16\_t addr)

This function is called by Provisioner to set own Primary element address.

---

**Note:** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the `prov_unicast_addr` value in the struct *esp\_ble\_mesh\_prov\_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

---

**Parameters** `addr` –[in] Unicast address of the Primary element of Provisioner.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_info** (*esp\_ble\_mesh\_fast\_prov\_info\_t* \*fast\_prov\_info)

This function is called to set provisioning data information before starting fast provisioning.

**Parameters** **fast\_prov\_info** –[in] Pointer to a struct containing unicast address range, net\_idx, etc.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_set\_fast\_prov\_action** (*esp\_ble\_mesh\_fast\_prov\_action\_t* action)

This function is called to start/suspend/exit fast provisioning.

**Parameters** **action** –[in] fast provisioning action (i.e. enter, suspend, exit).

**Returns** ESP\_OK on success or error code otherwise.

## Type Definitions

```
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,  
esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```
typedef void (*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const  
esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info,  
esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Param addr** [in] Pointer to the unprovisioned device address.

**Param addr\_type** [in] Unprovisioned device address type.

**Param adv\_type** [in] Adv packet type(ADV\_IND or ADV\_NONCONN\_IND).

**Param dev\_uuid** [in] Unprovisioned device UUID pointer.

**Param oob\_info** [in] OOB information of the unprovisioned device.

**Param bearer** [in] Adv packet received from PB-GATT or PB-ADV bearer.

## ESP-BLE-MESH GATT Proxy Server

### Header File

- components/bt/esp\_ble\_mesh/api/core/include/esp\_ble\_mesh\_proxy\_api.h

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_identity\_enable** (void)

Enable advertising with Node Identity.

---

**Note:** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

---

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_enable** (void)

Enable BLE Mesh GATT Proxy Service.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_gatt\_disable** (void)

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_connect** (*esp\_ble\_mesh\_bd\_addr\_t* addr,  
*esp\_ble\_mesh\_addr\_type\_t* addr\_type, uint16\_t  
net\_idx)

Proxy Client creates a connection with the Proxy Server.

**Parameters**

- **addr** –[in] Device address of the Proxy Server.
- **addr\_type** –[in] Device address type(public or static random).
- **net\_idx** –[in] NetKey Index related with Network ID in the Mesh Proxy advertising packet.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_disconnect** (uint8\_t conn\_handle)

Proxy Client terminates a connection with the Proxy Server.

**Parameters** **conn\_handle** –[in] Proxy connection handle.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_set\_filter\_type** (uint8\_t conn\_handle, uint16\_t net\_idx,  
*esp\_ble\_mesh\_proxy\_filter\_type\_t*  
filter\_type)

Proxy Client sets the filter type of the Proxy Server.

**Parameters**

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **filter\_type** –[in] whitelist or blacklist.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_add\_filter\_addr** (uint8\_t conn\_handle, uint16\_t net\_idx,  
uint16\_t \*addr, uint16\_t addr\_num)

Proxy Client adds address to the Proxy Server filter list.

**Parameters**

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr\_num** –[in] Number of the filter address.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_proxy\_client\_remove\_filter\_addr** (uint8\_t conn\_handle, uint16\_t  
net\_idx, uint16\_t \*addr, uint16\_t  
addr\_num)

Proxy Client removes address from the Proxy Server filter list.

**Parameters**

- **conn\_handle** –[in] Proxy connection handle.
- **net\_idx** –[in] Corresponding NetKey Index.
- **addr** –[in] Pointer to the filter address.
- **addr\_num** –[in] Number of the filter address.

**Returns** ESP\_OK on success or error code otherwise.

## ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- *Configuration Client/Server Models*
- *Health Client/Server Models*
- *Generic Client/Server Models*
- *Sensor Client/Server Models*
- *Time and Scenes Client/Server Models*
- *Lighting Client/Server Models*

---

**Note:** Definitions related to Server Models are being updated, and will be released soon.

---

## Configuration Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_config_client_callback` (`esp_ble_mesh_cfg_client_cb_t` callback)

Register BLE Mesh Config Client Model callback.

**Parameters** `callback` –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_register_config_server_callback` (`esp_ble_mesh_cfg_server_cb_t` callback)

Register BLE Mesh Config Server Model callback.

**Parameters** `callback` –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_config_client_get_state` (`esp_ble_mesh_client_common_param_t` \*params, `esp_ble_mesh_cfg_client_get_state_t` \*get\_state)

Get the value of Config Server Model states using the Config Client Model get messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_get_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- `params` –[in] Pointer to BLE Mesh common client parameters.
- `get_state` –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_config_client_set_state` (`esp_ble_mesh_client_common_param_t` \*params, `esp_ble_mesh_cfg_client_set_state_t` \*set\_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_config_client_set_t` in `esp_ble_mesh_defs.h`

---

**Parameters**

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

Relay Mode state

uint8\_t **relay\_retransmit**

Relay Retransmit state

uint8\_t **beacon**

Secure Network Beacon state

uint8\_t **gatt\_proxy**

GATT Proxy state

uint8\_t **friend\_state**

Friend state

uint8\_t **default\_ttl**

Default TTL

struct k\_delayed\_work **timer**

Heartbeat Publication timer

uint16\_t **dst**

Destination address for Heartbeat messages

uint16\_t **count**

Number of Heartbeat messages to be sent

Number of Heartbeat messages received

uint8\_t **period**

Period for sending Heartbeat messages

uint8\_t **ttl**

TTL to be used when sending Heartbeat messages

uint16\_t **feature**

Bit field indicating features that trigger Heartbeat messages when changed

uint16\_t **net\_idx**

NetKey Index used by Heartbeat Publication

struct *esp\_ble\_mesh\_cfg\_srv::*[anonymous] **heartbeat\_pub**

Heartbeat Publication

int64\_t **expiry**

Timestamp when Heartbeat subscription period is expired

uint16\_t **src**

Source address for Heartbeat messages

uint8\_t **min\_hops**

Minimum hops when receiving Heartbeat messages

uint8\_t **max\_hops**

Maximum hops when receiving Heartbeat messages

*esp\_ble\_mesh\_cb\_t* **heartbeat\_recv\_cb**

Optional heartbeat subscription tracking function

struct *esp\_ble\_mesh\_cfg\_srv::*[anonymous] **heartbeat\_sub**

Heartbeat Subscription

struct **esp\_ble\_mesh\_cfg\_composition\_data\_get\_t**

Parameters of Config Composition Data Get.

### Public Members

uint8\_t **page**

Page number of the Composition Data.

struct **esp\_ble\_mesh\_cfg\_model\_pub\_get\_t**

Parameters of Config Model Publication Get.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_sig\_model\_sub\_get\_t**

Parameters of Config SIG Model Subscription Get.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

struct **esp\_ble\_mesh\_cfg\_vnd\_model\_sub\_get\_t**

Parameters of Config Vendor Model Subscription Get.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_app\_key\_get\_t**

Parameters of Config AppKey Get.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_node\_identity\_get\_t**

Parameters of Config Node Identity Get.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_sig\_model\_app\_get\_t**

Parameters of Config SIG Model App Get.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

struct **esp\_ble\_mesh\_cfg\_vnd\_model\_app\_get\_t**

Parameters of Config Vendor Model App Get.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_get\_t**

Parameters of Config Key Refresh Phase Get.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_lpn\_polltimeout\_get\_t**  
Parameters of Config Low Power Node PollTimeout Get.

#### **Public Members**

uint16\_t **lpn\_addr**  
The unicast address of the Low Power node

struct **esp\_ble\_mesh\_cfg\_beacon\_set\_t**  
Parameters of Config Beacon Set.

#### **Public Members**

uint8\_t **beacon**  
New Secure Network Beacon state

struct **esp\_ble\_mesh\_cfg\_default\_ttl\_set\_t**  
Parameters of Config Default TTL Set.

#### **Public Members**

uint8\_t **ttl**  
The default TTL state value

struct **esp\_ble\_mesh\_cfg\_friend\_set\_t**  
Parameters of Config Friend Set.

#### **Public Members**

uint8\_t **friend\_state**  
The friend state value

struct **esp\_ble\_mesh\_cfg\_gatt\_proxy\_set\_t**  
Parameters of Config GATT Proxy Set.

#### **Public Members**

uint8\_t **gatt\_proxy**  
The GATT Proxy state value

struct **esp\_ble\_mesh\_cfg\_relay\_set\_t**  
Parameters of Config Relay Set.

**Public Members****uint8\_t relay**

The relay value

**uint8\_t relay\_retransmit**

The relay retransmit value

struct **esp\_ble\_mesh\_cfg\_net\_key\_add\_t**

Parameters of Config NetKey Add.

**Public Members****uint16\_t net\_idx**

The network key index

**uint8\_t net\_key[16]**

The network key value

struct **esp\_ble\_mesh\_cfg\_app\_key\_add\_t**

Parameters of Config AppKey Add.

**Public Members****uint16\_t net\_idx**

The network key index

**uint16\_t app\_idx**

The app key index

**uint8\_t app\_key[16]**

The app key value

struct **esp\_ble\_mesh\_cfg\_model\_app\_bind\_t**

Parameters of Config Model App Bind.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_app\_idx**

Index of the app key to bind with the model

**uint16\_t model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_pub\_set\_t**

Parameters of Config Model Publication Set.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **publish\_addr**

Value of the publish address

uint16\_t **publish\_app\_idx**

Index of the application key

bool **cred\_flag**

Value of the Friendship Credential Flag

uint8\_t **publish\_ttl**

Default TTL value for the publishing messages

uint8\_t **publish\_period**

Period for periodic status publishing

uint8\_t **publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add.

### Public Members

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be removed from the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_overwrite\_t**

Parameters of Config Model Subscription Overwrite.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint16\_t **sub\_addr**

The address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_add\_t**

Parameters of Config Model Subscription Virtual Address Add.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_delete\_t**

Parameters of Config Model Subscription Virtual Address Delete.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be removed from the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t**

Parameters of Config Model Subscription Virtual Address Overwrite.

### **Public Members**

uint16\_t **element\_addr**

The element address

uint8\_t **label\_uuid**[16]

The Label UUID of the virtual address to be added to the Subscription List

uint16\_t **model\_id**

The model id

uint16\_t **company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t**

Parameters of Config Model Publication Virtual Address Set.

**Public Members****uint16\_t element\_addr**

The element address

**uint8\_t label\_uuid[16]**

Value of the Label UUID publish address

**uint16\_t publish\_app\_idx**

Index of the application key

**bool cred\_flag**

Value of the Friendship Credential Flag

**uint8\_t publish\_ttl**

Default TTL value for the publishing messages

**uint8\_t publish\_period**

Period for periodic status publishing

**uint8\_t publish\_retransmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t**

Parameters of Config Model Subscription Delete All.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp\_ble\_mesh\_cfg\_net\_key\_update\_t**

Parameters of Config NetKey Update.

### Public Members

uint16\_t **net\_idx**

The network key index

uint8\_t **net\_key**[16]

The network key value

struct **esp\_ble\_mesh\_cfg\_net\_key\_delete\_t**

Parameters of Config NetKey Delete.

### Public Members

uint16\_t **net\_idx**

The network key index

struct **esp\_ble\_mesh\_cfg\_app\_key\_update\_t**

Parameters of Config AppKey Update.

### Public Members

uint16\_t **net\_idx**

The network key index

uint16\_t **app\_idx**

The app key index

uint8\_t **app\_key**[16]

The app key value

struct **esp\_ble\_mesh\_cfg\_app\_key\_delete\_t**

Parameters of Config AppKey Delete.

### Public Members

uint16\_t **net\_idx**

The network key index

uint16\_t **app\_idx**

The app key index

struct **esp\_ble\_mesh\_cfg\_node\_identity\_set\_t**

Parameters of Config Node Identity Set.

**Public Members****uint16\_t net\_idx**

The network key index

**uint8\_t identity**

New Node Identity state

struct **esp\_ble\_mesh\_cfg\_model\_app\_unbind\_t**

Parameters of Config Model App Unbind.

**Public Members****uint16\_t element\_addr**

The element address

**uint16\_t model\_app\_idx**

Index of the app key to bind with the model

**uint16\_t model\_id**

The model id

**uint16\_t company\_id**

The company id, if not a vendor model, shall set to 0xFFFF

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_set\_t**

Parameters of Config Key Refresh Phase Set.

**Public Members****uint16\_t net\_idx**

The network key index

**uint8\_t transition**

New Key Refresh Phase Transition

struct **esp\_ble\_mesh\_cfg\_net\_transmit\_set\_t**

Parameters of Config Network Transmit Set.

**Public Members****uint8\_t net\_transmit**

Network Transmit State

struct **esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t**

Parameters of Config Model Heartbeat Publication Set.

**Public Members****uint16\_t dst**

Destination address for Heartbeat messages

**uint8\_t count**

Number of Heartbeat messages to be sent

**uint8\_t period**

Period for sending Heartbeat messages

**uint8\_t ttl**

TTL to be used when sending Heartbeat messages

**uint16\_t feature**

Bit field indicating features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**

NetKey Index

struct **esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t**

Parameters of Config Model Heartbeat Subscription Set.

**Public Members****uint16\_t src**

Source address for Heartbeat messages

**uint16\_t dst**

Destination address for Heartbeat messages

**uint8\_t period**

Period for receiving Heartbeat messages

struct **esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t**

Parameter of Config Beacon Status

**Public Members****uint8\_t beacon**

Secure Network Beacon state value

struct **esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t**

Parameters of Config Composition Data Status

**Public Members****uint8\_t page**

Page number of the Composition Data

struct net\_buf\_simple \***composition\_data**

Pointer to Composition Data for the identified page

struct **esp\_ble\_mesh\_cfg\_default\_ttl\_status\_cb\_t**

Parameter of Config Default TTL Status

**Public Members****uint8\_t default\_ttl**

Default TTL state value

struct **esp\_ble\_mesh\_cfg\_gatt\_proxy\_status\_cb\_t**

Parameter of Config GATT Proxy Status

**Public Members****uint8\_t gatt\_proxy**

GATT Proxy state value

struct **esp\_ble\_mesh\_cfg\_relay\_status\_cb\_t**

Parameters of Config Relay Status

**Public Members****uint8\_t relay**

Relay state value

**uint8\_t retransmit**

Relay retransmit value(number of retransmissions and number of 10-millisecond steps between retransmissions)

struct **esp\_ble\_mesh\_cfg\_model\_pub\_status\_cb\_t**

Parameters of Config Model Publication Status

**Public Members****uint8\_t status**

Status Code for the request message

**uint16\_t element\_addr**

Address of the element

uint16\_t **publish\_addr**

Value of the publish address

uint16\_t **app\_idx**

Index of the application key

bool **cred\_flag**

Value of the Friendship Credential Flag

uint8\_t **t1**

Default TTL value for the outgoing messages

uint8\_t **period**

Period for periodic status publishing

uint8\_t **transmit**

Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_cfg\_model\_sub\_status\_cb\_t**

Parameters of Config Model Subscription Status

### **Public Members**

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **sub\_addr**

Value of the address

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_cfg\_net\_key\_status\_cb\_t**

Parameters of Config NetKey Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

struct **esp\_ble\_mesh\_cfg\_app\_key\_status\_cb\_t**

Parameters of Config AppKey Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

uint16\_t **app\_idx**

Index of the application key

struct **esp\_ble\_mesh\_cfg\_mod\_app\_status\_cb\_t**

Parameters of Config Model App Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **app\_idx**

Index of the application key

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_cfg\_friend\_status\_cb\_t**

Parameter of Config Friend Status

**Public Members****uint8\_t friend\_state**

Friend state value

struct **esp\_ble\_mesh\_cfg\_hb\_pub\_status\_cb\_t**

Parameters of Config Heartbeat Publication Status

**Public Members****uint8\_t status**

Status Code for the request message

**uint16\_t dst**

Destination address for Heartbeat messages

**uint8\_t count**

Number of Heartbeat messages remaining to be sent

**uint8\_t period**

Period for sending Heartbeat messages

**uint8\_t ttl**

TTL to be used when sending Heartbeat messages

**uint16\_t features**

Features that trigger Heartbeat messages when changed

**uint16\_t net\_idx**

Index of the NetKey

struct **esp\_ble\_mesh\_cfg\_hb\_sub\_status\_cb\_t**

Parameters of Config Heartbeat Subscription Status

**Public Members****uint8\_t status**

Status Code for the request message

**uint16\_t src**

Source address for Heartbeat messages

**uint16\_t dst**

Destination address for Heartbeat messages

**uint8\_t period**

Remaining Period for processing Heartbeat messages

uint8\_t **count**

Number of Heartbeat messages received

uint8\_t **min\_hops**

Minimum hops when receiving Heartbeat messages

uint8\_t **max\_hops**

Maximum hops when receiving Heartbeat messages

struct **esp\_ble\_mesh\_cfg\_net\_trans\_status\_cb\_t**

Parameters of Config Network Transmit Status

### **Public Members**

uint8\_t **net\_trans\_count**

Number of transmissions for each Network PDU originating from the node

uint8\_t **net\_trans\_step**

Maximum hops when receiving Heartbeat messages

struct **esp\_ble\_mesh\_cfg\_model\_sub\_list\_cb\_t**

Parameters of Config SIG/Vendor Subscription List

### **Public Members**

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct net\_buf\_simple \***sub\_addr**

A block of all addresses from the Subscription List

struct **esp\_ble\_mesh\_cfg\_net\_key\_list\_cb\_t**

Parameter of Config NetKey List

### **Public Members**

struct net\_buf\_simple \***net\_idx**

A list of NetKey Indexes known to the node

struct **esp\_ble\_mesh\_cfg\_app\_key\_list\_cb\_t**

Parameters of Config AppKey List

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

NetKey Index of the NetKey that the AppKeys are bound to

struct net\_buf\_simple \***app\_idx**

A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

struct **esp\_ble\_mesh\_cfg\_node\_id\_status\_cb\_t**

Parameters of Config Node Identity Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

uint8\_t **identity**

Node Identity state

struct **esp\_ble\_mesh\_cfg\_model\_app\_list\_cb\_t**

Parameters of Config SIG/Vendor Model App List

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **element\_addr**

Address of the element

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct net\_buf\_simple \***app\_idx**

All AppKey indexes bound to the Model

struct **esp\_ble\_mesh\_cfg\_kr\_phase\_status\_cb\_t**

Parameters of Config Key Refresh Phase Status

### Public Members

uint8\_t **status**

Status Code for the request message

uint16\_t **net\_idx**

Index of the NetKey

uint8\_t **phase**

Key Refresh Phase state

struct **esp\_ble\_mesh\_cfg\_lpn\_pollto\_status\_cb\_t**

Parameters of Config Low Power Node PollTimeout Status

### Public Members

uint16\_t **lpn\_addr**

The unicast address of the Low Power node

int32\_t **poll\_timeout**

The current value of the PollTimeout timer of the Low Power node

struct **esp\_ble\_mesh\_cfg\_client\_cb\_param\_t**

Configuration Client Model callback parameters

### Public Members

int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters

*esp\_ble\_mesh\_cfg\_client\_common\_cb\_param\_t* **status\_cb**

The config status message callback values

struct **esp\_ble\_mesh\_state\_change\_cfg\_mod\_pub\_set\_t**

Configuration Server model related context.

**Public Members****uint16\_t element\_addr**

Element Address

**uint16\_t pub\_addr**

Publish Address

**uint16\_t app\_idx**

AppKey Index

**bool cred\_flag**

Friendship Credential Flag

**uint8\_t pub\_ttl**

Publish TTL

**uint8\_t pub\_period**

Publish Period

**uint8\_t pub\_retransmit**

Publish Retransmit

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_add\_t**

Parameters of Config Model Subscription Add

**Public Members****uint16\_t element\_addr**

Element Address

**uint16\_t sub\_addr**

Subscription Address

**uint16\_t company\_id**

Company ID

**uint16\_t model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_sub\_delete\_t**

Parameters of Config Model Subscription Delete

### Public Members

uint16\_t **element\_addr**

Element Address

uint16\_t **sub\_addr**

Subscription Address

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_add\_t**

Parameters of Config NetKey Add

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **net\_key**[16]

NetKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_update\_t**

Parameters of Config NetKey Update

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **net\_key**[16]

NetKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_netkey\_delete\_t**

Parameter of Config NetKey Delete

### Public Members

uint16\_t **net\_idx**

NetKey Index

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_add\_t**

Parameters of Config AppKey Add

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

uint8\_t **app\_key**[16]  
AppKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_update\_t**  
Parameters of Config AppKey Update

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

uint8\_t **app\_key**[16]  
AppKey

struct **esp\_ble\_mesh\_state\_change\_cfg\_appkey\_delete\_t**  
Parameters of Config AppKey Delete

### Public Members

uint16\_t **net\_idx**  
NetKey Index

uint16\_t **app\_idx**  
AppKey Index

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_bind\_t**  
Parameters of Config Model App Bind

### Public Members

uint16\_t **element\_addr**  
Element Address

uint16\_t **app\_idx**  
AppKey Index

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_model\_app\_unbind\_t**

Parameters of Config Model App Unbind

### Public Members

uint16\_t **element\_addr**

Element Address

uint16\_t **app\_idx**

AppKey Index

uint16\_t **company\_id**

Company ID

uint16\_t **model\_id**

Model ID

struct **esp\_ble\_mesh\_state\_change\_cfg\_kr\_phase\_set\_t**

Parameters of Config Key Refresh Phase Set

### Public Members

uint16\_t **net\_idx**

NetKey Index

uint8\_t **kr\_phase**

New Key Refresh Phase Transition

struct **esp\_ble\_mesh\_cfg\_server\_cb\_param\_t**

Configuration Server model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the server model structure

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received message

*esp\_ble\_mesh\_cfg\_server\_cb\_value\_t* **value**

Value of the received configuration messages

## Macros

**ESP\_BLE\_MESH\_MODEL\_CFG\_SRV** (srv\_data)

Define a new Config Server Model.

---

**Note:** The Config Server Model can only be included by a Primary Element.

---

### Parameters

- **srv\_data** –Pointer to a unique Config Server Model user\_data.

**Returns** New Config Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_CFG\_CLI** (cli\_data)

Define a new Config Client Model.

---

**Note:** The Config Client Model can only be included by a Primary Element.

---

### Parameters

- **cli\_data** –Pointer to a unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Config Client Model instance.

## Type Definitions

```
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```

Configuration Server Model context

```
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,  
esp_ble_mesh_cfg_client_cb_param_t *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,  
esp_ble_mesh_cfg_server_cb_param_t *param)
```

Configuration Server Model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_CLIENT\_EVT\_MAX**

enum **esp\_ble\_mesh\_cfg\_server\_cb\_event\_t**

This enum value is the event of Configuration Server model

*Values:*

enumerator **ESP\_BLE\_MESH\_CFG\_SERVER\_STATE\_CHANGE\_EVT**

enumerator **ESP\_BLE\_MESH\_CFG\_SERVER\_EVT\_MAX**

## Health Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_client\_callback** (*esp\_ble\_mesh\_health\_client\_cb\_t* callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_health\_server\_callback** (*esp\_ble\_mesh\_health\_server\_cb\_t* callback)

Register BLE Mesh Health Server Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_get\_state\_t* \*get\_state)

This function is called to get the Health Server states using the Health Client Model get messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_get_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_health\_client\_set\_state\_t* \*set\_state)

This function is called to set the Health Server states using the Health Client Model set messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_opcode_health_client_set_t` in `esp_ble_mesh_defs.h`

---

### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_health\_server\_fault\_update** (*esp\_ble\_mesh\_elem\_t* \*element)

This function is called by the Health Server Model to update the context of its Health Current status.

**Parameters** **element** –[in] The element to which the Health Server Model belongs.

**Returns** ESP\_OK on success or error code otherwise.

### Unions

union **esp\_ble\_mesh\_health\_client\_get\_state\_t**

*#include <esp\_ble\_mesh\_health\_model\_api.h>* For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_GET ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_GET the `get_state` parameter in the `esp_ble_mesh_health_client_get_state` function should not be set to NULL.

### Public Members

*esp\_ble\_mesh\_health\_fault\_get\_t* **fault\_get**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_GET.

union **esp\_ble\_mesh\_health\_client\_set\_state\_t**

*#include <esp\_ble\_mesh\_health\_model\_api.h>* For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK the `set_state` parameter in the `esp_ble_mesh_health_client_set_state` function should not be set to NULL.

### Public Members

*esp\_ble\_mesh\_health\_attention\_set\_t* **attention\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_ATTENTION\_SET\_UNACK.

*esp\_ble\_mesh\_health\_period\_set\_t* **period\_set**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_PERIOD\_SET\_UNACK.

*esp\_ble\_mesh\_health\_fault\_test\_t* **fault\_test**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_TEST\_UNACK.

*esp\_ble\_mesh\_health\_fault\_clear\_t* **fault\_clear**

For ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR or ESP\_BLE\_MESH\_MODEL\_OP\_HEALTH\_FAULT\_CLEAR\_UNACK.

union **esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t**  
*#include <esp\_ble\_mesh\_health\_model\_api.h>* Health Client Model received message union.

### Public Members

*esp\_ble\_mesh\_health\_current\_status\_cb\_t* **current\_status**

The health current status value

*esp\_ble\_mesh\_health\_fault\_status\_cb\_t* **fault\_status**

The health fault status value

*esp\_ble\_mesh\_health\_period\_status\_cb\_t* **period\_status**

The health period status value

*esp\_ble\_mesh\_health\_attention\_status\_cb\_t* **attention\_status**

The health attention status value

union **esp\_ble\_mesh\_health\_server\_cb\_param\_t**  
*#include <esp\_ble\_mesh\_health\_model\_api.h>* Health Server Model callback parameters union.

### Public Members

*esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t* **fault\_update\_comp**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT

*esp\_ble\_mesh\_health\_fault\_clear\_cb\_t* **fault\_clear**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT

*esp\_ble\_mesh\_health\_fault\_test\_cb\_t* **fault\_test**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT

*esp\_ble\_mesh\_health\_attention\_on\_cb\_t* **attention\_on**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT

*esp\_ble\_mesh\_health\_attention\_off\_cb\_t* **attention\_off**

ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT

### Structures

struct **esp\_ble\_mesh\_health\_srv\_cb\_t**  
ESP BLE Mesh Health Server callback

### Public Members

*esp\_ble\_mesh\_cb\_t* **fault\_clear**

Clear health registered faults. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **fault\_test**

Run a specific health test. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_on**

Health attention on callback. Initialized by the stack.

*esp\_ble\_mesh\_cb\_t* **attention\_off**

Health attention off callback. Initialized by the stack.

struct **esp\_ble\_mesh\_health\_test\_t**

ESP BLE Mesh Health Server test Context

### Public Members

uint8\_t **id\_count**

Number of Health self-test ID

const uint8\_t \***test\_ids**

Array of Health self-test IDs

uint16\_t **company\_id**

Company ID used to identify the Health Fault state

uint8\_t **prev\_test\_id**

Current test ID of the health fault test

uint8\_t **current\_faults**[ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE]

Array of current faults

uint8\_t **registered\_faults**[ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE]

Array of registered faults

struct **esp\_ble\_mesh\_health\_srv\_t**

ESP BLE Mesh Health Server Model Context

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Health Server Model

*esp\_ble\_mesh\_health\_srv\_cb\_t* **health\_cb**

Health callback struct

struct k\_delayed\_work **attention\_timer**

Attention Timer state

bool **attention\_timer\_start**

Attention Timer start flag

*esp\_ble\_mesh\_health\_test\_t* **health\_test**

Health Server fault test

struct **esp\_ble\_mesh\_health\_fault\_get\_t**

Parameter of Health Fault Get

### **Public Members**

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_attention\_set\_t**

Parameter of Health Attention Set

### **Public Members**

uint8\_t **attention**

Value of the Attention Timer state

struct **esp\_ble\_mesh\_health\_period\_set\_t**

Parameter of Health Period Set

### **Public Members**

uint8\_t **fast\_period\_divisor**

Divider for the Publish Period

struct **esp\_ble\_mesh\_health\_fault\_test\_t**

Parameter of Health Fault Test

### **Public Members**

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

uint8\_t **test\_id**

ID of a specific test to be performed

struct **esp\_ble\_mesh\_health\_fault\_clear\_t**

Parameter of Health Fault Clear

### **Public Members**

uint16\_t **company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_current\_status\_cb\_t**  
Parameters of Health Current Status

### Public Members

uint8\_t **test\_id**  
ID of a most recently performed test

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

struct net\_buf\_simple \***fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

struct **esp\_ble\_mesh\_health\_fault\_status\_cb\_t**  
Parameters of Health Fault Status

### Public Members

uint8\_t **test\_id**  
ID of a most recently performed test

uint16\_t **company\_id**  
Bluetooth assigned 16-bit Company ID

struct net\_buf\_simple \***fault\_array**  
FaultArray field contains a sequence of 1-octet fault values

struct **esp\_ble\_mesh\_health\_period\_status\_cb\_t**  
Parameter of Health Period Status

### Public Members

uint8\_t **fast\_period\_divisor**  
Divider for the Publish Period

struct **esp\_ble\_mesh\_health\_attention\_status\_cb\_t**  
Parameter of Health Attention Status

### Public Members

uint8\_t **attention**  
Value of the Attention Timer state

struct **esp\_ble\_mesh\_health\_client\_cb\_param\_t**  
Health Client Model callback parameters

**Public Members****int error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_health\_client\_common\_cb\_param\_t* **status\_cb**

The health message status callback values

struct **esp\_ble\_mesh\_health\_fault\_update\_comp\_cb\_t**

Parameter of publishing Health Current Status completion event

**Public Members****int error\_code**

The result of publishing Health Current Status

*esp\_ble\_mesh\_elem\_t* \***element**

Pointer to the element which contains the Health Server Model

struct **esp\_ble\_mesh\_health\_fault\_clear\_cb\_t**

Parameters of Health Fault Clear event

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_fault\_test\_cb\_t**

Parameters of Health Fault Test event

**Public Members***esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

**uint8\_t test\_id**

ID of a specific test to be performed

**uint16\_t company\_id**

Bluetooth assigned 16-bit Company ID

struct **esp\_ble\_mesh\_health\_attention\_on\_cb\_t**

Parameter of Health Attention On event

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

uint8\_t **time**

Duration of attention timer on (in seconds)

struct **esp\_ble\_mesh\_health\_attention\_off\_cb\_t**

Parameter of Health Attention Off event

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Health Server Model

### Macros

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV** (srv, pub)

Define a new Health Server Model.

---

**Note:** The Health Server Model can only be included by a Primary Element.

---

#### Parameters

- **srv** –Pointer to the unique struct *esp\_ble\_mesh\_health\_srv\_t*.
- **pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.

**Returns** New Health Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI** (cli\_data)

Define a new Health Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Health Client Model.

---

#### Parameters

- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Health Client Model instance.

**ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE** (\_name, \_max, \_role)

A helper to define a health publication context

#### Parameters

- **\_name** –Name given to the publication context variable.
- **\_max** –Maximum number of faults the element can have.
- **\_role** –Role of the device which contains the model.

**ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST**

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

**ESP\_BLE\_MESH\_NO\_FAULT**

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

**ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING**

**ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_ERROR**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_WARNING**

**ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_HIGH\_ERROR**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_WARNING**

**ESP\_BLE\_MESH\_POWER\_SUPPLY\_INTERRUPTED\_ERROR**

**ESP\_BLE\_MESH\_NO\_LOAD\_WARNING**

**ESP\_BLE\_MESH\_NO\_LOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERLOAD\_WARNING**

**ESP\_BLE\_MESH\_OVERLOAD\_ERROR**

**ESP\_BLE\_MESH\_OVERHEAT\_WARNING**

**ESP\_BLE\_MESH\_OVERHEAT\_ERROR**

**ESP\_BLE\_MESH\_CONDENSATION\_WARNING**

**ESP\_BLE\_MESH\_CONDENSATION\_ERROR**

**ESP\_BLE\_MESH\_VIBRATION\_WARNING**

**ESP\_BLE\_MESH\_VIBRATION\_ERROR**

**ESP\_BLE\_MESH\_CONFIGURATION\_WARNING**

**ESP\_BLE\_MESH\_CONFIGURATION\_ERROR**

ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_WARNING

ESP\_BLE\_MESH\_ELEMENT\_NOT\_CALIBRATED\_ERROR

ESP\_BLE\_MESH\_MEMORY\_WARNING

ESP\_BLE\_MESH\_MEMORY\_ERROR

ESP\_BLE\_MESH\_SELF\_TEST\_WARNING

ESP\_BLE\_MESH\_SELF\_TEST\_ERROR

ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_WARNING

ESP\_BLE\_MESH\_INPUT\_TOO\_LOW\_ERROR

ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_WARNING

ESP\_BLE\_MESH\_INPUT\_TOO\_HIGH\_ERROR

ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_WARNING

ESP\_BLE\_MESH\_INPUT\_NO\_CHANGE\_ERROR

ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_WARNING

ESP\_BLE\_MESH\_ACTUATOR\_BLOCKED\_ERROR

ESP\_BLE\_MESH\_HOUSING\_OPENED\_WARNING

ESP\_BLE\_MESH\_HOUSING\_OPENED\_ERROR

ESP\_BLE\_MESH\_TAMPER\_WARNING

ESP\_BLE\_MESH\_TAMPER\_ERROR

ESP\_BLE\_MESH\_DEVICE\_MOVED\_WARNING

ESP\_BLE\_MESH\_DEVICE\_MOVED\_ERROR

ESP\_BLE\_MESH\_DEVICE\_DROPPED\_WARNING

ESP\_BLE\_MESH\_DEVICE\_DROPPED\_ERROR

ESP\_BLE\_MESH\_OVERFLOW\_WARNING

**ESP\_BLE\_MESH\_OVERFLOW\_ERROR**

**ESP\_BLE\_MESH\_EMPTY\_WARNING**

**ESP\_BLE\_MESH\_EMPTY\_ERROR**

**ESP\_BLE\_MESH\_INTERNAL\_BUS\_WARNING**

**ESP\_BLE\_MESH\_INTERNAL\_BUS\_ERROR**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_WARNING**

**ESP\_BLE\_MESH\_MECHANISM\_JAMMED\_ERROR**

**ESP\_BLE\_MESH\_HEALTH\_FAULT\_ARRAY\_SIZE**

### Type Definitions

```
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event,  
esp_ble_mesh_health_client_cb_param_t *param)
```

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event,  
esp_ble_mesh_health_server_cb_param_t *param)
```

Health Server Model callback function type.

**Param event** Event type

**Param param** Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_health_client_cb_event_t
```

This enum value is the event of Health Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_CLIENT\_EVT\_MAX**

enum **esp\_ble\_mesh\_health\_server\_cb\_event\_t**

This enum value is the event of Health Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_UPDATE\_COMP\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_CLEAR\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_FAULT\_TEST\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_ON\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_ATTENTION\_OFF\_EVT**

enumerator **ESP\_BLE\_MESH\_HEALTH\_SERVER\_EVT\_MAX**

## Generic Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_generic\_client\_callback** (*esp\_ble\_mesh\_generic\_client\_cb\_t* callback)

Register BLE Mesh Generic Client Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_get\_state\_t* \*get\_state)

Get the value of Generic Server Model states using the Generic Client Model get messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to generic get message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_generic\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_generic\_client\_set\_state\_t* \*set\_state)

Set the value of Generic Server Model states using the Generic Client Model set messages.

---

**Note:** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to generic set message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_generic\_server\_callback** (*esp\_ble\_mesh\_generic\_server\_cb\_t* callback)

Register BLE Mesh Generic Server Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

### Unions

union **esp\_ble\_mesh\_generic\_client\_get\_state\_t**

### Structures

struct **esp\_ble\_mesh\_gen\_onoff\_set\_t**

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

Parameters of Generic OnOff Set.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

`uint8_t onoff`

Target value of Generic OnOff state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_level_set_t`

Parameters of Generic Level Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

`int16_t level`

Target value of Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_gen_delta_set_t`

Parameters of Generic Delta Set.

### Public Members

bool `op_en`

Indicate if optional parameters are included

`int32_t level`

Delta change of Generic Level state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_gen\_move\_set\_t**

Parameters of Generic Move Set.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

int16\_t **delta\_level**

Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_set\_t**

Parameter of Generic Default Transition Time Set.

### Public Members

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_onpowerup\_set\_t**

Parameter of Generic OnPowerUp Set.

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_level\_set\_t**

Parameters of Generic Power Level Set.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **power**

Target value of Generic Power Actual state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_gen\_power\_default\_set\_t**

Parameter of Generic Power Default Set.

### **Public Members**

uint16\_t **power**

The value of the Generic Power Default state

struct **esp\_ble\_mesh\_gen\_power\_range\_set\_t**

Parameters of Generic Power Range Set.

### **Public Members**

uint16\_t **range\_min**

Value of Range Min field of Generic Power Range state

uint16\_t **range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_gen\_loc\_global\_set\_t**

Parameters of Generic Location Global Set.

### **Public Members**

int32\_t **global\_latitude**

Global Coordinates (Latitude)

int32\_t **global\_longitude**

Global Coordinates (Longitude)

int16\_t **global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_gen\_loc\_local\_set\_t**

Parameters of Generic Location Local Set.

**Public Members**

`int16_t local_north`  
Local Coordinates (North)

`int16_t local_east`  
Local Coordinates (East)

`int16_t local_altitude`  
Local Altitude

`uint8_t floor_number`  
Floor Number

`uint16_t uncertainty`  
Uncertainty

struct `esp_ble_mesh_gen_user_property_get_t`  
Parameter of Generic User Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

struct `esp_ble_mesh_gen_user_property_set_t`  
Parameters of Generic User Property Set.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic User Property

struct `net_buf_simple *property_value`  
Raw value for the User Property

struct `esp_ble_mesh_gen_admin_property_get_t`  
Parameter of Generic Admin Property Get.

**Public Members**

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

struct `esp_ble_mesh_gen_admin_property_set_t`  
Parameters of Generic Admin Property Set.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Admin Property

**uint8\_t user\_access**

Enumeration indicating user access

**struct net\_buf\_simple \*property\_value**

Raw value for the Admin Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_get\_t**

Parameter of Generic Manufacturer Property Get.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**struct esp\_ble\_mesh\_gen\_manufacturer\_property\_set\_t**

Parameters of Generic Manufacturer Property Set.

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic Manufacturer Property

**uint8\_t user\_access**

Enumeration indicating user access

**struct esp\_ble\_mesh\_gen\_client\_properties\_get\_t**

Parameter of Generic Client Properties Get.

**Public Members****uint16\_t property\_id**

A starting Client Property ID present within an element

**struct esp\_ble\_mesh\_gen\_onoff\_status\_cb\_t**

Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

**Public Members**

bool **op\_en**

Indicate if optional parameters are included

uint8\_t **present\_onoff**

Current value of Generic OnOff state

uint8\_t **target\_onoff**

Target value of Generic OnOff state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_level\_status\_cb\_t**

Parameters of Generic Level Status.

### **Public Members**

bool **op\_en**

Indicate if optional parameters are included

int16\_t **present\_level**

Current value of Generic Level state

int16\_t **target\_level**

Target value of the Generic Level state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_status\_cb\_t**

Parameter of Generic Default Transition Time Status.

### **Public Members**

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_onpowerup\_status\_cb\_t**

Parameter of Generic OnPowerUp Status.

### **Public Members**

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_level\_status\_cb\_t**

Parameters of Generic Power Level Status.

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t present\_power**

Current value of Generic Power Actual state

**uint16\_t target\_power**

Target value of Generic Power Actual state (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_gen\_power\_last\_status\_cb\_t**

Parameter of Generic Power Last Status.

**Public Members****uint16\_t power**

The value of the Generic Power Last state

struct **esp\_ble\_mesh\_gen\_power\_default\_status\_cb\_t**

Parameter of Generic Power Default Status.

**Public Members****uint16\_t power**

The value of the Generic Default Last state

struct **esp\_ble\_mesh\_gen\_power\_range\_status\_cb\_t**

Parameters of Generic Power Range Status.

**Public Members****uint8\_t status\_code**

Status Code for the request message

**uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_gen\_battery\_status\_cb\_t**

Parameters of Generic Battery Status.

**Public Members****uint32\_t battery\_level**

Value of Generic Battery Level state

**uint32\_t time\_to\_discharge**

Value of Generic Battery Time to Discharge state

**uint32\_t time\_to\_charge**

Value of Generic Battery Time to Charge state

**uint32\_t flags**

Value of Generic Battery Flags state

struct **esp\_ble\_mesh\_gen\_loc\_global\_status\_cb\_t**

Parameters of Generic Location Global Status.

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_gen\_loc\_local\_status\_cb\_t**

Parameters of Generic Location Local Status.

**Public Members****int16\_t local\_north**

Local Coordinates (North)

**int16\_t local\_east**

Local Coordinates (East)

**int16\_t local\_altitude**

Local Altitude

**uint8\_t floor\_number**

Floor Number

**uint16\_t uncertainty**

Uncertainty

struct **esp\_ble\_mesh\_gen\_user\_properties\_status\_cb\_t**  
Parameter of Generic User Properties Status.

### Public Members

struct net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N User Property IDs

struct **esp\_ble\_mesh\_gen\_user\_property\_status\_cb\_t**  
Parameters of Generic User Property Status.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic User Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

struct net\_buf\_simple \***property\_value**  
Raw value for the User Property (C.1)

struct **esp\_ble\_mesh\_gen\_admin\_properties\_status\_cb\_t**  
Parameter of Generic Admin Properties Status.

### Public Members

struct net\_buf\_simple \***property\_ids**  
Buffer contains a sequence of N Admin Property IDs

struct **esp\_ble\_mesh\_gen\_admin\_property\_status\_cb\_t**  
Parameters of Generic Admin Property Status.

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID identifying a Generic Admin Property

uint8\_t **user\_access**  
Enumeration indicating user access (optional)

struct net\_buf\_simple **\*property\_value**

Raw value for the Admin Property (C.1)

struct **esp\_ble\_mesh\_gen\_manufacturer\_properties\_status\_cb\_t**

Parameter of Generic Manufacturer Properties Status.

### Public Members

struct net\_buf\_simple **\*property\_ids**

Buffer contains a sequence of N Manufacturer Property IDs

struct **esp\_ble\_mesh\_gen\_manufacturer\_property\_status\_cb\_t**

Parameters of Generic Manufacturer Property Status.

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID identifying a Generic Manufacturer Property

uint8\_t **user\_access**

Enumeration indicating user access (optional)

struct net\_buf\_simple **\*property\_value**

Raw value for the Manufacturer Property (C.1)

struct **esp\_ble\_mesh\_gen\_client\_properties\_status\_cb\_t**

Parameter of Generic Client Properties Status.

### Public Members

struct net\_buf\_simple **\*property\_ids**

Buffer contains a sequence of N Client Property IDs

struct **esp\_ble\_mesh\_generic\_client\_cb\_param\_t**

Generic Client Model callback parameters

### Public Members

int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* **\*params**

The client common parameters.

*esp\_ble\_mesh\_gen\_client\_status\_cb\_t* **status\_cb**

The generic status message callback values

struct **esp\_ble\_mesh\_gen\_onoff\_state\_t**

Parameters of Generic OnOff state

### Public Members

uint8\_t **onoff**

The present value of the Generic OnOff state

uint8\_t **target\_onoff**

The target value of the Generic OnOff state

struct **esp\_ble\_mesh\_gen\_onoff\_srv\_t**

User data of Generic OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onoff\_state\_t* **state**

Parameters of the Generic OnOff state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

struct **esp\_ble\_mesh\_gen\_level\_state\_t**

Parameters of Generic Level state

### Public Members

int16\_t **level**

The present value of the Generic Level state

int16\_t **target\_level**

The target value of the Generic Level state

int16\_t **last\_level**

When a new transaction starts, level should be set to last\_last, and use “level + incoming delta” to calculate the target level. In another word, “last\_level” is used to record “level” of the last transaction, and “last\_delta” is used to record the previously received delta\_level value. The last value of the Generic Level state

int32\_t **last\_delta**

The last delta change of the Generic Level state

bool **move\_start**

Indicate if the transition of the Generic Level state has been started

bool **positive**

Indicate if the transition is positive or negative

struct **esp\_ble\_mesh\_gen\_level\_srv\_t**

User data of Generic Level Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_level\_state\_t* **state**

Parameters of the Generic Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_level**

Delta change value of level state transition

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t**

Parameter of Generic Default Transition Time state

### Public Members

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t**

User data of Generic Default Transition Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Default Transition Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_def\_trans\_time\_state\_t* **state**

Parameters of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_gen\_onpowerup\_state\_t**

Parameter of Generic OnPowerUp state

### Public Members

uint8\_t **onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t**

User data of Generic Power OnOff Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t**

User data of Generic Power OnOff Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_onpowerup\_state\_t* \***state**

Parameters of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_gen\_power\_level\_state\_t**

Parameters of Generic Power Level state

### Public Members

uint16\_t **power\_actual**

The present value of the Generic Power Actual state

uint16\_t **target\_power\_actual**

The target value of the Generic Power Actual state

uint16\_t **power\_last**

The value of the Generic Power Last state

uint16\_t **power\_default**

The value of the Generic Power Default state

uint8\_t **status\_code**

The status code of setting Generic Power Range state

uint16\_t **power\_range\_min**

The minimum value of the Generic Power Range state

uint16\_t **power\_range\_max**

The maximum value of the Generic Power Range state

struct **esp\_ble\_mesh\_gen\_power\_level\_srv\_t**

User data of Generic Power Level Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power Level Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \***state**

Parameters of the Generic Power Level state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_level**

Delta change value of level state transition

struct **esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t**

User data of Generic Power Level Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Power Level Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_power\_level\_state\_t* \***state**

Parameters of the Generic Power Level state

struct **esp\_ble\_mesh\_gen\_battery\_state\_t**

Parameters of Generic Battery state

### Public Members

uint32\_t **battery\_level**

The value of the Generic Battery Level state

uint32\_t **time\_to\_discharge**

The value of the Generic Battery Time to Discharge state

uint32\_t **time\_to\_charge**

The value of the Generic Battery Time to Charge state

uint32\_t **battery\_flags**

The value of the Generic Battery Flags state

struct **esp\_ble\_mesh\_gen\_battery\_srv\_t**

User data of Generic Battery Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Battery Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_battery\_state\_t* **state**

Parameters of the Generic Battery state

struct **esp\_ble\_mesh\_gen\_location\_state\_t**

Parameters of Generic Location state

### Public Members

int32\_t **global\_latitude**

The value of the Global Latitude field

int32\_t **global\_longitude**

The value of the Global Longitude field

int16\_t **global\_altitude**

The value of the Global Altitude field

int16\_t **local\_north**

The value of the Local North field

int16\_t **local\_east**

The value of the Local East field

int16\_t **local\_altitude**

The value of the Local Altitude field

uint8\_t **floor\_number**

The value of the Floor Number field

uint16\_t **uncertainty**

The value of the Uncertainty field

struct **esp\_ble\_mesh\_gen\_location\_srv\_t**

User data of Generic Location Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

struct **esp\_ble\_mesh\_gen\_location\_setup\_srv\_t**

User data of Generic Location Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic Location Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_gen\_location\_state\_t* \***state**

Parameters of the Generic Location state

struct **esp\_ble\_mesh\_generic\_property\_t**

Parameters of Generic Property states

### Public Members

uint16\_t **id**

The value of User/Admin/Manufacturer Property ID

uint8\_t **user\_access**

The value of User Access field

uint8\_t **admin\_access**

The value of Admin Access field

uint8\_t **manu\_access**

The value of Manufacturer Access field

struct net\_buf\_simple \***val**

The value of User/Admin/Manufacturer Property

struct **esp\_ble\_mesh\_gen\_user\_prop\_srv\_t**

User data of Generic User Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Generic User Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

uint8\_t **property\_count**

Generic User Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**

Parameters of the Generic User Property state

struct **esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t**  
User data of Generic Admin Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Admin Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

uint8\_t **property\_count**  
Generic Admin Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**  
Parameters of the Generic Admin Property state

struct **esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t**  
User data of Generic Manufacturer Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

uint8\_t **property\_count**  
Generic Manufacturer Property count

*esp\_ble\_mesh\_generic\_property\_t* \***properties**  
Parameters of the Generic Manufacturer Property state

struct **esp\_ble\_mesh\_gen\_client\_prop\_srv\_t**  
User data of Generic Client Property Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Generic Client Property Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

uint8\_t **id\_count**

Generic Client Property ID count

uint16\_t \***property\_ids**

Parameters of the Generic Client Property state

struct **esp\_ble\_mesh\_state\_change\_gen\_onoff\_set\_t**

Parameter of Generic OnOff Set state change event

### **Public Members**

uint8\_t **onoff**

The value of Generic OnOff state

struct **esp\_ble\_mesh\_state\_change\_gen\_level\_set\_t**

Parameter of Generic Level Set state change event

### **Public Members**

int16\_t **level**

The value of Generic Level state

struct **esp\_ble\_mesh\_state\_change\_gen\_delta\_set\_t**

Parameter of Generic Delta Set state change event

### **Public Members**

int16\_t **level**

The value of Generic Level state

struct **esp\_ble\_mesh\_state\_change\_gen\_move\_set\_t**

Parameter of Generic Move Set state change event

### **Public Members**

int16\_t **level**

The value of Generic Level state

struct **esp\_ble\_mesh\_state\_change\_gen\_def\_trans\_time\_set\_t**

Parameter of Generic Default Transition Time Set state change event

### **Public Members**

uint8\_t **trans\_time**

The value of Generic Default Transition Time state

struct **esp\_ble\_mesh\_state\_change\_gen\_onpowerup\_set\_t**  
Parameter of Generic OnPowerUp Set state change event

#### **Public Members**

uint8\_t **onpowerup**  
The value of Generic OnPowerUp state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_level\_set\_t**  
Parameter of Generic Power Level Set state change event

#### **Public Members**

uint16\_t **power**  
The value of Generic Power Actual state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_default\_set\_t**  
Parameter of Generic Power Default Set state change event

#### **Public Members**

uint16\_t **power**  
The value of Generic Power Default state

struct **esp\_ble\_mesh\_state\_change\_gen\_power\_range\_set\_t**  
Parameters of Generic Power Range Set state change event

#### **Public Members**

uint16\_t **range\_min**  
The minimum value of Generic Power Range state

uint16\_t **range\_max**  
The maximum value of Generic Power Range state

struct **esp\_ble\_mesh\_state\_change\_gen\_loc\_global\_set\_t**  
Parameters of Generic Location Global Set state change event

#### **Public Members**

int32\_t **latitude**  
The Global Latitude value of Generic Location state

int32\_t **longitude**  
The Global Longitude value of Generic Location state

`int16_t altitude`

The Global Altitude value of Generic Location state

struct `esp_ble_mesh_state_change_gen_loc_local_set_t`

Parameters of Generic Location Local Set state change event

### Public Members

`int16_t north`

The Local North value of Generic Location state

`int16_t east`

The Local East value of Generic Location state

`int16_t altitude`

The Local Altitude value of Generic Location state

`uint8_t floor_number`

The Floor Number value of Generic Location state

`uint16_t uncertainty`

The Uncertainty value of Generic Location state

struct `esp_ble_mesh_state_change_gen_user_property_set_t`

Parameters of Generic User Property Set state change event

### Public Members

`uint16_t id`

The property id of Generic User Property state

struct `net_buf_simple *value`

The property value of Generic User Property state

struct `esp_ble_mesh_state_change_gen_admin_property_set_t`

Parameters of Generic Admin Property Set state change event

### Public Members

`uint16_t id`

The property id of Generic Admin Property state

`uint8_t access`

The property access of Generic Admin Property state

struct net\_buf\_simple \***value**

The property value of Generic Admin Property state

struct **esp\_ble\_mesh\_state\_change\_gen\_manu\_property\_set\_t**

Parameters of Generic Manufacturer Property Set state change event

### Public Members

uint16\_t **id**

The property id of Generic Manufacturer Property state

uint8\_t **access**

The property value of Generic Manufacturer Property state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_get\_t**

Context of the received Generic User Property Get message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic User Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_get\_t**

Context of the received Generic Admin Property Get message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Admin Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_get\_t**

Context of the received Generic Manufacturer Property message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Manufacturer Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_client\_properties\_get\_t**

Context of the received Generic Client Properties Get message

### Public Members

uint16\_t **property\_id**

A starting Client Property ID present within an element

struct **esp\_ble\_mesh\_server\_rcv\_gen\_onoff\_set\_t**  
Context of the received Generic OnOff Set message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint8\_t **onoff**  
Target value of Generic OnOff state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_level\_set\_t**  
Context of the received Generic Level Set message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

int16\_t **level**  
Target value of Generic Level state

uint8\_t **tid**  
Transaction ID

uint8\_t **trans\_time**  
Time to complete state transition (optional)

uint8\_t **delay**  
Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_delta\_set\_t**  
Context of the received Generic Delta Set message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

int32\_t **delta\_level**

Delta change of Generic Level state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_move\_set\_t**

Context of the received Generic Move Set message

### **Public Members**

bool **op\_en**

Indicate if optional parameters are included

int16\_t **delta\_level**

Delta Level step to calculate Move speed for Generic Level state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_def\_trans\_time\_set\_t**

Context of the received Generic Default Transition Time Set message

### **Public Members**

uint8\_t **trans\_time**

The value of the Generic Default Transition Time state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_onpowerup\_set\_t**

Context of the received Generic OnPowerUp Set message

**Public Members****uint8\_t onpowerup**

The value of the Generic OnPowerUp state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_level\_set\_t**

Context of the received Generic Power Level Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t power**

Target value of Generic Power Actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_default\_set\_t**

Context of the received Generic Power Default Set message

**Public Members****uint16\_t power**

The value of the Generic Power Default state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_power\_range\_set\_t**

Context of the received Generic Power Range Set message

**Public Members****uint16\_t range\_min**

Value of Range Min field of Generic Power Range state

**uint16\_t range\_max**

Value of Range Max field of Generic Power Range state

struct **esp\_ble\_mesh\_server\_rcv\_gen\_loc\_global\_set\_t**

Context of the received Generic Location Global Set message

**Public Members****int32\_t global\_latitude**

Global Coordinates (Latitude)

**int32\_t global\_longitude**

Global Coordinates (Longitude)

**int16\_t global\_altitude**

Global Altitude

struct **esp\_ble\_mesh\_server\_rcv\_gen\_loc\_local\_set\_t**

Context of the received Generic Location Local Set message

**Public Members****int16\_t local\_north**

Local Coordinates (North)

**int16\_t local\_east**

Local Coordinates (East)

**int16\_t local\_altitude**

Local Altitude

**uint8\_t floor\_number**

Floor Number

**uint16\_t uncertainty**

Uncertainty

struct **esp\_ble\_mesh\_server\_rcv\_gen\_user\_property\_set\_t**

Context of the received Generic User Property Set message

**Public Members****uint16\_t property\_id**

Property ID identifying a Generic User Property

struct net\_buf\_simple \***property\_value**

Raw value for the User Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_admin\_property\_set\_t**

Context of the received Generic Admin Property Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Admin Property

uint8\_t **user\_access**

Enumeration indicating user access

struct net\_buf\_simple \***property\_value**

Raw value for the Admin Property

struct **esp\_ble\_mesh\_server\_rcv\_gen\_manufacturer\_property\_set\_t**

Context of the received Generic Manufacturer Property Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Generic Manufacturer Property

uint8\_t **user\_access**

Enumeration indicating user access

struct **esp\_ble\_mesh\_generic\_server\_cb\_param\_t**

Generic Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Generic Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_generic\_server\_cb\_value\_t* **value**

Value of the received Generic Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic OnOff Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

---

#### Parameters

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic OnOff Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Level Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Level Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Generic Default Transition Time Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Default Transition Time Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power OnOff Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Power OnOff Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_CLI** (cli\_pub, cli\_data)

Define a new Generic Power Level Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Power Level Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Battery Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Battery Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_CLI** (cli\_pub, cli\_data)

Define a new Generic Location Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Location Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_PROPERTY\_CLI** (cli\_pub, cli\_data)

Define a new Generic Property Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Generic Location Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_SRV** (srv\_pub, srv\_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

---

**Note:** 1. The Generic OnOff Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_onoff\_srv\_t*.

**Returns** New Generic OnOff Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Level Server Model.

---

**Note:** 1. The Generic Level Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_level\_srv\_t*.

**Returns** New Generic Level Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_SRV** (srv\_pub, srv\_data)

Define a new Generic Default Transition Time Server Model.

---

**Note:** 1. The Generic Default Transition Time Server Model is a root model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_def\_trans\_time\_srv\_t*.

**Returns** New Generic Default Transition Time Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power OnOff Server Model.

---

**Note:** 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.

- a. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
  - b. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_srv\_t*.

**Returns** New Generic Power OnOff Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power OnOff Setup Server Model.

---

**Note:** 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_onoff\_setup\_srv\_t*.

**Returns** New Generic Power OnOff Setup Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Server Model.

---

**Note:** 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_srv\_t*.

**Returns** New Generic Power Level Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_LEVEL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Power Level Setup Server Model.

---

**Note:** 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_power\_level\_setup\_srv\_t*.

**Returns** New Generic Power Level Setup Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_BATTERY\_SRV** (srv\_pub, srv\_data)

Define a new Generic Battery Server Model.

---

**Note:** 1. The Generic Battery Server Model is a root model.

- a. This model shall support model publication and model subscription.
  - b. The model may be used to represent an element that is powered by a battery.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_battery\_srv\_t*.

**Returns** New Generic Battery Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Server Model.

---

**Note:** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be used to represent an element that knows its location (global or local).
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_location\_srv\_t*.

**Returns** New Generic Location Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_LOCATION\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Location Setup Server Model.

---

**Note:** 1. The Generic Location Setup Server model extends the Generic Location Server model.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_location\_setup\_srv\_t*.

**Returns** New Generic Location Setup Server Model instance.

---

**ESP\_BLE\_MESH\_MODEL\_GEN\_USER\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic User Property Server Model.

---

**Note:** 1. The Generic User Property Server model is a root model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_user\_prop\_srv\_t*.

**Returns** New Generic User Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_ADMIN\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Admin Property Server Model.

---

**Note:** 1. The Generic Admin Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_admin\_prop\_srv\_t*.

**Returns** New Generic Admin Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_MANUFACTURER\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic Manufacturer Property Server Model.

---

**Note:** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_manu\_prop\_srv\_t*.

**Returns** New Generic Manufacturer Property Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_GEN\_CLIENT\_PROP\_SRV** (srv\_pub, srv\_data)

Define a new Generic User Property Server Model.

---

**Note:** 1. The Generic Client Property Server model is a root model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_gen\_client\_prop\_srv\_t*.

**Returns** New Generic Client Property Server Model instance.

## Type Definitions

```
typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,  
esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,  
esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_GENERIC\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_PROHIBIT**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_WRITE**

enumerator **ESP\_BLE\_MESH\_GEN\_USER\_ACCESS\_READ\_WRITE**

```
enum esp_ble_mesh_gen_admin_prop_access_t
```

This enum value is the access value of Generic Admin Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_NOT\_USER\_PROP**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_WRITE**

enumerator **ESP\_BLE\_MESH\_GEN\_ADMIN\_ACCESS\_READ\_WRITE**

enum **esp\_ble\_mesh\_gen\_manu\_prop\_access\_t**

This enum value is the access value of Generic Manufacturer Property

*Values:*

enumerator **ESP\_BLE\_MESH\_GEN\_MANU\_NOT\_USER\_PROP**

enumerator **ESP\_BLE\_MESH\_GEN\_MANU\_ACCESS\_READ**

enum **esp\_ble\_mesh\_generic\_server\_cb\_event\_t**

This enum value is the event of Generic Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Generic Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Get messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_GENERIC\_SERVER\_EVT\_MAX**

## Sensor Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h`

### Functions

`esp_err_t esp_ble_mesh_register_sensor_client_callback` (`esp_ble_mesh_sensor_client_cb_t` callback)

Register BLE Mesh Sensor Client Model callback.

**Parameters** `callback` –[in] Pointer to the callback function.

**Returns** `ESP_OK` on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_get\_state\_t* \*get\_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp\_ble\_mesh\_sensor\_message\_opcode\_t* in *esp\_ble\_mesh\_defs.h*

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to sensor get message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_sensor\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_sensor\_client\_set\_state\_t* \*set\_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to *esp\_ble\_mesh\_sensor\_message\_opcode\_t* in *esp\_ble\_mesh\_defs.h*

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to sensor set message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_sensor\_server\_callback** (*esp\_ble\_mesh\_sensor\_server\_cb\_t* callback)

Register BLE Mesh Sensor Server Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

## Unions

union **esp\_ble\_mesh\_sensor\_client\_get\_state\_t**

### Structures

struct **esp\_ble\_mesh\_sensor\_descriptor\_get\_t**

Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_get\_t**

Parameter of Sensor Cadence Get

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_sensor\_cadence\_set\_t**

Parameters of Sensor Cadence Set

**Public Members****uint16\_t property\_id**

Property ID for the sensor

**uint8\_t fast\_cadence\_period\_divisor**

Divisor for the publish period

**uint8\_t status\_trigger\_type**

The unit and format of the Status Trigger Delta fields

**struct net\_buf\_simple \*status\_trigger\_delta\_down**

Delta down value that triggers a status message

**struct net\_buf\_simple \*status\_trigger\_delta\_up**

Delta up value that triggers a status message

**uint8\_t status\_min\_interval**

Minimum interval between two consecutive Status messages

**struct net\_buf\_simple \*fast\_cadence\_low**

Low value for the fast cadence range

**struct net\_buf\_simple \*fast\_cadence\_high**

Fast value for the fast cadence range

**struct esp\_ble\_mesh\_sensor\_settings\_get\_t**

Parameter of Sensor Settings Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_get\_t**

Parameters of Sensor Setting Get

**Public Members****uint16\_t sensor\_property\_id**

Property ID of a sensor

**uint16\_t sensor\_setting\_property\_id**

Setting ID identifying a setting within a sensor

**struct esp\_ble\_mesh\_sensor\_setting\_set\_t**

Parameters of Sensor Setting Set

**Public Members**

uint16\_t **sensor\_property\_id**

Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**

Setting ID identifying a setting within a sensor

struct net\_buf\_simple \***sensor\_setting\_raw**

Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_get\_t**

Parameters of Sensor Get

**Public Members**

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID for the sensor (optional)

struct **esp\_ble\_mesh\_sensor\_column\_get\_t**

Parameters of Sensor Column Get

**Public Members**

uint16\_t **property\_id**

Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x**

Raw value identifying a column

struct **esp\_ble\_mesh\_sensor\_series\_get\_t**

Parameters of Sensor Series Get

**Public Members**

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x1**

Raw value identifying a starting column (optional)

struct net\_buf\_simple \***raw\_value\_x2**  
Raw value identifying an ending column (C.1)

struct **esp\_ble\_mesh\_sensor\_descriptor\_status\_cb\_t**  
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.  
Parameter of Sensor Descriptor Status

### Public Members

struct net\_buf\_simple \***descriptor**  
Sequence of 8-octet sensor descriptors (optional)

struct **esp\_ble\_mesh\_sensor\_cadence\_status\_cb\_t**  
Parameters of Sensor Cadence Status

### Public Members

uint16\_t **property\_id**  
Property for the sensor

struct net\_buf\_simple \***sensor\_cadence\_value**  
Value of sensor cadence state

struct **esp\_ble\_mesh\_sensor\_settings\_status\_cb\_t**  
Parameters of Sensor Settings Status

### Public Members

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

struct net\_buf\_simple \***sensor\_setting\_property\_ids**  
A sequence of N sensor setting property IDs (optional)

struct **esp\_ble\_mesh\_sensor\_setting\_status\_cb\_t**  
Parameters of Sensor Setting Status

### Public Members

bool **op\_en**  
Indicate id optional parameters are included

uint16\_t **sensor\_property\_id**  
Property ID identifying a sensor

uint16\_t **sensor\_setting\_property\_id**  
Setting ID identifying a setting within a sensor

uint8\_t **sensor\_setting\_access**  
Read/Write access rights for the setting (optional)

struct net\_buf\_simple \***sensor\_setting\_raw**  
Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_status\_cb\_t**  
Parameter of Sensor Status

### Public Members

struct net\_buf\_simple \***marshalled\_sensor\_data**  
Value of sensor data state (optional)

struct **esp\_ble\_mesh\_sensor\_column\_status\_cb\_t**  
Parameters of Sensor Column Status

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor and the Y axis

struct net\_buf\_simple \***sensor\_column\_value**  
Left values of sensor column status

struct **esp\_ble\_mesh\_sensor\_series\_status\_cb\_t**  
Parameters of Sensor Series Status

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor and the Y axis

struct net\_buf\_simple \***sensor\_series\_value**  
Left values of sensor series status

struct **esp\_ble\_mesh\_sensor\_client\_cb\_param\_t**  
Sensor Client Model callback parameters

### Public Members

int **error\_code**

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_sensor\_client\_status\_cb\_t* **status\_cb**

The sensor status message callback values

struct **esp\_ble\_mesh\_sensor\_descriptor\_t**

Parameters of Sensor Descriptor state

### Public Members

uint32\_t **positive\_tolerance**

The value of Sensor Positive Tolerance field

uint32\_t **negative\_tolerance**

The value of Sensor Negative Tolerance field

uint32\_t **sampling\_function**

The value of Sensor Sampling Function field

uint8\_t **measure\_period**

The value of Sensor Measurement Period field

uint8\_t **update\_interval**

The value of Sensor Update Interval field

struct **esp\_ble\_mesh\_sensor\_setting\_t**

Parameters of Sensor Setting state

### Public Members

uint16\_t **property\_id**

The value of Sensor Setting Property ID field

uint8\_t **access**

The value of Sensor Setting Access field

struct net\_buf\_simple \***raw**

The value of Sensor Setting Raw field

struct **esp\_ble\_mesh\_sensor\_cadence\_t**

Parameters of Sensor Cadence state

### Public Members

uint8\_t **period\_divisor**

The value of Fast Cadence Period Divisor field

uint8\_t **trigger\_type**

The value of Status Trigger Type field

struct net\_buf\_simple \***trigger\_delta\_down**

Note: The parameter “size” in `trigger_delta_down`, `trigger_delta_up`, `fast_cadence_low` & `fast_cadence_high` indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

struct net\_buf\_simple \***trigger\_delta\_up**

The value of Status Trigger Delta Up field

uint8\_t **min\_interval**

The value of Status Min Interval field

struct net\_buf\_simple \***fast\_cadence\_low**

The value of Fast Cadence Low field

struct net\_buf\_simple \***fast\_cadence\_high**

The value of Fast Cadence High field

struct **esp\_ble\_mesh\_sensor\_data\_t**

Parameters of Sensor Data state

### Public Members

uint8\_t **format**

Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).  
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8\_t **length**

The value of the Sensor Data length

struct net\_buf\_simple \***raw\_value**

The value of Sensor Data raw value

struct **esp\_ble\_mesh\_sensor\_series\_column\_t**

Parameters of Sensor Series Column state

### Public Members

struct net\_buf\_simple \***raw\_value\_x**  
The value of Sensor Raw Value X field

struct net\_buf\_simple \***column\_width**  
The value of Sensor Column Width field

struct net\_buf\_simple \***raw\_value\_y**  
The value of Sensor Raw Value Y field

struct **esp\_ble\_mesh\_sensor\_state\_t**  
Parameters of Sensor states

### Public Members

uint16\_t **sensor\_property\_id**  
The value of Sensor Property ID field

*esp\_ble\_mesh\_sensor\_descriptor\_t* **descriptor**  
Parameters of the Sensor Descriptor state

const uint8\_t **setting\_count**  
Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

*esp\_ble\_mesh\_sensor\_setting\_t* \***settings**  
Parameters of the Sensor Setting state

*esp\_ble\_mesh\_sensor\_cadence\_t* \***cadence**  
The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

*esp\_ble\_mesh\_sensor\_data\_t* **sensor\_data**  
Parameters of the Sensor Data state

*esp\_ble\_mesh\_sensor\_series\_column\_t* **series\_column**  
Parameters of the Sensor Series Column state

struct **esp\_ble\_mesh\_sensor\_srv\_t**  
User data of Sensor Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**  
Pointer to the Sensor Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**  
Response control of the server model received messages

const uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

struct **esp\_ble\_mesh\_sensor\_setup\_srv\_t**

User data of Sensor Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Sensor Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

const uint8\_t **state\_count**

Sensor state count

*esp\_ble\_mesh\_sensor\_state\_t* \***states**

Parameters of the Sensor states

struct **esp\_ble\_mesh\_state\_change\_sensor\_cadence\_set\_t**

Parameters of Sensor Cadence Set state change event

### Public Members

uint16\_t **property\_id**

The value of Sensor Property ID state

uint8\_t **period\_divisor**

The value of Fast Cadence Period Divisor state

uint8\_t **trigger\_type**

The value of Status Trigger Type state

struct net\_buf\_simple \***trigger\_delta\_down**

The value of Status Trigger Delta Down state

struct net\_buf\_simple \***trigger\_delta\_up**

The value of Status Trigger Delta Up state

uint8\_t **min\_interval**

The value of Status Min Interval state

struct net\_buf\_simple \***fast\_cadence\_low**

The value of Fast Cadence Low state

struct net\_buf\_simple \***fast\_cadence\_high**

The value of Fast Cadence High state

struct **esp\_ble\_mesh\_state\_change\_sensor\_setting\_set\_t**

Parameters of Sensor Setting Set state change event

### Public Members

uint16\_t **property\_id**

The value of Sensor Property ID state

uint16\_t **setting\_property\_id**

The value of Sensor Setting Property ID state

struct net\_buf\_simple \***setting\_value**

The value of Sensor Property Value state

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_descriptor\_get\_t**

Context of the received Sensor Descriptor Get message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **property\_id**

Property ID of a sensor (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_get\_t**

Context of the received Sensor Cadence Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_settings\_get\_t**

Context of the received Sensor Settings Get message

### Public Members

uint16\_t **property\_id**

Property ID of a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_get\_t**  
Context of the received Sensor Setting Get message

### Public Members

uint16\_t **property\_id**  
Property ID of a sensor

uint16\_t **setting\_property\_id**  
Setting ID identifying a setting within a sensor

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_get\_t**  
Context of the received Sensor Get message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property ID for the sensor (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_column\_get\_t**  
Context of the received Sensor Column Get message

### Public Members

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value\_x**  
Raw value identifying a column

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_series\_get\_t**  
Context of the received Sensor Series Get message

### Public Members

bool **op\_en**  
Indicate if optional parameters are included

uint16\_t **property\_id**  
Property identifying a sensor

struct net\_buf\_simple \***raw\_value**  
Raw value containing X1 and X2 (optional)

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_cadence\_set\_t**

Context of the received Sensor Cadence Set message

### Public Members

uint16\_t **property\_id**

Property ID for the sensor

struct net\_buf\_simple \***cadence**

Value of Sensor Cadence state

struct **esp\_ble\_mesh\_server\_rcv\_sensor\_setting\_set\_t**

Context of the received Sensor Setting Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a sensor

uint16\_t **setting\_property\_id**

Setting ID identifying a setting within a sensor

struct net\_buf\_simple \***setting\_raw**

Raw value for the setting

struct **esp\_ble\_mesh\_sensor\_server\_cb\_param\_t**

Sensor Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Sensor Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_sensor\_server\_cb\_value\_t* **value**

Value of the received Sensor Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_CLI** (cli\_pub, cli\_data)

Define a new Sensor Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Sensor Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Sensor Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SRV** (srv\_pub, srv\_data)

Sensor Server Models related context.

Define a new Sensor Server Model.

---

**Note:** 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_sensor\_srv\_t*.

**Returns** New Sensor Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SENSOR\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Sensor Setup Server Model.

---

**Note:** 1. The Sensor Setup Server model extends the Sensor Server model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_sensor\_setup\_srv\_t*.

**Returns** New Sensor Setup Server Model instance.

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_PROPERTY\_ID**

Invalid Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_PROPERTY\_ID\_LEN**

Length of Sensor Property ID

**ESP\_BLE\_MESH\_SENSOR\_DESCRIPTOR\_LEN**

Length of Sensor Descriptor state

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_POS\_TOLERANCE**

Unspecified Sensor Positive Tolerance

**ESP\_BLE\_MESH\_SENSOR\_UNSPECIFIED\_NEG\_TOLERANCE**

Unspecified Sensor Negative Tolerance

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_MEASURE\_PERIOD**

Not applicable Sensor Measurement Period

**ESP\_BLE\_MESH\_SENSOR\_NOT\_APPL\_UPDATE\_INTERVAL**

Not applicable Sensor Update Interval

**ESP\_BLE\_MESH\_INVALID\_SENSOR\_SETTING\_PROPERTY\_ID**

Invalid Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_PROPERTY\_ID\_LEN**

Length of Sensor Setting Property ID

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_LEN**

Length of Sensor Setting Access

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ**

Sensor Setting Access - Read

**ESP\_BLE\_MESH\_SENSOR\_SETTING\_ACCESS\_READ\_WRITE**

Sensor Setting Access - Read & Write

**ESP\_BLE\_MESH\_SENSOR\_DIVISOR\_TRIGGER\_TYPE\_LEN**

Length of Sensor Divisor Trigger Type

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_LEN**

Length of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_PERIOD\_DIVISOR\_MAX\_VALUE**

Maximum value of Sensor Period Divisor

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_MIN\_INTERVAL\_MAX**

Maximum value of Sensor Status Min Interval

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_CHAR**

Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP\_BLE\_MESH\_SENSOR\_STATUS\_TRIGGER\_TYPE\_UINT16**

Sensor Status Trigger Type - Format Type “uint16”

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A**

Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B**

Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID\_LEN**

MPID length of Sensor Data Format A

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID\_LEN**

MPID length of Sensor Data Format B

**ESP\_BLE\_MESH\_SENSOR\_DATA\_ZERO\_LEN**

Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_FORMAT** (\_data)

Get format of the sensor data.

---

**Note:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the format of the corresponding sensor data.

---

**Parameters**

- **\_data** –Pointer to the start of the sensor data.

**Returns** Format of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_LENGTH** (\_data, \_fmt)

Get length of the sensor data.

---

**Note:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting the length of the corresponding sensor data.

---

**Parameters**

- **\_data** –Pointer to the start of the sensor data.
- **\_fmt** –Format of the sensor data.

**Returns** Length (zero-based) of the sensor data.

**ESP\_BLE\_MESH\_GET\_SENSOR\_DATA\_PROPERTY\_ID** (\_data, \_fmt)

Get Sensor Property ID of the sensor data.

---

**Note:** Multiple sensor data may be concatenated. Make sure the \_data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

---

**Parameters**

- **\_data** –Pointer to the start of the sensor data.
- **\_fmt** –Format of the sensor data.

**Returns** Sensor Property ID of the sensor data.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_A\_MPID** (\_len, \_id)

Generate a MPID value for sensor data with Format A.

---

**Note:** 1. The Format field is 0b0 and indicates that Format A is used.

- a. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
  - b. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
  - c. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.
- 

**Parameters**

- **\_len** –Length of Sensor Raw value.
- **\_id** –Sensor Property ID.

**Returns** 2-octet MPID value for sensor data with Format A.

**ESP\_BLE\_MESH\_SENSOR\_DATA\_FORMAT\_B\_MPID** (\_len, \_id)

Generate a MPID value for sensor data with Format B.

---

**Note:** 1. The Format field is 0b1 and indicates Format B is used.

---

- a. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
  - b. The Property ID is a 16-bit bit field representing a Property ID.
  - c. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
  - d. Exclude the generated 1-octet value, the 2-octet Sensor Property ID
- 

**Parameters**

- **\_len** –Length of Sensor Raw value.
- **\_id** –Sensor Property ID.

**Returns** 3-octet MPID value for sensor data with Format B.

**Type Definitions**

```
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event,  
esp_ble_mesh_sensor_client_cb_param_t *param)
```

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event,  
esp_ble_mesh_sensor_server_cb_param_t *param)
```

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

**Enumerations**

```
enum esp_ble_mesh_sensor_client_cb_event_t
```

This enum value is the event of Sensor Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_SENSOR\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_sensor_sample_func
```

This enum value is value of Sensor Sampling Function

*Values:*

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_UNSPECIFIED**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_INSTANTANEOUS**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ARITHMETIC\_MEAN**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_RMS**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MAXIMUM**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_MINIMUM**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_ACCUMULATED**

enumerator **ESP\_BLE\_MESH\_SAMPLE\_FUNC\_COUNT**

enum **esp\_ble\_mesh\_sensor\_server\_cb\_event\_t**

This enum value is the event of Sensor Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Sensor Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Get messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_SENSOR\_SERVER\_EVT\_MAX**

## Time and Scenes Client/Server Models

### Header File

- `components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h`

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_time\_scene\_client\_callback** (*esp\_ble\_mesh\_time\_scene\_client\_cb\_t* callback)

Register BLE Mesh Time Scene Client Model callback.

**Parameters** `callback` –[in] Pointer to the callback function.

**Returns** `ESP_OK` on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_get_state_t
                                                    *get_state)
```

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer to time scene get message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t
                                                    *params,
                                                    esp_ble_mesh_time_scene_client_set_state_t
                                                    *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_time_scene_message_opcode_t` in `esp_ble_mesh_defs.h`

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer to time scene set message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t
                                                           callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

## Unions

```
union esp_ble_mesh_time_scene_client_get_state_t
    #include <esp_ble_mesh_time_scene_model_api.h> Time Scene Client Model get message union.
```

#### Public Members

### Structures

struct **esp\_ble\_mesh\_time\_set\_t**

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **sub\_second**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_zone\_set\_t**

Parameters of Time Zone Set

### Public Members

uint8\_t **time\_zone\_offset\_new**

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_tai\_utc\_delta\_set\_t**

Parameters of TAI-UTC Delta Set

### Public Members

uint16\_t **tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

uint16\_t **padding**

Always 0b0. Other values are Prohibited.

uint8\_t **tai\_delta\_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_time\_role\_set\_t**

Parameter of Time Role Set

### **Public Members**

uint8\_t **time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_scene\_store\_t**

Parameter of Scene Store

### **Public Members**

uint16\_t **scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_scene\_recall\_t**

Parameters of Scene Recall

### **Public Members**

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **scene\_number**

The number of scenes to be recalled

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_scene\_delete\_t**

Parameter of Scene Delete

### Public Members

uint16\_t **scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_scheduler\_act\_get\_t**

Parameter of Scheduler Action Get

### Public Members

uint8\_t **index**

Index of the Schedule Register entry to get

struct **esp\_ble\_mesh\_scheduler\_act\_set\_t**

Parameters of Scheduler Action Set

### Public Members

uint64\_t **index**

Index of the Schedule Register entry to set

uint64\_t **year**

Scheduled year for the action

uint64\_t **month**

Scheduled month for the action

uint64\_t **day**

Scheduled day of the month for the action

uint64\_t **hour**

Scheduled hour for the action

uint64\_t **minute**

Scheduled minute for the action

uint64\_t **second**

Scheduled second for the action

uint64\_t **day\_of\_week**

Schedule days of the week for the action

uint64\_t **action**

Action to be performed at the scheduled time

uint64\_t **trans\_time**

Transition time for this action

uint16\_t **scene\_number**

Transition time for this action

struct **esp\_ble\_mesh\_time\_status\_cb\_t**

Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

uint8\_t **sub\_second**

The sub-second time in units of 1/256 second

uint8\_t **uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_zone\_status\_cb\_t**

Parameters of Time Zone Status

### Public Members

uint8\_t **time\_zone\_offset\_curr**

Current local time zone offset

uint8\_t **time\_zone\_offset\_new**

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_tai\_utc\_delta\_status\_cb\_t**

Parameters of TAI-UTC Delta Status

**Public Members****uint16\_t tai\_utc\_delta\_curr**

Current difference between TAI and UTC in seconds

**uint16\_t padding\_1**

Always 0b0. Other values are Prohibited.

**uint16\_t tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding\_2**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_time\_role\_status\_cb\_t**

Parameter of Time Role Status

**Public Members****uint8\_t time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_scene\_status\_cb\_t**

Parameters of Scene Status

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint8\_t status\_code**

Status code of the last operation

**uint16\_t current\_scene**

Scene Number of the current scene

**uint16\_t target\_scene**

Scene Number of the target scene (optional)

**uint8\_t remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_scene\_register\_status\_cb\_t**

Parameters of Scene Register Status

**Public Members****uint8\_t status\_code**

Status code for the previous operation

**uint16\_t current\_scene**

Scene Number of the current scene

**struct net\_buf\_simple \*scenes**

A list of scenes stored within an element

**struct esp\_ble\_mesh\_scheduler\_status\_cb\_t**

Parameter of Scheduler Status

**Public Members****uint16\_t schedules**

Bit field indicating defined Actions in the Schedule Register

**struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t**

Parameters of Scheduler Action Status

**Public Members****uint64\_t index**

Enumerates (selects) a Schedule Register entry

**uint64\_t year**

Scheduled year for the action

**uint64\_t month**

Scheduled month for the action

**uint64\_t day**

Scheduled day of the month for the action

**uint64\_t hour**

Scheduled hour for the action

**uint64\_t minute**

Scheduled minute for the action

**uint64\_t second**

Scheduled second for the action

**uint64\_t day\_of\_week**

Schedule days of the week for the action

uint64\_t **action**

Action to be performed at the scheduled time

uint64\_t **trans\_time**

Transition time for this action

uint16\_t **scene\_number**

Transition time for this action

struct **esp\_ble\_mesh\_time\_scene\_client\_cb\_param\_t**

Time Scene Client Model callback parameters

### Public Members

int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_time\_scene\_client\_status\_cb\_t* **status\_cb**

The scene status message callback values

struct **esp\_ble\_mesh\_time\_state\_t**

Parameters of Time state

### Public Members

uint8\_t **tai\_seconds**[5]

The value of the TAI Seconds state

uint8\_t **subsecond**

The value of the Subsecond field

uint8\_t **uncertainty**

The value of the Uncertainty field

uint8\_t **time\_zone\_offset\_curr**

The value of the Time Zone Offset Current field

uint8\_t **time\_zone\_offset\_new**

The value of the Time Zone Offset New state

uint8\_t **tai\_zone\_change**[5]

The value of the TAI of Zone Chaneg field

uint16\_t **time\_authority**

The value of the Time Authority bit

uint16\_t **tai\_utc\_delta\_curr**

The value of the TAI-UTC Delta Current state

uint16\_t **tai\_utc\_delta\_new**

The value of the TAI-UTC Delta New state

uint8\_t **tai\_delta\_change**[5]

The value of the TAI of Delta Change field

struct *esp\_ble\_mesh\_time\_state\_t*::[anonymous] **time**

Parameters of the Time state

uint8\_t **time\_role**

The value of the Time Role state

struct **esp\_ble\_mesh\_time\_srv\_t**

User data of Time Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Time Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

struct **esp\_ble\_mesh\_time\_setup\_srv\_t**

User data of Time Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Time Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_time\_state\_t* \***state**

Parameters of the Time state

struct **esp\_ble\_mesh\_scene\_register\_t**

- a. Scene Store is an operation of storing values of a present state of an element.
- b. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
- c. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
- d. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

uint16\_t **scene\_number**

The value of the Scene Number

uint8\_t **scene\_type**

The value of the Scene Type

struct net\_buf\_simple \***scene\_value**

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

struct **esp\_ble\_mesh\_scenes\_state\_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

const uint16\_t **scene\_count**

The Scenes state' s scene count

*esp\_ble\_mesh\_scene\_register\_t* \***scenes**

Parameters of the Scenes state

uint16\_t **current\_scene**

The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element's state that is marked as "Stored with Scene" has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

#### **uint16\_t target\_scene**

The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

#### **uint8\_t status\_code**

The status code of the last scene operation

#### **bool in\_progress**

Indicate if the scene transition is in progress

#### **struct esp\_ble\_mesh\_scene\_srv\_t**

User data of Scene Server Model

### **Public Members**

#### *esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scene Server Model. Initialized internally.

#### *esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

#### *esp\_ble\_mesh\_scenes\_state\_t* \***state**

Parameters of the Scenes state

#### *esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

#### *esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

#### **struct esp\_ble\_mesh\_scene\_setup\_srv\_t**

User data of Scene Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scene Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scenes\_state\_t* \***state**

Parameters of the Scenes state

struct **esp\_ble\_mesh\_schedule\_register\_t**

Parameters of Scheduler Register state

### Public Members

bool **in\_use**

Indicate if the registered schedule is in use

uint64\_t **year**

The value of Scheduled year for the action

uint64\_t **month**

The value of Scheduled month for the action

uint64\_t **day**

The value of Scheduled day of the month for the action

uint64\_t **hour**

The value of Scheduled hour for the action

uint64\_t **minute**

The value of Scheduled minute for the action

uint64\_t **second**

The value of Scheduled second for the action

uint64\_t **day\_of\_week**

The value of Schedule days of the week for the action

uint64\_t **action**

The value of Action to be performed at the scheduled time

uint64\_t **trans\_time**

The value of Transition time for this action

uint16\_t **scene\_number**

The value of Scene Number to be used for some actions

struct **esp\_ble\_mesh\_scheduler\_state\_t**

Parameters of Scheduler state

### Public Members

const uint8\_t **schedule\_count**

Scheduler count

*esp\_ble\_mesh\_schedule\_register\_t* \***schedules**

Up to 16 scheduled entries

struct **esp\_ble\_mesh\_scheduler\_srv\_t**

User data of Scheduler Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

struct **esp\_ble\_mesh\_scheduler\_setup\_srv\_t**

User data of Scheduler Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Scheduler Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_scheduler\_state\_t* \***state**

Parameters of the Scheduler state

struct **esp\_ble\_mesh\_state\_change\_time\_set\_t**

Parameters of Time Set state change event

### Public Members

uint8\_t **tai\_seconds**[5]

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_status_t`

Parameters of Time Status state change event

### Public Members

`uint8_t tai_seconds[5]`

The current TAI time in seconds

`uint8_t subsecond`

The sub-second time in units of 1/256 second

`uint8_t uncertainty`

The estimated uncertainty in 10-millisecond steps

`uint16_t time_authority`

0 = No Time Authority, 1 = Time Authority

`uint16_t tai_utc_delta_curr`

Current difference between TAI and UTC in seconds

`uint8_t time_zone_offset_curr`

The local time zone offset in 15-minute increments

struct `esp_ble_mesh_state_change_time_zone_set_t`

Parameters of Time Zone Set state change event

### Public Members

`uint8_t time_zone_offset_new`

Upcoming local time zone offset

uint8\_t **tai\_zone\_change**[5]

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_state\_change\_tai\_utc\_delta\_set\_t**

Parameters of TAI UTC Delta Set state change event

### Public Members

uint16\_t **tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

uint8\_t **tai\_delta\_change**[5]

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_state\_change\_time\_role\_set\_t**

Parameter of Time Role Set state change event

### Public Members

uint8\_t **time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_state\_change\_scene\_store\_t**

Parameter of Scene Store state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_state\_change\_scene\_recall\_t**

Parameter of Scene Recall state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be recalled

struct **esp\_ble\_mesh\_state\_change\_scene\_delete\_t**

Parameter of Scene Delete state change event

### Public Members

uint16\_t **scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_state\_change\_scheduler\_act\_set\_t**  
Parameter of Scheduler Action Set state change event

### Public Members

uint64\_t **index**  
Index of the Schedule Register entry to set

uint64\_t **year**  
Scheduled year for the action

uint64\_t **month**  
Scheduled month for the action

uint64\_t **day**  
Scheduled day of the month for the action

uint64\_t **hour**  
Scheduled hour for the action

uint64\_t **minute**  
Scheduled minute for the action

uint64\_t **second**  
Scheduled second for the action

uint64\_t **day\_of\_week**  
Schedule days of the week for the action

uint64\_t **action**  
Action to be performed at the scheduled time

uint64\_t **trans\_time**  
Transition time for this action

uint16\_t **scene\_number**  
Scene number to be used for some actions

struct **esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_get\_t**  
Context of the received Scheduler Action Get message

### Public Members

uint8\_t **index**  
Index of the Schedule Register entry to get

struct **esp\_ble\_mesh\_server\_rcv\_time\_set\_t**  
Context of the received Time Set message

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t subsecond**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

**uint16\_t time\_authority**

0 = No Time Authority, 1 = Time Authority

**uint16\_t tai\_utc\_delta**

Current difference between TAI and UTC in seconds

**uint8\_t time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_server\_rcv\_time\_zone\_set\_t**

Context of the received Time Zone Set message

**Public Members****uint8\_t time\_zone\_offset\_new**

Upcoming local time zone offset

**uint8\_t tai\_zone\_change[5]**

TAI Seconds time of the upcoming Time Zone Offset change

struct **esp\_ble\_mesh\_server\_rcv\_tai\_utc\_delta\_set\_t**

Context of the received TAI UTC Delta Set message

**Public Members****uint16\_t tai\_utc\_delta\_new**

Upcoming difference between TAI and UTC in seconds

**uint16\_t padding**

Always 0b0. Other values are Prohibited.

**uint8\_t tai\_delta\_change[5]**

TAI Seconds time of the upcoming TAI-UTC Delta change

struct **esp\_ble\_mesh\_server\_rcv\_time\_role\_set\_t**

Context of the received Time Role Set message

**Public Members****uint8\_t time\_role**

The Time Role for the element

struct **esp\_ble\_mesh\_server\_rcv\_scene\_store\_t**

Context of the received Scene Store message

**Public Members****uint16\_t scene\_number**

The number of scenes to be stored

struct **esp\_ble\_mesh\_server\_rcv\_scene\_recall\_t**

Context of the received Scene Recall message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t scene\_number**

The number of scenes to be recalled

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_scene\_delete\_t**

Context of the received Scene Delete message

**Public Members****uint16\_t scene\_number**

The number of scenes to be deleted

struct **esp\_ble\_mesh\_server\_rcv\_scheduler\_act\_set\_t**

Context of the received Scheduler Action Set message

**Public Members****uint64\_t index**

Index of the Schedule Register entry to set

**uint64\_t year**

Scheduled year for the action

**uint64\_t month**

Scheduled month for the action

**uint64\_t day**

Scheduled day of the month for the action

**uint64\_t hour**

Scheduled hour for the action

**uint64\_t minute**

Scheduled minute for the action

**uint64\_t second**

Scheduled second for the action

**uint64\_t day\_of\_week**

Schedule days of the week for the action

**uint64\_t action**

Action to be performed at the scheduled time

**uint64\_t trans\_time**

Transition time for this action

**uint16\_t scene\_number**

Scene number to be used for some actions

struct **esp\_ble\_mesh\_server\_rcv\_time\_status\_t**

Context of the received Time Status message

**Public Members****uint8\_t tai\_seconds[5]**

The current TAI time in seconds

**uint8\_t subsecond**

The sub-second time in units of 1/256 second

**uint8\_t uncertainty**

The estimated uncertainty in 10-millisecond steps

uint16\_t **time\_authority**

0 = No Time Authority, 1 = Time Authority

uint16\_t **tai\_utc\_delta**

Current difference between TAI and UTC in seconds

uint8\_t **time\_zone\_offset**

The local time zone offset in 15-minute increments

struct **esp\_ble\_mesh\_time\_scene\_server\_cb\_param\_t**

Time Scene Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Time and Scenes Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_time\_scene\_server\_cb\_value\_t* **value**

Value of the received Time and Scenes Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_TIME\_CLI** (cli\_pub, cli\_data)

Define a new Time Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Time Client Model.

---

#### Parameters

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Time Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_CLI** (cli\_pub, cli\_data)

Define a new Scene Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Scene Client Model.

---

#### Parameters

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Scene Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_CLI** (cli\_pub, cli\_data)

Define a new Scheduler Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Scheduler Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SRV** (srv\_pub, srv\_data)

Time Scene Server Models related context.

Define a new Time Server Model.

---

**Note:** 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_time\_srv\_t*.

**Returns** New Time Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_TIME\_SETUP\_SRV** (srv\_data)

Define a new Time Setup Server Model.

---

**Note:** 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

- a. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
  - b. This model does not support subscribing nor publishing.
- 

**Parameters**

- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_time\_setup\_srv\_t*.

**Returns** New Time Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SRV** (srv\_pub, srv\_data)

Define a new Scene Server Model.

---

**Note:** 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scene\_srv\_t*.

**Returns** New Scene Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCENE\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scene Setup Server Model.

---

**Note:** 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.

- a. This model shall support model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scene\_setup\_srv\_t*.

**Returns** New Scene Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Server Model.

---

**Note:** 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model may be present only on the Primary element of a node.
  - c. The model requires the Time Server model shall be present on the element.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scheduler\_srv\_t*.

**Returns** New Scheduler Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_SCHEDULER\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Scheduler Setup Server Model.

---

**Note:** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.

- a. This model shall support model subscription.
  - b. The model may be present only on the Primary element of a node.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_scheduler\_setup\_srv\_t*.

**Returns** New Scheduler Setup Server Model instance.

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_SECONDS**

Unknown TAI Seconds

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_ZONE\_CHANGE**

Unknown TAI of Zone Change

**ESP\_BLE\_MESH\_UNKNOWN\_TAI\_DELTA\_CHANGE**

Unknown TAI of Delta Change

**ESP\_BLE\_MESH\_TAI.UTC\_DELTA\_MAX\_VALUE**

Maximum TAI-UTC Delta value

**ESP\_BLE\_MESH\_TAI.SECONDS\_LEN**

Length of TAI Seconds

**ESP\_BLE\_MESH\_TAI.OF\_ZONE\_CHANGE\_LEN**

Length of TAI of Zone Change

**ESP\_BLE\_MESH\_TAI.OF\_DELTA\_CHANGE\_LEN**

Length of TAI of Delta Change

**ESP\_BLE\_MESH\_INVALID\_SCENE\_NUMBER**

Invalid Scene Number

**ESP\_BLE\_MESH\_SCENE\_NUMBER\_LEN**

Length of the Scene Number

**ESP\_BLE\_MESH\_SCHEDULE.YEAR\_ANY\_YEAR**

Any year of the Scheduled year

**ESP\_BLE\_MESH\_SCHEDULE.DAY\_ANY\_DAY**

Any day of the Scheduled day

**ESP\_BLE\_MESH\_SCHEDULE.HOUR\_ANY\_HOUR**

Any hour of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE.HOUR\_ONCE\_A\_DAY**

Any hour of the Scheduled Day

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_ANY\_OF\_HOUR**

Any minute of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_EVERY\_15\_MIN**

Every 15 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_EVERY\_20\_MIN**

Every 20 minutes of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_ONCE\_AN\_HOUR**

Once of the Scheduled hour

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_ANY\_OF\_MIN**

Any second of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE.SEC\_EVERY\_15\_SEC**

Every 15 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC EVERY\_20\_SEC**

Every 20 seconds of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_SEC ONCE\_AN\_MIN**

Once of the Scheduled minute

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_OFF**

Scheduled Action - Turn Off

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_TURN\_ON**

Scheduled Action - Turn On

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_SCENE\_RECALL**

Scheduled Action - Scene Recall

**ESP\_BLE\_MESH\_SCHEDULE\_ACT\_NO\_ACTION**

Scheduled Action - No Action

**ESP\_BLE\_MESH\_SCHEDULE\_SCENE\_NO\_SCENE**

Scheduled Scene - No Scene

**ESP\_BLE\_MESH\_SCHEDULE\_ENTRY\_MAX\_INDEX**

Maximum number of Scheduled entries

**ESP\_BLE\_MESH\_TIME\_NONE**

Time Role - None

**ESP\_BLE\_MESH\_TIME\_AUTHORITY**

Time Role - Mesh Time Authority

**ESP\_BLE\_MESH\_TIME\_RELAY**

Time Role - Mesh Time Relay

**ESP\_BLE\_MESH\_TIME\_CLINET**

Time Role - Mesh Time Client

**ESP\_BLE\_MESH\_SCENE\_SUCCESS**

Scene operation - Success

**ESP\_BLE\_MESH\_SCENE\_REG\_FULL**

Scene operation - Scene Register Full

**ESP\_BLE\_MESH\_SCENE\_NOT\_FOUND**

Scene operation - Scene Not Found

## Type Definitions

```
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(esp_ble_mesh_time_scene_client_cb_event_t event, esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(esp_ble_mesh_time_scene_server_cb_event_t event, esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

## Enumerations

```
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Get messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When status\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, this event will be callback to the application layer when Time Status message is received.

enumerator **ESP\_BLE\_MESH\_TIME\_SCENE\_SERVER\_EVT\_MAX**

## Lighting Client/Server Models

### Header File

- components/bt/esp\_ble\_mesh/api/models/include/esp\_ble\_mesh\_lighting\_model\_api.h

### Functions

*esp\_err\_t* **esp\_ble\_mesh\_register\_light\_client\_callback** (*esp\_ble\_mesh\_light\_client\_cb\_t* callback)

Register BLE Mesh Light Client Model callback.

**Parameters** **callback** –[in] pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_get\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_get\_state\_t* \*get\_state)

Get the value of Light Server Model states using the Light Client Model get messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_light\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **get\_state** –[in] Pointer of light get message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_light\_client\_set\_state** (*esp\_ble\_mesh\_client\_common\_param\_t* \*params, *esp\_ble\_mesh\_light\_client\_set\_state\_t* \*set\_state)

Set the value of Light Server Model states using the Light Client Model set messages.

---

**Note:** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp\_ble\_mesh\_light\_message\_opcode\_t in esp\_ble\_mesh\_defs.h

---

#### Parameters

- **params** –[in] Pointer to BLE Mesh common client parameters.
- **set\_state** –[in] Pointer of light set message value. Shall not be set to NULL.

**Returns** ESP\_OK on success or error code otherwise.

*esp\_err\_t* **esp\_ble\_mesh\_register\_lighting\_server\_callback** (*esp\_ble\_mesh\_lighting\_server\_cb\_t* callback)

Register BLE Mesh Lighting Server Model callback.

**Parameters** **callback** –[in] Pointer to the callback function.

**Returns** ESP\_OK on success or error code otherwise.

Indicate if optional parameters are included

uint16\_t **lightness**

Target value of light lightness linear state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default Set

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Default state

struct **esp\_ble\_mesh\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range Set

**Public Members****uint16\_t range\_min**

Value of range min field of light lightness range state

**uint16\_t range\_max**

Value of range max field of light lightness range state

struct **esp\_ble\_mesh\_light\_ctl\_set\_t**

Parameters of Light CTL Set

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t ctl\_lightness**

Target value of light ctl lightness state

**uint16\_t ctl\_temperatrue**

Target value of light ctl temperature state

**int16\_t ctl\_delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature Set

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t ctl\_temperatrue**

Target value of light ctl temperature state

**int16\_t ctl\_delta\_uv**

Target value of light ctl delta UV state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_ctl_temperature_range_set_t`

Parameters of Light CTL Temperature Range Set

### Public Members

`uint16_t range_min`

Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`

Value of temperature range max field of light ctl temperature range state

struct `esp_ble_mesh_light_ctl_default_set_t`

Parameters of Light CTL Default Set

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t temperature`

Value of light temperature default state

`int16_t delta_uv`

Value of light delta UV default state

struct `esp_ble_mesh_light_hsl_set_t`

Parameters of Light HSL Set

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t hsl_lightness`

Target value of light hsl lightness state

uint16\_t **hsl\_hue**

Target value of light hsl hue state

uint16\_t **hsl\_saturation**

Target value of light hsl saturation state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_hue\_set\_t**

Parameters of Light HSL Hue Set

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **hue**

Target value of light hsl hue state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_saturation\_set\_t**

Parameters of Light HSL Saturation Set

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **saturation**

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_light_hsl_default_set_t`

Parameters of Light HSL Default Set

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_light_hsl_range_set_t`

Parameters of Light HSL Range Set

### Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_light_xyl_set_t`

Parameters of Light xyL Set

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **xy1\_lightness**

The target value of the Light xyL Lightness state

uint16\_t **xy1\_x**

The target value of the Light xyL x state

uint16\_t **xy1\_y**

The target value of the Light xyL y state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_xy1\_default\_set\_t**

Parameters of Light xyL Default Set

### **Public Members**

uint16\_t **lightness**

The value of the Light Lightness Default state

uint16\_t **xy1\_x**

The value of the Light xyL x Default state

uint16\_t **xy1\_y**

The value of the Light xyL y Default state

struct **esp\_ble\_mesh\_light\_xy1\_range\_set\_t**

Parameters of Light xyL Range Set

### **Public Members**

uint16\_t **xy1\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **xy1\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16\_t **xy1\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16\_t **xy1\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp\_ble\_mesh\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode Set

### Public Members

uint8\_t **mode**

The target value of the Light LC Mode state

struct **esp\_ble\_mesh\_light\_lc\_om\_set\_t**

Parameter of Light LC OM Set

### Public Members

uint8\_t **mode**

The target value of the Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_light\_lc\_light\_onoff\_set\_t**

Parameters of Light LC Light OnOff Set

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint8\_t **light\_onoff**

The target value of the Light LC Light OnOff state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_light\_lc\_property\_get\_t**

Parameter of Light LC Property Get

### Public Members

uint16\_t **property\_id**

Property ID identifying a Light LC Property

struct **esp\_ble\_mesh\_light\_lc\_property\_set\_t**

Parameters of Light LC Property Set

### Public Members

uint16\_t **property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_light\_lightness\_status\_cb\_t**

Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_lightness**

Current value of light lightness actual state

uint16\_t **target\_lightness**

Target value of light lightness actual state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_linear\_status\_cb\_t**

Parameters of Light Lightness Linear Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_lightness**

Current value of light lightness linear state

uint16\_t **target\_lightness**

Target value of light lightness linear state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lightness\_last\_status\_cb\_t**

Parameter of Light Lightness Last Status

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Last state

struct **esp\_ble\_mesh\_light\_lightness\_default\_status\_cb\_t**

Parameter of Light Lightness Default Status

### Public Members

uint16\_t **lightness**

The value of the Light Lightness default State

struct **esp\_ble\_mesh\_light\_lightness\_range\_status\_cb\_t**

Parameters of Light Lightness Range Status

### Public Members

uint8\_t **status\_code**

Status Code for the request message

uint16\_t **range\_min**

Value of range min field of light lightness range state

uint16\_t **range\_max**

Value of range max field of light lightness range state

struct **esp\_ble\_mesh\_light\_ctl\_status\_cb\_t**

Parameters of Light CTL Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_ctl\_lightness**

Current value of light ctl lightness state

uint16\_t **present\_ctl\_temperature**

Current value of light ctl temperature state

uint16\_t **target\_ctl\_lightness**

Target value of light ctl lightness state (optional)

uint16\_t **target\_ctl\_temperature**

Target value of light ctl temperature state (C.1)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_ctl\_temperature\_status\_cb\_t**

Parameters of Light CTL Temperature Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_ctl\_temperature**

Current value of light ctl temperature state

uint16\_t **present\_ctl\_delta\_uv**

Current value of light ctl delta UV state

uint16\_t **target\_ctl\_temperature**

Target value of light ctl temperature state (optional)

uint16\_t **target\_ctl\_delta\_uv**

Target value of light ctl delta UV state (C.1)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_ctl\_temperature\_range\_status\_cb\_t**

Parameters of Light CTL Temperature Range Status

### Public Members

uint8\_t **status\_code**

Status code for the request message

uint16\_t **range\_min**

Value of temperature range min field of light ctl temperature range state

uint16\_t **range\_max**

Value of temperature range max field of light ctl temperature range state

struct **esp\_ble\_mesh\_light\_ctl\_default\_status\_cb\_t**

Parameters of Light CTL Default Status

### Public Members

uint16\_t **lightness**

Value of light lightness default state

uint16\_t **temperature**

Value of light temperature default state

int16\_t **delta\_uv**

Value of light delta UV default state

struct **esp\_ble\_mesh\_light\_hsl\_status\_cb\_t**

Parameters of Light HSL Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **hsl\_lightness**

Current value of light hsl lightness state

uint16\_t **hsl\_hue**

Current value of light hsl hue state

uint16\_t **hsl\_saturation**

Current value of light hsl saturation state

uint8\_t **remain\_time**

Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_hsl\_target\_status\_cb\_t**

Parameters of Light HSL Target Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **hsl\_lightness\_target**

Target value of light hsl lightness state

uint16\_t **hsl\_hue\_target**

Target value of light hsl hue state

uint16\_t **hsl\_saturation\_target**

Target value of light hsl saturation state

uint8\_t **remain\_time**

Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_hsl\_hue\_status\_cb\_t**

Parameters of Light HSL Hue Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_hue**

Current value of light hsl hue state

uint16\_t **target\_hue**

Target value of light hsl hue state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_saturation\_status\_cb\_t**

Parameters of Light HSL Saturation Status

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **present\_saturation**

Current value of light hsl saturation state

uint16\_t **target\_saturation**

Target value of light hsl saturation state (optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_hsl\_default\_status\_cb\_t**

Parameters of Light HSL Default Status

### Public Members

uint16\_t **lightness**

Value of light lightness default state

uint16\_t **hue**

Value of light hue default state

uint16\_t **saturation**

Value of light saturation default state

struct **esp\_ble\_mesh\_light\_hsl\_range\_status\_cb\_t**

Parameters of Light HSL Range Status

### Public Members

uint8\_t **status\_code**

Status code for the request message

uint16\_t **hue\_range\_min**

Value of hue range min field of light hsl hue range state

uint16\_t **hue\_range\_max**

Value of hue range max field of light hsl hue range state

uint16\_t **saturation\_range\_min**

Value of saturation range min field of light hsl saturation range state

uint16\_t **saturation\_range\_max**

Value of saturation range max field of light hsl saturation range state

struct **esp\_ble\_mesh\_light\_xyl\_status\_cb\_t**

Parameters of Light xyL Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **xyl\_lightness**

The present value of the Light xyL Lightness state

uint16\_t **xyl\_x**

The present value of the Light xyL x state

uint16\_t **xyl\_y**

The present value of the Light xyL y state

uint8\_t **remain\_time**

Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_xyl\_target\_status\_cb\_t**

Parameters of Light xyL Target Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **target\_xyl\_lightness**

The target value of the Light xyL Lightness state

uint16\_t **target\_xyl\_x**

The target value of the Light xyL x state

uint16\_t **target\_xyl\_y**

The target value of the Light xyL y state

uint8\_t **remain\_time**

Time to complete state transition (optional)

struct **esp\_ble\_mesh\_light\_xyl\_default\_status\_cb\_t**

Parameters of Light xyL Default Status

### Public Members

uint16\_t **lightness**

The value of the Light Lightness Default state

uint16\_t **xyl\_x**

The value of the Light xyL x Default state

uint16\_t **xyl\_y**

The value of the Light xyL y Default state

struct **esp\_ble\_mesh\_light\_xyl\_range\_status\_cb\_t**

Parameters of Light xyL Range Status

### Public Members

uint8\_t **status\_code**

Status Code for the requesting message

uint16\_t **xy1\_x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **xy1\_x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

uint16\_t **xy1\_y\_range\_min**

The value of the xyL y Range Min field of the Light xyL y Range state

uint16\_t **xy1\_y\_range\_max**

The value of the xyL y Range Max field of the Light xyL y Range state

struct **esp\_ble\_mesh\_light\_lc\_mode\_status\_cb\_t**

Parameter of Light LC Mode Status

### Public Members

uint8\_t **mode**

The present value of the Light LC Mode state

struct **esp\_ble\_mesh\_light\_lc\_om\_status\_cb\_t**

Parameter of Light LC OM Status

### Public Members

uint8\_t **mode**

The present value of the Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_light\_lc\_light\_onoff\_status\_cb\_t**

Parameters of Light LC Light OnOff Status

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint8\_t **present\_light\_onoff**

The present value of the Light LC Light OnOff state

uint8\_t **target\_light\_onoff**

The target value of the Light LC Light OnOff state (Optional)

uint8\_t **remain\_time**

Time to complete state transition (C.1)

struct **esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t**

Parameters of Light LC Property Status

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_light\_client\_cb\_param\_t**

Lighting Client Model callback parameters

**Public Members**int **error\_code**

Appropriate error code

*esp\_ble\_mesh\_client\_common\_param\_t* \***params**

The client common parameters.

*esp\_ble\_mesh\_light\_client\_status\_cb\_t* **status\_cb**

The light status message callback values

struct **esp\_ble\_mesh\_light\_lightness\_state\_t**

Parameters of Light Lightness state

**Public Members**uint16\_t **lightness\_linear**

The present value of Light Lightness Linear state

uint16\_t **target\_lightness\_linear**

The target value of Light Lightness Linear state

uint16\_t **lightness\_actual**

The present value of Light Lightness Actual state

uint16\_t **target\_lightness\_actual**

The target value of Light Lightness Actual state

uint16\_t **lightness\_last**

The value of Light Lightness Last state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint8\_t **status\_code**

The status code of setting Light Lightness Range state

uint16\_t **lightness\_range\_min**

The minimum value of Light Lightness Range state

uint16\_t **lightness\_range\_max**

The maximum value of Light Lightness Range state

struct **esp\_ble\_mesh\_light\_lightness\_srv\_t**

User data of Light Lightness Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \***state**

Parameters of the Light Lightness state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **actual\_transition**

Parameters of state transition

*esp\_ble\_mesh\_state\_transition\_t* **linear\_transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness\_actual**

Delta change value of lightness actual state transition

int32\_t **tt\_delta\_lightness\_linear**

Delta change value of lightness linear state transition

struct **esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t**

User data of Light Lightness Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_lightness\_state\_t* \*state

Parameters of the Light Lightness state

struct **esp\_ble\_mesh\_light\_ctl\_state\_t**

Parameters of Light CTL state

### Public Members

uint16\_t **lightness**

The present value of Light CTL Lightness state

uint16\_t **target\_lightness**

The target value of Light CTL Lightness state

uint16\_t **temperature**

The present value of Light CTL Temperature state

uint16\_t **target\_temperature**

The target value of Light CTL Temperature state

int16\_t **delta\_uv**

The present value of Light CTL Delta UV state

int16\_t **target\_delta\_uv**

The target value of Light CTL Delta UV state

uint8\_t **status\_code**

The statue code of setting Light CTL Temperature Range state

uint16\_t **temperature\_range\_min**

The minimum value of Light CTL Temperature Range state

uint16\_t **temperature\_range\_max**

The maximum value of Light CTL Temperature Range state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **temperature\_default**

The value of Light CTL Temperature Default state

int16\_t **delta\_uv\_default**

The value of Light CTL Delta UV Default state

struct **esp\_ble\_mesh\_light\_ctl\_srv\_t**

User data of Light CTL Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

struct **esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t**

User data of Light CTL Setup Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

struct **esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t**

User data of Light CTL Temperature Server Model

**Public Members**

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_ctl\_state\_t* \***state**

Parameters of the Light CTL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_temperature**

Delta change value of temperature state transition

int32\_t **tt\_delta\_delta\_uv**

Delta change value of delta uv state transition

struct **esp\_ble\_mesh\_light\_hsl\_state\_t**

Parameters of Light HSL state

### Public Members

uint16\_t **lightness**

The present value of Light HSL Lightness state

uint16\_t **target\_lightness**

The target value of Light HSL Lightness state

uint16\_t **hue**

The present value of Light HSL Hue state

uint16\_t **target\_hue**

The target value of Light HSL Hue state

uint16\_t **saturation**

The present value of Light HSL Saturation state

uint16\_t **target\_saturation**

The target value of Light HSL Saturation state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **hue\_default**

The value of Light HSL Hue Default state

`uint16_t saturation_default`  
The value of Light HSL Saturation Default state

`uint8_t status_code`  
The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`  
The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`  
The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`  
The minimum value of Light HSL Saturation state

`uint16_t saturation_range_max`  
The maximum value of Light HSL Saturation state

struct `esp_ble_mesh_light_hsl_srv_t`  
User data of Light HSL Server Model

### Public Members

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_lightness`  
Delta change value of lightness state transition

`int32_t tt_delta_hue`  
Delta change value of hue state transition

`int32_t tt_delta_saturation`  
Delta change value of saturation state transition

struct `esp_ble_mesh_light_hsl_setup_srv_t`  
User data of Light HSL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

struct **esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t**

User data of Light HSL Hue Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Hue Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_hue**

Delta change value of hue state transition

struct **esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t**

User data of Light HSL Saturation Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_hsl\_state\_t* \***state**

Parameters of the Light HSL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_saturation**

Delta change value of saturation state transition

struct **esp\_ble\_mesh\_light\_xyL\_state\_t**

Parameters of Light xyL state

### **Public Members**

uint16\_t **lightness**

The present value of Light xyL Lightness state

uint16\_t **target\_lightness**

The target value of Light xyL Lightness state

uint16\_t **x**

The present value of Light xyL x state

uint16\_t **target\_x**

The target value of Light xyL x state

uint16\_t **y**

The present value of Light xyL y state

uint16\_t **target\_y**

The target value of Light xyL y state

uint16\_t **lightness\_default**

The value of Light Lightness Default state

uint16\_t **x\_default**

The value of Light xyL x Default state

uint16\_t **y\_default**

The value of Light xyL y Default state

uint8\_t **status\_code**

The status code of setting Light xyL x & y Range state

uint16\_t **x\_range\_min**

The minimum value of Light xyL x Range state

uint16\_t **x\_range\_max**

The maximum value of Light xyL x Range state

uint16\_t **y\_range\_min**

The minimum value of Light xyL y Range state

uint16\_t **y\_range\_max**

The maximum value of Light xyL y Range state

struct **esp\_ble\_mesh\_light\_xyl\_srv\_t**

User data of Light xyL Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

int32\_t **tt\_delta\_lightness**

Delta change value of lightness state transition

int32\_t **tt\_delta\_x**

Delta change value of x state transition

int32\_t **tt\_delta\_y**

Delta change value of y state transition

struct **esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t**

User data of Light xyL Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting xyL Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_xyl\_state\_t* \***state**

Parameters of the Light xyL state

struct **esp\_ble\_mesh\_light\_lc\_state\_t**

Parameters of Light LC states

### Public Members

uint32\_t **mode**

0b0 The controller is turned off.

- The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
- The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32\_t **occupancy\_mode**

The value of Light LC Occupancy Mode state

uint32\_t **light\_onoff**

The present value of Light LC Light OnOff state

uint32\_t **target\_light\_onoff**

The target value of Light LC Light OnOff state

uint32\_t **occupancy**

The value of Light LC Occupancy state

uint32\_t **ambient\_luxlevel**

The value of Light LC Ambient LuxLevel state

uint16\_t **linear\_output**

- Light LC Linear Output =  $\max((\text{Lightness Out})^2/65535, \text{Regulator Output})$
- If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
- If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct **esp\_ble\_mesh\_light\_lc\_property\_state\_t**

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

### Public Members

**uint32\_t time\_occupancy\_delay**

A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

**uint32\_t time\_fade\_on**

A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

**uint32\_t time\_run\_on**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

**uint32\_t time\_fade**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

**uint32\_t time\_prolong**

A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

**uint32\_t time\_fade\_standby\_auto**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

**uint32\_t time\_fade\_standby\_manual**

A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

**uint16\_t lightness\_on**

A lightness state that determines the perceptible light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

**uint16\_t lightness\_prolong**

A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

**uint16\_t lightness\_standby**

A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

**uint16\_t ambient\_luxlevel\_on**

A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

**uint16\_t ambient\_luxlevel\_prolong**

A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

**uint16\_t ambient\_luxlevel\_standby**

A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

**float regulator\_kiu**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

**float regulator\_kid**

A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

**float regulator\_kpu**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

**float regulator\_kpd**

A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

**int8\_t regulator\_accuracy**

A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

**uint32\_t set\_occupancy\_to\_1\_delay**

If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

**struct esp\_ble\_mesh\_light\_lc\_state\_machine\_t**

Parameters of Light LC state machine

**Public Members****uint8\_t fade\_on**

The value of transition time of Light LC Time Fade On

**uint8\_t fade**

The value of transition time of Light LC Time Fade

uint8\_t **fade\_standby\_auto**

The value of transition time of Light LC Time Fade Standby Auto

uint8\_t **fade\_standby\_manual**

The value of transition time of Light LC Time Fade Standby Manual

struct *esp\_ble\_mesh\_light\_lc\_state\_machine\_t*::[anonymous] **trans\_time**

The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

*esp\_ble\_mesh\_lc\_state\_t* **state**

The value of Light LC state machine state

struct k\_delayed\_work **timer**

Timer of Light LC state machine

struct **esp\_ble\_mesh\_light\_control\_t**

Parameters of Light Lightness controller

### Public Members

*esp\_ble\_mesh\_light\_lc\_state\_t* **state**

Parameters of Light LC state

*esp\_ble\_mesh\_light\_lc\_property\_state\_t* **prop\_state**

Parameters of Light LC Property state

*esp\_ble\_mesh\_light\_lc\_state\_machine\_t* **state\_machine**

Parameters of Light LC state machine

struct **esp\_ble\_mesh\_light\_lc\_srv\_t**

User data of Light LC Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting LC Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**

Parameters of the Light controller

*esp\_ble\_mesh\_last\_msg\_info\_t* **last**

Parameters of the last received set message

*esp\_ble\_mesh\_state\_transition\_t* **transition**

Parameters of state transition

struct **esp\_ble\_mesh\_light\_lc\_setup\_srv\_t**

User data of Light LC Setup Server Model

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp\_ble\_mesh\_server\_rsp\_ctrl\_t* **rsp\_ctrl**

Response control of the server model received messages

*esp\_ble\_mesh\_light\_control\_t* \***lc**

Parameters of the Light controller

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_set\_t**

Parameter of Light Lightness Actual state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Actual state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_linear\_set\_t**

Parameter of Light Lightness Linear state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Linear state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_default\_set\_t**

Parameter of Light Lightness Default state change event

### Public Members

uint16\_t **lightness**

The value of Light Lightness Default state

struct **esp\_ble\_mesh\_state\_change\_light\_lightness\_range\_set\_t**

Parameters of Light Lightness Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light Lightness Range state

**uint16\_t range\_max**

The maximum value of Light Lightness Range state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_set\_t**

Parameters of Light CTL state change event

**Public Members****uint16\_t lightness**

The value of Light CTL Lightness state

**uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_set\_t**

Parameters of Light CTL Temperature state change event

**Public Members****uint16\_t temperature**

The value of Light CTL Temperature state

**int16\_t delta\_uv**

The value of Light CTL Delta UV state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_temperature\_range\_set\_t**

Parameters of Light CTL Temperature Range state change event

**Public Members****uint16\_t range\_min**

The minimum value of Light CTL Temperature Range state

**uint16\_t range\_max**

The maximum value of Light CTL Temperature Range state

struct **esp\_ble\_mesh\_state\_change\_light\_ctl\_default\_set\_t**

Parameters of Light CTL Default state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Default state

**uint16\_t temperature**

The value of Light CTL Temperature Default state

**int16\_t delta\_uv**

The value of Light CTL Delta UV Default state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_set\_t**

Parameters of Light HSL state change event

**Public Members****uint16\_t lightness**

The value of Light HSL Lightness state

**uint16\_t hue**

The value of Light HSL Hue state

**uint16\_t saturation**

The value of Light HSL Saturation state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_hue\_set\_t**

Parameter of Light HSL Hue state change event

**Public Members****uint16\_t hue**

The value of Light HSL Hue state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_saturation\_set\_t**

Parameter of Light HSL Saturation state change event

**Public Members****uint16\_t saturation**

The value of Light HSL Saturation state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_default\_set\_t**

Parameters of Light HSL Default state change event

**Public Members****uint16\_t lightness**

The value of Light HSL Lightness Default state

**uint16\_t hue**

The value of Light HSL Hue Default state

**uint16\_t saturation**

The value of Light HSL Saturation Default state

struct **esp\_ble\_mesh\_state\_change\_light\_hsl\_range\_set\_t**

Parameters of Light HSL Range state change event

**Public Members****uint16\_t hue\_range\_min**

The minimum hue value of Light HSL Range state

**uint16\_t hue\_range\_max**

The maximum hue value of Light HSL Range state

**uint16\_t saturation\_range\_min**

The minimum saturation value of Light HSL Range state

**uint16\_t saturation\_range\_max**

The maximum saturation value of Light HSL Range state

struct **esp\_ble\_mesh\_state\_change\_light\_xyL\_set\_t**

Parameters of Light xyL state change event

**Public Members****uint16\_t lightness**

The value of Light xyL Lightness state

**uint16\_t x**

The value of Light xyL x state

**uint16\_t y**

The value of Light xyL y state

struct **esp\_ble\_mesh\_state\_change\_light\_xyL\_default\_set\_t**

Parameters of Light xyL Default state change event

**Public Members****uint16\_t lightness**

The value of Light Lightness Default state

**uint16\_t x**

The value of Light xyL x Default state

**uint16\_t y**

The value of Light xyL y Default state

struct **esp\_ble\_mesh\_state\_change\_light\_xyl\_range\_set\_t**

Parameters of Light xyL Range state change event

**Public Members****uint16\_t x\_range\_min**

The minimum value of Light xyL x Range state

**uint16\_t x\_range\_max**

The maximum value of Light xyL x Range state

**uint16\_t y\_range\_min**

The minimum value of Light xyL y Range state

**uint16\_t y\_range\_max**

The maximum value of Light xyL y Range state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_mode\_set\_t**

Parameter of Light LC Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Mode state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_om\_set\_t**

Parameter of Light LC Occupancy Mode state change event

**Public Members****uint8\_t mode**

The value of Light LC Occupancy Mode state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_light\_onoff\_set\_t**

Parameter of Light LC Light OnOff state change event

**Public Members****uint8\_t onoff**

The value of Light LC Light OnOff state

struct **esp\_ble\_mesh\_state\_change\_light\_lc\_property\_set\_t**

Parameters of Light LC Property state change event

**Public Members****uint16\_t property\_id**

The property id of Light LC Property state

struct net\_buf\_simple \***property\_value**

The property value of Light LC Property state

struct **esp\_ble\_mesh\_state\_change\_sensor\_status\_t**

Parameters of Sensor Status state change event

**Public Members****uint16\_t property\_id**

The value of Sensor Property ID

**uint8\_t occupancy**

The value of Light LC Occupancy state

**uint32\_t set\_occupancy\_to\_1\_delay**

The value of Light LC Set Occupancy to 1 Delay state

**uint32\_t ambient\_luxlevel**

The value of Light LC Ambient Luxlevel state

union *esp\_ble\_mesh\_state\_change\_sensor\_status\_t*::[anonymous] **state**

Parameters of Sensor Status related state

struct **esp\_ble\_mesh\_server\_rcv\_light\_lc\_property\_get\_t**

Context of the received Light LC Property Get message

**Public Members****uint16\_t property\_id**

Property ID identifying a Light LC Property

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_set\_t**

Context of the received Light Lightness Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness actual state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_linear\_set\_t**

Context of the received Light Lightness Linear Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light lightness linear state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_default\_set\_t**

Context of the received Light Lightness Default Set message

**Public Members****uint16\_t lightness**

The value of the Light Lightness Default state

struct **esp\_ble\_mesh\_server\_rcv\_light\_lightness\_range\_set\_t**

Context of the received Light Lightness Range Set message

**Public Members****uint16\_t range\_min**

Value of range min field of light lightness range state

**uint16\_t range\_max**

Value of range max field of light lightness range state

struct **esp\_ble\_mesh\_server\_recv\_light\_ctl\_set\_t**

Context of the received Light CTL Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t lightness**

Target value of light ctl lightness state

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

**uint8\_t tid**

Transaction ID

**uint8\_t trans\_time**

Time to complete state transition (optional)

**uint8\_t delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_recv\_light\_ctl\_temperature\_set\_t**

Context of the received Light CTL Temperature Set message

**Public Members****bool op\_en**

Indicate if optional parameters are included

**uint16\_t temperature**

Target value of light ctl temperature state

**int16\_t delta\_uv**

Target value of light ctl delta UV state

uint8\_t **tid**

Transaction ID

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_ctl\_temperature\_range\_set\_t**

Context of the received Light CTL Temperature Range Set message

### Public Members

uint16\_t **range\_min**

Value of temperature range min field of light ctl temperature range state

uint16\_t **range\_max**

Value of temperature range max field of light ctl temperature range state

struct **esp\_ble\_mesh\_server\_rcv\_light\_ctl\_default\_set\_t**

Context of the received Light CTL Default Set message

### Public Members

uint16\_t **lightness**

Value of light lightness default state

uint16\_t **temperature**

Value of light temperature default state

int16\_t **delta\_uv**

Value of light delta UV default state

struct **esp\_ble\_mesh\_server\_rcv\_light\_hsl\_set\_t**

Context of the received Light HSL Set message

### Public Members

bool **op\_en**

Indicate if optional parameters are included

uint16\_t **lightness**

Target value of light hsl lightness state

`uint16_t hue`

Target value of light hsl hue state

`uint16_t saturation`

Target value of light hsl saturation state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_hue_set_t`

Context of the received Light HSL Hue Set message

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t hue`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_saturation_set_t`

Context of the received Light HSL Saturation Set message

### Public Members

bool `op_en`

Indicate if optional parameters are included

`uint16_t saturation`

Target value of light hsl hue state

`uint8_t tid`

Transaction ID

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_hsl_default_set_t`

Context of the received Light HSL Default Set message

### Public Members

`uint16_t lightness`

Value of light lightness default state

`uint16_t hue`

Value of light hue default state

`uint16_t saturation`

Value of light saturation default state

struct `esp_ble_mesh_server_rcv_light_hsl_range_set_t`

Context of the received Light HSL Range Set message

### Public Members

`uint16_t hue_range_min`

Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`

Value of hue range max field of light hsl hue range state

`uint16_t saturation_range_min`

Value of saturation range min field of light hsl saturation range state

`uint16_t saturation_range_max`

Value of saturation range max field of light hsl saturation range state

struct `esp_ble_mesh_server_rcv_light_xyl_set_t`

Context of the received Light xyL Set message

### Public Members

bool **op\_en**

Indicate whether optional parameters included

uint16\_t **lightness**

The target value of the Light xyL Lightness state

uint16\_t **x**

The target value of the Light xyL x state

uint16\_t **y**

The target value of the Light xyL y state

uint8\_t **tid**

Transaction Identifier

uint8\_t **trans\_time**

Time to complete state transition (optional)

uint8\_t **delay**

Indicate message execution delay (C.1)

struct **esp\_ble\_mesh\_server\_rcv\_light\_xyl\_default\_set\_t**

Context of the received Light xyL Default Set message

### **Public Members**

uint16\_t **lightness**

The value of the Light Lightness Default state

uint16\_t **x**

The value of the Light xyL x Default state

uint16\_t **y**

The value of the Light xyL y Default state

struct **esp\_ble\_mesh\_server\_rcv\_light\_xyl\_range\_set\_t**

Context of the received Light xyl Range Set message

### **Public Members**

uint16\_t **x\_range\_min**

The value of the xyL x Range Min field of the Light xyL x Range state

uint16\_t **x\_range\_max**

The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t y_range_min`

The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t y_range_max`

The value of the xyL y Range Max field of the Light xyL y Range state

struct `esp_ble_mesh_server_rcv_light_lc_mode_set_t`

Context of the received Light LC Mode Set message

### Public Members

`uint8_t mode`

The target value of the Light LC Mode state

struct `esp_ble_mesh_server_rcv_light_lc_om_set_t`

Context of the received Light OM Set message

### Public Members

`uint8_t mode`

The target value of the Light LC Occupancy Mode state

struct `esp_ble_mesh_server_rcv_light_lc_light_onoff_set_t`

Context of the received Light LC Light OnOff Set message

### Public Members

bool `op_en`

Indicate whether optional parameters included

`uint8_t light_onoff`

The target value of the Light LC Light OnOff state

`uint8_t tid`

Transaction Identifier

`uint8_t trans_time`

Time to complete state transition (optional)

`uint8_t delay`

Indicate message execution delay (C.1)

struct `esp_ble_mesh_server_rcv_light_lc_property_set_t`

Context of the received Light LC Property Set message

### Public Members

uint16\_t **property\_id**

Property ID identifying a Light LC Property

struct net\_buf\_simple \***property\_value**

Raw value for the Light LC Property

struct **esp\_ble\_mesh\_server\_recv\_sensor\_status\_t**

Context of the received Sensor Status message

### Public Members

struct net\_buf\_simple \***data**

Value of sensor data state (optional)

struct **esp\_ble\_mesh\_lighting\_server\_cb\_param\_t**

Lighting Server Model callback parameters

### Public Members

*esp\_ble\_mesh\_model\_t* \***model**

Pointer to Lighting Server Models

*esp\_ble\_mesh\_msg\_ctx\_t* **ctx**

Context of the received messages

*esp\_ble\_mesh\_lighting\_server\_cb\_value\_t* **value**

Value of the received Lighting Messages

### Macros

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_CLI** (cli\_pub, cli\_data)

Define a new Light Lightness Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

---

#### Parameters

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Light Lightness Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_CLI** (cli\_pub, cli\_data)

Define a new Light CTL Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Light CTL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_CLI** (cli\_pub, cli\_data)

Define a new Light HSL Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Light HSL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_CLI** (cli\_pub, cli\_data)

Define a new Light xyL Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Light xyL Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_CLI** (cli\_pub, cli\_data)

Define a new Light LC Client Model.

---

**Note:** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

---

**Parameters**

- **cli\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **cli\_data** –Pointer to the unique struct *esp\_ble\_mesh\_client\_t*.

**Returns** New Light LC Client Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SRV** (srv\_pub, srv\_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

---

**Note:** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_srv\_t*.

**Returns** New Light Lightness Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LIGHTNESS\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light Lightness Setup Server Model.

---

**Note:** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lightness\_setup\_srv\_t*.

**Returns** New Light Lightness Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Server Model.

---

**Note:** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_srv\_t*.

**Returns** New Light CTL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Setup Server Model.

---

**Note:** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_setup\_srv\_t*.

**Returns** New Light CTL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_CTL\_TEMP\_SRV** (srv\_pub, srv\_data)

Define a new Light CTL Temperature Server Model.

---

**Note:** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

- a. This model shall support model publication and model subscription.
-

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_ctl\_temp\_srv\_t*.

**Returns** New Light CTL Temperature Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Server Model.

---

**Note:** 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

- This model shall support model publication and model subscription.
  - The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_srv\_t*.

**Returns** New Light HSL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Setup Server Model.

---

**Note:** 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

- This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t*.

**Returns** New Light HSL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_HUE\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Hue Server Model.

---

**Note:** 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_hue\_srv\_t*.

**Returns** New Light HSL Hue Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_HSL\_SAT\_SRV** (srv\_pub, srv\_data)

Define a new Light HSL Saturation Server Model.

---

**Note:** 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_hsl\_sat\_srv\_t*.

**Returns** New Light HSL Saturation Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SRV** (srv\_pub, srv\_data)

Define a new Light xyL Server Model.

---

**Note:** 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_srv\_t*.

**Returns** New Light xyL Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_XYL\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light xyL Setup Server Model.

---

**Note:** 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.

- a. This model shall support model subscription.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t*.

**Returns** New Light xyL Setup Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SRV** (srv\_pub, srv\_data)

Define a new Light LC Server Model.

---

**Note:** 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.

- a. This model shall support model publication and model subscription.
  - b. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.
- 

**Parameters**

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lc\_srv\_t*.

**Returns** New Light LC Server Model instance.

**ESP\_BLE\_MESH\_MODEL\_LIGHT\_LC\_SETUP\_SRV** (srv\_pub, srv\_data)

Define a new Light LC Setup Server Model.

---

**Note:** 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.

- a. This model shall support model publication and model subscription.
  - b. This model may be used to configure setup parameters for the Light LC Server model.
- 

#### Parameters

- **srv\_pub** –Pointer to the unique struct *esp\_ble\_mesh\_model\_pub\_t*.
- **srv\_data** –Pointer to the unique struct *esp\_ble\_mesh\_light\_lc\_setup\_srv\_t*.

**Returns** New Light LC Setup Server Model instance.

### Type Definitions

```
typedef void (*esp_ble_mesh_light_client_cb_t)(esp_ble_mesh_light_client_cb_event_t event,  
esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

```
typedef void (*esp_ble_mesh_lighting_server_cb_t)(esp_ble_mesh_lighting_server_cb_event_t event,  
esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Param event** Event type

**Param param** Pointer to callback parameter

### Enumerations

```
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

*Values:*

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_GET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_SET\_STATE\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_PUBLISH\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_TIMEOUT\_EVT**

enumerator **ESP\_BLE\_MESH\_LIGHT\_CLIENT\_EVT\_MAX**

```
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

*Values:*

enumerator **ESP\_BLE\_MESH\_LC\_OFF**

enumerator **ESP\_BLE\_MESH\_LC\_STANDBY**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_ON**

enumerator **ESP\_BLE\_MESH\_LC\_RUN**

enumerator **ESP\_BLE\_MESH\_LC\_FADE**

enumerator **ESP\_BLE\_MESH\_LC\_PROLONG**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_STANDBY\_AUTO**

enumerator **ESP\_BLE\_MESH\_LC\_FADE\_STANDBY\_MANUAL**

enum **esp\_ble\_mesh\_lighting\_server\_cb\_event\_t**

This enum value is the event of Lighting Server Model

*Values:*

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_STATE\_CHANGE\_EVT**

- i. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Lighting Get messages are received.
- ii. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_GET\_MSG\_EVT**

When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Get messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_SET\_MSG\_EVT**

When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_RECV\_STATUS\_MSG\_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Sensor Status message is received.

enumerator **ESP\_BLE\_MESH\_LIGHTING\_SERVER\_EVT\_MAX**

## 2.3.5 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features

of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

### Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

**Typical programming sequence with NimBLE stack consists of the following steps:**

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

### API Reference

#### Header File

- [components/bt/host/nimble/esp-hci/include/esp\\_nimble\\_hci.h](#)

#### Functions

*esp\_err\_t* **esp\_nimble\_hci\_init** (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Returns**

- ESP\_OK if the initialization is successful
- Appropriate error code from *esp\_err\_t* in case of an error

*esp\_err\_t* **esp\_nimble\_hci\_deinit** (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

---

**Note:** This function should be called after the NimBLE host is deinitialized.

---

**Returns**

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from *esp\_err\_t* in case of an error

## Macros

**BLE\_HCI\_UART\_H4\_NONE**

**BLE\_HCI\_UART\_H4\_CMD**

**BLE\_HCI\_UART\_H4\_ACL**

**BLE\_HCI\_UART\_H4\_SCO**

**BLE\_HCI\_UART\_H4\_EVT**

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)
- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

## 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

*ESP\_FAIL* (-1): Generic *esp\_err\_t* code indicating failure

*ESP\_OK* (0): *esp\_err\_t* value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (**0x101**): Out of memory

*ESP\_ERR\_INVALID\_ARG* (**0x102**): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (**0x103**): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (**0x104**): Invalid size

*ESP\_ERR\_NOT\_FOUND* (**0x105**): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (**0x106**): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (**0x107**): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (**0x108**): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (**0x109**): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (**0x10a**): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (**0x10b**): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (**0x10c**): There are items remained to retrieve

*ESP\_ERR\_NVS\_BASE* (**0x1100**): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (**0x1101**): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (**0x1102**): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (**0x1103**): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (**0x1104**): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (**0x1105**): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (**0x1106**): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (**0x1107**): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED* (**0x1108**): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG* (**0x1109**): Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL* (**0x110a**): Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE* (**0x110b**): NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH* (**0x110c**): String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES* (**0x110d**): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG* (**0x110e**): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND* (**0x110f**): Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND* (**0x1110**): NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED* (**0x1111**): XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED* (**0x1112**): XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED* (**0x1113**): XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND* (**0x1114**): XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED* (**0x1115**): NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED* (**0x1116**): NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART* (**0x1117**): NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS* (**0x1118**): Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION* (**0x1119**): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE* (**0x1200**): Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG* (**0x1201**): Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR* (**0x1202**): Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL* (**0x1203**): More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL* (**0x1204**): Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE* (**0x1205**): Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE* (**0x1500**): Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT* (**0x1501**): Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID* (**0x1502**): Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED* (**0x1503**): Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER* (**0x1504**): Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED* (**0x1505**): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE* (**0x1506**): Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE* (**0x1600**): Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT* (**0x1601**): OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL* (**0x1602**): Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG* (**0x1603**): Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING* (**0x1604**): Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS* (**0x1605**): Error not enough unused key blocks available

*ESP\_ERR\_DAMAGED\_READING* (**0x1606**): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

*ESP\_ERR\_IMAGE\_BASE* (**0x2000**)

*ESP\_ERR\_IMAGE\_FLASH\_FAIL* (**0x2001**)

*ESP\_ERR\_IMAGE\_INVALID* (**0x2002**)

*ESP\_ERR\_WIFI\_BASE* (**0x3000**): Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT* (**0x3001**): WiFi driver was not installed by *esp\_wifi\_init*

*ESP\_ERR\_WIFI\_NOT\_STARTED* (**0x3002**): WiFi driver was not started by *esp\_wifi\_start*

*ESP\_ERR\_WIFI\_NOT\_STOPPED* (**0x3003**): WiFi driver was not stopped by *esp\_wifi\_stop*

*ESP\_ERR\_WIFI\_IF* (**0x3004**): WiFi interface error

*ESP\_ERR\_WIFI\_MODE* (**0x3005**): WiFi mode error

*ESP\_ERR\_WIFI\_STATE* (**0x3006**): WiFi internal state error

*ESP\_ERR\_WIFI\_CONN* (**0x3007**): WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS* (**0x3008**): WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC* (**0x3009**): MAC address is invalid

*ESP\_ERR\_WIFI\_SSID* (**0x300a**): SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD* (**0x300b**): Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT* (**0x300c**): Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL* (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK* (**0x300e**): The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT* (**0x300f**): Station still in disconnect status

*ESP\_ERR\_WIFI\_POST* (**0x3012**): Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE* (**0x3013**): Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE* (**0x3014**): Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC* (**0x3015**): The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW* (**0x3016**): The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_TWT\_FULL* (**0x3017**): no available flow id

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT* (**0x3018**): Timeout of receiving twt setup response frame, timeout times can be set during twt setup

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL* (**0x3019**): TWT setup frame tx failed

*ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT* (**0x301a**): The twt setup request was rejected by the AP

*ESP\_ERR\_WIFI\_DISCARD* (**0x301b**): Discard frame

*ESP\_ERR\_WIFI\_REGISTRAR* (**0x3033**): WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE* (**0x3034**): WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM* (**0x3035**): WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE* (**0x3064**): ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT* (**0x3065**): ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG* (**0x3066**): Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM* (**0x3067**): Out of memory

*ESP\_ERR\_ESPNOW\_FULL* (**0x3068**): ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND* (**0x3069**): ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL* (**0x306a**): Internal error

*ESP\_ERR\_ESPNOW\_EXIST* (**0x306b**): ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF* (**0x306c**): Interface error

*ESP\_ERR\_DPP\_FAILURE* (**0x3097**): Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE* (**0x3098**): DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR* (**0x3099**): Encountered invalid DPP Attribute

*ESP\_ERR\_MESH\_BASE* (**0x4000**): Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START (0x4001)*  
*ESP\_ERR\_MESH\_NOT\_INIT (0x4002)*  
*ESP\_ERR\_MESH\_NOT\_CONFIG (0x4003)*  
*ESP\_ERR\_MESH\_NOT\_START (0x4004)*  
*ESP\_ERR\_MESH\_NOT\_SUPPORT (0x4005)*  
*ESP\_ERR\_MESH\_NOT\_ALLOWED (0x4006)*  
*ESP\_ERR\_MESH\_NO\_MEMORY (0x4007)*  
*ESP\_ERR\_MESH\_ARGUMENT (0x4008)*  
*ESP\_ERR\_MESH\_EXCEED\_MTU (0x4009)*  
*ESP\_ERR\_MESH\_TIMEOUT (0x400a)*  
*ESP\_ERR\_MESH\_DISCONNECTED (0x400b)*  
*ESP\_ERR\_MESH\_QUEUE\_FAIL (0x400c)*  
*ESP\_ERR\_MESH\_QUEUE\_FULL (0x400d)*  
*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND (0x400e)*  
*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND (0x400f)*  
*ESP\_ERR\_MESH\_OPTION\_NULL (0x4010)*  
*ESP\_ERR\_MESH\_OPTION\_UNKNOWN (0x4011)*  
*ESP\_ERR\_MESH\_XON\_NO\_WINDOW (0x4012)*  
*ESP\_ERR\_MESH\_INTERFACE (0x4013)*  
*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE (0x4014)*

*ESP\_ERR\_TCP\_TRANSPORT\_BASE* (**0xe000**): Starting number of TCP Transport error codes

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_TIMEOUT (**0xe001**): Connection has timed out

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_CLOSED\_BY\_FIN (**0xe002**): Read FIN from peer and the connection has closed (in a clean way)

ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_FAILED (**0xe003**): Failed to connect to the peer

ESP\_ERR\_TCP\_TRANSPORT\_NO\_MEM (**0xe004**): Memory allocation failed

## 2.5 Networking APIs

### 2.5.1 Wi-Fi

#### ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol(CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

## Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_now_set_peer_rate_config()` to configure ESP-NOW rate of each peer. Make sure that the peer is added before configuring the rate. This API should be called after `esp_wifi_start()` and `esp_now_add_peer()`.

---

**Note:** `esp_wifi_config_espnw_rate()` is deprecated, please use `esp_now_set_peer_rate_config()` instead.

---

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32-C6 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

### Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnow](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW](#) repository.

### API Reference

#### Header File

- `components/esp_wifi/include/esp_now.h`

#### Functions

`esp_err_t esp_now_init (void)`

Initialize ESPNOW function.

##### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_INTERNAL : Internal error

`esp_err_t esp_now_deinit (void)`

De-initialize ESPNOW function.

##### Returns

- ESP\_OK : succeed

`esp_err_t esp_now_get_version (uint32_t *version)`

Get the version of ESPNOW.

**Parameters** `version` –ESPNOW version

##### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

`esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)`

Register callback function of receiving ESPNOW data.

**Parameters** `cb` –callback function of receiving ESPNOW data

##### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

`esp_err_t esp_now_unregister_recv_cb (void)`

Unregister callback function of receiving ESPNOW data.

##### Returns

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* cb)

Register callback function of sending ESPNOW data.

**Parameters** **cb** –callback function of sending ESPNOW data

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (const uint8\_t \*peer\_addr, const uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If peer\_addr is not NULL, send data to the peer whose MAC address matches peer\_addr

**Attention** 2. If peer\_addr is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than ESP\_NOW\_MAX\_DATA\_LEN

**Attention** 4. The buffer pointed to by data argument does not need to be valid after esp\_now\_send returns

**Parameters**

- **peer\_addr** –peer MAC address
- **data** –data to send
- **len** –length of data

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory, when this happens, you can delay a while before sending the next data
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found
- ESP\_ERR\_ESPNOW\_IF : current WiFi interface doesn't match that of peer

*esp\_err\_t* **esp\_now\_add\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Add a peer to peer list.

**Parameters** **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full
- ESP\_ERR\_ESPNOW\_NO\_MEM : out of memory
- ESP\_ERR\_ESPNOW\_EXIST : peer has existed

*esp\_err\_t* **esp\_now\_del\_peer** (const uint8\_t \*peer\_addr)

Delete a peer from peer list.

**Parameters** **peer\_addr** –peer MAC address

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

*esp\_err\_t* **esp\_now\_mod\_peer** (const *esp\_now\_peer\_info\_t* \*peer)

Modify a peer.

**Parameters** **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_FULL : peer list is full

*esp\_err\_t* **esp\_wifi\_config\_espnw\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config ESPNOW rate of specified interface.

*Deprecated:*

please use *esp\_now\_set\_peer\_rate\_config()* instead.

**Attention** 1. This API should be called after *esp\_wifi\_start()*.

**Attention** 2. This API only work when not use Wi-Fi 6 and *esp\_now\_set\_peer\_rate\_config()* not called.

**Parameters**

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_now\_set\_peer\_rate\_config** (const uint8\_t \*peer\_addr, *esp\_now\_rate\_config\_t* \*config)

Set ESPNOW rate config for each peer.

**Attention** 1. This API should be called after *esp\_wifi\_start()* and *esp\_now\_init()*.

**Parameters**

- **peer\_addr** –peer MAC address
- **config** –rate config to be configured.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_get\_peer** (const uint8\_t \*peer\_addr, *esp\_now\_peer\_info\_t* \*peer)

Get a peer whose MAC address matches peer\_addr from peer list.

**Parameters**

- **peer\_addr** –peer MAC address
- **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

*esp\_err\_t* **esp\_now\_fetch\_peer** (bool from\_head, *esp\_now\_peer\_info\_t* \*peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- **from\_head** –fetch from head of list or not
- **peer** –peer information

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument
- ESP\_ERR\_ESPNOW\_NOT\_FOUND : peer is not found

bool **esp\_now\_is\_peer\_exist** (const uint8\_t \*peer\_addr)

Peer exists or not.

**Parameters** **peer\_addr** –peer MAC address

**Returns**

- true : peer exists
- false : peer not exists

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \*num)

Get the number of peers.

**Parameters** **num** –number of peers

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Parameters** **pmk** –primary master key

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set wake window for esp\_now to wake up in interval unit.

**Attention** 1. This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention** 2. Default value is the maximum.

**Parameters** **window** –Milliseconds would the chip keep waked each interval, from 0 to 65535.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

**Structures**

struct **esp\_now\_peer\_info**

ESPNOW peer information parameters.

### Public Members

uint8\_t **peer\_addr**[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

struct **esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

### Public Members

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

struct **esp\_now\_recv\_info**

ESPNOW packet information.

### Public Members

uint8\_t \***src\_addr**

Source address of ESPNOW packet

uint8\_t \***des\_addr**

Destination address of ESPNOW packet

*wifi\_pkt\_rx\_ctrl\_t* \***rx\_ctrl**

Rx control info of ESPNOW packet

struct **esp\_now\_rate\_config**

ESPNOW rate config.

## Public Members

### *wifi\_phy\_mode\_t* **phymode**

ESPNow phymode of specified interface

### *wifi\_phy\_rate\_t* **rate**

ESPNow rate of specified interface

### bool **ersu**

ESPNow using ersu send frame

## Macros

### **ESP\_ERR\_ESPNow\_BASE**

ESPNow error number base.

### **ESP\_ERR\_ESPNow\_NOT\_INIT**

ESPNow is not initialized.

### **ESP\_ERR\_ESPNow\_ARG**

Invalid argument

### **ESP\_ERR\_ESPNow\_NO\_MEM**

Out of memory

### **ESP\_ERR\_ESPNow\_FULL**

ESPNow peer list is full

### **ESP\_ERR\_ESPNow\_NOT\_FOUND**

ESPNow peer is not found

### **ESP\_ERR\_ESPNow\_INTERNAL**

Internal error

### **ESP\_ERR\_ESPNow\_EXIST**

ESPNow peer has existed

### **ESP\_ERR\_ESPNow\_IF**

Interface error

### **ESP\_NOW\_ETH\_ALEN**

Length of ESPNow peer MAC address

### **ESP\_NOW\_KEY\_LEN**

Length of ESPNow peer local master key

### **ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNow total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

**Type Definitions**

```
typedef struct esp_now_peer_info esp_now_peer_info_t
```

ESPNOW peer information parameters.

```
typedef struct esp_now_peer_num esp_now_peer_num_t
```

Number of ESPNOW peers which exist currently.

```
typedef struct esp_now_recv_info esp_now_recv_info_t
```

ESPNOW packet information.

```
typedef struct esp_now_rate_config esp_now_rate_config_t
```

ESPNOW rate config.

```
typedef void (*esp_now_recv_cb_t)(const esp_now_recv_info_t *esp_now_info, const uint8_t *data, int data_len)
```

Callback function of receiving ESPNOW data.

**Attention** `esp_now_info` is a local variable, it can only be used in the callback.

**Param `esp_now_info`** received ESPNOW packet information

**Param `data`** received data

**Param `data_len`** length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

**Param `mac_addr`** peer MAC address

**Param `status`** status of sending ESPNOW data (succeed or fail)

**Enumerations**

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

*Values:*

enumerator **ESP\_NOW\_SEND\_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP\_NOW\_SEND\_FAIL**

Send ESPNOW data fail

### ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. *ESP-WIFI-MESH Programming Model*
2. *Writing an ESP-WIFI-MESH Application*
3. *Self Organized Networking*
4. *Application Examples*
5. *API Reference*

For documentation regarding the ESP-WIFI-MESH protocol, please see the [ESP-WIFI-MESH API Guide](#). For more information about ESP-WIFI-MESH Development Framework, please see [ESP-WIFI-MESH Development Framework](#).

### ESP-WIFI-MESH Programming Model

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

Fig. 2: ESP-WIFI-MESH Software Stack

**System Events** An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

Fig. 3: ESP-WIFI-MESH System Events Delivery

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH's self-organizing behavior.** Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`.** In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, **the corresponding handler must start the DHCP client service and immediately obtain an IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```
ESP_ERROR_CHECK(esp_netif_init());

/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());

/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_
↪event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. [Initialize Mesh](#)
2. [Configuring an ESP-WIFI-MESH Network](#)
3. [Start Mesh](#)

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```

/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_
↪event_handler, NULL));

```

**Configuring an ESP-WIFI-MESH Network** ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

Parameter	Description
Channel	Range from 1 to 14
Mesh ID	ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code>
Router	Router Configuration, see <code>mesh_router_t</code>
Mesh AP	Mesh AP Configuration, see <code>mesh_ap_cfg_t</code>
Crypto Functions	Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.

```

/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
      strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
      strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

```

**Start Mesh** The following code snippet demonstrates how to start ESP-WIFI-MESH.

```

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

**Self Organized Networking** Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in *Building a Network*)
- Selection of a preferred parent node (see **Parent Node Selection** in *Building a Network*)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in *Managing a Network*)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, **the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.**

**Toggle Self Organized Networking** Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node's current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking** The following code snippet demonstrates how to disable self organized networking.

```
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking** ESP-WIFI-MESH will attempt to maintain the node's current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

Select Parent	Is Root Node	Effects
N	N	<ul style="list-style-type: none"> <li>Nodes already connected to a parent node will remain connected.</li> <li>Nodes previously scanning for a parent nodes will stop scanning. Call <code>esp_mesh_connect()</code> to restart.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>A root node already connected to router will stay connected.</li> <li>A root node disconnected from router will need to call <code>esp_mesh_connect()</code> to reconnect.</li> </ul>
Y	N	<ul style="list-style-type: none"> <li>Nodes without a parent node will automatically select a preferred parent and connect.</li> <li>Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.</li> </ul>
	Y	<ul style="list-style-type: none"> <li>For a root node to connect to a parent node, it must give up it's role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.</li> </ul>

The following code snipping demonstrates how to enable self organized networking.

```
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);

...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi APIs**. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application's calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using

## ESP-WIFI-MESH.

```
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();
//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results

...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

**Application Examples** ESP-IDF contains these ESP-WIFI-MESH example projects:

[The Internal Communication Example](#) demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

[The Manual Networking Example](#) demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_mesh.h](#)

### Functions

*esp\_err\_t* **esp\_mesh\_init** (void)

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_deinit** (void)

Mesh de-initialization.

- Release resources **and** stop the mesh

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_start** (void)

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_CONFIG
- ESP\_ERR\_MESH\_NO\_MEMORY

*esp\_err\_t* **esp\_mesh\_stop** (void)

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI\_PS\_NONE.

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_send** (const *mesh\_addr\_t* \*to, const *mesh\_data\_t* \*data, int flag, const *mesh\_opt\_t* opt[], int opt\_count)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

### Parameters

- **to** –[in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** –[in] pointer to a sending mesh packet
  - Field size should not exceed MESH\_MPS. Note that the size of one mesh packet should not exceed MESH\_MTU.
  - Field proto should be set to data protocol in use (default is MESH\_PROTO\_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH\_TOS\_P2P for point-to-point reliable).
- **flag** –[in] bitmap for data sent
  - Speed up the route search
    - \* If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - \* If the packet is to an internal device, MESH\_DATA\_P2P should be set.
    - \* If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH\_DATA\_TODS should be set.
    - \* If the packet is from the root to an internal device, MESH\_DATA\_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - \* If needs non-blocking, MESH\_DATA\_NONBLOCK should be set. Otherwise, may use esp\_mesh\_send\_block\_time() to specify a blocking time.
  - In the situation of the root change, MESH\_DATA\_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp\_mesh\_rcv\_toDS().  
Generally, we suggest esp\_mesh\_rcv\_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp\_mesh\_rcv\_toDS() which avoids unnecessary memory copy.
- **opt** –[in] options
  - In case of sending a packet to a certain group, MESH\_OPT\_SEND\_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH\_OPT\_RECV\_DS\_ADDR is required to attach the target DS address.
- **opt\_count** –[in] option count
  - Currently, this API only takes one option, so opt\_count is only supported to be 1.

### Returns

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_DISCONNECTED
- ESP\_ERR\_MESH\_OPT\_UNKNOWN
- ESP\_ERR\_MESH\_EXCEED\_MTU
- ESP\_ERR\_MESH\_NO\_MEMORY
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND
- ESP\_ERR\_MESH\_DISCARD

*esp\_err\_t* esp\_mesh\_send\_block\_time (uint32\_t time\_ms)

Set blocking time of `esp_mesh_send()`

**Attention** This API shall be called before mesh is started.

**Parameters** `time_ms` –[in] blocking time of `esp_mesh_send()`, unit:ms

**Returns**

- ESP\_OK

`esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to self over the mesh network.

flag could be MESH\_DATA\_FROMDS or MESH\_DATA\_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications.

**Parameters**

- **from** –[out] the address of the original source of the packet
- **data** –[out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout\_ms** –[in] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[out] bitmap for data received
  - MESH\_DATA\_FROMDS represents data from external IP network
  - MESH\_DATA\_TODS represents data directed upward within the mesh network
- **opt** –[out] options desired to receive
  - MESH\_OPT\_RECV\_DS\_ADDR attaches the DS address
- **opt\_count** –[in] option count desired to receive
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD

`esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)`

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this `esp_mesh_recv_toDS()` hasn't been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use `esp_mesh_get_rx_pending()` to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using `esp_mesh_set_xon_qsize()` users may configure the RX queue size, default:32. If this size is too large, and `esp_mesh_recv_toDS()` isn't called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH\_DATA\_TODS.

**Attention** This API is only called by the root.

#### Parameters

- **from** –[**out**] the address of the original source of the packet
- **to** –[**out**] the address contains remote IP address and port (IPv4:PORT)
- **data** –[**out**] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout\_ms** –[**in**] wait time if a packet isn't immediately available (0:no wait, port-MAX\_DELAY:wait forever)
- **flag** –[**out**] bitmap for data received
  - MESH\_DATA\_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** –[**out**] options desired to receive
- **opt\_count** –[**in**] option count desired to receive

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_TIMEOUT
- ESP\_ERR\_MESH\_DISCARD
- ESP\_ERR\_MESH\_RECV\_RELEASE

*esp\_err\_t* **esp\_mesh\_set\_config** (const *mesh\_cfg\_t* \*config)

Set mesh stack configuration.

- Use MESH\_INIT\_CONFIG\_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn't set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn't handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max\_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters** **config** –[**in**] pointer to mesh stack configuration

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_get\_config** (*mesh\_cfg\_t* \*config)

Get mesh stack configuration.

**Parameters** `config` –[out] pointer to mesh stack configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_router` (const *mesh\_router\_t* \*router)

Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters** `router` –[in] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_get_router` (*mesh\_router\_t* \*router)

Get router configuration.

**Parameters** `router` –[out] pointer to router configuration

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_id` (const *mesh\_addr\_t* \*id)

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters** `id` –[in] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT: invalid argument

*esp\_err\_t* `esp_mesh_get_id` (*mesh\_addr\_t* \*id)

Get mesh network ID.

**Parameters** `id` –[out] pointer to mesh network ID

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* `esp_mesh_set_type` (*mesh\_type\_t* type)

Designate device type over the mesh network.

- MESH\_IDLE: designates a device as a self-organized node for a mesh network
- MESH\_ROOT: designates the root node for a mesh network
- MESH\_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH\_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Parameters** `type` –[in] device type

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*mesh\_type\_t* **esp\_mesh\_get\_type** (void)

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** mesh type

*esp\_err\_t* **esp\_mesh\_set\_max\_layer** (int max\_layer)

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Parameters** **max\_layer** –[in] max layer value

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

int **esp\_mesh\_get\_max\_layer** (void)

Get max layer value.

**Returns** max layer value

*esp\_err\_t* **esp\_mesh\_set\_ap\_password** (const uint8\_t \*pwd, int len)

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Parameters**

- **pwd** –[in] pointer to the password
- **len** –[in] password length

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_set\_ap\_authmode** (*wifi\_auth\_mode\_t* authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** **authmode** –[in] authentication mode

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*wifi\_auth\_mode\_t* **esp\_mesh\_get\_ap\_authmode** (void)

Get mesh softAP authentication mode.

**Returns** authentication mode

*esp\_err\_t* **esp\_mesh\_set\_ap\_connections** (int connections)

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** **connections** –[in] the number of max connections

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

int **esp\_mesh\_get\_ap\_connections** (void)

Get mesh max connection configuration.

**Returns** the number of mesh max connections

int **esp\_mesh\_get\_non\_mesh\_connections** (void)

Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

int **esp\_mesh\_get\_layer** (void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Returns** layer value

*esp\_err\_t* **esp\_mesh\_get\_parent\_bssid** (*mesh\_addr\_t* \*bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH\_EVENT\_PARENT\_CONNECTED.

**Parameters** **bssid** –[out] pointer to parent BSSID

**Returns**

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_is\_root** (void)

Return whether the device is the root node of the network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_self\_organized** (bool enable, bool select\_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via `esp_mesh_set_parent()`.

**Attention** This API is used to dynamically modify whether to enable the self organizing.

#### Parameters

- **enable** –[in] enable or disable self-organized networking
- **select\_parent** –[in] Only valid when self-organized networking is enabled.
  - if `select_parent` is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

#### Returns

- ESP\_OK
- ESP\_FAIL

bool **esp\_mesh\_get\_self\_organized** (void)

Return whether enable self-organized networking or not.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_waive\_root** (const *mesh\_vote\_t* \*vote, int reason)

Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

**Attention** This API is only called by the root.

#### Parameters

- **vote** –[in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field `is_rc_specified` shall be false.
  - Field `attempts` shall be at least 15 times.
- **reason** –[in] only accept MESH\_VOTE\_REASON\_ROOT\_INITIATED for now

#### Returns

- ESP\_OK
- ESP\_ERR\_MESH\_QUEUE\_FULL
- ESP\_ERR\_MESH\_DISCARD
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_set\_vote\_percentage** (float percentage)

Set vote percentage threshold for approval of being a root (default:0.9)

- During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

**Attention** This API shall be called before mesh is started.

**Parameters** **percentage** **–[in]** vote percentage threshold

**Returns**

- ESP\_OK
- ESP\_FAIL

float **esp\_mesh\_get\_vote\_percentage** (void)

Get vote percentage threshold for approval of being a root.

**Returns** percentage threshold

*esp\_err\_t* **esp\_mesh\_set\_ap\_assoc\_expire** (int seconds)

Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn't received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

**Parameters** **seconds** **–[in]** the expired time

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_ap\_assoc\_expire** (void)

Get mesh softAP associate expired time.

**Returns** seconds

int **esp\_mesh\_get\_total\_node\_num** (void)

Get total number of devices in current network (including the root)

**Attention** The returned value might be incorrect when the network is changing.

**Returns** total number of devices (including the root)

int **esp\_mesh\_get\_routing\_table\_size** (void)

Get the number of devices in this device's sub-network (including self)

**Returns** the number of devices over this device's sub-network (including self)

*esp\_err\_t* **esp\_mesh\_get\_routing\_table** (*mesh\_addr\_t* \*mac, int len, int \*size)

Get routing table of this device's sub-network (including itself)

**Parameters**

- **mac** **–[out]** pointer to routing table
- **len** **–[in]** routing table size(in bytes)
- **size** **–[out]** pointer to the number of devices in routing table (including itself)

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_post\_toDS\_state** (bool reachable)

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Parameters** **reachable** –[in] this state represents whether the root is able to access external IP network

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_tx\_pending** (*mesh\_tx\_pending\_t* \*pending)

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** **pending** –[out] pointer to the TX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_rx\_pending** (*mesh\_rx\_pending\_t* \*pending)

Return the number of packets available in the queue waiting to be received by applications.

**Parameters** **pending** –[out] pointer to the RX pending

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_available\_txupQ\_num** (const *mesh\_addr\_t* \*addr, uint32\_t \*xseqno\_in)

Return the number of packets could be accepted from the specified address.

**Parameters**

- **addr** –[in] self address or an associate children address
- **xseqno\_in** –[out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

*esp\_err\_t* **esp\_mesh\_set\_xon\_qsize** (int qsize)

Set the number of RX queue for the node, the average number of window allocated to one of its child node is:  $wnd = xon\_qsize / (2 * max\_connection + 1)$ . However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

**Attention** This API shall be called before mesh is started.

**Parameters** **qsize** –[in] default:32 (min:16)

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_mesh\_get\_xon\_qsize** (void)

Get queue size.

**Returns** the number of queue

*esp\_err\_t* **esp\_mesh\_allow\_root\_conflicts** (bool allowed)

Set whether allow more than one root existing in one network.

**Parameters** **allowed** –[in] allow or not

**Returns**

- ESP\_OK
- ESP\_WIFI\_ERR\_NOT\_INIT
- ESP\_WIFI\_ERR\_NOT\_START

bool **esp\_mesh\_is\_root\_conflicts\_allowed** (void)

Check whether allow more than one root to exist in one network.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Set group ID addresses.

**Parameters**

- **addr** –[in] pointer to new group ID addresses
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_delete\_group\_id** (const *mesh\_addr\_t* \*addr, int num)

Delete group ID addresses.

**Parameters**

- **addr** –[in] pointer to deleted group ID address
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_group\_num** (void)

Get the number of group ID addresses.

**Returns** the number of group ID addresses

*esp\_err\_t* **esp\_mesh\_get\_group\_list** (*mesh\_addr\_t* \*addr, int num)

Get group ID addresses.

**Parameters**

- **addr** –[out] pointer to group ID addresses
- **num** –[in] the number of group ID addresses

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

bool **esp\_mesh\_is\_my\_group** (const *mesh\_addr\_t* \*addr)

Check whether the specified group address is my group.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_capacity\_num** (int num)

Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Parameters** **num** –[in] mesh network capacity

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_ALLOWED
- ESP\_MESH\_ERR\_ARGUMENT

int **esp\_mesh\_get\_capacity\_num** (void)

Get mesh network capacity.

**Returns** mesh network capacity

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_funcs** (const mesh\_crypto\_funcs\_t \*crypto\_funcs)

Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Parameters** **crypto\_funcs** –[in] crypto functions for mesh IE

- If **crypto\_funcs** is set to NULL, mesh IE is no longer encrypted.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_ie\_crypto\_key** (const char \*key, int len)

Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Parameters**

- **key** –[in] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_ie\_crypto\_key** (char \*key, int len)

Get mesh IE crypto key.

**Parameters**

- **key** –[out] ASCII crypto key
- **len** –[in] length in bytes, range:8~64

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_set\_root\_healing\_delay** (int delay\_ms)

Set delay time before starting root healing.

**Parameters** **delay\_ms** –[in] delay time in milliseconds

**Returns**

- ESP\_OK

int **esp\_mesh\_get\_root\_healing\_delay** (void)

Get delay time before network starts root healing.

**Returns** delay time in milliseconds

*esp\_err\_t* **esp\_mesh\_fix\_root** (bool enable)

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Parameters** **enable** –[in] enable or not

**Returns**

- ESP\_OK

bool **esp\_mesh\_is\_root\_fixed** (void)

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_parent** (const *wifi\_config\_t* \*parent, const *mesh\_addr\_t* \*parent\_mesh\_id, *mesh\_type\_t* my\_type, int my\_layer)

Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

#### Parameters

- **parent** –[in] parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **parent\_mesh\_id** –[in] parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- **my\_type** –[in] mesh type
  - MESH\_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then my\_type shall set MESH\_ROOT and my\_layer shall set MESH\_ROOT\_LAYER.
- **my\_layer** –[in] mesh layer
  - my\_layer of the device may change after joining the network.
  - If my\_type is set MESH\_NODE, my\_layer shall be greater than MESH\_ROOT\_LAYER.
  - If my\_type is set MESH\_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

#### Returns

- ESP\_OK
- ESP\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_CONFIG

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_ie\_len** (int \*len)

Get mesh networking IE length of one AP.

**Parameters** len –[out] mesh networking IE length

#### Returns

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t* \*ap\_record, void \*buffer)

Get AP record.

**Attention** Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual\_networking” example.

#### Parameters

- **ap\_record** –[out] pointer to one AP record
- **buffer** –[out] pointer to the mesh networking IE of this AP

#### Returns

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_WIFI\_FAIL

*esp\_err\_t* **esp\_mesh\_flush\_upstream\_packets** (void)

Flush upstream packets pending in to\_parent queue and to\_parent\_p2p queue.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_num** (const *mesh\_addr\_t* \*child\_mac, int \*nodes\_num)

Get the number of nodes in the subnet of a specific child.

**Parameters**

- **child\_mac** –[in] an associated child address of this device
- **nodes\_num** –[out] pointer to the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_get\_subnet\_nodes\_list** (const *mesh\_addr\_t* \*child\_mac, *mesh\_addr\_t* \*nodes, int nodes\_num)

Get nodes in the subnet of a specific child.

**Parameters**

- **child\_mac** –[in] an associated child address of this device
- **nodes** –[out] pointer to nodes in the subnet of a specific child
- **nodes\_num** –[in] the number of nodes in the subnet of a specific child

**Returns**

- ESP\_OK
- ESP\_ERR\_MESH\_NOT\_START
- ESP\_ERR\_MESH\_ARGUMENT

*esp\_err\_t* **esp\_mesh\_disconnect** (void)

Disconnect from current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_connect** (void)

Connect to current parent.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_flush\_scan\_result** (void)

Flush scan result.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_switch\_channel** (const uint8\_t \*new\_bssid, int csa\_newchan, int csa\_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**

- **new\_bssid** **–[in]** the new router BSSID if the router changes
- **csa\_newchan** **–[in]** the new channel number to which the whole network is moving
- **csa\_count** **–[in]** channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_get\_router\_bssid** (uint8\_t \*router\_bssid)

Get the router BSSID.

**Parameters** **router\_bssid** **–[out]** pointer to the router BSSID

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_INVALID\_ARG

int64\_t **esp\_mesh\_get\_tsf\_time** (void)

Get the TSF time.

**Returns** the TSF time

*esp\_err\_t* **esp\_mesh\_set\_topology** (*esp\_mesh\_topology\_t* topo)

Set mesh topology. The default value is MESH\_TOPO\_TREE.

- MESH\_TOPO\_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters** **topo** **–[in]** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

**Returns**

- ESP\_OK
- ESP\_MESH\_ERR\_ARGUMENT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_mesh\_topology\_t* **esp\_mesh\_get\_topology** (void)

Get mesh topology.

**Returns** MESH\_TOPO\_TREE or MESH\_TOPO\_CHAIN

*esp\_err\_t* **esp\_mesh\_enable\_ps** (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

*esp\_err\_t* **esp\_mesh\_disable\_ps** (void)

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**

- ESP\_OK
- ESP\_ERR\_WIFI\_NOT\_INIT
- ESP\_ERR\_MESH\_NOT\_ALLOWED

bool **esp\_mesh\_is\_ps\_enabled** (void)

Check whether the mesh Power Save function is enabled.

**Returns** true/false

bool **esp\_mesh\_is\_device\_active** (void)

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Returns** true/false

*esp\_err\_t* **esp\_mesh\_set\_active\_duty\_cycle** (int dev\_duty, int dev\_duty\_type)

Set the device duty cycle and type.

- The range of dev\_duty values is 1 to 100. The default value is 10.
- dev\_duty = 100, the PS will be stopped.
- dev\_duty is better to not less than 5.
- dev\_duty\_type could be MESH\_PS\_DEVICE\_DUTY\_REQUEST or MESH\_PS\_DEVICE\_DUTY\_DEMAND.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_REQUEST, the device will use a nwk\_duty provided by the network.
- If dev\_duty\_type is set to MESH\_PS\_DEVICE\_DUTY\_DEMAND, the device will use the specified dev\_duty.

**Attention** This API can be called at any time after mesh is started.

**Parameters**

- **dev\_duty** **–[in]** device duty cycle
- **dev\_duty\_type** **–[in]** device PS duty cycle type, not accept MESH\_PS\_NETWORK\_DUTY\_MASTER

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_active\_duty\_cycle** (int \*dev\_duty, int \*dev\_duty\_type)

Get device duty cycle and type.

**Parameters**

- **dev\_duty** **–[out]** device duty cycle
- **dev\_duty\_type** **–[out]** device PS duty cycle type

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_mesh\_set\_network\_duty\_cycle** (int nwk\_duty, int duration\_mins, int applied\_rule)

Set the network duty cycle, duration and rule.

- The range of nwk\_duty values is 1 to 100. The default value is 10.
- nwk\_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk\_duty is known as a NWK-DUTY-MASTER.

- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = (-1)` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `(-1)`.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept `MESH_PS_NETWORK_DUTY_APPLIED_UPLINK`.
- A `nwk_duty` with `duration_mins(-1)` set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)`nwk_duty` shall be set to the same value for all devices; (2)`duration_mins` shall be set to `(-1)`; (3)`applied_rule` shall be set to `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

#### Parameters

- **`nwk_duty`** `-[in]` network duty cycle
- **`duration_mins`** `-[in]` duration (unit: minutes)
- **`applied_rule`** `-[in]` only support `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### Returns

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_mesh\_get\_network\_duty\_cycle** (int \*nwk\_duty, int \*duration\_mins, int \*dev\_duty\_type, int \*applied\_rule)

Get the network duty cycle, duration, type and rule.

#### Parameters

- **`nwk_duty`** `-[out]` current network duty cycle
- **`duration_mins`** `-[out]` the duration of current `nwk_duty`
- **`dev_duty_type`** `-[out]` if it includes `MESH_PS_DEVICE_DUTY_MASTER`, this device is the current NWK-DUTY-MASTER.
- **`applied_rule`** `-[out]` `MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE`

#### Returns

- ESP\_OK

int **esp\_mesh\_get\_running\_active\_duty\_cycle** (void)

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to `MESH_PS_DEVICE_DUTY_REQUEST`, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to `MESH_PS_DEVICE_DUTY_DEMAND`, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons,

and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Returns** the running active duty cycle

*esp\_err\_t* **esp\_mesh\_ps\_duty\_signaling** (int fwd\_times)

Duty signaling.

**Parameters** **fwd\_times** –[in] the times of forwarding duty signaling packets

**Returns**

- ESP\_OK

## Unions

union **mesh\_addr\_t**

*#include <esp\_mesh.h>* Mesh address.

### Public Members

uint8\_t **addr**[6]

mac address

*mip\_t* **mip**

mip address

union **mesh\_event\_info\_t**

*#include <esp\_mesh.h>* Mesh event information.

### Public Members

*mesh\_event\_channel\_switch\_t* **channel\_switch**

channel switch

*mesh\_event\_child\_connected\_t* **child\_connected**

child connected

*mesh\_event\_child\_disconnected\_t* **child\_disconnected**

child disconnected

*mesh\_event\_routing\_table\_change\_t* **routing\_table**

routing table change

*mesh\_event\_connected\_t* **connected**

parent connected

*mesh\_event\_disconnected\_t* **disconnected**

parent disconnected

*mesh\_event\_no\_parent\_found\_t* **no\_parent**

no parent found

*mesh\_event\_layer\_change\_t* **layer\_change**

layer change

*mesh\_event\_toDS\_state\_t* **toDS\_state**

toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH\_TODS\_REACHABLE.

*mesh\_event\_vote\_started\_t* **vote\_started**

vote started

*mesh\_event\_root\_address\_t* **root\_addr**

root address

*mesh\_event\_root\_switch\_req\_t* **switch\_req**

root switch request

*mesh\_event\_root\_conflict\_t* **root\_conflict**

other powerful root

*mesh\_event\_root\_fixed\_t* **root\_fixed**

fixed root

*mesh\_event\_scan\_done\_t* **scan\_done**

scan done

*mesh\_event\_network\_state\_t* **network\_state**

network state, such as whether current mesh network has a root.

*mesh\_event\_find\_network\_t* **find\_network**

network found that can join

*mesh\_event\_router\_switch\_t* **router\_switch**

new router information

*mesh\_event\_ps\_duty\_t* **ps\_duty**

PS duty information

union **mesh\_rc\_config\_t**

*#include <esp\_mesh.h>* Vote address configuration.

### Public Members

int **attempts**

max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

*mesh\_addr\_t* **rc\_addr**

a new root address specified by users for API `esp_mesh_waive_root()`

### Structures

struct **mip\_t**

IP address and port.

#### Public Members

*esp\_ip4\_addr\_t* **ip4**

IP address

uint16\_t **port**

port

struct **mesh\_event\_channel\_switch\_t**

Channel switch information.

#### Public Members

uint8\_t **channel**

new channel

struct **mesh\_event\_connected\_t**

Parent connected information.

#### Public Members

*wifi\_event\_sta\_connected\_t* **connected**

parent information, same as Wi-Fi event `SYSTEM_EVENT_STA_CONNECTED` does

uint16\_t **self\_layer**

layer

uint8\_t **duty**

parent duty

struct **mesh\_event\_no\_parent\_found\_t**

No parent found information.

#### Public Members

int **scan\_times**

scan times being through

struct **mesh\_event\_layer\_change\_t**

Layer change information.

### Public Members

uint16\_t **new\_layer**

new layer

struct **mesh\_event\_vote\_started\_t**

vote started information

### Public Members

int **reason**

vote reason, vote could be initiated by children or by the root itself

int **attempts**

max vote attempts before stopped

*mesh\_addr\_t* **rc\_addr**

root address specified by users via API `esp_mesh_waive_root()`

struct **mesh\_event\_find\_network\_t**

find a mesh network that this device can join

### Public Members

uint8\_t **channel**

channel number of the new found network

uint8\_t **router\_bssid**[6]

router BSSID

struct **mesh\_event\_root\_switch\_req\_t**

Root switch request information.

### Public Members

int **reason**

root switch reason, generally root switch is initialized by users via API `esp_mesh_waive_root()`

*mesh\_addr\_t* **rc\_addr**

the address of root switch requester

struct **mesh\_event\_root\_conflict\_t**

Other powerful root address.

### Public Members

int8\_t **rss\_i**

rss\_i with router

uint16\_t **capacity**

the number of devices in current network

uint8\_t **addr**[6]

other powerful root address

struct **mesh\_event\_routing\_table\_change\_t**

Routing table change.

### Public Members

uint16\_t **rt\_size\_new**

the new value

uint16\_t **rt\_size\_change**

the changed value

struct **mesh\_event\_root\_fixed\_t**

Root fixed.

### Public Members

bool **is\_fixed**

status

struct **mesh\_event\_scan\_done\_t**

Scan done event information.

### Public Members

uint8\_t **number**

the number of APs scanned

struct **mesh\_event\_network\_state\_t**

Network state information.

### Public Members

bool **is\_rootless**

whether current mesh network has a root

struct **mesh\_event\_ps\_duty\_t**

PS duty information.

### Public Members

uint8\_t **duty**

parent or child duty

[\*mesh\\_event\\_child\\_connected\\_t\*](#) **child\_connected**

child info

struct **mesh\_opt\_t**

Mesh option.

### Public Members

uint8\_t **type**

option type

uint16\_t **len**

option length

uint8\_t \***val**

option value

struct **mesh\_data\_t**

Mesh data for esp\_mesh\_send() and esp\_mesh\_rcv()

### Public Members

uint8\_t \***data**

data

uint16\_t **size**

data size

[\*mesh\\_proto\\_t\*](#) **proto**

data protocol

[\*mesh\\_tos\\_t\*](#) **tos**

data type of service

struct **mesh\_router\_t**

Router configuration.

### Public Members

uint8\_t **ssid**[32]  
SSID

uint8\_t **ssid\_len**  
length of SSID

uint8\_t **bssid**[6]  
BSSID, if this value is specified, users should also specify “allow\_router\_switch” .

uint8\_t **password**[64]  
password

bool **allow\_router\_switch**

if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh\_attempts\_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct **mesh\_ap\_cfg\_t**  
Mesh softAP configuration.

### Public Members

uint8\_t **password**[64]  
mesh softAP password

uint8\_t **max\_connection**  
max number of stations allowed to connect in, default 6, max 10 = max\_connection + non-mesh\_max\_connection max mesh connections

uint8\_t **nonmesh\_max\_connection**  
max non-mesh connections

struct **mesh\_cfg\_t**  
Mesh initialization configuration.

### Public Members

uint8\_t **channel**  
channel, the mesh network on

bool **allow\_channel\_switch**  
if this value is set, when “fail” (mesh\_attempts\_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

*mesh\_addr\_t* **mesh\_id**

mesh network identification

*mesh\_router\_t* **router**

router configuration

*mesh\_ap\_cfg\_t* **mesh\_ap**

mesh softAP configuration

const *mesh\_crypto\_funcs\_t* \***crypto\_funcs**

crypto functions

struct **mesh\_vote\_t**

Vote.

### **Public Members**

float **percentage**

vote percentage threshold for approval of being a root

bool **is\_rc\_specified**

if true, rc\_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

*mesh\_rc\_config\_t* **config**

vote address configuration

struct **mesh\_tx\_pending\_t**

The number of packets pending in the queue waiting to be sent by the mesh stack.

### **Public Members**

int **to\_parent**

to parent queue

int **to\_parent\_p2p**

to parent (P2P) queue

int **to\_child**

to child queue

int **to\_child\_p2p**

to child (P2P) queue

int **mgmt**

management queue

int **broadcast**

broadcast and multicast queue

struct **mesh\_rx\_pending\_t**

The number of packets available in the queue waiting to be received by applications.

### Public Members

int **toDS**

to external DS

int **toSelf**

to self

### Macros

**MESH\_ROOT\_LAYER**

root layer value

**MESH\_MTU**

max transmit unit(in bytes)

**MESH\_MPS**

max payload size(in bytes)

**ESP\_ERR\_MESH\_WIFI\_NOT\_START**

Mesh error code definition.

Wi-Fi isn't started

**ESP\_ERR\_MESH\_NOT\_INIT**

mesh isn't initialized

**ESP\_ERR\_MESH\_NOT\_CONFIG**

mesh isn't configured

**ESP\_ERR\_MESH\_NOT\_START**

mesh isn't started

**ESP\_ERR\_MESH\_NOT\_SUPPORT**

not supported yet

**ESP\_ERR\_MESH\_NOT\_ALLOWED**

operation is not allowed

**ESP\_ERR\_MESH\_NO\_MEMORY**

out of memory

**ESP\_ERR\_MESH\_ARGUMENT**

illegal argument

**ESP\_ERR\_MESH\_EXCEED\_MTU**

packet size exceeds MTU

**ESP\_ERR\_MESH\_TIMEOUT**

timeout

**ESP\_ERR\_MESH\_DISCONNECTED**

disconnected with parent on station interface

**ESP\_ERR\_MESH\_QUEUE\_FAIL**

queue fail

**ESP\_ERR\_MESH\_QUEUE\_FULL**

queue full

**ESP\_ERR\_MESH\_NO\_PARENT\_FOUND**

no parent found to join the mesh network

**ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND**

no route found to forward the packet

**ESP\_ERR\_MESH\_OPTION\_NULL**

no option found

**ESP\_ERR\_MESH\_OPTION\_UNKNOWN**

unknown option

**ESP\_ERR\_MESH\_XON\_NO\_WINDOW**

no window for software flow control on upstream

**ESP\_ERR\_MESH\_INTERFACE**

low-level Wi-Fi interface error

**ESP\_ERR\_MESH\_DISCARD\_DUPLICATE**

discard the packet due to the duplicate sequence number

**ESP\_ERR\_MESH\_DISCARD**

discard the packet

**ESP\_ERR\_MESH\_VOTING**

vote in progress

**ESP\_ERR\_MESH\_XMIT**

XMIT

**ESP\_ERR\_MESH\_QUEUE\_READ**

error in reading queue

**ESP\_ERR\_MESH\_PS**

mesh PS is not specified as enable or disable

**ESP\_ERR\_MESH\_RECV\_RELEASE**

release esp\_mesh\_rcv\_toDS

**MESH\_DATA\_ENC**

Flags bitmap for esp\_mesh\_send() and esp\_mesh\_rcv()

data encrypted (Unimplemented)

**MESH\_DATA\_P2P**

point-to-point delivery over the mesh network

**MESH\_DATA\_FROMDS**

receive from external IP network

**MESH\_DATA\_TODS**

identify this packet is target to external IP network

**MESH\_DATA\_NONBLOCK**

esp\_mesh\_send() non-block

**MESH\_DATA\_DROP**

in the situation of the root having been changed, identify this packet can be dropped by new root

**MESH\_DATA\_GROUP**

identify this packet is target to a group address

**MESH\_OPT\_SEND\_GROUP**

Option definitions for esp\_mesh\_send() and esp\_mesh\_rcv()

data transmission by group; used with esp\_mesh\_send() and shall have payload

**MESH\_OPT\_RECV\_DS\_ADDR**

return a remote IP address; used with esp\_mesh\_send() and esp\_mesh\_rcv()

**MESH\_ASSOC\_FLAG\_VOTE\_IN\_PROGRESS**

Flag of mesh networking IE.

vote in progress

**MESH\_ASSOC\_FLAG\_NETWORK\_FREE**

no root in current network

**MESH\_ASSOC\_FLAG\_ROOTS\_FOUND**

root conflict is found

**MESH\_ASSOC\_FLAG\_ROOT\_FIXED**

fixed root

**MESH\_PS\_DEVICE\_DUTY\_REQUEST**

Mesh PS (Power Save) duty cycle type.

requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH\_PS\_DEVICE\_DUTY\_DEMAND**

requests to join a network PS and specifies a demanded device duty cycle

**MESH\_PS\_NETWORK\_DUTY\_MASTER**

indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_ENTIRE**

Mesh PS (Power Save) duty cycle applied rule.

**MESH\_PS\_NETWORK\_DUTY\_APPLIED\_UPLINK****MESH\_INIT\_CONFIG\_DEFAULT ()**

### Type Definitions

typedef *mesh\_addr\_t* **mesh\_event\_root\_address\_t**

Root address.

typedef *wifi\_event\_sta\_disconnected\_t* **mesh\_event\_disconnected\_t**

Parent disconnected information.

typedef *wifi\_event\_ap\_staconnected\_t* **mesh\_event\_child\_connected\_t**

Child connected information.

typedef *wifi\_event\_ap\_stadisconnected\_t* **mesh\_event\_child\_disconnected\_t**

Child disconnected information.

typedef *wifi\_event\_sta\_connected\_t* **mesh\_event\_router\_switch\_t**

New router information.

### Enumerations

enum **mesh\_event\_id\_t**

Enumerated list of mesh event id.

*Values:*

enumerator **MESH\_EVENT\_STARTED**

mesh is started

enumerator **MESH\_EVENT\_STOPPED**

mesh is stopped

enumerator **MESH\_EVENT\_CHANNEL\_SWITCH**

channel switch

enumerator **MESH\_EVENT\_CHILD\_CONNECTED**

a child is connected on softAP interface

enumerator **MESH\_EVENT\_CHILD\_DISCONNECTED**

a child is disconnected on softAP interface

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_ADD**

routing table is changed by adding newly joined children

enumerator **MESH\_EVENT\_ROUTING\_TABLE\_REMOVE**

routing table is changed by removing leave children

enumerator **MESH\_EVENT\_PARENT\_CONNECTED**

parent is connected on station interface

enumerator **MESH\_EVENT\_PARENT\_DISCONNECTED**

parent is disconnected on station interface

enumerator **MESH\_EVENT\_NO\_PARENT\_FOUND**

no parent found

enumerator **MESH\_EVENT\_LAYER\_CHANGE**

layer changes over the mesh network

enumerator **MESH\_EVENT\_TODS\_STATE**

state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with `esp_mesh_post_toDS_state()`.

enumerator **MESH\_EVENT\_VOTE\_STARTED**

the process of voting a new root is started either by children or by the root

enumerator **MESH\_EVENT\_VOTE\_STOPPED**

the process of voting a new root is stopped

enumerator **MESH\_EVENT\_ROOT\_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_REQ**

root switch request sent from a new voted root candidate

enumerator **MESH\_EVENT\_ROOT\_SWITCH\_ACK**

root switch acknowledgment responds the above request sent from current root

enumerator **MESH\_EVENT\_ROOT\_ASKED\_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH\_EVENT\_ROOT\_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent's. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH\_EVENT\_SCAN\_DONE**

if self-organized networking is disabled, user can call `esp_wifi_scan_start()` to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH\_EVENT\_NETWORK\_STATE**

network state, such as whether current mesh network has a root.

enumerator **MESH\_EVENT\_STOP\_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH\_EVENT\_FIND\_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH\_EVENT\_ROUTER\_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

enumerator **MESH\_EVENT\_PS\_PARENT\_DUTY**

parent duty

enumerator **MESH\_EVENT\_PS\_CHILD\_DUTY**

child duty

enumerator **MESH\_EVENT\_PS\_DEVICE\_DUTY**

device duty

enumerator **MESH\_EVENT\_MAX**enum **mesh\_type\_t**

Device type.

*Values:*

enumerator **MESH\_IDLE**

hasn't joined the mesh network yet

enumerator **MESH\_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

enumerator **MESH\_NODE**

intermediate device. Has the ability to forward packets over the mesh network

enumerator **MESH\_LEAF**

has no forwarding ability

enumerator **MESH\_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh\_proto\_t**

Protocol of transmitted application data.

*Values:*

enumerator **MESH\_PROTO\_BIN**

binary

enumerator **MESH\_PROTO\_HTTP**

HTTP protocol

enumerator **MESH\_PROTO\_JSON**

JSON format

enumerator **MESH\_PROTO\_MQTT**

MQTT protocol

enumerator **MESH\_PROTO\_AP**

IP network mesh communication of node' s AP interface

enumerator **MESH\_PROTO\_STA**

IP network mesh communication of node' s STA interface

enum **mesh\_tos\_t**

For reliable transmission, mesh stack provides three type of services.

*Values:*

enumerator **MESH\_TOS\_P2P**

provide P2P (point-to-point) retransmission on mesh stack by default

enumerator **MESH\_TOS\_E2E**

provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator **MESH\_TOS\_DEF**

no retransmission on mesh stack

enum **mesh\_vote\_reason\_t**

Vote reason.

*Values:*

enumerator **MESH\_VOTE\_REASON\_ROOT\_INITIATED**

vote is initiated by the root

enumerator **MESH\_VOTE\_REASON\_CHILD\_INITIATED**

vote is initiated by children

enum **mesh\_disconnect\_reason\_t**

Mesh disconnect reason code.

*Values:*

enumerator **MESH\_REASON\_CYCLIC**

cyclic is detected

enumerator **MESH\_REASON\_PARENT\_IDLE**

parent is idle

enumerator **MESH\_REASON\_LEAF**

the connected device is changed to a leaf

enumerator **MESH\_REASON\_DIFF\_ID**

in different mesh ID

enumerator **MESH\_REASON\_ROOTS**

root conflict is detected

enumerator **MESH\_REASON\_PARENT\_STOPPED**

parent has stopped the mesh

enumerator **MESH\_REASON\_SCAN\_FAIL**

scan fail

enumerator **MESH\_REASON\_IE\_UNKNOWN**

unknown IE

enumerator **MESH\_REASON\_WAIVE\_ROOT**

waive root

enumerator **MESH\_REASON\_PARENT\_WORSE**

parent with very poor RSSI

enumerator **MESH\_REASON\_EMPTY\_PASSWORD**

use an empty password to connect to an encrypted parent

enumerator **MESH\_REASON\_PARENT\_UNENCRYPTED**

connect to an unencrypted parent/router

enum **esp\_mesh\_topology\_t**

Mesh topology.

*Values:*

enumerator **MESH\_TOPO\_TREE**

tree topology

enumerator **MESH\_TOPO\_CHAIN**

chain topology

enum **mesh\_event\_toDS\_state\_t**

The reachability of the root to a DS (distribute system)

*Values:*

enumerator **MESH\_TODS\_UNREACHABLE**

the root isn't able to access external IP network

enumerator **MESH\_TODS\_REACHABLE**

the root is able to access external IP network

## SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C6 devices, check [Provisioning API](#).

**Application Example** Connect ESP32-C6 to target AP using SmartConfig: [wifi/smart\\_config](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_smartconfig.h](#)

### Functions

const char \***esp\_smartconfig\_get\_version** (void)

Get the version of SmartConfig.

#### Returns

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (const *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

**Parameters** `config` –pointer to smartconfig start configure structure

#### Returns

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

**Parameters** `time_s` –range 15s~255s, offset:45s.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Parameters** `type` –Choose from the `smartconfig_type_t`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Parameters** `enable` –false-disable(default); true-enable;

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \*rvd\_data, uint8\_t len)

Get reserved data of ESPTouch v2.

**Parameters**

- `rvd_data` –reserved data
- `len` –length of reserved data

**Returns**

- ESP\_OK: succeed
- others: fail

## Structures

struct **smartconfig\_event\_got\_ssid\_pswd\_t**  
Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

uint8\_t **ssid**[32]  
SSID of the AP. Null terminated string.

uint8\_t **password**[64]  
Password of the AP. Null terminated string.

bool **bssid\_set**  
whether set MAC address of target AP or not.

uint8\_t **bssid**[6]  
MAC address of target AP.

*smartconfig\_type\_t* **type**  
Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**  
Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]  
IP address of cellphone.

struct **smartconfig\_start\_config\_t**  
Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**  
Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**  
Enable ESPTouch v2 crypt.

char \***esp\_touch\_v2\_key**  
ESPTouch v2 crypt key, len should be 16.

## Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

## Enumerations

enum **smartconfig\_type\_t**

*Values:*

enumerator **SC\_TYPE\_ESPTOUCH**

protocol: ESPTouch

enumerator **SC\_TYPE\_AIRKISS**

protocol: AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_AIRKISS**

protocol: ESPTouch and AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_V2**

protocol: ESPTouch v2

enum **smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

enumerator **SC\_EVENT\_SCAN\_DONE**

Station smartconfig has finished to scan for APs

enumerator **SC\_EVENT\_FOUND\_CHANNEL**

Station smartconfig has found the channel of the target AP

enumerator **SC\_EVENT\_GOT\_SSID\_PSWD**

Station smartconfig got the SSID and password

enumerator **SC\_EVENT\_SEND\_ACK\_DONE**

Station smartconfig has sent ACK to cellphone

## Wi-Fi

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C6 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C6 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C6.
- Station/AP-coexistence mode (ESP32-C6 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** Several application examples demonstrating the functionality of Wi-Fi library are provided in [wifi](#) directory of ESP-IDF repository. Please check the [README](#) for more details.

## API Reference

### Header File

- `components/esp_wifi/include/esp_wifi.h`

### Functions

`esp_err_t esp_wifi_init` (const `wifi_init_config_t` \*config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field ‘magic’ of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

**Parameters** `config` –pointer to WiFi initialized configuration structure; can point to a temporary variable.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

`esp_err_t esp_wifi_deinit` (void)

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_mode` (`wifi_mode_t` mode)

Set the WiFi operating mode.

Set the WiFi operating mode **as** station, soft-AP, station+soft-AP **or** NAN.  
The default mode **is** station mode.

**Parameters** `mode` –WiFi operating mode

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- others: refer to error code in `esp_err.h`

`esp_err_t esp_wifi_get_mode` (`wifi_mode_t` \*mode)

Get current operating mode of WiFi.

**Parameters** `mode` –[out] store current WiFi mode

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

- ESP\_ERR\_INVALID\_ARG: invalid argument

#### *esp\_err\_t* **esp\_wifi\_start** (void)

Start WiFi according to current configuration. If mode is WIFI\_MODE\_STA, it creates station control block and starts station. If mode is WIFI\_MODE\_AP, it creates soft-AP control block and starts soft-AP. If mode is WIFI\_MODE\_APSTA, it creates soft-AP and station control block and starts soft-AP and station. If mode is WIFI\_MODE\_NAN, it creates NAN control block and starts NAN.

##### **Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

#### *esp\_err\_t* **esp\_wifi\_stop** (void)

Stop WiFi. If mode is WIFI\_MODE\_STA, it stops station and frees station control block. If mode is WIFI\_MODE\_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI\_MODE\_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI\_MODE\_NAN, it stops NAN and frees NAN control block.

##### **Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

#### *esp\_err\_t* **esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

##### **Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

#### *esp\_err\_t* **esp\_wifi\_connect** (void)

Connect WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If station interface is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_scan\_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE.

**Attention** 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure\_retry\_cnt' feature in the 'wifi\_sta\_config\_t'. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

##### **Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_ERR\_WIFI\_SSID: SSID of AP which station connects is invalid

*esp\_err\_t* **esp\_wifi\_disconnect** (void)

Disconnect WiFi station from the AP.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi was not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_wifi\_deauth\_sta** (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**Parameters** **aid** –when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

*esp\_err\_t* **esp\_wifi\_scan\_start** (const *wifi\_scan\_config\_t* \*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp\_wifi\_scan\_get\_ap\_records, so generally, call esp\_wifi\_scan\_get\_ap\_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**

- **config** –configuration settings for scanning, if set to NULL default settings will be used of which default values are show\_hidden:false, scan\_type:active, scan\_time.active.min:0, scan\_time.active.max:120 miliseconds, scan\_time.passive:360 miliseconds
- **block** –if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_TIMEOUT: blocking scan is timeout
- ESP\_ERR\_WIFI\_STATE: wifi still connecting when invoke esp\_wifi\_scan\_start
- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters** **number** –[out] store number of APs found in last scan

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

**Parameters**

- **number** –[inout] As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- **ap\_records** –*wifi\_ap\_record\_t* array to hold the found APs

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_clear\_ap\_list** (void)

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_sta\_get\_ap\_info** (*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** **ap\_info** –the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** –power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** –[out] store current power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N) if CONFIG\_SOC\_WIFI\_HE\_SUPPORT, the default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_11AC|WIFI\_PROTOCOL\_11AX|WIFI\_PROTOCOL\_11BE)

**Attention** Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnax or LR mode

**Parameters**

- **ifx** –interfaces
- **protocol\_bitmap** –WiFi protocol bitmap

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_protocol** (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

**Parameters**

- **ifx** –interface
- **protocol\_bitmap** –[out] store current WiFi protocol bitmap of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_set\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Parameters**

- **ifx** –interface to be configured
- **bw** –bandwidth

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_bandwidth** (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

#### Parameters

- **ifx** –interface to be configured
- **bw** –[out] store bandwidth of interface ifx

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_channel** (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of device.

**Attention** 1. This API should be called after esp\_wifi\_start() and before esp\_wifi\_stop()

**Attention** 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remeber the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp\_wifi\_set\_config() to store the channel info in NVS.

#### Parameters

- **primary** –for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** –for HT20, second is ignored, for HT40, second is the second channel

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_get\_channel** (uint8\_t \*primary, *wifi\_second\_chan\_t* \*second)

Get the primary/secondary channel of device.

**Attention** 1. API return false if try to get a interface that is not enable

#### Parameters

- **primary** –store current primary channel
- **second** –[out] store current second channel

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_country** (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

**Attention** 2. The default country is "01" (world safe mode) `{.cc="01", .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO}`.

**Attention** 3. The third octet of country code string is one of the following: '0', 'O', 'I', 'X', otherwise it is considered as '0'.

**Attention** 4. When the country policy is `WIFI_COUNTRY_POLICY_AUTO`, the country info of the AP to which the station is connected is used. E.g. if the configured country info is `{.cc="US", .schan=1, .nchan=11}` and the country info of the AP to which the station is connected is `{.cc="JP", .schan=1, .nchan=14}` then the country info that will be used is `{.cc="JP", .schan=1, .nchan=14}`. If the station disconnected from the AP the country info is set back to the country info of the station automatically, `{.cc="US", .schan=1, .nchan=11}` in the example.

**Attention** 5. When the country policy is `WIFI_COUNTRY_POLICY_MANUAL`, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Parameters** **country** –the configured country info

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country** (*wifi\_country\_t* \*country)

get the current country info

**Parameters** **country** –country info

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_mac** (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of WiFi station, soft-AP or NAN interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

**Parameters**

- **ifx** –interface
- **mac** –the MAC address

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_IF`: invalid interface
- `ESP_ERR_WIFI_MAC`: invalid mac address
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong

- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Parameters**

- **ifx** –interface
- **mac** –[out] store mac of the interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters** **cb** –callback

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Parameters** **en** –false - disable, true - enable

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Parameters** **en** –[out] store the current status of promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

---

**Note:** The default filter is to filter all packets except WIFI\_PKT\_MISC

---

**Parameters** **filter** –the packet type filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Parameters** **filter** –[out] store the current status of promiscuous filter

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

---

**Note:** The default filter is to filter none control packet.

---

**Parameters** **filter** –the subtype of the control packet filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters** **filter** –[out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the STA, AP or NAN.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.

**Attention** 4. The configuration will be stored in NVS for station and soft-AP

**Parameters**

- **interface** –interface
- **conf** –station, soft-AP or NAN configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Get configuration of specified interface.

**Parameters**

- **interface** –interface
- **conf** –[out] station or soft-AP configuration

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

`esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)`

Get STAs associated with soft-AP.

**Attention** SSC only API

**Parameters** `sta` –[`out`] station list ap can get the connected sta's phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_lr` in the `wifi_sta_info_t` struct. For example, `phy_11b = 1` imply that sta support 802.11b mode

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)`

Get AID of STA connected with soft-AP.

**Parameters**

- `mac` –STA's mac address
- `aid` –[`out`] Store the AID corresponding to STA mac

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument
- `ESP_ERR_NOT_FOUND`: Requested resource not found
- `ESP_ERR_WIFI_MODE`: WiFi mode is wrong
- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage (wifi_storage_t storage)`

Set the WiFi API configuration storage type.

**Attention** 1. The default value is `WIFI_STORAGE_FLASH`

**Parameters** `storage` –: storage type

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

`esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

**Parameters**

- `enable` –If true, specified IE is enabled. If false, specified IE is removed.
- `type` –Information Element type. Determines the frame type to associate with the IE.
- `idx` –Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` –Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `wifi_vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init()`
- `ESP_ERR_INVALID_ARG`: Invalid argument, including if first byte of `vnd_ie` is not `WIFI_VENDOR_IE_ELEMENT_ID` (0xDD) or second byte is an invalid length.

- ESP\_ERR\_NO\_MEM: Out of memory

*esp\_err\_t* **esp\_wifi\_set\_vendor\_ie\_cb** (*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

#### Parameters

- **cb** –Callback function
- **ctx** –Context argument, passed to callback function.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_max\_tx\_power** (int8\_t power)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max\_tx\_power of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Parameters** **power** –Maximum WiFi transmitting power.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument, e.g. parameter is out of range

*esp\_err\_t* **esp\_wifi\_get\_max\_tx\_power** (int8\_t \*power)

Get maximum transmitting power after WiFi start.

**Parameters** **power** –Maximum WiFi transmitting power, unit is 0.25dBm.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_event\_mask** (uint32\_t mask)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI\_EVENT\_MASK\_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI\_EVENT\_MASK\_AP\_PROBEREQRCVD.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Parameters** **mask** –WiFi event mask.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_event\_mask** (uint32\_t \*mask)

Get mask of WiFi events.

**Parameters** *mask* –WiFi event mask.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_80211\_tx** (*wifi\_interface\_t* ifx, const void \*buffer, int len, bool en\_sys\_seq)

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**

- **ifx** –interface if the Wi-Fi mode is Station, the ifx should be WIFI\_IF\_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI\_IF\_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI\_IF\_STA or WIFI\_IF\_AP. If the ifx is wrong, the API returns ESP\_ERR\_WIFI\_IF.
- **buffer** –raw ieee80211 buffer
- **len** –the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en\_sys\_seq** –indicate whether use the internal sequence number. If en\_sys\_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp\_wifi\_80211\_tx is called before the Wi-Fi connection has been set up, both en\_sys\_seq==true and en\_sys\_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en\_sys\_seq must be true, otherwise ESP\_ERR\_INVALID\_ARG is returned.

**Returns**

- ESP\_OK: success
- ESP\_ERR\_WIFI\_IF: Invalid interface
- ESP\_ERR\_INVALID\_ARG: Invalid parameter
- ESP\_ERR\_WIFI\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_set\_csi\_rx\_cb** (*wifi\_csi\_cb\_t* cb, void \*ctx)

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

**Parameters**

- **cb** –callback
- **ctx** –context argument, passed to callback function

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_csi\_config** (const *wifi\_csi\_config\_t* \*config)

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start or promiscuous mode is not enabled

- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters** `config` –configuration

`esp_err_t esp_wifi_set_csi` (bool `en`)

Enable or disable CSI.

return

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- `ESP_ERR_INVALID_ARG`: invalid argument

**Parameters** `en` –true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio` (const `wifi_ant_gpio_config_t` \*`config`)

Set antenna GPIO configuration.

**Parameters** `config` –Antenna GPIO configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

`esp_err_t esp_wifi_get_ant_gpio` (`wifi_ant_gpio_config_t` \*`config`)

Get current antenna GPIO configuration.

**Parameters** `config` –Antenna GPIO configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`esp_err_t esp_wifi_set_ant` (const `wifi_ant_config_t` \*`config`)

Set antenna configuration.

**Parameters** `config` –Antenna configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

`esp_err_t esp_wifi_get_ant` (`wifi_ant_config_t` \*`config`)

Get current antenna configuration.

**Parameters** `config` –Antenna configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is NULL

`int64_t esp_wifi_get_tsf_time` (`wifi_interface_t` `interface`)

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters** **interface** –The interface whose tsf\_time is to be retrieved.

**Returns** 0 or the TSF time

*esp\_err\_t* **esp\_wifi\_set\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t sec)

Set the inactive time of the STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force death the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Parameters**

- **ifx** –interface to be configured.
- **sec** –Inactive time. Unit seconds.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t \*sec)

Get inactive time of specified interface.

**Parameters**

- **ifx** –Interface to be configured.
- **sec** –Inactive time. Unit seconds.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_stats\_dump** (uint32\_t modules)

Dump WiFi statistics.

**Parameters** **modules** –statistic modules to be dumped

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_set\_rssi\_threshold** (int32\_t rssi)

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW.

**Attention** If the user wants to receive another WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

**Parameters** **rssi** –threshold value in dbm between -100 to 0

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_ftm\_initiate\_session** (*wifi\_ftm\_initiator\_cfg\_t* \*cfg)

Start an FTM Initiator session by sending FTM request. If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Parameters** *cfg* –FTM Initiator session configuration

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_end\_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_resp\_set\_offset** (int16\_t offset\_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters** *offset\_cm* –T1 Offset to be added in centimeters

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_config\_11b\_rate** (*wifi\_interface\_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp\_wifi\_init() and before esp\_wifi\_start().

**Attention** 2. Only when really need to disable 11b rate call this API otherwise don't call this.

**Parameters**

- *ifx* –Interface to be configured.
- *disable* –true means disable 11b rate while false means enable 11b rate.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_connectionless\_module\_set\_wake\_interval** (uint16\_t wake\_interval)

Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.

**Attention 2.** This configuration could work at connected status. When `ESP_WIFI_STA_DISCONNECTED_PM_ENABLE` is enabled, this configuration could work at disconnected status.

**Attention 3.** Event `WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START` would be posted each time wake interval starts.

**Attention 4.** Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Attention 5.** Recommend to configure interval to `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE` to get stable performance at coexistence mode.

**Parameters** `wake_interval` –Milliseconds after would the chip wake up, from 1 to 65535.

*esp\_err\_t* `esp_wifi_force_wakeup_acquire` (void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state(RF opened) to be able to receive packets.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

*esp\_err\_t* `esp_wifi_force_wakeup_release` (void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state(RF closed) if no more use of radio.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

*esp\_err\_t* `esp_wifi_set_country_code` (const char \*country, bool ieee80211d\_enabled)

configure country

**Attention 1.** When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention 2.** When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention 3.** When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention 4.** The country configuration is stored into flash.

**Attention 5.** When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention 6.** Supported country codes are “01” (world safe mode) “AT” ,” AU” ,” BE” ,” BG” ,” BR” ,” CA” ,” CH” ,” CN” ,” CY” ,” CZ” ,” DE” ,” DK” ,” EE” ,” ES” ,” FI” ,” FR” ,” GB” ,” GR” ,” HK” ,” HR” ,” HU” ,” IE” ,” IN” ,” IS” ,” IT” ,” JP” ,” KR” ,” LI” ,” LT” ,” LU” ,” LV” ,” MT” ,” MX” ,” NL” ,” NO” ,” NZ” ,” PL” ,” PT” ,” RO” ,” SE” ,” SI” ,” SK” ,” TW” ,” US”

**Attention 7.** When country code “01” (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention 8.** The default country is “01” (world safe mode) and `ieee80211d_enabled` is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ‘‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘‘.

**Parameters**

- **country** –the configured country ISO code
- **ieee80211d\_enabled** –802.11d is enabled or not

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country\_code** (char \*country)

get the current country code

**Parameters** **country** –country code

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_config\_80211\_tx\_rate** (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp\_wifi\_init() and before esp\_wifi\_start().

**Parameters**

- **ifx** –Interface to be configured.
- **rate** –Phy rate to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_disable\_pmf\_config** (*wifi\_interface\_t* ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after esp\_wifi\_set\_config() and before esp\_wifi\_start().

**Parameters** **ifx** –Interface to be configured.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_sta\_get\_aid** (uint16\_t \*aid)

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters** **aid** –[out] store the aid

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_sta\_get\_negotiated\_phymode** (*wifi\_phy\_mode\_t* \*phymode)

Get the negotiated phymode after connection.

**Parameters** **phymode** –[out] store the negotiated phymode.

**Returns**

- ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_dynamic\_cs** (bool enabled)

Config dynamic carrier sense.

**Attention** This API should be called after esp\_wifi\_start().

**Parameters** **enabled** –Dynamic carrier sense is enabled or not.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_sta\_get\_rssi** (int \*rssi)

Get the rssi info after station connected to AP.

**Attention** This API should be called after station connected to AP.

**Parameters** **rssi** –store the rssi info received from last beacon.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_FAIL: failed

**Structures**

struct **wifi\_init\_config\_t**

WiFi stack configuration parameters passed to esp\_wifi\_init call.

**Public Members**

wifi\_osi\_funcs\_t \***osi\_funcs**

WiFi OS functions

wpa\_crypto\_funcs\_t **wpa\_crypto\_funcs**

WiFi station crypto functions when connect

int **static\_rx\_buf\_num**

WiFi static RX buffer number

int **dynamic\_rx\_buf\_num**

WiFi dynamic RX buffer number

int **tx\_buf\_type**

WiFi TX buffer type

int **static\_tx\_buf\_num**

WiFi static TX buffer number

- int **dynamic\_tx\_buf\_num**  
WiFi dynamic TX buffer number
- int **rx\_mgmt\_buf\_type**  
WiFi RX MGMT buffer type
- int **rx\_mgmt\_buf\_num**  
WiFi RX MGMT buffer number
- int **cache\_tx\_buf\_num**  
WiFi TX cache buffer number
- int **csi\_enable**  
WiFi channel state information enable flag
- int **ampdu\_rx\_enable**  
WiFi AMPDU RX feature enable flag
- int **ampdu\_tx\_enable**  
WiFi AMPDU TX feature enable flag
- int **amsdu\_tx\_enable**  
WiFi AMSDU TX feature enable flag
- int **nvs\_enable**  
WiFi NVS flash enable flag
- int **nano\_enable**  
Nano option for printf/scan family enable flag
- int **rx\_ba\_win**  
WiFi Block Ack RX window size
- int **wifi\_task\_core\_id**  
WiFi Task Core ID
- int **beacon\_max\_len**  
WiFi softAP maximum length of the beacon
- int **mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32
- uint64\_t **feature\_caps**  
Enables additional WiFi features and capabilities
- bool **sta\_disconnected\_pm**  
WiFi Power Management for station at disconnected status

int **espnow\_max\_encrypt\_num**  
Maximum encrypt number of peers supported by espnow

int **magic**  
WiFi init magic number, it should be the last field

### Macros

**ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**  
WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**  
WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**  
WiFi interface error

**ESP\_ERR\_WIFI\_MODE**  
WiFi mode error

**ESP\_ERR\_WIFI\_STATE**  
WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**  
WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**  
WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**  
MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**  
SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**  
Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**  
Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**  
WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**  
The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**

Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC**

The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW**

The WiFi TX is disallowed

**ESP\_ERR\_WIFI\_TWT\_FULL**

no available flow id

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT**

Timeout of receiving twt setup response frame, timeout times can be set during twt setup

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL**

TWT setup frame tx failed

**ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT**

The twt setup request was rejected by the AP

**ESP\_ERR\_WIFI\_DISCARD**

Discard frame

**WIFI\_STATIC\_TX\_BUFFER\_NUM**

**WIFI\_CACHE\_TX\_BUFFER\_NUM**

**WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

**WIFI\_RX\_MGMT\_BUF\_NUM\_DEF**

**WIFI\_CSI\_ENABLED**

**WIFI\_AMPDU\_RX\_ENABLED**

**WIFI\_AMPDU\_TX\_ENABLED**

WIFI\_AMSDU\_TX\_ENABLED

WIFI\_NVS\_ENABLED

WIFI\_NANO\_FORMAT\_ENABLED

WIFI\_INIT\_CONFIG\_MAGIC

WIFI\_DEFAULT\_RX\_BA\_WIN

WIFI\_TASK\_CORE\_ID

WIFI\_SOFTAP\_BEACON\_MAX\_LEN

CONFIG\_FEATURE\_FTM\_RESPONDER\_BIT

WIFI\_INIT\_CONFIG\_DEFAULT()

ESP\_WIFI\_CONNECTIONLESS\_INTERVAL\_DEFAULT\_MODE

### Type Definitions

typedef void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef void (\***esp\_vendor\_ie\_cb\_t**)(void \*ctx, *wifi\_vendor\_ie\_type\_t* type, const uint8\_t sa[6], const *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to *esp\_wifi\_set\_vendor\_ie\_cb()* when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd\_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

```
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data **is** received, the callback function will be called.

**Param ctx** context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_types.h](#)

### Unions

```
union wifi_config_t
```

*#include <esp\_wifi\_types.h>* Configuration data for device' s AP or STA or NAN.

The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**

configuration of AP

*wifi\_sta\_config\_t* **sta**

configuration of STA

*wifi\_nan\_config\_t* **nan**

configuration of NAN

### Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

### Public Members

char **cc**[3]

country code string

uint8\_t **schan**

start channel

uint8\_t **nchan**

total channel number

`int8_t max_tx_power`

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

`wifi_country_policy_t policy`

country policy

struct `wifi_active_scan_time_t`

Range of active scan times per channel.

### Public Members

`uint32_t min`

minimum active scan time per channel, units: millisecond

`uint32_t max`

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct `wifi_scan_time_t`

Aggregate of active & passive scan time per channel.

### Public Members

`wifi_active_scan_time_t active`

active scan time per channel, units: millisecond.

`uint32_t passive`

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct `wifi_scan_config_t`

Parameters for an SSID scan.

### Public Members

`uint8_t *ssid`

SSID of AP

`uint8_t *bssid`

MAC address of AP

`uint8_t channel`

channel, scan the specific channel

`bool show_hidden`

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

uint8\_t **home\_chan\_dwell\_time**

time spent at home channel between scanning consecutive channels.

struct **wifi\_he\_ap\_info\_t**

Description of a WiFi AP HE Info.

### Public Members

uint8\_t **bss\_color**

an unsigned integer whose value is the BSS Color of the BSS corresponding to the AP

uint8\_t **partial\_bss\_color**

indicate if an AID assignment rule based on the BSS color

uint8\_t **bss\_color\_disabled**

indicate if the use of BSS color is disabled

uint8\_t **bssid\_index**

in M-BSSID set, identifies the nontransmitted BSSID

struct **wifi\_ap\_record\_t**

Description of a WiFi AP.

### Public Members

uint8\_t **bssid**[6]

MAC address of AP

uint8\_t **ssid**[33]

SSID of AP

uint8\_t **primary**

channel of AP

*wifi\_second\_chan\_t* **second**

secondary channel of AP

int8\_t **rsqi**

signal strength of AP

*wifi\_auth\_mode\_t* **authmode**

authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

group cipher of AP

*wifi\_ant\_t* **ant**

antenna used to receive beacon from AP

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **phy\_11ax**

bit: 4 flag to identify if 11ax mode is enabled or not

uint32\_t **wps**

bit: 5 flag to identify if WPS is supported or not

uint32\_t **ftm\_responder**

bit: 6 flag to identify if FTM is supported in responder mode

uint32\_t **ftm\_initiator**

bit: 7 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved**

bit: 8..31 reserved

*wifi\_country\_t* **country**

country information of AP

*wifi\_he\_ap\_info\_t* **he\_ap**

HE AP info

struct **wifi\_scan\_threshold\_t**

Structure describing parameters for a WiFi fast scan.

### Public Members

`int8_t rssi`

The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`

The weakest authmode to accept in the fast scan mode Note: In case this value is not set and password is set as per WPA2 standards (password len  $\geq$  8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI\_AUTH\_WEP/WIFI\_AUTH\_WPA\_PSK to connect to WEP/WPA networks

struct `wifi_pmf_config_t`

Configuration structure for Protected Management Frame

### Public Members

bool `capable`

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool `required`

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct `wifi_ap_config_t`

Soft-AP configuration settings for the device.

### Public Members

`uint8_t ssid[32]`

SSID of soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

`uint8_t password[64]`

Password of soft-AP.

`uint8_t ssid_len`

Optional length of SSID field.

`uint8_t channel`

Channel of soft-AP

`wifi_auth_mode_t authmode`

Auth mode of soft-AP. Do not support AUTH\_WEP, AUTH\_WAPI\_PSK and AUTH\_OWE in soft-AP mode. When the auth mode is set to WPA2\_PSK, WPA2\_WPA3\_PSK or WPA3\_PSK, the pairwise cipher will be overwritten with WIFI\_CIPHER\_TYPE\_CCMP.

`uint8_t ssid_hidden`

Broadcast SSID or not, default 0, broadcast the SSID

uint8\_t **max\_connection**

Max number of stations allowed to connect in

uint16\_t **beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

*wifi\_cipher\_type\_t* **pairwise\_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

bool **ftm\_responder**

Enable FTM Responder mode

*wifi\_pmf\_config\_t* **pmf\_cfg**

Configuration for Protected Management Frame

*wifi\_sae\_pwe\_method\_t* **sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

struct **wifi\_sta\_config\_t**

STA configuration settings for the device.

### Public Members

uint8\_t **ssid**[32]

SSID of target AP.

uint8\_t **password**[64]

Password of target AP.

*wifi\_scan\_method\_t* **scan\_method**

do all channel scan or fast scan

bool **bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8\_t **bssid**[6]

MAC address of target AP

uint8\_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16\_t listen\_interval**

Listen interval for ESP32 station to receive beacon when WIFI\_PS\_MAX\_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi\_sort\_method\_t sort\_method**

sort the connect AP in the list by rssi or security mode

**wifi\_scan\_threshold\_t threshold**

When scan\_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi\_pmf\_config\_t pmf\_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

**uint32\_t rm\_enabled**

Whether Radio Measurements are enabled for the connection

**uint32\_t btm\_enabled**

Whether BSS Transition Management is enabled for the connection

**uint32\_t mbo\_enabled**

Whether MBO is enabled for the connection

**uint32\_t ft\_enabled**

Whether FT is enabled for the connection

**uint32\_t owe\_enabled**

Whether OWE is enabled for the connection

**uint32\_t transition\_disable**

Whether to enable transition disable feature

**uint32\_t reserved**

Reserved for future feature set

**wifi\_sae\_pwe\_method\_t sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

**wifi\_sae\_pk\_mode\_t sae\_pk\_mode**

Configuration for SAE-PK (Public Key) Authentication method

**uint8\_t failure\_retry\_cnt**

Number of connection retries station will do before moving to next AP. scan\_method should be set as WIFI\_ALL\_CHANNEL\_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

**uint32\_t he\_dcm\_set**

Whether DCM max.constellation for transmission and reception is set.

**uint32\_t he\_dcm\_max\_constellation\_tx**

Indicate the max.constellation for DCM in TB PDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_dcm\_max\_constellation\_rx**

Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_mcs9\_enabled**

Whether to support HE-MCS 0 to 9. The default value is 0.

**uint32\_t he\_su\_beamformee\_disabled**

Whether to disable support for operation as an SU beamformee.

**uint32\_t he\_trig\_su\_biforming\_feedback\_disabled**

Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_mu\_biforming\_partial\_feedback\_disabled**

Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_cqi\_feedback\_disabled**

Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

**uint32\_t he\_reserved**

Reserved for future feature set

**uint8\_t sae\_h2e\_identifier[SAE\_H2E\_IDENTIFIER\_LEN]**

Password identifier for H2E. this needs to be null terminated string

**struct wifi\_nan\_config\_t**

NAN Discovery start configuration.

**Public Members****uint8\_t op\_channel**

NAN Discovery operating channel

**uint8\_t master\_pref**

Device' s preference value to serve as NAN Master

**uint8\_t scan\_time**

Scan time in seconds while searching for a NAN cluster

**uint16\_t warm\_up\_sec**

Warm up time before assuming NAN Anchor Master role

**struct wifi\_sta\_info\_t**

Description of STA associated with AP.

**Public Members**`uint8_t mac[6]`

mac address

`int8_t rssi`

current average rssi of sta connected

`uint32_t phy_11b`

bit: 0 flag to identify if 11b mode is enabled or not

`uint32_t phy_11g`

bit: 1 flag to identify if 11g mode is enabled or not

`uint32_t phy_11n`

bit: 2 flag to identify if 11n mode is enabled or not

`uint32_t phy_1r`

bit: 3 flag to identify if low rate is enabled or not

`uint32_t phy_11ax`

bit: 4 flag to identify if 11ax mode is enabled or not

`uint32_t is_mesh_child`

bit: 5 flag to identify mesh child

`uint32_t reserved`

bit: 6..31 reserved

struct `wifi_sta_list_t`

List of stations associated with the Soft-AP.

**Public Members**`wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]`

station list

`int num`

number of stations in the list (other entries are invalid)

struct `vendor_ie_data_t`

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

uint8\_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi\_promiscuous\_pkt\_t**

Payload passed to 'buf' parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

metadata header

uint8\_t **payload**[0]

Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

struct **wifi\_promiscuous\_filter\_t**

Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**

OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

struct **wifi\_csi\_info\_t**

CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

received packet radio metadata header of the CSI data

uint8\_t **mac**[6]

source MAC address of the CSI data

uint8\_t **dmac**[6]  
destination MAC address of the CSI data

bool **first\_word\_invalid**  
first four bytes of the CSI data is invalid or not

int8\_t \***buf**  
buffer of CSI data

uint16\_t **len**  
length of CSI data

struct **wifi\_ant\_gpio\_t**  
WiFi GPIO configuration for antenna selection.

### Public Members

uint8\_t **gpio\_select**  
Whether this GPIO is connected to external antenna switch

uint8\_t **gpio\_num**  
The GPIO number that connects to external antenna switch

struct **wifi\_ant\_gpio\_config\_t**  
WiFi GPIOs configuration for antenna selection.

### Public Members

*wifi\_ant\_gpio\_t* **gpio\_cfg**[4]  
The configurations of GPIOs that connect to external antenna switch

struct **wifi\_ant\_config\_t**  
WiFi antenna configuration.

### Public Members

*wifi\_ant\_mode\_t* **rx\_ant\_mode**  
WiFi antenna mode for receiving

*wifi\_ant\_t* **rx\_ant\_default**  
Default antenna mode for receiving, it's ignored if rx\_ant\_mode is not WIFI\_ANT\_MODE\_AUTO

*wifi\_ant\_mode\_t* **tx\_ant\_mode**  
WiFi antenna mode for transmission, it can be set to WIFI\_ANT\_MODE\_AUTO only if rx\_ant\_mode is set to WIFI\_ANT\_MODE\_AUTO

uint8\_t **enabled\_ant0**

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT0

uint8\_t **enabled\_ant1**

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT1

struct **wifi\_action\_tx\_req\_t**

Action Frame Tx Request.

### Public Members

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint8\_t **dest\_mac**[6]

Destination MAC address

bool **no\_ack**

Indicates no ack required

*wifi\_action\_rx\_cb\_t* **rx\_cb**

Rx Callback to receive any response

uint32\_t **data\_len**

Length of the appended Data

uint8\_t **data**[0]

Appended Data payload

struct **wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

### Public Members

uint8\_t **resp\_mac**[6]

MAC address of the FTM Responder

uint8\_t **channel**

Primary channel of the FTM Responder

uint8\_t **frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested time period between consecutive FTM bursts in 100<sup>7</sup> s of milliseconds (0 - No pref)

struct **wifi\_beacon\_monitor\_config\_t**

WiFi beacon monitor parameter configuration.

### Public Members

bool **enable**

Enable or disable beacon monitor

uint8\_t **loss\_timeout**

Beacon lost timeout

uint8\_t **loss\_threshold**

Maximum number of consecutive lost beacons allowed

uint8\_t **delta\_intr\_early**

Delta early time for RF PHY on

uint8\_t **delta\_loss\_timeout**

Delta timeout time for RF PHY off

uint8\_t **beacon\_abort**

Enable or disable beacon abort

uint8\_t **broadcast\_wakeup**

Enable or disable TIM element multicast wakeup

uint8\_t **reserved**

Reserved

uint8\_t **tsf\_time\_sync\_deviation**

Deviation range to sync with AP TSF timestamp

uint16\_t **modem\_state\_consecutive**

PMU MODEM state consecutive count limit

uint16\_t **rf\_ctrl\_wait\_cycle**

RF on wait time (unit: Modem APB clock cycle)

struct **wifi\_nan\_publish\_cfg\_t**

NAN Publish service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]

Service name identifier

*wifi\_nan\_service\_type\_t* **type**

Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]

Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info shared in Publish frame

uint8\_t **single\_replied\_event**

Give single Replied event or every time

uint8\_t **datapath\_reqd**

NAN Datapath required for the service

uint8\_t **reserved**

Reserved

struct **wifi\_nan\_subscribe\_cfg\_t**

NAN Subscribe service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]

Service name identifier

*wifi\_nan\_service\_type\_t* **type**

Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]

Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info shared in Subscribe frame

uint8\_t **single\_match\_event**

Give single Match event or every time

uint8\_t **reserved**

Reserved

struct **wifi\_nan\_followup\_params\_t**

NAN Follow-up parameters.

### Public Members

uint8\_t **inst\_id**

Own service instance id

uint8\_t **peer\_inst\_id**

Peer' s service instance id

uint8\_t **peer\_mac**[6]

Peer' s MAC address

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info(or message) to be shared

struct **wifi\_nan\_datapath\_req\_t**

NAN Datapath Request parameters.

### Public Members

uint8\_t **pub\_id**

Publisher' s service instance id

uint8\_t **peer\_mac**[6]

Peer' s MAC address

bool **confirm\_required**

NDP Confirm frame required

struct **wifi\_nan\_datapath\_resp\_t**

NAN Datapath Response parameters.

### Public Members

bool **accept**

True - Accept incoming NDP, False - Reject it

uint8\_t **ndp\_id**

NAN Datapath Identifier

uint8\_t **peer\_mac**[6]

Peer' s MAC address

struct **wifi\_nan\_datapath\_end\_req\_t**

NAN Datapath End parameters.

### Public Members

uint8\_t **ndp\_id**

NAN Datapath Identifier

uint8\_t **peer\_mac**[6]

Peer' s MAC address

struct **wifi\_event\_sta\_scan\_done\_t**

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

**Public Members****uint32\_t status**

status of scanning APs: 0 — success, 1 - failure

**uint8\_t number**

number of scan results

**uint8\_t scan\_id**

scan sequence number, used for block scan

struct **wifi\_event\_sta\_connected\_t**

Argument structure for WIFI\_EVENT\_STA\_CONNECTED event

**Public Members****uint8\_t ssid[32]**

SSID of connected AP

**uint8\_t ssid\_len**

SSID length of connected AP

**uint8\_t bssid[6]**

BSSID of connected AP

**uint8\_t channel**

channel of connected AP

*wifi\_auth\_mode\_t* **authmode**

authentication mode used by AP

**uint16\_t aid**

authentication id assigned by the connected AP

struct **wifi\_event\_sta\_disconnected\_t**

Argument structure for WIFI\_EVENT\_STA\_DISCONNECTED event

**Public Members****uint8\_t ssid[32]**

SSID of disconnected AP

**uint8\_t ssid\_len**

SSID length of disconnected AP

**uint8\_t bssid[6]**

BSSID of disconnected AP

uint8\_t **reason**

reason of disconnection

int8\_t **rssi**

rssi of disconnection

struct **wifi\_event\_sta\_authmode\_change\_t**

Argument structure for WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE event

### Public Members

*wifi\_auth\_mode\_t* **old\_mode**

the old auth mode of AP

*wifi\_auth\_mode\_t* **new\_mode**

the new auth mode of AP

struct **wifi\_event\_sta\_wps\_er\_pin\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

### Public Members

uint8\_t **ap\_cred\_cnt**

Number of AP credentials received

uint8\_t **ssid**[MAX\_SSID\_LEN]

SSID of AP

uint8\_t **passphrase**[MAX\_PASSPHRASE\_LEN]

Passphrase for the AP

struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[MAX\_WPS\_AP\_CRED]

All AP credentials received from WPS handshake

struct **wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members****uint8\_t mac**[6]

MAC address of the station connected to Soft-AP

**uint8\_t aid**

the aid that soft-AP gives to the station connected to

**bool is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

**Public Members****uint8\_t mac**[6]

MAC address of the station disconnects to soft-AP

**uint8\_t aid**

the aid that soft-AP gave to the station disconnects to

**bool is\_mesh\_child**

flag to identify mesh child

**uint8\_t reason**

reason of disconnection

struct **wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

**Public Members****int rssi**

Received probe request signal strength

**uint8\_t mac**[6]

MAC address of the station which send probe request

struct **wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event

**Public Members****int32\_t rssi**

RSSI value of bss

struct **wifi\_ftm\_report\_entry\_t**

Argument structure for

### Public Members

uint8\_t **dlog\_token**

Dialog Token of the FTM frame

int8\_t **rssi**

RSSI of the FTM frame received

uint32\_t **rtt**

Round Trip Time in pSec with a peer

uint64\_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64\_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64\_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64\_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi\_event\_ftm\_report\_t**

Argument structure for WIFI\_EVENT\_FTM\_REPORT event

### Public Members

uint8\_t **peer\_mac**[6]

MAC address of the FTM Peer

*wifi\_ftm\_status\_t* **status**

Status of the FTM operation

uint32\_t **rtt\_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32\_t **rtt\_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32\_t **dist\_est**

Estimated one-way distance in Centi-Meters

*wifi\_ftm\_report\_entry\_t* \***ftm\_report\_data**

Pointer to FTM Report with multiple entries, should be freed after use

uint8\_t **ftm\_report\_num\_entries**

Number of entries in the FTM Report data

struct **wifi\_event\_action\_tx\_status\_t**

Argument structure for WIFI\_EVENT\_ACTION\_TX\_STATUS event

### Public Members

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint32\_t **context**

Context to identify the request

uint8\_t **da**[6]

Destination MAC address

uint8\_t **status**

Status of the operation

struct **wifi\_event\_roc\_done\_t**

Argument structure for WIFI\_EVENT\_ROC\_DONE event

### Public Members

uint32\_t **context**

Context to identify the request

struct **wifi\_event\_ap\_wps\_rg\_pin\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_PIN event

### Public Members

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_ap\_wps\_rg\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_FAILED event

### Public Members

*wps\_fail\_reason\_t* **reason**

WPS failure reason *wps\_fail\_reason\_t*

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_ap\_wps\_rg\_success\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS event

### **Public Members**

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_nan\_svc\_match\_t**

Argument structure for WIFI\_EVENT\_NAN\_SVC\_MATCH event

### **Public Members**

uint8\_t **subscribe\_id**

Subscribe Service Identifier

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **pub\_if\_mac**[6]

NAN Interface MAC of the Publisher

bool **update\_pub\_id**

Indicates whether publisher's service ID needs to be updated

struct **wifi\_event\_nan\_replied\_t**

Argument structure for WIFI\_EVENT\_NAN\_REPLIED event

### **Public Members**

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **subscribe\_id**

Subscribe Service Identifier

uint8\_t **sub\_if\_mac**[6]

NAN Interface MAC of the Subscriber

struct **wifi\_event\_nan\_receive\_t**

Argument structure for WIFI\_EVENT\_NAN\_RECEIVE event

**Public Members**`uint8_t inst_id`

Our Service Identifier

`uint8_t peer_inst_id`

Peer' s Service Identifier

`uint8_t peer_if_mac[6]`

Peer' s NAN Interface MAC

`uint8_t peer_svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]`

Peer Service Info

struct `wifi_event_ndp_indication_t`

Argument structure for WIFI\_EVENT\_NDP\_INDICATION event

**Public Members**`uint8_t publish_id`

Publish Id for NAN Service

`uint8_t ndp_id`

NDP instance id

`uint8_t peer_nmi[6]`

Peer' s NAN Management Interface MAC

`uint8_t peer_ndi[6]`

Peer' s NAN Data Interface MAC

`uint8_t svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]`

Service Specific Info

struct `wifi_event_ndp_confirm_t`

Argument structure for WIFI\_EVENT\_NDP\_CONFIRM event

**Public Members**`uint8_t status`

NDP status code

`uint8_t ndp_id`

NDP instance id

`uint8_t peer_nmi[6]`

Peer' s NAN Management Interface MAC

uint8\_t **peer\_ndi**[6]  
Peer' s NAN Data Interface MAC

uint8\_t **own\_ndi**[6]  
Own NAN Data Interface MAC

uint8\_t **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service Specific Info

struct **wifi\_event\_ndp\_terminated\_t**  
Argument structure for WIFI\_EVENT\_NDP\_TERMINATED event

### Public Members

uint8\_t **reason**  
Termination reason code

uint8\_t **ndp\_id**  
NDP instance id

uint8\_t **init\_ndi**[6]  
Initiator' s NAN Data Interface MAC

### Macros

**WIFI\_OFFCHAN\_TX\_REQ**

**WIFI\_OFFCHAN\_TX\_CANCEL**

**WIFI\_ROC\_REQ**

**WIFI\_ROC\_CANCEL**

**WIFI\_PROTOCOL\_11B**

**WIFI\_PROTOCOL\_11G**

**WIFI\_PROTOCOL\_11N**

**WIFI\_PROTOCOL\_LR**

**WIFI\_PROTOCOL\_11AX**

**SAE\_H2E\_IDENTIFIER\_LEN**

**ESP\_WIFI\_MAX\_CONN\_NUM**  
max number of stations which can connect to ESP32C3 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**

filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**

filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**

filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**

filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**

filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**

filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**

filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**

filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**

filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**

filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**

mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**

mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRCVED**

mask SYSTEM\_EVENT\_AP\_PROBEREQRCVED event

**ESP\_WIFI\_NAN\_MAX\_SVC\_SUPPORTED**

**ESP\_WIFI\_NAN\_DATAPATH\_MAX\_PEERS**

**ESP\_WIFI\_NDP\_ROLE\_INITIATOR**

**ESP\_WIFI\_NDP\_ROLE\_RESPONDER**

**ESP\_WIFI\_MAX\_SVC\_NAME\_LEN**

**ESP\_WIFI\_MAX\_FILTER\_LEN**

**ESP\_WIFI\_MAX\_SVC\_INFO\_LEN**

**MAX\_SSID\_LEN**

**MAX\_PASSPHRASE\_LEN**

**MAX\_WPS\_AP\_CRED**

**WIFI\_STATIS\_BUFFER**

**WIFI\_STATIS\_RXTX**

**WIFI\_STATIS\_HW**

**WIFI\_STATIS\_DIAG**

**WIFI\_STATIS\_PS**

**WIFI\_STATIS\_ALL**

## Type Definitions

typedef esp\_wifi\_rxctrl\_t **wifi\_pkt\_rx\_ctrl\_t**

typedef wifi\_csi\_acquire\_config\_t **wifi\_csi\_config\_t**

Channel state information(CSI) configuration type.

typedef int (\***wifi\_action\_rx\_cb\_t**)(uint8\_t \*hdr, uint8\_t \*payload, size\_t len, uint8\_t channel)

The Rx callback function of Action Tx operations.

**Param hdr** pointer to the IEEE 802.11 Header structure

**Param payload** pointer to the Payload following 802.11 Header

**Param len** length of the Payload

**Param channel** channel number the frame is received on

## Enumerations

enum **wifi\_mode\_t**

*Values:*

enumerator **WIFI\_MODE\_NULL**

null mode

enumerator **WIFI\_MODE\_STA**

WiFi station mode

enumerator **WIFI\_MODE\_AP**

WiFi soft-AP mode

enumerator **WIFI\_MODE\_APSTA**

WiFi station + soft-AP mode

enumerator **WIFI\_MODE\_NAN**

WiFi NAN mode

enumerator **WIFI\_MODE\_MAX**

enum **wifi\_interface\_t**

*Values:*

enumerator **WIFI\_IF\_STA**

enumerator **WIFI\_IF\_AP**

enumerator **WIFI\_IF\_MAX**

enum **wifi\_country\_policy\_t**

*Values:*

enumerator **WIFI\_COUNTRY\_POLICY\_AUTO**

Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI\_COUNTRY\_POLICY\_MANUAL**

Country policy is manual, always use the configured country info

enum **wifi\_auth\_mode\_t**

*Values:*

enumerator **WIFI\_AUTH\_OPEN**

authenticate mode : open

enumerator **WIFI\_AUTH\_WEP**

authenticate mode : WEP

enumerator **WIFI\_AUTH\_WPA\_PSK**

authenticate mode : WPA\_PSK

enumerator **WIFI\_AUTH\_WPA2\_PSK**

authenticate mode : WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA\_WPA2\_PSK**

authenticate mode : WPA\_WPA2\_PSK

enumerator **WIFI\_AUTH\_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI\_AUTH\_WPA2\_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI\_AUTH\_WPA3\_PSK**

authenticate mode : WPA3\_PSK

enumerator **WIFI\_AUTH\_WPA2\_WPA3\_PSK**

authenticate mode : WPA2\_WPA3\_PSK

enumerator **WIFI\_AUTH\_WAPI\_PSK**

authenticate mode : WAPI\_PSK

enumerator **WIFI\_AUTH\_OWE**

authenticate mode : OWE

enumerator **WIFI\_AUTH\_WPA3\_ENT\_192**

authenticate mode : WPA3\_ENT\_SUITE\_B\_192\_BIT

enumerator **WIFI\_AUTH\_MAX**

enum **wifi\_err\_reason\_t**

*Values:*

enumerator **WIFI\_REASON\_UNSPECIFIED**

enumerator **WIFI\_REASON\_AUTH\_EXPIRE**

enumerator **WIFI\_REASON\_AUTH\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_EXPIRE**

enumerator **WIFI\_REASON\_ASSOC\_TOOMANY**

enumerator **WIFI\_REASON\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_NOT\_ASSOCED**

enumerator **WIFI\_REASON\_ASSOC\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_DISASSOC\_PWRCAP\_BAD**

enumerator **WIFI\_REASON\_DISASSOC\_SUPCHAN\_BAD**

enumerator **WIFI\_REASON\_BSS\_TRANSITION\_DISASSOC**

enumerator **WIFI\_REASON\_IE\_INVALID**

enumerator **WIFI\_REASON\_MIC\_FAILURE**

enumerator **WIFI\_REASON\_4WAY\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_GROUP\_KEY\_UPDATE\_TIMEOUT**

enumerator **WIFI\_REASON\_IE\_IN\_4WAY\_DIFFERS**

enumerator **WIFI\_REASON\_GROUP\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_PAIRWISE\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_AKMP\_INVALID**

enumerator **WIFI\_REASON\_UNSUPP\_RSN\_IE\_VERSION**

enumerator **WIFI\_REASON\_INVALID\_RSN\_IE\_CAP**

enumerator **WIFI\_REASON\_802\_1X\_AUTH\_FAILED**

enumerator **WIFI\_REASON\_CIPHER\_SUITE\_REJECTED**

enumerator **WIFI\_REASON\_TDLS\_PEER\_UNREACHABLE**

enumerator **WIFI\_REASON\_TDLS\_UNSPECIFIED**

enumerator **WIFI\_REASON\_SSP\_REQUESTED\_DISASSOC**

enumerator **WIFI\_REASON\_NO\_SSP\_ROAMING\_AGREEMENT**

enumerator **WIFI\_REASON\_BAD\_CIPHER\_OR\_AKM**

enumerator **WIFI\_REASON\_NOT\_AUTHORIZED\_THIS\_LOCATION**

enumerator **WIFI\_REASON\_SERVICE\_CHANGE\_PERCLUDES\_TS**

enumerator **WIFI\_REASON\_UNSPECIFIED\_QOS**

enumerator **WIFI\_REASON\_NOT\_ENOUGH\_BANDWIDTH**

enumerator **WIFI\_REASON\_MISSING\_ACKS**

enumerator **WIFI\_REASON\_EXCEEDED\_TXOP**

enumerator **WIFI\_REASON\_STA\_LEAVING**

enumerator **WIFI\_REASON\_END\_BA**

enumerator **WIFI\_REASON\_UNKNOWN\_BA**

enumerator **WIFI\_REASON\_TIMEOUT**

enumerator **WIFI\_REASON\_PEER\_INITIATED**

enumerator **WIFI\_REASON\_AP\_INITIATED**

enumerator **WIFI\_REASON\_INVALID\_FT\_ACTION\_FRAME\_COUNT**

enumerator **WIFI\_REASON\_INVALID\_PMKID**

enumerator **WIFI\_REASON\_INVALID\_MDE**

enumerator **WIFI\_REASON\_INVALID\_FTE**

enumerator **WIFI\_REASON\_TRANSMISSION\_LINK\_ESTABLISH\_FAILED**

enumerator **WIFI\_REASON\_ALTERNATIVE\_CHANNEL\_OCCUPIED**

enumerator **WIFI\_REASON\_BEACON\_TIMEOUT**

enumerator **WIFI\_REASON\_NO\_AP\_FOUND**

enumerator **WIFI\_REASON\_AUTH\_FAIL**

enumerator **WIFI\_REASON\_ASSOC\_FAIL**

enumerator **WIFI\_REASON\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_CONNECTION\_FAIL**

enumerator **WIFI\_REASON\_AP\_TSF\_RESET**

enumerator **WIFI\_REASON\_ROAMING**

enumerator **WIFI\_REASON\_ASSOC\_COMEBACK\_TIME\_TOO\_LONG**

enumerator **WIFI\_REASON\_SA\_QUERY\_TIMEOUT**

enum **wifi\_second\_chan\_t**

*Values:*

enumerator **WIFI\_SECOND\_CHAN\_NONE**

the channel width is HT20

enumerator **WIFI\_SECOND\_CHAN\_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI\_SECOND\_CHAN\_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi\_scan\_type\_t**

*Values:*

enumerator **WIFI\_SCAN\_TYPE\_ACTIVE**

active scan

enumerator **WIFI\_SCAN\_TYPE\_PASSIVE**

passive scan

enum **wifi\_cipher\_type\_t**

*Values:*

enumerator **WIFI\_CIPHER\_TYPE\_NONE**

the cipher type is none

enumerator **WIFI\_CIPHER\_TYPE\_WEP40**

the cipher type is WEP40

enumerator **WIFI\_CIPHER\_TYPE\_WEP104**

the cipher type is WEP104

enumerator **WIFI\_CIPHER\_TYPE\_TKIP**

the cipher type is TKIP

enumerator **WIFI\_CIPHER\_TYPE\_CCMP**

the cipher type is CCMP

enumerator **WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI\_CIPHER\_TYPE\_AES\_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_SMS4**

the cipher type is SMS4

enumerator **WIFI\_CIPHER\_TYPE\_GCMP**

the cipher type is GCMP

enumerator **WIFI\_CIPHER\_TYPE\_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI\_CIPHER\_TYPE\_UNKNOWN**

the cipher type is unknown

enum **wifi\_ant\_t**

WiFi antenna.

*Values:*

enumerator **WIFI\_ANT\_ANT0**

WiFi antenna 0

enumerator **WIFI\_ANT\_ANT1**

WiFi antenna 1

enumerator **WIFI\_ANT\_MAX**

Invalid WiFi antenna

enum **wifi\_scan\_method\_t**

*Values:*

enumerator **WIFI\_FAST\_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi\_sort\_method\_t**

*Values:*

enumerator **WIFI\_CONNECT\_AP\_BY\_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

enum **wifi\_ps\_type\_t**

*Values:*

enumerator **WIFI\_PS\_NONE**

No power save

enumerator **WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)

enum **wifi\_bandwidth\_t**

*Values:*

enumerator **WIFI\_BW\_HT20**

enumerator **WIFI\_BW\_HT40**

enum **wifi\_sae\_pwe\_method\_t**

Configuration for SAE PWE derivation

*Values:*

enumerator **WPA3\_SAE\_PWE\_UNSPECIFIED**

enumerator **WPA3\_SAE\_PWE\_HUNT\_AND\_PECK**

enumerator **WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT**

enumerator **WPA3\_SAE\_PWE\_BOTH**

enum **wifi\_sae\_pk\_mode\_t**

Configuration for SAE-PK

*Values:*

enumerator **WPA3\_SAE\_PK\_MODE\_AUTOMATIC**

enumerator **WPA3\_SAE\_PK\_MODE\_ONLY**

enumerator **WPA3\_SAE\_PK\_MODE\_DISABLED**

enum **wifi\_storage\_t**

*Values:*

enumerator **WIFI\_STORAGE\_FLASH**

all configuration will store in both memory and flash

enumerator **WIFI\_STORAGE\_RAM**

all configuration will only store in the memory

enum **wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

enumerator **WIFI\_VND\_IE\_TYPE\_BEACON**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

enum **wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

enumerator **WIFI\_VND\_IE\_ID\_0**

enumerator **WIFI\_VND\_IE\_ID\_1**

enum **wifi\_phy\_mode\_t**

Operation Phymode.

*Values:*

enumerator **WIFI\_PHY\_MODE\_LR**

PHY mode for Low Rate

enumerator **WIFI\_PHY\_MODE\_11B**

PHY mode for 11b

enumerator **WIFI\_PHY\_MODE\_11G**

PHY mode for 11g

enumerator **WIFI\_PHY\_MODE\_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI\_PHY\_MODE\_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI\_PHY\_MODE\_HE20**

PHY mode for Bandwidth HE20

enum **wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

enumerator **WIFI\_PKT\_MGMT**

Management frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_CTRL**

Control frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_DATA**

Data frame, indicates ‘buf’ argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_MISC**

Other type, such as MIMO etc. ‘buf’ argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

enum **wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:*

enumerator **WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

enum **wifi\_nan\_service\_type\_t**

NAN Services types.

*Values:*

enumerator **NAN\_PUBLISH\_SOLICITED**

Send unicast Publish frame to Subscribers that match the requirement

enumerator **NAN\_PUBLISH\_UN SOLICITED**

Send broadcast Publish frames in every Discovery Window(DW)

enumerator **NAN\_SUBSCRIBE\_ACTIVE**

Send broadcast Subscribe frames in every DW

enumerator **NAN\_SUBSCRIBE\_PASSIVE**

Passively listens to Publish frames

enum **wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:*

enumerator **WIFI\_PHY\_RATE\_1M\_L**

1 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_L**

2 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_5M\_L**

5.5 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_11M\_L**

11 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_S**

2 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_5M\_S**

5.5 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_11M\_S**

11 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_48M**

48 Mbps

enumerator **WIFI\_PHY\_RATE\_24M**

24 Mbps

enumerator **WIFI\_PHY\_RATE\_12M**

12 Mbps

enumerator **WIFI\_PHY\_RATE\_6M**

6 Mbps

enumerator **WIFI\_PHY\_RATE\_54M**

54 Mbps

enumerator **WIFI\_PHY\_RATE\_36M**

36 Mbps

enumerator **WIFI\_PHY\_RATE\_18M**

18 Mbps

enumerator **WIFI\_PHY\_RATE\_9M**

9 Mbps rate table and guard interval information for each MCS rate

enumerator **WIFI\_PHY\_RATE\_MCS0\_LGI**

MCS0 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS1\_LGI**

MCS1 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS2\_LGI**

MCS2 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS3\_LGI**

MCS3 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS4\_LGI**

MCS4 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS5\_LGI**

MCS5 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS6\_LGI**

MCS6 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS7\_LGI**

MCS7 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS8\_LGI**

MCS8 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS9\_LGI**

MCS9 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS0\_SGI**

MCS0 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS1\_SGI**

MCS1 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS2\_SGI**

MCS2 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS3\_SGI**

MCS3 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS4\_SGI**

MCS4 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS5\_SGI**

MCS5 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS6\_SGI**

MCS6 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS7\_SGI**

MCS7 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS8\_SGI**

MCS8 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS9\_SGI**

MCS9 with short GI

enumerator **WIFI\_PHY\_RATE\_LORA\_250K**

250 Kbps

enumerator **WIFI\_PHY\_RATE\_LORA\_500K**

500 Kbps

enumerator **WIFI\_PHY\_RATE\_MAX**

enum **wifi\_event\_t**

WiFi event declarations

*Values:*

enumerator **WIFI\_EVENT\_WIFI\_READY**

WiFi ready

enumerator **WIFI\_EVENT\_SCAN\_DONE**

Finished scanning AP

enumerator **WIFI\_EVENT\_STA\_START**

Station start

enumerator **WIFI\_EVENT\_STA\_STOP**

Station stop

enumerator **WIFI\_EVENT\_STA\_CONNECTED**

Station connected to AP

enumerator **WIFI\_EVENT\_STA\_DISCONNECTED**

Station disconnected from AP

enumerator **WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by device's station changed

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

Station wps succeeds in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

Station wps fails in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

Station wps timeout in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

Station wps pin code in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

Station wps overlap in enrollee mode

enumerator **WIFI\_EVENT\_AP\_START**

Soft-AP start

enumerator **WIFI\_EVENT\_AP\_STOP**

Soft-AP stop

enumerator **WIFI\_EVENT\_AP\_STACONNECTED**

a station connected to Soft-AP

enumerator **WIFI\_EVENT\_AP\_STADISCONNECTED**

a station disconnected from Soft-AP

enumerator **WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

enumerator **WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP' s RSSI crossed configured threshold

enumerator **WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

enumerator **WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

enumerator **WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

Station beacon timeout

enumerator **WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START**

Connectionless module wake interval start

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PBC\_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI\_EVENT\_ITWT\_SETUP**

iTWT setup

enumerator **WIFI\_EVENT\_ITWT\_TEARDOWN**

iTWT teardown

enumerator **WIFI\_EVENT\_ITWT\_PROBE**

iTWT probe

enumerator **WIFI\_EVENT\_ITWT\_SUSPEND**

iTWT suspend

enumerator **WIFI\_EVENT\_NAN\_STARTED**

NAN Discovery has started

enumerator **WIFI\_EVENT\_NAN\_STOPPED**

NAN Discovery has stopped

enumerator **WIFI\_EVENT\_NAN\_SVC\_MATCH**

NAN Service Discovery match found

enumerator **WIFI\_EVENT\_NAN\_REPLIED**

Replied to a NAN peer with Service Discovery match

enumerator **WIFI\_EVENT\_NAN\_RECEIVE**

Received a Follow-up message

enumerator **WIFI\_EVENT\_NDP\_INDICATION**

Received NDP Request from a NAN Peer

enumerator **WIFI\_EVENT\_NDP\_CONFIRM**

NDP Confirm Indication

enumerator **WIFI\_EVENT\_NDP\_TERMINATED**

NAN Datapath terminated indication

enumerator **WIFI\_EVENT\_MAX**

Invalid WiFi event ID

enum **wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

enumerator **WPS\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_FAIL\_REASON\_RECV\_M2D**

WPS receive M2D frame

enumerator **WPS\_FAIL\_REASON\_MAX**

enum **wifi\_ftm\_status\_t**

FTM operation status types.

*Values:*

enumerator **FTM\_STATUS\_SUCCESS**

FTM exchange is successful

enumerator **FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM\_STATUS\_NO\_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM\_STATUS\_FAIL**

Unknown error during FTM exchange

enum **wps\_fail\_reason\_t**

*Values:*

enumerator **WPS\_AP\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_AP\_FAIL\_REASON\_CONFIG**

WPS failed due to incorrect config

enumerator **WPS\_AP\_FAIL\_REASON\_AUTH**

WPS failed during auth

enumerator **WPS\_AP\_FAIL\_REASON\_MAX**

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_eap\\_client.h](#)

## Functions

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_enable** (void)

Enable EAP authentication(WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

---

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

---

### Returns

- **ESP\_OK**: EAP authentication enabled successfully.
- **ESP\_ERR\_NO\_MEM**: Failed to enable EAP authentication due to memory allocation failure.

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_disable** (void)

Disable EAP authentication(WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using `esp_wifi_set_config()`.

---

**Returns**

- `ESP_OK`: EAP authentication disabled successfully.
- `ESP_ERR_INVALID_STATE`: EAP client is in an invalid state for disabling.

*esp\_err\_t* **esp\_eap\_client\_set\_identity** (const unsigned char \*identity, int len)

Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

**Parameters**

- **identity** –[in] Pointer to the identity data.
- **len** –[in] Length of the identity data (limited to 1~127 bytes).

**Returns**

- `ESP_OK`: The identity was set successfully.
- `ESP_ERR_INVALID_ARG`: Invalid argument (len <= 0 or len >= 128).
- `ESP_ERR_NO_MEM`: Memory allocation failure.

void **esp\_eap\_client\_clear\_identity** (void)

Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_username** (const unsigned char \*username, int len)

Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

**Parameters**

- **username** –[in] Pointer to the username data.
- **len** –[in] Length of the username data (limited to 1~127 bytes).

**Returns**

- `ESP_OK`: The username was set successfully.
- `ESP_ERR_INVALID_ARG`: Failed due to an invalid argument (len <= 0 or len >= 128).
- `ESP_ERR_NO_MEM`: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_username** (void)

Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_password** (const unsigned char \*password, int len)

Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

**Parameters**

- **password** –[in] Pointer to the password data.
- **len** –[in] Length of the password data (len > 0).

**Returns**

- `ESP_OK`: The password was set successfully.
- `ESP_ERR_INVALID_ARG`: Failed due to an invalid argument (len <= 0).
- `ESP_ERR_NO_MEM`: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_password** (void)

Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_new\_password** (const unsigned char \*new\_password, int len)

Set a new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR\_PASSWD\_EXPIRED is received.

#### Parameters

- **new\_password** –[in] Pointer to the new password data.
- **len** –[in] Length of the new password data.

#### Returns

- ESP\_OK: The new password was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_new\_password** (void)

Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_ca\_cert** (const unsigned char \*ca\_cert, int ca\_cert\_len)

Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

#### Parameters

- **ca\_cert** –[in] Pointer to the CA certificate data.
- **ca\_cert\_len** –[in] Length of the CA certificate data.

#### Returns

- ESP\_OK: The CA certificate was set successfully.

void **esp\_eap\_client\_clear\_ca\_cert** (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_certificate\_and\_key** (const unsigned char \*client\_cert, int client\_cert\_len, const unsigned char \*private\_key, int private\_key\_len, const unsigned char \*private\_key\_password, int private\_key\_passwd\_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client\_cert, private\_key, and private\_key\_password should be zero-terminated.

#### Parameters

- **client\_cert** –[in] Pointer to the client certificate data.
- **client\_cert\_len** –[in] Length of the client certificate data.
- **private\_key** –[in] Pointer to the private key data.
- **private\_key\_len** –[in] Length of the private key data (limited to 1~4096 bytes).
- **private\_key\_password** –[in] Pointer to the private key password data (optional).
- **private\_key\_passwd\_len** –[in] Length of the private key password data (can be 0 for no password).

#### Returns

- ESP\_OK: The certificate, private key, and password (if provided) were set successfully.

void **esp\_eap\_client\_clear\_certificate\_and\_key** (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_disable\_time\_check** (bool disable)

Set EAP client certificates time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

**Parameters** **disable** –[in] True to disable EAP client certificates time check, false to enable it.

**Returns**

- ESP\_OK: The EAP client certificates time check setting was updated successfully.

*esp\_err\_t* **esp\_eap\_client\_get\_disable\_time\_check** (bool \*disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

**Parameters** **disable** –[out] Pointer to a boolean variable to store the disable status.

**Returns**

- ESP\_OK: The status of EAP client certificates time check was retrieved successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_ttls\_phase2\_method** (*esp\_eap\_ttls\_phase2\_types* type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.

**Parameters** **type** –[in] The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

**Returns**

- ESP\_OK: The EAP-TTLS phase 2 method was set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_suiteb\_192bit\_certification** (bool enable)

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

**Parameters** **enable** –[in] True to enable 192-bit Suite-B certification checks, false to disable it.

**Returns**

- ESP\_OK: The 192-bit Suite-B certification checks were set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_pac\_file** (const unsigned char \*pac\_file, int pac\_file\_len)

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client's credentials.

**Attention** 1. For files read from the file system, length has to be decremented by 1 byte.

**Attention** 2. Disabling the ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT config is required to use EAP-FAST.

**Parameters**

- **pac\_file** –[in] Pointer to the PAC file buffer.
- **pac\_file\_len** –[in] Length of the PAC file buffer.

**Returns**

- ESP\_OK: The PAC file for EAP-FAST authentication was set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_fast\_params** (*esp\_eap\_fast\_config* config)

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

**Attention** 1. Disabling the `ESP_WIFI_MBEDTLS_TLS_CLIENT` config is required to use EAP-FAST.

**Parameters** `config` –[in] Configuration structure with Fast Provisioning parameters.

**Returns**

- `ESP_OK`: The parameters for EAP-FAST Phase 1 authentication were set successfully.

*esp\_err\_t* **esp\_eap\_client\_use\_default\_cert\_bundle** (bool use\_default\_bundle)

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

**Parameters** `use_default_bundle` –[in] True to use the default certificate bundle, false to use a custom bundle.

**Returns**

- `ESP_OK`: The option to use the default certificate bundle was set successfully.

## Structures

struct **esp\_eap\_fast\_config**

Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).

This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

## Public Members

int **fast\_provisioning**

Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int **fast\_max\_pac\_list\_len**

Maximum length of the PAC (Protected Access Credential) list

bool **fast\_pac\_format\_binary**

Set to true for binary format PAC, false for ASCII format PAC

## Enumerations

enum **esp\_eap\_ttls\_phase2\_types**

Enumeration of phase 2 authentication types for EAP-TTLS.

This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.

*Values:*

enumerator **ESP\_EAP\_TTLS\_PHASE2\_EAP**

EAP (Extensible Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_MSCHAPV2**

MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_MSCHAP**

MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_PAP**

PAP (Password Authentication Protocol)

enumerator **ESP\_EAP\_TTLS\_PHASE2\_CHAP**

CHAP (Challenge Handshake Authentication Protocol)

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_wps.h](#)

### Functions

*esp\_err\_t* **esp\_wifi\_wps\_enable** (const *esp\_wps\_config\_t* \*config)

Enable Wi-Fi WPS function.

**Parameters** *config* –: WPS config to be used in connection

#### Returns

- **ESP\_OK** : succeed
- **ESP\_ERR\_WIFI\_WPS\_TYPE** : wps type is invalid
- **ESP\_ERR\_WIFI\_WPS\_MODE** : wifi is not in station mode or sniffer mode is on
- **ESP\_FAIL** : wps initialization fails

*esp\_err\_t* **esp\_wifi\_wps\_disable** (void)

Disable Wi-Fi WPS function and release resource it taken.

#### Returns

- **ESP\_OK** : succeed
- **ESP\_ERR\_WIFI\_WPS\_MODE** : wifi is not in station mode or sniffer mode is on

*esp\_err\_t* **esp\_wifi\_wps\_start** (int timeout\_ms)

Start WPS session.

**Attention** WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters** *timeout\_ms* –: deprecated: This argument's value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See *wifi\_event\_t* enum for more info.

#### Returns

- **ESP\_OK** : succeed
- **ESP\_ERR\_WIFI\_WPS\_TYPE** : wps type is invalid
- **ESP\_ERR\_WIFI\_WPS\_MODE** : wifi is not in station mode or sniffer mode is on
- **ESP\_ERR\_WIFI\_WPS\_SM** : wps state machine is not initialized
- **ESP\_FAIL** : wps initialization fails

*esp\_err\_t* **esp\_wifi\_ap\_wps\_enable** (const *esp\_wps\_config\_t* \*config)

Enable Wi-Fi AP WPS function.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** **config** –wps configuration to be used.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_WIFI\_WPS\_TYPE : wps type is invalid
- ESP\_ERR\_WIFI\_WPS\_MODE : wifi is not in station mode or sniffer mode is on
- ESP\_FAIL : wps initialization fails

*esp\_err\_t* **esp\_wifi\_ap\_wps\_disable** (void)

Disable Wi-Fi SoftAP WPS function and release resource it taken.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_WIFI\_WPS\_MODE : wifi is not in station mode or sniffer mode is on

*esp\_err\_t* **esp\_wifi\_ap\_wps\_start** (const unsigned char \*pin)

WPS starts to work.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** **pin** –: Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during *esp\_wifi\_ap\_wps\_enable()* and reported in `WIFI_EVENT_AP_WPS_RG_PIN`

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_WIFI\_WPS\_TYPE : wps type is invalid
- ESP\_ERR\_WIFI\_WPS\_MODE : wifi is not in station mode or sniffer mode is on
- ESP\_ERR\_WIFI\_WPS\_SM : wps state machine is not initialized
- ESP\_FAIL : wps initialization fails

## Structures

struct **wps\_factory\_information\_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

## Public Members

char **manufacturer**[WPS\_MAX\_MANUFACTURER\_LEN]

Manufacturer of the device. If empty, the default manufacturer is used.

char **model\_number**[WPS\_MAX\_MODEL\_NUMBER\_LEN]

Model number of the device. If empty, the default model number is used.

char **model\_name**[WPS\_MAX\_MODEL\_NAME\_LEN]

Model name of the device. If empty, the default model name is used.

char **device\_name**[WPS\_MAX\_DEVICE\_NAME\_LEN]

Device name. If empty, the default device name is used.

struct **esp\_wps\_config\_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

### Public Members

*wps\_type\_t* **wps\_type**

The type of WPS to be used (PBC or PIN).

*wps\_factory\_information\_t* **factory\_info**

Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

char **pin**[PIN\_LEN]

WPS PIN (Personal Identification Number) used when `wps_type` is set to `WPS_TYPE_PIN`.

### Macros

**ESP\_ERR\_WIFI\_REGISTRAR**

WPS registrar is not supported

**ESP\_ERR\_WIFI\_WPS\_TYPE**

WPS type error

**ESP\_ERR\_WIFI\_WPS\_SM**

WPS state machine is not initialized

**WPS\_MAX\_MANUFACTURER\_LEN**

Maximum length of the manufacturer name in WPS information

**WPS\_MAX\_MODEL\_NUMBER\_LEN**

Maximum length of the model number in WPS information

**WPS\_MAX\_MODEL\_NAME\_LEN**

Maximum length of the model name in WPS information

**WPS\_MAX\_DEVICE\_NAME\_LEN**

Maximum length of the device name in WPS information

**PIN\_LEN**

The length of the WPS PIN (Personal Identification Number).

**WPS\_CONFIG\_INIT\_DEFAULT** (type)

Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a `esp_wps_config_t` structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

**Parameters**

- **type** –The WPS type to be used (PBC or PIN).

**Returns** An initialized `esp_wps_config_t` structure with the specified WPS type and default values.

**Type Definitions**

```
typedef enum wps_type wps_type_t
```

Enumeration of WPS (Wi-Fi Protected Setup) types.

**Enumerations**

```
enum wps_type
```

Enumeration of WPS (Wi-Fi Protected Setup) types.

*Values:*

```
enumerator WPS_TYPE_DISABLE
```

WPS is disabled

```
enumerator WPS_TYPE_PBC
```

WPS Push Button Configuration method

```
enumerator WPS_TYPE_PIN
```

WPS PIN (Personal Identification Number) method

```
enumerator WPS_TYPE_MAX
```

Maximum value for WPS type enumeration

**Header File**

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_rrm.h](#)

**Functions**

```
int esp_rrm_send_neighbor_rep_request (neighbor_rep_request_cb cb, void *cb_ctx)
```

Send Radio measurement neighbor report request to connected AP.

**Parameters**

- **cb** –callback function for neighbor report
- **cb\_ctx** –callback context

**Returns**

- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

```
bool esp_rrm_is_rrm_supported_connection (void)
```

Check RRM capability of connected AP.

**Returns**

- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

### Type Definitions

typedef void (**\*neighbor\_rep\_request\_cb**)(void \*ctx, const uint8\_t \*report, size\_t report\_len)

Callback function type to get neighbor report.

**Param ctx** neighbor report context

**Param report** neighbor report

**Param report\_len** neighbor report length

**Return**

- void

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_wnm.h](#)

### Functions

int **esp\_wnm\_send\_bss\_transition\_mgmt\_query** (enum *btm\_query\_reason* query\_reason, const char \*btm\_candidates, int cand\_list)

Send bss transition query to connected AP.

#### Parameters

- **query\_reason** –reason for sending query
- **btm\_candidates** –btm candidates list if available
- **cand\_list** –whether candidate list to be included from scan results available in supplicant's cache.

#### Returns

- 0: success
- -1: AP does not support BTM
- -2: station not connected to AP

bool **esp\_wnm\_is\_btm\_supported\_connection** (void)

Check bss transition capability of connected AP.

#### Returns

- true: AP supports BTM
- false: AP does not support BTM or station not connected to AP

### Enumerations

enum **btm\_query\_reason**

enum btm\_query\_reason: Reason code for sending btm query

*Values:*

enumerator **REASON\_UNSPECIFIED**

enumerator **REASON\_FRAME\_LOSS**

enumerator **REASON\_DELAY**

enumerator **REASON\_BANDWIDTH**

enumerator **REASON\_LOAD\_BALANCE**

enumerator **REASON\_RSSI**

enumerator **REASON\_RETRANSMISSIONS**

enumerator **REASON\_INTERFERENCE**

enumerator **REASON\_GRAY\_ZONE**

enumerator **REASON\_PREMIUM\_AP**

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_mbo.h](#)

### Functions

int **esp\_mbo\_update\_non\_pref\_chan** (struct *non\_pref\_chan\_s* \*non\_pref\_chan)

Update channel preference for MBO IE.

**Parameters** *non\_pref\_chan* –Non preference channel list

**Returns**

- 0: success else failure

### Structures

struct **non\_pref\_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

### Public Members

enum *non\_pref\_chan\_reason* **reason**

Reason for the channel being non-preferred

uint8\_t **oper\_class**

Operating class of the channel

uint8\_t **chan**

Channel number

uint8\_t **preference**

Preference level of the channel

struct **non\_pref\_chan\_s**

Structure representing a list of non-preferred channels in a wireless network.

This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

## Public Members

size\_t **non\_pref\_chan\_num**

Number of non-preferred channels in the list

struct *non\_pref\_chan* **chan**[]

Array of structures representing individual non-preferred channels

## Enumerations

enum **non\_pref\_chan\_reason**

Enumeration of reasons for a channel being non-preferred in a wireless network.

This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

*Values:*

enumerator **NON\_PREF\_CHAN\_REASON\_UNSPECIFIED**

Unspecified reason for non-preference

enumerator **NON\_PREF\_CHAN\_REASON\_RSSI**

Non-preferred due to low RSSI (Received Signal Strength Indication)

enumerator **NON\_PREF\_CHAN\_REASON\_EXT\_INTERFERENCE**

Non-preferred due to external interference

enumerator **NON\_PREF\_CHAN\_REASON\_INT\_INTERFERENCE**

Non-preferred due to internal interference

## Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-C6 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C6 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-C6 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

## API Reference

### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_dpp.h](#)

### Functions

*esp\_err\_t* **esp\_supp\_dpp\_init** (*esp\_supp\_dpp\_event\_cb\_t* evt\_cb)

Initialize DPP Supplicant.

Starts DPP Supplicant **and** initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

**Parameters** *evt\_cb* –Callback function to receive DPP related events

void **esp\_supp\_dpp\_deinit** (void)

De-initialize DPP Supplicant.

Frees memory **from DPP** Supplicant Data Structures.

*esp\_err\_t* **esp\_supp\_dpp\_bootstrap\_gen** (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information **as** an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

#### Parameters

- **chan\_list** –List of channels device will be available on for listening
- **type** –Bootstrap method type, only QR Code method is supported for now.
- **key** –(Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** –(Optional) Ancilliary Device Information like Serial Number

#### Returns

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* **esp\_supp\_dpp\_start\_listen** (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel **from Channel** List **for** a pre-defined wait time.

#### Returns

- ESP\_OK: Success
- ESP\_FAIL: Generic Failure
- ESP\_ERR\_INVALID\_STATE: ROC attempted before WiFi is started
- ESP\_ERR\_NO\_MEM: Memory allocation failed while posting ROC request

void **esp\_supp\_dpp\_stop\_listen** (void)

Stop listening on Channels.

Stops listening on Channels **and** cancels ongoing listen operation.

## Macros

### ESP\_ERR\_DPP\_FAILURE

Generic failure during DPP Operation

### ESP\_ERR\_DPP\_TX\_FAILURE

DPP Frame Tx failed OR not Acked

### ESP\_ERR\_DPP\_INVALID\_ATTR

Encountered invalid DPP Attribute

## Type Definitions

typedef enum *dpp\_bootstrap\_type* **esp\_supp\_dpp\_bootstrap\_t**

Types of Bootstrap Methods for DPP.

typedef void (\***esp\_supp\_dpp\_event\_cb\_t**)(*esp\_supp\_dpp\_event\_t* evt, void \*data)

Callback function for receiving DPP Events from Supplicant.

Callback function will be called **with** DPP related information.

**Param evt** DPP event ID

**Param data** Event data payload

## Enumerations

enum **dpp\_bootstrap\_type**

Types of Bootstrap Methods for DPP.

*Values:*

enumerator **DPP\_BOOTSTRAP\_QR\_CODE**

QR Code Method

enumerator **DPP\_BOOTSTRAP\_PKEX**

Proof of Knowledge Method

enumerator **DPP\_BOOTSTRAP\_NFC\_URI**

NFC URI record Method

enum **esp\_supp\_dpp\_event\_t**

Types of Callback Events received from DPP Supplicant.

*Values:*

enumerator **ESP\_SUPP\_DPP\_URI\_READY**

URI is ready through Bootstrapping

enumerator **ESP\_SUPP\_DPP\_CFG\_RECVD**

Config received via DPP Authentication

enumerator **ESP\_SUPP\_DPP\_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.

Code examples for ESP-WIFI-MESH are provided in the [mesh](#) directory of ESP-IDF examples.

## 2.5.2 Ethernet

### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc Control of Ethernet Driver*

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

Fig. 4: Ethernet Data Frame Format

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field. If the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = 0800H

- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They're not supported in ESP-IDF.

---

**Configure MAC and PHY** The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.

- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

### SPI-Ethernet Module

```
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // apply default
↳common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // apply default PHY
↳configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                // alter the PHY
↳address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // alter the GPIO
↳used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);
```

### Note:

- When creating MAC and PHY instances for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don't have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's specs and the examples in ESP-IDF.

**Install Driver** To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g. TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver_
↳configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get_
↳the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

The Ethernet driver also includes an event-driven model, which will send useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that runs in the_
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);_
↳// register Ethernet event handler (to deal with user specific stuff when event_
↳like link up/down happened) (continues on next page)
```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it's infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to [LwIP](#).

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to [Network Interface](#).

```
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user's handlers.

**Misc Control of Ethernet Driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`

- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
         mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_
         →addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow Control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing that should be kept in mind is that the pause frame ability will be advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: [ethernet/basic](#)
- Ethernet iperf example: [ethernet/iperf](#)
- Ethernet to Wi-Fi AP “router” : [ethernet/eth2ap](#)
- Most protocol examples should also work for Ethernet: [protocols](#)

### Advanced Topics

**Custom PHY Driver** There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user’s actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called “MII Management Interface” to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

---

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

---

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#). However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

#### Steps to create a custom PHY driver:

1. Define vendor-specific registry layout based on the PHY datasheet. See [esp\\_eth/src/esp\\_eth\\_phy\\_ip101.c](#) as an example.
2. Prepare derived PHY management object info structure which:
  - must contain at least parent IEEE 802.3 [phy\\_802\\_3\\_t](#) object
  - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp\\_eth/src/esp\\_eth\\_phy\\_ksz80xx.c](#) as an example.
3. Define chip-specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via [IDF Component Registry](#).

## API Reference

### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_driver.h](#)

### Functions

[esp\\_err\\_t esp\\_eth\\_driver\\_install](#) (const [esp\\_eth\\_config\\_t](#) \*config, [esp\\_eth\\_handle\\_t](#) \*out\_hdl)

Install Ethernet driver.

#### Parameters

- **config** –[in] configuration of the Ethernet driver
- **out\_hdl** –[out] handle of Ethernet driver

#### Returns

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

[esp\\_err\\_t esp\\_eth\\_driver\\_uninstall](#) ([esp\\_eth\\_handle\\_t](#) hdl)

Uninstall Ethernet driver.

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

#### Returns

- ESP\_OK: uninstall esp\_eth driver successfully

- `ESP_ERR_INVALID_ARG`: uninstall `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: uninstall `esp_eth` driver failed because it has more than one reference
- `ESP_FAIL`: uninstall `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**Note:** This API will start driver state machine and internal software timer (for checking link status).

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: start `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: start `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: start `esp_eth` driver failed because driver has started already
- `ESP_FAIL`: start `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_stop** (*esp\_eth\_handle\_t* hdl)

Stop Ethernet driver.

---

**Note:** This function does the oppsite operation of `esp_eth_start`.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: stop `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: stop `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: stop `esp_eth` driver failed because driver has not started yet
- `ESP_FAIL`: stop `esp_eth` driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_update\_input\_path** (*esp\_eth\_handle\_t* hdl, *esp\_err\_t* (\*stack\_input)(*esp\_eth\_handle\_t* hdl, uint8\_t \*buffer, uint32\_t length, void \*priv), void \*priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**Note:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **stack\_input** –[in] function pointer, which does the actual process on incoming packets
- **priv** –[in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit** (*esp\_eth\_handle\_t* hdl, void \*buf, size\_t length)

General Transmit.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **buf** –[in] buffer of the packet to transfer
- **length** –[in] length of the buffer to transfer

**Returns**

- ESP\_OK: transmit frame buffer successfully
- ESP\_ERR\_INVALID\_ARG: transmit frame buffer failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_transmit\_vargs** (*esp\_eth\_handle\_t* hdl, uint32\_t argc, ...)

Special Transmit with variable number of arguments.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **argc** –[in] number variable arguments
- ... –variable arguments

**Returns**

- ESP\_OK: transmit successfull
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Etherent driver.

The following common IO control commands are supported:

- ETH\_CMD\_S\_MAC\_ADDR sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH\_CMD\_G\_MAC\_ADDR gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH\_CMD\_S\_PHY\_ADDR sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32\_t* datatype from where the configuration option is read.
- ETH\_CMD\_G\_PHY\_ADDR gets PHY address. *data* argument is pointer to memory of *uint32\_t* datatype to which the PHY address is to be stored.
- ETH\_CMD\_S\_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH\_CMD\_G\_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype to which the current configuration is to be stored.
- ETH\_CMD\_S\_SPEED sets the Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH\_CMD\_G\_SPEED gets current Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype to which the speed is to be stored.
- ETH\_CMD\_S\_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_FLOW\_CTRL sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_DUPLEX\_MODE sets the Ethernet duplex mode. *data* argument is pointer to memory of *eth\_duplex\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

- `ETH_CMD_G_DUPLEX_MODE` gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- `ETH_CMD_S_PHY_LOOPBACK` sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** –[in] handle of Ethernet driver
- **cmd** –[in] IO control command
- **data** –[inout] address of data for `set` command or address where to store the data when used with `get` command

**Returns**

- `ESP_OK`: process io command successfully
- `ESP_ERR_INVALID_ARG`: process io command failed because of some invalid argument
- `ESP_FAIL`: process io command failed because some other error occurred
- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**Note:** Ethernet driver handle can be obtained by `os_timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Parameters** **hdl** –[in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

**Structures**

struct **esp\_eth\_config\_t**

Configuration of Ethernet driver.

**Public Members**

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (\***stack\_input**)(*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Param eth\_handle [in]** handle of Ethernet driver

**Param buffer [in]** frame buffer that will get input to upper stack

**Param length [in]** length of the frame buffer

**Return**

- ESP\_OK: input frame buffer to upper stack successfully
- ESP\_FAIL: error occurred when inputting buffer to upper stack

*esp\_err\_t* (\***on\_lowlevel\_init\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding

read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

### Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

typedef void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

### Enumerations

enum **esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:*

enumerator **ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

enumerator **ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

enumerator **ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

enumerator **ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

enumerator **ETH\_CMD\_G\_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH\_CMD\_S\_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_SPEED**

Set Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

enumerator **ETH\_CMD\_S\_FLOW\_CTRL**

Set flow control

enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**

Get Duplex mode

enumerator **ETH\_CMD\_S\_DUPLEX\_MODE**

Set Duplex mode

enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**

Set PHY loopback

enumerator **ETH\_CMD\_CUSTOM\_MAC\_CMDS**

enumerator **ETH\_CMD\_CUSTOM\_PHY\_CMDS**

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_com.h](#)

## Structures

struct **esp\_eth\_mediator\_s**

Ethernet mediator.

## Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth [in]** mediator of Ethernet driver

**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully

- **ESP\_FAIL**: write PHY register failed because some error occurred

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- **ESP\_OK**: deliver packet to upper stack successfully
- **ESP\_FAIL**: deliver packet failed because some error occurred

*esp\_err\_t* (**\*on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- **ESP\_OK**: process the new state successfully
- **ESP\_FAIL**: process the new state failed because some error occurred

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac.h](#)

### Unions

union **eth\_mac\_clock\_config\_t**

*#include* <esp\_eth\_mac.h> Ethernet MAC Clock Configuration.

### Public Members

struct *eth\_mac\_clock\_config\_t*::[anonymous] **mii**

EMAC MII Clock Configuration

*emac\_rmii\_clock\_mode\_t* **clock\_mode**

RMII Clock Mode Configuration

*emac\_rmii\_clock\_gpio\_t* **clock\_gpio**

RMII Clock GPIO Configuration

struct *eth\_mac\_clock\_config\_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

### Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

### Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (\***init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***transmit**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t length)

Transmit packet from Ethernet MAC.

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***transmit\_vargs**)(*esp\_eth\_mac\_t* \*mac, uint32\_t argc, va\_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

---

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

---

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param argc [in]** number variable arguments

**Param args [in]** variable arguments

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

---

**Note:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, eth\_speed\_t speed)

Set speed of MAC.

**Param ma:c [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, eth\_duplex\_t duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, eth\_link\_t link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (\***set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (\***enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (\***set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_mac\_t* \*mac, uint32\_t cmd, void \*data)

Custom IO function of MAC driver. This function is intended to extend common options of `esp_eth_ioctl` to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

---

**Param mac [in]** Ethernet MAC instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for `set` command or address where to store the data when used with `get` command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (\***del**)(*esp\_eth\_mac\_t* \*mac)

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

uint32\_t **flags**

Flags that specify extra capability for mac driver

### Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG()**

Default configuration for Ethernet MAC object.

### Type Definitions

typedef struct *esp\_eth\_mac\_s* **esp\_eth\_mac\_t**

Ethernet MAC.

### Enumerations

enum **emac\_rmii\_clock\_mode\_t**

RMII Clock Mode Options.

*Values:*

enumerator **EMAC\_CLK\_DEFAULT**

Default values configured using Kconfig are going to be used when “Default” selected.

enumerator **EMAC\_CLK\_EXT\_IN**

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

---

**Note:** MAC will get RMI clock from outside. Note that ESP32 only supports GPIO0 to input the RMI clock.

---

enumerator **EMAC\_CLK\_OUT**

Output RMI Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

enum **emac\_rmii\_clock\_gpio\_t**

RMI Clock GPIO number Options.

*Values:*

enumerator **EMAC\_CLK\_IN\_GPIO**

MAC will get RMI clock from outside at this GPIO.

---

**Note:** ESP32 only supports GPIO0 to input the RMI clock.

---

enumerator **EMAC\_APPL\_CLK\_OUT\_GPIO**

Output RMI Clock from internal APLL Clock available at GPIO0.

---

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMI clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC\_CLK\_OUT\_GPIO**

Output RMI Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC\_CLK\_OUT\_180\_GPIO**

Inverted Output RMI Clock from internal APLL Clock available at GPIO17.

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy.h](#)

## Functions

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ip101** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of IP101.

**Parameters** *config* –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of RTL8201.

**Parameters** *config* –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully

- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan87xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN87xx.

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of DP83848.

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ksz80xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters** **config** –[in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

## Structures

struct **esp\_eth\_phy\_s**

Ethernet PHY.

## Public Members

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Param phy** [in] Ethernet PHY instance

**Param mediator** [in] mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

*esp\_err\_t* (\***reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Param phy** [in] Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

---

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (\***autonego\_ctrl**)(*esp\_eth\_phy\_t* \*phy, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Configure auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego\_en\_stat [out]** Address where to store current status of auto negotiation configuration

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid command

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrctl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, uint32\_t \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, uint32\_t ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (\***loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Sets the PHY to loopback mode.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: PHY instance loopback mode has been configured successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_phy\_t* \*phy, eth\_speed\_t speed)

Sets PHY speed mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param speed [in]** Speed mode to be set

**Return**

- ESP\_OK: PHY instance speed mode has been configured successfully
- ESP\_FAIL: PHY instance speed mode configuration failed because some error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_phy\_t* \*phy, eth\_duplex\_t duplex)

Sets PHY duplex mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param duplex [in]** Duplex mode to be set

**Return**

- ESP\_OK: PHY instance duplex mode has been configured successfully
- ESP\_FAIL: PHY instance duplex mode configuration failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_phy\_t* \*phy, uint32\_t cmd, void \*data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of PHY chip.

---

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

---

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

*esp\_err\_t* (\***del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: free PHY instance successfully
- ESP\_FAIL: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset\_gpio\_num**  
Reset GPIO number, -1 means no hardware reset

### Macros

**ESP\_ETH\_PHY\_ADDR\_AUTO**  
**ETH\_PHY\_DEFAULT\_CONFIG()**  
Default configuration for Ethernet PHY object.

### Type Definitions

typedef struct *esp\_eth\_phy\_s* **esp\_eth\_phy\_t**  
Ethernet PHY.

### Enumerations

enum **eth\_phy\_autoneg\_cmd\_t**  
Auto-negotiation controll commands.  
*Values:*  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_RESTART**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_EN**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_DIS**  
  
enumerator **ESP\_ETH\_PHY\_AUTONEGO\_G\_STAT**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy\\_802\\_3.h](#)

### Functions

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset\_hw**(*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t reset\_assert\_us)  
Performs hardware reset with specific reset pin assertion time.

#### Parameters

- **phy\_802\_3** –IEEE 802.3 PHY object infostructure
- **reset\_assert\_us** –Hardware reset pin assertion time

#### Returns

- ESP\_OK: reset Ethernet PHY successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_detect\_phy\_addr**(*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)  
Detect PHY address.

#### Parameters

- **eth** –Mediator of Ethernet driver
- **detected\_addr** –[out] a valid address after detection

#### Returns

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip initialization.

---

**Note:** It should be called as the first function in PHY specific driver instance

---

**Parameters** *phy\_802\_3* –IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: initialized Ethernet PHY successfully
- ESP\_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: PHY device not detected
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip de-initialization.

---

**Note:** It should be called as the last function in PHY specific driver instance

---

**Parameters** *phy\_802\_3* –IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: de-initialized Ethernet PHY successfully
- ESP\_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_oui** (*phy\_802\_3\_t* \*phy\_802\_3, *uint32\_t* \*oui)

Reads raw content of OUI field.

**Parameters**

- *phy\_802\_3* –IEEE 802.3 PHY object infostructure
- *oui* –[out] OUI value

**Returns**

- ESP\_OK: OUI field read successfully
- ESP\_FAIL: OUI field read failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid *oui* argument
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_manufac\_info** (*phy\_802\_3\_t* \*phy\_802\_3, *uint8\_t* \*model, *uint8\_t* \*rev)

Reads manufacturer' s model and revision number.

**Parameters**

- *phy\_802\_3* –IEEE 802.3 PHY object infostructure
- *model* –[out] Manufacturer' s model number (can be NULL when not required)
- *rev* –[out] Manufacturer' s revision number (can be NULL when not required)

**Returns**

- ESP\_OK: Manufacturer' s info read successfully
- ESP\_FAIL: Manufacturer' s info read failed because some error occurred
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*phy\_802\_3\_t* \***esp\_eth\_phy\_into\_phy\_802\_3** (*esp\_eth\_phy\_t* \*phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters** `phy` –Ethernet PHY instance

**Returns** `phy_802_3_t*`

- address to parent IEEE 802.3 PHY object infostructure

`esp_err_t esp_eth_phy_802_3_obj_config_init` (`phy_802_3_t *phy_802_3`, const `eth_phy_config_t *config`)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**

- `phy_802_3` –Address to IEEE 802.3 PHY object infostructure
- `config` –Configuration of the IEEE 802.3 PHY object

**Returns**

- `ESP_OK`: configuration initialized successfully
- `ESP_ERR_INVALID_ARG`: invalid `config` argument

## Structures

struct `phy_802_3_t`

IEEE 802.3 PHY object infostructure.

## Public Members

`esp_eth_phy_t parent`

Parent Ethernet PHY instance

`esp_eth_mediator_t *eth`

Mediator of Ethernet driver

int `addr`

PHY address

uint32\_t `reset_timeout_ms`

Reset timeout value (Unit: ms)

uint32\_t `autonego_timeout_ms`

Auto-negotiation timeout value (Unit: ms)

eth\_link\_t `link_status`

Current Link status

int `reset_gpio_num`

Reset GPIO number, -1 means no hardware reset

## Header File

- `components/esp_eth/include/esp_eth_netif_glue.h`

## Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**Note:** netif glue is used to attach io driver to TCP/IP netif

---

**Parameters** **eth\_hdl** –Ethernet driver handle

**Returns** glue object, which inherits esp\_netif\_driver\_base\_t

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**Parameters** **eth\_netif\_glue** –netif glue

**Returns** -ESP\_OK: delete netif glue successfully

### Type Definitions

```
typedef struct esp_eth_netif_glue_t *esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

## 2.5.3 Thread

### Thread

**Introduction** [Thread](#) is a IP-based mesh networking protocol. It' s based on the 802.15.4 physical and MAC layer.

**Application Examples** The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot\\_cli](#).
- The Thread border router [openthread/ot\\_br](#).
- The Thread radio co-processor [openthread/ot\\_rcp](#).

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

### Header File

- [components/openthread/include/esp\\_openthread.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_init** (const *esp\_openthread\_platform\_config\_t* \*init\_config)

Initializes the full OpenThread stack.

---

**Note:** The OpenThread instance will also be initialized in this function.

---

**Parameters** **init\_config** –[in] The initialization configuration.

**Returns**

- ESP\_OK on success

- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_ARG if radio or host connection mode not supported
- ESP\_ERR\_INVALID\_STATE if already initialized

*esp\_err\_t* **esp\_openthread\_auto\_start** (otOperationalDatasetTlvs \*datasetTlvs)

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** **datasetTlvs** –[in] The operational dataset (TLV encoded), if it's NULL, the function will generate the dataset based on the configurations from kconfig.

**Returns**

- ESP\_OK on success
- ESP\_FAIL on failures

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**Note:** This function will not return unless error happens when running the OpenThread stack.

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**Note:** This function can be called on other tasks without lock.

---

**Returns** The OpenThread instance pointer

## Header File

- [components/openthread/include/esp\\_openthread\\_types.h](#)

## Structures

struct **esp\_openthread\_role\_changed\_event\_t**

OpenThread role changed event data.

## Public Members

otDeviceRole **previous\_role**

Previous Thread role

otDeviceRole **current\_role**

Current Thread role

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a select() based mainloop.

### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

### Public Members

*uart\_port\_t* **port**

UART port number

*uart\_config\_t* **uart\_config**

UART configuration, see *uart\_config\_t* docs

*gpio\_num\_t* **rx\_pin**

UART RX pin

*gpio\_num\_t* **tx\_pin**

UART TX pin

struct **esp\_openthread\_spi\_host\_config\_t**

The spi port config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_dma\_chan\_t* **dma\_channel**

DMA channel

*spi\_bus\_config\_t* **spi\_interface**

SPI bus

*spi\_device\_interface\_config\_t* **spi\_device**

SPI peripheral device

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_spi\_slave\_config\_t**

The spi slave config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_bus\_config\_t* **bus\_config**

SPI bus config

*spi\_slave\_interface\_config\_t* **slave\_config**

SPI slave config

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_radio\_config\_t**

The OpenThread radio configuration.

### Public Members

*esp\_openthread\_radio\_mode\_t* **radio\_mode**

The radio mode

*esp\_openthread\_uart\_config\_t* **radio\_uart\_config**

The uart configuration to RCP

*esp\_openthread\_spi\_host\_config\_t* **radio\_spi\_config**

The spi configuration to RCP

struct **esp\_openthread\_host\_connection\_config\_t**

The OpenThread host connection configuration.

### Public Members

*esp\_openthread\_host\_connection\_mode\_t* **host\_connection\_mode**

The host connection mode

*esp\_openthread\_uart\_config\_t* **host\_uart\_config**

The uart configuration to host

*usb\_serial\_jtag\_driver\_config\_t* **host\_usb\_config**

The usb configuration to host

*esp\_openthread\_spi\_slave\_config\_t* **spi\_slave\_config**

The spi configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

### Public Members

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

### Public Members

*esp\_openthread\_radio\_config\_t* **radio\_config**

The radio configuration

*esp\_openthread\_host\_connection\_config\_t* **host\_config**

The host connection configuration

*esp\_openthread\_port\_config\_t* **port\_config**

The port configuration

### Type Definitions

typedef void (\***esp\_openthread\_rcp\_failure\_handler**)(void)

## Enumerations

enum **esp\_openthread\_event\_t**

OpenThread event declarations.

*Values:*

enumerator **OPENTHREAD\_EVENT\_START**

OpenThread stack start

enumerator **OPENTHREAD\_EVENT\_STOP**

OpenThread stack stop

enumerator **OPENTHREAD\_EVENT\_DETACHED**

OpenThread detached

enumerator **OPENTHREAD\_EVENT\_ATTACHED**

OpenThread attached

enumerator **OPENTHREAD\_EVENT\_ROLE\_CHANGED**

OpenThread role changed

enumerator **OPENTHREAD\_EVENT\_IF\_UP**

OpenThread network interface up

enumerator **OPENTHREAD\_EVENT\_IF\_DOWN**

OpenThread network interface down

enumerator **OPENTHREAD\_EVENT\_GOT\_IP6**

OpenThread stack added IPv6 address

enumerator **OPENTHREAD\_EVENT\_LOST\_IP6**

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_TREL\_ADD\_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_REMOVE\_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_SET\_DNS\_SERVER**

OpenThread stack set DNS server >

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_MAX**

Using for parameter check

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_CLI\_USB**

CLI USB connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_SPI**

RCP SPI connection to the host

enumerator **HOST\_CONNECTION\_MODE\_MAX**

Using for parameter check

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

#### Returns

- **ESP\_OK** on success
- **ESP\_ERR\_NO\_MEM** if allocation has failed
- **ESP\_ERR\_INVALID\_STATE** if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API lock.

---

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

---

**Parameters** **block\_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

bool **esp\_openthread\_task\_switching\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API task switching lock.

---

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This task\_switching lock allows the OpenThread API can be called in this case.

---

---

**Note:** Please use esp\_openthread\_lock\_acquire() for normal cases.

---

**Parameters** **block\_ticks** –[in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_task\_switching\_lock\_release** (void)

This function releases the OpenThread API task switching lock.

## Header File

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)

## Functions

void \***esp\_openthread\_netif\_glue\_init** (const *esp\_openthread\_platform\_config\_t* \*config)

This function initializes the OpenThread network interface glue.

**Parameters** **config** –[in] The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

void **esp\_openthread\_netif\_glue\_deinit** (void)

This function deinitializes the OpenThread network interface glue.

*esp\_netif\_t* \***esp\_openthread\_get\_netif** (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

## Macros

**ESP\_NETIF\_INHERENT\_DEFAULT\_OPENTHREAD** ()

Default configuration reference of OT esp-netif.

**ESP\_NETIF\_DEFAULT\_OPENTHREAD** ()

## Header File

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)

## Functions

void **esp\_openthread\_set\_backbone\_netif** (*esp\_netif\_t* \*backbone\_netif)

Sets the backbone interface used for border routing.

---

**Note:** This function must be called before `esp_openthread_init`

---

**Parameters** `backbone_netif` –[in] The backbone network interface (WiFi or ethernet)

*esp\_err\_t* **esp\_openthread\_border\_router\_init** (void)

Initializes the border router features of OpenThread.

---

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option `CONFIG_OPENTHREAD_BORDER_ROUTER` is required.

---

### Returns

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if feature not supported
- `ESP_ERR_INVALID_STATE` if already initialized
- `ESP_FIAL` on other failures

*esp\_err\_t* **esp\_openthread\_border\_router\_deinit** (void)

Deinitializes the border router features of OpenThread.

### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if not initialized
- `ESP_FIAL` on other failures

*esp\_netif\_t* \***esp\_openthread\_get\_backbone\_netif** (void)

Gets the backbone interface of OpenThread border router.

**Returns** The backbone interface or NULL if border router not initialized.

void **esp\_openthread\_register\_rcp\_failure\_handler** (*esp\_openthread\_rcp\_failure\_handler* handler)

Registers the callback for RCP failure.

void **esp\_openthread\_rcp\_deinit** (void)

Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the [openthread](#) directory of ESP-IDF examples.

## 2.5.4 ESP-NETIF

### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

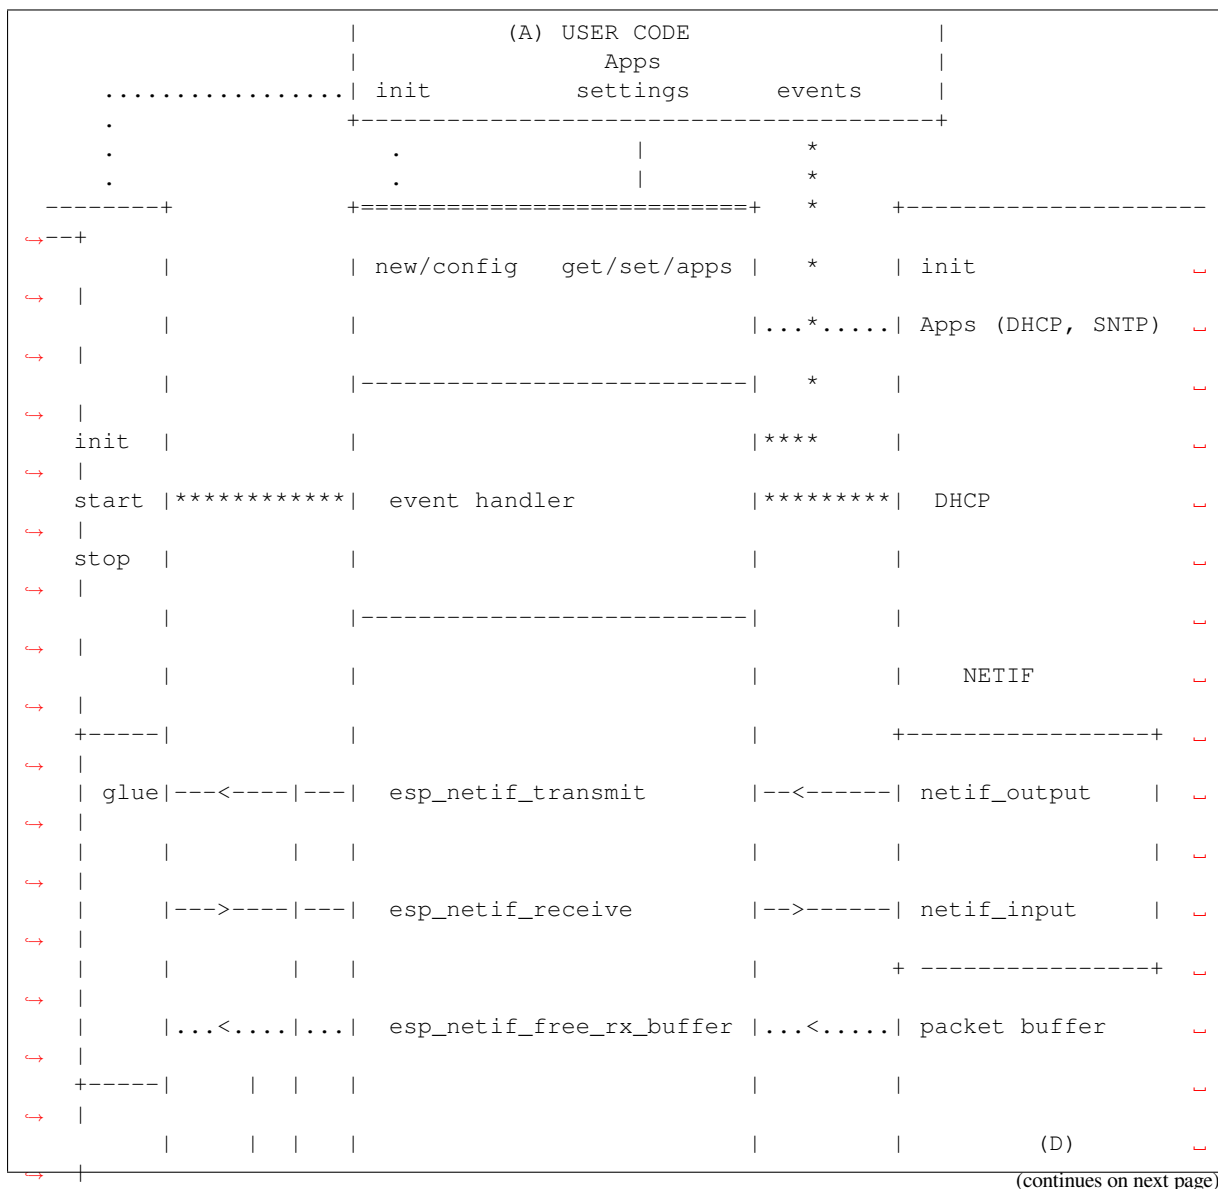

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to [components/esp\\_netif\\_stack/README.md](#).

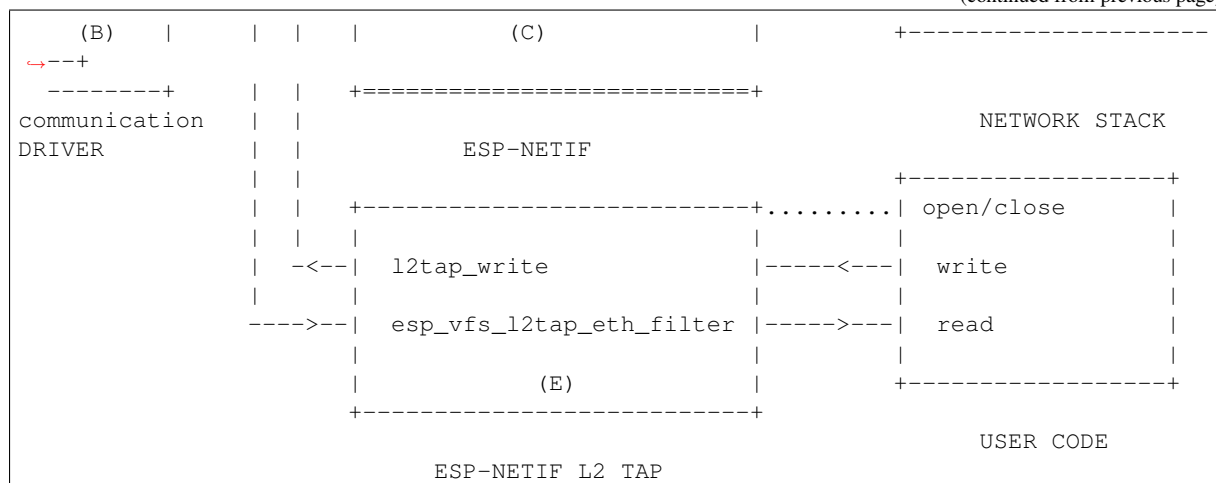

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

### ESP-NETIF architecture

(continued from previous page)

### Data and event flow in the diagram

- ..... Initialization line from user code to ESP-NETIF and communication driver
- --<----->-- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver

- Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
  - [SNTP API](#)
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to [Virtual filesystem component](#) to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

### ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval  $\langle 0, 0x05DC \rangle$  at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

---

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

---

---

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.
- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.  
**EBADF** - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**SNTP API** You can find a brief introduction to SNTP in general, its initialization code and basic modes in *SNTP Time Synchronization* section in the *System Time Document*.

This section provides more details about specific use cases of SNTP service, with statically configured servers, or using DHCP provided servers, or both. The workflow is usually very simple:

- 1) Initialize and configure the service using `esp_netif_sntp_init()`.
- 2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It's useful to start the service explicitly after connecting, if we want to use DHCP obtained NTP servers. (This option needs to be enabled before connecting, but SNTP service should be started after)
- 3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
- 4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic mode with statically defined server(s)** Initialize the module with the default configuration after connecting to network. Note that it's possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
    ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"
↪) );
esp_netif_sntp_init(&config);
```

**Note:** If we want to configure multiple SNTP servers, we have to update lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

**Use DHCP obtained SNTP server(s)** First of all, we have to enable lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and no NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});
config.start = false; // start SNTP service explicitly
config.server_from_dhcp = true; // accept NTP offer from DHCP server
esp_netif_sntp_init(&config);
```

Then, once we're connected, we could start the service using:

```
esp_netif_sntp_start();
```

**Note:** It's also possible to start the service during initialization (default `config.start=true`). This would likely cause the initial SNTP request to fail (since we are not connected yet) and thus some backoff time for subsequent requests.

**Use both static and dynamic servers** Very similar to the scenario above (DHCP provided SNTP server), but in this configuration we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when DHCP provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start SNTP service explicitly
↳(after connecting)
config.server_from_dhcp = true; // accept NTP offers from DHCP server
config.renew_servers_after_new_IP = true; // let esp-netif update configured
↳SNTP server(s) after receiving DHCP lease
config.index_of_first_server = 1; // updates from server num 1, leaving
↳server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
↳the configuration
```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF programmer' s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- L2 TAP: `protocols/l2tap/main/l2tap_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- `components/esp_netif/include/esp_netif.h`

### Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

---

**Note:** This function should be called exactly once from application code, when the application starts up.

---

### Returns

- ESP\_OK on success
- ESP\_FAIL if initializing failed

*esp\_err\_t* **esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization **is not** supported yet

#### Returns

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

*esp\_netif\_t* \***esp\_netif\_new** (const *esp\_netif\_config\_t* \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters** *esp\_netif\_config* –pointer esp-netif configuration

#### Returns

- pointer to esp-netif object on success
- NULL otherwise

void **esp\_netif\_destroy** (*esp\_netif\_t* \*esp\_netif)

Destroys the esp\_netif object.

**Parameters** *esp\_netif* –[in] pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_driver\_ifconfig\_t* \*driver\_config)

Configures driver related options of esp\_netif object.

#### Parameters

- *esp\_netif* –[inout] pointer to the object to be configured
- *driver\_config* –[in] pointer esp-netif io driver related configuration

#### Returns

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_io\_driver\_handle* driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

#### Parameters

- *esp\_netif* –[inout] pointer to esp\_netif object to be attached
- *driver\_handle* –[in] pointer to the driver handle

#### Returns

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's post\_attach callback failed

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

#### Parameters

- *esp\_netif* –[in] Handle to esp-netif instance
- *buffer* –[in] Received data
- *len* –[in] Length of the data frame

- **eb** –[in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

- ESP\_OK

void **esp\_netif\_action\_start** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_stop** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver stop event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_connected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver connected event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon network got IP event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **base** –
- **event\_id** –
- **data** –

*esp\_err\_t* **esp\_netif\_set\_default\_netif** (*esp\_netif\_t* \*esp\_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route\_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route\_prio number (unless the selected netif gets destroyed).

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns** ESP\_OK on success

*esp\_netif\_t* \***esp\_netif\_get\_default\_netif** (void)

Getter function of the default netif.

This API returns the selected default netif.

**Returns** Handle to esp-netif instance of the default netif.

*esp\_err\_t* **esp\_netif\_join\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to join

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_leave\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **addr** –[in] The multicast group to leave

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **mac** –[in] Desired mac address for the related network interface

#### Returns

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error

- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

`esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])`

Get the mac address for the interface instance.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **mac** –[out] Resultant mac address for the related network interface

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

`esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)`

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **hostname** –[in] New hostname for the interface. Maximum length 32 bytes.

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

`esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)`

Get interface hostname.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **hostname** –[out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

`bool esp_netif_is_netif_up (esp_netif_t *esp_netif)`

Test if supplied interface is up or down.

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

#### Returns

- true - Interface is up
- false - Interface is down

`esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[out] If successful, IP information will be returned in this argument.

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t* **esp\_netif\_get\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[out] If successful, IP information will be returned in this argument.

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_set\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**Note:** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

---

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[in] IP information to set on the specified interface

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

*esp\_err\_t* **esp\_netif\_set\_old\_ip\_info** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

#### Parameters

- **esp\_netif** –[in] Handle to esp-netif instance
- **ip\_info** –[in] Store the old IP information for the specified interface

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

`int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)`

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt ()` to bind socket with multicast interface

---

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

`esp_err_t esp_netif_get_netif_impl_name (esp_netif_t *esp_netif, char *name)`

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt ()` to bind socket with appropriate interface

---

**Parameters**

- `esp_netif` –[in] Handle to esp-netif instance
- `name` –[out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

`esp_err_t esp_netif_napt_enable (esp_netif_t *esp_netif)`

Enable NAPT on an interface.

---

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

---

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

`esp_err_t esp_netif_napt_disable (esp_netif_t *esp_netif)`

Disable NAPT on an interface.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

`esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)`

Set or Get DHCP server option.

**Parameters**

- `esp_netif` –[in] Handle to esp-netif instance
- `opt_op` –[in] ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- `opt_id` –[in] Option index to get or set, must be one of the supported enum values.
- `opt_val` –[inout] Pointer to the option parameter.
- `opt_len` –[in] Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **opt\_op** –[in] ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** –[in] Option index to get or set, must be one of the supported enum values.
- **opt\_val** –[inout] Pointer to the option parameter.
- **opt\_len** –[in] Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**Note:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**Note:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP client status.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP Server status.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **status** –[out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** –[in] Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcps\_get\_clients\_by\_mac** (*esp\_netif\_t* \*esp\_netif, int num, *esp\_netif\_pair\_mac\_ip\_t* \*mac\_ip\_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **num** –[in] Number of clients with specified MAC addresses in the array of pairs
- **mac\_ip\_pair** –[inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS on invalid params
- ESP\_ERR\_NOT\_SUPPORTED if DHCP server not enabled

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance

- **type** *–[in]* Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** *–[in]* DNS Server address to set

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **type** *–[in]* Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** *–[out]* DNS Server result is written here on success

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**Parameters** **esp\_netif** *–[in]* Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** *–[in]* Handle to esp-netif instance
- **if\_ip6** *–[out]* IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK

- `ESP_FAIL` If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int `esp_netif_get_all_ip6` (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* if\_ip6[])

Get all IPv6 addresses of the specified interface.

#### Parameters

- `esp_netif` `–[in]` Handle to esp-netif instance
- `if_ip6` `–[out]` Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

void `esp_netif_set_ip4_addr` (*esp\_ip4\_addr\_t* \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

#### Parameters

- `addr` `–[out]` IP address to be set
- `a` `–`the first octet (127 for IP 127.0.0.1)
- `b` `–`
- `c` `–`
- `d` `–`

char \*`esp_ip4addr_ntoa` (const *esp\_ip4\_addr\_t* \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

#### Parameters

- `addr` `–`ip address in network order to convert
- `buf` `–`target buffer where the string is stored
- `buflen` `–`length of buf

**Returns** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32\_t `esp_ip4addr_aton` (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Parameters** `addr` `–`IP address in ascii representation (e.g. “127.0.0.1” )

**Returns** ip address in network order

*esp\_err\_t* `esp_netif_str_to_ip4` (const char \*src, *esp\_ip4\_addr\_t* \*dst)

Converts Ascii internet IPv4 address into `esp_ip4_addr_t`.

#### Parameters

- `src` `–[in]` IPv4 address in ascii representation (e.g. “127.0.0.1” )
- `dst` `–[out]` Address of the target `esp_ip4_addr_t` structure to receive converted address

#### Returns

- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

*esp\_err\_t* `esp_netif_str_to_ip6` (const char \*src, *esp\_ip6\_addr\_t* \*dst)

Converts Ascii internet IPv6 address into `esp_ip4_addr_t` Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1” )

#### Parameters

- `src` `–[in]` IPv6 address in ascii representation (e.g. “2001:0db8:85a3:0000:0000:0000:0002:0001” )
- `dst` `–[out]` Address of the target `esp_ip6_addr_t` structure to receive converted address

#### Returns

- `ESP_OK` on success
- `ESP_FAIL` if conversion failed
- `ESP_ERR_INVALID_ARG` if invalid parameter is passed into

*esp\_netif\_io\_driver\_handle* `esp_netif_get_io_driver` (*esp\_netif\_t* \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** opaque pointer of related IO driver

`esp_netif_t *esp_netif_get_handle_from_ifkey` (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters** `if_key` –Textual description of network interface

**Returns** Handle to esp-netif instance

`esp_netif_flags_t esp_netif_get_flags` (`esp_netif_t *esp_netif`)

Returns configured flags for this interface.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Configuration flags

const char \*`esp_netif_get_ifkey` (`esp_netif_t *esp_netif`)

Returns configured interface key for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Textual description of related interface

const char \*`esp_netif_get_desc` (`esp_netif_t *esp_netif`)

Returns configured interface type for this esp-netif instance.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

int `esp_netif_get_route_prio` (`esp_netif_t *esp_netif`)

Returns configured routing priority number.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** Integer representing the instance's route-prio, or -1 if invalid paramters

int32\_t `esp_netif_get_event_id` (`esp_netif_t *esp_netif`, `esp_netif_ip_event_type_t event_type`)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**

- `esp_netif` –[in] Handle to esp-netif instance
- `event_type` –(either get or lost IP)

**Returns** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

`esp_netif_t *esp_netif_next` (`esp_netif_t *esp_netif`)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

**Parameters** `esp_netif` –[in] Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

size\_t `esp_netif_get_nr_of_ifs` (void)

Returns number of registered esp\_netif objects.

**Returns** Number of esp\_netifs

void `esp_netif_netstack_buf_ref` (void \*netstack\_buf)

increase the reference counter of net stack buffer

**Parameters** `netstack_buf` –[in] the net stack buffer

void `esp_netif_netstack_buf_free` (void \*netstack\_buf)

free the netstack buffer

**Parameters** `netstack_buf` –[in] the net stack buffer

*esp\_err\_t* **esp\_netif\_tcpip\_exec** (*esp\_netif\_callback\_fn* fn, void \*ctx)

Utility to execute the supplied callback in TCP/IP context.

**Parameters**

- **fn** –Pointer to the callback
- **ctx** –Parameter to the callback

**Returns** The error code (*esp\_err\_t*) returned by the callback

## Type Definitions

typedef *esp\_err\_t* (\***esp\_netif\_callback\_fn**)(void \*ctx)

TCP/IP thread safe callback used with *esp\_netif\_tcpip\_exec()*

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_sntp.h](#)

## Functions

*esp\_err\_t* **esp\_netif\_sntp\_init** (const *esp\_sntp\_config\_t* \*config)

Initialize SNTP with supplied config struct.

**Parameters** **config** –Config struct

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_sntp\_start** (void)

Start SNTP service if it wasn't started during init (config.start = false) or restart it if already started.

**Returns** ESP\_OK on success

void **esp\_netif\_sntp\_deinit** (void)

Deinitialize esp\_netif SNTP module.

*esp\_err\_t* **esp\_netif\_sntp\_sync\_wait** (TickType\_t tout)

Wait for time sync event.

**Parameters** **tout** –Specified timeout in RTOS ticks

**Returns** ESP\_TIMEOUT if sync event didn't come within the timeout  
ESP\_ERR\_NOT\_FINISHED if the sync event came, but we're in smooth update mode and still in progress (SNTP\_SYNC\_STATUS\_IN\_PROGRESS) ESP\_OK if time sync'ed

## Structures

struct **esp\_sntp\_config**

SNTP configuration struct.

### Public Members

bool **smooth\_sync**

set to true if smooth sync required

bool **server\_from\_dhcp**

set to true to request NTP server config from DHCP

bool **wait\_for\_sync**

if true, we create a semaphore to signal time sync event

bool **start**

set to true to automatically start the SNTP service

*esp\_sntp\_time\_cb\_t* **sync\_cb**

optionally sets callback function on time sync event

bool **renew\_servers\_after\_new\_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

*ip\_event\_t* **ip\_event\_to\_renew**

set the IP event id on which we refresh server list (if `renew_servers_after_new_IP=true`)

size\_t **index\_of\_first\_server**

refresh server list after this server (if `renew_servers_after_new_IP=true`)

size\_t **num\_of\_servers**

number of preconfigured NTP servers

const char \***servers**[1]

list of servers

## Macros

**ESP\_SNTP\_SERVER\_LIST** (...)

Utility macro for providing multiple servers in parentheses.

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG\_MULTIPLE** (servers\_in\_list, list\_of\_servers)

Default configuration to init SNTP with multiple servers.

### Parameters

- **servers\_in\_list** –Number of servers in the list
- **list\_of\_servers** –List of servers (use *ESP\_SNTP\_SERVER\_LIST*(...))

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG** (server)

Default configuration with a single server.

## Type Definitions

typedef void (\***esp\_sntp\_time\_cb\_t**)(struct timeval \*tv)

Time sync notification function.

typedef struct *esp\_sntp\_config* **esp\_sntp\_config\_t**

SNTP configuration struct.

## Header File

- `components/esp_netif/include/esp_netif_types.h`

## Structures

struct **esp\_netif\_dns\_info\_t**

DNS server info.

### Public Members

*esp\_ip\_addr\_t* **ip**

IPV4 address of DNS server

struct **esp\_netif\_ip\_info\_t**

Event structure for IP\_EVENT\_STA\_GOT\_IP, IP\_EVENT\_ETH\_GOT\_IP events

### Public Members

*esp\_ip4\_addr\_t* **ip**

Interface IPV4 address

*esp\_ip4\_addr\_t* **netmask**

Interface IPV4 netmask

*esp\_ip4\_addr\_t* **gw**

Interface IPV4 gateway address

struct **esp\_netif\_ip6\_info\_t**

IPV6 IP address information.

### Public Members

*esp\_ip6\_addr\_t* **ip**

Interface IPV6 address

struct **ip\_event\_got\_ip\_t**

Event structure for IP\_EVENT\_GOT\_IP event.

### Public Members

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip\_info\_t* **ip\_info**

IP address, netmask, gateway IP address

bool **ip\_changed**

Whether the assigned IP has changed or not

struct **ip\_event\_got\_ip6\_t**

Event structure for IP\_EVENT\_GOT\_IP6 event

**Public Members**

*esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip6\_info\_t* **ip6\_info**

IPv6 address of the interface

int **ip\_index**

IPv6 address index

struct **ip\_event\_add\_ip6\_t**

Event structure for ADD\_IP6 event

**Public Members**

*esp\_ip6\_addr\_t* **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip\_event\_ap\_staipassigned\_t**

Event structure for IP\_EVENT\_AP\_STAIPASSIGNED event

**Public Members**

*esp\_netif\_t* \***esp\_netif**

Pointer to the associated netif handle

*esp\_ip4\_addr\_t* **ip**

IP address which was assigned to the station

uint8\_t **mac**[6]

MAC address of the connected client

struct **bridgeif\_config**

LwIP bridge configuration

**Public Members**

uint16\_t **max\_fdb\_dyn\_entries**

maximum number of entries in dynamic forwarding database

uint16\_t **max\_fdb\_sta\_entries**

maximum number of entries in static forwarding database

uint8\_t **max\_ports**

maximum number of ports the bridge can consist of

struct **esp\_netif\_inherent\_config**

ESP-netif inherent config parameters.

### Public Members

*esp\_netif\_flags\_t* **flags**

flags that define esp-netif behavior

uint8\_t **mac**[6]

initial mac address for this interface

const *esp\_netif\_ip\_info\_t* \***ip\_info**

initial ip address for this interface

uint32\_t **get\_ip\_event**

event id to be raised when interface gets an IP

uint32\_t **lost\_ip\_event**

event id to be raised when interface loses its IP

const char \***if\_key**

string identifier of the interface

const char \***if\_desc**

textual description of the interface

int **route\_prio**

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route\_prio indicates a higher priority

*bridgeif\_config\_t* \***bridge\_info**

LwIP bridge configuration

struct **esp\_netif\_driver\_base\_s**

ESP-netif driver base handle.

### Public Members

*esp\_err\_t* (**post\_attach**)(*esp\_netif\_t* \*netif, *esp\_netif\_io\_driver\_handle* h)

post attach function pointer

*esp\_netif\_t* \***netif**

netif handle

struct **esp\_netif\_driver\_ifconfig**

Specific IO driver configuration.

### Public Members

*esp\_netif\_iodriver\_handle* **handle**

io-driver handle

*esp\_err\_t* (\***transmit**)(void \*h, void \*buffer, size\_t len)

transmit function pointer

*esp\_err\_t* (\***transmit\_wrap**)(void \*h, void \*buffer, size\_t len, void \*netstack\_buffer)

transmit wrap function pointer

void (\***driver\_free\_rx\_buffer**)(void \*h, void \*buffer)

free rx buffer function pointer

struct **esp\_netif\_config**

Generic esp\_netif configuration.

### Public Members

const *esp\_netif\_inherent\_config\_t* \***base**

base config

const *esp\_netif\_driver\_ifconfig\_t* \***driver**

driver config

const *esp\_netif\_netstack\_config\_t* \***stack**

stack config

struct **esp\_netif\_pair\_mac\_ip\_t**

DHCP client's addr info (pair of MAC and IP address)

### Public Members

uint8\_t **mac**[6]

Clients MAC address

*esp\_ip4\_addr\_t* **ip**

Clients IP address

### Macros

**ESP\_ERR\_ESP\_NETIF\_BASE**

Definition of ESP-NETIF based errors.

**ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS**

**ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED**

**ESP\_ERR\_ESP\_NETIF\_NO\_MEM**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED**

**ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED**

**ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED**

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_NETIF\_BR\_FLOOD**

Definition of ESP-NETIF bridge controll.

**ESP\_NETIF\_BR\_DROP**

**ESP\_NETIF\_BR\_FDW\_CPU**

### Type Definitions

typedef struct esp\_netif\_obj **esp\_netif\_t**

typedef enum *esp\_netif\_flags* **esp\_netif\_flags\_t**

typedef enum *esp\_netif\_ip\_event\_type* **esp\_netif\_ip\_event\_type\_t**

typedef struct *bridgeif\_config* **bridgeif\_config\_t**

LwIP bridge configuration

typedef struct *esp\_netif\_inherent\_config* **esp\_netif\_inherent\_config\_t**

ESP-netif inherent config parameters.

typedef struct *esp\_netif\_config* **esp\_netif\_config\_t**

typedef void \***esp\_netif\_iodriver\_handle**

IO driver handle type.

typedef struct *esp\_netif\_driver\_base\_s* **esp\_netif\_driver\_base\_t**

ESP-netif driver base handle.

typedef struct *esp\_netif\_driver\_ifconfig* **esp\_netif\_driver\_ifconfig\_t**

typedef struct *esp\_netif\_netstack\_config* **esp\_netif\_netstack\_config\_t**

Specific L3 network stack configuration.

typedef *esp\_err\_t* (\***esp\_netif\_receive\_t**)(*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

ESP-NETIF Receive function type.

### Enumerations

enum **esp\_netif\_dns\_type\_t**

Type of DNS server.

*Values:*

enumerator **ESP\_NETIF\_DNS\_MAIN**

DNS main server address

enumerator **ESP\_NETIF\_DNS\_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_MAX**

enum **esp\_netif\_dhcp\_status\_t**

Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_DHCP\_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP\_NETIF\_DHCP\_STARTED**

DHCP client/server has been started

enumerator **ESP\_NETIF\_DHCP\_STOPPED**

DHCP client/server has been stopped

enumerator **ESP\_NETIF\_DHCP\_STATUS\_MAX**

enum **esp\_netif\_dhcp\_option\_mode\_t**

Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP\_NETIF\_OP\_START**

enumerator **ESP\_NETIF\_OP\_SET**

Set option

enumerator **ESP\_NETIF\_OP\_GET**

Get option

enumerator **ESP\_NETIF\_OP\_MAX**

enum **esp\_netif\_dhcp\_option\_id\_t**

Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_SUBNET\_MASK**

Network mask

enumerator **ESP\_NETIF\_DOMAIN\_NAME\_SERVER**

Domain name server

enumerator **ESP\_NETIF\_ROUTER\_SOLICITATION\_ADDRESS**

Solicitation router address

enumerator **ESP\_NETIF\_REQUESTED\_IP\_ADDRESS**

Request specific IP address

enumerator **ESP\_NETIF\_IP\_ADDRESS\_LEASE\_TIME**

Request IP address lease time

enumerator **ESP\_NETIF\_IP\_REQUEST\_RETRY\_TIME**

Request IP address retry counter

enumerator **ESP\_NETIF\_VENDOR\_CLASS\_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP\_NETIF\_VENDOR\_SPECIFIC\_INFO**

Vendor Specific Information of a DHCP server

enum **ip\_event\_t**

IP event declarations

*Values:*

enumerator **IP\_EVENT\_STA\_GOT\_IP**

station got IP from connected AP

enumerator **IP\_EVENT\_STA\_LOST\_IP**

station lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_AP\_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP\_EVENT\_GOT\_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP\_EVENT\_ETH\_GOT\_IP**

ethernet got IP from connected AP

enumerator **IP\_EVENT\_ETH\_LOST\_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_PPP\_GOT\_IP**

PPP interface got IP

enumerator **IP\_EVENT\_PPP\_LOST\_IP**

PPP interface lost IP

enum **esp\_netif\_flags**

*Values:*

enumerator **ESP\_NETIF\_DHCP\_CLIENT**

enumerator **ESP\_NETIF\_DHCP\_SERVER**

enumerator **ESP\_NETIF\_FLAG\_AUTOUP**

enumerator **ESP\_NETIF\_FLAG\_GARP**

enumerator **ESP\_NETIF\_FLAG\_EVENT\_IP\_MODIFIED**

enumerator **ESP\_NETIF\_FLAG\_IS\_PPP**

enumerator **ESP\_NETIF\_FLAG\_IS\_BRIDGE**

enumerator **ESP\_NETIF\_FLAG\_MLDV6\_REPORT**

enum **esp\_netif\_ip\_event\_type**

*Values:*

enumerator **ESP\_NETIF\_IP\_EVENT\_GOT\_IP**

enumerator **ESP\_NETIF\_IP\_EVENT\_LOST\_IP**

## Header File

- `components/esp_netif/include/esp_netif_ip_addr.h`

## Functions

`esp_ip6_addr_type_t esp_netif_ip6_get_addr_type (esp_ip6_addr_t *ip6_addr)`

Get the IPv6 address type.

**Parameters** `ip6_addr` –[in] IPv6 type

**Returns** IPv6 type in form of enum `esp_ip6_addr_type_t`

static inline void `esp_netif_ip_addr_copy (esp_ip_addr_t *dest, const esp_ip_addr_t *src)`

Copy IP addresses.

### Parameters

- `dest` –[out] destination IP
- `src` –[in] source IP

## Structures

struct `esp_ip6_addr`

IPv6 address.

### Public Members

uint32\_t `addr`[4]

IPv6 address

uint8\_t `zone`

zone ID

struct `esp_ip4_addr`

IPv4 address.

### Public Members

uint32\_t `addr`

IPv4 address

struct `_ip_addr`

IP address.

### Public Members

`esp_ip6_addr_t ip6`

IPv6 address type

`esp_ip4_addr_t ip4`

IPv4 address type

union *\_ip\_addr*::[anonymous] **u\_addr**

IP address union

uint8\_t **type**

ipaddress type

### Macros

### Functions

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_register** (*l2tap\_vfs\_config\_t* \*config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters** **config** –L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- **ESP\_OK** on success

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_unregister** (const char \*base\_path)

Removes L2 TAP virtual filesystem driver.

**Parameters** **base\_path** –Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- ESP\_OK on success

*esp\_err\_t* **esp\_vfs\_l2tap\_eth\_filter** (*l2tap\_iodriver\_handle* driver\_handle, void \*buff, size\_t \*size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- **driver\_handle** –handle of driver at which the frame was received
- **buff** –received L2 frame
- **size** –input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** *esp\_err\_t*

- ESP\_OK is always returned

## Structures

struct **l2tap\_vfs\_config\_t**

L2Tap VFS config parameters.

## Public Members

const char \***base\_path**  
vfs base path

## Macros

**L2TAP\_VFS\_DEFAULT\_PATH**

**L2TAP\_VFS\_CONFIG\_DEFAULT** ()

## Type Definitions

typedef void \***l2tap\_iodriver\_handle**

## Enumerations

enum **l2tap\_ioctl\_opt\_t**

*Values:*

enumerator **L2TAP\_S\_RCV\_FILTER**

enumerator **L2TAP\_G\_RCV\_FILTER**

enumerator **L2TAP\_S\_INTF\_DEVICE**

enumerator **L2TAP\_G\_INTF\_DEVICE**

enumerator **L2TAP\_S\_DEVICE\_DRV\_HNDL**

enumerator `L2TAP_G_DEVICE_DRV_HNDL`

## WiFi default API reference

### Header File

- `components/esp_wifi/include/esp_wifi_default.h`

### Functions

*esp\_err\_t* **esp\_netif\_attach\_wifi\_station** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi station interface to supplied netif.

**Parameters** `esp_netif` –instance to attach the wifi station to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi soft AP interface to supplied netif.

**Parameters** `esp_netif` –instance to attach the wifi AP to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_nan\_handlers** (void)

Sets default wifi event handlers for NAN interface.

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \*esp\_netif)

Clears default wifi event handlers for supplied network interface.

**Parameters** `esp_netif` –instance of corresponding if object

**Returns**

- ESP\_OK on success, error returned from `esp_event_handler_register` if failed

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

---

**Note:** The API creates `esp_netif` object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to `esp-netif` instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

---

**Note:** The API creates *esp\_netif* object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses `assert()` to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_nan** (void)

Creates default WIFI NAN. In case of any init error this API aborts.

---

**Note:** The API creates *esp\_netif* object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

void **esp\_netif\_destroy\_default\_wifi** (void \*esp\_netif)

Destroys default WIFI netif created with `esp_netif_create_default_wifi_...` API.

---

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if *esp\_netif* is NULL)

---

**Parameters** *esp\_netif* –[in] object to detach from WiFi and destroy

*esp\_netif\_t* \***esp\_netif\_create\_wifi** (*wifi\_interface\_t* wifi\_if, const *esp\_netif\_inherent\_config\_t* \*esp\_netif\_config)

Creates *esp\_netif* WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Parameters**

- *wifi\_if* –[in] type of wifi interface
- *esp\_netif\_config* –inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

*esp\_err\_t* **esp\_netif\_create\_default\_wifi\_mesh\_netifs** (*esp\_netif\_t* \*\*p\_netif\_sta, *esp\_netif\_t* \*\*p\_netif\_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Parameters**

- *p\_netif\_sta* –[out] pointer where the resultant STA interface is saved (if non NULL)
- *p\_netif\_ap* –[out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP\_OK on success

## 2.5.5 IP Network Layer

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls `esp_netif_receive()` on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
↳ driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver's object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↳ esp-netif driver */
    driver_impl_t *h;                       /*!< handle of driver_
↳ implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
```

(continues on next page)

(continued from previous page)

```

my_driver_start (driver->driver_impl);
return ESP_OK;
}

```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```

esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}

```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in [esp\\_netif/include/esp\\_netif\\_defaults.h](#) and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

### Functions

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_netif\_impl** (void \*dev)

Returns esp-netif handle.

**Parameters** *dev* –[in] opaque ptr to network interface of specific TCP/IP stack

**Returns** handle to related esp-netif instance

void \***esp\_netif\_get\_netif\_impl** (*esp\_netif\_t* \*esp\_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Parameters** *esp\_netif* –[in] Handle to esp-netif instance

**Returns** handle to related network stack netif handle

*esp\_err\_t* **esp\_netif\_set\_link\_speed** (*esp\_netif\_t* \*esp\_netif, uint32\_t speed)

Set link-speed for the specified network interface.

**Parameters**

- *esp\_netif* –[in] Handle to esp-netif instance
- *speed* –[in] Link speed in bit/s

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_transmit** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

*esp\_err\_t* **esp\_netif\_transmit\_wrap** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **data** –[in] Data to be transmitted
- **len** –[in] Length of the data frame
- **netstack\_buf** –[in] net stack buffer

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

void **esp\_netif\_free\_rx\_buffer** (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

**Parameters**

- **esp\_netif** –[in] Handle to esp-netif instance
- **buffer** –[in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

## 2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.6 Peripherals API

### 2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

#### Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pins.

ESP32-C6 has one ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide introduces ADC oneshot mode conversion.

## Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- [Resource Allocation](#) - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- [Unit Configuration](#) - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- [Read Conversion Result](#) - covers how to get ADC conversion raw result.
- [Hardware Limitations](#) - describes the ADC-related hardware limitations.
- [Power Management](#) - covers power management-related information.
- [IRAM Safe](#) - describes tips on how to read ADC conversion raw results when the cache is disabled.
- [Thread Safety](#) - lists which APIs are guaranteed to be thread-safe by the driver.
- [Kconfig Options](#) - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The ADC oneshot mode driver is implemented based on ESP32-C6 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver's point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the [datasheet](#) to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If set to 0, the driver will fall back to using a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

### Create an ADC Unit Handle Under Normal Oneshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to [TRM](#) > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number, check [datasheet](#) to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

### Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_11,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see [Hardware Limitations](#). This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to <a href="#">TRM</a> > On-Chip Sensor and Analog Signal Processing.
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>adc_oneshot_chan_cfg_t.bitwidth</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪adc_raw[0][1]);
```

### Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.
- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like `Illegal Instruction` or `Load/Store Prohibited`.

### Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

### Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see *IRAM Safe* for more details.

### Application Examples

- ADC oneshot mode example: [peripherals/adc/oneshot\\_read](#).

### API Reference

#### Header File

- `components/hal/include/hal/adc_types.h`

#### Structures

struct `adc_digi_pattern_config_t`  
ADC digital controller pattern configuration.

### Public Members

uint8\_t **atten**

Attenuation of this ADC channel.

uint8\_t **channel**

ADC channel.

uint8\_t **unit**

ADC unit.

uint8\_t **bit\_width**

ADC output bit width.

struct **adc\_digi\_output\_data\_t**

ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

### Public Members

uint32\_t **data**

ADC real output data info. Resolution: 12 bit.

uint32\_t **reserved12**

Reserved12.

uint32\_t **channel**

ADC channel index info. If (channel < ADC\_CHANNEL\_MAX), The data is valid. If (channel > ADC\_CHANNEL\_MAX), The data is invalid.

uint32\_t **reserved17\_31**

Reserved 17-31.

struct *adc\_digi\_output\_data\_t*::[anonymous]::[anonymous] **type2**

When the configured output format is 12bit.

uint32\_t **val**

Raw data value

### Type Definitions

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_one\_shot\_clk\_src\_t**

Clock source type of oneshot mode which uses digital controller.

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_continuous\_clk\_src\_t**

Clock source type of continuous mode which uses digital controller.

### Enumerations

enum **adc\_unit\_t**

ADC unit.

*Values:*

enumerator **ADC\_UNIT\_1**

SAR ADC 1.

enumerator **ADC\_UNIT\_2**

SAR ADC 2.

enum **adc\_channel\_t**

ADC channels.

*Values:*

enumerator **ADC\_CHANNEL\_0**

ADC channel.

enumerator **ADC\_CHANNEL\_1**

ADC channel.

enumerator **ADC\_CHANNEL\_2**

ADC channel.

enumerator **ADC\_CHANNEL\_3**

ADC channel.

enumerator **ADC\_CHANNEL\_4**

ADC channel.

enumerator **ADC\_CHANNEL\_5**

ADC channel.

enumerator **ADC\_CHANNEL\_6**

ADC channel.

enumerator **ADC\_CHANNEL\_7**

ADC channel.

enumerator **ADC\_CHANNEL\_8**

ADC channel.

enumerator **ADC\_CHANNEL\_9**

ADC channel.

enum **adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

*Values:*

enumerator **ADC\_ATTEN\_DB\_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC\_ATTEN\_DB\_2\_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

enumerator **ADC\_ATTEN\_DB\_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

enumerator **ADC\_ATTEN\_DB\_11**

The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

enum **adc\_bitwidth\_t**

*Values:*

enumerator **ADC\_BITWIDTH\_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC\_BITWIDTH\_9**

ADC output width is 9Bit.

enumerator **ADC\_BITWIDTH\_10**

ADC output width is 10Bit.

enumerator **ADC\_BITWIDTH\_11**

ADC output width is 11Bit.

enumerator **ADC\_BITWIDTH\_12**

ADC output width is 12Bit.

enumerator **ADC\_BITWIDTH\_13**

ADC output width is 13Bit.

enum **adc\_ulp\_mode\_t**

*Values:*

enumerator **ADC\_ULP\_MODE\_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC\_ULP\_MODE\_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC\_ULP\_MODE\_RISCV**

ADC is controlled by ULP RISCV.

enum **adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

*Values:*

enumerator **ADC\_CONV\_SINGLE\_UNIT\_1**

Only use ADC1 for conversion.

enumerator **ADC\_CONV\_SINGLE\_UNIT\_2**

Only use ADC2 for conversion.

enumerator **ADC\_CONV\_BOTH\_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC\_CONV\_ALTER\_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum **adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE2**

See `adc_digi_output_data_t.type2`

enum **adc\_digi\_iir\_filter\_t**

ADC IIR Filter ID.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_0**

Filter 0.

enumerator **ADC\_DIGI\_IIR\_FILTER\_1**

Filter 1.

enum **adc\_digi\_iir\_filter\_coeff\_t**

IIR Filter Coefficient.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_2**

The filter coefficient is 2.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_4**

The filter coefficient is 4.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_8**

The filter coefficient is 8.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_16**

The filter coefficient is 16.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_64**

The filter coefficient is 64.

### Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_oneshot.h](#)

### Functions

*esp\_err\_t* **adc\_oneshot\_new\_unit** (const *adc\_oneshot\_unit\_init\_cfg\_t* \*init\_config,  
*adc\_oneshot\_unit\_handle\_t* \*ret\_unit)

Create a handle to a specific ADC unit.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

#### Parameters

- **init\_config** –[in] Driver initial configurations
- **ret\_unit** –[out] ADC unit handle

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NO\_MEM: No memory
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be claimed is already in use
- ESP\_FAIL: Clock source isn't initialised correctly

*esp\_err\_t* **adc\_oneshot\_config\_channel** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* channel,  
const *adc\_oneshot\_chan\_cfg\_t* \*config)

Set ADC oneshot mode required configurations.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

#### Parameters

- **handle** –[in] ADC handle
- **channel** –[in] ADC channel to be configured
- **config** –[in] ADC configurations

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments

*esp\_err\_t* **adc\_oneshot\_read** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* chan, int \*out\_raw)

Get one ADC conversion raw result.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

---

**Note:** This API should NOT be called in an ISR context

---

#### Parameters

- **handle** –[in] ADC handle
- **chan** –[in] ADC channel
- **out\_raw** –[out] ADC conversion raw result

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_TIMEOUT: Timeout, the ADC result is invalid

*esp\_err\_t* **adc\_oneshot\_del\_unit** (*adc\_oneshot\_unit\_handle\_t* handle)

Delete the ADC unit handle.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters** **handle** –[in] ADC handle

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be disclaimed isn't in use

*esp\_err\_t* **adc\_oneshot\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*unit\_id, *adc\_channel\_t* \*channel)

Get ADC channel from the given GPIO number.

**Parameters**

- **io\_num** –[in] GPIO number
- **unit\_id** –[out] ADC unit
- **channel** –[out] ADC channel

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_oneshot\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*io\_num)

Get GPIO number from the given ADC channel.

**Parameters**

- **unit\_id** –[in] ADC unit
- **channel** –[in] ADC channel
- **io\_num** –[out] GPIO number
- – ESP\_OK: On success
- – ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **adc\_oneshot\_get\_calibrated\_result** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_cali\_handle\_t* cali\_handle, *adc\_channel\_t* chan, int \*cali\_result)

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

**Parameters**

- **handle** –[in] ADC oneshot handle, you should call `adc_oneshot_new_unit()` to get this handle
- **cali\_handle** –[in] ADC calibration handle, you should call `adc_cali_create_scheme_x()` in `adc_cali_scheme.h` to create a handle
- **chan** –[in] ADC channel
- **cali\_result** –[out] Calibrated ADC result (in mV)

**Returns**

- ESP\_OK Other return errors from `adc_oneshot_read()` and `adc_cali_raw_to_voltage()`

### Structures

struct **adc\_oneshot\_unit\_init\_cfg\_t**  
ADC oneshot driver initial configurations.

#### Public Members

*adc\_unit\_t* **unit\_id**  
ADC unit.

*adc\_oneshot\_clk\_src\_t* **clk\_src**  
Clock source.

*adc\_ulp\_mode\_t* **ulp\_mode**  
ADC controlled by ULP, see `adc_ulp_mode_t`

struct **adc\_oneshot\_chan\_cfg\_t**  
ADC channel configurations.

#### Public Members

*adc\_atten\_t* **atten**  
ADC attenuation.

*adc\_bitwidth\_t* **bitwidth**  
ADC conversion result bits.

### Type Definitions

typedef struct `adc_oneshot_unit_ctx_t` \***adc\_oneshot\_unit\_handle\_t**  
Type of ADC unit handle for oneshot mode.

## 2.6.2 Analog to Digital Converter (ADC) Continuous Mode Driver

### Introduction

The Analog to Digital Converter is an on-chip sensor which is able to measure analog signals from specific analog IO pads.

ESP32-C6 has one ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result
- Generate continuous ADC conversion results

This guide will introduce ADC continuous mode conversion.

**Driver Concepts** ADC continuous mode conversion is made up with multiple Conversion Frames.

- Conversion Frame: One Conversion Frame contains multiple Conversion Results. Conversion Frame size is configured in `adc_continuous_new_handle()`, in bytes.
- Conversion Result: One Conversion Result contains multiple bytes (see `SOC_ADC_DIGI_RESULT_BYTES`). Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel and raw data.

### Functional Overview

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from group of ADC channels continuously:

- *Resource Allocation* - covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- *ADC Configurations* - describes how to configure the ADC(s) to make it work under continuous mode.
- *ADC Control* - describes ADC control functions.
- *Register Event Callbacks* - describes how to hook user specific code to an ADC continuous mode event callback function.
- *Read Conversion Result* - covers how to get ADC conversion result.
- *Hardware Limitations* - describes the ADC related hardware limitations.
- *Power Management* - covers power management related.
- *IRAM Safe* - covers the IRAM safe functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.

**Resource Allocation** The ADC continuous mode driver is implemented based on ESP32-C6 SAR ADC module. Different ESP targets might have different number of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size` set the maximum size (in bytes) of the pool that the driver saves ADC conversion result into. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size` set the size of the ADC conversion frame, in bytes.

After setting up above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means there is no free GDMA channel.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.

Two IIR filters are available when ADC is working under continuous mode. To create an ADC IIR filter, you should set up the `adc_continuous_iir_filter_config_t`, and call `adc_new_continuous_iir_filter()`.

- `adc_digi_filter_config_t::unit`, ADC unit.
- `adc_digi_filter_config_t::channel`, ADC channel to be filtered.

- `adc_digi_filter_config_t::coeff`, filter coefficient.

To recycle a filter, you should call `adc_del_continuous_iir_filter()`.

---

**Note:** If you use both the filters on a same ADC channel, then only the first one will take effect.

---

### Initialize the ADC Continuous Mode Driver

```
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_continuous_deinit());
```

**ADC Configurations** After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`, number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`, list of configs for each ADC channel that will be used, see below description.
- `adc_continuous_config_t::sample_freq_hz`, expected ADC sampling frequency in Hz.
- `adc_continuous_config_t::conv_mode`, continuous conversion mode.
- `adc_continuous_config_t::format`, conversion output format.

For `adc_digi_pattern_config_t`:

- `adc_digi_pattern_config_t::atten`, ADC attenuation. Refer to the On-Chip Sensor chapter in TRM.
- `adc_digi_pattern_config_t::channel`, the IO corresponding ADC channel number. See below note.
- `adc_digi_pattern_config_t::unit`, the ADC that the IO is subordinate to.
- `adc_digi_pattern_config_t::bit_width`, the bitwidth of the raw conversion result.

---

**Note:** For the IO corresponding ADC channel number. Check [datasheet](#) to acquire the ADC IOs. On the other hand, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to acquire the ADC channels and ADC IOs.

---

To make these settings take effect, call `adc_continuous_config()` with the configuration structure above. This API may fail due to reasons like `ESP_ERR_INVALID_ARG`. When it returns `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't call this API at this moment.

See ADC continuous mode example [peripherals/adc/continuous\\_read](#) to see configuration codes.

To enable / disable the ADC IIR filter, you should call `adc_continuous_iir_filter_enable()` / `adc_continuous_iir_filter_disable()`.

### ADC Control

**Start and Stop** Calling `adc_continuous_start()` will make the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling `adc_continuous_stop()` will stop the ADC conversion.

```
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks** By calling `adc_continuous_register_event_callbacks()`, you can hook your own function to the driver ISR. Supported event callbacks are listed in `adc_continuous_evt_cbs_t` - `adc_continuous_evt_cbs_t::on_conv_done`, this is invoked when one conversion frame finishes. - `adc_continuous_evt_cbs_t::on_pool_ovf`, this is invoked when internal pool is full. Newer conversion results will be discarded.

As above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logics should not appear in these callbacks. Callback function prototype is declared in `adc_continuous_callback_t`.

You can also register your own context when calling `adc_continuous_register_event_callbacks()`, by the parameter `user_data`. This user data will be passed to the callback functions directly.

This function may fail due to reasons like `ESP_ERR_INVALID_ARG`. Specially, when `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, this error may indicate that the callback functions aren't in internal RAM. Check error log to know this. Besides, when it fails due to `ESP_ERR_INVALID_STATE`, this means the ADC continuous mode driver is started, you shouldn't add callback at this moment.

**Conversion Done Event** The driver will fill in the event data of a `adc_continuous_evt_cbs_t::on_conv_done` event. Event data contains a buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuous_evt_data_t` to know the event data structure.

---

**Note:** It is worth noting that, the data buffer `adc_continuous_evt_data_t::conv_frame_buffer` is maintained by the driver itself. Therefore, never free this piece of memory.

---

---

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered callbacks and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed in internal RAM as well.

---

**Pool Overflow Event** The ADC continuous mode driver has an internal pool to save the conversion results. When the pool is full, a pool overflow event will emerge. Under this condition, the driver won't fill in the event data. This usually happens the speed to read data from the pool (by calling `adc_continuous_read()`) is much slower than the ADC conversion speed.

**Read Conversion Result** After calling `adc_continuous_start()`, the ADC continuous conversion starts. Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer to get the raw results.

This function will try to read the expected length of conversion results each time.

- If the requested length isn't reached, the function will still move the data from the internal pool to the buffer you prepared. Therefore, check the `out_length` to know the actual size of conversion results.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms` until the conversion results are generated. If there is still no generated results, the function will return `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, new generated results will be lost. Next time when the `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` indicating this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from above function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor chapter in <a href="#">TRM</a> .
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>:cpp:member::adc_digi_pattern_config_t:bit_width</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise the power management will be out of action.

**IRAM Safe** All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, driver internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

**Thread Safety** ADC continuous mode driver APIs are not guaranteed to be thread safe. However, the share hardware mutual exclusion is provided by the driver. See [Hardware Limitations](#) for more details.

### Application Examples

- ADC continuous mode example: [peripherals/adc/continuous\\_read](#).

### API Reference

#### Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`

## Functions

*esp\_err\_t* **adc\_continuous\_new\_handle** (const *adc\_continuous\_handle\_cfg\_t* \*hdl\_config, *adc\_continuous\_handle\_t* \*ret\_handle)

Initialize ADC continuous driver and get a handle to it.

### Parameters

- **hdl\_config** **–[in]** Pointer to ADC initialization config. Refer to *adc\_continuous\_handle\_cfg\_t*.
- **ret\_handle** **–[out]** ADC continuous mode driver handle

### Returns

- **ESP\_ERR\_INVALID\_ARG** If the combination of arguments is invalid.
- **ESP\_ERR\_NOT\_FOUND** No free interrupt found with the specified flags
- **ESP\_ERR\_NO\_MEM** If out of memory
- **ESP\_OK** On success

*esp\_err\_t* **adc\_continuous\_config** (*adc\_continuous\_handle\_t* handle, const *adc\_continuous\_config\_t* \*config)

Set ADC continuous mode required configurations.

### Parameters

- **handle** **–[in]** ADC continuous mode driver handle
- **config** **–[in]** Refer to *adc\_digi\_config\_t*.

### Returns

- **ESP\_ERR\_INVALID\_STATE**: Driver state is invalid, you shouldn't call this API at this moment
- **ESP\_ERR\_INVALID\_ARG**: If the combination of arguments is invalid.
- **ESP\_OK**: On success

*esp\_err\_t* **adc\_continuous\_register\_event\_callbacks** (*adc\_continuous\_handle\_t* handle, const *adc\_continuous\_evt\_cbs\_t* \*cbs, void \*user\_data)

Register callbacks.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the *cbs* structure to NULL.

---

---

**Note:** When **CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE** is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including *user\_data*) should be in internal RAM as well.

---

---

**Note:** You should only call this API when the ADC continuous mode driver isn't started. Check return value to know this.

---

### Parameters

- **handle** **–[in]** ADC continuous mode driver handle
- **cbs** **–[in]** Group of callback functions
- **user\_data** **–[in]** User data, which will be delivered to the callback functions directly

### Returns

- **ESP\_OK**: On success
- **ESP\_ERR\_INVALID\_ARG**: Invalid arguments
- **ESP\_ERR\_INVALID\_STATE**: Driver state is invalid, you shouldn't call this API at this moment

*esp\_err\_t* **adc\_continuous\_start** (*adc\_continuous\_handle\_t* handle)

Start the ADC under continuous mode. After this, the hardware starts working.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_read** (*adc\_continuous\_handle\_t* handle, uint8\_t \*buf, uint32\_t length\_max, uint32\_t \*out\_length, uint32\_t timeout\_ms)

Read bytes from ADC under continuous mode.

**Parameters**

- **handle** –[in] ADC continuous mode driver handle
- **buf** –[out] Conversion result buffer to read from ADC. Suggest convert to *adc\_digi\_output\_data\_t* for ADC Conversion Results. See @brief Driver Backgrounds to know this concept.
- **length\_max** –[in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out\_length** –[out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout\_ms** –[in] Time to wait for data via this API, in millisecond.

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP\_ERR\_TIMEOUT Operation timed out
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_stop** (*adc\_continuous\_handle\_t* handle)

Stop the ADC. After this, the hardware stops working.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_deinit** (*adc\_continuous\_handle\_t* handle)

Deinitialize the ADC continuous driver.

**Parameters** **handle** –[in] ADC continuous mode driver handle

**Returns**

- ESP\_ERR\_INVALID\_STATE Driver state is invalid.
- ESP\_OK On success

*esp\_err\_t* **adc\_continuous\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*unit\_id, *adc\_channel\_t* \*channel)

Get ADC channel from the given GPIO number.

**Parameters**

- **io\_num** –[in] GPIO number
- **unit\_id** –[out] ADC unit
- **channel** –[out] ADC channel

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_continuous\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*io\_num)

Get GPIO number from the given ADC channel.

**Parameters**

- **unit\_id** –[in] ADC unit
- **channel** –[in] ADC channel
- **io\_num** –[out] GPIO number
- – ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

## Structures

struct **adc\_continuous\_handle\_cfg\_t**

ADC continuous mode driver initial configurations.

### Public Members

uint32\_t **max\_store\_buf\_size**

Max length of the conversion Results that driver can store, in bytes.

uint32\_t **conv\_frame\_size**

Conversion frame size, in bytes. This should be in multiples of SOC\_ADC\_DIGI\_DATA\_BYTES\_PER\_CONV.

struct **adc\_continuous\_config\_t**

ADC continuous mode driver configurations.

### Public Members

uint32\_t **pattern\_num**

Number of ADC channels that will be used.

[adc\\_digi\\_pattern\\_config\\_t](#) \***adc\_pattern**

List of configs for each ADC channel that will be used.

uint32\_t **sample\_freq\_hz**

The expected ADC sampling frequency in Hz. Please refer to `soc/soc_caps.h` to know available sampling frequency range

[adc\\_digi\\_convert\\_mode\\_t](#) **conv\_mode**

ADC DMA conversion mode, see `adc_digi_convert_mode_t`.

[adc\\_digi\\_output\\_format\\_t](#) **format**

ADC DMA conversion output format, see `adc_digi_output_format_t`.

struct **adc\_continuous\_evt\_data\_t**

Event data structure.

---

**Note:** The `conv_frame_buffer` is maintained by the driver itself, so never free this piece of memory.

---

### Public Members

uint8\_t \***conv\_frame\_buffer**

Pointer to conversion result buffer for one conversion frame.

uint32\_t **size**

Conversion frame size.

struct **adc\_continuous\_evt\_cbs\_t**

Group of ADC continuous mode callbacks.

---

**Note:** These callbacks are all running in an ISR environment.

---

---

**Note:** When CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

---

### Public Members

*adc\_continuous\_callback\_t* **on\_conv\_done**

Event callback, invoked when one conversion frame is done. See @brief Driver Backgrounds to know conversion frame concept.

*adc\_continuous\_callback\_t* **on\_pool\_ovf**

Event callback, invoked when the internal pool is full.

### Macros

**ADC\_MAX\_DELAY**

Driver Backgrounds.

### Type Definitions

typedef struct adc\_continuous\_ctx\_t \***adc\_continuous\_handle\_t**

Type of adc continuous mode driver handle.

typedef bool (**adc\_continuous\_callback\_t**)(*adc\_continuous\_handle\_t* handle, const *adc\_continuous\_evt\_data\_t* \*edata, void \*user\_data)

Prototype of ADC continuous mode event callback.

**Param handle [in]** ADC continuous mode driver handle

**Param edata [in]** Pointer to ADC continuous mode event data

**Param user\_data [in]** User registered context, registered when in `adc_continuous_register_event_callbacks()`

**Return** Whether a high priority task is woken up by this function

## 2.6.3 Analog to Digital Converter (ADC) Calibration Driver

### Introduction

In ESP32-C6, the digital-to-analog converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32-C6 is 1100 mV. However, the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

## Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Result Conversion* - covers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver's point of view, an ADC calibration scheme is created for an ADC calibration handle `adc_cali_handle_t`.

`adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.

If you use your custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Curve Fitting Scheme** ESP32-C6 supports `ADC_CALI_SCHEME_VER_CURVE_FITTING` scheme. To create this scheme, set up `adc_cali_curve_fitting_config_t` first.

- `adc_cali_curve_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_curve_fitting_config_t::chan`, the ADC channel that your ADC raw results are from. The calibration scheme not only differs by attenuation but is also related to the channels.
- `adc_cali_curve_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_curve_fitting_config_t::bitwidth`, bit width of ADC raw result.

After setting up the configuration structure, call `adc_cali_create_scheme_curve_fitting()` to create a Curve Fitting calibration scheme handle. This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function return `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burnt on your board.

### Create Curve Fitting Scheme

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Curve Fitting");
adc_cali_curve_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_curve_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme driver from the calibration handle by calling `adc_cali_delete_scheme_curve_fitting()`.

### Delete Curve Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Curve Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_curve_fitting(handle));
```

---

**Note:** If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

---

**Result Conversion** After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

### Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

**Thread Safety** The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

**Minimize Noise** The ESP32-C6 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

## API Reference

### Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_cali.h](#)

### Functions

`esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

**Parameters** `scheme_mask` –[out] Supported ADC calibration scheme(s)

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

`esp_err_t adc_cali_raw_to_voltage(adc_cali_handle_t handle, int raw, int *voltage)`

Convert ADC raw data to calibrated voltage.

#### Parameters

- `handle` –[in] ADC calibration handle
- `raw` –[in] ADC raw data
- `voltage` –[out] Calibrated ADC voltage (in mV)

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_INVALID_STATE`: Invalid state, scheme didn't registered

### Type Definitions

`typedef struct adc_cali_scheme_t *adc_cali_handle_t`

ADC calibration handle.

## Enumerations

enum `adc_cali_scheme_ver_t`

ADC calibration scheme.

*Values:*

enumerator `ADC_CALI_SCHEME_VER_LINE_FITTING`

Line fitting scheme.

enumerator `ADC_CALI_SCHEME_VER_CURVE_FITTING`

Curve fitting scheme.

## Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_cali\\_scheme.h](#)

## 2.6.4 Clock Tree

The clock subsystem of ESP32-C6 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

### Introduction

This section lists definitions of ESP32-C6's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

**Root Clocks** Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-C6's root clocks are listed in `soc_root_clk_t`:

- Internal 17.5 MHz RC Oscillator (`RC_FAST`)  
This RC oscillator generates a about 17.5 MHz clock signal output as the `RC_FAST_CLK`.  
The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration.
- External 40 MHz Crystal (`XTAL`)
- Internal 136 kHz RC Oscillator (`RC_SLOW`)  
This RC oscillator generates a about 136kHz clock signal output as the `RC_SLOW_CLK`.  
The exact frequency of this clock can be computed in runtime through calibration.
- External 32 kHz Crystal - optional (`XTAL32K`)  
The clock source for this `XTAL32K_CLK` can be either a 32 kHz crystal connecting to the `XTAL_32K_P` and `XTAL_32K_N` pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the `XTAL_32K_P` pin.  
`XTAL32K_CLK` can also be calibrated to get its exact frequency.
- External Slow Clock - optional (`OSC_SLOW`)

A clock signal generated by an external circuit can be connected to GPIO0 to be the clock source for the `RTC_SLOW_CLK`. This clock can also be calibrated to get its exact frequency.

- Internal 32 kHz RC Oscillator (RC32K)

The exact frequency of this clock can be computed in runtime through calibration.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-C6 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to [RTC Timer Clock Sources](#).

**Module Clocks** ESP32-C6's available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

### API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

### API Reference

#### Header File

- `components/soc/esp32c6/include/soc/clk_tree_defs.h`

#### Macros

##### `SOC_CLK_RC_FAST_FREQ_APPROX`

Approximate `RC_FAST_CLK` frequency in Hz

##### `SOC_CLK_RC_SLOW_FREQ_APPROX`

Approximate `RC_SLOW_CLK` frequency in Hz

##### `SOC_CLK_RC32K_FREQ_APPROX`

Approximate `RC32K_CLK` frequency in Hz

##### `SOC_CLK_XTAL32K_FREQ_APPROX`

Approximate `XTAL32K_CLK` frequency in Hz

##### `SOC_CLK_OSC_SLOW_FREQ_APPROX`

Approximate `OSC_SLOW_CLK` (external slow clock) frequency in Hz

##### `SOC_GPTIMER_CLKS`

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)
SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC\_RMT\_CLKS**

Array initializer for all supported clock sources of RMT.

**SOC\_TEMP\_SENSOR\_CLKS**

Array initializer for all supported clock sources of Temperature Sensor.

**SOC\_MCPWM\_TIMER\_CLKS**

Array initializer for all supported clock sources of MCPWM Timer.

**SOC\_MCPWM\_CAPTURE\_CLKS**

Array initializer for all supported clock sources of MCPWM Capture Timer.

**SOC\_MCPWM\_CARRIER\_CLKS**

Array initializer for all supported clock sources of MCPWM Carrier.

**SOC\_I2S\_CLKS**

Array initializer for all supported clock sources of I2S.

**SOC\_I2C\_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC\_LP\_I2C\_CLKS**

Array initializer for all supported clock sources of LP\_I2C.

**SOC\_SPI\_CLKS**

Array initializer for all supported clock sources of SPI.

**SOC\_SDM\_CLKS**

Array initializer for all supported clock sources of SDM.

**SOC\_GLITCH\_FILTER\_CLKS**

Array initializer for all supported clock sources of Glitch Filter.

**SOC\_TWAI\_CLKS**

Array initializer for all supported clock sources of TWAI.

**SOC\_ADC\_DIGI\_CLKS**

Array initializer for all supported clock sources of ADC digital controller.

**SOC\_MWDT\_CLKS**

Array initializer for all supported clock sources of MWDT.

**SOC\_LEDC\_CLKS**

Array initializer for all supported clock sources of LEDC.

**SOC\_PARLIO\_CLKS**

Array initializer for all supported clock sources of PARLIO.

**Enumerations**enum **soc\_root\_clk\_t**

Root clock.

*Values:*enumerator **SOC\_ROOT\_CLK\_INT\_RC\_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL**

External 40MHz crystal

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL32K**

External 32kHz crystal

enumerator **SOC\_ROOT\_CLK\_INT\_RC32K**

Internal 32kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_OSC\_SLOW**

External slow clock signal at pin0

enum **soc\_cpu\_clk\_src\_t**

CPU\_CLK mux inputs, which are the supported clock sources for the CPU\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*enumerator **SOC\_CPU\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_PLL**

Select PLL\_CLK as CPU\_CLK source (PLL\_CLK is the output of 40MHz crystal oscillator frequency multiplier, 480MHz)

enumerator **SOC\_CPU\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_INVALID**

Invalid CPU\_CLK source

enum **soc\_rtc\_slow\_clk\_src\_t**

RTC\_SLOW\_CLK mux inputs, which are the supported clock sources for the RTC\_SLOW\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_SLOW**

Select RC\_SLOW\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_XTAL32K**

Select XTAL32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC32K**

Select RC32K\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_OSC\_SLOW**

Select OSC\_SLOW\_CLK (external slow clock) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_INVALID**

Invalid RTC\_SLOW\_CLK source

enum **soc\_rtc\_fast\_clk\_src\_t**

RTC\_FAST\_CLK mux inputs, which are the supported clock sources for the RTC\_FAST\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D2**

Select XTAL\_D2\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_DIV**

Alias name for SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D2

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_INVALID**

Invalid RTC\_FAST\_CLK source

enum **soc\_module\_clk\_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

*Values:*

enumerator **SOC\_MOD\_CLK\_CPU**

CPU\_CLK can be sourced from XTAL, PLL, or RC\_FAST by configuring soc\_cpu\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_FAST**

RTC\_FAST\_CLK can be sourced from XTAL\_D2 or RC\_FAST by configuring soc\_rtc\_fast\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_SLOW**

RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, RC32K, or OSC\_SLOW by configuring `soc_rtc_slow_clk_src_t`

enumerator **SOC\_MOD\_CLK\_PLL\_F80M**

PLL\_F80M\_CLK is derived from PLL (clock gating + fixed divider of 6), it has a fixed frequency of 80MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F160M**

PLL\_F160M\_CLK is derived from PLL (clock gating + fixed divider of 3), it has a fixed frequency of 160MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F240M**

PLL\_F240M\_CLK is derived from PLL (clock gating + fixed divider of 2), it has a fixed frequency of 240MHz

enumerator **SOC\_MOD\_CLK\_XTAL32K**

XTAL32K\_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST**

RC\_FAST\_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_XTAL**

XTAL\_CLK comes from the external 40MHz crystal

enumerator **SOC\_MOD\_CLK\_XTAL\_D2**

XTAL\_D2\_CLK comes from the external 40MHz crystal, passing a div of 2 to the LP peripherals

enumerator **SOC\_MOD\_CLK\_INVALID**

Indication of the end of the available module clock sources

enum **soc\_periph\_systimer\_clk\_src\_t**

Type of SYSTIMER clock source.

*Values:*

enumerator **SYSTIMER\_CLK\_SRC\_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER\_CLK\_SRC\_RC\_FAST**

SYSTIMER source clock is RC\_FAST

enumerator **SYSTIMER\_CLK\_SRC\_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc\_periph\_gptimer\_clk\_src\_t**

Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M as the source clock

enumerator **GPTIMER\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **GPTIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M as the default choice

enum **soc\_periph\_tg\_clk\_src\_legacy\_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER\_SRC\_CLK\_PLL\_F80M**

Timer group clock source is PLL\_F80M

enumerator **TIMER\_SRC\_CLK\_XTAL**

Timer group clock source is XTAL

enumerator **TIMER\_SRC\_CLK\_DEFAULT**

Timer group clock source default choice is PLL\_F80M

enum **soc\_periph\_rmt\_clk\_src\_t**

Type of RMT clock source.

*Values:*

enumerator **RMT\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M as the source clock

enumerator **RMT\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **RMT\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **RMT\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M as the default choice

enum **soc\_periph\_rmt\_clk\_src\_legacy\_t**

Type of RMT clock source, reserved for the legacy RMT driver.

*Values:*

enumerator **RMT\_BASECLK\_PLL\_F80M**

RMT source clock is PLL\_F80M

enumerator **RMT\_BASECLK\_XTAL**

RMT source clock is XTAL

enumerator **RMT\_BASECLK\_DEFAULT**

RMT source clock default choice is PLL\_F80M

enum **soc\_periph\_temperature\_sensor\_clk\_src\_t**

Type of Temp Sensor clock source.

*Values:*

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_uart\_clk\_src\_legacy\_t**

Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator **UART\_SCLK\_PLL\_F80M**

UART source clock is PLL\_F80M

enumerator **UART\_SCLK\_RTC**

UART source clock is RC\_FAST

enumerator **UART\_SCLK\_XTAL**

UART source clock is XTAL

enumerator **UART\_SCLK\_DEFAULT**

UART source clock default choice is PLL\_F80M

enum **soc\_periph\_mcpwm\_timer\_clk\_src\_t**

Type of MCPWM timer clock source.

*Values:*

enumerator **MCPWM\_TIMER\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_TIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_TIMER\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default clock choice

enum **soc\_periph\_mcpwm\_capture\_clk\_src\_t**

Type of MCPWM capture clock source.

*Values:*

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_CAPTURE\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default clock choice

enum **soc\_periph\_mcpwm\_carrier\_clk\_src\_t**

Type of MCPWM carrier clock source.

*Values:*

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_PLL160M**

Select PLL\_F160M as the source clock

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MCPWM\_CARRIER\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default clock choice

enum **soc\_periph\_i2s\_clk\_src\_t**

I2S clock source enum.

*Values:*

enumerator **I2S\_CLK\_SRC\_DEFAULT**

Select PLL\_F160M as the default source clock

enumerator **I2S\_CLK\_SRC\_PLL\_160M**

Select PLL\_F160M as the source clock

enumerator **I2S\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enum **soc\_periph\_i2c\_clk\_src\_t**

Type of I2C clock source.

*Values:*

enumerator **I2C\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **I2C\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **I2C\_CLK\_SRC\_DEFAULT**

Select XTAL as the default source clock

enum **soc\_periph\_lp\_i2c\_clk\_src\_t**

Type of LP\_I2C clock source.

*Values:*

enumerator **LP\_I2C\_SCLK\_LP\_FAST**

LP\_I2C source clock is RTC\_FAST

enumerator **LP\_I2C\_SCLK\_XTAL\_D2**

LP\_I2C source clock is XTAL\_D2

enumerator **LP\_I2C\_SCLK\_DEFAULT**

LP\_I2C source clock default choice is RTC\_FAST

enum **soc\_periph\_spi\_clk\_src\_t**

Type of SPI clock source.

*Values:*

enumerator **SPI\_CLK\_SRC\_DEFAULT**

Select PLL\_80M as SPI source clock

enumerator **SPI\_CLK\_SRC\_PLL\_F80M**

Select PLL\_80M as SPI source clock

enumerator **SPI\_CLK\_SRC\_XTAL**

Select XTAL as SPI source clock

enumerator **SPI\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as SPI source clock

enum **soc\_periph\_sdm\_clk\_src\_t**

Sigma Delta Modulator clock source.

*Values:*

enumerator **SDM\_CLK\_SRC\_XTAL**

Select XTAL clock as the source clock

enumerator **SDM\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M clock as the source clock

enumerator **SDM\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M clock as the default clock choice

enum **soc\_periph\_glitch\_filter\_clk\_src\_t**

Glitch filter clock source.

*Values:*

enumerator **GLITCH\_FILTER\_CLK\_SRC\_XTAL**

Select XTAL clock as the source clock

enumerator **GLITCH\_FILTER\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M clock as the source clock

enumerator **GLITCH\_FILTER\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M clock as the default clock choice

enum **soc\_periph\_twai\_clk\_src\_t**

TWAI clock source.

*Values:*

enumerator **TWAI\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **TWAI\_CLK\_SRC\_DEFAULT**

Select XTAL as the default clock choice

enum **soc\_periph\_adc\_digi\_clk\_src\_t**

ADC digital controller clock source.

*Values:*

enumerator **ADC\_DIGI\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_PLL\_F80M**

Select PLL\_F80M as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_DEFAULT**

Select PLL\_F80M as the default clock choice

enum **soc\_periph\_mwdt\_clk\_src\_t**

MWDT clock source.

*Values:*

enumerator **MWDT\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **MWDT\_CLK\_SRC\_PLL\_F80M**

Select PLL fixed 80 MHz as the source clock

enumerator **MWDT\_CLK\_SRC\_RC\_FAST**

Select RTC fast as the source clock

enumerator **MWDT\_CLK\_SRC\_DEFAULT**

Select PLL fixed 80 MHz as the default clock choice

enum **soc\_periph\_ledc\_clk\_src\_legacy\_t**

Type of LEDC clock source, reserved for the legacy LEDC driver.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_PLL\_DIV\_CLK**

Select PLL\_F80M clock as the source clock

enumerator **LEDC\_USE\_RC\_FAST\_CLK**

Select RC\_FAST as the source clock

enumerator **LEDC\_USE\_XTAL\_CLK**

Select XTAL as the source clock

enumerator **LEDC\_USE\_RTC8M\_CLK**

Alias of 'LEDC\_USE\_RC\_FAST\_CLK'

enum **soc\_periph\_parlio\_clk\_src\_t**

PARLIO clock source.

*Values:*

enumerator **PARLIO\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **PARLIO\_CLK\_SRC\_PLL\_F240M**

Select PLL\_F240M as the source clock

enumerator **PARLIO\_CLK\_SRC\_DEFAULT**

Select PLL\_F240M as the default clock choice

## Header File

- [components/esp\\_hw\\_support/include/esp\\_clk\\_tree.h](#)

## Functions

*esp\_err\_t* **esp\_clk\_tree\_src\_get\_freq\_hz** (*soc\_module\_clk\_t* clk\_src, *esp\_clk\_tree\_src\_freq\_precision\_t* precision, *uint32\_t* \*freq\_value)

Get frequency of module clock source.

### Parameters

- **clk\_src** – [in] Clock source available to modules, in *soc\_module\_clk\_t*

- **precision** *–[in]* Degree of precision, one of `esp_clk_tree_src_freq_precision_t` values. This arg only applies to the clock sources that their frequencies can vary: `SOC_MOD_CLK_RTC_FAST`, `SOC_MOD_CLK_RTC_SLOW`, `SOC_MOD_CLK_RC_FAST`, `SOC_MOD_CLK_RC_FAST_D256`, `SOC_MOD_CLK_XTAL32K`. For other clock sources, this field is ignored.
- **freq\_value** *–[out]* Frequency of the clock source, in Hz

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Calibration failed

**Enumerations**

enum `esp_clk_tree_src_freq_precision_t`

Degree of precision of frequency value to be returned by `esp_clk_tree_src_get_freq_hz()`

*Values:*

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT`

enumerator `ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID`

## 2.6.5 Event Task Matrix (ETM)

**Introduction**

Normally, if a peripheral X needs to notify peripheral Y of a particular event, this could only be done via a CPU interrupt from peripheral X, where the CPU notifies peripheral Y on behalf of peripheral X. However, in time-critical applications, the latency introduced by CPU interrupts is non-negligible.

With the help of the Event Task Matrix (ETM) module, some peripherals can directly notify other peripherals of events through pre-set connections without the intervention of CPU interrupts. This allows precise and low latency synchronization between peripherals, and lessens the CPU's workload as the CPU no longer needs to handle these events.

The ETM module has multiple programmable channels, they are used to connect a particular **Event** to a particular **Task**. When an event is activated, the ETM channel will trigger the corresponding task automatically.

Peripherals that support ETM functionality provide their or unique set of events and tasks to be connected by the ETM. An ETM channel can connect any event to any task, even looping back an event to a task on the same peripheral. However, an ETM channel can only connect one event to one task at a time (i.e., 1 to 1 relation). If you want to use different events to trigger the same task, you can set up more ETM channels.

Typically, with the help of the ETM module, you can implement features like:

- Toggle the GPIO when a timer alarm event happens
- Start an ADC conversion when a pulse edge is detected on a GPIO

Fig. 5: ETM channels Overview

## Functional Overview

The following sections of this document cover the typical steps to configure and use the ETM module.

- *ETM Channel Allocation* - describes how to install and uninstall the ETM channel.
- *ETM Event* - describes how to allocate a new ETM event handle or fetch an existing handle from various peripherals.
- *ETM Task* - describes how to allocate a new ETM task handle or fetch an existing handle from various peripherals.
- *ETM Channel Control* - describes common ETM channel control functions.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**ETM Channel Allocation** There are many identical ETM channels in ESP32-C6<sup>1</sup>, and each channel is represented by `esp_etm_channel_handle_t` in the software. The ETM core driver manages all available hardware resources in a pool so that you do not need to care about which channel is in use and which is not. The ETM core driver will allocate a channel for you when you call `esp_etm_new_channel()` and delete it when you call `esp_etm_del_channel()`. All requirements needed for allocating a channel are provided in `esp_etm_channel_config_t`.

Before deleting an ETM channel, please disable it by `esp_etm_channel_disable()` in advance or make sure it has not been enabled yet by `esp_etm_channel_enable()`.

**ETM Event** ETM Event abstracts the event source, masking the details of specific event sources, and is represented by `esp_etm_event_handle_t` in the software, allowing applications to handle different types of events more easily. ETM events can be generated from a variety of peripherals, thus the way to get the event handle differs from peripherals. When an ETM event is no longer used, you should call `esp_etm_channel_connect()` with a NULL event handle to disconnect it and then call `esp_etm_del_event()` to free the event resource.

**GPIO Events** GPIO **edge** event is the most common event type, it can be generated by any GPIO pin. You can call `gpio_new_etm_event()` to create a GPIO event handle, with the configurations provided in `gpio_etm_event_config_t`:

- `gpio_etm_event_config_t::edge` decides which edge to trigger the event, supported edge types are listed in the `gpio_etm_event_edge_t`.

<sup>1</sup> Different ESP chip series might have different numbers of ETM channels. For more details, please refer to *ESP32-C6 Technical Reference Manual* > Chapter **Event Task Matrix (ETM)** [PDF]. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing channel allocation (i.e., `esp_etm_new_channel()`).

You need to build a connection between the GPIO ETM event handle and the GPIO number. So you should call `gpio_etm_event_bind_gpio()` afterwards. Please note, only the ETM event handle that created by `gpio_new_etm_event()` can set a GPIO number. Calling this function with other kinds of ETM events returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

### Other Peripheral Events

- You can call `esp_systick_new_etm_alarm_event()` to get the ETM event from RTOS SysTick, one per CPU core.
- Refer to *High Resolution Timer (ESP Timer)* for how to get the ETM event handle from `esp_timer`.
- Refer to *General Purpose Timer (GPTimer)* for how to get the ETM event handle from `GPTimer`.
- Refer to *The Async memcpy API* for how to get the ETM event handle from `async_memcpy`.

**ETM Task** ETM Task abstracts the task action and is represented by `esp_etm_task_handle_t` in the software, allowing tasks to be managed and represented in the same way. ETM tasks can be assigned to a variety of peripherals, thus the way to get the task handle differs from peripherals. When an ETM task is no longer used, you should call `esp_etm_channel_connect()` with a NULL task handle to disconnect it and then call `esp_etm_del_task()` to free the task resource.

**GPIO Tasks** GPIO task is the most common task type, one GPIO task can even manage multiple GPIOs. When the task gets activated by the ETM channel, all managed GPIOs can set/clear/toggle at the same time. You can call `gpio_new_etm_task()` to create a GPIO task handle, with the configurations provided in `gpio_etm_task_config_t`:

- `gpio_etm_task_config_t::action` decides what GPIO action would be taken by the ETM task. Supported actions are listed in the `gpio_etm_task_action_t`.

To build a connection between the GPIO ETM task and the GPIO number, you should call `gpio_etm_task_add_gpio()`. You can call this function by several times if you want the task handle to manage more GPIOs. Please note, only the ETM task handle that created by `gpio_new_etm_task()` can manage a GPIO. Calling this function with other kinds of ETM tasks returns `ESP_ERR_INVALID_ARG` error. Needless to say, this function does not help with the GPIO initialization, you still need to call `gpio_config()` to set the property like direction, pull up/down mode separately.

Before you call `esp_etm_del_task()` to delete the GPIO ETM task, make sure that all previously added GPIOs are removed by `gpio_etm_task_rm_gpio()` in advance.

### Other Peripheral Tasks

- Refer to *GPTimer* for how to get the ETM task handle from `GPTimer`.

### ETM Channel Control

**Connect Event and Task** An ETM event has no association with an ETM task, until they are connected to the same ETM channel by calling `esp_etm_channel_connect()`. Especially, calling the function with a NULL task/event handle means disconnecting the channel from any task or event. Note that, this function can be called either before or after the channel is enabled. But calling this function at runtime to change the connection can be dangerous, because the channel may be in the middle of a cycle, and the new connection may not take effect immediately.

**Enable and Disable Channel** You can call `esp_etm_channel_enable()` and `esp_etm_channel_disable()` to enable and disable the ETM channel from working.

**ETM Channel Profiling** To check if the ETM channels are set with proper events and tasks, you can call `esp_etm_dump()` to dump all working ETM channels with their associated events and tasks. The dumping format is like:

```
=====ETM Dump Start=====
channel 0: event 48 ==> task 17
channel 1: event 48 ==> task 90
channel 2: event 48 ==> task 94
=====ETM Dump End=====
```

The digital ID printed in the dump information is defined in the `soc/soc_etm_source.h` file.

**Thread Safety** The factory functions like `esp_etm_new_channel()` and `gpio_new_etm_task()` are guaranteed to be thread-safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

No functions are allowed to run within the ISR environment.

Other functions that take `esp_etm_channel_handle_t`, `esp_etm_task_handle_t` and `esp_etm_event_handle_t` as the first positional parameter, are not treated as thread-safe, which means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_ETM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size as well.

### API Reference

#### Header File

- `components/esp_hw_support/include/esp_etm.h`

#### Functions

`esp_err_t esp_etm_new_channel` (const `esp_etm_channel_config_t` \*config, `esp_etm_channel_handle_t` \*ret\_chan)

Allocate an ETM channel.

---

**Note:** The channel can later be freed by `esp_etm_del_channel`

---

#### Parameters

- **config** –[in] ETM channel configuration
- **ret\_chan** –[out] Returned ETM channel handle

#### Returns

- `ESP_OK`: Allocate ETM channel successfully
- `ESP_ERR_INVALID_ARG`: Allocate ETM channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Allocate ETM channel failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Allocate ETM channel failed because all channels are used up and no more free one
- `ESP_FAIL`: Allocate ETM channel failed because of other reasons

`esp_err_t esp_etm_del_channel` (`esp_etm_channel_handle_t` chan)

Delete an ETM channel.

**Parameters** **chan** –[in] ETM channel handle that created by `esp_etm_new_channel`

#### Returns

- `ESP_OK`: Delete ETM channel successfully

- `ESP_ERR_INVALID_ARG`: Delete ETM channel failed because of invalid argument
- `ESP_FAIL`: Delete ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_enable** (*esp\_etm\_channel\_handle\_t* chan)

Enable ETM channel.

---

**Note:** This function will transit the channel state from init to enable.

---

**Parameters** **chan** –[in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**

- `ESP_OK`: Enable ETM channel successfully
- `ESP_ERR_INVALID_ARG`: Enable ETM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable ETM channel failed because the channel has been enabled already
- `ESP_FAIL`: Enable ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_disable** (*esp\_etm\_channel\_handle\_t* chan)

Disable ETM channel.

---

**Note:** This function will transit the channel state from enable to init.

---

**Parameters** **chan** –[in] ETM channel handle that created by `esp_etm_new_channel`

**Returns**

- `ESP_OK`: Disable ETM channel successfully
- `ESP_ERR_INVALID_ARG`: Disable ETM channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable ETM channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable ETM channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_channel\_connect** (*esp\_etm\_channel\_handle\_t* chan, *esp\_etm\_event\_handle\_t* event, *esp\_etm\_task\_handle\_t* task)

Connect an ETM event to an ETM task via a previously allocated ETM channel.

---

**Note:** Setting the ETM event/task handle to NULL means to disconnect the channel from any event/task

---

**Parameters**

- **chan** –[in] ETM channel handle that created by `esp_etm_new_channel`
- **event** –[in] ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`
- **task** –[in] ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**

- `ESP_OK`: Connect ETM event and task to the channel successfully
- `ESP_ERR_INVALID_ARG`: Connect ETM event and task to the channel failed because of invalid argument
- `ESP_FAIL`: Connect ETM event and task to the channel failed because of other reasons

*esp\_err\_t* **esp\_etm\_del\_event** (*esp\_etm\_event\_handle\_t* event)

Delete ETM event.

---

**Note:** Although the ETM event comes from various peripherals, we provide the same user API to delete the event handle seamlessly.

---

**Parameters** **event** **–[in]** ETM event handle obtained from a driver/peripheral, e.g. `xxx_new_etm_event`

**Returns**

- `ESP_OK`: Delete ETM event successfully
- `ESP_ERR_INVALID_ARG`: Delete ETM event failed because of invalid argument
- `ESP_FAIL`: Delete ETM event failed because of other reasons

*esp\_err\_t* **esp\_etm\_del\_task** (*esp\_etm\_task\_handle\_t* task)

Delete ETM task.

---

**Note:** Although the ETM task comes from various peripherals, we provide the same user API to delete the task handle seamlessly.

---

**Parameters** **task** **–[in]** ETM task handle obtained from a driver/peripheral, e.g. `xxx_new_etm_task`

**Returns**

- `ESP_OK`: Delete ETM task successfully
- `ESP_ERR_INVALID_ARG`: Delete ETM task failed because of invalid argument
- `ESP_FAIL`: Delete ETM task failed because of other reasons

*esp\_err\_t* **esp\_etm\_dump** (FILE \*out\_stream)

Dump ETM channel usages to the given IO stream.

**Parameters** **out\_stream** **–[in]** IO stream (e.g. stdout)

**Returns**

- `ESP_OK`: Dump ETM channel usages successfully
- `ESP_ERR_INVALID_ARG`: Dump ETM channel usages failed because of invalid argument
- `ESP_FAIL`: Dump ETM channel usages failed because of other reasons

## Structures

struct **esp\_etm\_channel\_config\_t**

ETM channel configuration.

## Type Definitions

typedef struct esp\_etm\_channel\_t \***esp\_etm\_channel\_handle\_t**

ETM channel handle.

typedef struct esp\_etm\_event\_t \***esp\_etm\_event\_handle\_t**

ETM event handle.

typedef struct esp\_etm\_task\_t \***esp\_etm\_task\_handle\_t**

ETM task handle.

## Header File

- `components/driver/gpio/include/driver/gpio_etm.h`

## Functions

*esp\_err\_t* **gpio\_new\_etm\_event** (const *gpio\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*ret\_event)

Create an ETM event object for the GPIO peripheral.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

---

**Note:** The newly created ETM event object is not bind to any GPIO, you need to call `gpio_etm_event_bind_gpio` to bind the wanted GPIO

---

#### Parameters

- **config** –[in] GPIO ETM event configuration
- **ret\_event** –[out] Returned ETM event handle

#### Returns

- **ESP\_OK**: Create ETM event successfully
- **ESP\_ERR\_INVALID\_ARG**: Create ETM event failed because of invalid argument
- **ESP\_ERR\_NO\_MEM**: Create ETM event failed because of out of memory
- **ESP\_ERR\_NOT\_FOUND**: Create ETM event failed because all events are used up and no more free one
- **ESP\_FAIL**: Create ETM event failed because of other reasons

*esp\_err\_t* **gpio\_etm\_event\_bind\_gpio** (*esp\_etm\_event\_handle\_t* event, int gpio\_num)

Bind the GPIO with the ETM event.

---

**Note:** Calling this function multiple times with different GPIO number can override the previous setting immediately.

---

---

**Note:** Only GPIO ETM object can call this function

---

#### Parameters

- **event** –[in] ETM event handle that created by `gpio_new_etm_event`
- **gpio\_num** –[in] GPIO number that can trigger the ETM event

#### Returns

- **ESP\_OK**: Set the GPIO for ETM event successfully
- **ESP\_ERR\_INVALID\_ARG**: Set the GPIO for ETM event failed because of invalid argument, e.g. GPIO is not input capable, ETM event is not of GPIO type
- **ESP\_FAIL**: Set the GPIO for ETM event failed because of other reasons

*esp\_err\_t* **gpio\_new\_etm\_task** (const *gpio\_etm\_task\_config\_t* \*config, *esp\_etm\_task\_handle\_t* \*ret\_task)

Create an ETM task object for the GPIO peripheral.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

---

**Note:** The GPIO ETM task works like a container, a newly created ETM task object doesn't have GPIO members to be managed. You need to call `gpio_etm_task_add_gpio` to put one or more GPIOs to the container.

---

#### Parameters

- **config** –[in] GPIO ETM task configuration
- **ret\_task** –[out] Returned ETM task handle

#### Returns

- `ESP_OK`: Create ETM task successfully
- `ESP_ERR_INVALID_ARG`: Create ETM task failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create ETM task failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Create ETM task failed because all tasks are used up and no more free one
- `ESP_FAIL`: Create ETM task failed because of other reasons

*esp\_err\_t* `gpio_etm_task_add_gpio` (*esp\_etm\_task\_handle\_t* task, int gpio\_num)

Add GPIO to the ETM task.

---

**Note:** You can call this function multiple times to add more GPIOs

---

---

**Note:** Only GPIO ETM object can call this function

---

#### Parameters

- `task` –[in] ETM task handle that created by `gpio_new_etm_task`
- `gpio_num` –[in] GPIO number that can be controlled by the ETM task

#### Returns

- `ESP_OK`: Add GPIO to the ETM task successfully
- `ESP_ERR_INVALID_ARG`: Add GPIO to the ETM task failed because of invalid argument, e.g. GPIO is not output capable, ETM task is not of GPIO type
- `ESP_ERR_INVALID_STATE`: Add GPIO to the ETM task failed because the GPIO is used by other ETM task already
- `ESP_FAIL`: Add GPIO to the ETM task failed because of other reasons

*esp\_err\_t* `gpio_etm_task_rm_gpio` (*esp\_etm\_task\_handle\_t* task, int gpio\_num)

Remove the GPIO from the ETM task.

---

**Note:** Before deleting the ETM task, you need to remove all the GPIOs from the ETM task by this function

---

---

**Note:** Only GPIO ETM object can call this function

---

#### Parameters

- `task` –[in] ETM task handle that created by `gpio_new_etm_task`
- `gpio_num` –[in] GPIO number that to be remove from the ETM task

#### Returns

- `ESP_OK`: Remove the GPIO from the ETM task successfully
- `ESP_ERR_INVALID_ARG`: Remove the GPIO from the ETM task failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove the GPIO from the ETM task failed because the GPIO is not controlled by this ETM task
- `ESP_FAIL`: Remove the GPIO from the ETM task failed because of other reasons

## Structures

struct `gpio_etm_event_config_t`

GPIO ETM event configuration.

## Public Members

***gpio\_etm\_event\_edge\_t edge***

Which kind of edge can trigger the ETM event module

struct **gpio\_etm\_task\_config\_t**

GPIO ETM task configuration.

**Public Members*****gpio\_etm\_task\_action\_t action***

Which action to take by the ETM task module

**Enumerations**

enum **gpio\_etm\_event\_edge\_t**

GPIO edges that can be used as ETM event.

*Values:*

enumerator **GPIO\_ETM\_EVENT\_EDGE\_POS**

A rising edge on the GPIO will generate an ETM event signal

enumerator **GPIO\_ETM\_EVENT\_EDGE\_NEG**

A falling edge on the GPIO will generate an ETM event signal

enumerator **GPIO\_ETM\_EVENT\_EDGE\_ANY**

Any edge on the GPIO can generate an ETM event signal

enum **gpio\_etm\_task\_action\_t**

GPIO actions that can be taken by the ETM task.

*Values:*

enumerator **GPIO\_ETM\_TASK\_ACTION\_SET**

Set the GPIO level to high

enumerator **GPIO\_ETM\_TASK\_ACTION\_CLR**

Clear the GPIO level to low

enumerator **GPIO\_ETM\_TASK\_ACTION\_TOG**

Toggle the GPIO level

**Header File**

- [components/esp\\_system/include/esp\\_systick\\_etm.h](#)

**Functions**

***esp\_err\_t esp\_systick\_new\_etm\_alarm\_event*** (int core\_id, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event handle of systick hardware's alarm/heartbeat event.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

**Parameters**

- **core\_id** –[in] CPU core ID
- **out\_event** –[out] Returned ETM event handle

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## 2.6.6 GPIO & RTC GPIO

### GPIO Summary

The ESP32-C6 chip features 31 physical GPIO pins (GPIO0 ~ GPIO30). Each pin can be used as a general-purpose I/O, or to be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-C6 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	LP GPIO	Comments
GPIO0	ADC1_CH0	LP_GPIO0	
GPIO1	ADC1_CH1	LP_GPIO1	
GPIO2	ADC1_CH2	LP_GPIO2	
GPIO3	ADC1_CH3	LP_GPIO3	
GPIO4	ADC1_CH4	LP_GPIO4	Strapping pin
GPIO5	ADC1_CH5	LP_GPIO5	Strapping pin
GPIO6	ADC1_CH6	LP_GPIO6	
GPIO7		LP_GPIO7	
GPIO8			Strapping pin
GPIO9			Strapping pin
GPIO10			
GPIO11			
GPIO12			USB-JTAG
GPIO13			USB-JTAG
GPIO14			
GPIO15			Strapping pin
GPIO16			
GPIO17			
GPIO18			
GPIO19			
GPIO20			
GPIO21			
GPIO22			
GPIO23			
GPIO24			SPI0/1
GPIO25			SPI0/1
GPIO26			SPI0/1
GPIO27			SPI0/1
GPIO28			SPI0/1
GPIO29			SPI0/1
GPIO30			SPI0/1

**Note:**

- **Strapping pin: GPIO4, GPIO5, GPIO8, GPIO9, and GPIO15 are strapping pins. For more information, please refer to**
    - SPI0/1: GPIO24-30 are usually used for SPI flash and not recommended for other uses.
    - USB-JTAG: GPIO 12 and 13 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
  - For chip variants with an SiP flash built in, GPIO24 ~ GPIO30 are dedicated to connecting the SiP flash; GPIO10 ~ GPIO11 are not led out to any chip pins; therefore, only the remaining 22 GPIO pins are available.
  - For chip variants without an in-package flash, GPIO14 is not led out to any chip pins.
- 

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- Analog functions such as ADC/DAC/etc are in use.

### GPIO Glitch Filter

The ESP32-C6 chip features hardware filters to remove unwanted glitch pulses from the input GPIO, which can help reduce false triggering of the interrupt and prevent a noise being routed to the peripheral side.

Each GPIO can be configured with a glitch filter, which can be used to filter out pulses shorter than **two** sample clock cycles. The duration of the filter is not configurable. The sample clock is the clock source of the IO\_MUX. In the driver, we call this kind of filter as `pin glitch filter`. You can create the filter handle by calling `gpio_new_pin_glitch_filter()`. All the configurations for a pin glitch filter are listed in the `gpio_pin_glitch_filter_config_t` structure.

- `gpio_pin_glitch_filter_config_t::gpio_num` sets the GPIO number to enable the glitch filter.

ESP32-C6 provides 8 flexible glitch filters, whose duration is configurable. We refer to this kind of filter as `flex glitch filter`. Each of them can be applied to any input GPIO. However, applying multiple filters to the same GPIO doesn't make difference from one. You can create the filter handle by calling `gpio_new_flex_glitch_filter()`. All the configurations for a flexible glitch filter are listed in the `gpio_flex_glitch_filter_config_t` structure.

- `gpio_flex_glitch_filter_config_t::gpio_num` sets the GPIO that will be applied to the flex glitch filter.
- `gpio_flex_glitch_filter_config_t::window_width_ns` and `gpio_flex_glitch_filter_config_t::window_thres_ns` are the key parameters of the glitch filter. During `gpio_flex_glitch_filter_config_t::window_width_ns`, any pulse whose width is shorter than `gpio_flex_glitch_filter_config_t::window_thres_ns` will be discarded. Please note that, you can't set `gpio_flex_glitch_filter_config_t::window_thres_ns` bigger than `gpio_flex_glitch_filter_config_t::window_width_ns`.

Please note, the `pin glitch filter` and `flex glitch filter` are independent. You can enable both of them for the same GPIO.

The glitch filter is disabled by default, and can be enabled by calling `gpio_glitch_filter_enable()`. To recycle the filter, you can call `gpio_del_glitch_filter()`. Please note, before deleting the filter, you should disable it first by calling `gpio_glitch_filter_disable()`.

## Application Example

- GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

## API Reference - Normal GPIO

### Header File

- [components/driver/gpio/include/driver/gpio.h](#)

### Functions

*esp\_err\_t* **gpio\_config** (const *gpio\_config\_t* \*pGPIOConfig)

GPIO common configuration.

Configure GPIO's Mode, pull-up, PullDown, IntrType

**Parameters** *pGPIOConfig* –Pointer to GPIO configure struct

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_reset\_pin** (*gpio\_num\_t* gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**Parameters** *gpio\_num* –GPIO number.

**Returns** Always return ESP\_OK.

*esp\_err\_t* **gpio\_set\_intr\_type** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- **gpio\_num** –GPIO number. If you want to set the trigger type of e.g. of GPIO16, *gpio\_num* should be GPIO\_NUM\_16 (16);
- **intr\_type** –Interrupt type, select from *gpio\_int\_type\_t*

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_enable** (*gpio\_num\_t* gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

---

**Parameters** *gpio\_num* –GPIO number. If you want to enable an interrupt on e.g. GPIO16, *gpio\_num* should be GPIO\_NUM\_16 (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_intr\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** **gpio\_num** –GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- `ESP_OK` success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* gpio\_num, *uint32\_t* level)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters**

- **gpio\_num** –GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- **level** –Output level. 0: low ; 1: high

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO number error

*int* **gpio\_get\_level** (*gpio\_num\_t* gpio\_num)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters** **gpio\_num** –GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction.

Configure GPIO direction,such as `output_only`,`input_only`,`output_and_input`

**Parameters**

- **gpio\_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- **mode** –GPIO direction

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` GPIO error

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** –GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Parameters**

- **gpio\_num** –GPIO number.
- **intr\_type** –GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

**Parameters** **gpio\_num** –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**Parameters**

- **fn** –Interrupt handler function.
- **arg** –Parameter for handler function
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

**Parameters** **gpio\_num** –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-up on GPIO.

**Parameters** *gpio\_num* –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-down on GPIO.

**Parameters** *gpio\_num* –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpiopulldown\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-down on GPIO.

**Parameters** *gpio\_num* –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's `ETS_GPIO_INTR_SOURCE` ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters** *intr\_alloc\_flags* –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**

- *gpio\_num* –GPIO number
- *isr\_handler* –ISR handler function for the corresponding GPIO number.
- *args* –parameter for ISR handler.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** *gpio\_num* –GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

**Parameters**

- *gpio\_num* –GPIO number, only support output GPIOs
- *strength* –Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

**Parameters**

- *gpio\_num* –GPIO number, only support output GPIOs
- *strength* –Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the chip or system is reset, for example, when watchdog time-out or Deep-sleep events are triggered.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** *gpio\_num* –GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** *gpio\_num* –GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

void **gpio\_iomux\_in** (uint32\_t gpio\_num, uint32\_t signal\_idx)  
SOC\_GPIO\_SUPPORT\_HOLD\_SINGLE\_IO\_IN\_DSLP.

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- **gpio\_num** –GPIO number of the pad.
- **signal\_idx** –Peripheral signal id to input. One of the \*\_IN\_IDX signals in soc/gpio\_sig\_map.h.

void **gpio\_iomux\_out** (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- **gpio\_num** –gpio\_num GPIO number of the pad.
- **func** –The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in soc/io\_mux\_reg.h.
- **oen\_inv** –True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:** This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Force unhold all digital and rtc gpio pads.

*esp\_err\_t* **gpio\_sleep\_sel\_en** (*gpio\_num\_t* gpio\_num)

Enable SLP\_SEL to change GPIO status automantically in lightsleep.

**Parameters** **gpio\_num** –GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (*gpio\_num\_t* gpio\_num)

Disable SLP\_SEL to change GPIO status automantically in lightsleep.

**Parameters** **gpio\_num** –GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Parameters**

- **gpio\_num** –Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

#### Parameters

- **gpio\_num** –GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** –GPIO pull up/down mode.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable GPIO deep-sleep wake-up function.

---

**Note:** Called by the SDK. User shouldn't call this directly in the APP.

---

#### Parameters

- **gpio\_num** –GPIO number.
- **intr\_type** –GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO deep-sleep wake-up function.

**Parameters** **gpio\_num** –GPIO number

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for gpio\_config function.

## Public Members

uint64\_t **pin\_bit\_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

*gpio\_mode\_t* **mode**

GPIO mode: set input/output mode

*gpio\_pullup\_t* **pull\_up\_en**

GPIO pull-up

*gpio\_pulldown\_t* **pull\_down\_en**

GPIO pull-down

*gpio\_int\_type\_t* **intr\_type**

GPIO interrupt type

### Macros

**GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (gpio\_num)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

**GPIO\_IS\_VALID\_DIGITAL\_IO\_PAD** (gpio\_num)

Check whether it can be a valid digital I/O pad.

**GPIO\_IS\_DEEP\_SLEEP\_WAKEUP\_VALID\_GPIO** (gpio\_num)

### Type Definitions

typedef *intr\_handle\_t* **gpio\_isr\_handle\_t**

typedef void (\***gpio\_isr\_t**)(void \*arg)

GPIO interrupt handler.

**Param arg** User registered data

### Enumerations

enum `gpio_port_t`

*Values:*

enumerator `GPIO_PORT_0`

enumerator `GPIO_PORT_MAX`

enum **gpio\_num\_t**

*Values:*

enumerator **GPIO\_NUM\_NC**

Use to signal not connected to S/W

enumerator **GPIO\_NUM\_0**

GPIO0, input and output

enumerator **GPIO\_NUM\_1**

GPIO1, input and output

enumerator **GPIO\_NUM\_2**

GPIO2, input and output

enumerator **GPIO\_NUM\_3**

GPIO3, input and output

enumerator **GPIO\_NUM\_4**

GPIO4, input and output

enumerator **GPIO\_NUM\_5**

GPIO5, input and output

enumerator **GPIO\_NUM\_6**

GPIO6, input and output

enumerator **GPIO\_NUM\_7**

GPIO7, input and output

enumerator **GPIO\_NUM\_8**

GPIO8, input and output

enumerator **GPIO\_NUM\_9**

GPIO9, input and output

enumerator **GPIO\_NUM\_10**

GPIO10, input and output

enumerator **GPIO\_NUM\_11**

GPIO11, input and output

enumerator **GPIO\_NUM\_12**

GPIO12, input and output

enumerator **GPIO\_NUM\_13**

GPIO13, input and output

- enumerator **GPIO\_NUM\_14**  
GPIO14, input and output
- enumerator **GPIO\_NUM\_15**  
GPIO15, input and output
- enumerator **GPIO\_NUM\_16**  
GPIO16, input and output
- enumerator **GPIO\_NUM\_17**  
GPIO17, input and output
- enumerator **GPIO\_NUM\_18**  
GPIO18, input and output
- enumerator **GPIO\_NUM\_19**  
GPIO19, input and output
- enumerator **GPIO\_NUM\_20**  
GPIO20, input and output
- enumerator **GPIO\_NUM\_21**  
GPIO21, input and output
- enumerator **GPIO\_NUM\_22**  
GPIO22, input and output
- enumerator **GPIO\_NUM\_23**  
GPIO23, input and output
- enumerator **GPIO\_NUM\_24**  
GPIO24, input and output
- enumerator **GPIO\_NUM\_25**  
GPIO25, input and output
- enumerator **GPIO\_NUM\_26**  
GPIO26, input and output
- enumerator **GPIO\_NUM\_27**  
GPIO27, input and output
- enumerator **GPIO\_NUM\_28**  
GPIO28, input and output
- enumerator **GPIO\_NUM\_29**  
GPIO29, input and output

enumerator **GPIO\_NUM\_30**  
GPIO30, input and output

enumerator **GPIO\_NUM\_MAX**

enum **gpio\_int\_type\_t**

*Values:*

enumerator **GPIO\_INTR\_DISABLE**  
Disable GPIO interrupt

enumerator **GPIO\_INTR\_POSEDGE**  
GPIO interrupt type : rising edge

enumerator **GPIO\_INTR\_NEGEDGE**  
GPIO interrupt type : falling edge

enumerator **GPIO\_INTR\_ANYEDGE**  
GPIO interrupt type : both rising and falling edge

enumerator **GPIO\_INTR\_LOW\_LEVEL**  
GPIO interrupt type : input low level trigger

enumerator **GPIO\_INTR\_HIGH\_LEVEL**  
GPIO interrupt type : input high level trigger

enumerator **GPIO\_INTR\_MAX**

enum **gpio\_mode\_t**

*Values:*

enumerator **GPIO\_MODE\_DISABLE**  
GPIO mode : disable input and output

enumerator **GPIO\_MODE\_INPUT**  
GPIO mode : input only

enumerator **GPIO\_MODE\_OUTPUT**  
GPIO mode : output only mode

enumerator **GPIO\_MODE\_OUTPUT\_OD**  
GPIO mode : output only with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT\_OD**  
GPIO mode : output and input with open-drain mode

enumerator **GPIO\_MODE\_INPUT\_OUTPUT**  
GPIO mode : output and input mode

enum **gpio\_pullup\_t**

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**

Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**

Enable GPIO pull-up resistor

enum **gpiopulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**

Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**

Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

enum **gpio\_hys\_ctrl\_mode\_t**

Available option for configuring hysteresis feature of GPIOs.

*Values:*

enumerator **GPIO\_HYS\_CTRL\_EFUSE**

Pad input hysteresis ctrl by efuse

enumerator **GPIO\_HYS\_SOFT\_ENABLE**

Pad input hysteresis enable by software

enumerator **GPIO\_HYS\_SOFT\_DISABLE**

Pad input hysteresis disable by software

## API Reference - RTC GPIO

### Header File

- [components/driver/gpio/include/driver/rtc\\_io.h](#)

### Functions

bool **rtc\_gpio\_is\_valid\_gpio** (*gpio\_num\_t* gpio\_num)

Determine if the specified GPIO is a valid RTC GPIO.

**Parameters** **gpio\_num** –GPIO number

**Returns** true if GPIO is valid for RTC GPIO use. false otherwise.

int **rtc\_io\_number\_get** (*gpio\_num\_t* gpio\_num)

Get RTC IO index number by gpio number.

**Parameters** **gpio\_num** –GPIO number

**Returns** >=0: Index of rtcio. -1 : The gpio is not rtcio.

*esp\_err\_t* **rtc\_gpio\_init** (*gpio\_num\_t* gpio\_num)

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_deinit** (*gpio\_num\_t* gpio\_num)

Init a GPIO as digital GPIO.

**Parameters** **gpio\_num** –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)`

Get the RTC IO input level.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- 1 High level
- 0 Low level
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)`

Set the RTC IO output level.

**Parameters**

- `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)
- `level` –output level

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)`

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**

- `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)
- `mode` –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)`

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT\_ONLY mode. ESP32S2 support INPUT\_ONLY, OUTPUT\_ONLY, INPUT\_OUTPUT mode.

**Parameters**

- `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)
- `mode` –GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)`

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call `gpio_pullup_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

`esp_err_t rtc_gpio_pulldown_en (gpio_num_t gpio_num)`

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call `gpio_pulldown_en`, which will work both for normal GPIOs and RTC IOs.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call `gpio_pullup_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpiopulldown\_dis** (*gpio\_num\_t* gpio\_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call `gpio_pulldown_dis`, which will work both for normal GPIOs and RTC IOs.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set RTC GPIO pad drive capability.

**Parameters**

- `gpio_num` –GPIO number, only support output GPIOs
- `strength` –Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get RTC GPIO pad drive capability.

**Parameters**

- `gpio_num` –GPIO number, only support output GPIOs
- `strength` –Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **rtc\_gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC\_IO peripheral.

**Parameters** `gpio_num` –GPIO number (e.g. GPIO\_NUM\_12)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO is not an RTC IO

*esp\_err\_t* **rtc\_gpio\_force\_hold\_en\_all** (void)

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

*esp\_err\_t* **rtc\_gpio\_force\_hold\_dis\_all** (void)

Disable force hold signal for all RTC IOs.

*esp\_err\_t* **rtc\_gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_intr\_type\_t* intr\_type)

Enable wakeup from sleep mode using specific GPIO.

#### Parameters

- **gpio\_num** –GPIO number
- **intr\_type** –Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

*esp\_err\_t* **rtc\_gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable wakeup from sleep mode using specific GPIO.

**Parameters** **gpio\_num** –GPIO number

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO

### Macros

**RTC\_GPIO\_IS\_VALID\_GPIO** (gpio\_num)

### Header File

- [components/hal/include/hal/rtc\\_io\\_types.h](#)

### Enumerations

enum **rtc\_gpio\_mode\_t**

RTCIO output/input mode type.

*Values:*

enumerator **RTC\_GPIO\_MODE\_INPUT\_ONLY**

Pad input

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_ONLY**

Pad output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT**

Pad input + output

enumerator **RTC\_GPIO\_MODE\_DISABLED**

Pad (output + input) disable

enumerator **RTC\_GPIO\_MODE\_OUTPUT\_OD**

Pad open-drain output

enumerator **RTC\_GPIO\_MODE\_INPUT\_OUTPUT\_OD**

Pad input + open-drain output

## API Reference - GPIO Glitch Filter

### Header File

- [components/driver/gpio/include/driver/gpio\\_filter.h](#)

### Functions

*esp\_err\_t* **gpio\_new\_pin\_glitch\_filter** (const *gpio\_pin\_glitch\_filter\_config\_t* \*config, *gpio\_glitch\_filter\_handle\_t* \*ret\_filter)

Create a pin glitch filter.

---

**Note:** Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX's source clock) will be filtered out. It's independent with "flex" glitch filter. See also `gpio_new_flex_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** –[in] Glitch filter configuration
- **ret\_filter** –[out] Returned glitch filter handle

#### Returns

- **ESP\_OK**: Create a pin glitch filter successfully
- **ESP\_ERR\_INVALID\_ARG**: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- **ESP\_ERR\_NO\_MEM**: Create a pin glitch filter failed because of out of memory
- **ESP\_FAIL**: Create a pin glitch filter failed because of other error

*esp\_err\_t* **gpio\_new\_flex\_glitch\_filter** (const *gpio\_flex\_glitch\_filter\_config\_t* \*config, *gpio\_glitch\_filter\_handle\_t* \*ret\_filter)

Allocate a flex glitch filter.

---

**Note:** "flex" means the filter parameters (window, threshold) are adjustable. It's independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** –[in] Glitch filter configuration
- **ret\_filter** –[out] Returned glitch filter handle

#### Returns

- ESP\_OK: Allocate a flex glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- ESP\_ERR\_NO\_MEM: Allocate a flex glitch filter failed because of out of memory
- ESP\_ERR\_NOT\_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- ESP\_FAIL: Allocate a flex glitch filter failed because of other error

*esp\_err\_t* **gpio\_del\_glitch\_filter** (*gpio\_glitch\_filter\_handle\_t* filter)

Delete a glitch filter.

**Parameters** **filter** **-[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Delete glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Delete glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP\_FAIL: Delete glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_enable** (*gpio\_glitch\_filter\_handle\_t* filter)

Enable a glitch filter.

**Parameters** **filter** **-[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Enable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Enable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP\_FAIL: Enable glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_disable** (*gpio\_glitch\_filter\_handle\_t* filter)

Disable a glitch filter.

**Parameters** **filter** **-[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Disable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Disable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Disable glitch filter failed because the glitch filter is not enabled yet
- ESP\_FAIL: Disable glitch filter failed because of other error

## Structures

struct **gpio\_pin\_glitch\_filter\_config\_t**

Configuration of GPIO pin glitch filter.

### Public Members

glitch\_filter\_clock\_source\_t **clk\_src**

Clock source for the glitch filter

*gpio\_num\_t* **gpio\_num**

GPIO number

struct **gpio\_flex\_glitch\_filter\_config\_t**

Configuration of GPIO flex glitch filter.

### Public Members

glitch\_filter\_clock\_source\_t **clk\_src**

Clock source for the glitch filter

*gpio\_num\_t* **gpio\_num**

GPIO number

uint32\_t **window\_width\_ns**

Sample window width (in ns)

uint32\_t **window\_thres\_ns**

Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < `window_thres_ns` will be discarded.

### Type Definitions

typedef struct gpio\_glitch\_filter\_t \***gpio\_glitch\_filter\_handle\_t**

Typedef of GPIO glitch filter handle.

## 2.6.7 General Purpose Timer (GPTimer)

### Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-C6 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- *Resource Allocation* - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- *Set and Get Count Value* - covers how to force the timer counting from a start point and how to get the count value at anytime.
- *Set up Alarm Action* - covers the parameters that should be set up to enable the alarm event.
- *Register Event Callbacks* - covers how to hook user specific code to the alarm event callback function.
- *Enable and Disable Timer* - covers how to enable and disable the timer.
- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *ETM Event and Task* - describes what the events and tasks can be connected to the ETM channel.
- *Power Management* - describes how different source clock selections can affect power consumption.

- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to  $1 / \text{resolution\_hz}$  seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to *ESP32-C6 Technical Reference Manual > Chapter Timer Group (TIMG) [PDF]*. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.
- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g. the “Alarm Event” ) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you needs to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from **init** to **enable**.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event. Calling `gptimer_start()` will transit the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the “start protection” state (i.e. `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```

ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));

```

### Trigger Period Events

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this_
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {

```

(continues on next page)

(continued from previous page)

```

        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

**ETM Event and Task** GPTimer is able to generate various events that can interact with the *ETM* module. The supported events are listed in the `gptimer_etm_event_type_t`. You can call `gptimer_new_etm_event()` to get the corresponding ETM event handle. Likewise, GPTimer exposes several tasks that can be triggered by other ETM events. The supported tasks are listed in the `gptimer_etm_task_type_t`. You can call `gptimer_new_etm_task()` to get the corresponding ETM task handle.

For how to connect the event and task to an ETM channel, please refer to the *ETM* documentation.

**Power Management** There're some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver will increase the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
- Place all functions that used by the ISR into IRAM<sup>2</sup>
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

## Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).
- GPTimer capture external event's timestamp, with the help of ETM module: [peripherals/timer\\_group/gptimer\\_capture\\_hc\\_sr04](#).

## API Reference

### Header File

- `components/driver/gptimer/include/driver/gptimer.h`

### Functions

`esp_err_t gptimer_new_timer` (const `gptimer_config_t` \*config, `gptimer_handle_t` \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the “init” state.

---

#### Parameters

- **config** –[in] GPTimer configuration
- **ret\_timer** –[out] Returned timer handle

#### Returns

- `ESP_OK`: Create GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Create GPTimer failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create GPTimer failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create GPTimer failed because all hardware timers are used up and no more free one
- `ESP_FAIL`: Create GPTimer failed because of other error

`esp_err_t gptimer_del_timer` (`gptimer_handle_t` timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the “init” state before it can be deleted.

---

**Parameters** **timer** –[in] Timer handle created by `gptimer_new_timer`

#### Returns

- `ESP_OK`: Delete GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Delete GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete GPTimer failed because the timer is not in init state
- `ESP_FAIL`: Delete GPTimer failed because of other error

`esp_err_t gptimer_set_raw_count` (`gptimer_handle_t` timer, `uint64_t` value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **value** –[in] Count value to be set

#### Returns

- `ESP_OK`: Set GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Set GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Set GPTimer raw count value failed because of other error

*esp\_err\_t* `gptimer_get_raw_count` (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer raw count value.

---

**Note:** This function will trigger a software capture event and then return the captured count value.

---

---

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **value** –[out] Returned GPTimer count value

#### Returns

- `ESP_OK`: Get GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer raw count value failed because of other error

*esp\_err\_t* `gptimer_get_resolution` (*gptimer\_handle\_t* timer, uint32\_t \*out\_resolution)

Return the real resolution of the timer.

---

**Note:** usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. `RC_FAST`) will do a calibration, the real resolution can be different from the configured one.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **out\_resolution** –[out] Returned timer resolution, in Hz

**Returns**

- ESP\_OK: Get GPTimer resolution successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer resolution failed because of invalid argument
- ESP\_FAIL: Get GPTimer resolution failed because of other error

*esp\_err\_t* `gptimer_get_captured_count` (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer captured count value.

---

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **value** –[out] Returned captured count value

**Returns**

- ESP\_OK: Get GPTimer captured count value successfully
- ESP\_ERR\_INVALID\_ARG: Get GPTimer captured count value failed because of invalid argument
- ESP\_FAIL: Get GPTimer captured count value failed because of other error

*esp\_err\_t* `gptimer_register_event_callbacks` (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set event callbacks failed because the timer is not in init state
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **gptimer\_set\_alarm\_action** (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

---

---

**Note:** If CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **config** –[in] Alarm configuration, especially, set config to NULL means disabling the alarm function

#### Returns

- ESP\_OK: Set alarm action for GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP\_FAIL: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from “init” to “enable” .

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while CONFIG\_PM\_ENABLE is enabled.

---

---

**Note:** Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

---

**Parameters** **timer** –[in] Timer handle created by `gptimer_new_timer`

#### Returns

- ESP\_OK: Enable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Enable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable GPTimer failed because the timer is already enabled
- ESP\_FAIL: Enable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_disable** (*gptimer\_handle\_t* timer)

Disable GPTimer.

---

**Note:** This function will transit the timer state from “enable” to “init” .

---

---

**Note:** This function will disable the interrupt service if it's installed.

---

---

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Disable GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Disable GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable GPTimer failed because the timer is not enabled yet
- `ESP_FAIL`: Disable GPTimer failed because of other error

*esp\_err\_t* `gptimer_start` (*gptimer\_handle\_t* timer)

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from “enable” to “run” .

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* `gptimer_stop` (*gptimer\_handle\_t* timer)

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from “run” to “enable” .

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** `timer` –[in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Stop GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Stop GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Stop GPTimer failed because the timer is not in running.
- ESP\_FAIL: Stop GPTimer failed because of other error

**Structures**

struct **gptimer\_config\_t**

General Purpose Timer configuration.

**Public Members**

*gptimer\_clock\_source\_t* **clk\_src**

GPTimer clock source

*gptimer\_count\_direction\_t* **direction**

Count direction

uint32\_t **resolution\_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution\_hz) seconds

int **intr\_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **intr\_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer\_config\_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer\_event\_callbacks\_t**

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

**Public Members**

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

## Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

## Header File

- [components/driver/gptimer/include/driver/gptimer\\_etm.h](#)

## Functions

*esp\_err\_t* **gptimer\_new\_etm\_event** (*gptimer\_handle\_t* timer, const *gptimer\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event for GPTimer.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **config** –[in] GPTimer ETM event configuration
- **out\_event** –[out] Returned ETM event handle

### Returns

- ESP\_OK: Get ETM event successfully
- ESP\_ERR\_INVALID\_ARG: Get ETM event failed because of invalid argument
- ESP\_FAIL: Get ETM event failed because of other error

*esp\_err\_t* **gptimer\_new\_etm\_task** (*gptimer\_handle\_t* timer, const *gptimer\_etm\_task\_config\_t* \*config, *esp\_etm\_task\_handle\_t* \*out\_task)

Get the ETM task for GPTimer.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

### Parameters

- **timer** –[in] Timer handle created by `gptimer_new_timer`
- **config** –[in] GPTimer ETM task configuration
- **out\_task** –[out] Returned ETM task handle

### Returns

- ESP\_OK: Get ETM task successfully
- ESP\_ERR\_INVALID\_ARG: Get ETM task failed because of invalid argument
- ESP\_FAIL: Get ETM task failed because of other error

## Structures

struct **gptimer\_etm\_event\_config\_t**  
GPTimer ETM event configuration.

### Public Members

*gptimer\_etm\_event\_type\_t* **event\_type**  
GPTimer ETM event type

struct **gptimer\_etm\_task\_config\_t**  
GPTimer ETM task configuration.

### Public Members

*gptimer\_etm\_task\_type\_t* **task\_type**  
GPTimer ETM task type

## Header File

- `components/driver/gptimer/include/driver/gptimer_types.h`

## Structures

struct **gptimer\_alarm\_event\_data\_t**  
GPTimer alarm event data.

### Public Members

uint64\_t **count\_value**  
Current count value

uint64\_t **alarm\_value**  
Current alarm value

## Type Definitions

typedef struct gptimer\_t \***gptimer\_handle\_t**  
Type of General Purpose Timer handle.

typedef bool (\***gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer** [in] Timer handle created by `gptimer_new_timer`

**Param edata** [in] Alarm event data, fed by driver

**Param user\_ctx** [in] User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/timer\\_types.h](#)

### Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**  
GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **gptimer\_count\_direction\_t**  
GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**  
Decrease count value

enumerator **GPTIMER\_COUNT\_UP**  
Increase count value

enum **gptimer\_etm\_task\_type\_t**  
GPTimer specific tasks that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_TASK\_START\_COUNT**  
Start the counter

enumerator **GPTIMER\_ETM\_TASK\_STOP\_COUNT**  
Stop the counter

enumerator **GPTIMER\_ETM\_TASK\_EN\_ALARM**  
Enable the alarm

enumerator **GPTIMER\_ETM\_TASK\_RELOAD**  
Reload preset value into counter

enumerator **GPTIMER\_ETM\_TASK\_CAPTURE**  
Capture current count value into specific register

enumerator **GPTIMER\_ETM\_TASK\_MAX**  
Maximum number of tasks

enum **gptimer\_etm\_event\_type\_t**  
GPTimer specific events that supported by the ETM module.

*Values:*

enumerator `GPTIMER_ETM_EVENT_ALARM_MATCH`

Count value matches the alarm target value

enumerator `GPTIMER_ETM_EVENT_MAX`

Maximum number of events

## 2.6.8 Dedicated GPIO

### Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

### Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’ s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

---

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’ s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’ s impossible to control GPIOA.

---

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
```

(continues on next page)

(continued from previous page)

```

        .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
        .flags = {
            .out_en = 1,
        },
    };
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));

```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**Note:** `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

## GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that output from the given GPIO bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that input to the given GPIO bundle	<code>dedic_gpio_bundle_read_in()</code>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try [Manipulate GPIOs by Writing Assembly Code](#) instead to reduce the overhead but should take care of the thread safety by themselves.

## Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:
  - Set bits of GPIO: `csrrsi rd, csr, imm[4:0]`
  - Clear bits of GPIO: `csrrci rd, csr, imm[4:0]`
  - Note: Can only control the lowest 4 GPIO channels

Code examples for manipulating dedicated GPIOs from assembly are provided in the [peripherals/dedicated\\_gpio](#) directory of ESP-IDF examples. These examples show how to emulate a UART, an I2C and an SPI bus in assembly thanks to dedicated GPIOs.

For details of supported dedicated GPIO instructions, please refer to [ESP32-C6 Technical Reference Manual > ESP-RISC-V CPU \[PDF\]](#).

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

## API Reference

### Header File

- `components/driver/gpio/include/driver/dedic_gpio.h`

### Functions

`esp_err_t dedic_gpio_get_out_mask` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *mask`)

Get allocated channel mask.

---

**Note:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

---

---

**Note:** With the returned mask, user can directly invoke LL function like “`dedic_gpio_cpu_ll_write_mask`” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

---

#### Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “`dedic_gpio_new_bundle`”
- **mask** –[out] Returned mask value for on specific direction (in or out)

#### Returns

- `ESP_OK`: Get channel mask successfully
- `ESP_ERR_INVALID_ARG`: Get channel mask failed because of invalid argument
- `ESP_FAIL`: Get channel mask failed because of other error

`esp_err_t dedic_gpio_get_in_mask` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *mask`)

`esp_err_t dedic_gpio_get_out_offset` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *offset`)

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOs of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle’s first channel of a particular direction within the bank.

#### Parameters

- **bundle** –[in] Handle of GPIO bundle that returned from “`dedic_gpio_new_bundle`”
- **offset** –[out] Offset value to the first channel of a specific direction (in or out)

#### Returns

- `ESP_OK`: Get channel offset successfully
- `ESP_ERR_INVALID_ARG`: Get channel offset failed because of invalid argument
- `ESP_FAIL`: Get channel offset failed because of other error

`esp_err_t dedic_gpio_get_in_offset` (`dedic_gpio_bundle_handle_t` bundle, `uint32_t *offset`)

`esp_err_t dedic_gpio_new_bundle` (`const dedic_gpio_bundle_config_t *config`, `dedic_gpio_bundle_handle_t *ret_bundle`)

Create GPIO bundle and return the handle.

---

**Note:** One has to enable at least input or output mode in “`config`” parameter.

---

#### Parameters

- **config** –[in] Configuration of GPIO bundle
- **ret\_bundle** –[out] Returned handle of the new created GPIO bundle

#### Returns

- `ESP_OK`: Create GPIO bundle successfully
- `ESP_ERR_INVALID_ARG`: Create GPIO bundle failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create GPIO bundle failed because of no capable memory

- `ESP_ERR_NOT_FOUND`: Create GPIO bundle failed because of no enough continuous dedicated channels
- `ESP_FAIL`: Create GPIO bundle failed because of other error

`esp_err_t` **dedic\_gpio\_del\_bundle** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Destroy GPIO bundle.

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns**

- `ESP_OK`: Destroy GPIO bundle successfully
- `ESP_ERR_INVALID_ARG`: Destroy GPIO bundle failed because of invalid argument
- `ESP_FAIL`: Destroy GPIO bundle failed because of other error

void **dedic\_gpio\_bundle\_write** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, uint32\_t value)

Write value to GPIO bundle.

---

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters**

- **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”
- **mask** –[in] Mask of the GPIOs to be written in the given bundle
- **value** –[in] Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_out** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that output from the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_in** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that input to the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** –[in] Handle of GPIO bundle that returned from “dedic\_gpio\_new\_bundle”

**Returns** Value that input to the GPIO bundle, low bit represents low member in the bundle

## Structures

struct **dedic\_gpio\_bundle\_config\_t**

Type of Dedicated GPIO bundle configuration.

## Public Members

const int **\*gpio\_array**

Array of GPIO numbers, gpio\_array[0] ~ gpio\_array[size-1] <=> low\_dedic\_channel\_num ~ high\_dedic\_channel\_num

size\_t **array\_size**

Number of GPIOs in gpio\_array

unsigned int **in\_en**

Enable input

unsigned int **in\_invert**

Invert input signal

unsigned int **out\_en**

Enable output

unsigned int **out\_invert**

Invert output signal

struct *dedic\_gpio\_bundle\_config\_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

## Type Definitions

```
typedef struct dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t
```

Type of Dedicated GPIO bundle.

## 2.6.9 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.

For more detailed information on the application workflow and the HMAC calculation process, see *ESP32-C6 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Generalized Application Scheme

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A's messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn't bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

## HMAC on the ESP32-C6

On the ESP32-C6, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-C6 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called *Upstream* mode, while the last two modes are called *Downstream* modes.

**eFuse Keys for HMAC** Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0` ... `HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

Key Purpose	Application Scenario
8	HMAC generated for software use
7	HMAC used as a key for the Digital Signature (DS) module
6	HMAC used for enabling the soft-disabled JTAG interface
5	HMAC both as a key for the DS module and for enabling JTAG

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see *ESP32-C6 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

### HMAC Generation for Software

Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length and the eFuse key block ID which contains the secret and has eFuse key purpose set to Upstream mode.

### HMAC for Digital Signature

Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-C6 Technical Reference Manual > Digital Signature (DS)* [PDF].

### HMAC for Enabling JTAG

Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose `HMAC_DOWN_ALL` (5) or `HMAC_DOWN_JTAG` (6). This can be done using the `ets_efuse_write_key()` function in the firmware or using `espefuse.py` from the host.

3. Configure the eFuse key block to be read protected using the `esp_efuse_set_read_protect()`, so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit/bits on ESP32-C6. This will permanently disable JTAG unless the correct key value is provided by software.

---

**Note:** The API `esp_efuse_write_field_cnt(ESP_EFUSE_SOFT_DIS_JTAG, ESP_EFUSE_SOFT_DIS_JTAG[0]->bit_count)` can be used to burn “soft JTAG disable” bits on ESP32-C6.

---

---

**Note:** If `DIS_PAD_JTAG` eFuse is set, then `SOFT_DIS_JTAG` functionality does not work because JTAG is permanently disabled.

---

#### JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the `esp_hmac_jtag_enable()` function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call `esp_hmac_jtag_disable()`.

For more details, see *ESP32-C6 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

### Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use `ets_efuse_write_key` to set physical key block 4 in the eFuse for the HMAC module together with its purpose. `ETS_EFUSE_KEY_PURPOSE_HMAC_UP(8)` means that this key can only be used for HMAC generation for software usage:

```
#include "esp32c6/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
    ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
    key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_hmac.h](#)

### Functions

*esp\_err\_t* **esp\_hmac\_calculate** (*hmac\_key\_id\_t* key\_id, const void \*message, size\_t message\_len, uint8\_t \*hmac)

Calculate the HMAC of a given message.

Calculate the HMAC *hmac* of a given message *message* with length *message\_len*. SHA256 is used for the calculation.

---

**Note:** Uses the HMAC peripheral in “upstream” mode.

---

#### Parameters

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** –the message for which to calculate the HMAC
- **message\_len** –message length return ESP\_ERR\_INVALID\_STATE if unsuccessful
- **hmac** –[out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

#### Returns

- ESP\_OK, if the calculation was successful,
- ESP\_ERR\_INVALID\_ARG if message or hmac is a nullptr or if key\_id out of range
- ESP\_FAIL, if the hmac calculation failed

*esp\_err\_t* **esp\_hmac\_jtag\_enable** (*hmac\_key\_id\_t* key\_id, const uint8\_t \*token)

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

---

**Note:** Return value of the API does not indicate the JTAG status.

---

#### Parameters

- **key\_id** –Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** –Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

#### Returns

- ESP\_OK, if the key\_purpose of the key\_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- ESP\_FAIL, if the key\_purpose of the key\_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE\_HARD\_DIS\_JTAG eFuse parameter.
- ESP\_ERR\_INVALID\_ARG, invalid input arguments

*esp\_err\_t* **esp\_hmac\_jtag\_disable** (void)

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp\_hmac\_jtag\_enable() API.

**Returns**

- `ESP_OK` return `ESP_OK` after writing the `HMAC_SET_INVALIDATE_JTAG_REG` with value 1.

**Enumerations**

enum `hmac_key_id_t`

The possible efuse keys for the HMAC peripheral

*Values:*

enumerator `HMAC_KEY0`

enumerator `HMAC_KEY1`

enumerator `HMAC_KEY2`

enumerator `HMAC_KEY3`

enumerator `HMAC_KEY4`

enumerator `HMAC_KEY5`

enumerator `HMAC_KEY_MAX`

### 2.6.10 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-C6 Technical Reference Manual > Digital Signature (DS)* [PDF].

#### Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

#### Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-C6 or alternatively on a host. For this context, the IDF provides `esp_efuse_write_block()` to set the HMAC key and `esp_hmac_calculate()` to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-C6 Technical Reference Manual > Digital Signature (DS)* [PDF].

### Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see *ESP32-C6 Technical Reference Manual > Digital Signature (DS)* [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is `esp_ds_sign()` and simply blocks until the calculation is finished. If software needs to do something else during the calculation, `esp_ds_start_sign()` can be called, followed by periodic calls to `esp_ds_is_busy()` to check when the calculation has finished. Once the calculation has finished, `esp_ds_finish_sign()` can be called to get the resulting signature.

The APIs `esp_ds_sign()` and `esp_ds_start_sign()` calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API `esp_ds_rsa_sign()` can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses `esp_ds_start_sign()` and converts the signature into PKCS#1 v1.5 format.

---

**Note:** Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

---

### Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-C6 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

- 1) Randomly generate a 256 bit value called the *Initialization Vector (IV)*.
- 2) Randomly generate a 256 bit value called the *HMAC\_KEY*.
- 3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
- 4) Then burn the 256 bit *HMAC\_KEY* on the efuse, which can only be read by the DS peripheral.

For more details, see *ESP32-C6 Technical Reference Manual > Digital Signature (DS)* [PDF].

To configure the DS peripheral for development purposes, you can use the [esp-secure-cert-tool](#).

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the ds data from the flash which has been done through the API's provided by the `esp_secure_cert_mgr` component. Please refer the [component/README](#). for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of *ESP-TLS*. Please refer to *Digital Signature with ESP-TLS* in *ESP-TLS* for more details. As mentioned in the *ESP-TLS* documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

## Example for SSL Mutual Authentication using DS

The example `ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through `ESP-MQTT`) to connect to broker `test.mosquitto.org` using `ssl` transport with mutual authentication. The `ssl` part is internally performed with `ESP-TLS`. See [example README](#) for more details.

## API Reference

### Header File

- `components/esp_hw_support/include/esp_ds.h`

### Functions

`esp_err_t esp_ds_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, void \*signature)

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where,  $Z$  is the signature,  $X$  is the input message,  $Y$  and  $M$  are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

---

**Note:** Please see note section of `esp_ds_start_sign()` for more details about the input parameters.

---

### Parameters

- **message** –the message to be signed; its length should be  $(\text{data->rsa\_length} + 1) * 4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** –the destination of the signature, should be  $(\text{data->rsa\_length} + 1) * 4$  bytes long

### Returns

- `ESP_OK` if successful, the signature was written to the parameter `signature`.
- `ESP_ERR_INVALID_ARG` if one of the parameters is `NULL` or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPTODS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPTODS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component
- `ESP_ERR_HW_CRYPTODS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid.
- `ESP_ERR_HW_CRYPTODS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches.

`esp_err_t esp_ds_start_sign` (const void \*message, const `esp_ds_data_t` \*data, `hmac_key_id_t` key\_id, `esp_ds_context_t` \*\*esp\_ds\_ctx)

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows:  $Z = XY \text{ mod } M$  where,  $Z$  is the signature,  $X$  is the input message,  $Y$  and  $M$  are the RSA private key parameters.

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers Y, M, Rb which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriately padded before calling the API.

---

#### Parameters

- **message** –the message to be signed; its length should be  $(data->rsa\_length + 1)*4$  bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** –the encrypted signing key data (AES encrypted RSA key + IV)
- **key\_id** –the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp\_ds\_ctx** –the context object which is needed for finishing the signing process later

#### Returns

- `ESP_OK` if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `data->rsa_length` is too long or 0
- `ESP_ERR_HW_CRYPT_DS_HMAC_FAIL` if there was an HMAC failure during retrieval of the decryption key
- `ESP_ERR_NO_MEM` if there hasn't been enough memory to allocate the context object
- `ESP_ERR_HW_CRYPT_DS_INVALID_KEY` if there's a problem with passing the HMAC key to the DS component

bool **esp\_ds\_is\_busy** (void)

Return true if the DS peripheral is busy, otherwise false.

---

**Note:** Only valid if `esp_ds_start_sign()` was called before.

---

*esp\_err\_t* **esp\_ds\_finish\_sign** (void \*signature, *esp\_ds\_context\_t* \*esp\_ds\_ctx)

Finish the signing process.

#### Parameters

- **signature** –the destination of the signature, should be  $(data->rsa\_length + 1)*4$  bytes long, the resultant signature bytes shall be written in little endian format.
- **esp\_ds\_ctx** –the context object retrieved by `esp_ds_start_sign()`

#### Returns

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL
- `ESP_ERR_HW_CRYPT_DS_INVALID_DIGEST` if the message digest didn't match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
- `ESP_ERR_HW_CRYPT_DS_INVALID_PADDING` if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

*esp\_err\_t* **esp\_ds\_encrypt\_params** (*esp\_ds\_data\_t* \*data, const void \*iv, const *esp\_ds\_p\_data\_t* \*p\_data, const void \*key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

---

**Note:** The numbers Y, M, Rb which are a part of `esp_ds_data_t` should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

---

#### Parameters

- **data** –Output buffer to store encrypted data, suitable for later use generating signatures.
- **iv** –Pointer to 16 byte IV buffer, will be copied into ‘data’ . Should be randomly generated bytes each time.
- **p\_data** –Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- **key** –Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

#### Returns

- `ESP_OK` if successful, the ds operation has been finished and the result is written to signature.
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL or `p_data->rsa_length` is too long

### Structures

struct **esp\_digital\_signature\_data**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

### Public Members

*esp\_digital\_signature\_length\_t* **rsa\_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in ‘c’ , or invalid results will be returned. (The DS peripheral will always use the value in ‘c’ , not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

---

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangeably. See the ROM code for the original declaration of struct `ets_ds_data_t`.

---

uint32\_t **iv**[ESP\_DS\_IV\_BIT\_LEN / 32]

IV value used to encrypt ‘c’

uint8\_t **c**[ESP\_DS\_C\_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct **esp\_ds\_p\_data\_t**

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling `esp_ds_encrypt_params()`. Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

---

**Note:** Y, M, Rb, & M\_Prime must all be in little endian format.

---

### Public Members

uint32\_t **Y**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA exponent.

uint32\_t **M**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA modulus.

uint32\_t **Rb**[ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN / 32]

RSA r inverse operand.

uint32\_t **M\_prime**

RSA M prime operand.

uint32\_t **length**

RSA length in words (32 bit)

### Macros

**ESP\_DS\_IV\_BIT\_LEN**

**ESP\_DS\_IV\_LEN**

**ESP\_DS\_SIGNATURE\_MAX\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_MD\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_M\_PRIME\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_L\_BIT\_LEN**

**ESP\_DS\_SIGNATURE\_PADDING\_BIT\_LEN**

**ESP\_DS\_C\_LEN**

### Type Definitions

typedef struct esp\_ds\_context **esp\_ds\_context\_t**

typedef struct *esp\_digital\_signature\_data* **esp\_ds\_data\_t**

Encrypted private key data. Recommended to store in flash in this format.

---

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

---

### Enumerations

enum **esp\_digital\_signature\_length\_t**

*Values:*

enumerator **ESP\_DS\_RSA\_1024**

enumerator **ESP\_DS\_RSA\_2048**

enumerator **ESP\_DS\_RSA\_3072**

enumerator **ESP\_DS\_RSA\_4096**

## 2.6.11 Inter-Integrated Circuit (I2C)

### Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C6 has 1 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

### Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

### Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item

- a) *Communication as Master* - handle communications (master)
  - b) *Communication as Slave* - respond to messages from the master (slave)
4. *Interrupt Handling* - configure and service I2C interrupts
  5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
  6. *Error Handling* - how to recognize and handle driver configuration and communication errors
  7. *Delete Driver* - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master or slave from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-C6's internal pull-ups
- (Master only) Set I2C **clock speed**
- (Slave only) Configure the following
  - Whether to enable **10 bit address mode**
  - Define **slave address**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select SDA GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select SCL GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,    // select frequency specific to your_
↪project
    .clk_flags = 0,                             // optional; you can use I2C_SCLK_SRC_
↪FLAG_* flags to choose i2c source clock here
};
```

Configuration example (slave):

```
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,           // select SDA GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_SLAVE_SCL_IO,           // select SCL GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,       // slave address of your project
    .slave.maximum_speed = I2C_SLAVE_MAX_SPEED // expected maximum clock speed
    .clk_flags = 0,                             // optional; you can use I2C_SCLK_
↪SRC_FLAG_* flags to choose I2C source clock here
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see [Customized Configuration](#).

**Source Clock Configuration** **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

---

**Note:** A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

---

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock's baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C6, reading technical reference manual before using it.

---

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

---

---

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

---

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master's request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master's own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32-C6 is ready to communicate with other I2C devices.

ESP32-C6's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a "command link", that should be populated with a sequence of commands and then passed to the I2C controller for execution.

Fig. 6: I2C command link - master write example

**Master Write** The example below shows how to build a command link for an I2C master to send  $n$  bytes to a slave. The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`
  - b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
  - c) **Data** - One or more bytes as an argument of `i2c_master_write()`
  - d) **Stop bit** - `i2c_master_stop()`
Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.
2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read  $n$  bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

Fig. 7: I2C command link - master read example

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32-C6 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`

Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`

The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in [peripherals/i2c](#).

**Interrupt Handling** During driver installation, an interrupt handler is installed by default.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles.

Table 3: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<code>i2c_set_period()</code>
SCL and SDA signal timing used during generation of <b>start</b> signals	<code>i2c_set_start_timing()</code>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<code>i2c_set_stop_timing()</code>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<code>i2c_set_data_timing()</code>
I2C timeout	<code>i2c_set_timeout()</code>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code>	<code>i2c_set_data_mode()</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

---

**Note:** ESP32-C6's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see [TI Application Note](#)

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

### Application Example

I2C examples: [peripherals/i2c](#).

### API Reference

#### Header File

- `components/driver/i2c/include/driver/i2c.h`

## Functions

*esp\_err\_t* **i2c\_driver\_install** (*i2c\_port\_t* i2c\_num, *i2c\_mode\_t* mode, size\_t slv\_rx\_buf\_len, size\_t slv\_tx\_buf\_len, int intr\_alloc\_flags)

Install an I2C driver.

---

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

---

---

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

---

### Parameters

- **i2c\_num** – I2C port number
- **mode** – I2C mode (either master or slave).
- **slv\_rx\_buf\_len** – Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv\_tx\_buf\_len** – Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr\_alloc\_flags** – Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

*esp\_err\_t* **i2c\_driver\_delete** (*i2c\_port\_t* i2c\_num)

Delete I2C driver.

---

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

---

**Parameters** **i2c\_num** – I2C port to delete

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_param\_config** (*i2c\_port\_t* i2c\_num, const *i2c\_config\_t* \*i2c\_conf)

Configure an I2C bus with the given configuration.

### Parameters

- **i2c\_num** – I2C port to configure
- **i2c\_conf** – Pointer to the I2C configuration

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_tx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C tx hardware fifo

**Parameters** **i2c\_num** – I2C port number

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_rx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C rx fifo

**Parameters** **i2c\_num** –I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* i2c\_num, int sda\_io\_num, int scl\_io\_num, bool sda\_pullup\_en, bool scl\_pullup\_en, *i2c\_mode\_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

**Parameters**

- **i2c\_num** –I2C port number
- **sda\_io\_num** –GPIO number for I2C SDA signal
- **scl\_io\_num** –GPIO number for I2C SCL signal
- **sda\_pullup\_en** –Enable the internal pullup for SDA pin
- **scl\_pullup\_en** –Enable the internal pullup for SCL pin
- **mode** –I2C mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_master\_write\_to\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, TickType\_t ticks\_to\_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **write\_buffer** –Bytes to send on the bus
- **write\_size** –Size, in bytes, of the write buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_read\_from\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc...It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** –I2C port number to perform the transfer on
- **device\_address** –I2C device's 7-bit address
- **read\_buffer** –Buffer to store the bytes received on the bus
- **read\_size** –Size, in bytes, of the read buffer
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_write\_read\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

#### Parameters

- **i2c\_num** – I2C port number to perform the transfer on
- **device\_address** – I2C device's 7-bit address
- **write\_buffer** – Bytes to send on the bus
- **write\_size** – Size, in bytes, of the write buffer
- **read\_buffer** – Buffer to store the bytes received on the bus
- **read\_size** – Size, in bytes, of the read buffer
- **ticks\_to\_wait** – Maximum ticks to wait before issuing a timeout.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create\_static** (uint8\_t \*buffer, uint32\_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

---

**Note:** It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

---

#### Parameters

- **buffer** – Buffer to use for commands allocations
- **size** – Size in bytes of the buffer

**Returns** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**Returns** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void **i2c\_cmd\_link\_delete\_static** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

**Parameters** **cmd\_handle** – I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list.

**Parameters** **cmd\_handle** – I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** **cmd\_handle** –I2C commands list

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t data, bool ack\_en)

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Byte to send on the port
- **ack\_en** –Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write** (*i2c\_cmd\_handle\_t* cmd\_handle, const uint8\_t \*data, size\_t data\_len, bool ack\_en)

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data\_len** –Length, in bytes, of the data buffer
- **ack\_en** –Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, *i2c\_ack\_type\_t* ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** –ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, size\_t data\_len, *i2c\_ack\_type\_t* ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C

bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** –I2C commands list
- **data** –Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data\_len** –Size, in bytes, of the `data` buffer
- **ack** –ACK signal

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

*esp\_err\_t* `i2c_master_stop` (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** **cmd\_handle** –I2C commands list

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

*esp\_err\_t* `i2c_master_cmd_begin` (*i2c\_port\_t* i2c\_num, *i2c\_cmd\_handle\_t* cmd\_handle, `TickType_t` ticks\_to\_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** –I2C port number
- **cmd\_handle** –I2C commands list
- **ticks\_to\_wait** –Maximum ticks to wait before issuing a timeout.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Sending command error, slave hasn't ACK the transfer.
- `ESP_ERR_INVALID_STATE` I2C driver not installed or not in master mode.
- `ESP_ERR_TIMEOUT` Operation timeout because the bus is busy.

`int` `i2c_slave_write_buffer` (*i2c\_port\_t* i2c\_num, `const uint8_t *`data, `int` size, `TickType_t` ticks\_to\_wait)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer's data.

---

**Note:** This function shall only be called in I2C slave mode.

---

**Parameters**

- **i2c\_num** –I2C port number
- **data** –Bytes to write into internal buffer
- **size** –Size, in bytes, of `data` buffer
- **ticks\_to\_wait** –Maximum ticks to wait.

**Returns**

- `ESP_FAIL` (-1) Parameter error
- Other ( $\geq 0$ ) The number of data bytes pushed to the I2C slave buffer.

int **i2c\_slave\_read\_buffer** (*i2c\_port\_t* i2c\_num, uint8\_t \*data, size\_t max\_size, TickType\_t ticks\_to\_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

---

**Note:** This function shall only be called in I2C slave mode.

---

#### Parameters

- **i2c\_num** –I2C port number
- **data** –Buffer to fill with ringbuffer' s bytes
- **max\_size** –Maximum bytes to read
- **ticks\_to\_wait** –Maximum waiting ticks

#### Returns

- ESP\_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

*esp\_err\_t* **i2c\_set\_period** (*i2c\_port\_t* i2c\_num, int high\_period, int low\_period)

Set I2C master clock period.

#### Parameters

- **i2c\_num** –I2C port number
- **high\_period** –Clock cycle number during SCL is high level, high\_period is a 14 bit value
- **low\_period** –Clock cycle number during SCL is low level, low\_period is a 14 bit value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_period** (*i2c\_port\_t* i2c\_num, int \*high\_period, int \*low\_period)

Get I2C master clock period.

#### Parameters

- **i2c\_num** –I2C port number
- **high\_period** –pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low\_period** –pointer to get clock cycle number during SCL is low level, will get a 14 bit value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_enable** (*i2c\_port\_t* i2c\_num, uint8\_t cyc\_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

---

**Note:** Enable filter will slow down the SCL clock.

---

#### Parameters

- **i2c\_num** –I2C port number to filter
- **cyc\_num** –the APB cycles need to be filtered (0<= cyc\_num <=7). When the period of a pulse is less than cyc\_num \* APB\_cycle, the I2C controller will ignore this pulse.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_disable** (*i2c\_port\_t* i2c\_num)

Disable filter on I2C bus.

**Parameters** **i2c\_num** –I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_start\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master start signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it' s a 10-bit value.
- **hold\_time** –clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it' s a 10-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_start\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master start signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time
- **hold\_time** –pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_stop\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master stop signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –clock num between the rising-edge of SCL and the rising-edge of SDA, it' s a 10-bit value.
- **hold\_time** –clock number after the STOP bit' s rising-edge, it' s a 14-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_stop\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master stop signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **setup\_time** –pointer to get setup time.
- **hold\_time** –pointer to get hold time.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_timing** (*i2c\_port\_t* i2c\_num, int sample\_time, int hold\_time)

set I2C data signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **sample\_time** –clock number I2C used to sample data on SDA after the rising-edge of SCL, it' s a 10-bit value

- **hold\_time** –clock number I2C used to hold the data after the falling-edge of SCL, it's a 10-bit value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_timing** (*i2c\_port\_t* i2c\_num, int \*sample\_time, int \*hold\_time)

get I2C data signal timing

**Parameters**

- **i2c\_num** –I2C port number
- **sample\_time** –pointer to get sample time
- **hold\_time** –pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_timeout** (*i2c\_port\_t* i2c\_num, int timeout)

set I2C timeout value

**Parameters**

- **i2c\_num** –I2C port number
- **timeout** –timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_timeout** (*i2c\_port\_t* i2c\_num, int \*timeout)

get I2C timeout value

**Parameters**

- **i2c\_num** –I2C port number
- **timeout** –pointer to get timeout value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* tx\_trans\_mode, *i2c\_trans\_mode\_t* rx\_trans\_mode)

set I2C data transfer mode

**Parameters**

- **i2c\_num** –I2C port number
- **tx\_trans\_mode** –I2C sending data mode
- **rx\_trans\_mode** –I2C receiving data mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* \*tx\_trans\_mode, *i2c\_trans\_mode\_t* \*rx\_trans\_mode)

get I2C data transfer mode

**Parameters**

- **i2c\_num** –I2C port number
- **tx\_trans\_mode** –pointer to get I2C sending data mode
- **rx\_trans\_mode** –pointer to get I2C receiving data mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **i2c\_config\_t**

I2C initialization parameters.

### Public Members

*i2c\_mode\_t* **mode**

I2C mode

int **sda\_io\_num**

GPIO number for I2C sda signal

int **scl\_io\_num**

GPIO number for I2C scl signal

bool **sda\_pullup\_en**

Internal GPIO pull mode for I2C sda signal

bool **scl\_pullup\_en**

Internal GPIO pull mode for I2C scl signal

uint32\_t **clk\_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c\_config\_t*::[anonymous]::[anonymous] **master**

I2C master config

uint8\_t **addr\_10bit\_en**

I2C 10bit address mode enable for slave mode

uint16\_t **slave\_addr**

I2C address for slave mode

uint32\_t **maximum\_speed**

I2C expected clock speed from SCL.

struct *i2c\_config\_t*::[anonymous]::[anonymous] **slave**

I2C slave config

uint32\_t **clk\_flags**

Bitwise of `I2C_SCLK_SRC_FLAG_**FOR_DFS**` for clk source choice

## Macros

**I2C\_SCLK\_SRC\_FLAG\_FOR\_NOMAL**

Any one clock source that is available for the specified frequency may be choosen

**I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS**

For REF tick clock, it won't change with APB.

**I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP**

For light sleep mode.

**I2C\_INTERNAL\_STRUCT\_SIZE**

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C\_LINK\_RECOMMENDED\_SIZE** (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start” , “stop” , “nack” , “ack” shall not be counted.

**Type Definitions**

```
typedef void *i2c_cmd_handle_t
```

I2C command handle

**Header File**

- [components/hal/include/hal/i2c\\_types.h](#)

**Structures**

```
struct i2c_hal_clk_config_t
```

Data structure for calculating I2C bus timing.

**Public Members**

```
uint16_t clkm_div
```

I2C core clock divider

```
uint16_t scl_low
```

I2C scl low period

```
uint16_t scl_high
```

I2C scl high period

```
uint16_t scl_wait_high
```

I2C scl wait\_high period

```
uint16_t sda_hold
```

I2C scl low period

uint16\_t **sda\_sample**  
I2C sda sample time

uint16\_t **setup**  
I2C start and stop condition setup period

uint16\_t **hold**  
I2C start and stop condition hold period

uint16\_t **tout**  
I2C bus timeout period

struct **i2c\_hal\_timing\_config\_t**  
Timing configuration structure. Used for I2C reset internally.

### Public Members

int **high\_period**  
high\_period time

int **low\_period**  
low\_period time

int **wait\_high\_period**  
wait\_high\_period time

int **rstart\_setup**  
restart setup

int **start\_hold**  
start hold time

int **stop\_setup**  
stop setup

int **stop\_hold**  
stop hold time

int **sda\_sample**  
high\_period time

int **sda\_hold**  
sda hold time

int **timeout**  
timeout value

## Type Definitions

typedef *soc\_periph\_i2c\_clk\_src\_t* **i2c\_clock\_source\_t**

I2C group clock source.

## Enumerations

enum **i2c\_port\_t**

I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

*Values:*

enumerator **I2C\_NUM\_0**

I2C port 0

enumerator **LP\_I2C\_NUM\_0**

enumerator **I2C\_NUM\_MAX**

I2C port max

enum **i2c\_mode\_t**

*Values:*

enumerator **I2C\_MODE\_SLAVE**

I2C slave mode

enumerator **I2C\_MODE\_MASTER**

I2C master mode

enumerator **I2C\_MODE\_MAX**

enum **i2c\_rw\_t**

*Values:*

enumerator **I2C\_MASTER\_WRITE**

I2C write data

enumerator **I2C\_MASTER\_READ**

I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**

I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**

I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum **i2c\_addr\_mode\_t**

*Values:*

enumerator **I2C\_ADDR\_BIT\_7**  
I2C 7bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_10**  
I2C 10bit address for slave mode

enumerator **I2C\_ADDR\_BIT\_MAX**

enum **i2c\_ack\_type\_t**

*Values:*

enumerator **I2C\_MASTER\_ACK**  
I2C ack for each byte read

enumerator **I2C\_MASTER\_NACK**  
I2C nack for each byte read

enumerator **I2C\_MASTER\_LAST\_NACK**  
I2C nack for the last byte

enumerator **I2C\_MASTER\_ACK\_MAX**

## 2.6.12 Inter-IC Sound (I2S)

### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-C6 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

An I2S bus that communicates in PDM mode consists of the following lines:

- **CLK:** PDM clock line.
- **DIN/DOUT:** Serial data input/output line.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver

- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller has separate RX and TX channels. That means they are able to work under different clocks and slot configurations with separate GPIO pins. Note that although the internal MCLKs of TX channel and RX channel are separate on a controller, the output MCLK signal can only be attached to one channel. If independent MCLK output is required for each channel, they must be allocated on different I2S controllers.

## I2S File Structure

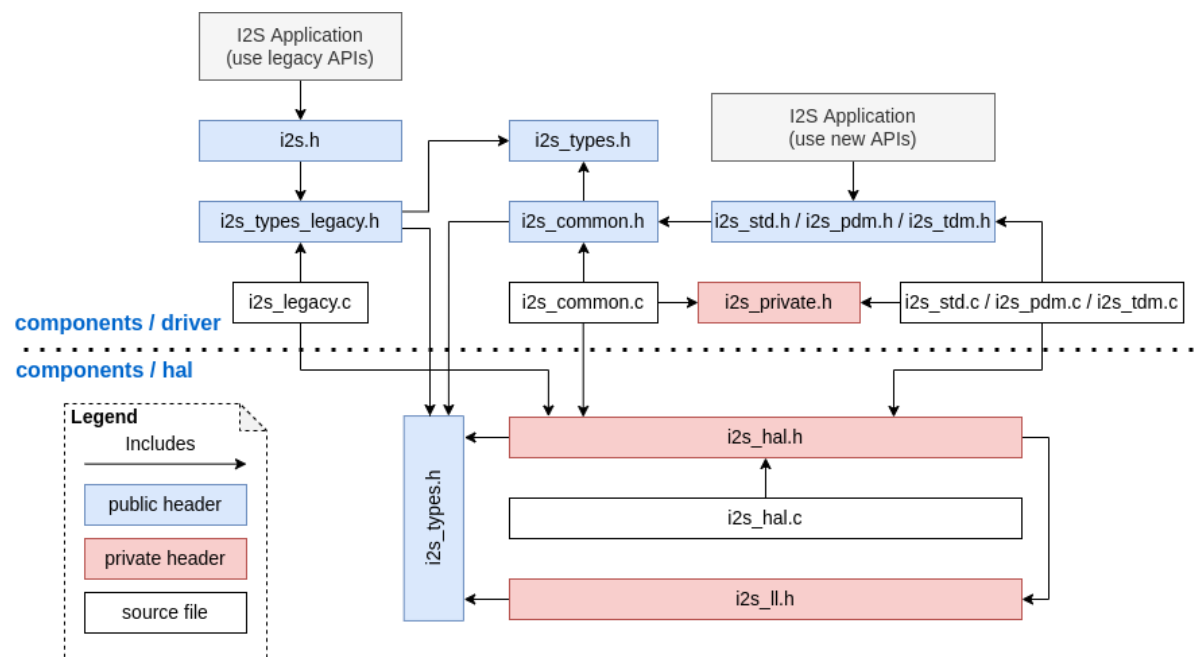

Fig. 8: I2S File Structure

### Public headers that need to be included in the I2S application are as follows:

- `i2s.h`: The header file that provides legacy I2S APIs (for apps using legacy driver).
- `i2s_std.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- `i2s_pdm.h`: The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
- `i2s_tdm.h`: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note:** The legacy driver cannot coexist with the new driver. Include `i2s.h` to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

### Public headers that have been included in the headers above are as follows:

- `i2s_types_legacy.h`: The header file that provides legacy public types that are only used in the legacy driver.
- `i2s_types.h`: The header file that provides public types.
- `i2s_common.h`: The header file that provides common APIs for all communication modes.

## I2S Clock

### Clock Source

- `i2s_clock_src_t::I2S_CLK_SRC_DEFAULT`: Default PLL clock.

- `i2s_clock_src_t::I2S_CLK_SRC_PLL_160M`: 160 MHz PLL clock.

**Clock Terminology**

- **Sample rate**: The number of sampled data in one second per slot.
- **SCLK**: Source clock frequency. It is the frequency of the clock source.
- **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
- **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.
- **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

**I2S Communication Mode**

**Overview of All Modes**

Target	Standard	PDM TX	PDM RX	TDM	ADC/DAC	LCD/Camera
ESP32	I2S 0/1	I2S 0	I2S 0	none	I2S 0	I2S 0
ESP32-S2	I2S 0	none	none	none	none	I2S 0
ESP32-C3	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-C6	I2S 0	I2S 0	none	I2S 0	none	none
ESP32-S3	I2S 0/1	I2S 0	I2S 0	I2S 0/1	none	none
ESP32-H2	I2S 0	I2S 0	none	I2S 0	none	none

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called “slots”. These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

- **Philips Format**: Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

- **MSB Format**: Basically the same as Philips format, but without data shift.

Standard MSB Timing Diagram

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

Standard PCM Timing Diagram

**PDM Mode (TX)** PDM (Pulse-density Modulation) mode for the TX channel can convert PCM data into PDM format which always has left and right slots. PDM TX is only supported on I2S0 and it only supports 16-bit width sample data. It needs at least a CLK pin for clock signal and a DOUT pin for data signal (i.e., the WS and SD signal in the following figure; the BCK signal is an internal bit sampling clock, which is not needed between PDM devices). This mode allows users to configure the up-sampling parameters `i2s_pdm_tx_clk_config_t::up_sample_fp` and `i2s_pdm_tx_clk_config_t::up_sample_fs`. The up-sampling rate can be calculated by  $up\_sample\_rate = i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fp / i2s\_pdm\_tx\_clk\_config\_t::up\_sample\_fs$ . There are two up-sampling modes in PDM TX:

- **Fixed Clock Frequency:** In this mode, the up-sampling rate changes according to the sample rate. Setting  $fp = 960$  and  $fs = sample\_rate / 100$ , then the clock frequency (Fpdm) on CLK pin will be fixed to  $128 * 48\text{ KHz} = 6.144\text{ MHz}$ . Note that this frequency is not equal to the sample rate (Fpcm).
- **Fixed Up-sampling Rate:** In this mode, the up-sampling rate is fixed to 2. Setting  $fp = 960$  and  $fs = 480$ , then the clock frequency (Fpdm) on CLK pin will be  $128 * sample\_rate$ .

PDM Timing Diagram

**TDM Mode** TDM (Time Division Multiplexing) mode supports up to 16 slots. These slots can be enabled by `i2s_tdm_slot_config_t::slot_mask`.

But due to the hardware limitation, only up to 4 slots are supported while the slot is set to 32 bit-width, and 8 slots for 16 bit-width, 16 slots for 8 bit-width. The slot communication format of TDM is almost the same as the standard

mode, yet with some small differences.

- **Philips Format:** Data signal has one-bit shift comparing to the WS signal. And no matter how many slots are contained in one frame, the duty of WS signal always keeps 50%.

- **MSB Format:** Basically the same as the Philips format, but without data shift.

- **PCM Short Format:** Data has one-bit shift and the WS signal becomes a pulse lasting one BCLK cycle for every frame.

- **PCM Long Format:** Data has one-bit shift and the WS signal lasts one-slot bit width for every frame. For example, the duty of WS will be 25% if there are four slots enabled, and 20% if there are five slots.

### Functional Overview

The I2S driver offers the following services:

**Resource Management** There are three levels of resources in the I2S driver:

- `platform` level: Resources of all I2S controllers in the current target.
- `controller` level: Resources in one I2S controller.
- `channel` level: Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels' resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management** When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver will guarantee that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, `registered`, `ready`, and `running`. Their relationship is shown in the following diagram:

Fig. 9: I2S Finite State Machine

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keep waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding ‘reconfig’ functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that will:

1. Keep the interrupt being serviced even when the cache is disabled.
2. Place driver object into DRAM (in case it is linked to PSRAM by accident).

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

### Kconfig Options

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See *IRAM Safe* for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Example

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to *Standard Mode* for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`.

**STD TX Mode** Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data width	bit	slot mode	slot mask	WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high
16 bit	mono	left		0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
		right		0x0000	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004
		both		0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
	stereo	left		0x0001	0x0000	0x0003	0x0000	0x0005	0x0000	0x0007	0x0000
		right		0x0000	0x0002	0x0000	0x0004	0x0000	0x0006	0x0000	0x0008
		both		0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro.
 * This helper macro is defined in 'i2s_common.h' and shared by all the I2S_
 * communication modes.
 * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Setting the configurations, the slot configuration and clock configuration can_
↳be generated by the macros
 * These two helper macros are defined in 'i2s_std.h' which can only be used in_
↳STD mode.
 * They can help to specify the slot and clock configurations for initialization_
↳or updating */
i2s_std_config_t std_cfg = {
```

(continues on next page)

(continued from previous page)

```

        .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
        .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),
        .gpio_cfg = {
            .mclk = I2S_GPIO_UNUSED,
            .bclk = GPIO_NUM_4,
            .ws = GPIO_NUM_5,
            .dout = GPIO_NUM_18,
            .din = I2S_GPIO_UNUSED,
            .invert_flags = {
                .mclk_inv = false,
                .bclk_inv = false,
                .ws_inv = false,
            },
        },
    },
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_cfg);

/* Before writing data, start the TX channel first */
i2s_channel_enable(tx_handle);
i2s_channel_write(tx_handle, src_buf, bytes_to_write, bytes_written, ticks_to_
↳wait);

/* If the configurations of slot or clock need to be updated,
 * stop the channel first and then update it */
// i2s_channel_disable(tx_handle);
// std_cfg.slot_cfg.slot_mode = I2S_SLOT_MODE_MONO; // Default is stereo
// i2s_channel_reconfig_std_slot(tx_handle, &std_cfg.slot_cfg);
// std_cfg.clk_cfg.sample_rate_hz = 96000;
// i2s_channel_reconfig_std_clock(tx_handle, &std_cfg.clk_cfg);

/* Have to stop the channel before deleting it */
i2s_channel_disable(tx_handle);
/* If the handle is not needed any more, delete it to release the channel_
↳resources */
i2s_del_channel(tx_handle);

```

**STD RX Mode** Taking 16-bit data width for example, when the data on the line are:

WS low	WS high	WS low	WS high	WS low	WS high	WS low	WS high	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the data received in the buffer with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

data bit width	slot mode	slot mask	data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7
16 bit	mono	left	0x0001	0x0003	0x0005	0x0007	0x0009	0x000b	0x000d	0x000f
		right	0x0002	0x0004	0x0006	0x0008	0x000a	0x000c	0x000e	0x0010
	stereo	any	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008

**Note:** 8-bit, 24-bit, and 32-bit are similar as 16-bit, the data bit-width in the receiving buffer is equal to the data bit-width on the line. Additionally, when using 24-bit data width, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the receiving buffer size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```

/* If the handle is not needed any more, delete it to release the channel_
↪resources */
i2s_del_channel(rx_handle);

```

**PDM TX Usage** For PDM mode in TX channel, the slot configuration helper macro is:

- [I2S\\_PDM\\_TX\\_SLOT\\_DEFAULT\\_CONFIG](#)

The clock configuration helper macro is:

- [I2S\\_PDM\\_TX\\_CLK\\_DEFAULT\\_CONFIG](#)

Please refer to [PDM Mode](#) for information about PDM TX API. And for more details, please refer to [driver/i2s/include/driver/i2s\\_pdm.h](#).

The PDM data width is fixed to 16-bit. When the data in an `int16_t` writing buffer is:

data 0	data 1	data 2	data 3	data 4	data 5	data 6	data 7	...
0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008	...

Here is the table of the real data on the line with different `i2s_pdm_tx_slot_config_t::slot_mode` and `i2s_pdm_tx_slot_config_t::line_mode` (The PDM format on the line is transferred to PCM format for easier comprehension).

line mode	slot mode	line	left	right	left	right	left	right	left	right
one-line Codec	mono	dout	0x0001	0x0000	0x0002	0x0000	0x0003	0x0000	0x0004	0x0000
	stereo	dout	0x0001	0x0002	0x0003	0x0004	0x0005	0x0006	0x0007	0x0008
one-line DAC	mono	dout	0x0001	0x0001	0x0002	0x0002	0x0003	0x0003	0x0004	0x0004
two-line DAC	mono	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000	0x0000
	stereo	dout	0x0002	0x0002	0x0004	0x0004	0x0006	0x0006	0x0008	0x0008
		dout2	0x0001	0x0001	0x0003	0x0003	0x0005	0x0005	0x0007	0x0007

**Note:** There are three line modes for PDM TX mode, i.e., `I2S_PDM_TX_ONE_LINE_CODEC`, `I2S_PDM_TX_ONE_LINE_DAC`, and `I2S_PDM_TX_TWO_LINE_DAC`. One-line codec is for the PDM codecs that require clock signal. The PDM codec can differentiate the left and right slots by the clock level. The other two modes are used to drive power amplifiers directly with a low-pass filter. They do not need the clock signal, so there are two lines to differentiate the left and right slots. Additionally, for the mono mode of one-line codec, users can force change the slot to the right by setting the clock invert flag in GPIO configuration.

```
#include "driver/i2s_pdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into PDM TX mode */
i2s_pdm_tx_config_t pdm_tx_cfg = {
    .clk_cfg = I2S_PDM_TX_CLK_DEFAULT_CONFIG(36000),
    .slot_cfg = I2S_PDM_TX_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↳MODE_MONO),
    .gpio_cfg = {
        .clk = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .invert_flags = {
            .clk_inv = false,
        },
    },
};
i2s_channel_init_pdm_tx_mode(tx_handle, &pdm_tx_cfg);

...
```

**TDM TX/RX Usage** Different slot communication formats can be generated by the following helper macros for TDM mode. As described above, there are four formats in TDM mode, and their helper macros are:

- `I2S_TDM_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_MSB_SLOT_DEFAULT_CONFIG`
- `I2S_TDM_PCM_SHORT_SLOT_DEFAULT_CONFIG`

- `I2S_TDM_PCM_LONG_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_TDM_CLK_DEFAULT_CONFIG`

Please refer to *TDM Mode* for information about TDM API. And for more details, please refer to `driver/i2s/include/driver/i2s_tdm.h`.

**Note:** Due to hardware limitation, when setting the clock configuration for a slave role, please be aware that `i2s_tdm_clk_config_t::bclk_div` should not be smaller than 8. Increasing this field can reduce the lagging of the data sent from the slave. In the high sample rate case, the data might lag behind for more than one BCLK which will lead to data malposition. Users may gradually increase `i2s_tdm_clk_config_t::bclk_div` to correct it.

As `i2s_tdm_clk_config_t::bclk_div` is the division of MCLK to BCLK, increasing it will also increase the MCLK frequency. Therefore, the clock calculation may fail if MCLK is too high to divide from the source clock. This means that a larger value for `i2s_tdm_clk_config_t::bclk_div` is not necessarily better.

### TDM TX Mode

```
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Allocate an I2S TX channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↪MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↪MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(tx_handle, &tdm_cfg);

...
```

### TDM RX Mode

```
#include "driver/i2s_tdm.h"
#include "driver/gpio.h"

/* Set the channel mode to TDM */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_CONFIG(I2S_ROLE_MASTER, I2S_COMM_MODE_TDM,
↪ &i2s_pin);
```

(continues on next page)

(continued from previous page)

```

i2s_new_channel(&chan_cfg, NULL, &rx_handle);

/* Init the channel into TDM mode */
i2s_tdm_config_t tdm_cfg = {
    .clk_cfg = I2S_TDM_CLK_DEFAULT_CONFIG(44100),
    .slot_cfg = I2S_TDM_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_SLOT_
↳MODE_STEREO,
        I2S_TDM_SLOT0 | I2S_TDM_SLOT1 | I2S_TDM_SLOT2 | I2S_TDM_SLOT3),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_18,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_tdm_mode(rx_handle, &tdm_cfg);
...

```

**Full-duplex** Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels share the BCLK and WS signals. Currently, STD and TDM communication modes supports full-duplex mode in the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_
↳MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full-
↳duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);

/* Set the configurations for BOTH TWO channels, since TX and RX channel have to_
↳be same in full-duplex mode */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,

```

(continues on next page)

(continued from previous page)

```

        .bclk_inv = false,
        .ws_inv = false,
    },
},
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);

i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

...

```

**Simplex Mode** To allocate a channel in simplex mode, `i2s_new_channel()` should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-C6 are independent, so they can be configured with different modes and clocks, and are able to coexist on the same I2S port in simplex mode. PDM duplex can be realized by registering PDM TX simplex and PDM RX simplex on the same I2S port. But in this way, PDM TX/RX might work with different clocks, so take care when configuring the GPIO pins and clocks.

The following example offers a use case for the simplex mode, but note that although the internal MCLK signals for TX and RX channel are separate, the output MCLK can only be bound to one of them if they are from the same controller. If MCLK has been initialized by both channels, it will be bound to the channel that initializes later.

```

#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
i2s_chan_handle_t rx_handle;
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_0, I2S_ROLE_
↳MASTER);
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
i2s_std_config_t std_tx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S_
↳SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = GPIO_NUM_0,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = I2S_GPIO_UNUSED,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
},
};
/* Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit_
↳found
 * it will return ESP_ERR_NOT_FOUND */
i2s_new_channel(&chan_cfg, NULL, &rx_handle); // Both RX and TX channel will be_
↳registered on I2S0, but they can work with different configurations.
i2s_std_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_
↳MODE_STEREO),

```

(continues on next page)

(continued from previous page)

```

.gpio_cfg = {
    .mclk = I2S_GPIO_UNUSED,
    .bclk = GPIO_NUM_6,
    .ws = GPIO_NUM_7,
    .dout = I2S_GPIO_UNUSED,
    .din = GPIO_NUM_19,
    .invert_flags = {
        .mclk_inv = false,
        .bclk_inv = false,
        .ws_inv = false,
    },
},
};
i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);
i2s_channel_enable(rx_handle);

```

### Application Notes

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```

static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t_
↳handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ...
    return false;
}

i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};
TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));

```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

```

interrupt_interval(unit: sec) = dma_frame_num / sample_rate
dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092

```

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

```

dma_desc_num > polling_cycle / interrupt_interval

```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:

```

recv_buffer_size > dma_desc_num * dma_buffer_size

```

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
dma_frame_num <= 511
interrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.
↳ 549 ms
dma_desc_num > polling_cycle / interrupt_interval = cell(10 / 3.549) = cell(2.818)
↳ = 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

## API Reference

### Standard Mode

#### Header File

- [components/driver/i2s/include/driver/i2s\\_std.h](#)

#### Functions

`esp_err_t i2s_channel_init_std_mode` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_config\_t* \*std\_cfg)

Initialize i2s channel to standard mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

#### Parameters

- **handle** `–[in]` I2S channel handler
- **std\_cfg** `–[in]` Configurations for standard mode, including clock, slot and gpio. The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG`. The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

#### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_std_clock` (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won't change the state. `i2s_channel_disable` should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **clk\_cfg** –[in] Standard mode clock configuration, can be generated by I2S\_STD\_CLK\_DEFAULT\_CONFIG

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **slot\_cfg** –[in] Standard mode slot configuration, can be generated by I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG, I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG and I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG.

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_NO\_MEM No memory for DMA buffer
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not standard mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_std\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_std\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S gpio for standard mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to standard mode, i.e., ‘i2s\_channel\_init\_std\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **gpio\_cfg** –[in] Standard mode gpio configuration, specified by user

**Returns**

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not standard mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

## Structures

struct `i2s_std_slot_config_t`

I2S slot configuration for standard mode.

### Public Members

`i2s_data_bit_width_t data_bit_width`

I2S sample data bit width (valid data bits per sample)

`i2s_slot_bit_width_t slot_bit_width`

I2S slot bit width (total bits per slot)

`i2s_slot_mode_t slot_mode`

Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data

`i2s_std_slot_mask_t slot_mask`

Select the left, right or both slot

`uint32_t ws_width`

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool `ws_pol`

WS signal polarity, set true to enable high lever first

bool `bit_shift`

Set to enable bit shift in Philips mode

bool `left_align`

Set to enable left alignment

bool `big_endian`

Set to enable big endian

bool `bit_order_lsb`

Set to enable lsb first

struct `i2s_std_clk_config_t`

I2S clock configuration for standard mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of mclk to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of '3' (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct **i2s\_std\_gpio\_config\_t**

I2S standard mode GPIO pins configuration.

### Public Members

*gpio\_num\_t* **mclk**

MCK pin, output

*gpio\_num\_t* **bclk**

BCK pin, input in slave role, output in master role

*gpio\_num\_t* **ws**

WS pin, input in slave role, output in master role

*gpio\_num\_t* **dout**

DATA pin, output

*gpio\_num\_t* **din**

DATA pin, input

uint32\_t **mclk\_inv**

Set 1 to invert the mclk output

uint32\_t **bclk\_inv**

Set 1 to invert the bclk input/output

uint32\_t **ws\_inv**

Set 1 to invert the ws input/output

struct *i2s\_std\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_std\_config\_t**

I2S standard mode major configuration that including clock/slot/gpio configuration.

## Public Members

### *i2s\_std\_clk\_config\_t* **clk\_cfg**

Standard mode clock configuration, can be generated by macro I2S\_STD\_CLK\_DEFAULT\_CONFIG

### *i2s\_std\_slot\_config\_t* **slot\_cfg**

Standard mode slot configuration, can be generated by macros I2S\_STD\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM

### *i2s\_std\_gpio\_config\_t* **gpio\_cfg**

Standard mode gpio configuration, specified by user

## Macros

**I2S\_STD\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_PCM\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PCM(short) format in 2 slots.

---

**Note:** PCM(long) is same as philips in 2 slots

---

### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

MSB format in 2 slots.

### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

**I2S\_STD\_CLK\_DEFAULT\_CONFIG** (rate)

i2s default standard clock configuration

---

**Note:** Please set the mclk\_multiple to I2S\_MCLK\_MULTIPLE\_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the bclk division is not a integer

---

### Parameters

- **rate** –sample rate

## PDM Mode

## Header File

- `components/driver/i2s/include/driver/i2s_pdm.h`

## Functions

`esp_err_t i2s_channel_init_pdm_tx_mode` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_config\_t* \*pdm\_tx\_cfg)

Initialize i2s channel to PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

### Parameters

- **handle** `–[in]` I2S tx channel handler
- **pdm\_tx\_cfg** `–[in]` Configurations for PDM TX mode, including clock, slot and gpio The clock configuration can be generated by the helper macro `I2S_PDM_TX_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_PDM_TX_SLOT_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Initialize successfully
- `ESP_ERR_NO_MEM` No memory for storing the channel information
- `ESP_ERR_INVALID_ARG` NULL pointer or invalid configuration
- `ESP_ERR_INVALID_STATE` This channel is not registered

`esp_err_t i2s_channel_reconfig_pdm_tx_clock` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s\_channel\_disable' should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., 'i2s\_channel\_init\_pdm\_tx\_mode' has been called before reconfiguring

---

### Parameters

- **handle** `–[in]` I2S tx channel handler
- **clk\_cfg** `–[in]` PDM TX mode clock configuration, can be generated by `I2S_PDM_TX_CLK_DEFAULT_CONFIG`

### Returns

- `ESP_OK` Set clock successfully
- `ESP_ERR_INVALID_ARG` NULL pointer, invalid configuration or not PDM mode
- `ESP_ERR_INVALID_STATE` This channel is not initialized or not stopped

`esp_err_t i2s_channel_reconfig_pdm_tx_slot` (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. 'i2s\_channel\_disable' should be called before calling this function if i2s has started.

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s\_channel\_init\_pdm\_tx\_mode’ has been called before reconfiguring

---

#### Parameters

- **handle** –[in] I2S tx channel handler
- **slot\_cfg** –[in] PDM TX mode slot configuration, can be generated by I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG

#### Returns

- ESP\_OK Set clock successfully
- ESP\_ERR\_NO\_MEM No memory for DMA buffer
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not PDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_pdm\_tx\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_pdm\_tx\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S gpio for PDM TX mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to PDM TX mode, i.e., ‘i2s\_channel\_init\_pdm\_tx\_mode’ has been called before reconfiguring

---

#### Parameters

- **handle** –[in] I2S tx channel handler
- **gpio\_cfg** –[in] PDM TX mode gpio configuration, specified by user

#### Returns

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not PDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

## Structures

struct **i2s\_pdm\_tx\_slot\_config\_t**

I2S slot configuration for pdm tx mode.

## Public Members

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample), only support 16 bits for PDM mode

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot), only support 16 bits for PDM mode

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO For PDM TX mode, mono means the data buffer only contains one slot data, Stereo means the data buffer contains two slots data

uint32\_t **sd\_prescale**

Sigma-delta filter prescale

*i2s\_pdm\_sig\_scale\_t* **sd\_scale**

Sigma-delta filter scaling value

*i2s\_pdm\_sig\_scale\_t* **hp\_scale**

High pass filter scaling value

*i2s\_pdm\_sig\_scale\_t* **lp\_scale**

Low pass filter scaling value

*i2s\_pdm\_sig\_scale\_t* **sinc\_scale**

Sinc filter scaling value

*i2s\_pdm\_tx\_line\_mode\_t* **line\_mode**

PDM TX line mode, one-line codec, one-line dac, two-line dac mode can be selected

bool **hp\_en**

High pass filter enable

float **hp\_cut\_off\_freq\_hz**

High pass filter cut-off frequency, range 23.3Hz ~ 185Hz, see cut-off frequency sheet above

uint32\_t **sd\_dither**

Sigma-delta filter dither

uint32\_t **sd\_dither2**

Sigma-delta filter dither2

struct **i2s\_pdm\_tx\_clk\_config\_t**

I2S clock configuration for pdm tx mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate, not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of mclk to the sample rate

uint32\_t **up\_sample\_fp**

Up-sampling param fp

uint32\_t **up\_sample\_fs**

Up-sampling param fs, not allowed to be greater than 480

struct **i2s\_pdm\_tx\_gpio\_config\_t**

I2S PDM tx mode GPIO pins configuration.

### Public Members

*gpio\_num\_t* **clk**

PDM clk pin, output

*gpio\_num\_t* **dout**

DATA pin, output

*gpio\_num\_t* **dout2**

The second data pin for the DAC dual-line mode, only take effect when the line mode is I2S\_PDM\_TX\_TWO\_LINE\_DAC

uint32\_t **clk\_inv**

Set 1 to invert the clk output

struct *i2s\_pdm\_tx\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_pdm\_tx\_config\_t**

I2S PDM TX mode major configuration that including clock/slot/gpio configuration.

### Public Members

*i2s\_pdm\_tx\_clk\_config\_t* **clk\_cfg**

PDM TX clock configurations, can be generated by macro I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG

*i2s\_pdm\_tx\_slot\_config\_t* **slot\_cfg**

PDM TX slot configurations, can be generated by macro I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG

*i2s\_pdm\_tx\_gpio\_config\_t* **gpio\_cfg**

PDM TX gpio configurations, specified by user

### Macros

**I2S\_PDM\_TX\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo)

PDM style in 2 slots(TX)

This file is specified for I2S PDM communication mode Features:

- Only support PDM tx/rx mode
- Fixed to 2 slots
- Data bit width only support 16 bits

### Parameters

- **bits\_per\_sample** –i2s data bit width, only support 16 bits for PDM mode
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO

#### **I2S\_PDM\_TX\_CLK\_DEFAULT\_CONFIG** (rate)

i2s default pdm tx clock configuration

---

**Note:** TX PDM can only be set to the following two up-sampling rate configurations: 1: fp = 960, fs = sample\_rate\_hz / 100, in this case, Fpdm = 128\*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128\*Fpcm = 128\*sample\_rate\_hz If the pdm receiver do not care the pdm serial clock, it' s recommended set Fpdm = 128\*48000. Otherwise, the second configuration should be adopted.

---

#### **Parameters**

- **rate** –sample rate (not suggest to exceed 48000 Hz, otherwise more glitches and noise may appear)

### **TDM Mode**

#### **Header File**

- [components/driver/i2s/include/driver/i2s\\_tdm.h](#)

#### **Functions**

*esp\_err\_t* **i2s\_channel\_init\_tdm\_mode** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_config\_t* \*tdm\_cfg)

Initialize i2s channel to TDM mode.

---

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

---

#### **Parameters**

- **handle** –[in] I2S channel handler
- **tdm\_cfg** –[in] Configurations for TDM mode, including clock, slot and gpio The clock configuration can be generated by the helper macro I2S\_TDM\_CLK\_DEFAULT\_CONFIG The slot configuration can be generated by the helper macro I2S\_TDM\_PHILIPS\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_SHORT\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG or I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG

#### **Returns**

- ESP\_OK Initialize successfully
- ESP\_ERR\_NO\_MEM No memory for storing the channel information
- ESP\_ERR\_INVALID\_ARG NULL pointer or invalid configuration
- ESP\_ERR\_INVALID\_STATE This channel is not registered

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_clock** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_clk\_config\_t* \*clk\_cfg)

Reconfigure the I2S clock for TDM mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won' t change the state. 'i2s\_channel\_disable' should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., ‘i2s\_channel\_init\_tdm\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **clk\_cfg** –[in] Standard mode clock configuration, can be generated by I2S\_TDM\_CLK\_DEFAULT\_CONFIG

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not TDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_slot** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_slot\_config\_t* \*slot\_cfg)

Reconfigure the I2S slot for TDM mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., ‘i2s\_channel\_init\_tdm\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler
- **slot\_cfg** –[in] Standard mode slot configuration, can be generated by I2S\_TDM\_PHILIPS\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_SHORT\_SLOT\_DEFAULT\_CONFIG, I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG or I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG.

**Returns**

- ESP\_OK Set clock successfully
- ESP\_ERR\_NO\_MEM No memory for DMA buffer
- ESP\_ERR\_INVALID\_ARG NULL pointer, invalid configuration or not TDM mode
- ESP\_ERR\_INVALID\_STATE This channel is not initialized or not stopped

*esp\_err\_t* **i2s\_channel\_reconfig\_tdm\_gpio** (*i2s\_chan\_handle\_t* handle, const *i2s\_tdm\_gpio\_config\_t* \*gpio\_cfg)

Reconfigure the I2S gpio for TDM mode.

---

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started this function won't change the state. ‘i2s\_channel\_disable’ should be called before calling this function if i2s has started.

---

---

**Note:** The input channel handle has to be initialized to TDM mode, i.e., ‘i2s\_channel\_init\_tdm\_mode’ has been called before reconfiguring

---

**Parameters**

- **handle** –[in] I2S channel handler

- **gpio\_cfg** *–[in]* Standard mode gpio configuration, specified by user

**Returns**

- **ESP\_OK** Set clock successfully
- **ESP\_ERR\_INVALID\_ARG** NULL pointer, invalid configuration or not TDM mode
- **ESP\_ERR\_INVALID\_STATE** This channel is not initialized or not stopped

**Structures**

struct **i2s\_tdm\_slot\_config\_t**

I2S slot configuration for tdm mode.

**Public Members**

*i2s\_data\_bit\_width\_t* **data\_bit\_width**

I2S sample data bit width (valid data bits per sample)

*i2s\_slot\_bit\_width\_t* **slot\_bit\_width**

I2S slot bit width (total bits per slot)

*i2s\_slot\_mode\_t* **slot\_mode**

Set mono or stereo mode with **I2S\_SLOT\_MODE\_MONO** or **I2S\_SLOT\_MODE\_STEREO**

*i2s\_tdm\_slot\_mask\_t* **slot\_mask**

Slot mask. Activating slots by setting 1 to corresponding bits. When the activated slots is not consecutive, those data in inactivated slots will be ignored

uint32\_t **ws\_width**

WS signal width (i.e. the number of bclk ticks that ws signal is high)

bool **ws\_pol**

WS signal polarity, set true to enable high lever first

bool **bit\_shift**

Set true to enable bit shift in Philips mode

bool **left\_align**

Set true to enable left alignment

bool **big\_endian**

Set true to enable big endian

bool **bit\_order\_lsb**

Set true to enable lsb first

bool **skip\_mask**

Set true to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

uint32\_t **total\_slot**

I2S total number of slots. If it is smaller than the biggest activated channel number, it will be set to this number automatically.

struct **i2s\_tdm\_clk\_config\_t**

I2S clock configuration for tdm mode.

### Public Members

uint32\_t **sample\_rate\_hz**

I2S sample rate

*i2s\_clock\_src\_t* **clk\_src**

Choose clock source

*i2s\_mclk\_multiple\_t* **mclk\_multiple**

The multiple of mclk to the sample rate, only take effect for master role

uint32\_t **bclk\_div**

The division from mclk to bclk, only take effect for slave role, it shouldn't be smaller than 8. Increase this field when data sent by slave lag behind

struct **i2s\_tdm\_gpio\_config\_t**

I2S TDM mode GPIO pins configuration.

### Public Members

*gpio\_num\_t* **mclk**

MCK pin, output

*gpio\_num\_t* **bclk**

BCK pin, input in slave role, output in master role

*gpio\_num\_t* **ws**

WS pin, input in slave role, output in master role

*gpio\_num\_t* **dout**

DATA pin, output

*gpio\_num\_t* **din**

DATA pin, input

uint32\_t **mclk\_inv**

Set 1 to invert the mclk output

uint32\_t **bclk\_inv**

Set 1 to invert the bclk input/output

uint32\_t **ws\_inv**

Set 1 to invert the ws input/output

struct *i2s\_tdm\_gpio\_config\_t*::[anonymous] **invert\_flags**

GPIO pin invert flags

struct **i2s\_tdm\_config\_t**

I2S TDM mode major configuration that including clock/slot/gpio configuration.

### Public Members

*i2s\_tdm\_clk\_config\_t* **clk\_cfg**

TDM mode clock configuration, can be generated by macro I2S\_TDM\_CLK\_DEFAULT\_CONFIG

*i2s\_tdm\_slot\_config\_t* **slot\_cfg**

TDM mode slot configuration, can be generated by macros I2S\_TDM\_[mode]\_SLOT\_DEFAULT\_CONFIG, [mode] can be replaced with PHILIPS/MSB/PCM\_SHORT/PCM\_LONG

*i2s\_tdm\_gpio\_config\_t* **gpio\_cfg**

TDM mode gpio configuration, specified by user

### Macros

**I2S\_TDM\_AUTO\_SLOT\_NUM**

This file is specified for I2S TDM communication mode Features:

- More than 2 slots

**I2S\_TDM\_AUTO\_WS\_WIDTH**

**I2S\_TDM\_PHILIPS\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

Philips format in active slot that enabled by mask.

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** –active slot mask

**I2S\_TDM\_MSB\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

MSB format in active slot enabled that by mask.

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** –active slot mask

**I2S\_TDM\_PCM\_SHORT\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

PCM(short) format in active slot that enabled by mask.

#### Parameters

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** –active slot mask

**I2S\_TDM\_PCM\_LONG\_SLOT\_DEFAULT\_CONFIG** (bits\_per\_sample, mono\_or\_stereo, mask)

PCM(long) format in active slot that enabled by mask.

**Parameters**

- **bits\_per\_sample** –i2s data bit width
- **mono\_or\_stereo** –I2S\_SLOT\_MODE\_MONO or I2S\_SLOT\_MODE\_STEREO
- **mask** –active slot mask

**I2S\_TDM\_CLK\_DEFAULT\_CONFIG** (rate)

i2s default tdm clock configuration

---

**Note:** Please set the mclk\_multiple to I2S\_MCLK\_MULTIPLE\_384 while the data width in slot configuration is set to 24 bits Otherwise the sample rate might be imprecise since the bclk division is not a integer

---

**Parameters**

- **rate** –sample rate

## I2S Driver

### Header File

- [components/driver/i2s/include/driver/i2s\\_common.h](#)

### Functions

**esp\_err\_t i2s\_new\_channel** (const *i2s\_chan\_config\_t* \*chan\_cfg, *i2s\_chan\_handle\_t* \*ret\_tx\_handle, *i2s\_chan\_handle\_t* \*ret\_rx\_handle)

Allocate new I2S channel(s)

---

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

---

---

**Note:** When the port id in channel configuration is I2S\_NUM\_AUTO, driver will allocate I2S port automatically on one of the i2s controller, otherwise driver will try to allocate the new channel on the selected port.

---

---

**Note:** If both tx\_handle and rx\_handle are not NULL, it means this I2S controller will work at full-duplex mode, the rx and tx channels will be allocated on a same I2S port in this case. Note that some configurations of tx/rx channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode can't guarantee tx/rx channels write/read synchronously, they can only share the clock signals for now.

---

---

**Note:** If tx\_handle OR rx\_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both rx and tx channel) will be occupied, even if only one of rx or tx channel is registered. For the other targets, another channel on this controller will still available.

---

**Parameters**

- **chan\_cfg** –[in] I2S controller channel configurations
- **ret\_tx\_handle** –[out] I2S channel handler used for managing the sending channel(optional)

- **ret\_rx\_handle** –[out] I2S channel handler used for managing the receiving channel(optional)

**Returns**

- ESP\_OK Allocate new channel(s) success
- ESP\_ERR\_NOT\_SUPPORTED The communication mode is not supported on the current chip
- ESP\_ERR\_INVALID\_ARG NULL pointer or illegal parameter in *i2s\_chan\_config\_t*
- ESP\_ERR\_NOT\_FOUND No available I2S channel found

*esp\_err\_t* **i2s\_del\_channel** (*i2s\_chan\_handle\_t* handle)

Delete the i2s channel.

---

**Note:** Only allowed to be called when the i2s channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

---

---

**Note:** Resource will be free automatically if all channels in one port are deleted

---

**Parameters** **handle** –[in] I2S channel handler

- ESP\_OK Delete successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer

*esp\_err\_t* **i2s\_channel\_get\_info** (*i2s\_chan\_handle\_t* handle, *i2s\_chan\_info\_t* \*chan\_info)

Get I2S channel information.

**Parameters**

- **handle** –[in] I2S channel handler
- **chan\_info** –[out] I2S channel basic information

**Returns**

- ESP\_OK Get i2s channel information success
- ESP\_ERR\_NOT\_FOUND The input handle doesn't match any registered I2S channels, it may not an i2s channel handle or not available any more
- ESP\_ERR\_INVALID\_ARG The input handle or chan\_info pointer is NULL

*esp\_err\_t* **i2s\_channel\_enable** (*i2s\_chan\_handle\_t* handle)

Enable the i2s channel.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

---

---

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting bclk and ws signal. For mclk signal, it will start to output when initialization is finished

---

**Parameters** **handle** –[in] I2S channel handler

- ESP\_OK Start successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not initialized or already started

*esp\_err\_t* **i2s\_channel\_disable** (*i2s\_chan\_handle\_t* handle)

Disable the i2s channel.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

---

---

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop bclk and ws signal but not mclk signal

---

**Parameters** **handle** –[in] I2S channel handler

**Returns**

- ESP\_OK Stop successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_preload\_data** (*i2s\_chan\_handle\_t* tx\_handle, const void \*src, size\_t size, size\_t \*bytes\_loaded)

Preload the data into TX DMA buffer.

---

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

---

---

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

---

---

**Note:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

---

**Parameters**

- **tx\_handle** –[in] I2S TX channel handler
- **src** –[in] The pointer of the source buffer to be loaded
- **size** –[in] The source buffer size
- **bytes\_loaded** –[out] The bytes that successfully been loaded into the TX DMA buffer

**Returns**

- ESP\_OK Load data successful
- ESP\_ERR\_INVALID\_ARG NULL pointer or not TX direction
- ESP\_ERR\_INVALID\_STATE This channel has not stated

*esp\_err\_t* **i2s\_channel\_write** (*i2s\_chan\_handle\_t* handle, const void \*src, size\_t size, size\_t \*bytes\_written, uint32\_t timeout\_ms)

I2S write data.

---

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., tx channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**Parameters**

- **handle** –[in] I2S channel handler

- **src** –[in] The pointer of sent data buffer
- **size** –[in] Max data buffer length
- **bytes\_written** –[out] Byte number that actually be sent, can be NULL if not needed
- **timeout\_ms** –[in] Max block time

**Returns**

- ESP\_OK Write successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not tx handle
- ESP\_ERR\_TIMEOUT Writing timeout, no writing event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to write

*esp\_err\_t* **i2s\_channel\_read** (*i2s\_chan\_handle\_t* handle, void \*dest, size\_t size, size\_t \*bytes\_read, uint32\_t timeout\_ms)

I2S read data.

---

**Note:** Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn't mean there is no the signal transporting on line.

---

**Parameters**

- **handle** –[in] I2S channel handler
- **dest** –[in] The pointer of receiving data buffer
- **size** –[in] Max data buffer length
- **bytes\_read** –[out] Byte number that actually be read, can be NULL if not needed
- **timeout\_ms** –[in] Max block time

**Returns**

- ESP\_OK Read successfully
- ESP\_ERR\_INVALID\_ARG NULL pointer or this handle is not rx handle
- ESP\_ERR\_TIMEOUT Reading timeout, no reading event received from ISR within ticks\_to\_wait
- ESP\_ERR\_INVALID\_STATE I2S is not ready to read

*esp\_err\_t* **i2s\_channel\_register\_event\_callback** (*i2s\_chan\_handle\_t* handle, const *i2s\_event\_callbacks\_t* \*callbacks, void \*user\_data)

Set event callbacks for I2S channel.

---

**Note:** Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM or internal RAM as well.

---

**Parameters**

- **handle** –[in] I2S channel handler
- **callbacks** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- ESP\_OK Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

## Structures

struct **i2s\_event\_callbacks\_t**

Group of I2S callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_I2S\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

*i2s\_isr\_callback\_t* **on\_recv**

Callback of data received event, only for rx channel The event data includes DMA buffer address and size that just finished receiving data

*i2s\_isr\_callback\_t* **on\_recv\_q\_ovf**

Callback of receiving queue overflowed event, only for rx channel The event data includes buffer size that has been overwritten

*i2s\_isr\_callback\_t* **on\_sent**

Callback of data sent event, only for tx channel The event data includes DMA buffer address and size that just finished sending data

*i2s\_isr\_callback\_t* **on\_send\_q\_ovf**

Callback of sending queue overflowed event, only for tx channel The event data includes buffer size that has been overwritten

struct **i2s\_chan\_config\_t**

I2S controller channel configuration.

## Public Members

*i2s\_port\_t* **id**

I2S port id

*i2s\_role\_t* **role**

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

uint32\_t **dma\_desc\_num**

I2S DMA buffer number, it is also the number of DMA descriptor

uint32\_t **dma\_frame\_num**

I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of '3' when the data bit width is 24.

bool **auto\_clear**

Set to auto clear DMA TX buffer, i2s will always send zero automatically if no data to send

struct **i2s\_chan\_info\_t**

I2S channel information.

### Public Members

*i2s\_port\_t* **id**

I2S port id

*i2s\_role\_t* **role**

I2S role, I2S\_ROLE\_MASTER or I2S\_ROLE\_SLAVE

*i2s\_dir\_t* **dir**

I2S channel direction

*i2s\_comm\_mode\_t* **mode**

I2S channel communication mode

*i2s\_chan\_handle\_t* **pair\_chan**

I2S pair channel handle in duplex mode, always NULL in simplex mode

### Macros

**I2S\_CHANNEL\_DEFAULT\_CONFIG** (i2s\_num, i2s\_role)

get default I2S property

**I2S\_GPIO\_UNUSED**

Used in i2s\_gpio\_config\_t for signals which are not used

### I2S Types

#### Header File

- [components/driver/i2s/include/driver/i2s\\_types.h](#)

#### Structures

struct **i2s\_event\_data\_t**

Event structure used in I2S event queue.

## Public Members

void **\*data**

The pointer of DMA buffer that just finished sending or receiving for `on_recv` and `on_sent` callback  
NULL for `on_recv_q_ovf` and `on_send_q_ovf` callback

size\_t **size**

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the `dma_frame_num` and `data_bit_width`, typically it is fixed when `data_bit_width` is not changed.

## Type Definitions

typedef struct i2s\_channel\_obj\_t **\*i2s\_chan\_handle\_t**

i2s channel object handle, the control unit of the i2s driver

typedef bool (**\*i2s\_isr\_callback\_t**)(*i2s\_chan\_handle\_t* handle, *i2s\_event\_data\_t* \*event, void \*user\_ctx)

I2S event callback.

**Param handle [in]** I2S channel handle, created from `i2s_new_channel()`

**Param event [in]** I2S event data

**Param user\_ctx [in]** User registered context, passed from  
`i2s_channel_register_event_callback()`

**Return** Whether a high priority task has been waken up by this callback function

## Enumerations

enum **i2s\_port\_t**

I2S controller port number, the max port number is (SOC\_I2S\_NUM - 1).

*Values:*

enumerator **I2S\_NUM\_0**

I2S controller port 0

enumerator **I2S\_NUM\_AUTO**

Select whichever port is available

enum **i2s\_comm\_mode\_t**

I2S controller communication mode.

*Values:*

enumerator **I2S\_COMM\_MODE\_STD**

I2S controller using standard communication mode, support philips/MSB/PCM format

enumerator **I2S\_COMM\_MODE\_PDM**

I2S controller using PDM communication mode, support PDM output or input

enumerator **I2S\_COMM\_MODE\_TDM**

I2S controller using TDM communication mode, support up to 16 slots per frame

enumerator **I2S\_COMM\_MODE\_NONE**

Unspecified I2S controller mode

enum **i2s\_mclk\_multiple\_t**

The multiple of mclk to sample rate.

*Values:*

enumerator **I2S\_MCLK\_MULTIPLE\_128**

mclk = sample\_rate \* 128

enumerator **I2S\_MCLK\_MULTIPLE\_256**

mclk = sample\_rate \* 256

enumerator **I2S\_MCLK\_MULTIPLE\_384**

mclk = sample\_rate \* 384

enumerator **I2S\_MCLK\_MULTIPLE\_512**

mclk = sample\_rate \* 512

### Header File

- [components/hal/include/hal/i2s\\_types.h](#)

### Type Definitions

typedef *soc\_periph\_i2s\_clk\_src\_t* **i2s\_clock\_src\_t**

I2S clock source

### Enumerations

enum **i2s\_slot\_mode\_t**

I2S channel slot mode.

*Values:*

enumerator **I2S\_SLOT\_MODE\_MONO**

I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S\_SLOT\_MODE\_STEREO**

I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enum **i2s\_dir\_t**

I2S channel direction.

*Values:*

enumerator **I2S\_DIR\_RX**

I2S channel direction RX

enumerator **I2S\_DIR\_TX**

I2S channel direction TX

enum **i2s\_role\_t**

I2S controller role.

*Values:*

enumerator **I2S\_ROLE\_MASTER**

I2S controller master role, bclk and ws signal will be set to output

enumerator **I2S\_ROLE\_SLAVE**

I2S controller slave role, bclk and ws signal will be set to input

enum **i2s\_data\_bit\_width\_t**

Available data bit width in one slot.

*Values:*

enumerator **I2S\_DATA\_BIT\_WIDTH\_8BIT**

I2S channel data bit-width: 8

enumerator **I2S\_DATA\_BIT\_WIDTH\_16BIT**

I2S channel data bit-width: 16

enumerator **I2S\_DATA\_BIT\_WIDTH\_24BIT**

I2S channel data bit-width: 24

enumerator **I2S\_DATA\_BIT\_WIDTH\_32BIT**

I2S channel data bit-width: 32

enum **i2s\_slot\_bit\_width\_t**

Total slot bit width in one slot.

*Values:*

enumerator **I2S\_SLOT\_BIT\_WIDTH\_AUTO**

I2S channel slot bit-width equals to data bit-width

enumerator **I2S\_SLOT\_BIT\_WIDTH\_8BIT**

I2S channel slot bit-width: 8

enumerator **I2S\_SLOT\_BIT\_WIDTH\_16BIT**

I2S channel slot bit-width: 16

enumerator **I2S\_SLOT\_BIT\_WIDTH\_24BIT**

I2S channel slot bit-width: 24

enumerator **I2S\_SLOT\_BIT\_WIDTH\_32BIT**

I2S channel slot bit-width: 32

enum **i2s\_pcm\_compress\_t**

A/U-law decompress or compress configuration.

*Values:*

enumerator **I2S\_PCM\_DISABLE**

Disable A/U law decompress or compress

enumerator **I2S\_PCM\_A\_DECOMPRESS**

A-law decompress

enumerator **I2S\_PCM\_A\_COMPRESS**

A-law compress

enumerator **I2S\_PCM\_U\_DECOMPRESS**

U-law decompress

enumerator **I2S\_PCM\_U\_COMPRESS**

U-law compress

enum **i2s\_pdm\_sig\_scale\_t**

pdm tx signal scaling mode

*Values:*

enumerator **I2S\_PDM\_SIG\_SCALING\_DIV\_2**

I2S TX PDM signal scaling: /2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_1**

I2S TX PDM signal scaling: x1

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_2**

I2S TX PDM signal scaling: x2

enumerator **I2S\_PDM\_SIG\_SCALING\_MUL\_4**

I2S TX PDM signal scaling: x4

enum **i2s\_pdm\_tx\_line\_mode\_t**

PDM TX line mode.

---

**Note:** For the standard codec mode, PDM pins are connect to a codec which requires both clock signal and data signal For the DAC output mode, PDM data signal can be connected to a power amplifier directly with a low-pass filter, normally, DAC output mode doesn't need the clock signal.

---

*Values:*

enumerator **I2S\_PDM\_TX\_ONE\_LINE\_CODEC**

Standard PDM format output, left and right slot data on a single line

enumerator **I2S\_PDM\_TX\_ONE\_LINE\_DAC**

PDM DAC format output, left or right slot data on a single line

enumerator **I2S\_PDM\_TX\_TWO\_LINE\_DAC**

PDM DAC format output, left and right slot data on separated lines

enum **i2s\_std\_slot\_mask\_t**

I2S slot select in standard mode.

---

**Note:** It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference

---

*Values:*

enumerator **I2S\_STD\_SLOT\_LEFT**

I2S transmits or receives left slot

enumerator **I2S\_STD\_SLOT\_RIGHT**

I2S transmits or receives right slot

enumerator **I2S\_STD\_SLOT\_BOTH**

I2S transmits or receives both left and right slot

enum **i2s\_pdm\_slot\_mask\_t**

I2S slot select in PDM mode.

*Values:*

enumerator **I2S\_PDM\_SLOT\_RIGHT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled up

enumerator **I2S\_PDM\_SLOT\_LEFT**

I2S PDM only transmits or receives the PDM device whose 'select' pin is pulled down

enumerator **I2S\_PDM\_SLOT\_BOTH**

I2S PDM transmits or receives both two slots

enum **i2s\_tdm\_slot\_mask\_t**

tdm slot number

---

**Note:** Multiple slots in TDM mode. For TX module, only the active slot send the audio data, the inactive slot send a constant or will be skipped if 'skip\_msk' is set. For RX module, only receive the audio data in active slots, the data in inactive slots will be ignored. the bit map of active slot can not exceed (0x1<<total\_slot\_num). e.g: slot\_mask = (I2S\_TDM\_SLOT0 | I2S\_TDM\_SLOT3), here the active slot number is 2 and total\_slot is not supposed to be smaller than 4.

---

*Values:*

enumerator **I2S\_TDM\_SLOT0**

I2S slot 0 enabled

enumerator **I2S\_TDM\_SLOT1**

I2S slot 1 enabled

enumerator **I2S\_TDM\_SLOT2**

I2S slot 2 enabled

enumerator **I2S\_TDM\_SLOT3**

I2S slot 3 enabled

enumerator **I2S\_TDM\_SLOT4**

I2S slot 4 enabled

enumerator **I2S\_TDM\_SLOT5**

I2S slot 5 enabled

enumerator **I2S\_TDM\_SLOT6**

I2S slot 6 enabled

enumerator **I2S\_TDM\_SLOT7**

I2S slot 7 enabled

enumerator **I2S\_TDM\_SLOT8**

I2S slot 8 enabled

enumerator **I2S\_TDM\_SLOT9**

I2S slot 9 enabled

enumerator **I2S\_TDM\_SLOT10**

I2S slot 10 enabled

enumerator **I2S\_TDM\_SLOT11**

I2S slot 11 enabled

enumerator **I2S\_TDM\_SLOT12**

I2S slot 12 enabled

enumerator **I2S\_TDM\_SLOT13**

I2S slot 13 enabled

enumerator **I2S\_TDM\_SLOT14**

I2S slot 14 enabled

enumerator **I2S\_TDM\_SLOT15**

I2S slot 15 enabled

### **2.6.13 LCD**

## Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

## Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g. ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the *Espressif Component Registry* <<https://components.espressif.com/>>.
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

## SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver will use this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to `-1` to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of

the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↳panel_handle));
```

## I2C Interfaced LCD

1. Create I2C bus. Please refer to [I2C API doc](#) for more details.

```
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0,
↳0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.
- `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t) I2C_
↳HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &
↳panel_handle));
```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

### LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- Use `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen (different from LCD backlight).
- `esp_lcd_panel_draw_bitmap()` is the most significant function, that will do the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

### Application Example

LCD examples are located under: [peripherals/lcd](#):

- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi\\_lcd\\_touch](#)
- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c\\_oled](#)

## API Reference

### Header File

- [components/hal/include/hal/lcd\\_types.h](#)

### Macros

`LCD_RGB_ENDIAN_RGB`

`LCD_RGB_ENDIAN_BGR`

### Type Definitions

typedef `lcd_rgb_element_order_t` `lcd_color_rgb_endian_t`  
for backward compatible

### Enumerations

enum `lcd_rgb_element_order_t`

RGB color endian.

*Values:*

enumerator `LCD_RGB_ELEMENT_ORDER_RGB`

RGB element order: RGB

enumerator `LCD_RGB_ELEMENT_ORDER_BGR`

RGB element order: BGR

enum `lcd_rgb_data_endian_t`

RGB data endian.

*Values:*

enumerator `LCD_RGB_DATA_ENDIAN_BIG`

RGB data endian: MSB first

enumerator `LCD_RGB_DATA_ENDIAN_LITTLE`

RGB data endian: LSB first

enum `lcd_color_space_t`

LCD color space.

*Values:*

enumerator `LCD_COLOR_SPACE_RGB`

Color space: RGB

enumerator `LCD_COLOR_SPACE_YUV`

Color space: YUV

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)

### Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**

Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**

Type of LCD panel handle

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_panel\\_io.h](#)

**Functions**

*esp\_err\_t* **esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**Parameters**

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **–[in]** The specific LCD command, set to -1 if no command needed
- **param** **–[out]** Buffer for the command data
- **param\_size** **–[in]** Size of `param` buffer

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*param, size\_t param\_size)

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

**Parameters**

- **io** **–[in]** LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** **–[in]** The specific LCD command, set to -1 if no command needed
- **param** **–[in]** Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** **–[in]** Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_color** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*color, size\_t color\_size)

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

**Parameters**

- **io** **–[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

- **lcd\_cmd** **-[in]** The specific LCD command, set to -1 if no command needed
- **color** **-[in]** Buffer that holds the RGB color data
- **color\_size** **-[in]** Size of `color` in memory, in bytes

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_del** (*esp\_lcd\_panel\_io\_handle\_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_register\_event\_callbacks** (*esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_io\_callbacks\_t* \*cbs, void \*user\_ctx)

Register LCD panel IO callbacks.

**Parameters**

- **io** **-[in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** **-[in]** structure with all LCD panel IO callbacks
- **user\_ctx** **-[in]** User private data, passed directly to callback's `user_ctx`

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_spi** (*esp\_lcd\_spi\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_spi\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for SPI interface.

**Parameters**

- **bus** **-[in]** SPI bus handle
- **io\_config** **-[in]** IO configuration, for SPI interface
- **ret\_io** **-[out]** Returned IO handle

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c** (*esp\_lcd\_i2c\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface.

**Parameters**

- **bus** **-[in]** I2C bus handle
- **io\_config** **-[in]** IO configuration, for I2C interface
- **ret\_io** **-[out]** Returned IO handle

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

**Structures**

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_callbacks\_t**

Type of LCD panel IO callbacks.

### Public Members

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

struct **esp\_lcd\_panel\_io\_spi\_config\_t**

Panel IO configuration structure, for SPI interface.

### Public Members

int **cs\_gpio\_num**

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to `on_color_trans_done`'s `user_ctx`

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad\_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to *on\_color\_trans\_done*'s *user\_ctx*

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

```
struct esp_lcd_panel_io_i2c_config_t::[anonymous] flags
```

Extra flags to fine-tune the I2C device

### Type Definitions

```
typedef void *esp_lcd_spi_bus_handle_t
```

Type of LCD SPI bus handle

```
typedef void *esp_lcd_i2c_bus_handle_t
```

Type of LCD I2C bus handle

```
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
```

Type of LCD intel 8080 bus handle

```
typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,  
esp_lcd_panel_io_event_data_t *edata, void *user_ctx)
```

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like

`esp_lcd_new_panel_io_spi()`

**Param edata [in]** Panel IO event data, fed by driver

**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_xxx_config_t`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_panel\\_ops.h](#)

### Functions

```
esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
```

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters panel** **–[in]** LCD panel handle, which is created by other factory API like

`esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

```
esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
```

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the `reset` stage by `esp_lcd_panel_reset()`.

---

**Parameters panel** **–[in]** LCD panel handle, which is created by other factory API like

`esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_del** (*esp\_lcd\_panel\_handle\_t* panel)

Deinitialize the LCD panel.

**Parameters** **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_draw\_bitmap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_start, int y\_start, int x\_end, int y\_end, const void \*color\_data)

Draw bitmap on LCD panel.

**Parameters**

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** **–[in]** Start index on x-axis (x\_start included)
- **y\_start** **–[in]** Start index on y-axis (y\_start included)
- **x\_end** **–[in]** End index on x-axis (x\_end not included)
- **y\_end** **–[in]** End index on y-axis (y\_end not included)
- **color\_data** **–[in]** RGB color data that will be dumped to the specific window range

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

**Parameters**

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** **–[in]** Whether the panel will be mirrored about the x axis
- **mirror\_y** **–[in]** Whether the panel will be mirrored about the y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

**Parameters**

- **panel** **–[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** **–[in]** Whether to swap the x and y axis

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** **-[in]** Extra gap on x axis, in pixels
- **y\_gap** **-[in]** Extra gap on y axis, in pixels

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** **-[in]** Whether to invert the color data

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_on\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** **-[in]** True to turns on display, False to turns off display

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

**Parameters**

- **panel** **-[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** **-[in]** Whether to turn off the screen

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

**Header File**

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

**Functions**

*esp\_err\_t* **esp\_lcd\_new\_panel\_st7789** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model ST7789.

**Parameters**

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_nt35510** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model NT35510.

**Parameters**

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_ssd1306** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model SSD1306.

**Parameters**

- **io** –[in] LCD panel IO handle
- **panel\_dev\_config** –[in] general panel device configuration
- **ret\_panel** –[out] Returned LCD panel handle

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

**Structures**

struct **esp\_lcd\_panel\_dev\_config\_t**

Configuration structure for panel device.

**Public Members**

int **reset\_gpio\_num**

GPIO used to reset the LCD panel, set to -1 if it's not used

*lcd\_rgb\_element\_order\_t* **color\_space**

*Deprecated:*

Set RGB color space, please use *rgb\_ele\_order* instead

*lcd\_rgb\_element\_order\_t* **rgb\_endian**

*Deprecated:*

Set RGB data endian, please use *rgb\_ele\_order* instead

*lcd\_rgb\_element\_order\_t* **rgb\_ele\_order**

Set RGB element order, RGB or BGR

*lcd\_rgb\_data\_endian\_t* **data\_endian**

Set the data endian for color data larger than 1 byte

unsigned int **bits\_per\_pixel**

Color depth, in bpp

unsigned int **reset\_active\_high**

Setting this if the panel reset is high level active

struct *esp\_lcd\_panel\_dev\_config\_t*::[anonymous] **flags**

LCD panel config flags

void \***vendor\_config**

vendor specific configuration, optional, left as NULL if not used

## 2.6.14 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C6 only supports configuring channels in “low speed” mode.

1. *Timer Configuration* by specifying the PWM signal’s frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

---

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling *ledc\_timer\_config()*), and then for the channels (by calling *ledc\_channel\_config()*). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

---

**Timer Configuration** Setting the timer is done by calling the function *ledc\_timer\_config()* and passing the data structure *ledc\_timer\_config\_t* that contains the following configuration settings:

Fig. 10: Key Settings of LED PWM Controller' s API

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 4: Characteristics of ESP32-C6 LEDC source clocks

Clock name	Clock freq	Clock capabilities
<code>PLL_80M_CLK</code>	80 MHz	/
<code>RC_FAST_CLK</code>	~20 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
<code>XTAL_CLK</code>	40 MHz	Dynamic Frequency Scaling compatible

**Note:**

1. On ESP32-C6, if `RC_FAST_CLK` is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.
2. For ESP32-C6, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel' s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

---

**Note:** All the timers and channels in the ESP32-C6's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

---

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2^{**} \text{duty\_resolution}) - 1$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

On ESP32-C6, the hardware additionally allows to perform up to 16 consecutive linear fades without CPU intervention. This feature can be useful if you want to do a fade with gamma correction.

The luminance perceived by human eyes does not have a linear relationship with the PWM duty cycle. In order to make human feel the LED is dimming or lightening linearly, the change in duty cycle should be non-linear, which is the so-called gamma correction. The LED controller can simulate a gamma curve fading by piecewise linear approximation. `ledc_fill_multi_fade_param_list()` is a function that can help to construct the parameters for the piecewise linear fades. First, you need to allocate a memory block for saving the fade parameters, then by providing start/end PWM duty cycle values, gamma correction function, and the total number of desired linear segments to the helper function, it will fill the calculation results into the allocated space. You can also construct the array of `ledc_fade_param_config_t` manually. Once the fade parameter structs are prepared, a consecutive fading can be configured by passing the pointer to the prepared `ledc_fade_param_config_t` list and the total number of fade ranges to `ledc_set_multi_fade()`.

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly” :

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

### Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the *ESP32-C6 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

## Application Example

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

The LEDC color control with Gamma correction on RGB LED example: [peripherals/ledc/ledc\\_gamma\\_curve\\_fade](#).

## API Reference

### Header File

- [components/driver/ledc/include/driver/ledc.h](#)

### Functions

*esp\_err\_t* **ledc\_channel\_config** (const *ledc\_channel\_config\_t* \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Parameters** *ledc\_conf* –Pointer of LEDC channel configure struct

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_timer\_config** (const *ledc\_timer\_config\_t* \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** *timer\_conf* –Pointer of LEDC timer configure struct

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty\_resolution.

*esp\_err\_t* **ledc\_update\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

**Parameters**

- **gpio\_num** –The LEDC output gpio
- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)`

LEDC stop. Disable LEDC output, and set idle level.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **idle\_level** –Set output idle level after LEDC stops.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)`

LEDC set channel frequency (Hz)

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** –Set the LEDC frequency

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

`uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)`

LEDC get channel frequency (Hz)

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** –LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- 0 error
- Others Current LEDC frequency

`esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)`

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is

ledc\_set\_duty\_and\_update

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

int **ledc\_get\_hpoint** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t

**Returns**

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc\_set\_duty\_with\_hpoint. only after calling ledc\_update\_duty will the duty update.

---

**Note:** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

uint32\_t **ledc\_get\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling ledc\_update\_duty, because duty update doesn't take effect until the next cycle.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the `ledc_update_duty` function, the function can take effect.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** –Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **fade\_direction** –Set the direction of the gradient
- **step\_num** –Set the number of the gradient
- **duty\_cycle\_num** –Set how many LEDC tick each time the gradient lasts
- **duty\_scale** –Set gradient change amplitude

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** –Interrupt handler function.
- **arg** –User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.
- **handle** –Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** –Timer clock divide value, the timer clock is divided from the selected clock source

- **duty\_resolution** –Resolution of duty setting in number of bits. The range of duty values is [0, (2\*\*duty\_resolution)]
- **clk\_src** –Select LEDC source clock.

**Returns**

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** –LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every `cycle_num` cycles

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_set_fade_with_time` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode. ,
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).

#### Returns

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_fade_func_install` (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** `intr_alloc_flags` –Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function already installed.

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

`esp_err_t ledc_fade_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_fade_mode_t` fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel number
- **fade\_mode** –Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

**Returns**

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

`esp_err_t ledc_fade_stop` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

---

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

---

---

**Note:** Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

---

---

**Note:** If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards HAS no use in stopping the fade. Fade will continue until it reaches the target duty.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.

- **channel** –LEDC channel number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_ERR\_INVALID\_ARG Parameter error.

*esp\_err\_t* **ledc\_set\_duty\_and\_update** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, uint32\_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **duty** –Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution) - 1]
- **hpoint** –Set the LEDC hpoint value(max: 0xffff)

*esp\_err\_t* **ledc\_set\_fade\_time\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call *ledc\_fade\_func\_install()* once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **max\_fade\_time\_ms** –The maximum time of the fading ( ms ).
- **fade\_mode** –choose blocking or non-blocking mode

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Fade function not installed.
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_step\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call *ledc\_fade\_func\_install()* once before calling this function.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** –Target duty of fading [0, (2\*\*duty\_resolution) - 1]
- **scale** –Controls the increase or decrease step scale.
- **cycle\_num** –increase or decrease the duty every cycle\_num cycles
- **fade\_mode** –choose blocking or non-blocking mode

#### Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_cb_register` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_cbs_t` \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** –Group of LEDC callback functions
- **user\_arg** –user registered data for the callback function

#### Returns

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Fade function not installed.
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_set_multi_fade` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` start\_duty, const `ledc_fade_param_config_t` \*fade\_params\_list, `uint32_t` list\_len)

Set a LEDC multi-fade.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** This function is not thread-safe, do not call it to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_multi_fade_and_start`

---

---

**Note:** This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way

---

around.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** –Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_params\_list** –Pointer to the array of fade parameters for a multi-fade
- **list\_len** –Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Fade function not installed
- ESP\_FAIL Fade function init error

`esp_err_t ledc_set_multi_fade_and_start` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` start\_duty, const `ledc_fade_param_config_t` \*fade\_params\_list, `uint32_t` list\_len, `ledc_fade_mode_t` fade\_mode)

A thread-safe API to set and start LEDC multi-fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** Fade will always begin from the current duty cycle. Make sure it is stable and synchronized to the desired initial value before calling this function. Otherwise, you may see unexpected duty change.

---

---

**Note:** This function does not prohibit from duty overflow. User should take care of this by themselves. If duty overflow happens, the PWM signal will suddenly change from 100% duty cycle to 0%, or the other way around.

---

#### Parameters

- **speed\_mode** –Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** –Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_params\_list** –Pointer to the array of fade parameters for a multi-fade
- **list\_len** –Length of the `fade_params_list`, i.e. number of fade ranges for a multi-fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **fade\_mode** –Choose blocking or non-blocking mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Fade function not installed
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_fill\_multi\_fade\_param\_list** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t start\_duty, uint32\_t end\_duty, uint32\_t linear\_phase\_num, uint32\_t max\_fade\_time\_ms, uint32\_t (\*gamma\_correction\_operator)(uint32\_t), uint32\_t fade\_params\_list\_size, *ledc\_fade\_param\_config\_t* \*fade\_params\_list, uint32\_t \*hw\_fade\_range\_num)

Helper function to fill the fade params for a multi-fade. Useful if desires a gamma curve fading.

---

**Note:** The fade params are calculated based on the given start\_duty and end\_duty. If the duty is not at the start duty (gamma-corrected) when the fade begins, you may see undesired brightness change. Therefore, please always remember that when passing the fade\_params to either `ledc_set_multi_fade` or `ledc_set_multi_fade_and_start`, the start\_duty argument has to be the gamma-corrected start\_duty.

---

#### Parameters

- **speed\_mode** –[in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –[in] LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **start\_duty** –[in] Duty cycle [0, (2\*\*duty\_resolution)] where the multi-fade begins with. This value should be a non-gamma-corrected duty cycle.
- **end\_duty** –[in] Duty cycle [0, (2\*\*duty\_resolution)] where the multi-fade ends with. This value should be a non-gamma-corrected duty cycle.
- **linear\_phase\_num** –[in] Number of linear fades to simulate a gamma curved fade (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **max\_fade\_time\_ms** –[in] The maximum time of the fading ( ms ).
- **gamma\_correction\_operator** –[in] User provided gamma correction function. The function argument should be able to take any value within [0, (2\*\*duty\_resolution)]. And returns the gamma-corrected duty cycle.
- **fade\_params\_list\_size** –[in] The size of the fade\_params\_list user allocated (1 - SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX)
- **fade\_params\_list** –[out] Pointer to the array of *ledc\_fade\_param\_config\_t* structure
- **hw\_fade\_range\_num** –[out] Number of fade ranges for this multi-fade

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE LEDC not initialized
- ESP\_ERR\_NO\_MEM Out of memory
- ESP\_FAIL Required number of hardware ranges exceeds the size of the *ledc\_fade\_param\_config\_t* array user allocated

*esp\_err\_t* **ledc\_read\_fade\_param** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t range, uint32\_t \*dir, uint32\_t \*cycle, uint32\_t \*scale, uint32\_t \*step)

Get the fade parameters that are stored in gamma ram for a certain fade range.

Gamma ram is where saves the fade parameters for each fade range. The fade parameters are written in during fade configuration. When fade begins, the duty will change according to the parameters in gamma ram.

#### Parameters

- **speed\_mode** –[in] Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** –[in] LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **range** –[in] Range index (0 - (SOC\_LEDC\_GAMMA\_CURVE\_FADE\_RANGE\_MAX-1)), it specifies to which range in gamma ram to read

- **dir** *–[out]* Pointer to accept fade direction value
- **cycle** *–[out]* Pointer to accept fade cycle value
- **scale** *–[out]* Pointer to accept fade scale value
- **step** *–[out]* Pointer to accept fade step value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE LEDC not initialized

**Structures**

struct **ledc\_channel\_config\_t**

Configuration parameters of LEDC channel for `ledc_channel_config` function.

**Public Members**

int **gpio\_num**

the LEDC output gpio\_num, if you want to use gpio16, gpio\_num = 16

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode or low-speed mode

*ledc\_channel\_t* **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

*ledc\_intr\_type\_t* **intr\_type**

configure interrupt, Fade interrupt enable or Fade interrupt disable

*ledc\_timer\_t* **timer\_sel**

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t **duty**

LEDC channel duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

int **hpoint**

LEDC channel hpoint value, the max value is 0xffff

unsigned int **output\_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

**Public Members**

***ledc\_mode\_t* speed\_mode**

LEDC speed speed\_mode, high-speed mode or low-speed mode

***ledc\_timer\_bit\_t* duty\_resolution**

LEDC channel duty resolution

***ledc\_timer\_t* timer\_num**

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

**uint32\_t freq\_hz**

LEDC timer frequency (Hz)

***ledc\_clk\_cfg\_t* clk\_cfg**

Configure LEDC source clock from *ledc\_clk\_cfg\_t*. Note that LEDC\_USE\_RC\_FAST\_CLK and LEDC\_USE\_XTAL\_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC\_FAST\_CLK as the clock source and have another LEDC timer uses XTAL\_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

**struct ledc\_cb\_param\_t**

LEDC callback parameter.

**Public Members*****ledc\_cb\_event\_t* event**

Event name

**uint32\_t speed\_mode**

Speed mode of the LEDC channel group

**uint32\_t channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

**uint32\_t duty**

LEDC current duty of the channel, the range of duty is  $[0, (2^{**}duty\_resolution) - 1]$

**struct ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

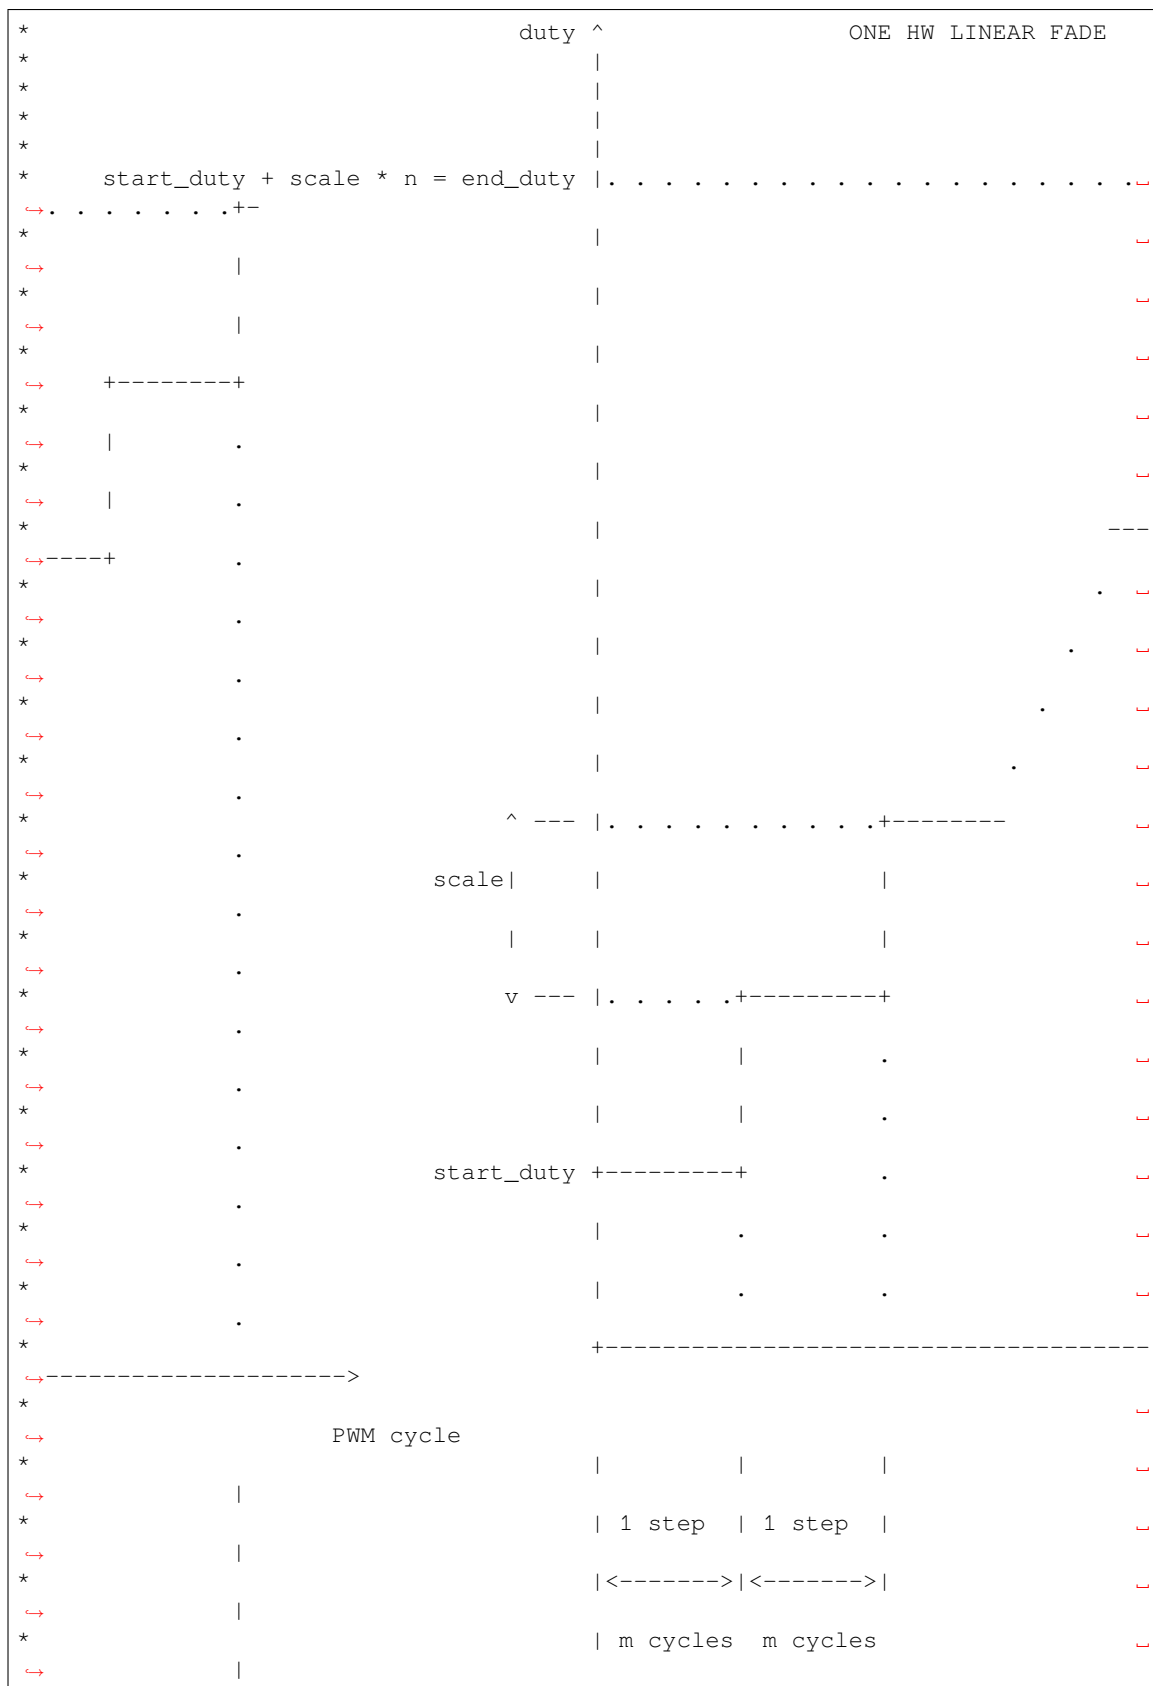

---

**Public Members*****ledc\_cb\_t* fade\_cb**

LEDC fade\_end callback function

struct **ledc\_fade\_param\_config\_t**

Structure for the fade parameters for one hardware fade to be written to gamma wr register.

(continues on next page)

(continued from previous page)

**Note:** Be aware of the maximum value available on each element

### Public Members

uint32\_t **dir**

Duty change direction. Set 1 as increase, 0 as decrease

uint32\_t **cycle\_num**

Number of PWM cycles of each step [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

uint32\_t **scale**

Duty change of each step [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

uint32\_t **step\_num**

Total number of steps in one hardware fade [0, 2\*\*SOC\_LEDC\_FADE\_PARAMS\_BIT\_WIDTH-1]

### Macros

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (\***ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

Values:

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

## Header File

- [components/hal/include/hal/ledc\\_types.h](#)

## Type Definitions

typedef *soc\_periph\_ledc\_clk\_src\_legacy\_t* **ledc\_clk\_cfg\_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver' s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

## Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

LEDC global clock sources.

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RC\_FAST**

LEDC low speed timer clock source is RC\_FAST clock

enumerator **LEDC\_SLOW\_CLK\_PLL\_DIV**

LEDC low speed timer clock source is a PLL\_DIV clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

Alias of 'LEDC\_SLOW\_CLK\_RC\_FAST'

enum **ledc\_clk\_src\_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

*Values:*

enumerator **LEDC\_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_CLK_SEL`

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**

enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**  
LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**  
LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**  
LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_15\_BIT**  
LEDC PWM duty resolution of 15 bits

enumerator **LEDC\_TIMER\_16\_BIT**  
LEDC PWM duty resolution of 16 bits

enumerator **LEDC\_TIMER\_17\_BIT**  
LEDC PWM duty resolution of 17 bits

enumerator **LEDC\_TIMER\_18\_BIT**  
LEDC PWM duty resolution of 18 bits

enumerator **LEDC\_TIMER\_19\_BIT**  
LEDC PWM duty resolution of 19 bits

enumerator **LEDC\_TIMER\_20\_BIT**  
LEDC PWM duty resolution of 20 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum **ledc\_fade\_mode\_t**

*Values:*

enumerator **LEDC\_FADE\_NO\_WAIT**  
LEDC fade function will return immediately

enumerator **LEDC\_FADE\_WAIT\_DONE**  
LEDC fade function will block until fading to the target duty

enumerator **LEDC\_FADE\_MAX**

### 2.6.15 Motor Control Pulse Width Modulator (MCPWM)

The MCPWM peripheral is a versatile PWM generator, which contains various submodules to make it a key element in power electronic applications like motor control, digital power and so on. Typically, the MCPWM peripheral can be used in the following scenarios:

- Digital motor control, e.g. brushed/brushless DC motor, RC servo motor
- Switch mode based digital power conversion
- Power DAC, where the duty cycle is equivalent to a DAC analog value
- Calculate external pulse width, and convert it into other analog value like speed, distance

- Generate Space Vector PWM (SVPWM) signals for Field Oriented Control (FOC)

The main submodules are listed in the following diagram:

Fig. 11: MCPWM Overview

- **MCPWM Timer**: The time base of the final PWM signal, it also determines the event timing of other sub-modules.
- **MCPWM Operator**: The key module that is responsible for generating the PWM waveforms. It consists of other submodules, like comparator, PWM generator, dead-time and carrier modulator.
- **MCPWM Comparator**: The compare module takes the time-base count value as input, and continuously compare to the threshold value that configured by user. When the time-base counter is equal to any of the threshold value, an compare event will be generated and the MCPWM generator can update its level accordingly.
- **MCPWM Generator**: One MCPWM generator can generate a pair of PWM waves, complementarily or independently, based on various events triggered from other submodules like MCPWM Timer, MCPWM Comparator.
- **MCPWM Fault**: The fault module is used to detect the fault condition from outside, mainly via GPIO matrix. Once the fault signal is active, MCPWM Operator will force all the generators into a predefined state, to protect the system from damage.
- **MCPWM Sync**: The sync module is used to synchronize the MCPWM timers, so that the final PWM signals generated by different MCPWM generators can have a fixed phase difference. The sync signal can be routed from GPIO matrix or from MCPWM Timer event.
- **Dead Time**: This submodule is used to insert extra delay to the existing PWM edges that generated in the previous steps.
- **Carrier Modulation**: The carrier submodule allows a high-frequency carrier signal to modulate the PWM waveforms generated by the generator and dead time submodules. This capability is mandatory if you need pulse transformer-based gate drivers to control the power switching elements.
- **Brake**: MCPWM operator can set how to brake the generators when particular fault is detected. We can shut down the PWM output immediately or regulate the PWM output cycle by cycle, depends on how critical the fault is.
- **MCPWM Capture**: This is a standalone submodule which can work even without the above MCPWM operators. The capture consists one dedicated timer and several independent channels. Each channel is connected to the GPIO, a pulse on the GPIO will trigger the capture timer to store the time-base count value and then notify the user by interrupt. Using this feature, we can measure a pulse width precisely. What's more, the capture timer can also be synchronized by the MCPWM Sync submodule.

## Functional Overview

Description of the MCPWM functionality is divided into the following sections:

- *Resource Allocation and Initialization* - covers how to allocate various MCPWM objects, like timers, operators, comparators, generators and so on. These objects are the basis of the following IO setting and control functions.

- *Timer Operations and Events* - describes control functions and event callbacks that supported by the MCPWM timer.
- *Comparator Operations and Events* - describes control functions and event callbacks that supported by the MCPWM comparator.
- *Generator Actions on Events* - describes how to set actions for MCPWM generators on particular events that generated by the MCPWM timer and comparators.
- *Classical PWM Waveforms and Generator Configurations* - demonstrates some classical PWM waveforms that can be achieved by configuring generator actions.
- *Dead Time* - describes how to set dead time for MCPWM generators.
- *Classical PWM Waveforms and Dead Time Configurations* - demonstrates some classical PWM waveforms that can be achieved by configuring dead time.
- *Carrier Modulation* - describes how to set modulate a high frequency onto the final PWM waveforms.
- *Faults and Brake Actions* - describes how to set brake actions for MCPWM operators on particular fault event.
- *Generator Force Actions* - describes how to control the generator output level asynchronously in a forceful way.
- *Synchronization* - describes how to synchronize the MCPWM timers and get a fixed phase difference between the generated PWM signals.
- *Capture* - describes how to use the MCPWM capture module to measure the pulse width of a signal.
- *Power Management* - describes how different source clock will affect power consumption.
- *IRAM Safe* - describes tips on how to make the RMT interrupt work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation and Initialization** As displayed in the diagram above, the MCPWM peripheral consists of several submodules. Each submodule has its own resource allocation, which is described in the following sections.

**MCPWM Timers** You can allocate a MCPWM timer object by calling `mcpwm_new_timer()` function, with a configuration structure `mcpwm_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_config_t::group_id` specifies the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, timers located in different groups are totally independent.
- `mcpwm_timer_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_timer_config_t::clk_src` sets the clock source of the timer.
- `mcpwm_timer_config_t::resolution_hz` set the expected resolution of the timer, the driver internally will set a proper divider based on the clock source and the resolution.
- `mcpwm_timer_config_t::count_mode` sets the count mode of the timer.
- `mcpwm_timer_config_t::period_ticks` sets the period of the timer, in ticks (the tick resolution is set in the `mcpwm_timer_config_t::resolution_hz`).
- `mcpwm_timer_config_t::update_period_on_empty` sets whether to update the period value when the timer counts to zero.
- `mcpwm_timer_config_t::update_period_on_sync` sets whether to update the period value when the timer takes a sync signal.

The `mcpwm_new_timer()` will return a pointer to the allocated timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free timers in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error.<sup>1</sup>

On the contrary, calling `mcpwm_del_timer()` function will free the allocated timer object.

**MCPWM Operators** You can allocate a MCPWM operator object by calling `mcpwm_new_operator()` function, with a configuration structure `mcpwm_operator_config_t` as the parameter. The configuration structure is defined as:

<sup>1</sup> Different ESP chip series might have different number of MCPWM resources (e.g. groups, timers, comparators, operators, generators and so on). Please refer to the [TRM] for details. The driver won't forbid you from applying for more MCPWM resources, but it will return error when there's no hardware resources available. Please always check the return value when doing [Resource Allocation](#).

- `mcpwm_operator_config_t::group_id` specifies the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range. Please note, operators located in different groups are totally independent.
- `mcpwm_operator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_operator_config_t::update_gen_action_on_tez` sets whether to update the generator action when the timer counts to zero. Here and below, the timer refers to the one that is connected to the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_operator_config_t::update_gen_action_on_tep` sets whether to update the generator action when the timer counts to peak.
- `mcpwm_operator_config_t::update_gen_action_on_sync` sets whether to update the generator action when the timer takes a sync signal.
- `mcpwm_operator_config_t::update_dead_time_on_tez` sets whether to update the dead time when the timer counts to zero.
- `mcpwm_operator_config_t::update_dead_time_on_tep` sets whether to update the dead time when the timer counts to peak.
- `mcpwm_operator_config_t::update_dead_time_on_sync` sets whether to update the dead time when the timer takes a sync signal.

The `mcpwm_new_operator()` will return a pointer to the allocated operator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free operators in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 987, 1</sup>

On the contrary, calling `mcpwm_del_operator()` function will free the allocated operator object.

**MCPWM Comparators** You can allocate a MCPWM comparator object by calling `mcpwm_new_comparator()` function, with a MCPWM operator handle and configuration structure `mcpwm_comparator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_comparator_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_comparator_config_t::update_cmp_on_tez` sets whether to update the compare threshold when the timer counts to zero.
- `mcpwm_comparator_config_t::update_cmp_on_tep` sets whether to update the compare threshold when the timer counts to peak.
- `mcpwm_comparator_config_t::update_cmp_on_sync` sets whether to update the compare threshold when the timer takes a sync signal.

The `mcpwm_new_comparator()` will return a pointer to the allocated comparator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free comparators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 987, 1</sup>

On the contrary, calling `mcpwm_del_comparator()` function will free the allocated comparator object.

**MCPWM Generators** You can allocate a MCPWM generator object by calling `mcpwm_new_generator()` function, with a MCPWM operator handle and configuration structure `mcpwm_generator_config_t` as the parameter. The operator handle is created by `mcpwm_new_operator()`. The configuration structure is defined as:

- `mcpwm_generator_config_t::gen_gpio_num` sets the GPIO number used by the generator.
- `mcpwm_generator_config_t::invert_pwm` sets whether to invert the PWM signal.
- `mcpwm_generator_config_t::io_loop_back` sets whether to enable the Loop-back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.
- `mcpwm_generator_config_t::io_od_mode` configures the PWM GPIO as open-drain output.
- `mcpwm_generator_config_t::pull_up` and `mcpwm_generator_config_t::pull_down` controls whether to enable the internal pull-up and pull-down resistors accordingly.

The `mcpwm_new_generator()` will return a pointer to the allocated generator object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free generators in the MCPWM operator, this function will return `ESP_ERR_NOT_FOUND` error. [Page 987, 1](#)

On the contrary, calling `mcpwm_del_generator()` function will free the allocated generator object.

**MCPWM Faults** There are two types of faults: A fault signal reflected from the GPIO and a fault generated by software. To allocate a GPIO fault object, you can call `mcpwm_new_gpio_fault()` function, with configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

To allocate a GPIO fault object, you can call the `mcpwm_new_gpio_fault()` function, with the configuration structure `mcpwm_gpio_fault_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_fault_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO faults located in different groups are totally independent, i.e., GPIO faults in group 0 can not be detected by the operator in group 1.
- `mcpwm_gpio_fault_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_gpio_fault_config_t::gpio_num` sets the GPIO number used by the fault.
- `mcpwm_gpio_fault_config_t::active_level` sets the active level of the fault signal.
- `mcpwm_gpio_fault_config_t::pull_up` and `mcpwm_gpio_fault_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_fault_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_fault()` will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO faults in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. [Page 987, 1](#)

Software fault object can be used to trigger a fault by calling a function `mcpwm_soft_fault_activate()` instead of waiting for a real fault signal on the GPIO. A software fault object can be allocated by calling `mcpwm_new_soft_fault()` function, with configuration structure `mcpwm_soft_fault_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_fault()` function will return a pointer to the allocated fault object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the fault object, this function will return `ESP_ERR_NO_MEM` error. Although the software fault and GPIO fault are of different types, but the returned fault handle is of the same type.

On the contrary, calling `mcpwm_del_fault()` function will free the allocated fault object, this function works for both software and GPIO fault.

**MCPWM Sync Sources** The sync source is what can be used to synchronize the MCPWM timer and MCPWM capture timer. There're three types of sync sources: A sync source reflected from the GPIO, a sync source generated by software and a sync source generated by MCPWM timer event.

To allocate a GPIO sync source, you can call `mcpwm_new_gpio_sync_src()` function, with configuration structure `mcpwm_gpio_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_gpio_sync_src_config_t::group_id` sets the MCPWM group ID. The ID should belong to [0, `SOC_MCPWM_GROUPS` - 1] range. Please note, GPIO sync source located in different groups are totally independent, i.e. GPIO sync source in group 0 can not be detected by the timers in group 1.
- `mcpwm_gpio_sync_src_config_t::gpio_num` sets the GPIO number used by the sync source.
- `mcpwm_gpio_sync_src_config_t::active_neg` sets whether the sync signal is active on falling edge.
- `mcpwm_gpio_sync_src_config_t::pull_up` and `mcpwm_gpio_sync_src_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_gpio_sync_src_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_gpio_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no more free GPIO sync sources in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 987, 1</sup>

To allocate a Timer event sync source, you can call `mcpwm_new_timer_sync_src()` function, with configuration structure `mcpwm_timer_sync_src_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_timer_sync_src_config_t::timer_event` specifies on what timer event to generate the sync signal.
- `mcpwm_timer_sync_src_config_t::propagate_input_sync` sets whether to propagate the input sync signal (i.e. the input sync signal will be routed to its sync output).

The `mcpwm_new_timer_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, if a sync source has been allocated from the same timer before, this function will return `ESP_ERR_INVALID_STATE` error.

Last but not least, to allocate a software sync source, you can call `mcpwm_new_soft_sync_src()` function, with configuration structure `mcpwm_soft_sync_config_t` as the parameter. Currently this configuration structure is left for future purpose. `mcpwm_new_soft_sync_src()` will return a pointer to the allocated sync source object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no memory left for the sync source object, this function will return `ESP_ERR_NO_MEM` error. Please note, to make a software sync source take effect, don't forget to call `mcpwm_soft_sync_activate()`.

On the contrary, calling `mcpwm_del_sync_src()` function will free the allocated sync source object, this function works for all types of sync sources.

**MCPWM Capture Timer and Channels** The MCPWM group has a dedicated timer which is used to capture the timestamp when specific event occurred. The capture timer is connected with several independent channels, each channel is assigned with a GPIO.

To allocate a capture timer, you can call `mcpwm_new_capture_timer()` function, with configuration structure `mcpwm_capture_timer_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_timer_config_t::group_id` sets the MCPWM group ID. The ID should belong to `[0, SOC_MCPWM_GROUPS - 1]` range.
- `mcpwm_capture_timer_config_t::clk_src` sets the clock source of the capture timer.
- `mcpwm_capture_timer_config_t::resolution_hz` The driver internally will set a proper divider based on the clock source and the resolution. If it is set to 0, the driver will pick an appropriate resolution on its own, and you can subsequently view the current timer resolution via `mcpwm_capture_timer_get_resolution()`.

The `mcpwm_new_capture_timer()` will return a pointer to the allocated capture timer object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture timer left in the MCPWM group, this function will return `ESP_ERR_NOT_FOUND` error. <sup>Page 987, 1</sup>

Next, to allocate a capture channel, you can call `mcpwm_new_capture_channel()` function, with a capture timer handle and configuration structure `mcpwm_capture_channel_config_t` as the parameter. The configuration structure is defined as:

- `mcpwm_capture_channel_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- `mcpwm_capture_channel_config_t::gpio_num` sets the GPIO number used by the capture channel.
- `mcpwm_capture_channel_config_t::prescale` sets the prescaler of the input signal.
- `mcpwm_capture_channel_config_t::pos_edge` and `mcpwm_capture_channel_config_t::neg_edge` set whether to capture on the positive and/or negative edge of the input signal.
- `mcpwm_capture_channel_config_t::pull_up` and `mcpwm_capture_channel_config_t::pull_down` set whether to pull up and/or pull down the GPIO internally.
- `mcpwm_capture_channel_config_t::invert_cap_signal` sets whether to invert the capture signal.

- `mcpwm_capture_channel_config_t::io_loop_back` sets whether to enable the loop back mode. It is for debugging purposes only. It enables both the GPIO's input and output ability through the GPIO matrix peripheral.

The `mcpwm_new_capture_channel()` will return a pointer to the allocated capture channel object if the allocation succeeds. Otherwise, it will return error code. Specifically, when there are no free capture channel left in the capture timer, this function will return `ESP_ERR_NOT_FOUND` error.

On the contrary, calling `mcpwm_del_capture_channel()` and `mcpwm_del_capture_timer()` will free the allocated capture channel and timer object accordingly.

**MCPWM interrupt priority** MCPWM allows configuring interrupts separately for timer, operator, comparator, fault, and capture events. The interrupt priority is determined by the respective `config_t::intr_priority`. Additionally, events within the same MCPWM group share a common interrupt source. When registering multiple interrupt events, the interrupt priorities need to remain consistent.

---

**Note:** When registering multiple interrupt events within an MCPWM group, the driver will use the interrupt priority of the first registered event as the MCPWM group's interrupt priority.

---

## Timer Operations and Events

**Register Event Callbacks** The MCPWM timer can generate different events at runtime. If you have some function that should be called when particular event happens, you should hook your function to the interrupt service routine by calling `mcpwm_timer_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_timer_event_cb_t`. All supported event callbacks are listed in the `mcpwm_timer_event_callbacks_t`:

- `mcpwm_timer_event_callbacks_t::on_full` sets callback function for timer when it counts to peak value.
- `mcpwm_timer_event_callbacks_t::on_empty` sets callback function for timer when it counts to zero.
- `mcpwm_timer_event_callbacks_t::on_stop` sets callback function for timer when it is stopped.

The callback functions above are called within the ISR context, so they should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with ISR suffix is called within the function).

The parameter `user_data` of `mcpwm_timer_register_event_callbacks()` function is used to save user's own context, it will be passed to each callback function directly.

This function will lazy install interrupt service for the MCPWM timer without enabling it. It is only allowed to be called before `mcpwm_timer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See also *Enable and Disable timer* for more information.

**Enable and Disable Timer** Before doing IO control to the timer, user needs to enable the timer first, by calling `mcpwm_timer_enable()`. Internally, this function will:

- switch the timer state from **init** to **enable**.
- enable the interrupt service if it has been lazy installed by `mcpwm_timer_register_event_callbacks()`.
- acquire a proper power management lock if a specific clock source (e.g. PLL\_160M clock) is selected. See also *Power management* for more information.

On the contrary, calling `mcpwm_timer_disable()` will put the timer driver back to **init** state, disable the interrupts service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `mcpwm_timer_start_stop()` with different `mcpwm_timer_start_stop_cmd_t` commands can start the timer immediately or stop the timer at a specific event. What' re more, you can even start the timer for only one round, that means, the timer will count to peak value or zero, and then stop itself.

**Connect Timer with Operator** The allocated MCPWM Timer should be connected with a MCPWM operator by calling `mcpwm_operator_connect_timer()`, so that the operator can take that timer as its time base, and generate the required PWM waves. Make sure the MCPWM timer and operator are in the same group, otherwise, this function will return `ESP_ERR_INVALID_ARG` error.

### Comparator Operations and Events

**Register Event Callbacks** The MCPWM comparator can inform the user when the timer counter equals to the compare value. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_comparator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_compare_event_cb_t`. All supported event callbacks are listed in the `mcpwm_comparator_event_callbacks_t`:

- `mcpwm_comparator_event_callbacks_t::on_reach` sets callback function for comparator when the timer counter equals to the compare value.

The callback function will provide event specific data of type `mcpwm_compare_event_data_t` to the user. The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_comparator_register_event_callbacks()` function is used to save user' s own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM comparator, whereas the service can only be removed in `mcpwm_del_comparator`.

**Set Compare Value** You can set the compare value for the MCPWM comparator at runtime by calling `mcpwm_comparator_set_compare_value()`. There' re a few points to note:

- New compare value might won' t take effect immediately. The update time for the compare value is set by `mcpwm_comparator_config_t::update_cmp_on_tez` or `mcpwm_comparator_config_t::update_cmp_on_tep` or `mcpwm_comparator_config_t::update_cmp`.
- Make sure the operator has connected to one MCPWM timer already by `mcpwm_operator_connect_timer()`. Otherwise, it will return error code `ESP_ERR_INVALID_STATE`.
- The compare value shouldn' t exceed timer' s count peak, otherwise, the compare event will never got triggered.

### Generator Actions on Events

**Set Generator Action on Timer Event** One generator can set multiple actions on different timer events, by calling `mcpwm_generator_set_actions_on_timer_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_timer_event_action_t`:

- `mcpwm_gen_timer_event_action_t::direction` specific the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_timer_event_action_t::event` specifies the timer event. The supported timer events are listed in `mcpwm_timer_event_t`.
- `mcpwm_gen_timer_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_TIMER_EVENT_ACTION` to simplify the construction of a timer event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_timer_event()` **must** be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END`.

You can also set the timer action one by one by calling `mcpwm_generator_set_action_on_timer_event()` without varargs.

**Set Generator Action on Compare Event** One generator can set multiple actions on different compare events, by calling `mcpwm_generator_set_actions_on_compare_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_compare_event_action_t`:

- `mcpwm_gen_compare_event_action_t::direction` specific the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_compare_event_action_t::comparator` specifies the comparator handle. See [MCPWM Comparators](#) for how to allocate a comparator.
- `mcpwm_gen_compare_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_COMPARE_EVENT_ACTION` to simplify the construction of a compare event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_compare_event()` **must** be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END`.

You can also set the compare action one by one by calling `mcpwm_generator_set_action_on_compare_event()` without varargs.

**Classical PWM Waveforms and Generator Configurations** This section will demonstrate the classical PWM waveforms that can be generated by the pair of the generators. The code snippet that is used to generate the waveforms is also provided below the diagram. Some general summary:

- The **Symmetric** or **Asymmetric** of the waveforms are determined by the count mode of the MCPWM timer.
- The **active level** of the waveform pair is determined by the level of the PWM with a smaller duty cycle.
- The period of the PWM waveform is determined by the timer's period and count mode.
- The duty cycle of the PWM waveform is determined by the generator's various action combinations.

}

```

**Dead Time** In power electronics, the rectifier and inverter are commonly used. This requires the use of rectifier bridge and inverter bridge. Each bridge arm has two power electronic devices, such as MOSFET, IGBT, etc. The two MOSFETs on the same arm can't conduct at the same time, otherwise there will be a short circuit. The fact is that, although the PWM wave shows it is turning off the switch, but the MOSFET still needs a small time window to make that happen. This requires an extra delay to be added to the existing PWM wave that generated by setting *Generator Actions on Events*.

The dead time driver works like a *decorator*. This is also reflected in the function parameters of `mcpwm_generator_set_dead_time()`, where it takes the primary generator handle (`in_generator`), and returns a new generator (`out_generator`) after applying the dead time. Please note, if the `out_generator` and `in_generator` are the same, it means we are adding the time delay to the PWM waveform in an “in-place” fashion. In turn, if the `out_generator` and `in_generator` are different, it means we're deriving a new PWM waveform from the existing `in_generator`.

Dead-time specific configuration is listed in the `mcpwm_dead_time_config_t` structure:

- `mcpwm_dead_time_config_t::posedge_delay_ticks` and `mcpwm_dead_time_config_t::negedge_delay_ticks` set the number of ticks to delay the PWM waveform on the rising and falling edge. Specifically, setting both of them to zero means to bypass the dead-time module. The resolution of the dead-time tick is the same to the timer that is connected with the operator by `mcpwm_operator_connect_timer()`.
- `mcpwm_dead_time_config_t::invert_output`: Whether to invert the signal after applying the dead-time, which can be used to control the delay edge polarity.

**Warning:** Due to the hardware limitation, one delay module (either *posedge delay* or *negedge delay*) can't be applied to multiple MCPWM generators at the same time. e.g. the following configuration is **invalid**:

```
mcpwm_dead_time_config_t dt_config = {
    .posedge_delay_ticks = 10,
};
// Set posedge delay to generator A
mcpwm_generator_set_dead_time(mcpwm_gen_a, mcpwm_gen_a, &dt_config);
// NOTE: This is invalid, you can't apply the posedge delay to another generator
mcpwm_generator_set_dead_time(mcpwm_gen_b, mcpwm_gen_b, &dt_config);
```

However, you can apply *posedge delay* to generator A and *negedge delay* to generator B. You can also set both *posedge delay* and *negedge delay* for generator A, while letting generator B bypass the dead time module.

**Note:** It is also possible to generate the required dead time by setting *Generator Actions on Events*, especially by controlling edge placement using different comparators. However, if the more classical edge delay-based dead time with polarity control is required, then the dead-time submodule should be used.

**Classical PWM Waveforms and Dead Time Configurations** This section will demonstrate the classical PWM waveforms that can be generated by the dead-time submodule. The code snippet that is used to generate the waveforms is also provided below the diagram.

```

static void gen_action_config(mcpwm_gen_handle_t gena, mcpwm_gen_handle_t genb,
↪mcpwm_cmpr_handle_t cmpa, mcpwm_cmpr_handle_t cmpb)
{
    ESP_ERROR_CHECK(mcpwm_generator_set_action_on_timer_event(gena,
        MCPWM_GEN_TIMER_EVENT_ACTION(MCPWM_TIMER_DIRECTION_UP, MCPWM_

```

**Carrier Modulation** The MCPWM operator has a carrier submodule that can be used if galvanic isolation from the motor driver is required (e.g. isolated digital power application) by passing the PWM output signals through transformers. Any of PWM output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To configure the carrier submodule, you can call `mcpwm_operator_apply_carrier()`, and provide configuration structure `mcpwm_carrier_config_t`:

- `mcpwm_carrier_config_t::clk_src` sets the clock source of the carrier.
- `mcpwm_carrier_config_t::frequency_hz` indicates carrier frequency in Hz.
- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver will search for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can't be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a `NULL` configuration.

**Faults and Brake Actions** The MCPWM operator is able to sense external signals with information about failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into *MCPWM fault objects*.

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

**Set Operator Brake Mode on Fault** The way that MCPWM operator reacts to the fault is called **Brake**. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Brake specific configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` set which fault that the operator should react to.
- `mcpwm_brake_config_t::brake_mode` set the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator will recover itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST`

mode, the operator can't recover even though the fault disappears. User has to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event** One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specific the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There's a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` **must** be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform the user when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform the user when it going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets callback function that will be called when the operator is going to take a *CBC* action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets callback function that will be called when the operator is going to take an *OST* action.

The callback function is called within the ISR context, so is should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_operator_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g. `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator's output level will be controlled by the event actions again.
- Set the `hold_on` to true, the force output level will keep alive, until it's removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined **phase**, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See [MCPWM Sync Sources](#) for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the MCPWM capture timer [MCPWM Capture Timer](#) can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See [MCPWM Sync Sources](#) for how to create a sync source object. Specifically, if this is set to NULL, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

### Sync Timers by GPIO

```
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
        .group_id = 0, // GPIO fault should be in the same group of
        ↪the above timers
        .gpio_num = EXAMPLE_SYNC_GPIO,
        .flags.pull_down = true,
        .flags.active_neg = false, // by default, a posedge pulse can trigger a
        ↪sync event
    };
    ESP_ERROR_CHECK(mcpwm_new_gpio_sync_src(&gpio_sync_config, &gpio_sync_source));

    mcpwm_timer_sync_phase_config_t sync_phase_config = {
        .count_value = 0, // sync phase: target count value
        .direction = MCPWM_TIMER_DIRECTION_UP, // sync phase: count direction
        .sync_src = gpio_sync_source, // sync source
    };
    for (int i = 0; i < 3; i++) {
        ESP_ERROR_CHECK(mcpwm_timer_set_phase_on_sync(timers[i], &sync_phase_
        ↪config));
    }
}
```

Fig. 12: GPIO Sync All MCPWM Timers

**Capture** The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantity like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, we can use the capture submodule to sense the rotor position from Hall sensor.

The capture timer is usually connected with several capture channels, please refer to [MCPWM Capture Timer and Channels](#) for resource allocation.

**Register Event Callbacks** The MCPWM capture channel can inform the user when there's a valid edge detected on the signal. You have to register a callback function to get the timer count value of the capture moment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets callback function for the capture channel when a valid edge is detected.

The callback function will provide event specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should **not** attempt to block (e.g., make sure that only FreeRTOS APIs with `_ISR` suffix is called within the function).

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save user's own context, it will be passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

Fig. 13: MCPWM BLDC with Hall Sensor

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, user needs to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function will:

- switch the capture timer state from **init** to **enable**.
- acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See also [Power management](#) for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to **init** state, and release the power management lock.

**Start and Stop Capture Timer** The basic IO operation of a capture timer is to start and stop. Calling `mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can stop the timer immediately.

**Trigger a Software Capture Event** Sometime, the software also wants to trigger a “fake” capture event. The `mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even though it’s a “fake” capture event, it can still cause an interrupt, thus your capture event callback function will get invoked as well.

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the PLL, APB frequency before going into light sleep, thus potentially changing the period of a MCPWM timers’ counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a MCPWM timer instance that has selected `MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_timer_enable()`. Likewise, the driver releases the lock when `mcpwm_timer_disable()` is called for that timer.

Likewise, Whenever the driver creates a MCPWM capture timer instance that has selected `MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the timer by `mcpwm_capture_timer_enable()`. And will release the lock in `mcpwm_capture_timer_disable()`.

**IRAM Safe** By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM<sup>2</sup>
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `mcpwm_comparator_set_compare_value()`

**Thread Safety** The factory functions like `mcpwm_new_timer()` are guaranteed to be thread safe by the driver, which means, you can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, as the driver uses a critical section to prevent them being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`

Other functions that are not related to *Resource Allocation*, are not thread safe. Thus, you should avoid calling them in different tasks without mutex protection.

### Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see *IRAM Safe* for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Brushed DC motor speed control by PID algorithm: [peripherals/mcpwm/mcpwm\\_bdc\\_speed\\_control](#)
- BLDC motor control with hall sensor feedback: [peripherals/mcpwm/mcpwm\\_bldc\\_hall\\_control](#)
- Ultrasonic sensor (HC-SR04) distance measurement: [peripherals/mcpwm/mcpwm\\_capture\\_hc\\_sr04](#)
- Servo motor angle control: [peripherals/mcpwm/mcpwm\\_servo\\_control](#)
- MCPWM synchronization between timers: [peripherals/mcpwm/mcpwm\\_sync](#)

---

<sup>2</sup> Callback function and the sub-functions invoked by itself should also be placed in IRAM, users need to take care of this by themselves.

## API Reference

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_timer.h`

### Functions

*esp\_err\_t* **mcpwm\_new\_timer** (const *mcpwm\_timer\_config\_t* \*config, *mcpwm\_timer\_handle\_t* \*ret\_timer)

Create MCPWM timer.

#### Parameters

- **config** –[in] MCPWM timer configuration
- **ret\_timer** –[out] Returned MCPWM timer handle

#### Returns

- ESP\_OK: Create MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM timer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM timer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_del\_timer** (*mcpwm\_timer\_handle\_t* timer)

Delete MCPWM timer.

**Parameters** **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

#### Returns

- ESP\_OK: Delete MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete MCPWM timer failed because timer is not in init state
- ESP\_FAIL: Delete MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_enable** (*mcpwm\_timer\_handle\_t* timer)

Enable MCPWM timer.

**Parameters** **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

#### Returns

- ESP\_OK: Enable MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Enable MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP\_FAIL: Enable MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_disable** (*mcpwm\_timer\_handle\_t* timer)

Disable MCPWM timer.

**Parameters** **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

#### Returns

- ESP\_OK: Disable MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Disable MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable MCPWM timer failed because timer is disabled already
- ESP\_FAIL: Disable MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_start\_stop** (*mcpwm\_timer\_handle\_t* timer, *mcpwm\_timer\_start\_stop\_cmd\_t* command)

Send specific start/stop commands to MCPWM timer.

#### Parameters

- **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** –[in] Supported command list for MCPWM timer

#### Returns

- ESP\_OK: Start or stop MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Start or stop MCPWM timer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Start or stop MCPWM timer failed because timer is not enabled
- ESP\_FAIL: Start or stop MCPWM timer failed because of other error

*esp\_err\_t* **mcpwm\_timer\_register\_event\_callbacks** (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM timer.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

#### Parameters

- **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

#### Returns

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Set event callbacks failed because timer is not in init state
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_timer\_set\_phase\_on\_sync** (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_sync\_phase\_config\_t* \*config)

Set sync phase for MCPWM timer.

#### Parameters

- **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** –[in] MCPWM timer sync phase configuration

#### Returns

- ESP\_OK: Set sync phase for MCPWM timer successfully
- ESP\_ERR\_INVALID\_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP\_FAIL: Set sync phase for MCPWM timer failed because of other error

### Structures

struct **mcpwm\_timer\_event\_callbacks\_t**

Group of supported MCPWM timer event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_timer\_event\_cb\_t* **on\_full**

callback function when MCPWM timer counts to peak value

*mcpwm\_timer\_event\_cb\_t* **on\_empty**

callback function when MCPWM timer counts to zero

*mcpwm\_timer\_event\_cb\_t* **on\_stop**

callback function when MCPWM timer stops

struct **mcpwm\_timer\_config\_t**

MCPWM timer configuration.

### Public Members

int **group\_id**

Specify from which group to allocate the MCPWM timer

*mcpwm\_timer\_clock\_source\_t* **clk\_src**

MCPWM timer clock source

uint32\_t **resolution\_hz**

Counter resolution in Hz The step size of each count tick equals to (1 / resolution\_hz) seconds

*mcpwm\_timer\_count\_mode\_t* **count\_mode**

Count mode

uint32\_t **period\_ticks**

Number of count ticks within a period

int **intr\_priority**

MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_period\_on\_empty**

Whether to update period when timer counts to zero

uint32\_t **update\_period\_on\_sync**

Whether to update period on sync event

struct *mcpwm\_timer\_config\_t*::[anonymous] **flags**

Extra configuration flags for timer

struct **mcpwm\_timer\_sync\_phase\_config\_t**

MCPWM Timer sync phase configuration.

### Public Members

*mcpwm\_sync\_handle\_t* **sync\_src**

The sync event source. Set to NULL will disable the timer being synced by others

uint32\_t **count\_value**

The count value that should lock to upon sync event

*mcpwm\_timer\_direction\_t* **direction**

The count direction that should lock to upon sync event

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_oper.h](#)

### Functions

*esp\_err\_t* **mcpwm\_new\_operator** (const *mcpwm\_operator\_config\_t* \*config, *mcpwm\_oper\_handle\_t* \*ret\_oper)

Create MCPWM operator.

#### Parameters

- **config** –[in] MCPWM operator configuration
- **ret\_oper** –[out] Returned MCPWM operator handle

#### Returns

- ESP\_OK: Create MCPWM operator successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM operator failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM operator failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM operator failed because can't find free resource
- ESP\_FAIL: Create MCPWM operator failed because of other error

*esp\_err\_t* **mcpwm\_del\_operator** (*mcpwm\_oper\_handle\_t* oper)

Delete MCPWM operator.

**Parameters** **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`

#### Returns

- ESP\_OK: Delete MCPWM operator successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM operator failed because of invalid argument
- ESP\_FAIL: Delete MCPWM operator failed because of other error

*esp\_err\_t* **mcpwm\_operator\_connect\_timer** (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_timer\_handle\_t* timer)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

#### Parameters

- **oper** –[in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

#### Returns

- ESP\_OK: Connect MCPWM operator and timer successfully
- ESP\_ERR\_INVALID\_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP\_FAIL: Connect MCPWM operator and timer failed because of other error

*esp\_err\_t* **mcpwm\_operator\_set\_brake\_on\_fault** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_brake\_config\_t* \*config)

Set brake method for MCPWM operator.

#### Parameters

- **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** –[in] MCPWM brake configuration

#### Returns

- ESP\_OK: Set trip for operator successfully
- ESP\_ERR\_INVALID\_ARG: Set trip for operator failed because of invalid argument
- ESP\_FAIL: Set trip for operator failed because of other error

*esp\_err\_t* **mcpwm\_operator\_recover\_from\_fault** (*mcpwm\_oper\_handle\_t* oper, *mcpwm\_fault\_handle\_t* fault)

Try to make the operator recover from fault.

---

**Note:** To recover from fault or escape from trip, you make sure the fault signal has disappeared already. Otherwise the recovery can't succeed.

---

#### Parameters

- **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **fault** –[in] MCPWM fault handle

#### Returns

- `ESP_OK`: Recover from fault successfully
- `ESP_ERR_INVALID_ARG`: Recover from fault failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Recover from fault failed because the fault source is still active
- `ESP_FAIL`: Recover from fault failed because of other error

*esp\_err\_t* **mcpwm\_operator\_register\_event\_callbacks** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_operator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM operator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

#### Parameters

- **oper** –[in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_operator\_apply\_carrier** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_carrier\_config\_t* \*config)

Apply carrier feature for MCPWM operator.

#### Parameters

- **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** –[in] MCPWM carrier specific configuration

#### Returns

- `ESP_OK`: Set carrier for operator successfully
- `ESP_ERR_INVALID_ARG`: Set carrier for operator failed because of invalid argument
- `ESP_FAIL`: Set carrier for operator failed because of other error

## Structures

struct **mcpwm\_operator\_config\_t**

MCPWM operator configuration.

## Public Members

int **group\_id**

Specify from which group to allocate the MCPWM operator

int **intr\_priority**

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_gen\_action\_on\_tez**

Whether to update generator action when timer counts to zero

uint32\_t **update\_gen\_action\_on\_tep**

Whether to update generator action when timer counts to peak

uint32\_t **update\_gen\_action\_on\_sync**

Whether to update generator action on sync event

uint32\_t **update\_dead\_time\_on\_tez**

Whether to update dead time when timer counts to zero

uint32\_t **update\_dead\_time\_on\_tep**

Whether to update dead time when timer counts to peak

uint32\_t **update\_dead\_time\_on\_sync**

Whether to update dead time on sync event

struct *mcpwm\_operator\_config\_t*::[anonymous] **flags**

Extra configuration flags for operator

struct **mcpwm\_brake\_config\_t**

MCPWM brake configuration structure.

### Public Members

*mcpwm\_fault\_handle\_t* **fault**

Which fault causes the operator to brake

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

uint32\_t **cbc\_recover\_on\_tez**

Recovery CBC brake state on tez event

uint32\_t **cbc\_recover\_on\_tep**

Recovery CBC brake state on tep event

struct *mcpwm\_brake\_config\_t*::[anonymous] **flags**

Extra flags for brake configuration

struct **mcpwm\_operator\_event\_callbacks\_t**

Group of supported MCPWM operator event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_cbc**

callback function when mcpwm operator brakes in CBC

*mcpwm\_brake\_event\_cb\_t* **on\_brake\_ost**

callback function when mcpwm operator brakes in OST

struct **mcpwm\_carrier\_config\_t**

MCPWM carrier configuration structure.

### Public Members

*mcpwm\_carrier\_clock\_source\_t* **clk\_src**

MCPWM carrier clock source

uint32\_t **frequency\_hz**

Carrier frequency in Hz

uint32\_t **first\_pulse\_duration\_us**

The duration of the first PWM pulse, in us

float **duty\_cycle**

Carrier duty cycle

uint32\_t **invert\_before\_modulate**

Invert the raw signal

uint32\_t **invert\_after\_modulate**

Invert the modulated signal

struct *mcpwm\_carrier\_config\_t*::[anonymous] **flags**

Extra flags for carrier configuration

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_cmpr.h](#)

## Functions

*esp\_err\_t* **mcpwm\_new\_comparator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_comparator\_config\_t* \*config, *mcpwm\_cmpr\_handle\_t* \*ret\_cmpr)

Create MCPWM comparator.

### Parameters

- **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- **config** –[in] MCPWM comparator configuration
- **ret\_cmpr** –[out] Returned MCPWM comparator

### Returns

- ESP\_OK: Create MCPWM comparator successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM comparator failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM comparator failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM comparator failed because can't find free resource
- ESP\_FAIL: Create MCPWM comparator failed because of other error

*esp\_err\_t* **mcpwm\_del\_comparator** (*mcpwm\_cmpr\_handle\_t* cmpr)

Delete MCPWM comparator.

**Parameters** **cmpr** –[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

### Returns

- ESP\_OK: Delete MCPWM comparator successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP\_FAIL: Delete MCPWM comparator failed because of other error

*esp\_err\_t* **mcpwm\_comparator\_register\_event\_callbacks** (*mcpwm\_cmpr\_handle\_t* cmpr, const *mcpwm\_comparator\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM comparator.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

### Parameters

- **cmpr** –[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

### Returns

- ESP\_OK: Set event callbacks successfully
- ESP\_ERR\_INVALID\_ARG: Set event callbacks failed because of invalid argument
- ESP\_FAIL: Set event callbacks failed because of other error

*esp\_err\_t* **mcpwm\_comparator\_set\_compare\_value** (*mcpwm\_cmpr\_handle\_t* cmpr, *uint32\_t* cmp\_ticks)

Set MCPWM comparator's compare value.

### Parameters

- **cmpr** –[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- **cmp\_ticks** –[in] The new compare value

### Returns

- ESP\_OK: Set MCPWM compare value successfully
- ESP\_ERR\_INVALID\_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the `cmp_ticks` is out of range)
- ESP\_ERR\_INVALID\_STATE: Set MCPWM compare value failed because the operator doesn't have a timer connected

- **ESP\_FAIL**: Set MCPWM compare value failed because of other error

## Structures

struct **mcpwm\_comparator\_config\_t**

MCPWM comparator configuration.

### Public Members

int **intr\_priority**

MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **update\_cmp\_on\_tez**

Whether to update compare value when timer count equals to zero (tez)

uint32\_t **update\_cmp\_on\_tep**

Whether to update compare value when timer count equals to peak (tep)

uint32\_t **update\_cmp\_on\_sync**

Whether to update compare value on sync event

struct *mcpwm\_comparator\_config\_t*::[anonymous] **flags**

Extra configuration flags for comparator

struct **mcpwm\_comparator\_event\_callbacks\_t**

Group of supported MCPWM compare event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*mcpwm\_compare\_event\_cb\_t* **on\_reach**

ISR callback function which would be invoked when counter reaches compare value

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_gen.h](#)

## Functions

*esp\_err\_t* **mcpwm\_new\_generator** (*mcpwm\_oper\_handle\_t* oper, const *mcpwm\_generator\_config\_t* \*config, *mcpwm\_gen\_handle\_t* \*ret\_gen)

Allocate MCPWM generator from given operator.

### Parameters

- **oper** –[in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** –[in] MCPWM generator configuration
- **ret\_gen** –[out] Returned MCPWM generator

### Returns

- `ESP_OK`: Create MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM generator failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM generator failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM generator failed because can't find free resource
- `ESP_FAIL`: Create MCPWM generator failed because of other error

*esp\_err\_t* `mcpwm_del_generator` (*mcpwm\_gen\_handle\_t* gen)

Delete MCPWM generator.

**Parameters** `gen` –[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

**Returns**

- `ESP_OK`: Delete MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM generator failed because of other error

*esp\_err\_t* `mcpwm_generator_set_force_level` (*mcpwm\_gen\_handle\_t* gen, int level, bool hold\_on)

Set force level for MCPWM generator.

---

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator's behaviour.

---

---

**Note:** If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to `-1`.

---

---

**Note:** If the `hold_on` is false, the force level can be overridden by the next event action.

---

---

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn't equal to the final output level.

---

**Parameters**

- `gen` –[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `level` –[in] GPIO level to be applied to MCPWM generator, specially, `-1` means to remove the force level
- `hold_on` –[in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**

- `ESP_OK`: Set force level for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set force level for MCPWM generator failed because of invalid argument
- `ESP_FAIL`: Set force level for MCPWM generator failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_timer_event` (*mcpwm\_gen\_handle\_t* gen, *mcpwm\_gen\_timer\_event\_action\_t* ev\_act)

Set generator action on MCPWM timer event.

**Parameters**

- `gen` –[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` –[in] MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

**Returns**

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set generator action failed because of timer is not connected to operator
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_timer_event` (*mcpwm\_gen\_handle\_t* gen, *mcpwm\_gen\_timer\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM timer events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

---

#### Parameters

- **gen** `–[in]` MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** `–[in]` MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

#### Returns

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set generator actions failed because of timer is not connected to operator
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act)

Set generator action on MCPWM compare event.

#### Parameters

- **generator** `–[in]` MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** `–[in]` MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

#### Returns

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_compare_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_compare\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM compare events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

---

#### Parameters

- **generator** `–[in]` MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** `–[in]` MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

#### Returns

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument

- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_action_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act)

Set generator action on MCPWM brake event.

#### Parameters

- **generator** `–[in]` MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** `–[in]` MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

#### Returns

- `ESP_OK`: Set generator action successfully
- `ESP_ERR_INVALID_ARG`: Set generator action failed because of invalid argument
- `ESP_FAIL`: Set generator action failed because of other error

*esp\_err\_t* `mcpwm_generator_set_actions_on_brake_event` (*mcpwm\_gen\_handle\_t* generator, *mcpwm\_gen\_brake\_event\_action\_t* ev\_act, ...)

Set generator actions on multiple MCPWM brake events.

---

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

---

#### Parameters

- **generator** `–[in]` MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev\_act** `–[in]` MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

#### Returns

- `ESP_OK`: Set generator actions successfully
- `ESP_ERR_INVALID_ARG`: Set generator actions failed because of invalid argument
- `ESP_FAIL`: Set generator actions failed because of other error

*esp\_err\_t* `mcpwm_generator_set_dead_time` (*mcpwm\_gen\_handle\_t* in\_generator, *mcpwm\_gen\_handle\_t* out\_generator, const *mcpwm\_dead\_time\_config\_t* \*config)

Set dead time for MCPWM generator.

---

**Note:** Due to a hardware limitation, you can't set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

---

#### Parameters

- **in\_generator** `–[in]` MCPWM generator, before adding the dead time
- **out\_generator** `–[in]` MCPWM generator, after adding the dead time
- **config** `–[in]` MCPWM dead time configuration

#### Returns

- `ESP_OK`: Set dead time for MCPWM generator successfully
- `ESP_ERR_INVALID_ARG`: Set dead time for MCPWM generator failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- `ESP_FAIL`: Set dead time for MCPWM generator failed because of other error

## Structures

struct **mcpwm\_generator\_config\_t**

MCPWM generator configuration.

### Public Members

int **gen\_gpio\_num**

The GPIO number used to output the PWM signal

uint32\_t **invert\_pwm**

Whether to invert the PWM signal (done by GPIO matrix)

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **io\_od\_mode**

Configure the GPIO as open-drain mode

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_generator\_config\_t*::[anonymous] **flags**

Extra configuration flags for generator

struct **mcpwm\_gen\_timer\_event\_action\_t**

Generator action on specific timer event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_timer\_event\_t* **event**

Timer event

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_compare\_event\_action\_t**

Generator action on specific comparator event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_cmpr\_handle\_t* **comparator**

Comparator handle

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_gen\_brake\_event\_action\_t**

Generator action on specific brake event.

### Public Members

*mcpwm\_timer\_direction\_t* **direction**

Timer direction

*mcpwm\_operator\_brake\_mode\_t* **brake\_mode**

Brake mode

*mcpwm\_generator\_action\_t* **action**

Generator action should perform

struct **mcpwm\_dead\_time\_config\_t**

MCPWM dead time configuration structure.

### Public Members

uint32\_t **posedge\_delay\_ticks**

delay time applied to rising edge, 0 means no rising delay time

uint32\_t **negedge\_delay\_ticks**

delay time applied to falling edge, 0 means no falling delay time

uint32\_t **invert\_output**

Invert the signal after applied the dead time

struct *mcpwm\_dead\_time\_config\_t*::[anonymous] **flags**

Extra flags for dead time configuration

### Macros

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION** (dir, ev, act)

Help macros to construct a *mcpwm\_gen\_timer\_event\_action\_t* entry.

**MCPWM\_GEN\_TIMER\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION** (dir, cmp, act)

Help macros to construct a *mcpwm\_gen\_compare\_event\_action\_t* entry.

**MCPWM\_GEN\_COMPARE\_EVENT\_ACTION\_END** ()

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION** (dir, mode, act)

Help macros to construct a *mcpwm\_gen\_brake\_event\_action\_t* entry.

**MCPWM\_GEN\_BRAKE\_EVENT\_ACTION\_END** ()

### Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_fault.h](#)

### Functions

*esp\_err\_t* **mcpwm\_new\_gpio\_fault** (const *mcpwm\_gpio\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM GPIO fault.

#### Parameters

- **config** –[in] MCPWM GPIO fault configuration
- **ret\_fault** –[out] Returned GPIO fault handle

#### Returns

- ESP\_OK: Create MCPWM GPIO fault successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM GPIO fault failed because can't find free resource
- ESP\_FAIL: Create MCPWM GPIO fault failed because of other error

*esp\_err\_t* **mcpwm\_new\_soft\_fault** (const *mcpwm\_soft\_fault\_config\_t* \*config, *mcpwm\_fault\_handle\_t* \*ret\_fault)

Create MCPWM software fault.

#### Parameters

- **config** –[in] MCPWM software fault configuration
- **ret\_fault** –[out] Returned software fault handle

#### Returns

- ESP\_OK: Create MCPWM software fault successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM software fault failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM software fault failed because out of memory
- ESP\_FAIL: Create MCPWM software fault failed because of other error

*esp\_err\_t* **mcpwm\_del\_fault** (*mcpwm\_fault\_handle\_t* fault)

Delete MCPWM fault.

**Parameters** **fault** –[in] MCPWM fault handle allocated by *mcpwm\_new\_gpio\_fault* () or *mcpwm\_new\_soft\_fault* ()

#### Returns

- ESP\_OK: Delete MCPWM fault successfully
- ESP\_ERR\_INVALID\_ARG: Delete MCPWM fault failed because of invalid argument
- ESP\_FAIL: Delete MCPWM fault failed because of other error

*esp\_err\_t* **mcpwm\_soft\_fault\_activate** (*mcpwm\_fault\_handle\_t* fault)

Activate the software fault, trigger the fault event for once.

**Parameters** **fault** –[in] MCPWM soft fault, allocated by *mcpwm\_new\_soft\_fault* ()

#### Returns

- ESP\_OK: Trigger MCPWM software fault event successfully
- ESP\_ERR\_INVALID\_ARG: Trigger MCPWM software fault event failed because of invalid argument

- `ESP_FAIL`: Trigger MCPWM software fault event failed because of other error

`esp_err_t mcpwm_fault_register_event_callbacks` (`mcpwm_fault_handle_t` fault, const `mcpwm_fault_event_callbacks_t` \*cbs, void \*user\_data)

Set event callbacks for MCPWM fault.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

#### Parameters

- **fault** `-[in]` MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** `-[in]` Group of callback functions
- **user\_data** `-[in]` User data, which will be passed to callback functions directly

#### Returns

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

### Structures

struct `mcpwm_gpio_fault_config_t`

MCPWM GPIO fault configuration structure.

#### Public Members

int `group_id`

In which MCPWM group that the GPIO fault belongs to

int `intr_priority`

MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

int `gpio_num`

GPIO used by the fault signal

uint32\_t `active_level`

On which level the fault signal is treated as active

uint32\_t `io_loop_back`

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t `pull_up`

Whether to pull up internally

uint32\_t `pull_down`

Whether to pull down internally

struct `mcpwm_gpio_fault_config_t::[anonymous]` `flags`

Extra configuration flags for GPIO fault

struct **mcpwm\_soft\_fault\_config\_t**

MCPWM software fault configuration structure.

struct **mcpwm\_fault\_event\_callbacks\_t**

Group of supported MCPWM fault event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_enter**

ISR callback function that would be invoked when fault signal becomes active

*mcpwm\_fault\_event\_cb\_t* **on\_fault\_exit**

ISR callback function that would be invoked when fault signal becomes inactive

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_sync.h](#)

## Functions

*esp\_err\_t* **mcpwm\_new\_timer\_sync\_src** (*mcpwm\_timer\_handle\_t* timer, const *mcpwm\_timer\_sync\_src\_config\_t* \*config, *mcpwm\_sync\_handle\_t* \*ret\_sync)

Create MCPWM timer sync source.

### Parameters

- **timer** –[in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **config** –[in] MCPWM timer sync source configuration
- **ret\_sync** –[out] Returned MCPWM sync handle

### Returns

- `ESP_OK`: Create MCPWM timer sync source successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM timer sync source failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM timer sync source failed because out of memory
- `ESP_ERR_INVALID_STATE`: Create MCPWM timer sync source failed because the timer has created a sync source before
- `ESP_FAIL`: Create MCPWM timer sync source failed because of other error

*esp\_err\_t* **mcpwm\_new\_gpio\_sync\_src** (const *mcpwm\_gpio\_sync\_src\_config\_t* \*config, *mcpwm\_sync\_handle\_t* \*ret\_sync)

Create MCPWM GPIO sync source.

### Parameters

- **config** –[in] MCPWM GPIO sync source configuration
- **ret\_sync** –[out] Returned MCPWM GPIO sync handle

### Returns

- `ESP_OK`: Create MCPWM GPIO sync source successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM GPIO sync source failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM GPIO sync source failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM GPIO sync source failed because can't find free resource

- `ESP_FAIL`: Create MCPWM GPIO sync source failed because of other error

`esp_err_t mcpwm_new_soft_sync_src` (const `mcpwm_soft_sync_config_t` \*config, `mcpwm_sync_handle_t` \*ret\_sync)

Create MCPWM software sync source.

#### Parameters

- **config** –[in] MCPWM software sync source configuration
- **ret\_sync** –[out] Returned software sync handle

#### Returns

- `ESP_OK`: Create MCPWM software sync successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM software sync failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM software sync failed because out of memory
- `ESP_FAIL`: Create MCPWM software sync failed because of other error

`esp_err_t mcpwm_del_sync_src` (`mcpwm_sync_handle_t` sync)

Delete MCPWM sync source.

**Parameters** **sync** –[in] MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

#### Returns

- `ESP_OK`: Delete MCPWM sync source successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM sync source failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM sync source failed because of other error

`esp_err_t mcpwm_soft_sync_activate` (`mcpwm_sync_handle_t` sync)

Activate the software sync, trigger the sync event for once.

**Parameters** **sync** –[in] MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

#### Returns

- `ESP_OK`: Trigger MCPWM software sync event successfully
- `ESP_ERR_INVALID_ARG`: Trigger MCPWM software sync event failed because of invalid argument
- `ESP_FAIL`: Trigger MCPWM software sync event failed because of other error

## Structures

struct `mcpwm_timer_sync_src_config_t`

MCPWM timer sync source configuration.

## Public Members

`mcpwm_timer_event_t` **timer\_event**

Timer event, upon which MCPWM timer will generate the sync signal

uint32\_t **propagate\_input\_sync**

The input sync signal would be routed to its sync output

struct `mcpwm_timer_sync_src_config_t`::[anonymous] **flags**

Extra configuration flags for timer sync source

struct `mcpwm_gpio_sync_src_config_t`

MCPWM GPIO sync source configuration.

## Public Members

int **group\_id**

MCPWM group ID

int **gpio\_num**

GPIO used by sync source

uint32\_t **active\_neg**

Whether the sync signal is active on negedge, by default, the sync signal's posedge is treated as active

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

struct *mcpwm\_gpio\_sync\_src\_config\_t*::[anonymous] **flags**

Extra configuration flags for GPIO sync source

struct **mcpwm\_soft\_sync\_config\_t**

MCPWM software sync configuration structure.

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_cap.h](#)

## Functions

*esp\_err\_t* **mcpwm\_new\_capture\_timer** (const *mcpwm\_capture\_timer\_config\_t* \*config, *mcpwm\_cap\_timer\_handle\_t* \*ret\_cap\_timer)

Create MCPWM capture timer.

### Parameters

- **config** –[in] MCPWM capture timer configuration
- **ret\_cap\_timer** –[out] Returned MCPWM capture timer handle

### Returns

- ESP\_OK: Create MCPWM capture timer successfully
- ESP\_ERR\_INVALID\_ARG: Create MCPWM capture timer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create MCPWM capture timer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create MCPWM capture timer failed because can't find free resource
- ESP\_FAIL: Create MCPWM capture timer failed because of other error

*esp\_err\_t* **mcpwm\_del\_capture\_timer** (*mcpwm\_cap\_timer\_handle\_t* cap\_timer)

Delete MCPWM capture timer.

**Parameters** **cap\_timer** –[in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

### Returns

- ESP\_OK: Delete MCPWM capture timer successfully

- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_enable(mcpwm_cap_timer_handle_t cap_timer)`

Enable MCPWM capture timer.

**Parameters** `cap_timer` **[-in]** MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Enable MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture timer failed because timer is enabled already
- `ESP_FAIL`: Enable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_disable(mcpwm_cap_timer_handle_t cap_timer)`

Disable MCPWM capture timer.

**Parameters** `cap_timer` **[-in]** MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Disable MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM capture timer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM capture timer failed because timer is disabled already
- `ESP_FAIL`: Disable MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_start(mcpwm_cap_timer_handle_t cap_timer)`

Start MCPWM capture timer.

**Parameters** `cap_timer` **[-in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Start MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Start MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Start MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_stop(mcpwm_cap_timer_handle_t cap_timer)`

Stop MCPWM capture timer.

**Parameters** `cap_timer` **[-in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**

- `ESP_OK`: Stop MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Stop MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Stop MCPWM capture timer failed because of other error

`esp_err_t mcpwm_capture_timer_get_resolution(mcpwm_cap_timer_handle_t cap_timer, uint32_t *out_resolution)`

Get MCPWM capture timer resolution, in Hz.

**Parameters**

- `cap_timer` **[-in]** MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `out_resolution` **[-out]** Returned capture timer resolution, in Hz

**Returns**

- `ESP_OK`: Get capture timer resolution successfully

- `ESP_ERR_INVALID_ARG`: Get capture timer resolution failed because of invalid argument
- `ESP_FAIL`: Get capture timer resolution failed because of other error

*esp\_err\_t* `mcpwm_capture_timer_set_phase_on_sync` (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, const *mcpwm\_capture\_timer\_sync\_phase\_config\_t* \*config)

Set sync phase for MCPWM capture timer.

#### Parameters

- **cap\_timer** `-[in]` MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **config** `-[in]` MCPWM capture timer sync phase configuration

#### Returns

- `ESP_OK`: Set sync phase for MCPWM capture timer successfully
- `ESP_ERR_INVALID_ARG`: Set sync phase for MCPWM capture timer failed because of invalid argument
- `ESP_FAIL`: Set sync phase for MCPWM capture timer failed because of other error

*esp\_err\_t* `mcpwm_new_capture_channel` (*mcpwm\_cap\_timer\_handle\_t* cap\_timer, const *mcpwm\_capture\_channel\_config\_t* \*config, *mcpwm\_cap\_channel\_handle\_t* \*ret\_cap\_channel)

Create MCPWM capture channel.

---

**Note:** The created capture channel won't be enabled until calling `mcpwm_capture_channel_enable`

---

#### Parameters

- **cap\_timer** `-[in]` MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- **config** `-[in]` MCPWM capture channel configuration
- **ret\_cap\_channel** `-[out]` Returned MCPWM capture channel

#### Returns

- `ESP_OK`: Create MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Create MCPWM capture channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create MCPWM capture channel failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create MCPWM capture channel failed because can't find free resource
- `ESP_FAIL`: Create MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_del_capture_channel` (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Delete MCPWM capture channel.

**Parameters** **cap\_channel** `-[in]` MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

#### Returns

- `ESP_OK`: Delete MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Delete MCPWM capture channel failed because of invalid argument
- `ESP_FAIL`: Delete MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_enable` (*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Enable MCPWM capture channel.

---

**Note:** This function will transit the channel state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

---

**Parameters** `cap_channel` **–[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Enable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Enable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable MCPWM capture channel failed because the channel is already enabled
- `ESP_FAIL`: Enable MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_disable`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Disable MCPWM capture channel.

**Parameters** `cap_channel` **–[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Disable MCPWM capture channel successfully
- `ESP_ERR_INVALID_ARG`: Disable MCPWM capture channel failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable MCPWM capture channel failed because the channel is not enabled yet
- `ESP_FAIL`: Disable MCPWM capture channel failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_register_event_callbacks`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel, const *mcpwm\_capture\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for MCPWM capture channel.

---

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- `cap_channel` **–[in]** MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- `cbs` **–[in]** Group of callback functions
- `user_data` **–[in]** User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the channel is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `mcpwm_capture_channel_trigger_soft_catch`(*mcpwm\_cap\_channel\_handle\_t* cap\_channel)

Trigger a catch by software.

**Parameters** `cap_channel` *-[in]* MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- `ESP_OK`: Trigger software catch successfully
- `ESP_ERR_INVALID_ARG`: Trigger software catch failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Trigger software catch failed because the channel is not enabled yet
- `ESP_FAIL`: Trigger software catch failed because of other error

**Structures**

struct `mcpwm_capture_timer_config_t`

MCPWM capture timer configuration structure.

**Public Members**

int `group_id`

Specify from which group to allocate the capture timer

*`mcpwm_capture_clock_source_t`* `clk_src`

MCPWM capture timer clock source

uint32\_t `resolution_hz`

Resolution of capture timer

struct `mcpwm_capture_timer_sync_phase_config_t`

MCPWM Capture timer sync phase configuration.

**Public Members**

*`mcpwm_sync_handle_t`* `sync_src`

The sync event source

uint32\_t `count_value`

The count value that should lock to upon sync event

*`mcpwm_timer_direction_t`* `direction`

The count direction that should lock to upon sync event

struct `mcpwm_capture_channel_config_t`

MCPWM capture channel configuration structure.

**Public Members**

int `gpio_num`

GPIO used capturing input signal

int **intr\_priority**

MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **prescale**

Prescale of input signal, effective frequency = cap\_input\_clk/prescale

uint32\_t **pos\_edge**

Whether to capture on positive edge

uint32\_t **neg\_edge**

Whether to capture on negative edge

uint32\_t **pull\_up**

Whether to pull up internally

uint32\_t **pull\_down**

Whether to pull down internally

uint32\_t **invert\_cap\_signal**

Invert the input capture signal

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t **keep\_io\_conf\_at\_exit**

For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

struct *mcpwm\_capture\_channel\_config\_t*::[anonymous] **flags**

Extra configuration flags for capture channel

struct **mcpwm\_capture\_event\_callbacks\_t**

Group of supported MCPWM capture event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

## Public Members

*mcpwm\_capture\_event\_cb\_t* **on\_cap**

Callback function that would be invoked when capture event occurred

## Header File

- [components/driver/mcpwm/include/driver/mcpwm\\_types.h](#)

## Structures

struct **mcpwm\_timer\_event\_data\_t**  
MCPWM timer event data.

### Public Members

uint32\_t **count\_value**  
MCPWM timer count value

*mcpwm\_timer\_direction\_t* **direction**  
MCPWM timer count direction

struct **mcpwm\_brake\_event\_data\_t**  
MCPWM brake event data.

struct **mcpwm\_fault\_event\_data\_t**  
MCPWM fault event data.

struct **mcpwm\_compare\_event\_data\_t**  
MCPWM compare event data.

### Public Members

uint32\_t **compare\_ticks**  
Compare value

*mcpwm\_timer\_direction\_t* **direction**  
Count direction

struct **mcpwm\_capture\_event\_data\_t**  
MCPWM capture event data.

### Public Members

uint32\_t **cap\_value**  
Captured value

*mcpwm\_capture\_edge\_t* **cap\_edge**  
Capture edge

## Type Definitions

typedef struct mcpwm\_timer\_t \***mcpwm\_timer\_handle\_t**  
Type of MCPWM timer handle.

typedef struct mcpwm\_oper\_t \***mcpwm\_oper\_handle\_t**  
Type of MCPWM operator handle.

```
typedef struct mcpwm_cmpr_t *mcpwm_cmpr_handle_t
```

Type of MCPWM comparator handle.

```
typedef struct mcpwm_gen_t *mcpwm_gen_handle_t
```

Type of MCPWM generator handle.

```
typedef struct mcpwm_fault_t *mcpwm_fault_handle_t
```

Type of MCPWM fault handle.

```
typedef struct mcpwm_sync_t *mcpwm_sync_handle_t
```

Type of MCPWM sync handle.

```
typedef struct mcpwm_cap_timer_t *mcpwm_cap_timer_handle_t
```

Type of MCPWM capture timer handle.

```
typedef struct mcpwm_cap_channel_t *mcpwm_cap_channel_handle_t
```

Type of MCPWM capture channel handle.

```
typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const  
mcpwm_timer_event_data_t *edata, void *user_ctx)
```

MCPWM timer event callback function.

**Param timer** [in] MCPWM timer handle

**Param edata** [in] MCPWM timer event data, fed by driver

**Param user\_ctx** [in] User data, set in `mcpwm_timer_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t  
*edata, void *user_ctx)
```

MCPWM operator brake event callback function.

**Param oper** [in] MCPWM operator handle

**Param edata** [in] MCPWM brake event data, fed by driver

**Param user\_ctx** [in] User data, set in `mcpwm_operator_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t  
*edata, void *user_ctx)
```

MCPWM fault event callback function.

**Param fault** MCPWM fault handle

**Param edata** MCPWM fault event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_fault_register_event_callbacks()`

**Return** whether a task switch is needed after the callback returns

```
typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const  
mcpwm_compare_event_data_t *edata, void *user_ctx)
```

MCPWM comparator event callback function.

**Param comparator** MCPWM comparator handle

**Param edata** MCPWM comparator event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_comparator_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

```
typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const
mcpwm_capture_event_data_t *edata, void *user_ctx)
```

MCPWM capture event callback function.

**Param cap\_channel** MCPWM capture channel handle

**Param edata** MCPWM capture event data, fed by driver

**Param user\_ctx** User data, set in `mcpwm_capture_channel_register_event_callbacks()`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/mcpwm\\_types.h](#)

### Type Definitions

```
typedef soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t
```

MCPWM timer clock source.

```
typedef soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t
```

MCPWM capture clock source.

```
typedef soc_periph_mcpwm_carrier_clk_src_t mcpwm_carrier_clock_source_t
```

MCPWM carrier clock source.

### Enumerations

```
enum mcpwm_timer_direction_t
```

MCPWM timer count direction.

*Values:*

enumerator **MCPWM\_TIMER\_DIRECTION\_UP**

Counting direction: Increase

enumerator **MCPWM\_TIMER\_DIRECTION\_DOWN**

Counting direction: Decrease

```
enum mcpwm_timer_event_t
```

MCPWM timer events.

*Values:*

enumerator **MCPWM\_TIMER\_EVENT\_EMPTY**

MCPWM timer counts to zero (i.e. counter is empty)

enumerator **MCPWM\_TIMER\_EVENT\_FULL**

MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM\_TIMER\_EVENT\_INVALID**

MCPWM timer invalid event

enum **mcpwm\_timer\_count\_mode\_t**

MCPWM timer count modes.

*Values:*

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_PAUSE**

MCPWM timer paused

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP**

MCPWM timer counting up

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_DOWN**

MCPWM timer counting down

enumerator **MCPWM\_TIMER\_COUNT\_MODE\_UP\_DOWN**

MCPWM timer counting up and down

enum **mcpwm\_timer\_start\_stop\_cmd\_t**

MCPWM timer commands, specify the way to start or stop the timer.

*Values:*

enumerator **MCPWM\_TIMER\_STOP\_EMPTY**

MCPWM timer stops when next count reaches zero

enumerator **MCPWM\_TIMER\_STOP\_FULL**

MCPWM timer stops when next count reaches peak

enumerator **MCPWM\_TIMER\_START\_NO\_STOP**

MCPWM timer starts counting, and don't stop until received stop command

enumerator **MCPWM\_TIMER\_START\_STOP\_EMPTY**

MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM\_TIMER\_START\_STOP\_FULL**

MCPWM timer starts counting and stops when next count reaches peak

enum **mcpwm\_generator\_action\_t**

MCPWM generator actions.

*Values:*

enumerator **MCPWM\_GEN\_ACTION\_KEEP**

Generator action: Keep the same level

enumerator **MCPWM\_GEN\_ACTION\_LOW**

Generator action: Force to low level

enumerator **MCPWM\_GEN\_ACTION\_HIGH**

Generator action: Force to high level

enumerator **MCPWM\_GEN\_ACTION\_TOGGLE**

Generator action: Toggle level

enum **mcpwm\_operator\_brake\_mode\_t**

MCPWM operator brake mode.

*Values:*

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_CBC**

Brake mode: CBC (cycle by cycle)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_OST**

Brake mode, OST (one shot)

enumerator **MCPWM\_OPER\_BRAKE\_MODE\_INVALID**

MCPWM operator invalid brake mode

enum **mcpwm\_capture\_edge\_t**

MCPWM capture edge.

*Values:*

enumerator **MCPWM\_CAP\_EDGE\_POS**

Capture on the positive edge

enumerator **MCPWM\_CAP\_EDGE\_NEG**

Capture on the negative edge

## 2.6.16 Parallel IO

### Introduction

The Parallel IO peripheral is a general purpose parallel interface that can be used to connect to external devices such as LED matrix, LCD display, Printer and Camera. The peripheral has independent TX and RX units. Each unit can have up to 8 or 16 data signals plus 1 or 2 clock signals.<sup>1</sup>

**Warning:** At the moment, the Parallel IO driver only supports TX mode. The RX feature is still working in progress.

### Application Examples

- Simple REG LED Matrix with HUB75 interface: [peripherals/parlio/simple\\_rgb\\_led\\_matrix](#).

### API Reference

#### Header File

- [components/driver/parlio/include/driver/parlio\\_tx.h](#)

---

<sup>1</sup> Different ESP chip series might have different numbers of PARLIO TX/RX instances, and the maximum data bus can also be different. For more details, please refer to *ESP32-C6 Technical Reference Manual* > Chapter *Parallel IO (PARLIO)* [PDF]. The driver will not forbid you from applying for more driver objects, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `parlio_new_tx_unit()`).

**Functions**

*esp\_err\_t* **parlio\_new\_tx\_unit** (const *parlio\_tx\_unit\_config\_t* \*config, *parlio\_tx\_unit\_handle\_t* \*ret\_unit)

Create a Parallel IO TX unit.

**Parameters**

- **config** –[in] Parallel IO TX unit configuration
- **ret\_unit** –[out] Returned Parallel IO TX unit handle

**Returns**

- ESP\_OK: Create Parallel IO TX unit successfully
- ESP\_ERR\_INVALID\_ARG: Create Parallel IO TX unit failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create Parallel IO TX unit failed because of out of memory
- ESP\_ERR\_NOT\_FOUND: Create Parallel IO TX unit failed because all TX units are used up and no more free one
- ESP\_ERR\_NOT\_SUPPORTED: Create Parallel IO TX unit failed because some feature is not supported by hardware, e.g. clock gating
- ESP\_FAIL: Create Parallel IO TX unit failed because of other error

*esp\_err\_t* **parlio\_del\_tx\_unit** (*parlio\_tx\_unit\_handle\_t* unit)

Delete a Parallel IO TX unit.

**Parameters** **unit** –[in] Parallel IO TX unit that created by *parlio\_new\_tx\_unit*

**Returns**

- ESP\_OK: Delete Parallel IO TX unit successfully
- ESP\_ERR\_INVALID\_ARG: Delete Parallel IO TX unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete Parallel IO TX unit failed because it is still in working
- ESP\_FAIL: Delete Parallel IO TX unit failed because of other error

*esp\_err\_t* **parlio\_tx\_unit\_enable** (*parlio\_tx\_unit\_handle\_t* unit)

Enable the Parallel IO TX unit.

---

**Note:** This function will transit the driver state from init to enable

---

---

**Note:** This function will acquire a PM lock that might be installed during channel allocation

---

---

**Note:** If there 're transaction pending in the queue, this function will pick up the first one and start the transfer

---

**Parameters** **unit** –[in] Parallel IO TX unit that created by *parlio\_new\_tx\_unit*

**Returns**

- ESP\_OK: Enable Parallel IO TX unit successfully
- ESP\_ERR\_INVALID\_ARG: Enable Parallel IO TX unit failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable Parallel IO TX unit failed because it is already enabled
- ESP\_FAIL: Enable Parallel IO TX unit failed because of other error

*esp\_err\_t* **parlio\_tx\_unit\_disable** (*parlio\_tx\_unit\_handle\_t* unit)

Disable the Parallel IO TX unit.

---

**Note:** This function will transit the driver state from enable to init

---

---

**Note:** This function will release the PM lock that might be installed during channel allocation

---

---

**Note:** If one transaction is undergoing, this function will terminate it immediately

---

**Parameters** **unit** –[in] Parallel IO TX unit that created by `parlio_new_tx_unit`

**Returns**

- `ESP_OK`: Disable Parallel IO TX unit successfully
- `ESP_ERR_INVALID_ARG`: Disable Parallel IO TX unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable Parallel IO TX unit failed because it's not enabled yet
- `ESP_FAIL`: Disable Parallel IO TX unit failed because of other error

*esp\_err\_t* `parlio_tx_unit_register_event_callbacks` (*parlio\_tx\_unit\_handle\_t* tx\_unit, const *parlio\_tx\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for Parallel IO TX unit.

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

---

**Note:** When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

---

**Parameters**

- **tx\_unit** –[in] Parallel IO TX unit that created by `parlio_new_tx_unit`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `parlio_tx_unit_transmit` (*parlio\_tx\_unit\_handle\_t* tx\_unit, const void \*payload, size\_t payload\_bits, const *parlio\_transmit\_config\_t* \*config)

Transmit data on by Parallel IO TX unit.

---

**Note:** After the function returns, it doesn't mean the transaction is finished. This function only constructs a transaction structure and push into a queue.

---

**Parameters**

- **tx\_unit** –[in] Parallel IO TX unit that created by `parlio_new_tx_unit`
- **payload** –[in] Pointer to the data to be transmitted
- **payload\_bits** –[in] Length of the data to be transmitted, in bits
- **config** –[in] Transmit configuration

**Returns**

- `ESP_OK`: Transmit data successfully
- `ESP_ERR_INVALID_ARG`: Transmit data failed because of invalid argument

- `ESP_ERR_INVALID_STATE`: Transmit data failed because the Parallel IO TX unit is not enabled
- `ESP_FAIL`: Transmit data failed because of other error

`esp_err_t parlio_tx_unit_wait_all_done` (*parlio\_tx\_unit\_handle\_t* tx\_unit, int timeout\_ms)

Wait for all pending TX transactions done.

#### Parameters

- `tx_unit` `-[in]` Parallel IO TX unit that created by `parlio_new_tx_unit`
- `timeout_ms` `-[in]` Timeout in milliseconds, `-1` means to wait forever

#### Returns

- `ESP_OK`: All pending TX transactions is finished and recycled
- `ESP_ERR_INVALID_ARG`: Wait for all pending TX transactions done failed because of invalid argument
- `ESP_ERR_TIMEOUT`: Wait for all pending TX transactions done timeout
- `ESP_FAIL`: Wait for all pending TX transactions done failed because of other error

## Structures

struct `parlio_tx_unit_config_t`

Parallel IO TX unit configuration.

## Public Members

*parlio\_clock\_source\_t* `clk_src`

Parallel IO internal clock source

*gpio\_num\_t* `clk_in_gpio_num`

If the clock source is input from external, set the corresponding GPIO number. Otherwise, set to `-1` and the driver will use the internal `clk_src` as clock source. This option has higher priority than `clk_src`

`uint32_t` `input_clk_src_freq_hz`

Frequency of the input clock source, valid only if `clk_in_gpio_num` is not `-1`

`uint32_t` `output_clk_freq_hz`

Frequency of the output clock. It' s divided from either internal `clk_src` or external clock source

`size_t` `data_width`

Parallel IO data width, can set to `1/2/4/8/...`, but can' t bigger than `PARLIO_TX_UNIT_MAX_DATA_WIDTH`

*gpio\_num\_t* `data_gpio_nums`[`PARLIO_TX_UNIT_MAX_DATA_WIDTH`]

Parallel IO data GPIO numbers, if any GPIO is not used, you can set it to `-1`

*gpio\_num\_t* `clk_out_gpio_num`

GPIO number of the output clock signal, the clock is synced with TX data

*gpio\_num\_t* `valid_gpio_num`

GPIO number of the valid signal, which stays high when transferring data. Note that, the valid signal will always occupy the MSB data bit

size\_t **trans\_queue\_depth**

Depth of internal transaction queue

size\_t **max\_transfer\_size**

Maximum transfer size in one transaction, in bytes. This decides the number of DMA nodes will be used for each transaction

*parlio\_sample\_edge\_t* **sample\_edge**

Parallel IO sample edge

*parlio\_bit\_pack\_order\_t* **bit\_pack\_order**

Set the order of packing the bits into bytes (only works when `data_width < 8`)

uint32\_t **clk\_gate\_en**

Enable TX clock gating, the output clock will be controlled by the MSB bit of the data bus, i.e. by `data_gpio_nums[PARLIO_TX_UNIT_MAX_DATA_WIDTH-1]`. High level to enable the clock output, low to disable

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *parlio\_tx\_unit\_config\_t*::[anonymous] **flags**

Extra configuration flags

struct **parlio\_tx\_done\_event\_data\_t**

Type of Parallel IO TX done event data.

struct **parlio\_tx\_event\_callbacks\_t**

Group of Parallel IO TX callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When `CONFIG_PARLIO_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

---

## Public Members

*parlio\_tx\_done\_callback\_t* **on\_trans\_done**

Event callback, invoked when one transmission is finished

struct **parlio\_transmit\_config\_t**

Parallel IO transmit configuration.

## Public Members

uint32\_t **idle\_value**

The value on the data line when the parallel IO is in idle state

### Type Definitions

```
typedef bool (*parlio_tx_done_callback_t)(parlio_tx_unit_handle_t tx_unit, const  
parlio_tx_done_event_data_t *edata, void *user_ctx)
```

Prototype of parlio tx event callback.

**Param tx\_unit [in]** Parallel IO TX unit that created by `parlio_new_tx_unit`

**Param edata [in]** Point to Parallel IO TX event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.

**Param user\_ctx [in]** User registered context, passed from `parlio_tx_unit_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this callback function

### Header File

- [components/driver/parlio/include/driver/parlio\\_types.h](#)

### Type Definitions

```
typedef struct parlio_tx_unit_t *parlio_tx_unit_handle_t
```

Type of Parallel IO TX unit handle.

### Header File

- [components/hal/include/hal/parlio\\_types.h](#)

### Macros

```
PARLIO_TX_UNIT_MAX_DATA_WIDTH
```

Maximum data width of TX unit.

### Type Definitions

```
typedef soc_periph_parlio_clk_src_t parlio_clock_source_t
```

Parallel IO clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

```
enum parlio_sample_edge_t
```

Parallel IO sample edge.

*Values:*

enumerator **PARLIO\_SAMPLE\_EDGE\_NEG**

Sample data on falling edge of clock

enumerator **PARLIO\_SAMPLE\_EDGE\_POS**

Sample data on rising edge of clock

enum `parlio_bit_pack_order_t`

Parallel IO bit packing order.

Data in memory: Byte 0: MSB < B0.7 B0.6 B0.5 B0.4 B0.3 B0.2 B0.1 B0.0 > LSB Byte 1: MSB < B1.7 B1.6 B1.5 B1.4 B1.3 B1.2 B1.1 B1.0 > LSB

Output on line (PARLIO\_BIT\_PACK\_ORDER\_LSB): Cycle 0 Cycle 1 Cycle 2 &#8212;> time GPIO 0: B0.0 B0.4 B1.0 GPIO 1: B0.1 B0.5 B1.1 GPIO 2: B0.2 B0.6 B1.2 GPIO 3: B0.3 B0.7 B1.3

Output on line (PARLIO\_BIT\_PACK\_ORDER\_MSB): Cycle 0 Cycle 1 Cycle 2 &#8212;> time GPIO 0: B0.4 B0.0 B1.4 GPIO 1: B0.5 B0.1 B1.5 GPIO 2: B0.6 B0.2 B1.6 GPIO 3: B0.7 B0.3 B1.7

*Values:*

enumerator `PARLIO_BIT_PACK_ORDER_LSB`

Bit pack order: LSB

enumerator `PARLIO_BIT_PACK_ORDER_MSB`

Bit pack order: MSB

## 2.6.17 Pulse Counter (PCNT)

### Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-C6 contains multiple pulse counter units in the module.<sup>1</sup> Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of **edge** type and **level** type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit's counter on each edge. The level signal is the so-called **control signal**, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a **quadrature decoder**.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal's frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

### Functional Overview

Description of the PCNT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- *Set Up Channel Actions* - covers how to configure the PCNT channel to behave on different signal edges and levels.
- *Watch Points* - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- *Register Event Callbacks* - describes how to hook your specific code to the watch point event callback function.
- *Set Glitch Filter* - describes how to enable and set the timing parameters for the internal glitch filter.
- *Enable and Disable Unit* - describes how to enable and disable the PCNT unit.

---

<sup>1</sup> Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver won't forbid you from applying for more PCNT units and channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `pcnt_new_unit()`).

- *Unit IO Control* - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- *Power Management* - describes what functionality will prevent the chip from going into low power mode.
- *IRAM Safe* - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there's a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter's width, which by default is 16bit at most, defined in the hardware. See also *Compensate Overflow Loss* for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

---

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

---

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e. unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it's recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by **edge** type signal and **level** type signal. Please note, either of them can

be assigned to *-1* if it's not actually used, and thus it will become a **virtual IO**. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO will cause that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.

- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for **edge** and **level** input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to *-1*.
- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.
- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO's input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e. channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it's recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};
pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

**Set Up Channel Actions** The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.
- `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to *-1* when allocating PCNT channel by `pcnt_new_channel()`.

```
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
↪DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
↪counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
↪KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

**Watch Points** Each PCNT unit can be configured to watch several different values that you're interested in. The value to be watched is also called **Watch Point**. The watch point itself can't exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See *Register Event Callbacks* for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly used watch points are: **zero cross**, **maximum / minimum count** and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can't find any free hardware resource to save the watch point. You can't add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function doesn't attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different **counting direction** and **counting step size**.

Registering callback function will result in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_
↳data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &(edata->watch_point_value), &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

pcnt_event_callbacks_t cbs = {
```

(continues on next page)

(continued from previous page)

```

        .on_reach = example_pcnt_on_reach,
    };
    QueueHandle_t queue = xQueueCreate(10, sizeof(int));
    ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));

```

**Set Glitch Filter** The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in [pcnt\\_glitch\\_filter\\_config\\_t](#):

- [pcnt\\_glitch\\_filter\\_config\\_t::max\\_glitch\\_ns](#) sets the maximum glitch width, in nano seconds. If a signal pulse's width is smaller than this value, then it will be treated as noise and won't increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#) with a *NULL* filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

---

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB\_CLK cycle (usually 12.5 ns if APB equals 80MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter won't work as expect in that case. So the driver will install a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see [Power Management](#).

---

```

pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));

```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling [pcnt\\_unit\\_enable\(\)](#). Internally, this function will:

- switch the PCNT driver state from **init** to **enable**.
- enable the interrupt service if it has been lazy installed in [pcnt\\_unit\\_register\\_event\\_callbacks\(\)](#).
- acquire a proper power management lock if it has been lazy installed in [pcnt\\_unit\\_set\\_glitch\\_filter\(\)](#). See also [Power Management](#) for more information.

On the contrary, calling [pcnt\\_unit\\_disable\(\)](#) will do the opposite, that is, put the PCNT driver back to the **init** state, disable the interrupts service and release the power management lock.

## Unit IO Control

**Start/Stop and Clear** Calling [pcnt\\_unit\\_start\(\)](#) will make the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling [pcnt\\_unit\\_stop\(\)](#) will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling [pcnt\\_unit\\_clear\\_count\(\)](#).

Note, [pcnt\\_unit\\_start\(\)](#) and [pcnt\\_unit\\_stop\(\)](#) should be called when the unit has been enabled by [pcnt\\_unit\\_enable\(\)](#). Otherwise, it will return [ESP\\_ERR\\_INVALID\\_STATE](#) error.

**Get Count Value** You can read current count value at any time by calling [pcnt\\_unit\\_get\\_count\(\)](#). The returned count value is a **signed** integer, where the sign can be used to reflect the direction.

```
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter's bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware's count value, but also accumulates the high/low overflow loss to it.

---

**Note:** `pcnt_unit_clear_count()` will reset the accumulated count value as well.

---

**Power Management** When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by `pcnt_unit_set_glitch_filter()`, the driver will guarantee that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

**IRAM Safe** By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There's a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM<sup>2</sup>
3. Place driver object into DRAM (in case it's mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There's another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety** The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

---

<sup>2</sup> `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see *IRAM Safe* for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see *IRAM Safe* for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Decode the quadrature signals from rotary encoder: [peripherals/pcnt/rotary\\_encoder](#).

### API Reference

#### Header File

- `components/driver/pcnt/include/driver/pulse_cnt.h`

#### Functions

`esp_err_t pcnt_new_unit` (const `pcnt_unit_config_t` \*config, `pcnt_unit_handle_t` \*ret\_unit)

Create a new PCNT unit, and return the handle.

---

**Note:** The newly created PCNT unit is put in the init state.

---

#### Parameters

- `config` –[in] PCNT unit configuration
- `ret_unit` –[out] Returned PCNT unit handle

#### Returns

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit` (`pcnt_unit_handle_t` unit)

Delete the PCNT unit handle.

---

**Note:** A PCNT unit can't be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

---

**Parameters** `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`

#### Returns

- `ESP_OK`: Delete the PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- `ESP_FAIL`: Delete the PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_set\_glitch\_filter** (*pcnt\_unit\_handle\_t* unit, const *pcnt\_glitch\_filter\_config\_t* \*config)

Set glitch filter for PCNT unit.

---

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won't be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

---

---

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

---

#### Parameters

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **config** –[in] PCNT filter configuration, set config to NULL means disabling the filter function

#### Returns

- **ESP\_OK:** Set glitch filter successfully
- **ESP\_ERR\_INVALID\_ARG:** Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- **ESP\_ERR\_INVALID\_STATE:** Set glitch filter failed because the unit is not in the init state
- **ESP\_FAIL:** Set glitch filter failed because of other error

*esp\_err\_t* **pcnt\_unit\_enable** (*pcnt\_unit\_handle\_t* unit)

Enable the PCNT unit.

---

**Note:** This function will transit the unit state from init to enable.

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `pcnt_unit_register_event_callbacks()`.

---

---

**Note:** This function will acquire the PM lock if it's lazy installed in `pcnt_unit_set_glitch_filter()`.

---

---

**Note:** Enable a PCNT unit doesn't mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

#### Returns

- **ESP\_OK:** Enable PCNT unit successfully
- **ESP\_ERR\_INVALID\_ARG:** Enable PCNT unit failed because of invalid argument
- **ESP\_ERR\_INVALID\_STATE:** Enable PCNT unit failed because the unit is already enabled
- **ESP\_FAIL:** Enable PCNT unit failed because of other error

*esp\_err\_t* **pcnt\_unit\_disable** (*pcnt\_unit\_handle\_t* unit)

Disable the PCNT unit.

---

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

---

**Note:** Disable a PCNT unit doesn't mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

---

**Parameters** `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Disable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Disable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Disable PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Disable PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_start` (*pcnt\_unit\_handle\_t* unit)

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it's allowed to be executed when Cache is disabled

---

**Parameters** `unit` –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Start PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Start PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Start PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_stop` (*pcnt\_unit\_handle\_t* unit)

Stop PCNT from counting.

---

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

---

---

**Note:** The stop operation won't clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Stop PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Stop PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop PCNT unit failed because the unit is not enabled yet
- `ESP_FAIL`: Stop PCNT unit failed because of other error

*esp\_err\_t* `pcnt_unit_clear_count` (*pcnt\_unit\_handle\_t* unit)

Clear PCNT pulse count value to zero.

---

**Note:** It's recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters** **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- `ESP_OK`: Clear PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Clear PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Clear PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_get_count` (*pcnt\_unit\_handle\_t* unit, int \*value)

Get PCNT count value.

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it's allowed to be executed when Cache is disabled

---

**Parameters**

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **value** –[out] Returned count value

**Returns**

- `ESP_OK`: Get PCNT pulse count successfully
- `ESP_ERR_INVALID_ARG`: Get PCNT pulse count failed because of invalid argument
- `ESP_FAIL`: Get PCNT pulse count failed because of other error

*esp\_err\_t* `pcnt_unit_register_event_callbacks` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set event callbacks for PCNT unit.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

---

**Parameters**

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** –[in] Group of callback functions
- **user\_data** –[in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the unit is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `pcnt_unit_add_watch_point` (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters**

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** –[in] Value to be watched

**Returns**

- `ESP_OK`: Add watch point successfully
- `ESP_ERR_INVALID_ARG`: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- `ESP_ERR_INVALID_STATE`: Add watch point failed because the same watch point has already been added
- `ESP_ERR_NOT_FOUND`: Add watch point failed because no more hardware watch point can be configured
- `ESP_FAIL`: Add watch point failed because of other error

*esp\_err\_t* `pcnt_unit_remove_watch_point` (*pcnt\_unit\_handle\_t* unit, int watch\_point)

Remove a watch point for PCNT unit.

**Parameters**

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **watch\_point** –[in] Watch point value

**Returns**

- `ESP_OK`: Remove watch point successfully
- `ESP_ERR_INVALID_ARG`: Remove watch point failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- `ESP_FAIL`: Remove watch point failed because of other error

*esp\_err\_t* `pcnt_new_channel` (*pcnt\_unit\_handle\_t* unit, const *pcnt\_chan\_config\_t* \*config, *pcnt\_channel\_handle\_t* \*ret\_chan)

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

---

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

---

**Parameters**

- **unit** –[in] PCNT unit handle created by `pcnt_new_unit()`
- **config** –[in] PCNT channel configuration
- **ret\_chan** –[out] Returned channel handle

**Returns**

- `ESP_OK`: Create PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT channel failed because of invalid argument
- `ESP_ERR_NO_MEM`: Create PCNT channel failed because of insufficient memory
- `ESP_ERR_NOT_FOUND`: Create PCNT channel failed because all PCNT channels are used up and no more free one
- `ESP_ERR_INVALID_STATE`: Create PCNT channel failed because the unit is not in the init state
- `ESP_FAIL`: Create PCNT channel failed because of other error

`esp_err_t pcnt_del_channel` (*pcnt\_channel\_handle\_t* chan)

Delete the PCNT channel.

**Parameters** `chan` –[in] PCNT channel handle created by `pcnt_new_channel()`

**Returns**

- `ESP_OK`: Delete the PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Delete the PCNT channel failed because of invalid argument
- `ESP_FAIL`: Delete the PCNT channel failed because of other error

`esp_err_t pcnt_channel_set_edge_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_edge\_action\_t* pos\_act, *pcnt\_channel\_edge\_action\_t* neg\_act)

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**

- `chan` –[in] PCNT channel handle created by `pcnt_new_channel()`
- `pos_act` –[in] Action on posedge signal
- `neg_act` –[in] Action on negedge signal

**Returns**

- `ESP_OK`: Set edge action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set edge action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set edge action for PCNT channel failed because of other error

`esp_err_t pcnt_channel_set_level_action` (*pcnt\_channel\_handle\_t* chan, *pcnt\_channel\_level\_action\_t* high\_act, *pcnt\_channel\_level\_action\_t* low\_act)

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**

- `chan` –[in] PCNT channel handle created by `pcnt_new_channel()`
- `high_act` –[in] Action on high level signal
- `low_act` –[in] Action on low level signal

**Returns**

- `ESP_OK`: Set level action for PCNT channel successfully
- `ESP_ERR_INVALID_ARG`: Set level action for PCNT channel failed because of invalid argument
- `ESP_FAIL`: Set level action for PCNT channel failed because of other error

## Structures

struct `pcnt_watch_event_data_t`

PCNT watch event data.

## Public Members

int **watch\_point\_value**

Watch point value that triggered the event

*pcnt\_unit\_zero\_cross\_mode\_t* **zero\_cross\_mode**

Zero cross mode

struct **pcnt\_event\_callbacks\_t**

Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_PCNT\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

### Public Members

*pcnt\_watch\_cb\_t* **on\_reach**

Called when PCNT unit counter reaches any watch point

struct **pcnt\_unit\_config\_t**

PCNT unit configuration.

### Public Members

int **low\_limit**

Low limitation of the count unit, should be lower than 0

int **high\_limit**

High limitation of the count unit, should be higher than 0

int **intr\_priority**

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **accum\_count**

Whether to accumulate the count value when overflows at the high/low limit

struct *pcnt\_unit\_config\_t*::[anonymous] **flags**

Extra flags

struct **pcnt\_chan\_config\_t**

PCNT channel configuration.

### Public Members

int **edge\_gpio\_num**

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int **level\_gpio\_num**

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32\_t **invert\_edge\_input**

Invert the input edge signal

uint32\_t **invert\_level\_input**

Invert the input level signal

uint32\_t **virt\_edge\_io\_level**

Virtual edge IO level, 0: low, 1: high. Only valid when edge\_gpio\_num is set to -1

uint32\_t **virt\_level\_io\_level**

Virtual level IO level, 0: low, 1: high. Only valid when level\_gpio\_num is set to -1

uint32\_t **io\_loop\_back**

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct *pcnt\_chan\_config\_t*::[anonymous] **flags**

Channel config flags

struct **pcnt\_glitch\_filter\_config\_t**

PCNT glitch filter configuration.

## Public Members

uint32\_t **max\_glitch\_ns**

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

## Type Definitions

typedef struct pcnt\_unit\_t \***pcnt\_unit\_handle\_t**

Type of PCNT unit handle.

typedef struct pcnt\_chan\_t \***pcnt\_channel\_handle\_t**

Type of PCNT channel handle.

typedef bool (\***pcnt\_watch\_cb\_t**)(*pcnt\_unit\_handle\_t* unit, const *pcnt\_watch\_event\_data\_t* \*edata, void \*user\_ctx)

PCNT watch event callback prototype.

---

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

---

**Param unit [in]** PCNT unit handle

**Param edata [in]** PCNT event data, fed by the driver

**Param user\_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- [components/hal/include/hal/pcnt\\_types.h](#)

### Enumerations

enum **pcnt\_channel\_level\_action\_t**

PCNT channel action on control level.

*Values:*

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_KEEP**

Keep current count mode

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_INVERSE**

Invert current count mode (increase -> decrease, decrease -> increase)

enumerator **PCNT\_CHANNEL\_LEVEL\_ACTION\_HOLD**

Hold current count value

enum **pcnt\_channel\_edge\_action\_t**

PCNT channel action on signal edge.

*Values:*

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_HOLD**

Hold current count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_INCREASE**

Increase count value

enumerator **PCNT\_CHANNEL\_EDGE\_ACTION\_DECREASE**

Decrease count value

enum **pcnt\_unit\_zero\_cross\_mode\_t**

PCNT unit zero cross mode.

*Values:*

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_ZERO**

start from positive value, end to zero, i.e. +N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_ZERO**

start from negative value, end to zero, i.e. -N->0

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_NEG\_POS**

start from negative value, end to positive value, i.e. -N->+M

enumerator **PCNT\_UNIT\_ZERO\_CROSS\_POS\_NEG**

start from positive value, end to negative value, i.e. +N->-M

## 2.6.18 Remote Control Transceiver (RMT)

### Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-C6 contains multiple channels in the RMT peripheral<sup>1</sup>. Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern –the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal's duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal's logic level, i.e., high or low.

Fig. 14: Structure of RMT symbols (L - signal level)

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user's data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

<sup>1</sup> Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing *Resource Allocation*.

Fig. 15: RMT Transmitter Overview

Fig. 16: RMT Receiver Overview

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal's stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

## Functional Overview

The description of the RMT functionality is divided into the following sections:

- *Resource Allocation* - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- *Carrier Modulation and Demodulation* - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- *Register Event Callbacks* - covers how to register user-provided event callbacks in order to receive RMT channel events.
- *Enable and Disable Channel* - shows how to enable and disable the RMT channel.
- *Initiate TX Transaction* - describes the steps to initiate a transaction for a TX channel.
- *Initiate RX Transaction* - describes the steps to initiate a transaction for an RX channel.
- *Multiple Channels Simultaneous Transmission* - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- *RMT Encoder* - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- *Power Management* - describes how different clock sources affects power consumption.
- *IRAM Safe* - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Kconfig Options* - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the *Power Management* section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, we recommend you set a large value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel's assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .trans_queue_depth = 4,          // set the number of transactions that can
    ↪pend in the background
    .flags.invert_out = false,        // do not invert output signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

**Install RMT RX Channel** To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the [Power Management](#) section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this **tick**.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel's workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel's assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the

driver will use an interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,    // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 μs
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                   // GPIO number
    .flags.invert_in = false,         // do not invert input signal
    .flags.with_dma = false,          // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

**Uninstall RMT Channel** If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

**Carrier Modulation and Demodulation** The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal's frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:

- `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.
- `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.
- `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.
- `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {
    .duty_cycle = 0.33,                // duty cycle 33%
    .frequency_hz = 38000,             // 38 KHz
    .flags.polarity_active_low = false, // carrier should be modulated to high_
    ↪level
};
```

(continues on next page)

```

// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {
    .duty_cycle = 0.33,           // duty cycle 33%
    .frequency_hz = 25000,       // 25 KHz carrier, should be smaller than
    ↪the transmitter's carrier frequency
    .flags.polarity_active_low = false, // the carrier is modulated to high level
};
// demodulate carrier from RX channel
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));

```

**Register Event Callbacks** When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver's ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

**Enable and Disable Channel** `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`.

`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

**Initiate TX Transaction** RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to [RMT Encoder](#).

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, we also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

---

**Note:** The **loop transmit** feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

---

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.

---

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also [RMT Encoder](#).
- 

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), we do not want any time drift in between when startup multiple TX channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

**Install RMT Sync Manager** To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

Fig. 17: RMT TX Sync

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```

rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that
        ↪ can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));

ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_
↪ num * 3, &transmit_config));

```

(continues on next page)

(continued from previous page)

```
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for
↳tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_
↳num * 3, &transmit_config));
```

**Initiate RX Transaction** As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver notifies the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_
↳rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}

QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));

// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is
↳560 µs, 1250 ns < 560 µs, valid signal is not treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is
↳9000 µs, 12000000 ns > 9000 µs, the receive does not stop early
};
```

(continues on next page)

```

rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a
↳standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
↳config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, we utilize a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** in order to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly-used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also [Composite Pattern](#) for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- `rmt_encoder_t::encode` is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, we need to yield from the current session, as there is no space to save more encoding artifacts.
- `rmt_encoder_t::reset` should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- `rmt_encoder_t::del` should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder's main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode `const` data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder's main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

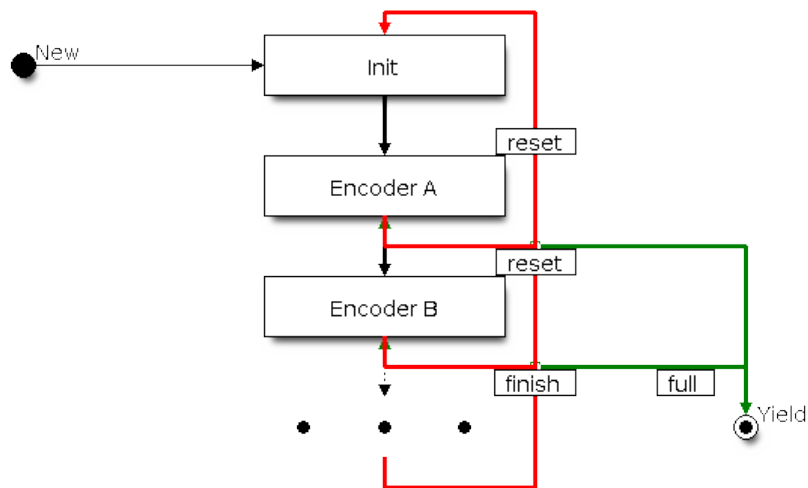

Fig. 18: RMT Encoder Chain

**Customize RMT Encoder for NEC Protocol** In this section, we demonstrate how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is  $562.5 \mu\text{s}$  in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a  $562.5 \mu\text{s}$  pulse burst followed by a  $562.5 \mu\text{s}$  space, with a total transmit time of  $1.125 \text{ ms}$
- Logical 1: a  $562.5 \mu\text{s}$  pulse burst followed by a  $1.6875 \text{ ms}$  space, with a total transmit time of  $2.25 \text{ ms}$

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

Fig. 19: IR NEC Frame

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final  $562.5 \mu\text{s}$  pulse burst to signify the end of message transmission

Then we can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```

// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;

```

A full sample code can be found in [peripherals/rmt/ir\\_nec\\_transceiver](#). In the above snippet, we use a switch-case and several goto statements to implement a [Finite-state machine](#). With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., [CONFIG\\_PM\\_ENABLE](#) is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type [ESP\\_PM\\_APB\\_FREQ\\_MAX](#). Whenever the user creates an RMT channel that has selected [RMT\\_CLK\\_SRC\\_APB](#) as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by [rmt\\_enable\(\)](#). Likewise, the driver releases the lock after [rmt\\_disable\(\)](#) is called for the same channel. This also reveals that the [rmt\\_enable\(\)](#) and [rmt\\_disable\(\)](#) should appear in pairs.

If the channel clock source is selected to others like [RMT\\_CLK\\_SRC\\_XTAL](#), then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on **ping-pong** interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#) that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM<sup>2</sup>
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

### Kconfig Options

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also *IRAM Safe* for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

### Application Examples

- RMT-based RGB LED strip customized encoder: [peripherals/rmt/led\\_strip](#)
- RMT IR NEC protocol encoding and decoding: [peripherals/rmt/ir\\_nec\\_transceiver](#)
- RMT transactions in queue: [peripherals/rmt/musical\\_buzzer](#)
- RMT-based stepper motor with S-curve algorithm: [peripherals/rmt/stepper\\_motor](#)
- RMT infinite loop for driving DShot ESC: [peripherals/rmt/dshot\\_esc](#)
- RMT simulate 1-wire protocol (take DS18B20 as example): [peripherals/rmt/onewire](#)

### FAQ

- Why the RMT encoder results in more data than expected?
