- Setting and getting count value are done by *`gptimer_get_raw_count()`* and *`gptimer_set_raw_count()`*. The driver does not help convert the raw value into UTC time-stamp. Instead, the conversion should be done from user's side as the timer resolution is also known to the user.
- The driver will install the interrupt service as well if *`gptimer_event_callbacks_t::on_alarm`* is set to a valid callback function. In the callback, users do not have to deal with the low level registers (like "clear interrupt status", "re-enable alarm event" and so on). So functions like `timer_group_get_intr_status_in_isr` and `timer_group_get_auto_reload_in_isr` are not used anymore.
- To update the alarm configurations when alarm event happens, one can call *`gptimer_set_alarm_action()`* in the interrupt callback, then the alarm will be re-enabled again.
- Alarm will always be re-enabled by the driver if *`gptimer_alarm_config_t::auto_reload_on_alarm`* is set to true.

UART

Removed/Deprecated items	Replacement	Remarks
`uart_isr_register()`	None	UART interrupt handling is implemented by driver itself.
`uart_isr_free()`	None	UART interrupt handling is implemented by driver itself.
`use_ref_tick` in *`uart_config_t`*	*`uart_config_t::source_clk`*	Select the clock source.
`uart_enable_pattern_det_intr()`	*`uart_enable_pattern_det_baud_intr()`*	Enable pattern detection interrupt.

I2C

Removed/Deprecated items	Replacement	Remarks
`i2c_isr_register()`	None	I2C interrupt handling is implemented by driver itself.
`i2c_isr_register()`	None	I2C interrupt handling is implemented by driver itself.
`i2c_opmode_t`	None	It is not used anywhere in ESP-IDF.

SPI

Removed/Deprecated items	Replacement	Remarks
`spi_cal_clock()`	*`spi_get_actual_clock()`*	Get SPI real working frequency.

- The internal header file `spi_common_internal.h` has been moved to `esp_private/spi_common_internal.h`.

LEDC

Removed/Deprecated items	Replacement	Remarks
`bit_num` in *`ledc_timer_config_t`*	*`ledc_timer_config_t::duty_resolution`*	Set resolution of the duty cycle.

Pulse Counter Driver Pulse counter driver has been redesigned (see *PCNT*), which aims to unify and simplify the usage of PCNT peripheral.

Although it is recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/pcnt.h`. However, including `driver/pcnt.h` triggers the build warning below by default. The warning can be suppressed by the Kconfig option *CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN*.

```
legacy pcnt driver is deprecated, please migrate to use driver/pulse_cnt.h
```

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts

- `pcnt_port_t`, `pcnt_unit_t` and `pcnt_channel_t` which used to identify the hardware unit and channel are removed from user's code. In the new driver, PCNT unit is represented by *`pcnt_unit_handle_t`*, likewise, PCNT channel is represented by *`pcnt_channel_handle_t`*. Both of them are opaque pointers.
- `pcnt_evt_type_t` is not used any more, they have been replaced by a universal **Watch Point Event**. In the event callback *`pcnt_watch_cb_t`*, it is still possible to distinguish different watch points from *`pcnt_watch_event_data_t`*.
- `pcnt_count_mode_t` is replaced by *`pcnt_channel_edge_action_t`*, and `pcnt_ctrl_mode_t` is replaced by *`pcnt_channel_level_action_t`*.

Breaking Changes in Usage

- Previously, the PCNT unit configuration and channel configuration were combined into a single function: `pcnt_unit_config`. They are now split into the two factory APIs: *`pcnt_new_unit()`* and *`pcnt_new_channel()`* respectively.
  - Only the count range is necessary for initializing a PCNT unit. GPIO number assignment has been moved to *`pcnt_new_channel()`*.
  - High/Low control mode and positive/negative edge count mode are set by stand-alone functions: *`pcnt_channel_set_edge_action()`* and *`pcnt_channel_set_level_action()`*.
- `pcnt_get_counter_value` is replaced by *`pcnt_unit_get_count()`*.
- `pcnt_counter_pause` is replaced by *`pcnt_unit_stop()`*.
- `pcnt_counter_resume` is replaced by *`pcnt_unit_start()`*.
- `pcnt_counter_clear` is replaced by *`pcnt_unit_clear_count()`*.
- `pcnt_intr_enable` and `pcnt_intr_disable` are removed. In the new driver, the interrupt is enabled by registering event callbacks *`pcnt_unit_register_event_callbacks()`*.
- `pcnt_event_enable` and `pcnt_event_disable` are removed. In the new driver, the PCNT events are enabled/disabled by adding/removing watch points *`pcnt_unit_add_watch_point()`*, *`pcnt_unit_remove_watch_point()`*.
- `pcnt_set_event_value` is removed. In the new driver, event value is also set when adding watch point by *`pcnt_unit_add_watch_point()`*.
- `pcnt_get_event_value` and `pcnt_get_event_status` are removed. In the new driver, these information are provided by event callback *`pcnt_watch_cb_t`* in the *`pcnt_watch_event_data_t`*.
- `pcnt_isr_register` and `pcnt_isr_unregister` are removed. Register of the ISR handler from user's code is no longer permitted. Users should register event callbacks instead by calling *`pcnt_unit_register_event_callbacks()`*.
- `pcnt_set_pin` is removed and the new driver no longer allows the switching of the GPIO at runtime. If users want to change to other GPIOs, please delete the existing PCNT channel by *`pcnt_del_channel()`* and reinstall with the new GPIO number by *`pcnt_new_channel()`*.
- `pcnt_filter_enable`, `pcnt_filter_disable` and `pcnt_set_filter_value` are replaced by *`pcnt_unit_set_glitch_filter()`*. Meanwhile, `pcnt_get_filter_value` has been removed.
- `pcnt_set_mode` is replaced by *`pcnt_channel_set_edge_action()`* and *`pcnt_channel_set_level_action()`*.
- `pcnt_isr_service_install`, `pcnt_isr_service_uninstall`, `pcnt_isr_handler_add` and `pcnt_isr_handler_remove` are replaced by *`pcnt_unit_register_event_callbacks()`*. The default ISR handler is lazy installed in the new driver.

Temperature Sensor Driver The temperature sensor driver has been redesigned and it is recommended to use the new driver. However, the old driver is still available but cannot be used with the new driver simultaneously.

The new driver can be included via `driver/temperature_sensor.h`. The old driver is still available in the previous include path `driver/temp_sensor.h`. However, including `driver/temp_sensor.h` triggers the build warning below by default. The warning can be suppressed by enabling the menuconfig option *CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN*.

```
legacy temperature sensor driver is deprecated, please migrate to driver/
↪temperature_sensor.h
```

Configuration contents has been changed. In the old version, users need to configure `clk_div` and `dac_offset`. While in the new version, users only need to choose `tsens_range`.

The process of using temperature sensor has been changed. In the old version, users can use `config->start->read_celsius` to get value. In the new version, users should install the temperature sensor driver firstly, by `temperature_sensor_install` and uninstall it when finished. For more information, please refer to *Temperature Sensor* .

RMT Driver RMT driver has been redesigned (see *RMT transceiver*), which aims to unify and extend the usage of RMT peripheral.

Although it is recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/rmt.h`. However, including `driver/rmt.h` triggers the build warning below by default. The warning can be suppressed by the Kconfig option *CONFIG_RMT_SUPPRESS_DEPRECATE_WARN*.

```
The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_
↪rx.h
```

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts

- `rmt_channel_t` which used to identify the hardware channel are removed from user space. In the new driver, RMT channel is represented by *`rmt_channel_handle_t`*. The channel is dynamically allocated by the driver, instead of designated by user.
- `rmt_item32_t` is replaced by *`rmt_symbol_word_t`*, which avoids a nested union inside a struct.
- `rmt_mem_t` is removed, as we do not allow users to access RMT memory block (a.k.an RMTMEM) directly. Direct access to RMTMEM does not make sense but make mistakes, especially when the RMT channel also connected with a DMA channel.
- `rmt_mem_owner_t` is removed, as the ownership is controlled by driver, not by user anymore.
- `rmt_source_clk_t` is replaced by *`rmt_clock_source_t`*, and note they are not binary compatible.
- `rmt_data_mode_t` is removed, the RMT memory access mode is configured to always use Non-FIFO and DMA mode.
- `rmt_mode_t` is removed, as the driver has stand alone install functions for TX and RX channels.
- `rmt_idle_level_t` is removed, setting IDLE level for TX channel is available in *`rmt_transmit_config_t::eot_level`*.
- `rmt_carrier_level_t` is removed, setting carrier polarity is available in *`rmt_carrier_config_t::polarity_active_low`*.
- `rmt_channel_status_t` and `rmt_channel_status_result_t` are removed, they are not used anywhere.
- Transmitting by RMT channel does not expect user to prepare the RMT symbols, instead, user needs to provide an RMT Encoder to tell the driver how to convert user data into RMT symbols.

Breaking Changes in Usage

- Channel installation has been separated for TX and RX channels into *`rmt_new_tx_channel()`* and *`rmt_new_rx_channel()`*.
- `rmt_set_clk_div` and `rmt_get_clk_div` are removed. Channel clock configuration can only be done during channel installation.
- `rmt_set_rx_idle_thresh` and `rmt_get_rx_idle_thresh` are removed. In the new driver, the RX channel IDLE threshold is redesigned into a new concept *`rmt_receive_config_t::signal_range_max_ns`*.
- `rmt_set_mem_block_num` and `rmt_get_mem_block_num` are removed. In the new driver, the memory block number is determined by *`rmt_tx_channel_config_t::mem_block_symbols`* and *`rmt_rx_channel_config_t::mem_block_symbols`*.
- `rmt_set_tx_carrier` is removed, the new driver uses *`rmt_apply_carrier()`* to set carrier behavior.
- `rmt_set_mem_pd` and `rmt_get_mem_pd` are removed. The memory power is managed by the driver automatically.
- `rmt_memory_rw_rst`, `rmt_tx_memory_reset` and `rmt_rx_memory_reset` are removed. Memory reset is managed by the driver automatically.
- `rmt_tx_start` and `rmt_rx_start` are merged into a single function *`rmt_enable()`*, for both TX and RX channels.
- `rmt_tx_stop` and `rmt_rx_stop` are merged into a single function *`rmt_disable()`*, for both TX and RX channels.
- `rmt_set_memory_owner` and `rmt_get_memory_owner` are removed. RMT memory owner guard is added automatically by the driver.
- `rmt_set_tx_loop_mode` and `rmt_get_tx_loop_mode` are removed. In the new driver, the loop mode is configured in *`rmt_transmit_config_t::loop_count`*.

- `rmt_set_source_clk` and `rmt_get_source_clk` are removed. Configuring clock source is only possible during channel installation by *`rmt_tx_channel_config_t::clk_src`* and *`rmt_rx_channel_config_t::clk_src`*.
- `rmt_set_rx_filter` is removed. In the new driver, the filter threshold is redesigned into a new concept *`rmt_receive_config_t::signal_range_min_ns`*.
- `rmt_set_idle_level` and `rmt_get_idle_level` are removed. Setting IDLE level for TX channel is available in *`rmt_transmit_config_t::eot_level`*.
- `rmt_set_rx_intr_en`, `rmt_set_err_intr_en`, `rmt_set_tx_intr_en`, `rmt_set_tx_thr_intr_en` and `rmt_set_rx_thr_intr_en` are removed. The new driver does not allow user to turn on/off interrupt from user space. Instead, it provides callback functions.
- `rmt_set_gpio` and `rmt_set_pin` are removed. The new driver does not support to switch GPIO dynamically at runtime.
- `rmt_config` is removed. In the new driver, basic configuration is done during the channel installation stage.
- `rmt_isr_register` and `rmt_isr_deregister` are removed, the interrupt is allocated by the driver itself.
- `rmt_driver_install` is replaced by *`rmt_new_tx_channel()`* and *`rmt_new_rx_channel()`*.
- `rmt_driver_uninstall` is replaced by *`rmt_del_channel()`*.
- `rmt_fill_tx_items`, `rmt_write_items` and `rmt_write_sample` are removed. In the new driver, user needs to provide an encoder to "translate" the user data into RMT symbols.
- `rmt_get_counter_clock` is removed, as the channel clock resolution is configured by user from *`rmt_tx_channel_config_t::resolution_hz`*.
- `rmt_wait_tx_done` is replaced by *`rmt_tx_wait_all_done()`*.
- `rmt_translator_init`, `rmt_translator_set_context` and `rmt_translator_get_context` are removed. In the new driver, the translator has been replaced by the RMT encoder.
- `rmt_get_ringbuf_handle` is removed. The new driver does not use Ringbuffer to save RMT symbols. Instead, the incoming data are saved to the user provided buffer directly. The user buffer can even be mounted to DMA link internally.
- `rmt_register_tx_end_callback` is replaced by *`rmt_tx_register_event_callbacks()`*, where user can register *`rmt_tx_event_callbacks_t::on_trans_done`* event callback.
- `rmt_set_intr_enable_mask` and `rmt_clr_intr_enable_mask` are removed, as the interrupt is handled by the driver, user does not need to take care of it.
- `rmt_add_channel_to_group` and `rmt_remove_channel_from_group` are replaced by RMT sync manager. Please refer to *`rmt_new_sync_manager()`*.
- `rmt_set_tx_loop_count` is removed. The loop count in the new driver is configured in *`rmt_transmit_config_t::loop_count`*.
- `rmt_enable_tx_loop_autostop` is removed. In the new driver, TX loop auto stop is always enabled if available, it is not configurable anymore.

LCD

- The LCD panel initialization flow is slightly changed. Now the *`esp_lcd_panel_init()`* will not turn on the display automatically. User needs to call *`esp_lcd_panel_disp_on_off()`* to manually turn on the display. Note, this is different from turning on backlight. With this breaking change, user can flash a predefined pattern to the screen before turning on the screen. This can help avoid random noise on the screen after a power on reset.
- *`esp_lcd_panel_disp_off()`* is deprecated, please use *`esp_lcd_panel_disp_on_off()`* instead.
- `dc_as_cmd_phase` is removed. The SPI LCD driver currently does not support a 9-bit SPI LCD. Please always use a dedicated GPIO to control the LCD D/C line.
- The way to register RGB panel event callbacks has been moved from the `esp_lcd_rgb_panel_config_t` into a separate API `esp_lcd_rgb_panel_register_event_callbacks()`. However, the event callback signature is not changed.
- Previous `relax_on_idle` flag in `esp_lcd_rgb_panel_config_t` has been renamed into `esp_lcd_rgb_panel_config_t::refresh_on_demand`, which expresses the same meaning but with a clear name.
- If the RGB LCD is created with the `refresh_on_demand` flag enabled, the driver will

not start a refresh in the *esp_lcd_panel_draw_bitmap()*. Now users have to call `esp_lcd_rgb_panel_refresh()` to refresh the screen by themselves.
- `esp_lcd_color_space_t` is deprecated, please use *lcd_color_space_t* to describe the color space, and use *lcd_rgb_element_order_t* to describe the data order of RGB color.

MCPWM MCPWM driver was redesigned (see *MCPWM*), meanwhile, the legacy driver is deprecated.

The new driver's aim is to make each MCPWM submodule independent to each other, and give the freedom of resource connection back to users.

Although it is recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/mcpwm.h`. However, using legacy driver triggers the build warning below by default. This warning can be suppressed by the Kconfig option *CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN*.

```
legacy MCPWM driver is deprecated, please migrate to the new driver (include␣
↪driver/mcpwm_prelude.h)
```

The major breaking changes in concept and usage are listed as follows:

Breaking Changes in Concepts The new MCPWM driver is object-oriented, where most of the MCPWM submodule has a driver object associated with it. The driver object is created by factory function like *mcpwm_new_timer()*. IO control function always needs an object handle, in the first place.

The legacy driver has an inappropriate assumption, that is the MCPWM operator should be connected to different MCPWM timer. In fact, the hardware does not have such limitation. In the new driver, a MCPWM timer can be connected to multiple operators, so that the operators can achieve the best synchronization performance.

The legacy driver presets the way to generate a PWM waveform into a so called `mcpwm_duty_type_t`. However, the duty cycle modes listed there are far from sufficient. Likewise, legacy driver has several preset `mcpwm_deadtime_type_t`, which also does not cover all the use cases. What is more, user usually gets confused by the name of the duty cycle mode and dead-time mode. In the new driver, there are no such limitation, but user has to construct the generator behavior from scratch.

In the legacy driver, the ways to synchronize the MCPWM timer by GPIO, software and other timer module are not unified. It increased learning costs for users. In the new driver, the synchronization APIs are unified.

The legacy driver has mixed the concepts of "Fault detector" and "Fault handler". Which make the APIs very confusing to users. In the new driver, the fault object just represents a failure source, and we introduced a new concept -- **brake** to express the concept of "Fault handler". What is more, the new driver supports software fault.

The legacy drive only provides callback functions for the capture submodule. The new driver provides more useful callbacks for various MCPWM submodules, like timer stop, compare match, fault enter, brake, etc.

- `mcpwm_io_signals_t` and `mcpwm_pin_config_t` are not used. GPIO configuration has been moved into submodule's configuration structure.
- `mcpwm_timer_t`, `mcpwm_generator_t` are not used. Timer and generator are represented by *mcpwm_timer_handle_t* and *mcpwm_gen_handle_t*.
- `mcpwm_fault_signal_t` and `mcpwm_sync_signal_t` are not used. Fault and sync source are represented by *mcpwm_fault_handle_t* and *mcpwm_sync_handle_t*.
- `mcpwm_capture_signal_t` is not used. A capture channel is represented by *mcpwm_cap_channel_handle_t*.

Breaking Changes in Usage

- `mcpwm_gpio_init` and `mcpwm_set_pin`: GPIO configurations are moved to submodule's own configuration. e.g., set the PWM GPIO in *mcpwm_generator_config_t::gen_gpio_num*.
- `mcpwm_init`: To get an expected PWM waveform, users need to allocated at least one MCPWM timer and MCPWM operator, then connect them by calling *mcpwm_operator_connect_timer()*. After that, users should set the generator's actions on various events by calling e.g., *mcpwm_generator_set_actions_on_timer_event()*, *mcpwm_generator_set_actions_on_compare_event()*.

- `mcpwm_group_set_resolution`: in the new driver, the group resolution is fixed to the maximum, usually it is 80 MHz.
- `mcpwm_timer_set_resolution`: MCPWM Timer resolution is set in *`mcpwm_timer_config_t::resolution_hz`*.
- `mcpwm_set_frequency`: PWM frequency is determined by *`mcpwm_timer_config_t::resolution_hz`*, *`mcpwm_timer_config_t::count_mode`* and *`mcpwm_timer_config_t::period_ticks`*.
- `mcpwm_set_duty`: To set the PWM duty cycle, users should call *`mcpwm_comparator_set_compare_value()`* to change comparator's threshold.
- `mcpwm_set_duty_type`: There is no preset duty cycle types. The duty cycle type is configured by setting different generator actions. e.g., *`mcpwm_generator_set_actions_on_timer_event()`*.
- `mcpwm_set_signal_high` and `mcpwm_set_signal_low` are replaced by *`mcpwm_generator_set_force_level()`*. In the new driver, it is implemented by setting force action for the generator, instead of changing the duty cycle to 0% or 100% at the background.
- `mcpwm_start` and `mcpwm_stop` are replaced by *`mcpwm_timer_start_stop()`*. You have more modes to start and stop the MCPWM timer, see *`mcpwm_timer_start_stop_cmd_t`*.
- `mcpwm_carrier_init` is replaced by *`mcpwm_operator_apply_carrier()`*.
- `mcpwm_carrier_enable` and `mcpwm_carrier_disable`: Enabling and disabling carrier submodule is done automatically by checking whether the carrier configuration structure *`mcpwm_carrier_config_t`* is NULL.
- `mcpwm_carrier_set_period` is replaced by *`mcpwm_carrier_config_t::frequency_hz`*.
- `mcpwm_carrier_set_duty_cycle` is replaced by *`mcpwm_carrier_config_t::duty_cycle`*.
- `mcpwm_carrier_oneshot_mode_enable` is replaced by *`mcpwm_carrier_config_t::first_pulse_durat`*
- `mcpwm_carrier_oneshot_mode_disable` is removed. Disabling the first pulse (a.k.a the one-shot pulse) in the carrier is never supported by the hardware.
- `mcpwm_carrier_output_invert` is replaced by *`mcpwm_carrier_config_t::invert_before_modulate`* and *`mcpwm_carrier_config_t::invert_after_modulate`*.
- `mcpwm_deadtime_enable` and `mcpwm_deadtime_disable` are replaced by *`mcpwm_generator_set_dead_time()`*.
- `mcpwm_fault_init` is replaced by *`mcpwm_new_gpio_fault()`*.
- `mcpwm_fault_set_oneshot_mode`, `mcpwm_fault_set_cyc_mode` are replaced by *`mcpwm_operator_set_brake_on_fault()`* and *`mcpwm_generator_set_actions_on_brake_event()`*.
- `mcpwm_capture_enable` is removed. It is duplicated to `mcpwm_capture_enable_channel()`.
- `mcpwm_capture_disable` is removed. It is duplicated to `mcpwm_capture_capture_disable_channel()`.
- `mcpwm_capture_enable_channel` and `mcpwm_capture_disable_channel` are replaced by *`mcpwm_capture_channel_enable()`* and *`mcpwm_capture_channel_disable()`*.
- `mcpwm_capture_signal_get_value` and `mcpwm_capture_signal_get_edge`: Capture timer count value and capture edge are provided in the capture event callback, via *`mcpwm_capture_event_data_t`*. Capture data are only valuable when capture event happens. Providing single API to fetch capture data is meaningless.
- `mcpwm_sync_enable` is removed. It is duplicated to `mcpwm_sync_configure()`.
- `mcpwm_sync_configure` is replaced by *`mcpwm_timer_set_phase_on_sync()`*.
- `mcpwm_sync_disable` is equivalent to setting *`mcpwm_timer_sync_phase_config_t::sync_src`* to `NULL`.
- `mcpwm_set_timer_sync_output` is replaced by *`mcpwm_new_timer_sync_src()`*.
- `mcpwm_timer_trigger_soft_sync` is replaced by *`mcpwm_soft_sync_activate()`*.
- `mcpwm_sync_invert_gpio_synchro` is equivalent to setting *`mcpwm_gpio_sync_src_config_t::active_ne`*
- `mcpwm_isr_register` is removed. You can register various event callbacks instead. For example, to register capture event callback, users can use *`mcpwm_capture_channel_register_event_callbacks()`*.

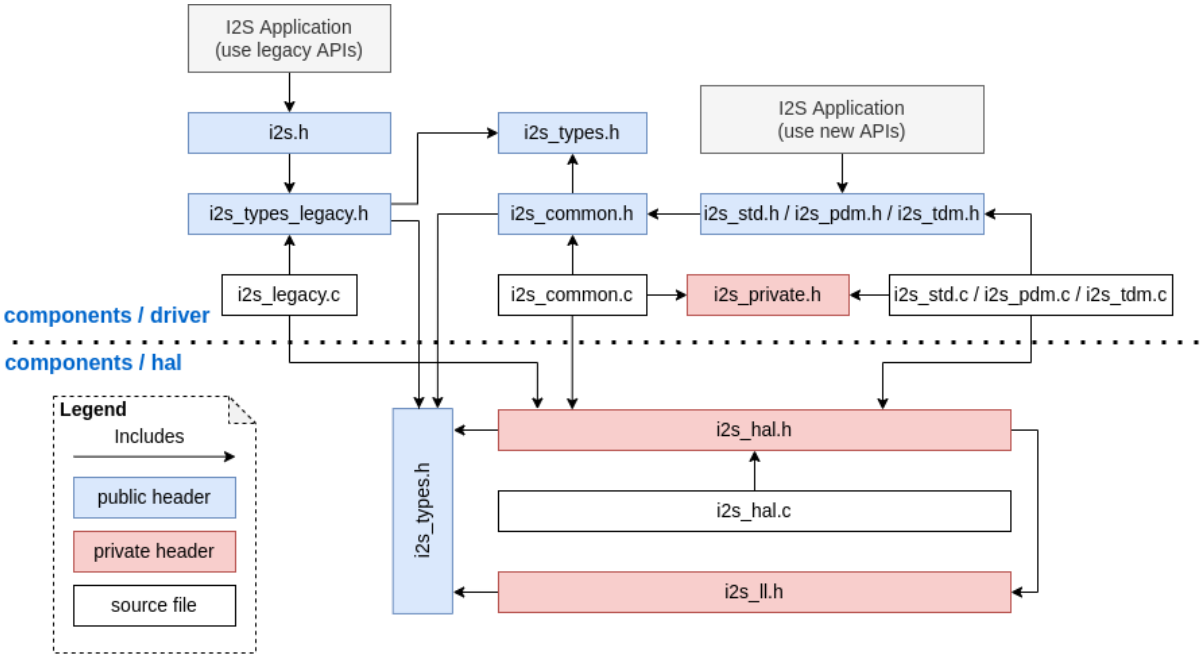
Dedicated GPIO Driver

- All of the dedicated GPIO related Low Level (LL) functions in `cpu_ll.h` have been moved to `dedic_gpio_cpu_ll.h` and renamed.

I2S Driver The I2S driver has been redesigned (see *I2S Driver*), which aims to rectify the shortcomings of the driver that were exposed when supporting all the new features of ESP32-C3 & ESP32-S3. The new driver's APIs are available by including corresponding I2S mode's header files driver/i2s/include/driver/i2s_std.h, driver/i2s/include/driver/i2s_pdm.h, or driver/i2s/include/driver/i2s_tdm.h.

Meanwhile, the old driver's APIs in driver/deprecated/driver/i2s.h are still supported for backward compatibility. But there will be warnings if users keep using the old APIs in their projects, these warnings can be suppressed by the Kconfig option *CONFIG_I2S_SUPPRESS_DEPRECATE_WARN*.

Here is the general overview of the current I2S files:



Breaking changes in Concepts

Independent TX/RX channels The minimum control unit in new I2S driver are now individual TX/RX channels instead of an entire I2S controller (that consistes of multiple channels).

- The TX and RX channels of the same I2S controller can be controlled separately, meaning that they are configured such that they can be started or stopped separately.
- The `i2s_chan_handle_t` handle type is used to uniquely identify I2S channels. All the APIs require the channel handle and users need to maintain the channel handles by themselves.
- On the ESP32-C3 and ESP32-S3, TX and RX channels in the same controller can be configured to different clocks or modes.
- However, on the ESP32 and ESP32-S2, the TX and RX channels of the same controller still share some hardware resources. Thus, configurations may cause one channel to affect another channel in the same controller.
- The channels can be registered to an available I2S controller automatically by setting `i2s_port_t::I2S_NUM_AUTO` as I2S port ID which causes the driver to search for the available TX/RX channels. However, the driver also supports registering channels to a specific port.
- In order to distinguish between TX/RX channels and sound channels, the term "channel" in the context of the I2S driver only refers to TX/RX channels. Meanwhile, sound channels are referred to as "slots".

I2S Mode Categorization I2S communication modes are categorized into the following three modes. Note that:

- **Standard mode**: Standard mode always has two slots, it can support Philips, MSB, and PCM (short frame sync) formats. Please refer to driver/i2s/include/driver/i2s_std.h for more details.
- **PDM mode**: PDM mode only supports two slots with 16-bit data width, but the configurations of PDM TX and PDM RX are slightly different. For PDM TX, the sample rate

can be set by `i2s_pdm_tx_clk_config_t::sample_rate`, and its clock frequency depends on the up-sampling configuration. For PDM RX, the sample rate can be set by `i2s_pdm_rx_clk_config_t::sample_rate`, and its clock frequency depends on the down-sampling configuration. Please refer to driver/i2s/include/driver/i2s_pdm.h for details.

- **TDM mode**: TDM mode can support up to 16 slots. It can work in Philips, MSB, PCM (short frame sync), and PCM (long frame sync) formats. Please refer to driver/i2s/include/driver/i2s_tdm.h for details.

When allocating a new channel in a specific mode, users should initialize that channel by its corresponding function. It is strongly recommended to use the helper macros to generate the default configurations in case the default values are changed in the future.

Independent Slot and Clock Configuration The slot configurations and clock configurations can be configured separately.

- Call *`i2s_channel_init_std_mode()`*, `i2s_channel_init_pdm_rx_mode()`, *`i2s_channel_init_pdm_tx_mode()`*, or *`i2s_channel_init_tdm_mode()`* to initialize the slot/clock/gpio_pin configurations.
- Calling *`i2s_channel_reconfig_std_slot()`*, `i2s_channel_reconfig_pdm_rx_slot()`, *`i2s_channel_reconfig_pdm_tx_slot()`*, or *`i2s_channel_reconfig_tdm_slot()`* can change the slot configurations after initialization.
- Calling *`i2s_channel_reconfig_std_clock()`*, `i2s_channel_reconfig_pdm_rx_clock()`, *`i2s_channel_reconfig_pdm_tx_clock()`*, or *`i2s_channel_reconfig_tdm_clock()`* can change the clock configurations after initialization.
- Calling *`i2s_channel_reconfig_std_gpio()`*, `i2s_channel_reconfig_pdm_rx_gpio()`, *`i2s_channel_reconfig_pdm_tx_gpio()`*, or *`i2s_channel_reconfig_tdm_gpio()`* can change the GPIO configurations after initialization.

Misc

- States and state-machine are adopted in the new I2S driver to avoid APIs called in wrong state.
- ADC and DAC modes are removed. They are only supported in their own drivers and the legacy I2S driver.

Breaking Changes in Usage To use the new I2S driver, please follow these steps:

1. Call *`i2s_new_channel()`* to acquire channel handles. We should specify the work role and I2S port in this step. Besides, the TX or RX channel handle will be generated by the driver. Inputting both two TX and RX channel handles is not necessary but at least one handle is needed. In the case of inputting both two handles, the driver will work at the duplex mode. Both TX and RX channels will be avaliable on a same port, and they will share the MCLK, BCLK and WS signal. But if only one of the TX or RX channel handle is inputted, this channel will only work in the simplex mode.
2. Call `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` or `i2s_channel_init_tdm_mode()` to initialize the channel to the specified mode. Corresponding slot, clock and GPIO configurations are needed in this step.
3. (Optional) Call *`i2s_channel_register_event_callback()`* to register the ISR event callback functions. I2S events now can be received by the callback function synchronously, instead of from the event queue asynchronously.
4. Call *`i2s_channel_enable()`* to start the hardware of I2S channel. In the new driver, I2S does not start automatically after installed, and users are supposed to know clearly whether the channel has started or not.
5. Read or write data by *`i2s_channel_read()`* or *`i2s_channel_write()`*. Certainly, only the RX channel handle is suppoesd to be inputted in *`i2s_channel_read()`* and the TX channel handle in *`i2s_channel_write()`*.
6. (Optional) The slot, clock and GPIO configurations can be changed by corresponding 'reconfig' functions, but *`i2s_channel_disable()`* must be called before updating the configurations.
7. Call *`i2s_channel_disable()`* to stop the hardware of I2S channel.
8. Call *`i2s_del_channel()`* to delete and release the resources of the channel if it is not needed any more, but the channel must be disabled before deleting it.

TWAI Driver The deprecated `CAN` peripheral driver is removed. Please use `TWAI` driver instead (i.e., include `driver/twai.h` in your application).

Register Access Macros Previously, all register access macros could be used as expressions, so the following was allowed:

```
uint32_t val = REG_SET_BITS(reg, bits, mask);
```

In ESP-IDF v5.0, register access macros which write or read-modify-write the register can no longer be used as expressions, and can only be used as statements. This applies to the following macros: `REG_WRITE`, `REG_SET_BIT`, `REG_CLR_BIT`, `REG_SET_BITS`, `REG_SET_FIELD`, `WRITE_PERI_REG`, `CLEAR_PERI_REG_MASK`, `SET_PERI_REG_MASK`, `SET_PERI_REG_BITS`.

To store the value which would have been written into the register, split the operation as follows:

```
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);
```

To get the value of the register after modification (which may be different from the value written), add an explicit read:

```
REG_SET_BITS(reg, bits, mask);
uint32_t new_val = REG_READ(reg);
```

Protocols

Mbed TLS For ESP-IDF v5.0, Mbed TLS has been updated from v2.x to v3.1.0.

For more details about Mbed TLS's migration from version 2.x to version 3.0 or greater, please refer to the official guide.

Breaking Changes (Summary)

Most Structure Fields Are Now Private

- Direct access to fields of structures (`struct` types) declared in public headers is no longer supported.
- Appropriate accessor functions (getter/setter) must be used for the same. A temporary workaround would be to use `MBEDTLS_PRIVATE` macro (**not recommended**).
- For more details, refer to the official guide.

SSL

- Removed support for TLS 1.0, 1.1, and DTLS 1.0
- Removed support for SSL 3.0

Deprecated Functions Were Removed from Cryptography Modules

- The functions `mbedtls_*_ret()` (related to MD, SHA, RIPEMD, RNG, HMAC modules) was renamed to replace the corresponding functions without `_ret` appended and updated return value.
- For more details, refer to the official guide.

Deprecated Config Options Following are some of the important config options deprecated by this update. The configs related to and/or dependent on these have also been deprecated.

- `MBEDTLS_SSL_PROTO_SSL3` : Support for SSL 3.0
- `MBEDTLS_SSL_PROTO_TLS1` : Support for TLS 1.0
- `MBEDTLS_SSL_PROTO_TLS1_1`: Support for TLS 1.1
- `MBEDTLS_SSL_PROTO_DTLS` : Support for DTLS 1.1 (Only DTLS 1.2 is supported now)
- `MBEDTLS_DES_C` : Support for 3DES ciphersuites
- `MBEDTLS_RC4_MODE` : Support for RC4-based ciphersuites

Note: This list includes only major options configurable through `idf.py menuconfig`. For more details on deprecated options, refer to the official guide.

Miscellaneous

Disabled Diffie-Hellman Key Exchange Modes The Diffie-Hellman Key Exchange modes have now been disabled by default due to security risks (see warning text here). Related configs are given below:

- `MBEDTLS_DHM_C` : Support for the Diffie-Hellman-Merkle module
- `MBEDTLS_KEY_EXCHANGE_DHE_PSK` : Support for Diffie-Hellman PSK (pre-shared-key) TLS authentication modes
- `MBEDTLS_KEY_EXCHANGE_DHE_RSA` : Support for cipher suites with the prefix `TLS-DHE-RSA-WITH-`

Note: During the initial step of the handshake (i.e., `client_hello`), the server selects a cipher from the list that the client publishes. As the DHE_PSK/DHE_RSA ciphers have now been disabled by the above change, the server would fall back to an alternative cipher; if in a rare case, it does not support any other cipher, the handshake would fail. To retrieve the list of ciphers supported by the server, one must attempt to connect with the server with a specific cipher from the client-side. Few utilities can help do this, e.g., `sslscan`.

Remove `certs` Module from X509 Library

- The `mbedtls/certs.h` header is no longer available in mbedtls 3.1. Most applications can safely remove it from the list of includes.

Breaking Change for `esp_crt_bundle_set` API

- The *`esp_crt_bundle_set()`* API now requires one additional argument named `bundle_size`. The return type of the API has also been changed to *`esp_err_t`* from `void`.

Breaking Change for `esp_ds_rsa_sign` API

- The `esp_ds_rsa_sign()` API now requires one less argument. The argument `mode` is no longer required.

HTTPS Server

Breaking Changes (Summary) Names of variables holding different certs in *`httpd_ssl_config_t`* structure have been updated.

- *`httpd_ssl_config::servercert`* variable inherits role of `cacert_pem` variable.
- *`httpd_ssl_config::servercert_len`* variable inherits role of `cacert_len` variable
- *`httpd_ssl_config::cacert_pem`* variable inherits role of `client_verify_cert_pem` variable

- *httpd_ssl_config::cacert_len* variable inherits role of `client_verify_cert_len` variable

The return type of the *httpd_ssl_stop()* API has been changed to *esp_err_t* from `void`.

ESP HTTPS OTA

Breaking Changes (Summary)

- The function *esp_https_ota()* now requires pointer to *esp_https_ota_config_t* as argument instead of pointer to *esp_http_client_config_t*.

ESP-TLS

Breaking Changes (Summary)

`esp_tls_t` Structure Is Now Private The *esp_tls_t* has now been made completely private. You cannot access its internal structures directly. Any necessary data that needs to be obtained from the ESP-TLS handle can be done through respective getter/setter functions. If there is a requirement of a specific getter/setter function, please raise an issue on ESP-IDF.

The list of newly added getter/setter function is as as follows:

- *esp_tls_get_ssl_context()* - Obtain the ssl context of the underlying ssl stack from the ESP-TLS handle.

Function Deprecations And Recommended Alternatives Following table summarizes the deprecated functions removed and their alternatives to be used from ESP-IDF v5.0 onwards.

Deprecated Function	Alternative
`esp_tls_conn_new()`	*esp_tls_conn_new_sync()*
`esp_tls_conn_delete()`	*esp_tls_conn_destroy()*

- The function *esp_tls_conn_http_new()* has now been termed as deprecated. Please use the alternative function *esp_tls_conn_http_new_sync()* (or its asynchronous *esp_tls_conn_http_new_async()*). Note that the alternatives need an additional parameter *esp_tls_t*, which has to be initialized using the *esp_tls_init()* function.

HTTP Server

Breaking Changes (Summary)

- `http_server.h` header is no longer available in `esp_http_server`. Please use `esp_http_server.h` instead.

ESP HTTP Client

Breaking Changes (Summary)

- The functions *esp_http_client_read()* and *esp_http_client_fetch_headers()* now return an additional return value `-ESP_ERR_HTTP_EAGAIN` for timeout errors - call timed-out before any data was ready.

TCP Transport

Breaking Changes (Summary)

- The function `esp_transport_read()` now returns `0` for a connection timeout and `< 0` for other errors. Please refer `esp_tcp_transport_err_t` for all possible return values.

MQTT Client

Breaking Changes (Summary)

- *`esp_mqtt_client_config_t`* have all fields grouped in sub structs.

Most common configurations are listed below:

- Broker address now is set in `esp_mqtt_client_config_t::broker::address::uri`
- Security related to broker verification in `esp_mqtt_client_config_t::broker::verification`
- Client username is set in `esp_mqtt_client_config_t::credentials::username`
- *`esp_mqtt_client_config_t`* no longer supports the `user_context` field. Please use *`esp_mqtt_client_register_event()`* instead for registering an event handler; the last argument `event_handler_arg` can be used to pass user context to the handler.

ESP-Modbus

Breaking Changes (Summary) The ESP-IDF component `freemodbus` has been removed from ESP-IDF and is supported as a separate component. Additional information for the `ESP-Modbus` component can be found in the separate repository:

- ESP-Modbus component on GitHub

The `main` component folder of the new application shall include the component manager manifest file `idf_component.yml` as in the example below:

```
dependencies:
  espressif/esp-modbus:
    version: "^1.0"
```

The `esp-modbus` component can be found in component manager registry. Refer to component manager documentation for more information on how to set up the component manager.

For applications targeting v4.x releases of ESP-IDF that need to use new `esp-modbus` component, adding the component manager manifest file `idf_component.yml` will be sufficient to pull in the new component. However, users should also exclude the legacy `freemodbus` component from the build. This can be achieved using the statement below in the project's `CMakeLists.txt`:

```
set(EXCLUDE_COMPONENTS freemodbus)
```

Provisioning

Protocomm The `pop` field in the *`protocomm_set_security()`* API is now deprecated. Please use the `sec_params` field instead of `pop`. This parameter should contain the structure (including the security parameters) as required by the protocol version used.

For example, when using security version 2, the `sec_params` parameter should contain the pointer to the structure of type *`protocomm_security2_params_t`*.

Wi-Fi Provisioning

- The `pop` field in the *`wifi_prov_mgr_start_provisioning()`* API is now deprecated. For backward compatibility, `pop` can be still passed as a string for security version 1. However, for security version 2, the `wifi_prov_sec_params` argument needs to be passed instead of `pop`. This parameter should contain the structure (containing the security parameters) as required by the protocol version used. For example, when using security version 2, the `wifi_prov_sec_params` parameter should contain the pointer to the structure of type *`wifi_prov_security2_params_t`*. For security 1, the behaviour and the usage of the API remain the same.
- The API *`wifi_prov_mgr_is_provisioned()`* does not return *`ESP_ERR_INVALID_STATE`* error any more. This API now works without any dependency on provisioning manager initialization state.

ESP Local Control The `pop` field in the *`esp_local_ctrl_proto_sec_cfg_t`* API is now deprecated. Please use the `sec_params` field instead of `pop`. This field should contain the structure (containing the security parameters) as required by the protocol version used.

For example, when using security version 2, the `sec_params` field should contain pointer to the structure of type *`esp_local_ctrl_security2_params_t`*.

Removed or Deprecated Components

Components Moved to ESP-IDF Component Registry Following components are removed from ESP-IDF and moved to ESP-IDF Component Registry:

- libsodium
- cbor
- jsmn
- esp_modem
- nghttp
- mdns
- esp_websocket_client
- asio
- freemodbus
- sh2lib
- expat
- coap
- esp-cryptoauthlib
- qrcode
- tjpgd
- esp_serial_slave_link
- tinyusb

Note: Please note that http parser functionality which was previously part of `nghttp` component is now part of http_parser component.

These components can be installed using `idf.py add-dependency` command.

For example, to install libsodium component with the exact version X.Y, run `idf.py add-dependency libsodium==X.Y`.

To install libsodium component with the latest version compatible to X.Y according to semver rules, run `idf.py add-dependency libsodium~X.Y`.

To find out which versions of each component are available, open https://components.espressif.com, search for the component by its name and check the versions listed on the component page.

Deprecated Components The following components are removed since they were deprecated in ESP-IDF v4.x:

- `tcpip_adapter`. Please use the *ESP-NETIF* component instead; you can follow the *TCP/IP Adapter*.

Note: OpenSSL-API component is no longer supported. It is not available in the IDF Component Registry, either. Please use *ESP-TLS* or mbedtls API directly.

Note: `esp_adc_cal` component is no longer supported. New adc calibration driver is in `esp_adc` component. Legacy adc calibration driver has been moved into `esp_adc` component. To use legacy `esp_adc_cal` driver APIs, you should add `esp_adc` component to the list of component requirements in CMakeLists.txt. Also check *Peripherals Migration Guide* for more details.

The targets components are no longer necessary after refactoring and have been removed:

- `esp32`
- `esp32s2`
- `esp32s3`
- `esp32c2`
- `esp32c3`
- `esp32h2`

Storage

New Component for the Partition APIs Breaking change: all the Partition API code has been moved to a new component esp_partition. For the complete list of affected functions and data-types, see header file esp_partition.h .

These API functions and data-types were previously a part of the spi_flash component, and thus possible dependencies on the `spi_flash` in existing applications may cause the build failure, in case of direct esp_partition_* APIs/data-types use (for instance, `fatal error: esp_partition.h: No such file or directory` at lines with `#include "esp_partition.h"`). If you encounter such an issue, please update your project's CMakeLists.txt file as follows:

Original dependency setup:

```
idf_component_register(...
                       REQUIRES spi_flash)
```

Updated dependency setup:

```
idf_component_register(...
                       REQUIRES spi_flash esp_partition)
```

Note: Please update relevant `REQUIRES` or `PRIV_REQUIRES` section according to your project. The above-presented code snippet is just an example.

If the issue persists, please let us know and we will assist you with your code migration.

SDMMC/SDSPI SD card frequency on SDMMC/SDSPI interface can be now configured through `sdmmc_host_t.max_freq_khz` to a specific value, not only `SDMMC_FREQ_PROBING` (400 kHz), `SDMMC_FREQ_DEFAULT` (20 MHz), or `SDMMC_FREQ_HIGHSPEED` (40 MHz). Previously, in case you have specified a custom frequency other than any of the above-mentioned values, the closest lower-or-equal one was selected anyway.

Now, the underlaying drivers calculate the nearest fitting value, given by available frequency dividers instead of an enumeration item selection. This could cause troubles in communication with your SD card without a change of the existing application code.If you encounter such an issue, please, keep trying different frequencies around your desired

value unless you find the one working well. To check the frequency value calculated and actually applied, use `void sdmmc_card_print_info(FILE* stream, const sdmmc_card_t* card)` function.

FatFs FatFs is now updated to v0.14. As a result, the function signature of `f_mkfs()` has changed. The new signature is `FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);` which uses `MKFS_PARM` struct as a second argument.

Partition Table The partition table generator no longer supports misaligned partitions. When generating a partition table, `ESP-IDF` only accepts partitions with offsets that align to 4 KB. This change only affects generating new partition tables. Reading and writing to already existing partitions remains unchanged.

VFS The `esp_vfs_semihost_register()` function signature is changed as follows:

- The new signature is `esp_err_t esp_vfs_semihost_register(const char* base_path);`
- The `host_path` parameter of the old signature no longer exists. Instead, the OpenOCD command `ESP_SEMIHOST_BASEDIR` should be used to set the full path on the host.

Function Signature Changes The following functions now return `esp_err_t` instead of `void` or `nvs_iterator_t`. Previously, when parameters were invalid or when something goes wrong internally, these functions would `assert()` or return a `nullptr`. With an `esp_err_t` returned, you can get better error reporting.

- *nvs_entry_find()*
- *nvs_entry_next()*
- *nvs_entry_info()*

Because the `esp_err_t` return type changes, the usage patterns of `nvs_entry_find()` and `nvs_entry_next()` become different. Both functions now modify iterators via parameters instead of returning an iterator.

The old programming pattern to iterate over an NVS partition was as follows:

```
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_
↪ANY);
while (it != NULL) {
        nvs_entry_info_t info;
        nvs_entry_info(it, &info);
        it = nvs_entry_next(it);
        printf("key '%s', type '%d'", info.key, info.type);
};
```

The new programming pattern to iterate over an NVS partition is now:

```
nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &
↪it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are␣
↪guaranteed to be non-NULL
    printf("key '%s', type '%d'", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

Iterator Validity Note that because the function signature changes, if there is a parameter error, you may get an invalid iterator from `nvs_entry_find()`. Hence, it is important to initialize the iterator

to NULL before using nvs_entry_find(), so that you can avoid complex error checking before calling nvs_release_iterator(). A good example is the programming pattern above.

Removed SDSPI Deprecated API Structure sdspi_slot_config_t and function sdspi_host_init_slot() are removed, and replaced by structure sdspi_device_config_t and function sdspi_host_init_device() respectively.

ROM SPI Flash In versions before v5.0, ROM SPI flash functions were included via esp32**/rom/spi_flash.h. Thus, code written to support different ESP chips might be filled with ROM headers of different targets. Furthermore, not all of the APIs could be used on all ESP chips.

Now, the common APIs are extracted to esp_rom_spiflash.h. Although it is not a breaking change, you are strongly recommended to only use the functions from this header (i.e., prefixed with esp_rom_spiflash and included by esp_rom_spiflash.h) for better cross-compatibility between ESP chips.

To make ROM SPI flash APIs clearer, the following functions are also renamed:

- esp_rom_spiflash_lock() to esp_rom_spiflash_set_bp()
- esp_rom_spiflash_unlock() to esp_rom_spiflash_clear_bp()

SPI Flash Driver The esp_flash_speed_t enum type is now deprecated. Instead, you may now directly pass the real clock frequency value to the flash configuration structure. The following example demonstrates how to configure a flash frequency of 80MHz:

```
esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};
```

Legacy SPI Flash Driver To make SPI flash drivers more stable, the legacy SPI flash driver is removed from v5.0. The legacy SPI flash driver refers to default spi_flash driver since v3.0, and the SPI flash driver with configuration option CONFIG_SPI_FLASH_USE_LEGACY_IMPL enabled since v4.0. The major breaking change here is that the legacy spi_flash driver is no longer supported from v5.0. Therefore, the legacy driver APIs and the CONFIG_SPI_FLASH_USE_LEGACY_IMPL configuration option are both removed. Please use the new spi_flash driver's APIs instead.

Removed items	Replacement
spi_flash_erase_sector()	esp_flash_erase_region()
spi_flash_erase_range()	esp_flash_erase_region()
spi_flash_write()	esp_flash_write()
spi_flash_read()	esp_flash_read()
spi_flash_write_encrypted()	esp_flash_write_encrypted()
spi_flash_read_encrypted()	esp_flash_read_encrypted()

Note: New functions with prefix esp_flash accept an additional esp_flash_t* parameter. You can simply set it to NULL. This will make the function to run the main flash (esp_flash_default_chip).

The esp_spi_flash.h header is deprecated as system functions are no longer public. To use flash memory mapping APIs, you may include spi_flash_mmap.h instead.

System

Inter-Processor Call IPC (Inter-Processor Call) feature is no longer a stand-alone component and has been integrated into the `esp_system` component.

Thus, any project presenting a `CMakeLists.txt` file with the parameters `PRIV_REQUIRES esp_ipc` or `REQUIRES esp_ipc` should be modified to simply remove these options as the `esp_system` component is included by default.

ESP Clock The ESP Clock API (functions/types/macros prefixed with `esp_clk`) has been made into a private API. Thus, the previous include paths `#include "ESP32-C6/clk.h"` and `#include "esp_clk.h"` have been removed. If users still require usage of the ESP Clock API (though this is not recommended), it can be included via `#include "esp_private/esp_clk.h"`.

Note: Private APIs are not stable and no are longer subject to the ESP-IDF versioning scheme's breaking change rules. Thus, it is not recommended for users to continue calling private APIs in their applications.

Cache Error Interrupt The Cache Error Interrupt API (functions/types/macros prefixed with `esp_cache_err`) has been made into a private API. Thus, the previous include path `#include "ESP32-C6/cache_err_int.h"` has been removed. If users still require usage of the Cache Error Interrupt API (though this is not recommended), it can be included via `#include "esp_private/cache_err_int.h"`.

bootloader_support

- The function `bootloader_common_get_reset_reason()` has been removed. Please use the function `esp_rom_get_reset_reason()` in the ROM component.
- The functions `esp_secure_boot_verify_sbv2_signature_block()` and `esp_secure_boot_verify_rsa_signature_block()` have been removed without replacement. We do not expect users to use these directly. If they are indeed still neccessary, please open a feature request on GitHub explaining why these functions are necessary to you.

Brownout The Brownout API (functions/types/macros prefixed with `esp_brownout`) has been made into a private API. Thus, the previous include path `#include "brownout.h"` has been removed. If users still require usage of the Brownout API (though this is not recommended), it can be included via `#include "esp_private/brownout.h"`.

Trax The Trax API (functions/types/macros prefixed with `trax_`) has been made into a private API. Thus, the previous include path `#include "trax.h"` has been removed. If users still require usage of the Trax API (though this is not recommended), it can be included via `#include "esp_private/trax.h"`.

ROM The previously deprecated ROM-related header files located in `components/esp32/rom/` (old include path: `rom/*.h`) have been moved. Please use the new target-specific path from `components/esp_rom/include/ESP32-C6/` (new include path: `ESP32-C6/rom/*.h`).

esp_hw_support

- The header files `soc/cpu.h` have been deleted and deprecated CPU util functions have been removed. ESP-IDF developers should include `esp_cpu.h` instead for equivalent functions.
- The header files `hal/cpu_ll.h`, `hal/cpu_hal.h`, `hal/soc_ll.h`, `hal/soc_hal.h` and `interrupt_controller_hal.h` CPU API functions have been deprecated. ESP-IDF developers should include `esp_cpu.h` instead for equivalent functions.
- The header file `compare_set.h` have been deleted. ESP-IDF developers should use `esp_cpu_compare_and_set()` function provided in `esp_cpu.h` instead.

- `esp_cpu_get_ccount()`, `esp_cpu_set_ccount()` and `esp_cpu_in_ocd_debug_mode()` were removed from `esp_cpu.h`. ESP-IDF developers should use respectively `esp_cpu_get_cycle_count()`, `esp_cpu_set_cycle_count()` and `esp_cpu_dbgr_is_attached()` instead.
- The header file `esp_intr.h` has been deleted. Please include `esp_intr_alloc.h` to allocate and manipulate interrupts.
- The Panic API (functions/types/macros prefixed with `esp_panic`) has been made into a private API. Thus, the previous include path `#include "esp_panic.h"` has been removed. If users still require usage of the Trax API (though this is not recommended), it can be included via `#include "esp_private/panic_reason.h"`. Besides, developers should include `esp_debug_helpers.h` instead to use any debug-related helper functions, e.g., print backtrace.
- The header file `soc_log.h` is now renamed to `esp_hw_log.h` and has been made private. Users are encouraged to use logging APIs provided under `esp_log.h` instead.
- The header files `spinlock.h`, `clk_ctrl_os.h`, and `rtc_wdt.h` must now be included without the `soc` prefix. For example, `#include "spinlock.h"`.
- `esp_chip_info()` returns the chip version in the format = 100 * `major eFuse version` + `minor eFuse version`. Thus, the `revision` in the `esp_chip_info_t` structure is expanded to `uint16_t` to fit the new format.

PSRAM

- The target-specific header file `spiram.h` and the header file `esp_spiram.h` have been removed. A new component `esp_psram` is created instead. For PSRAM/SPIRAM-related functions, users now include `esp_psram.h` and set the `esp_psram` component as a component requirement in their `CMakeLists.txt` project files.
- `esp_spiram_get_chip_size` and `esp_spiram_get_size` have been deleted. You should use `esp_psram_get_size` instead.

eFuse

- The parameter type of function `esp_secure_boot_read_key_digests()` changed from `ets_secure_boot_key_digests_t*` to `esp_secure_boot_key_digests_t*`. The new type is the same as the old one, except that the `allow_key_revoke` flag has been removed. The latter was always set to `true` in current code, not providing additional information.
- Added eFuse wafer revisions: major and minor. The `esp_efuse_get_chip_ver()` API is not compatible with these changes, so it was removed. Instead, please use the following APIs: `efuse_hal_get_major_chip_version()`, `efuse_hal_get_minor_chip_version()` or `efuse_hal_chip_revision()`.

esp_common `EXT_RAM_ATTR` is deprecated. Use the new macro `EXT_RAM_BSS_ATTR` to put `.bss` on PSRAM.

esp_system

- The header files `esp_random.h`, `esp_mac.h`, and `esp_chip_info.h`, which were all previously indirectly included via the header file `esp_system.h`, must now be included directly. These indirect inclusions from `esp_system.h` have been removed.
- The Backtrace Parser API (functions/types/macros prefixed with `esp_eh_frame_`) has been made into a private API. Thus, the previous include path `#include "eh_frame_parser.h"` has been removed. If users still require usage of the Backtrace Parser API (though this is not recommended), it can be included via `#include "esp_private/eh_frame_parser.h"`.
- The Interrupt Watchdog API (functions/types/macros prefixed with `esp_int_wdt_`) has been made into a private API. Thus, the previous include path `#include "esp_int_wdt.h"` has been removed. If users still require usage of the Interrupt Watchdog API (though this is not recommended), it can be included via `#include "esp_private/esp_int_wdt.h"`.

SoC Dependency

- Public API headers listed in the Doxyfiles will not expose unstable and unnecessary SoC header files, such as `soc/soc.h` and `soc/rtc.h`. That means the user has to explicitly include them in their code if these "missing" header files are still wanted.
- Kconfig option `LEGACY_INCLUDE_COMMON_HEADERS` is also removed.
- The header file `soc/soc_memory_types.h` has been deprecated. Users should use the `esp_memory_utils.h` instead. Including `soc/soc_memory_types.h` will bring a build warning like `soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h`

APP Trace One of the timestamp sources has changed from the legacy timer group driver to the new *GPTimer*. Kconfig choices like `APPTRACE_SV_TS_SOURCE_TIMER00` has been changed to `APPTRACE_SV_TS_SOURCE_GPTIMER`. User no longer need to choose the group and timer ID.

`esp_timer` The FRC2-based legacy implementation of `esp_timer` available on ESP32 has been removed. The simpler and more efficient implementation based on the LAC timer is now the only option.

ESP Image The image SPI speed enum definitions have been renamed.

- Enum `ESP_IMAGE_SPI_SPEED_80M` has been renamed to `ESP_IMAGE_SPI_SPEED_DIV_1`.
- Enum `ESP_IMAGE_SPI_SPEED_40M` has been renamed to `ESP_IMAGE_SPI_SPEED_DIV_2`.
- Enum `ESP_IMAGE_SPI_SPEED_26M` has been renamed to `ESP_IMAGE_SPI_SPEED_DIV_3`.
- Enum `ESP_IMAGE_SPI_SPEED_20M` has been renamed to `ESP_IMAGE_SPI_SPEED_DIV_4`.

Task Watchdog Timers

- The API for `esp_task_wdt_init()` has changed as follows:
  - Configuration is now passed as a configuration structure.
  - The function will now handle subscribing of the idle tasks if configured to do so.
- The former `CONFIG_ESP_TASK_WDT` configuration option has been renamed to *CONFIG_ESP_TASK_WDT_INIT* and a new *CONFIG_ESP_TASK_WDT_EN* option has been introduced.

FreeRTOS

Legacy API and Data Types Previously, the `configENABLE_BACKWARD_COMPATIBILITY` option was set by default, thus allowing pre FreeRTOS v8.0.0 function names and data types to be used. The `configENABLE_BACKWARD_COMPATIBILITY` is now disabled by default, thus legacy FreeRTOS names/types are no longer supportd by default. Users should do one of the followings:

- Update their code to remove usage of legacy FreeRTOS names/types.
- Enable the *CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY* to explicitly allow the usage of legacy names/types.

Tasks Snapshot The header `task_snapshot.h` has been removed from `freertos/task.h`. ESP-IDF developers should include `freertos/task_snapshot.h` if they need tasks snapshot API.

The function `vTaskGetSnapshot()` now returns `BaseType_t`. Return value shall be `pdTRUE` on success and `pdFALSE` otherwise.

FreeRTOS Asserts Previously, FreeRTOS asserts were configured separately from the rest of the system using the `FREERTOS_ASSERT` kconfig option. This option has now been removed and the configuration is now done through `COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

Port Macro API The file `portmacro_deprecated.h` which was added to maintain backward compatibility for deprecated APIs is removed. Users are advised to use the alternate functions for the deprecated APIs as listed below:

- `portENTER_CRITICAL_NESTED()` is removed. Users should use the `portSET_INTERRUPT_MASK_FROM_ISR()` macro instead.
- `portEXIT_CRITICAL_NESTED()` is removed. Users should use the `portCLEAR_INTERRUPT_MASK_FROM_ISR()` macro instead.
- `vPortCPUInitializeMutex()` is removed. Users should use the `spinlock_initialize()` function instead.
- `vPortCPUAcquireMutex()` is removed. Users should use the `spinlock_acquire()` function instead.
- `vPortCPUAcquireMutexTimeout()` is removed. Users should use the `spinlock_acquire()` function instead.
- `vPortCPUReleaseMutex()` is removed. Users should use the `spinlock_release()` function instead.

App Update

- The functions *`esp_ota_get_app_description()`* and *`esp_ota_get_app_elf_sha256()`* have been termed as deprecated. Please use the alternative functions *`esp_app_get_description()`* and *`esp_app_get_elf_sha256()`* respectively. These functions have now been moved to a new component esp_app_format. Please refer to the header file esp_app_desc.h .

Bootloader Support

- The *`esp_app_desc_t`* structure, which used to be declared in esp_app_format.h , is now declared in esp_app_desc.h .
- The function `bootloader_common_get_partition_description()` has now been made private. Please use the alternative function *`esp_ota_get_partition_description()`*. Note that this function takes *`esp_partition_t`* as its first argument instead of `esp_partition_pos_t`.

Chip Revision The bootloader checks the chip revision at the beginning of the application loading. The application can only be loaded if the version is >= *CONFIG_ESP32C6_REV_MIN* and < `CONFIG_ESP32C6_REV_MAX_FULL`.

During the OTA upgrade, the version requirements and chip revision in the application header are checked for compatibility. The application can only be updated if the version is >= *CONFIG_ESP32C6_REV_MIN* and < `CONFIG_ESP32C6_REV_MAX_FULL`.

Tools

ESP-IDF Monitor ESP-IDF Monitor makes the following changes regarding baud-rate:

- ESP-IDF monitor now uses the custom console baud-rate (*CONFIG_ESP_CONSOLE_UART_BAUDRATE*) by default instead of 115200.
- Setting a custom baud from menuconfig is no longer supported.
- A custom baud-rate can be specified from command line with the `idf.py monitor -b <baud>` command or through setting environment variables.
- Please note that the baud-rate argument has been renamed from `-B` to `-b` in order to be consistent with the global baud-rate `idf.py -b <baud>`. Run `idf.py monitor --help` for more information.

Deprecated Commands `idf.py` sub-commands and `cmake` target names have been unified to use hyphens (-) instead of underscores (_). Using a deprecated sub-command or target name will produce a warning. Users are advised to migrate to using the new sub-commands and target names. The following changes have been made:

Table 1: Deprecated Sub-command and Target Names

Old Name	New Name
efuse_common_table	efuse-common-table
efuse_custom_table	efuse-custom-table
erase_flash	erase-flash
partition_table	partition-table
partition_table-flash	partition-table-flash
post_debug	post-debug
show_efuse_table	show-efuse-table
erase_otadata	erase-otadata
read_otadata	read-otadata

Esptool The `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT` option has been renamed to *CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE* and has been disabled by default. New and existing projects migrated to ESP-IDF v5.0 have to set *CONFIG_ESPTOOLPY_FLASHSIZE*. If this is not possible due to an unknown flash size at build time, then *CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE* can be enabled. However, once enabled, to keep the digest valid, an SHA256 digest is no longer appended to the image when updating the binary header with the flash size during flashing.

Windows Environment The Msys/Mingw-based Windows environment support got deprecated in ESP-IDF v4.0 and was entirely removed in v5.0. Please use *ESP-IDF Tools Installer* to set up a compatible environment. The options include Windows Command Line, Power Shell and the graphical user interface based on Eclipse IDE. In addition, a VS Code-based environment can be set up with the supported plugin: https://github.com/espressif/vscode-esp-idf-extension.

6.1.2 Migration from 5.0 to 5.1

GCC

GCC Version The previous GCC version was GCC 11.2.0. This has now been upgraded to GCC 12.2.0 on all targets. Users that need to port their code from GCC 11.2.0 to 12.2.0 should refer to the series of official GCC porting guides listed below:

- Porting to GCC 12

Warnings The upgrade to GCC 12.2.0 has resulted in the addition of new warnings, or enhancements to existing warnings. The full details of all GCC warnings can be found in GCC Warning Options. Users are advised to double-check their code, then fix the warnings if possible. Unfortunately, depending on the warning and the complexity of the user's code, some warnings will be false positives that require non-trivial fixes. In such cases, users can choose to suppress the warning in multiple ways. This section outlines some common warnings that users are likely to encounter and ways to fix them.

-Wuse-after-free Typically, this warning should not produce false-positives for release-level code. But this may appear in test cases. There is an example of how it was fixed in ESP-IDF's `test_realloc.c`.

```
void *x = malloc(64);
void *y = realloc(x, 48);
TEST_ASSERT_EQUAL_PTR(x, y);
```

Pointers may be converted to int to avoid warning `-Wuse-after-free`.

```
int x = (int) malloc(64);
int y = (int) realloc((void *) x, 48);
TEST_ASSERT_EQUAL_UINT32((uint32_t) x, (uint32_t) y);
```

-Waddress GCC 12.2.0 introduces an enhanced version of the `-Waddress` warning option, which is now more eager in detecting the checking of pointers to an array in if-statements.

The following code triggers the warning:

```
char array[8];
...
if (array)
    memset(array, 0xff, sizeof(array));
```

Eliminating unnecessary checks resolves the warning.

```
char array[8];
...
memset(array, 0xff, sizeof(array));
```

RISC-V Builds Outside of ESP-IDF The RISC-V extensions `zicsr` and `zifencei` have been separated from the `I` extension. GCC 12 reflects this change, and as a result, when building for RISC-V ESP32 chips outside of the ESP-IDF framework, you must include the `_zicsr_zifencei` postfix when specifying the -march option in your build system.

Example:

```
riscv32-esp-elf-gcc main.c -march=rv32imac
```

Now is replaced with:

```
riscv32-esp-elf-gcc main.c -march=rv32imac_zicsr_zifencei
```

IEEE 802.15.4

Receive Handle Done

Note: It is required since IDF v5.1.3 release.

User must call the function `esp_ieee802154_receive_handle_done()` to notify 802.15.4 driver after the received frame is handled. Otherwise the frame buffer will not be freed for future use.

Peripherals

GPSPI Following items are deprecated. Since ESP-IDF v5.1, GPSPI clock source is configurable.

- `spi_get_actual_clock` is deprecated, you should use *`spi_device_get_actual_freq()`* instead.

LEDC

- *`soc_periph_ledc_clk_src_legacy_t::LEDC_USE_RTC8M_CLK`* is deprecated. Please use `LEDC_USE_RC_FAST_CLK` instead.

Storage

FatFs `esp_vfs_fat_sdmmc_unmount()` is now deprecated, and you can use *`esp_vfs_fat_sdcard_unmount()`* instead. This API is deprecated in previous ESP-IDF versions, but without a deprecation warning or migration guide. Since ESP-IDF v5.1, calling this `esp_vfs_fat_sdmmc_unmount()` API will generate a deprecation warning.

SPI_FLASH

- *`spi_flash_get_counters()`* is deprecated, please use *`esp_flash_get_counters()`* instead.
- *`spi_flash_dump_counters()`* is deprecated, please use *`esp_flash_dump_counters()`* instead.
- *`spi_flash_reset_counters()`* is deprecated, please use *`esp_flash_reset_counters()`* instead.

Networking

SNTP SNTP module now provides thread safe APIs to access lwIP functionality. It is recommended to use *ESP_NETIF* API. Please refer to the chapter *SNTP API* for more details.

System

FreeRTOS

Power Management

- `esp_pm_config_esp32xx_t` is deprecated, use `esp_pm_config_t` instead.
- `esp32xx/pm.h` is deprecated, use `esp_pm.h` instead.

6.1.3 Migration from 5.1 to 5.2

GCC

GCC Version The previous GCC version was GCC 12.2.0. This has now been upgraded to GCC 13.2.0 on all targets. Users that need to port their code from GCC 12.2.0 to 13.2.0 should refer to the series of official GCC porting guides listed below:

- Porting to GCC 13

Common Porting Problems and Fixes

`stdio.h` No Longer Includes `sys/types.h`

Issue Compilation errors may occur in code that previously worked with the old toolchain. For example:

```
#include <stdio.h>
clock_t var; // error: expected specifier-qualifier-list before 'clock_t'
```

Solution To resolve this issue, the correct header must be included. Refactor the code like this:

```
#include <time.h>
clock_t var;
```

IEEE 802.15.4

Receive Handle Done User must call the function `esp_ieee802154_receive_handle_done()` to notify 802.15.4 driver after the received frame is handled. Otherwise the frame buffer will not be freed for future use.

Peripherals

UART

- *`UART_FIFO_LEN`* is deprecated. Please use *`UART_HW_FIFO_LEN`* instead.

I2C I2C driver has been redesigned (see *I2C API Reference*), which aims to unify the interface and extend the usage of I2C peripheral. Although it is recommended to use the new driver APIs, the legacy driver is still available in the previous include path `driver/i2c.h`.

The major breaking changes in concept and usage are listed as follows:

Major Changes in Concepts

- `i2c_config_t` which was used to configure the I2C bus, but it doesn't really tell whether to configure master or slave. So in the new design, master and slave initialization are separate, user can call `i2c_master_bus_config_t` or `i2c_slave_config_t`.
- `i2c_mode_t` which was used to tell whether I2C controller works in slave mode or master mode. This enumerator has been deprecated. In the new driver, users don'tneed to manually set the mode anymore since master and slave APIs are different.
- `i2c_rw_t` which was used to tell whether I2C master controller is performing a *write* or a *read* operation. This is now deprecated.
- `i2c_addr_mode_t` was renamed to `i2c_addr_bit_len_t`.

- In the legacy driver, operations needed to be chained with a command list (dynamically or statically created). The new driver now handles this internally, making the operations more size and space efficient.
- Capability flags like `I2C_SCLK_SRC_FLAG_FOR_NOMAL` are used to select clock source in the legacy driver. In the new driver, users can select clock source directly.

Major Changes in Usage

- I2C bus initialization is done in two parts: first, initialization of the bus with *`i2c_new_master_bus()`*, then, initialization of the I2C device with *`i2c_master_bus_add_device()`*.
- `i2c_reset_tx_fifo` and `i2c_reset_rx_fifo` have been removed, since it is never required to reset the fifo by users. Whole bus can still be reset by calling `i2c_master_bus_reset`.
- `i2c_cmd_link_xxx` functions have been removed, user doesn't need to use link to link commands on its own.
- `i2c_master_write_to_device` has been renamed to `i2c_master_transmit`.
- `i2c_master_read_from_device` has been renamed to `i2c_master_receive`.
- `i2c_master_write_read_device` has been renamed to `i2c_master_transmit_receive`
- `i2c_slave_write_buffer` has been renamed to `i2c_slave_transmit`
- `i2c_slave_read_buffer` has been renamed to `i2c_slave_receive`

Protocols

CoAP CoAP examples have been moved to idf-extra-components repository.

HTTP2 http2_request example has been moved to idf-extra-components repository.

Storage

NVS Encryption

- For SoCs with the HMAC peripheral (`SOC_HMAC_SUPPORTED`), turning on *Flash Encryption* will no longer automatically turn on *NVS Encryption*.
- You will need to explicitly turn on NVS encryption and select the required scheme (flash encryption-based or HMAC peripheral-based). You can select the HMAC peripheral-based scheme (*CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME*), even if flash encryption is not enabled.
- SoCs without the HMAC peripheral will still automatically turn on NVS encryption when flash encryption is enabled.

SPI Flash Driver XMC-C series flash suspend support has been removed. According to feedback from the flash manufacturer, in some situations the XMC-C flash would require a 1ms interval between resume and next command. This is too long for a software request. Based on the above reason, in order to use suspend safely, we decide to remove flash suspend support from XMC-C series. But you can still force enable it via *CONFIG_SPI_FLASH_FORCE_ENABLE_XMC_C_SUSPEND*. If you have any questions, please contact espressif business support.

System

FreeRTOS

IDF FreeRTOS Upgrade The IDF FreeRTOS kernel (which is a dual-core SMP implementation of FreeRTOS) has been upgraded to be based on Vanilla FreeRTOS v10.5.1. With this upgrade, the design and implementation of IDF FreeRTOS has also been changed significantly. As a result, users should take not of the following changes to kernel behavior and API:

- When enabling single-core mode via the *CONFIG_FREERTOS_UNICORE* option, the kernel's behavior will now be identical to Vanilla FreeRTOS (see *Single-Core Mode* for more details).
- For SMP related APIs that were added by IDF FreeRTOS, checks on `xCoreID` arguments are now stricter. Providing out of range values for `xCoreID` arguments will now trigger an assert.
- The following SMP related APIs are now deprecated and replaced due to naming consistency reasons:
  - `xTaskGetAffinity()` is deprecated, call *`xTaskGetCoreID()`* instead.
  - `xTaskGetIdleTaskHandleForCPU()` is deprecated, call *`xTaskGetIdleTaskHandleForCore()`* instead.
  - `xTaskGetCurrentTaskHandleForCPU()` is deprecated, call *`xTaskGetCurrentTaskHandleForCore()`* instead.

Task Snapshot The Task Snapshot API has been made private due to a lack of a practical way for the API to be used from user code (the scheduler must be halted before the API can be called).

Panic Handler Behavior The choice `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` in the configuration option *CONFIG_ESP_SYSTEM_PANIC* has been made dependent on whether the `esp_gdbstub` component is included in the build. When trimming the list of components in the build using `set(COMPONENTS main)`, `esp_gdbstub` component has to be added to this list of components to make the `CONFIG_ESP_SYSTEM_PANIC_GDBSTUB` option available.

WiFi

WiFi Enterprise Security APIs defined in *esp_wpa2.h* have been deprecated. Please use newer APIs from *esp_eap_client.h*.

WiFi Disconnect Reason Codes For the event WIFI_EVENT_STA_DISCONNECTED, the original reason code WIFI_REASON_NO_AP_FOUND has been split as follows:

- REASON_NO_AP_FOUND(original and still used in some scenarios)
- REASON_NO_AP_FOUND_IN_RSSI_THRESHOLD
- REASON_NO_AP_FOUND_IN_AUTHMODE_THRESHOLD
- REASON_NO_AP_FOUND_W_COMPATIBLE_SECURITY

For details, please refer to *Wi-Fi Reason Code*.

Chapter 7

Libraries and Frameworks

7.1 Cloud Frameworks

ESP32-C6 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks' agents and examples:

7.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. ESP RainMaker on GitHub.

7.1.2 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32-C6 based on Amazon Web Services' aws-iot-device-sdk-embedded-C.

7.1.3 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32-C6 based on Microsoft Azure's azure-iot-sdk-c SDK.

7.1.4 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32-C6 based on Google's iot-device-sdk-embedded-c SDK.

7.1.5 Aliyun IoT

https://github.com/espressif/esp-aliyun is an open source repository for ESP32-C6 based on Aliyun's iotkit-embedded SDK.

7.1.6 Joylink IoT

https://github.com/espressif/esp-joylink is an open source repository for ESP32-C6 based on Joylink's joylink_dev_sdk SDK.

7.1.7 Tencent IoT

https://github.com/espressif/esp-welink is an open source repository for ESP32-C6 based on Tencent's welink SDK.

7.1.8 Tencentyun IoT

https://github.com/espressif/esp-qcloud is an open source repository for ESP32-C6 based on Tencentyun's qcloud-iot-sdk-embedded-c SDK.

7.1.9 Baidu IoT

https://github.com/espressif/esp-baidu-iot is an open source repository for ESP32-C6 based on Baidu's iot-sdk-c SDK.

7.2 Espressif's Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

7.2.1 Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

- CODEC's HAL
- Music players and recorders
- Audio processing
- Bluetooth speakers
- Internet radios
- Hands-free devices
- Speech decognition

This framework is available on GitHub: ESP-ADF.

7.2.2 ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See the ESP-CSI project for more information.

7.2.3 Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

- Matrix multiplication
- Dot product
- FFT (Fast Fourier Transform)
- IIR (Infinite Impulse Response)
- FIR (Finite Impulse Response)
- Vector math operations

This library is available on Github: ESP-DSP library.

7.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

This framework is available on Github: ESP-MDF.

7.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera.

This framework is available on Github: ESP-WHO.

7.2.6 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

This project is available on Github: ESP RainMaker on GitHub.

7.2.7 ESP-IoT-Solution

ESP-IoT-Solution contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

This solution is available on Github: ESP-IoT-Solution on GitHub.

7.2.8 ESP-Protocols

The ESP-Protocols repository contains a collection of protocol components for ESP-IDF. The code within ESP-Protocols is organized into separate components, allowing them to be easily integrated into an ESP-IDF project. Additionally, each component is available in IDF Component Registry.

ESP-Protocols components:

- esp_modem enables connectivity with GSM/LTE modems using AT commands or PPP protocol. See the esp_modem documentation.
- mdns (mDNS) is a multicast UDP service that is used to provide local network service and host discovery. See the mdns documentation.
- esp_websocket_client is a managed component for ESP-IDF that contains implementation of WebSocket protocol client for ESP32. See the esp_websocket_client documentation. For detailes of WebSocket protocol client, see WebSocket_protocol_client.
- asio is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach. See the asio documentation.

7.2.9 ESP-BSP

The ESP-BSP repository contains Board Support Packages (BSPs) for various Espressif's and third-party development boards. BSPs help to quickly get started with a supported board. Usually they contain pinout definition and helper functions that will initialize peripherals for the specific board. Additionally, the BSPs contain drivers for external chips populated on the development board, such as sensors, displays, audio codecs, etc.

7.2.10 ESP-IDF-CXX

ESP-IDF-CXX contains C++ wrappers for part of ESP-IDF. The focuses are on ease of use, safety, automatic resource management. They also move error checking from runtime to compile time to prevent running failure. There are C++ classes for ESP-Timer, I2C, SPI, GPIO and other peripherals or features of ESP-IDF. ESP-IDF-CXX is available as a component from the component registry. Please check the project's README.md for more information.

Chapter 8

Contributions Guide

We welcome contributions to the ESP-IDF project!

8.1 How to Contribute

Contributions to ESP-IDF - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

8.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it. Please check the *Copyright Header Guide* for additional information.
- Does any new code conform to the ESP-IDF *Style Guide*?
- Have you installed the *pre-commit hook* for ESP-IDF project?
- Does the code documentation follow requirements in *Documenting Code*?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the *Creating Examples* guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like "fixed typo" squashed into previous commits?
- If you are unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

8.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself.

Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged into the public GitHub repository.

8.4 Legal Part

Before a contribution can be accepted, you will need to sign our *Contributor Agreement*. You will be prompted for this automatically as part of the Pull Request process.

8.5 Related Documents

8.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (ie shortening `data` to `dat`), unless the resulting name would otherwise be very long.

Indentation Use 4 spaces for each indentation level. Do not use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space Place one empty line between functions. Do not begin or end a function with an empty line.

```
void function1()
{
    do_one_thing();
    do_another_thing();
                                    // INCORRECT, do not place empty line here
}
                                    // place empty line here
void function2()
{
                                    // INCORRECT, do not use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
```

(continues on next page)

(continued from previous page)

```
    }
}
```

The maximum line length is 120 characters as long as it does not seriously affect the readability.

Horizontal Space Always add single space after conditional and loop keywords:

```
if (condition) {     // correct
    // ...
}

switch (n) {         // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {     // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);     // correct

const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);         // also okay

int y_cur = -y;                                          // correct
++y_cur;

const int y = y0+(x-x0)*(y1-y0)/(x1-x0);                 // INCORRECT
```

No space is necessary around `.` and `->` operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```
esp_rom_gpio_connect_in_signal(PIN_CAM_D6,   I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7,   I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX,  false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g., `PIN_CAM_VSYNC`), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

Braces

- Function definition should have a brace on a separate line:

```
// This is correct:
void function(int arg)
{

}
```

(continues on next page)

(continued from previous page)

```
// NOT like this:
void function(int arg) {

}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Do not use single comments to disable some functionality:

```
void init_something()
{
    setup_dma();
    // load_resources();                // WHY is this thing commented, asks␣
↪the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated␣
↪yet.
    // load_resources();
    start_timer();
}
```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Do not use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.
- Do not add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g., this comment adds clutter to the code without adding any useful information:

```
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

Line Endings Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. *Github has a document about setting this option <github-line-endings>.*

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs␣
↪dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it is possible to run `dos2unix FILENAME` and then run `git commit --amend`

Formatting Your Code ESP-IDF uses Astyle to format source code. The configuration is stored in tools/ci/astyle-rules.yml file.

Initially, all components are excluded from formatting checks. You can enable formatting checks for the component by removing it from `components_not_formatted_temporary` list. Then run:

```
pre-commit run --files <path_to_files> astyle_py
```

Alternatively, you can run `astyle_py` manually. You can install it with `pip install astyle_py==VERSION`. Make sure you have the same version installed as the one specified in .pre-commit-config.yaml file. With `astyle_py` installed, run:

```
astyle_py --rules=$IDF_PATH/tools/ci/astyle-rules.yml <path-to-file>
```

Type Definitions Should be snake_case, ending with _t suffix:

```
typedef int signed_32_bit_t;
```

Enum Enums should be defined through the *typedef* and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

Assertions The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns `false` or 0 will call `abort()` and trigger a *Fatal Error*.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it is not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an *error value should be returned*.

Note: When asserting a value of type `esp_err_t``is equal to ``ESP_OK`, use the *ESP_ERROR_CHECK Macro* instead of an `assert()`.

It is possible to configure ESP-IDF projects with assertions disabled (see *CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL*). Therefore, functions called in an `assert()` statement should not have side-effects.

It is also necessary to use particular techniques to avoid "variable set but not used" warnings when assertions are disabled, due to code patterns such as:

```
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```
int res = do_something();
assert(res == 0);
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```
int res __attribute__((unused));

res = do_something();
assert(res == 0);

res = do_something_else();
assert(res != 0);
```

Header File Guards

All public facing header files should have preprocessor guards. A pragma is preferred:

```
#pragma once
```

over the following pattern:

```
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```
#pragma once

#include <stdint.h>

#ifdef __cplusplus
extern "C" {
#endif

/* declarations go here */

#ifdef __cplusplus
}
#endif
```

Include Statements

When writing `#include` statements, try to maintain the following order:

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as `sys/queue.h`.)
- Common IDF headers (`esp_log.h`, `esp_system.h`, `esp_timer.h`, `esp_sleep.h`, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (`#include <stdio.h>`).

Use double quotes for all other headers (`#include "esp_log.h"`).

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming C++ Header files have the extension `.hpp`. C++ source files have the extension `.cpp`. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in `CamelCase` with a capital letter as beginning. Member variables and methods shall be in `snake_case`. An exception from `CamelCase` is if the readability is severely decreased, e.g., in `GPIOOutput`, then an underscore _ is allowed to make it more readable: `GPIO_Output`.
- **Namespaces** shall be in lower `snake_case`.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix `...Interface`. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining pubic methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```

Spacing

- Do not indent inside namespaces.
- Put `public`, `protected` and `private` labels at the same indentation level as the corresponding `class` label.

Simple Example

```
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>

namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;

private:
    const size_t crew;
};

class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};

class Sojuz : public SpaceShip {
public:
    Sojuz();
};

template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);

private:
    T cargo;
};

} // namespace spaceships

#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"

namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only␣
↪initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) { }

size_t SpaceShip::get_crew_size() const
{
    return crew;
}
```

(continues on next page)

(continued from previous page)

```
SpaceShuttle::SpaceShuttle() : SpaceShip(7)
{
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3)
{
    // doing further initialization
}

template <typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) { }

} // namespace spaceships
```

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Do not put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Third Party Component Code Styles

ESP-IDF integrates a number of third party components where these components may have differing code styles.

FreeRTOS The code style adopted by FreeRTOS is described in the FreeRTOS style guide. Formatting of FreeRTOS source code is automated using Uncrustify, thus a copy of the FreeRTOS code style's Uncrustify configuration (`uncrustify.cfg`) is stored within ESP-IDF FreeRTOS component.

If a FreeRTOS source file is modified, the updated file can be formatted again by following the steps below:

1. Ensure that Uncrustify (v0.69.0) is installed on your system
2. Run the following command on the update FreeRTOS source file (where `source.c` is the path to the source file that requires formatting).

```
uncrustify -c $IDF_PATH/components/freertos/FreeRTOS-Kernel/uncrustify.cfg --
↪replace source.c --no-backup
```

Documenting Code

Please see the guide here: *Documenting Code*.

Structure

To be written.

Language Features

To be written.

8.5.2 Install Pre-commit Hook for ESP-IDF Project

Required Dependency

Python 3.8.* or above. This is our recommended Python version for ESP-IDF developers.

If you still have Python versions not compatible, update your Python versions before installing the pre-commit hook.

Install `pre-commit`

Run `pip install pre-commit`

Install `pre-commit` Hook

1. Go to the ESP-IDF project directory.
2. Run `pre-commit install --allow-missing-config -t pre-commit -t commit-msg`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you are running `git commit` command

Uninstall `pre-commit` Hook

Run `pre-commit uninstall`

What Is More?

For detailed usage, please refer to the documentation of pre-commit.

Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

> If you are in Git Bash, please check the python executable location by run `which python`.
>
> If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it is a link to Windows AppStore, not a real one.
>
> Please install Python manually and update this in your `PATH` environment variable.

Your `USERPROFILE` contains non-ASCII characters

> `pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`'s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running pre-commit.

- CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- git bash: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

8.5.3 Documenting Code

The purpose of this description is to provide a quick summary of the documentation style used in espressif/esp-idf repository and how to add new documentation.

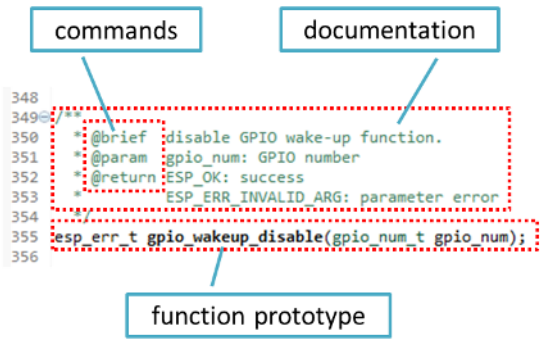
Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen can phrase the code, extract the commands together with subsequent text, and build documentation out of it.

Typical comment block, that contains documentation of a function, looks like below:

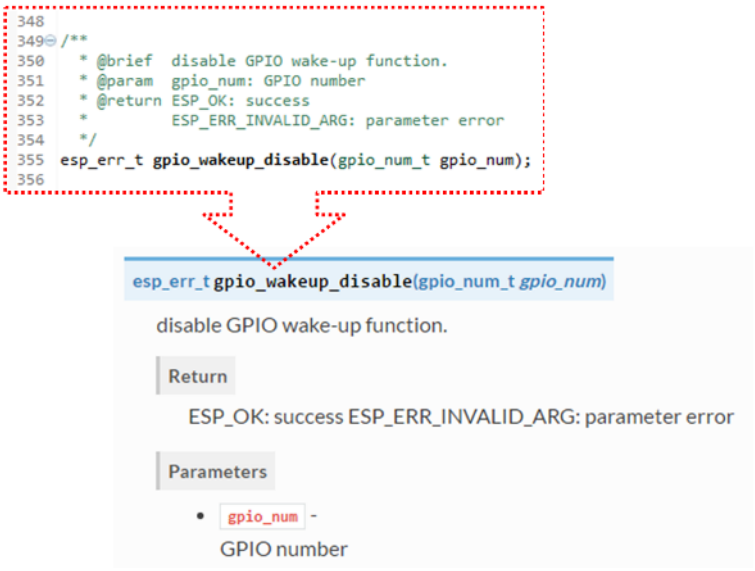


Doxygen supports a couple of formatting styles. It also gives you great flexibility on the level of details to include in documentation. To get familiar with available features, please check data-rich and very well-organized Doxygen Manual.

Why We Need Doxygen?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

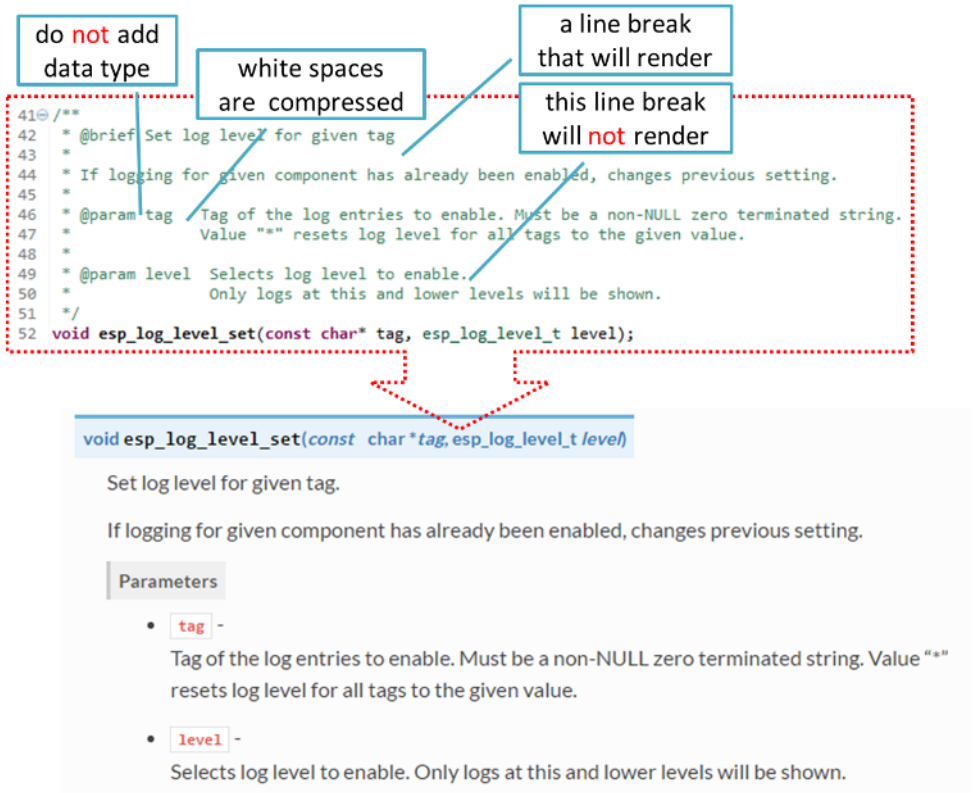
With these tools, the above piece of code renders like below:



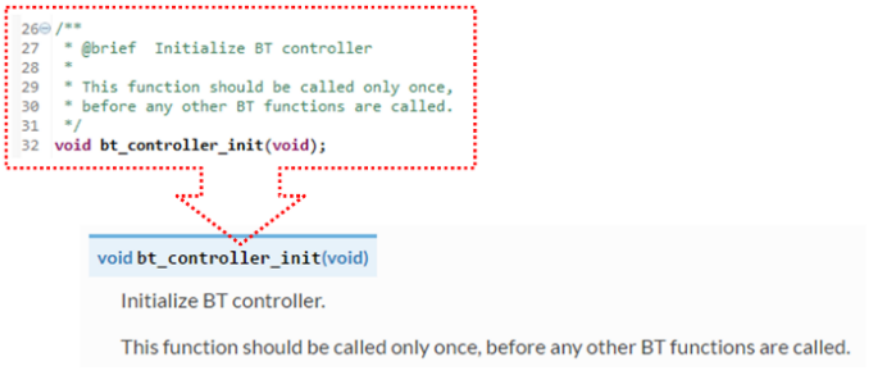
Go for It!

When writing code for this repository, please follow guidelines below:

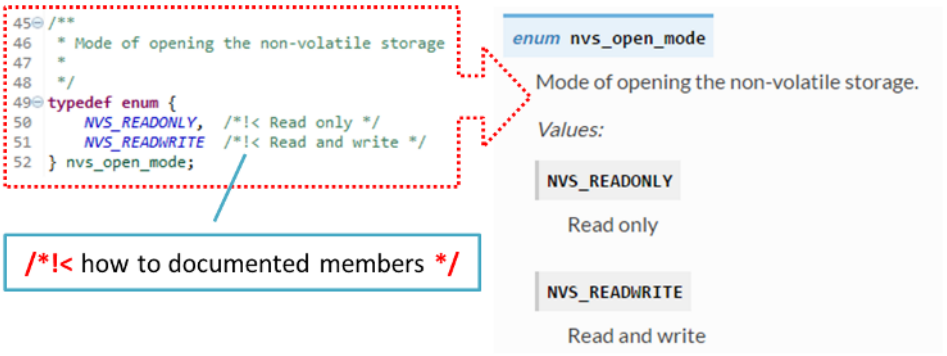
1. Document all building blocks of code, including functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality, and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.



4. If function has void input or does not return any value, then skip `@param` or `@return`.



5. When documenting a `define` as well as members of a `struct` or `enum`, place specific comment like below after each member.



6. To provide well-formatted lists, break the line after command (like `@return` in the example below).

```
*
* @return
*     - ESP_OK if erase operation was successful
*     - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
*     - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
*     - ESP_ERR_NVS_NOT_FOUND if the requested key does not exist
*     - other error codes from the underlying storage driver
*
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate `README.rst` file of the same directory. If this directory contains header files for different APIs, then the file name should be `apiname-readme.rst`.

Go One Extra Mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing code, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using `@code{c}` and `@endcode` commands.

```
*
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
```

(continues on next page)

(continued from previous page)

```
* @endcode
*
```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command `@attention` or `@note`.

```
*
* @attention
*     1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
*     2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to␣
↪disconnect.
*
```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using `/**@{*/` and `/**@}*/` markup commands.

```
/**@{*/
/**
 * @brief common description of similar functions
 *
 */
void  first_similar_function (void);
void second_similar_function (void);
/**@}*/
```

For practical example see nvs_flash/include/nvs.h.

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in driver/gpio/include/driver/gpio.h.
5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```
*
* [ESP32-C6 Technical Reference Manual](https://www.espressif.com/sites/
↪default/files/documentation/esp32-c6_technical_reference_manual_en.pdf)
*
```

Note: Code snippets, notes, links, etc., will not make it to the documentation, if not enclosed in a comment block associated with one of the documented objects.

6. Prepare one or more complete code examples together with description. Place description to a separate file `README.md` in specific folder of examples directory.

Standardize Document Format

When it comes to text, please follow guidelines below to provide well-formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Do not break lines like below. Breaking lines to enhance readability is only suitable for writing code. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

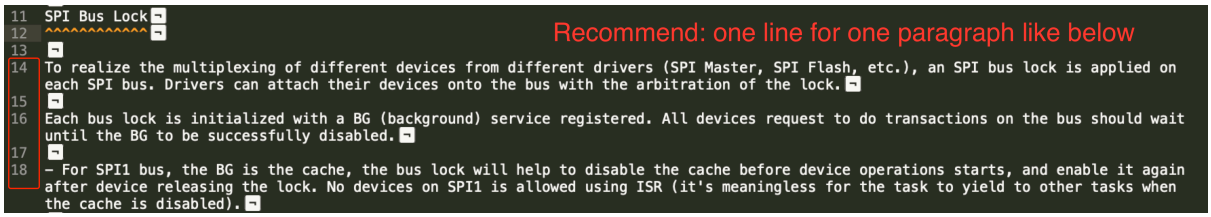


Fig. 1: One line for one paragraph (click to enlarge)

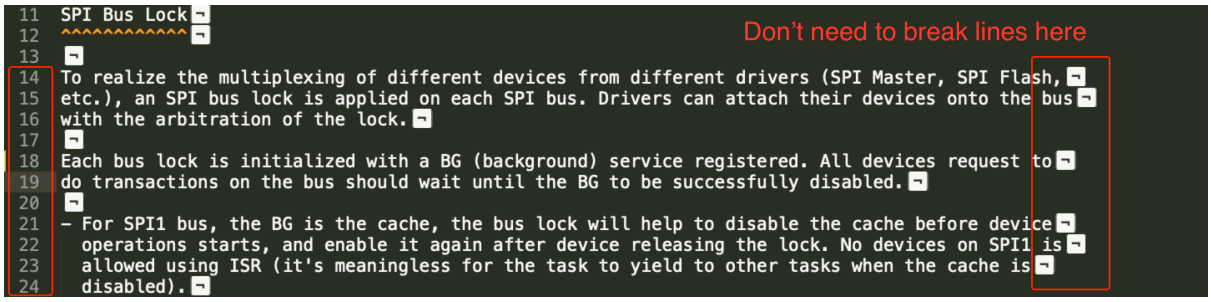

Fig. 2: No line breaks within the same paragraph (click to enlarge)

Fig. 3: Keep the line number for EN and CN documents consistent (click to enlarge)

Building Documentation

The documentation is built with the *esp-docs* Python package, which is a wrapper around Sphinx.

To install it simply do:

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
build-docs build
```

or for specific target and language with:

```
build-docs -t esp32 -l en build
```

For more in-depth documentation about *esp-docs* features please see the documentation at esp-docs.

Wrap Up

We love good code that is doing cool things. We love it even better, if it is well-documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

- *API Documentation Template*

8.5.4 Creating Examples

Each ESP-IDF example is a complete project that someone else can copy and adapt the code to solve their own problem. Examples should demonstrate ESP-IDF functionality, while keeping this purpose in mind.

Structure

- The `main` directory should contain a source file named `(something)_example_main.c` with the main functionality.
- If the example has additional functionality, split it logically into separate C or C++ source files under `main` and place a corresponding header file in the same directory.
- If the example has a lot of additional functionality, consider adding a `components` directory to the example project and make some example-specific components with library functionality. Only do this if the components are specific to the example, if they are generic or common functionality then they should be added to ESP-IDF itself.
- The example should have a `README.md` file. Use the template example README and adapt it for your particular example.
- Examples should have a `pytest_<example name>.py` file for running an automated example test. If submitting a GitHub Pull Request which includes an example, it is OK not to include this file initially. The details can be discussed as part of the Pull Request. Please refer to *IDF Tests with Pytest Guide* for details.

General Guidelines

Example code should follow the *Espressif IoT Development Framework Style Guide*.

Checklist

Checklist before submitting a new example:

- Example project name (in `README.md`) uses the word "example". Use "example" instead of "demo", "test" or similar words.
- Example does one distinct thing. If the example does more than one thing at a time, split it into two or more examples.
- Example has a `README.md` file which is similar to the template example README .
- Functions and variables in the example are named according to *naming section of the style guide*. For non-static names which are only specific to the example's source files, you can use `example` or something similar as a prefix.
- All code in the example is well structured and commented.
- Any unnecessary code (old debugging logs, commented-out code, etc.) is removed from the example.
- Options in the example (like network names, addresses, etc) are not hard-coded. Use configuration items if possible, or otherwise declare macros or constants.
- Configuration items are provided in a `KConfig.projbuild` file with a menu named "Example Configuration". See existing example projects to see how this is done.
- All original example code has a license header saying it is "in the public domain / CC0", and a warranty disclaimer clause. Alternatively, the example is licensed under Apache License 2.0. See existing examples for headers to adapt from.
- Any adapted or third party example code has the original license header on it. This code must be licensed compatible with Apache License 2.0.

8.5.5 API Documentation Template

Note: *INSTRUCTIONS*

1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents the documented API.
3. Include respective files with descriptions from the API folder using `..include::`
   - README.rst
   - example.rst
   - ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

Note: *INSTRUCTIONS*

1. Provide overview where and how this API may be used.
2. Include code snippets to illustrate functionality of particular functions when applicable.
3. To distinguish between sections, use the following heading levels:
   - # with overline, for parts
   - * with overline, for chapters
   - = for sections
   - - for subsections
   - ^ for subsubsections
   - " for paragraphs

Application Example

Note: *INSTRUCTIONS*

1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
3. Place example in this folder, and add `README.md` file.
4. Provide overview of demonstrated functionality in `README.md`.
5. With good overview readers should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.

API Reference

Note: *INSTRUCTIONS*

1. ESP-IDF repository provides automatic update of API reference documentation using *code markup retrieved by Doxygen from header files*.
2. Update is done on each documentation build by invoking Sphinx extension `esp_extensions/run_doxygen.py` for all header files listed in the `INPUT` statement of docs/doxygen/Doxyfile.
3. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that is used to generate corresponding `*.inc` files:

```
##
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

4. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*_caps.h` headers will be expanded. This allows the headers to include or exclude material based on the `IDF_TARGET` value.
5. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated, e.g., `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
6. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

   For example see docs/en/api-reference/network/esp_wifi.rst
7. Optionally, rather that using `*.inc` files, you may want to describe API in you own way. See docs/en/api-reference/storage/fatfs.rst for example.
   Below is the list of common `.. doxygen...::` directives:
   - Functions - `.. doxygenfunction:: name_of_function`
   - Unions - `.. doxygenunion:: name_of_union`
   - Structures - `.. doxygenstruct:: name_of_structure` together with `:members:`
   - Macros - `.. doxygendefine:: name_of_define`
   - Type Definitions - `.. doxygentypedef:: name_of_type`
   - Enumerations - `.. doxygenenum:: name_of_enumeration`

   See Breathe documentation for additional information.
   To provide a link to header file, use the *link custom role* directive as follows:

```
* :component_file:`path_to/header_file.h`
```

8. In any case, to generate API reference, the file docs/doxygen/Doxyfile should be updated with paths to `*.h` headers that are being documented.
9. When changes are committed and documentation is built, check how this section has been rendered. *Correct annotations* in respective header files, if required.

8.5.6 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement Including the Traditional Patent License OPTION

Thank you for your interest in contributing to this Espressif project hosted on GitHub ("We" or "Us").

The purpose of this contributor agreement ("Agreement") is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions in the *Contributions Guide*.

1. DEFINITIONS **You** means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You must have had Your employer approve this Agreement or sign the Entity version of this Agreement.

Contribution means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us by submitting a comment on GitHub.

Copyright means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

Material means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

Submit means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as "Not a Contribution."

Submission Date means the date You Submit a Contribution to Us.

Documentation means any non-software portion of a Contribution.

2. COPYRIGHT LICENSE 2.1 Grant of Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code
- to reproduce the Contribution in original or modified form
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENT LICENSE 3.1 Grant of Patent License to US

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if We make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a "Defensive Purpose" if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER THE CONTRIBUTION IS PROVIDED "AS IS". MORE PARTICULARLY, ALL EXPRESSED OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement, sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People's Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

8.5.7 Copyright Header Guide

ESP-IDF is released under the Apache License 2.0 with some additional third-party copyrighted code released under various licenses. For further information please refer to *the list of copyrights and licenses*.

This page explains how the source code should be properly marked with a copyright header. ESP-IDF uses the Software Package Data Exchange (SPDX) format which is short and can be easily read by humans or processed by automated tools for copyright checks.

How to Check the Copyright Headers

Please make sure you have installed the *pre-commit hooks* which contain a copyright header checker as well. The checker can suggest a header if it is not able to detect a properly formatted SPDX header.

What If the Checker's Suggestion Is Incorrect?

No automated checker (no matter how good is) can replace humans. So the developer's responsibility is to modify the offered header to be in line with the law and the license restrictions of the original code on which the work is based on. Certain licenses are not compatible between each other. Such corner cases will be covered by the following examples.

The checker can be configured with the `tools/ci/check_copyright_config.yaml` configuration file. Please check the options it offers and consider updating it in order to match the headers correctly.

Common Examples of Copyright Headers

The simplest case is when the code is not based on any licensed previous work, e.g., it was written completely from scratch. Such code can be decorated with the following copyright header and put under the license of ESP-IDF:

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Apache-2.0
 */
```

Less Restrictive Parts of ESP-IDF Some parts of ESP-IDF are deliberately under less restrictive licenses in order to ease their re-use in commercial closed source projects. This is the case for ESP-IDF examples which are in Public domain or under the Creative Commons Zero Universal (CC0) license. The following header can be used in such source files:

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```

The option allowing multiple licenses joined with the `OR` keyword from the above example can be achieved with the definition of multiple allowed licenses in the `tools/ci/check_copyright_config.yaml` configuration file. Please use this option with care and only selectively for a limited part of ESP-IDF.

Third Party Licenses Code licensed under different licenses, modified by Espressif Systems and included in ESP-IDF cannot be licensed under Apache License 2.0 not even if the checker suggests it. It is advised to keep the original copyright header and add an SPDX before it.

The following example is a suitable header for a code licensed under the "GNU General Public License v2.0 or later" held by John Doe with some additional modifications done by Espressif Systems:

```
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 *
 * SPDX-License-Identifier: GPL-2.0-or-later
 *
 * SPDX-FileContributor: 2019-2023 Espressif Systems (Shanghai) CO LTD
 */
```

The licenses can be identified and the short SPDX identifiers can be found in the official SPDX license list. Other very common licenses are the GPL-2.0-only, the BSD-3-Clause, and the BSD-2-Clause.

In exceptional case, when a license is not present on the SPDX license list, it can be expressed by using the LicenseRef-[idString] custom license identifier, for example `LicenseRef-Special-License`. The full license text must be added into the `LICENSES` directory under `Special-License` filename.

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Special-License
 */
```

Dedicated `LicenseRef-Included` custom license identifier can be used to express a situation when the custom license is included directly in the source file.

```
/*
 * SPDX-FileCopyrightText: 2015-2023 Espressif Systems (Shanghai) CO LTD
 *
 * SPDX-License-Identifier: LicenseRef-Included
 *
 * <Full custom license text>
 */
```

The configuration stored in `tools/ci/check_copyright_config.yaml` offers features useful for third party licenses:

- A different license can be defined for the files part of a third party library.
- The check for a selected set of files can be permanently disabled. Please use this option with care and only in cases when none of the other options are suitable.

8.5.8 pytest in ESP-IDF

ESP-IDF has numerous types of tests that are meant to be executed on an ESP chip (known as **on target testing**). Target tests are usually compiled as part of an IDF project used for testing (known as a **test app**), where test apps follows the same build, flash, and monitor process of any other standard IDF project.

Typically, on target testing will require a connected host (e.g., a PC) that is responsible for triggering a particular test case, providing test data, and inspecting test results.

ESP-IDF uses the pytest framework (and some pytest plugins) on the host side to automate on target testing. This guide introduces pytest in ESP-IDF and covers the following concepts:

1. The different types of test apps in ESP-IDF.
2. Using the pytest framework in Python scripts to automate target testing.
3. ESP-IDF Continuous Integration (CI) target testing process.
4. How to run target tests locally with pytest.
5. pytest tips and tricks.

Note: In ESP-IDF, we use the following pytest plugins by default:

- pytest-embedded with default services `esp,idf`
- pytest-rerunfailures

All the concepts and usages introduced in this guide are based on the default behavior of these plugins, thus may not be available in vanilla pytest.

Installation

All dependencies could be installed by running the install script with the `--enable-pytest` argument:

```
$ install.sh --enable-pytest
```

Common Issues During Installation

No Package 'dbus-1' Found

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:

No package 'dbus-1' found

Consider adjusting the PKG_CONFIG_PATH environment variable if you
installed software in a non-standard prefix.
```

If you encounter the error message above, you may need to install some missing packages.

If you are using Ubuntu, you may need to run:

```
sudo apt-get install libdbus-glib-1-dev
```

or

```
sudo apt-get install libdbus-1-dev
```

For other Linux distributions, please Google the error message above and find which missing packages need to be installed for your particular distribution.

Invalid Command 'bdist_wheel'

```
error: invalid command 'bdist_wheel'
```

If you encounter the error message above, you may need to install some missing Python packages such as:

```
python -m pip install -U pip
```

or

```
python -m pip install wheel
```

Note: Before running the pip commands, please make sure you are using the IDF Python virtual environment.

Test Apps

ESP-IDF contains different types of test apps that can be automated using pytest.

Component Tests ESP-IDF components typically contain component specific test apps that execute component specific unit tests. Component test apps are the recommended way to test components. All the test apps should be located under `${IDF_PATH}/components/<COMPONENT_NAME>/test_apps`, for example:

```
components/
└── my_component/
      ├── include/
      │   └── ...
      ├── test_apps/
      │   ├── test_app_1
      │   │   ├── main/
      │   │   │   └── ...
      │   │   ├── CMakeLists.txt
      │   │   └── pytest_my_component_app_1.py
      │   ├── test_app_2
      │   │   ├── ...
      │   │   └── pytest_my_component_app_2.py
      │   └── parent_folder
      │       ├── test_app_3
      │       │   ├── ...
      │       │   └── pytest_my_component_app_3.py
      │       └── ...
      ├── my_component.c
      └── CMakeLists.txt
```

Example Tests The purpose of ESP-IDF examples is to demonstrate parts of ESP-IDF functionality to users (refer to Examples Readme for more information).

However, to ensure that these examples operate correctly, examples can be treated as test apps and executed automatically by using pytest. All examples should be located under `${IDF_PATH}/examples`, with tested example including a Python test script, for example:

```
examples/
└── parent_folder/
    └── example_1/
        ├── main/
        │   └── ...
        ├── CMakeLists.txt
        └── pytest_example_1.py
```

Custom Tests Custom Tests are tests that aim to test some arbitrary functionality of ESP-IDF, thus are not intended to demonstrate IDF functionality to users in any way.

All custom test apps are located under `${IDF_PATH}/tools/test_apps`. For more information please refer to the Custom Test Readme .

pytest in ESP-IDF

pytest Execution Process

1. Bootstrapping Phase

   Create session-scoped caches:

   - port-target cache
   - port-app cache

2. Collection Phase

A. Gather all Python files with the prefix `pytest_`.
B. Gather all test functions with the prefix `test_`.
C. Apply the params, and duplicate the test functions.
D. Filter the test cases with CLI options. For the detailed usages, see *Filter the Test Cases*.

3. Execution Phase

   A. Construct the fixtures. In ESP-IDF, the common fixtures are initialized in this order:

      a. `pexpect_proc`: pexpect instance
      b. `app`: IdfApp instance

         The test app's information (e.g., sdkconfig, flash_files, partition_table, etc) would be parsed at this phase.

      c. `serial`: IdfSerial instance

         The port of the host to which the target is connected is auto-detected. In the case of multiple targets connected to the host, the test target's type is parsed from the app. The test app binary files are flashed to the test target automatically.

      d. `dut`: IdfDut instance

   B. Run the real test function.
   C. Deconstruct the fixtures in this order:

      a. `dut`

      i. close the `serial` port.
      ii. (Only for apps with Unity test framework) generate JUnit report of the Unity test cases.

      b. `serial`
      c. `app`
      d. `pexpect_proc`: Close the file descriptor

   D. (Only for apps with Unity test framework)

      If `dut.expect_from_unity_output()` is called, an `AssertionError` is raised upon detection of a Unity test failure.

4. Reporting Phase

A. Generate JUnit report of the test functions.
B. Modify the JUnit report test case name into ESP-IDF test case ID format: `<target>.<config>.<test function name>`.

5. Finalizatoin Phase (Only for apps with Unity test framework)

   Combine the JUnit reports if the JUnit reports of the Unity test cases are generated.

Basic Example This following Python test script example is taken from pytest_console_basic.py .

```
@pytest.mark.esp32
@pytest.mark.esp32c3
@pytest.mark.generic
@pytest.mark.parametrize('config', [
    'history',
    'nohistory',
], indirect=True)
def test_console_advanced(config: str, dut: IdfDut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

To demonstrate how pytest is typically used in an ESP-IDF test script, let us go through this simple test script line by line in the following subsections.

Target Markers Pytest markers can be used to indicate which targets (i.e., which ESP chip) a particular test case should should run on. For example:

```
@pytest.mark.esp32      # <-- support esp32
@pytest.mark.esp32c3    # <-- support esp32c3
@pytest.mark.generic    # <-- test env "generic"
```

The example above indicates that a particular test case is supported on the ESP32 and ESP32-C3. Furthermore, the target's board type should be `generic`. For more details regarding the `generic` type, you may run `pytest --markers` to get detailed information regarding all markers.

Note: If the test case can be run on all targets officially supported by ESP-IDF (call `idf.py --list-targets` for more details), you can use a special marker `supported_targets` to apply all of them in one line.

Parameterized Markers You can use `pytest.mark.parametrize` with `config` to apply the same test to different apps with different sdkconfig files. For more information about `sdkconfig.ci.xxx` files, please refer to the Configuration Files section under this readme .

```
@pytest.mark.parametrize('config', [
    'history',      # <-- run with app built by sdkconfig.ci.history
    'nohistory',    # <-- run with app built by sdkconfig.ci.nohistory
], indirect=True)   # <-- `indirect=True` is required
```

Overall, this test function would be replicated to 4 test cases:

- `esp32.history.test_console_advanced`
- `esp32.nohistory.test_console_advanced`
- `esp32c3.history.test_console_advanced`
- `esp32c3.nohistory.test_console_advanced`

Testing Serial Output To ensure that test has executed successfully on target, the test script can test that serial output of the target using the `dut.expect()` function, for example:

```
def test_console_advanced(config: str, dut: IdfDut) -> None:  # The value of␣
↪argument ``config`` is assigned by the parameterization.
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

The `dut.expect(...)` will first compile the expected string into regex, which in turn is then used to seek through the serial output until the compiled regex is matched, or until a timeout occurs.

Please pay extra attention to the expected string when it contains regex keyword characters (e.g., parentheses, square brackets). Alternatively, you may use `dut.expect_exact(...)` that will attempt to match the string without converting it into regex.

For more information regarding the different types of `expect` functions, please refer to the pytest-embedded Expecting documentation.

Advanced Examples

Multi-Target Tests with the Same App In some cases a test may involve multiple targets running the same test app. In this case, multiple DUTs can be instantiated using `parameterize`, for example:

```
@pytest.mark.esp32s2
@pytest.mark.esp32s3
@pytest.mark.usb_host
@pytest.mark.parametrize('count', [
    2,
], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0]  # <-- assume the first dut is the device
    host = dut[1]    # <-- and the second dut is the host
    ...
```

After setting the param `count` to 2, all these fixtures are changed into tuples.

Multi-Target Tests with Different Apps In some cases (in particular protocol tests), a test may involve multiple targets running different test apps (e.g., separate targets to act as master and slave). In this case, multiple DUTs with different test apps can be instantiated using `parameterize`.

This code example is taken from pytest_wifi_getting_started.py .

```
@pytest.mark.esp32
@pytest.mark.multi_dut_generic
@pytest.mark.parametrize(
    'count, app_path', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}'),
    ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Here the first DUT was flashed with the app softAP , and the second DUT was flashed with the app station .

Note: Here the `app_path` should be set with absolute path. The `__file__` macro in Python would return the absolute path of the test script itself.

Multi-Target Tests with Different Apps and Targets This code example is taken from pytest_wifi_getting_started.py . As the comment says, for now it is not running in the ESP-IDF CI.

```
@pytest.mark.parametrize(
    'count, app_path, target', [
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}',
         'esp32|esp32s2'),
        (2,
         f'{os.path.join(os.path.dirname(__file__), "softAP")}|{os.path.join(os.
↪path.dirname(__file__), "station")}',
         'esp32s2|esp32'),
    ],
    indirect=True,
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Overall, this test function would be replicated to 2 test cases:

- softAP with ESP32 target, and station with ESP32-S2 target
- softAP with ESP32-S2 target, and station with ESP32 target

Support Different Targets with Different sdkconfig Files This code example is taken from pytest_panic.py as an advanced example.

```
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]),  # sha256␣
↪only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.
↪esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]

@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...
```

Custom Classes Usually, you may want to write a custom class under these conditions:

1. Add more reusable functions for a certain number of DUTs.
2. Add custom setup and teardown functions in different phases described in Section *pytest Execution Process*.

This code example is taken from panic/conftest.py .

```
class PanicTestDut(IdfDut):
    ...

@pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@pytest.fixture(scope='module', autouse=True)
```

(continues on next page)

(continued from previous page)

```
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_module.setattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)
```

`monkeypatch_module` provides a module-scoped monkeypatch fixture.

`replace_dut_class` is a module-scoped autouse fixture. This function replaces the `IdfDut` class with your custom class.

Mark Flaky Tests Certain test cases are based on Ethernet or Wi-Fi. However, the test may be flaky due to networking issues. Thus, it is possible to mark a particular test case as flaky.

This code example is taken from pytest_esp_eth.py .

```
@pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: IdfDut) -> None:
    ...
```

This flaky marker means that if the test function failed, the test case would rerun for a maximum of 3 times with 5 seconds delay.

Mark Known Failures Sometimes, a test can consistently fail for the following reasons:

- The feature under test (or the test itself) has a bug.
- The test environment is unstable (e.g., due to network issues) leading to a high failure ratio.

Now you may mark this test case with marker xfail with a user-friendly readable reason.

This code example is taken from pytest_panic.py

```
@pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised␣
↪IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:
```

This marker means that test is a known failure on the ESP32-S2.

Mark Nightly Run Test Cases Some test cases are only triggered in nightly run pipelines due to a lack of runners.

```
@pytest.mark.nightly_run
```

This marker means that the test case would only be run with env var `NIGHTLY_RUN` or `INCLUDE_NIGHTLY_RUN`.

Mark Temporarily Disabled in CI Some test cases which can pass locally may need to be temporarily disabled in CI due to a lack of runners.

```
@pytest.mark.temp_skip_ci(targets=['esp32', 'esp32s2'], reason='lack of runners')
```

This marker means that the test case could still be run locally with `pytest --target esp32`, but will not run in CI.

Run Unity Test Cases For component-based unit test apps, all single-board test cases (including normal test cases and multi-stage test cases) can be run using the following command:

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases()
```

Using this command will skip all the test cases containing the `[ignore]` tag.

If you need to run a group of test cases, you may run:

```
def test_component_ut(dut: IdfDut):
    dut.run_all_single_board_cases(group='psram')
```

It would trigger all test cases with the `[psram]` tag.

You may also see that there are some test scripts with the following statements, which are deprecated. Please use the suggested one as above.

```
def test_component_ut(dut: IdfDut):
    dut.expect_exact('Press ENTER to see the list of tests')
    dut.write('*')
    dut.expect_unity_test_output()
```

For further reading about our unit testing in ESP-IDF, please refer to *our unit testing guide*.

Running Tests in CI

The workflow in CI is simple, build jobs > target test jobs.

Build Jobs

Build Job Names

- Component-based Unit Tests: `build_pytest_components_<target>`
- Example Tests: `build_pytest_examples_<target>`
- Custom Tests: `build_pytest_test_apps_<target>`

Build Job Commands The command used by CI to build all the relevant tests is: `python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps`

All apps which supported the specified target would be built with all supported sdkconfig files under `build_<target>_<config>`.

For example, If you run `python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps`, the folder structure would be like this:

```
basic
├── build_esp32_history/
│   └── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
├── CMakeLists.txt
├── pytest_console_basic.py
└── ...
```

All the build folders would be uploaded as artifacts under the same directories.

Target Test Jobs

Target Test Job Names

- Component-based Unit Tests: `component_ut_pytest_<target>_<test_env>`
- Example Tests: `example_test_pytest_<target>_<test_env>`
- Custom Tests: `test_app_test_pytest_<target>_<test_env>`

Target Test Job Commands The command used by CI to run all the relevant tests is: `pytest <parent_dir> --target <target> -m <test_env_marker>`

All test cases with the specified target marker and the test env marker under the parent folder would be executed.

The binaries in the target test jobs are downloaded from build jobs. the artifacts would be placed under the same directories.

Running Tests Locally

First you need to install ESP-IDF with additional Python requirements:

```
$ cd $IDF_PATH
$ bash install.sh --enable-pytest
$ . ./export.sh
```

By default, the pytest script will look for the build directory in this order:

- `build_<target>_<sdkconfig>`
- `build_<target>`
- `build_<sdkconfig>`
- `build`

Which means, the simplest way to run pytest is calling `idf.py build`.

For example, if you want to run all the esp32 tests under the `$IDF_PATH/examples/get-started/hello_world` folder, you should run:

```
$ cd examples/get-started/hello_world
$ idf.py build
$ pytest --target esp32
```

If you have multiple sdkconfig files in your test app, like those `sdkconfig.ci.*` files, the simple `idf.py build` won't apply the extra sdkconfig files. Let us take `$IDF_PATH/examples/system/console/basic` as an example.

If you want to test this app with config `history`, and build with `idf.py build`, you should run

```
$ cd examples/system/console/basic
$ idf.py -DSDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig.ci.history" build
$ pytest --target esp32 --sdkconfig history
```

If you want to build and test with all sdkconfig files at the same time, you should use our CI script as an helper script:

```
$ cd examples/system/console/basic
$ python $IDF_PATH/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

The app with `sdkconfig.ci.history` will be built in `build_esp32_history`, and the app with `sdkconfig.ci.nohistory` will be built in `build_esp32_nohistory`. `pytest --target esp32` will run tests on both apps.

Tips and Tricks

Filter the Test Cases

- Filter by target with `pytest --target <target>`
  pytest would run all the test cases that support specified target.
- Filter by sdkconfig file with `pytest --sdkconfig <sdkconfig>`
  If `<sdkconfig>` is `default`, pytest would run all the test cases with the sdkconfig file `sdkconfig.defaults`.
  In other cases, pytest would run all the test cases with sdkconfig file `sdkconfig.ci.<sdkconfig>`.

Add New Markers We are using two types of custom markers, target markers which indicate that the test cases should support this target, and env markers which indicate that the test cases should be assigned to runners with these tags in CI.

You can add new markers by adding one line under the `${IDF_PATH}/conftest.py`. If it is a target marker, it should be added into `TARGET_MARKERS`. If it is a marker that specifies a type of test environment, it should be added into `ENV_MARKERS`. The syntax should be: `<marker_name>: <marker_description>`.

Generate JUnit Report You can call pytest with `--junitxml <filepath>` to generate the JUnit report. In ESP-IDF, the test case name would be unified as `<target>.<config>.<function_name`.

Skip Auto Flash Binary Skipping auto-flash binary every time would be useful when you are debugging your test script.

You can call pytest with `--skip-autoflash y` to achieve it.

Record Statistics Sometimes you may need to record some statistics while running the tests, like the performance test statistics.

You can use record_xml_attribute fixture in your test script, and the statistics would be recorded as attributes in the JUnit report.

Logging System Sometimes you may need to add some extra logging lines while running the test cases.

You can use Python logging module to achieve this.

Useful Logging Functions (as Fixture)

`log_performance`

```
def test_hello_world(
    dut: IdfDut,
    log_performance: Callable[[str, object], None],
) -> None:
    log_performance('test', 1)
```

The above example would log the performance item with pre-defined format: `[performance][test]: 1` and record it under the `properties` tag in the JUnit report if `--junitxml <filepath>` is specified. The JUnit test case node would look like:

```
<testcase classname="examples.get-started.hello_world.pytest_hello_world" file=
↪"examples/get-started/hello_world/pytest_hello_world.py" line="13" name="esp32.
↪default.test_hello_world" time="8.389">
    <properties>
        <property name="test" value="1"/>
    </properties>
</testcase>
```

`check_performance` We provide C macros `TEST_PERFORMANCE_LESS_THAN` and `TEST_PERFORMANCE_GREATER_THAN` to log the performance item and check if the value is in the valid range. Sometimes the performance item value could not be measured in C code, so we also provide a Python function for the same purpose. Please note that using C macros is the preferred approach, since the Python function could not recognize the threshold values of the same performance item under different ifdef blocks well.

```
def test_hello_world(
    dut: IdfDut,
    check_performance: Callable[[str, float, str], None],
) -> None:
    check_performance('RSA_2048KEY_PUBLIC_OP', 123, 'esp32')
    check_performance('RSA_2048KEY_PUBLIC_OP', 19001, 'esp32')
```

The above example would first get the threshold values of the performance item `RSA_2048KEY_PUBLIC_OP` from components/idf_test/include/idf_performance.h and the target-specific one components/idf_test/include/esp32/idf_performance_target.h, then check if the value reached the minimum limit or exceeded the maximum limit.

Let us assume the value of `IDF_PERFORMANCE_MAX_RSA_2048KEY_PUBLIC_OP` is 19000. so the first `check_performance` line would pass and the second one would fail with warning: `[Performance] RSA_2048KEY_PUBLIC_OP value is 19001, doesn\'t meet pass standard 19000.0`.

Chapter 9

ESP-IDF Versions

The ESP-IDF GitHub repository is updated regularly, especially the master branch where new development takes place.

For production use, there are also stable releases available.

9.1 Releases

The documentation for the current stable release version can always be found at this URL:

https://docs.espressif.com/projects/esp-idf/en/stable/

Documentation for the latest version (master branch) can always be found at this URL:

https://docs.espressif.com/projects/esp-idf/en/latest/

The full history of releases can be found on the GitHub repository Releases page. There you can find release notes, links to each version of the documentation, and instructions for obtaining each version.

9.2 Which Version Should I Start With?

- For production purposes, use the current stable version. Stable versions have been manually tested, and are updated with "bugfix releases" which fix bugs without changing other functionality (see *Versioning Scheme* for more details). Every stable release version can be found on the Releases page. Also refer to Compatibility Between ESP-IDF Releases and Revisions of Espressif SoCs to make sure the ESP-IDF version you selected is compatible with the chip revision you are going to produce with.
- For prototyping, experimentation or for developing new ESP-IDF features, use the latest version (master branch in Git). The latest version in the master branch has all the latest features and has passed automated testing, but has not been completely manually tested ("bleeding edge").
- If a required feature is not yet available in a stable release, but you do not want to use the master branch, it is possible to check out a pre-release version or a release branch. It is recommended to start from a stable version and then follow the instructions for *Updating to a Pre-Release Version* or *Updating to a Release Branch*.
- If you plan to use another project which is based on ESP-IDF, please check the documentation of that project to determine the version(s) of ESP-IDF it is compatible with.

See *Updating ESP-IDF* if you already have a local copy of ESP-IDF and wish to update it.

9.3 Versioning Scheme

ESP-IDF uses Semantic Versioning. This means that:

- Major Releases, like `v3.0`, add new functionality and may change functionality. This includes removing deprecated functionality.
  If updating to a new major release (for example, from `v2.1` to `v3.0`), some of your project's code may need updating and functionality may need to be re-tested. The release notes on the Releases page include lists of Breaking Changes to refer to.
- Minor Releases like `v3.1` add new functionality and fix bugs but will not change or remove documented functionality, or make incompatible changes to public APIs.
  If updating to a new minor release (for example, from `v3.0` to `v3.1`), your project's code does not require updating, but you should re-test your project. Pay particular attention to the items mentioned in the release notes on the Releases page.
- Bugfix Releases like `v3.0.1` only fix bugs and do not add new functionality.
  If updating to a new bugfix release (for example, from `v3.0` to `v3.0.1`), you do not need to change any code in your project, and you only need to re-test the functionality directly related to bugs listed in the release notes on the Releases page.

9.4 Support Periods

Each ESP-IDF major and minor release version has an associated support period. After this period, the release is End of Life and no longer supported.

The ESP-IDF Support Period Policy explains this in detail, and describes how the support periods for each release are determined.

Each release on the Releases page includes information about the support period for that particular release.

As a general guideline:

- If starting a new project, use the latest stable release.
- If you have a GitHub account, click the "Watch" button in the top-right of the Releases page and choose "Releases only". GitHub will notify you whenever a new release is available. Whenever a bug fix release is available for the version you are using, plan to update to it.
- If possible, periodically update the project to a new major or minor ESP-IDF version (for example, once a year.) The update process should be straightforward for Minor updates, but may require some planning and checking of the release notes for Major updates.
- Always plan to update to a newer release before the release you are using becomes End of Life.

Each ESP-IDF major and minor release (V4.1, V4.2, etc) is supported for 30 months after the initial stable release date.

Supported means that the ESP-IDF team will continue to apply bug fixes, security fixes, etc to the release branch on GitHub, and periodically make new bugfix releases as needed.

Support period is divided into "Service" and "Maintenance" period:

Period	Duration	Recommended for new projects?
Service	12 months	Yes
Maintenance	18 months	No

During the Service period, bugfixes releases are more frequent. In some cases, support for new features may be added during the Service period (this is reserved for features which are needed to meet particular regulatory requirements or standards for new products, and which carry a very low risk of introducing regressions.)

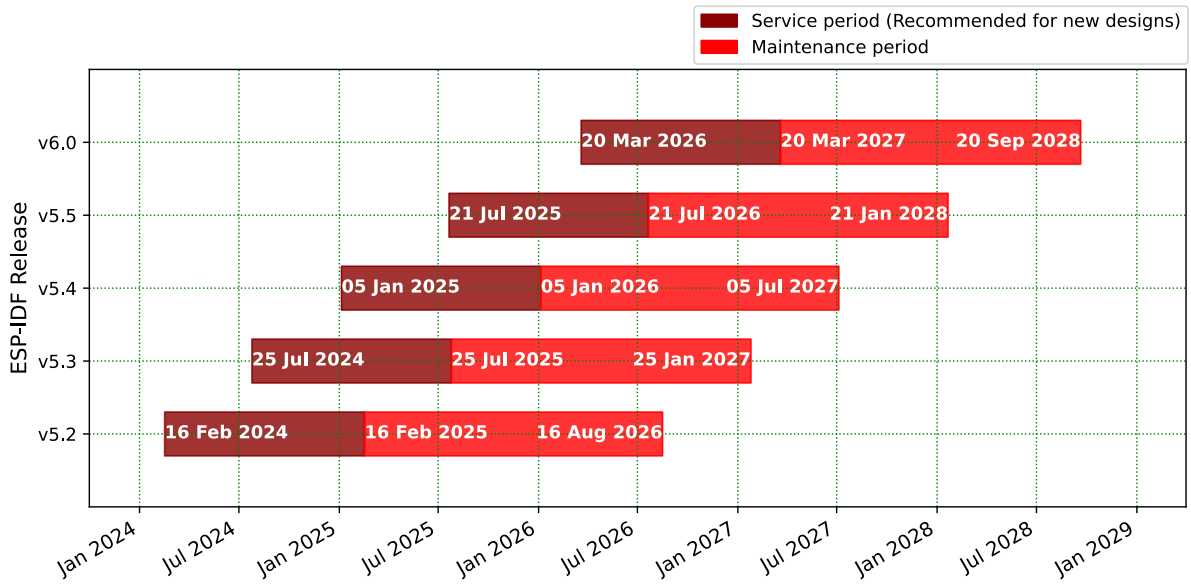
During the Maintenance period, the version is still supported but only bugfixes for high severity issues or security issues will be applied.

Using an "In Service" version is recommended when starting a new project.

Users are encouraged to upgrade all projects to a newer ESP-IDF release before the support period finishes and the release becomes End of Life (EOL). It is our policy to not continue fixing bugs in End of Life releases.

Pre-release versions (betas, previews, `-rc` and `-dev` versions, etc) are not covered by any support period. Sometimes a particular feature is marked as "Preview" in a release, which means it is also not covered by the support period.

The ESP-IDF Programming Guide has information about the different versions of ESP-IDF (major, minor, bugfix, etc).



9.5 Checking the Current Version

The local ESP-IDF version can be checked by using idf.py:

```
idf.py --version
```

The ESP-IDF version is also compiled into the firmware and can be accessed (as a string) via the macro `IDF_VER`. The default ESP-IDF bootloader will print the version on boot (the version information is not always updated if the code in the GitHub repo is updated, it only changes if there is a clean build or if that particular source file is recompiled).

If writing code that needs to support multiple ESP-IDF versions, the version can be checked at compile time using *compile-time macros*.

Examples of ESP-IDF versions:

Version String	Meaning
`v3.2-dev-306-gbeb3611ca`	Master branch pre-release. - `v3.2-dev` - in development for version 3.2. - `306` - number of commits after v3.2 development started. - `beb3611ca` - commit identifier.
`v3.0.2`	Stable release, tagged `v3.0.2`.
`v3.1-beta1-75-g346d6b0ea`	Beta version in development (on a *release branch*). - `v3.1-beta1` - pre-release tag. - `75` - number of commits after the pre-release beta tag was assigned. - `346d6b0ea` - commit identifier.
`v3.0.1-dirty`	Stable release, tagged `v3.0.1`. - `dirty` means that there are modifications in the local ESP-IDF directory.

9.6 Git Workflow

The development (Git) workflow of the Espressif ESP-IDF team is as follows:

- New work is always added on the master branch (latest version) first. The ESP-IDF version on `master` is always tagged with `-dev` (for "in development"), for example `v3.1-dev`.
- Changes are first added to an internal Git repository for code review and testing but are pushed to GitHub after automated testing passes.
- When a new version (developed on `master`) becomes feature complete and "beta" quality, a new branch is made for the release, for example `release/v3.1`. A pre-release tag is also created, for example `v3.1-beta1`. You can see a full list of branches and a list of tags on GitHub. Beta pre-releases have release notes which may include a significant number of Known Issues.
- As testing of the beta version progresses, bug fixes will be added to both the `master` branch and the release branch. New features for the next release may start being added to `master` at the same time.
- Once testing is nearly complete a new release candidate is tagged on the release branch, for example `v3.1-rc1`. This is still a pre-release version.
- If no more significant bugs are found or reported, then the final Major or Minor Version is tagged, for example `v3.1`. This version appears on the Releases page.
- As bugs are reported in released versions, the fixes will continue to be committed to the same release branch.
- Regular bugfix releases are made from the same release branch. After manual testing is complete, a bugfix release is tagged (i.e., `v3.1.1`) and appears on the Releases page.

9.7 Updating ESP-IDF

Updating ESP-IDF depends on which version(s) you wish to follow:

- *Updating to Stable Release* is recommended for production use.

- *Updating to Master Branch* is recommended for the latest features, development use, and testing.
- *Updating to a Release Branch* is a compromise between the first two.

Note: These guides assume that you already have a local copy of ESP-IDF cloned. To get one, check Step 2 in the *Getting Started* guide for any ESP-IDF version.

9.7.1 Updating to Stable Release

To update to a new ESP-IDF release (recommended for production use), this is the process to follow:

- Check the Releases page regularly for new releases.
- When a bugfix release for the version you are using is released (for example, if using `v3.0.1` and `v3.0.2` is released), check out the new bugfix version into the existing ESP-IDF directory.
- In Linux or macOS system, please run the following commands to update the local branch to vX.Y.Z:

```
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- In the Windows system, please replace `cd $IDF_PATH` with `cd %IDF_PATH%`.
- When major or minor updates are released, check the Release Notes on the releases page and decide if you want to update or to stay with your current release. Updating is via the same Git commands shown above.

Note: If you installed the stable release via zip file instead of using git, it might not be possible to update versions using the commands. In this case, update by downloading a new zip file and replacing the entire `IDF_PATH` directory with its contents.

9.7.2 Updating to a Pre-Release Version

It is also possible to `git checkout` a tag corresponding to a pre-release version or release candidate, the process is the same as *Updating to Stable Release*.

Pre-release tags are not always found on the Releases page. Consult the list of tags on GitHub for a full list. Caveats for using a pre-release are similar to *Updating to a Release Branch*.

9.7.3 Updating to Master Branch

Note: Using Master branch means living "on the bleeding edge" with the latest ESP-IDF code.

To use the latest version on the ESP-IDF master branch, this is the process to follow:

- In Linux or macOS system, please run the following commands to check out to the master branch locally:

```
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- In the Windows system, please replace `cd $IDF_PATH` with `cd %IDF_PATH%`.
- Periodically, re-run `git pull` to pull the latest version of master. Note that you may need to change your project or report bugs after updating your master branch.

- To switch from master to a release branch or stable version, run `git checkout` as shown in the other sections.

Important: It is strongly recommended to regularly run `git pull` and then `git submodule update --init --recursive` so a local copy of master does not get too old. Arbitrary old master branch revisions are effectively unsupportable "snapshots" that may have undocumented bugs. For a semi-stable version, try *Updating to a Release Branch* instead.

9.7.4 Updating to a Release Branch

In terms of stability, using a release branch is part-way between using the master branch and only using stable releases. A release branch is always beta quality or better, and receives bug fixes before they appear in each stable release.

You can find a list of branches on GitHub.

For example, in Linux or macOS system, you can execute the following commands to follow the branch for ESP-IDF v3.1, including any bugfixes for future releases like `v3.1.1`, etc:

```
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

In the Windows system, please replace `cd $IDF_PATH` with `cd %IDF_PATH%`.

Each time you `git pull` this branch, ESP-IDF will be updated with fixes for this release.

Note: There is no dedicated documentation for release branches. It is recommended to use the documentation for the closest version to the branch which is currently checked out.

Chapter 10

Resources

10.1 PlatformIO

- *What Is PlatformIO?*
- *Installation*
- *Configuration*
- *Tutorials*
- *Project Examples*
- *Next Steps*

10.1.1 What Is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

10.1.2 Installation

- PlatformIO IDE is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms.
- PlatformIO Core (CLI) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services

10.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

10.1.4 Tutorials

- ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

10.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation

10.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about integrations with other IDEs or Text Editors
- Get help from PlatformIO community

10.2 CLion

10.2.1 What Is CLion?

CLion is a cross-platform integrated Development Environment (IDE) for C and C++ programming. CLion also provides dedicated support for ESP-IDF, allowing developers to seamlessly work with the ESP-IDF framework.

10.2.2 Installation

To install CLion, please follow the instructions provided in Install CLion for your operating system (Windows, macOS, or Linux).

10.2.3 Configuration

To configure an ESP-IDF project in CLion, please refer to the guide on Configure an ESP CMake project in CLion. This guide will walk you through the necessary steps to set up your project properly.

10.2.4 Resources

For more information about CLion and ESP-IDF integration, please refer to the following resource:

- CLion Documentation: The official documentation for CLion provides detailed information on various aspects of the IDE, including ESP-IDF integration.

10.3 VisualGDB

10.3.1 What Is VisualGDB?

VisualGDB is a powerful extension for Microsoft Visual Studio that provides advanced development tools and features for embedded systems, including support for the ESP-IDF framework. VisualGDB allows you to leverage the familiar

and feature-rich Visual Studio environment for your ESP-IDF projects, enabling efficient coding, debugging, and deployment.

10.3.2 Installation

Please download and install VisualGDB by following the steps stated in VisualGDB download and installation.

10.3.3 Configuration

Creating Advanced ESP32 Projects with ESP-IDF provide basic steps about how to configure an ESP-IDF project in VisualGDB.

You can also refer to Advanced ESP-IDF Project Structure to get a more comprehensive impression for developing ESP-IDF projects using VisualGDB.

10.3.4 Resources

For more information about VisualGDB and ESP-IDF integration, refer to the following resources:

- VisualGDB Documentation: The official documentation for VisualGDB provides comprehensive guides and tutorials on using VisualGDB with ESP-IDF.

For inquiries related to these third-party tools, we recommend seeking assistance from the respective tool's support channels or user communities.

10.4 Useful Links

- The esp32.com forum is a place to ask questions and find community resources.
- Check the Issues section on GitHub if you find a bug or have a feature request. Please check existing Issues before opening a new one.
- A comprehensive collection of solutions, practical applications, components and drivers based on ESP-IDF is available in ESP IoT Solution repository. In most of cases descriptions are provided both in English and in 中文.
- To develop applications using Arduino platform, refer to Arduino core for the ESP32, ESP32-S2 and ESP32-C3.
- Several books have been written about ESP32 and they are listed on Espressif web site.
- If you're interested in contributing to ESP-IDF, please check the *Contributions Guide*.
- For additional ESP32-C6 product related information, please refer to documentation section of Espressif site.
- Download latest and previous versions of this documentation in PDF and HTML format.

Chapter 11

Copyrights and Licenses

11.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2023 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

Some examples use external components which are not Apache licensed, please check the copyright description in each example source code.

11.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- Newlib is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB .
- Xtensa header files are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of FreeRTOS (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in license.txt .
- Original parts of LWIP (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file .
- wpa_supplicant Copyright (c) 2003-2022 Jouni Malinen <j@w1.fi> and contributors and licensed under the BSD license.
- Fast PBKDF2 Copyright (c) 2015 Joseph Birr-Pixton and licensed under CC0 Public Domain Dedication license.
- FreeBSD net80211 Copyright (c) 2004-2008 Sam Leffler, Errno Consulting and licensed under the BSD license.
- argtable3 argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. argtable3 also includes the following software components. For details, please see argtable3 LICENSE file .
  - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
  - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
  - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- linenoise line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- FatFS library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license .

- cJSON library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file .
- micro-ecc library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
- Mbed TLS library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in LICENSE file .
- SPIFFS library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in LICENSE file .
- SD/MMC driver is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- ESP-MQTT MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuanpm at live dot com> is licensed under Apache License 2.0 as described in LICENSE file .

11.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C) ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

Chapter 12

About

This is documentation of ESP-IDF, the framework to develop applications for ESP32-C6.

The ESP32-C6 is a 2.4 GHz Wi-Fi, Bluetooth Low Energy, and 802.15.4 Thread/Zigbee combo SoC, which integrates a 32-bit RISC-V RV32IMAC single-core processor.

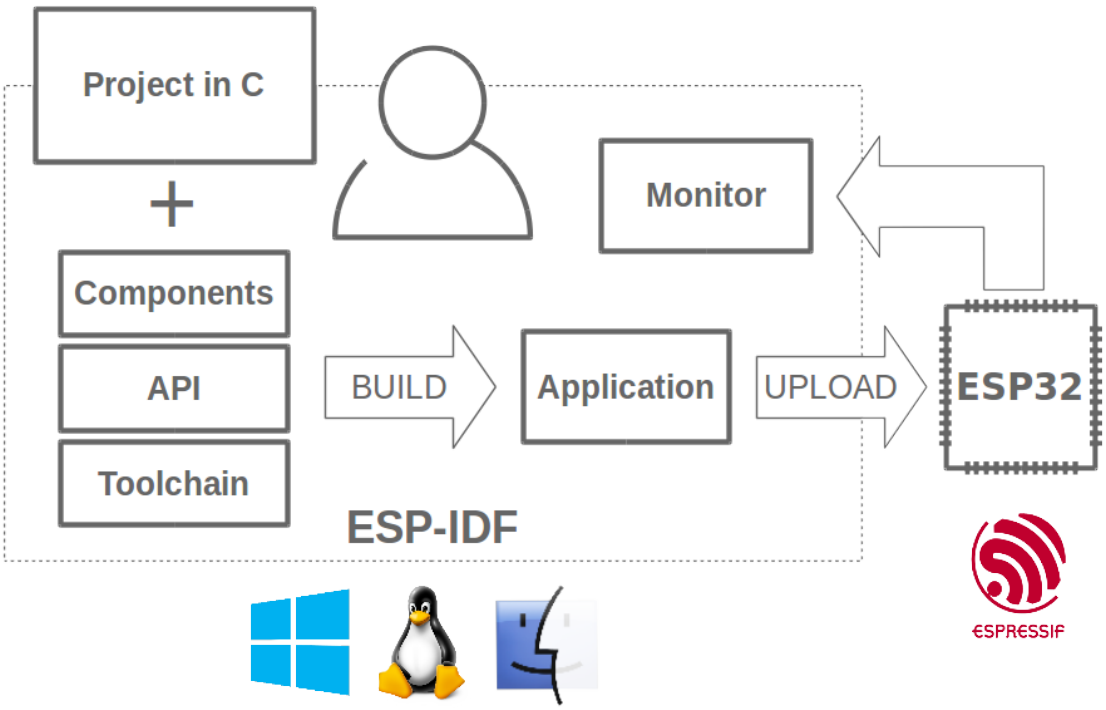

Fig. 1: Espressif IoT Integrated Development Framework

The ESP-IDF, Espressif IoT Development Framework, provides toolchain, API, components and workflows to develop applications for ESP32-C6 using Windows, Linux and macOS operating systems.

Chapter 13

Switch Between Languages

The ESP-IDF Programming Guide is now available in two languages. Please refer to the English version if there is any discrepancy.

- English
- Chinese

You can easily change from one language to another by clicking the language link you can find at the top of every document that has a translation.
