**esp_err_t protocomm_httpd_start(protocomm_t *pc, const protocomm_httpd_config_t *config)**

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_SUPPORTED: Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE: Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM: Memory allocation for server resource failed
- ESP_ERR_HTTPD_*: HTTP server error on start

**Parameters**

- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server

**esp_err_t protocomm_httpd_stop(protocomm_t *pc)**

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance pointer

**Parameters**

- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

### Unions

**union protocomm_httpd_config_data_t**

- include <protocomm_httpd.h> Protocomm HTTPD Configuration Data

### Public Members

**void *handle**

HTTP Server Handle, if ext_handle_provided is set to true

**protocomm_http_server_config_t config**

HTTP Server Configuration, if a server is not already active

### Structures

**struct protocomm_http_server_config_t**

Config parameters for protocomm HTTP server.

### Public Members

**uint16_t port**

Port on which the HTTP server will listen

**size_t stack_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler
unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will
use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

- components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return
- ESP_OK : Success
- ESP_FAIL : Simple BLE start error
- ESP_ERR_NO_MEM : Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE : Error in ble config
- ESP_ERR_INVALID_ARG : Null arguments

Parameters
- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing BLE

esp_err_t protocomm_ble_stop (protocomm_t *pc)
Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of
esp_bt_mem_release in that case.

Return
- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters
- [in] pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

struct name_uuid
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE
characteristics from a smartphone or a similar client device.
Public Members

```c
const char *name
  Name of the handler, which is passed to protocomm layer
```

```c
uint16_t uuid
  UUID to be assigned to the BLE characteristic which is mapped to the handler
```

```c
struct protocomm_ble_config
  Config parameters for protocomm BLE service.
```

Public Members

```c
char device_name[MAX_BLE_DEVNAME_LEN]
  BLE device name being broadcast at the time of provisioning
```

```c
uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
  128 bit UUID of the provisioning service
```

```c
uint8_t *manufacturer_data
  BLE device manufacturer data pointer in advertisement
```

```c
ssize_t manufacturer_data_len
  BLE device manufacturer data length in advertisement
```

```c
ssize_t nu_lookup_count
  Number of entries in the Name-UUID lookup table
```

```c
protocomm_ble_name_uuid_t *nu_lookup
  Pointer to the Name-UUID lookup table
```

Macros

```c
MAX_BLE_DEVNAME_LEN
  BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes
```

```c
BLE_UUID128_VAL_LENGTH
```

```c
MAX_BLE_MANUFACTURER_DATA_LEN
  Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).
```

Type Definitions

```c
typedef struct name_uuid protocomm_ble_name_uuid_t
  This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
```

```c
typedef struct protocomm_ble_config protocomm_ble_config_t
  Config parameters for protocomm BLE service.
```

2.5.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr_ APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.
**Initialization** *`wifi_prov_mgr_init()`* is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other *`wifi_prov_mgr_`* APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *`wifi_prov_mgr_deinit()`*.

```c
wifi_prov_mgr_config_t config = {
  .scheme = wifi_prov_scheme_ble,
  .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure *`wifi_prov_mgr_config_t`* has a few fields to specify the behavior desired of the manager:

- **`scheme`**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - *`wifi_prov_scheme_ble`*: BLE transport and GATT Server for handling provisioning commands
  - *`wifi_prov_scheme_softap`*: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - *`wifi_prov_scheme_console`*: Serial transport and console for handling provisioning commands

- **`scheme_event_handler`**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using *`wifi_prov_scheme_ble`*, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - *`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`*: Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - *`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`*: Free only BLE memory. Used when main application requires classic BT.
  - *`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`*: Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - *`WIFI_PROV_EVENT_HANDLER_NONE`*: Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **`app_event_handler`** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`’s that are emitted to the default event loop handler. See definition of ``wifi_prov_cb_event_t`* for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base,
                         int event_id, void* event_data) {      
  if (event_base == WIFI_PROV_EVENT) {
    switch (event_id) {
      case WIFI_PROV_START:
        ESP_LOGI(TAG, "Provisioning started");
        break;
      case WIFI_PROV_CRED_RECV:
        wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t*)event_data;
```

(下页继续)
The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
Security 0 is simply plain text communication. In this case the pop is simply ignored.

See Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";
wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
// Wait for service to complete
wifi_prov_mgr_wait();
// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`’s and call `wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement.
and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic will be assigned a UUID like 55cc____-fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the proto-ver endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like:

```json
```

Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version/capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding `.proto` files can be found under `wifi_provisioning/proto`):

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting/connected/disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode

Espressif Systems 1077 Release v5.0-dev-489-gef98a36

Submit Document Feedback
- **group_channels (input)** - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have $14 \% 3 = 2$ channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- **period_ms (input)** - Scan parameter specifying how long to wait on each channel

  * **scan_status** - Gives the status of scanning process:
    - **scan_finished** (output) - When scan has finished this returns true
    - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating

  * **scan_result** - For fetching scan results. This can be called even if scan is still on going
    - **start_index** (input) - Starting index from where to fetch the entries from the results list
    - **count** (input) - Number of entries to fetch from the starting index
    - **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

### Additional Endpoints

In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See protocomm for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
--custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

### When / How To Stop Provisioning Service?

The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some
time after the Wi-Fi connection is successfully established. For example, if the application requires the de-
vice to connect to some cloud service and obtain another set of credentials, and exchange this credentials
over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling
\texttt{wifi_prov_mgr_stop_provisioning()} inside the protocomm handler itself. The right amount of de-
lay ensures that the transport resources are freed only after the response from the protocomm handler reaches the
client side application.

**Application Examples**

For complete example implementation see \texttt{provisioning/wifi_prov_mgr}

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: \texttt{esp-idf-provisioning-android}.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: \texttt{esp-idf-provisioning-ios}.

- **Linux/MacOS/Windows:** tools/\texttt{esp_prov} (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as
a debugging tool for developers.

**API Reference**

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/manager.h

**Functions**

\[
\texttt{esp_err_t wifi_prov_mgr_init(wifi_prov_mgr_config_t config)}
\]

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

\textbf{Return}

- ESP_OK: Success
- ESP_FAIL: Fail

\textbf{Parameters}

- \texttt{[in]} \texttt{config}: Configuration structure

\[
\texttt{void wifi_prov_mgr_deinit(void)}
\]

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting
WIFI_PROV_END, and then performs the de-initialization

\[
\texttt{esp_err_t wifi_prov_mgr_is_provisioned(bool *provisioned)}
\]

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS
The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component.

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**
- ESP_OK: Retrieved provision state successfully
- ESP_FAIL: Wi-Fi not initialized
- ESP_ERR_INVALID_ARG: Null argument supplied
- ESP_ERR_INVALID_STATE: Manager not initialized

**Parameters**
- [out] provisioned: True if provisioned, else false

```c
esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure.

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true.

**Return**
- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

**Parameters**
- [in] security: Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- [in] pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- [in] service_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- [in] service_key: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - Ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning(void)
```

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.
Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait ( void )
```

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop ( uint32_t cleanup_delay )
```

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Return:

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: Manager not initialized or provisioning service already started

Parameters:

- [in] cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

```c
esp_err_t wifi_prov_mgr_set_app_info ( const char *label, const char *version, const char **capabilities, size_t total_capabilities )
```

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Return:

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM: Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG: Null argument

Parameters:

- [in] label: String indicating the application name.
- [in] version: String indicating the application version. There is no constraint on format.
- [in] capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] total_capabilities: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create ( const char *ep_name )
```

Create an additional endpoint and allocate internal resources for it.
This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

Note This API can only be called BEFORE provisioning is started
Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application
Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] ep_name: unique name of the endpoint

```
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

Note This API can only be called AFTER provisioning has started
Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application
Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] ep_name: Name of the endpoint
• [in] handler: Endpoint handler function
• [in] user_ctx: User data

```
void wifi_prov_mgr_endpoint_unregister(const char *ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters
• [in] ep_name: Name of the endpoint

```
esp_err_t wifi_prov_mgr_event_handler(void *ctx, system_event_t *event)
```

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events

Note : This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

Return
• ESP_OK : Event handled successfully

Parameters
• [in] ctx: Event context data
• [in] event: Event info
**esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)**

Get state of Wi-Fi Station during provisioning.

**Return**
- ESP_OK : Successfully retrieved Wi-Fi state
- ESP_FAIL : Provisioning app not running

**Parameters**
- [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

**esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)**

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Return**
- ESP_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL : Provisioning app not running

**Parameters**
- [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

**esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)**

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocol, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

**Return**
- ESP_OK : Wi-Fi configured and started successfully
- ESP_FAIL : Failed to set configuration

**Parameters**
- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

**esp_err_t wifi_prov_mgr_reset_provisioning (void)**

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Return**
- ESP_OK : Reset provisioning config successfully
- ESP_FAIL : Failed to reset provisioning config

**esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)**

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Return**
- ESP_OK : Reset provisioning state machine successfully
- ESP_FAIL : Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE : Manager not initialized

**Structures**

**struct wifi_prov_event_handler_t**

Event handler that is used by the manager while provisioning service is active.
Public Members

`wifi_prov_cb_func_t event_cb`
Callback function to be executed on provisioning events

`void *user_data`
User context data to pass as parameter to callback function

`struct wifi_prov_scheme`
Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:
- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

Public Members

`esp_err_t (*prov_start)(protocomm_t *pc, void *config)`
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

`esp_err_t (*prov_stop)(protocomm_t *pc)`
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

`void (*new_config)(void)`
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to `prov_start()`

`void (*delete_config)(void *config)`
Function which is to be called by the manager to delete a configuration generated using `new_config()`

`esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)`
Function which is to be called by the manager to set the service name and key values in the configuration structure

`esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)`
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

`wifi_mode_t wifi_mode`
Sets mode of operation of Wi-Fi during provisioning This is set to :
- `WIFI_MODE_APSTA` for SoftAP transport
- `WIFI_MODE_STA` for BLE transport

`struct wifi_prov_mgr_config_t`
Structure for specifying the manager configuration.

Public Members

`wifi_prov_scheme_t scheme`
Provisioning scheme to use. Following schemes are already available:
- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

`wifi_prov_event_handler_t scheme_event_handler`
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this
field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

`wifi_prov_event_handler_t app_event_handler`

Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE

Event handler can be set to none if not used.

Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t

Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Enumerations

enum wifi_prov_cb_event_t

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

WIFI_PROV_INIT

Emitted when the manager is initialized

WIFI_PROV_START

Indicates that provisioning has started

WIFI_PROV_CRED_RECV

Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

WIFI_PROV_CRED_FAIL

Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

WIFI_PROV_CRED_SUCCESS

Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

WIFI_PROV_END

Signals that provisioning service has stopped
**WIFI_PROV_DEINIT**
Signals that manager has been de-initialized

**enum wifi_prov_security**
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

*Values:*

**WIFI_PROV_SECURITY_0** = 0
No security (plain-text communication)

**WIFI_PROV_SECURITY_1**
This secure communication mode consists of X25519 key exchange
- proof of possession (pop) based authentication
- AES-CTR encryption

**Header File**
- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

**Functions**

```c
void wifi_prov_scheme_ble_event_cb_free_btdm(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_ble(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_bt(void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

**esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)**
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000ffff-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**
- [in] uuid128: A custom 128 bit UUID

**esp_err_t wifi_prov_scheme_ble_set_mfg_data (uint8_t *mfg_data, ssize_t mfg_data_len)**
Set manufacturer specific data in scan response.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. (mfg_data_len + 2) < 31 - (device_name_length + 2 ). If the mfg_data length exceeds this limit, the length will be truncated.

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**
- [in] mfg_data: Custom manufacturer data
• [in] mfg_data_len: Manufacturer data length

**Macros**

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

**Header File**

- `components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h`

**Functions**

```c
void wifi_prov_scheme_softap_set_httpd_handle (void *handle)
```

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note** This API should be called before `wifi_prov_mgr_start_provisioning()`

**Parameters**

- [in] handle: Handle to HTTPD server instance

**Header File**

- `components/wifi_provisioning/include/wifi_provisioning/scheme_console.h`

**Functions**

```c
esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm `protocomm_req_handler_t`) using `protocomm_add_endpoint()`

**Structures**

```c
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.

**Public Members**

- `char ip_addr[IP4ADDR_STRLEN_MAX]`
  IP Address received by station
- `char bssid[6]`
  BSSID of the AP to which connection was established
- `char ssid[33]`
  SSID of the to which connection was established
- `uint8_t channel`
  Channel of the AP
uint8_t auth_mode
   Authorization mode of the AP

struct wifi_prov_config_get_data_t
   WiFi status data to be sent in response to get_status request from master.

Public Members

wifi_prov_sta_state_t wifi_state
   WiFi state of the station

wifi_prov_sta_fail_reason_t fail_reason
   Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)

wifi_prov_sta_conn_info_t conn_info
   Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

struct wifi_prov_config_set_data_t
   WiFi config data received by slave during set_config request from master.

Public Members

char ssid[33]
   SSID of the AP to which the slave is to be connected

char password[64]
   Password of the AP

char bssid[6]
   BSSID of the AP

uint8_t channel
   Channel of the AP

struct wifi_prov_config_handlers
   Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
   Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
   Handler function called when WiFi connection configuration (e.g. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)
   Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx
   Context pointer to be passed to above handler functions upon invocation
Chapter 2. API

**Type Definitions**

```c
typedef struct wifi_prov_ctx wifi_prov_ctx_t
Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.
```

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

```c
typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
Internal handlers for receiving and responding to protocomm requests from master.
```

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

**Enumerations**

```c
enum wifi_prov_sta_state_t
WiFi STA status for conveying back to the provisioning master.
```

Values:

- `WIFI_PROV_STA_CONNECTING`
- `WIFI_PROV_STA_CONNECTED`
- `WIFI_PROV_STA_DISCONNECTED`

```c
enum wifi_prov_sta_fail_reason_t
WiFi STA connection fail reason.
```

Values:

- `WIFI_PROV_STA_AUTH_ERROR`
- `WIFI_PROV_STA_AP_NOT_FOUND`

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 provisioning 目录下。

## 2.6 存储 API

### 2.6.1 FAT 文件系统

ESP-IDF 使用 FatFs 库来实现 FAT 文件系统。FatFs 库位于 fatfs 组件中，您可以直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS（虚拟文件系统）使用 FatFs 库的大多数功能。

此外，我们对 FatFs 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 FatFs 驱动映射到物理磁盘。

**FatFs 与 VFS 配合使用**

头文件 fatfs/vfs/esp_vfs_fat.h 定义了连接 FatFs 和 VFS 的函数。

函数 `esp_vfs_fat_register()` 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 FatFs API。函数 `esp_vfs_fat_unregister()` 删除在 VFS 中的注册，并释放 FATFS 结构。

多数应用程序在使用 `esp_vfs_fat_` 函数时，采用如下步骤：

1. 调用 `esp_vfs_fat_register()`，指定:
   - 挂载文件系统的路径前缀（例如，"/sdcard" 或 "/spiflash"
   - FatFs 驱动编号
   - 一个用于接收指向 FATFS 结构指针的变量
2. 调用 `ff_diskio_register()` 为步骤 1 中的驱动编号注册磁盘 I/O 驱动；
3. 调用 FatFs 函数 `f_mount`，随后调用 `f_fdisk` 或 `f_mkfs`，并使用与传递到 `esp_vfs_fat_register()` 相同的驱动编号挂载文件系统，请参考 FatFs 文档，查看更多信息；
4. 调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，"/sdcard/hello.txt"）执行打开、读取、写入、删除、复制等操作。文件系统默认使用 8.3 文件名格式（SFN）。若您需要使用长文件名（LFN），启用 CONFIG_FATFS_LONG_FILENAMES 选项。请参考 here，查看更多信息；
5. 您可以选择启用 CONFIG_FATFS_USE_FASTSEEK 选项，使用 POSIX lseek 来快速执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭然后重新打开）文件；
6. 您也可以选择直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径（例如，"/hello.txt"）；
7. 关闭所有打开的文件；
8. 调用 FatFs 函数 f_mount 并使用 NULL FATFS* 参数，为与上述编号相同的驱动卸载文件系统；
9. 调用 FatFs 函数 ff_diskio_register() 并使用 NULL ff_diskio_impl_t* 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动。
10. 调用 esp_vfs_fat_unregister_path() 并使用文件系统挂载的路径将 FatFs 从 VFS 中移除，并释放步骤 1 中分配的 FATFS 结构。

便捷函数 esp_vfs_fat_sdmmc_mount，esp_vfs_fat_sdspi_mount，和 esp_vfs_fat_sdmmcUnmount 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍这两个函数。

esp_err_t esp_vfs_fat_register(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

Note This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

Parameters
- base_path: path prefix where FATFS should be registered
- fat_drive: FATFS drive specification; if only one drive is used, can be an empty string
- max_files: maximum number of files which can be open at the same time
- [out] out_fs: pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

esp_err_t esp_vfs_fat_unregister_path(const char *base_path)

Un-register FATFS from VFS.

Note FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

Parameters
- base_path: path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

FatFs 与 VFS 和 SD 卡配合使用

头文件 fatfs/vfs/esp_vfs_fat.h 定义了两个便捷函数 esp_vfs_fat_sdmmc_mount() 和 esp_vfs_fat_sdmmcUnmount()。这两个函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码并将更多高级功能集成到产品应用中。
Chapter 2. API

### esp_vfs_fat_sdmmc_unmount()

用于卸载文件系统并释放从esp_vfs_fat_sdmmc_mount()函数获取的资源。

```c
esp_err_t esp_vfs_fat_sdmmc_unmount()
{ }
```

### esp_vfs_fat_sdmmc_mount()

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**Parameters**
- base_path: path where partition should be registered (e.g. “/sdcard”)
- host_config: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- slot_config: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT(). (Deprecated) For SPI peripheral, pass a pointer to sdspi_slot_config_t structure initialized using SD-SPI SLOT_CONFIG_DEFAULT().
- mount_config: pointer to structure with extra parameters for mounting FATFS
- [out] out_card: if not NULL, pointer to the card information structure will be returned via this argument

```c
esp_err_t esp_vfs_fat_sdspi_mount()
{ }
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

**Return**
- ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
• ESP_ERR_NO_MEM if memory cannot be allocated
• ESP_FAIL if partition can not be mounted
• other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters
• base_path: path where partition should be registered (e.g. “/sdcard”)
• host_config_input: Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
• slot_config: Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to sdspi_device_config_t structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
• mount_config: Pointer to structure with extra parameters for mounting FATFS
• [out] out_card: If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_sdcardUnmount(const char *base_path, sdmmc_card_t*card)
Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_spiflash_mount()

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the card argument is unregistered
• ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

FatFs 与 VFS 配合使用（只读模式下）
头文件 fatfs/vfs/esp_vfs_fat.h 也定义了两个便捷函数esp_vfs_fat_rawflash_mount()和esp_vfs_fat_rawflashUnmount()。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

esp_err_t esp_vfs_fat_rawflash_mount(const char *base_path, const char *partition_label,
const esp_vfs_fat_mount_config_t *mount_config)
Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:
• finds the partition with defined partition_label. Partition label should be configured in the partition table.
• mounts FAT partition using FATFS library
* registers FATFS library with VFS, with prefix given by base_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_rawflash_mount was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**
- base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
- partition_label: label of the partition which should be used
- mount_config: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflashUnmount(const char *base_path, const char *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

**Parameters**
- base_path: path where partition should be registered (e.g. “/spiflash”)
- partition_label: label of partition to be unmounted

---

**FatFs 磁盘 I/O 层**

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

```
void ff_diskio_register (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

**Parameters**
- pdrv: drive number
- discio_impl: pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

- DSTATUS (*init)(unsigned char pdrv)
  - disk initialization function
- DSTATUS (*status)(unsigned char pdrv)
  - disk status check function
- DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
  - sector read function
Chapter 2. API

DRESULT(*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count);

sector write function

DRESULT(*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void ff_diskio_register_sdmmc(unsigned char pdrv, sdmmc_card_t *card)

Register SD/MMC diskio driver

Parameters
- pdrv: drive number
- card: pointer to sdmmc_card_t structure describing a card; card should be initialized before calling I f_mount.

esp_err_t ff_diskio_register_wl_partition(unsigned char pdrv, wl_handle_t flash_handle)

Register spi flash partition

Parameters
- pdrv: drive number
- flash_handle: handle of the wear levelling partition.

esp_err_t ff_diskio_register_raw_partition(unsigned char pdrv, const esp_partition_t *part_handle)

Register spi flash partition

Parameters
- pdrv: drive number
- part_handle: pointer to raw flash partition.

2.6.2 量产程序

介绍

这一程序主要用于量产时为每一设备创建工厂NVS（非易失性存储器）分区镜像。NVS 分区镜像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制镜像。您需要使用以下工具将镜像烧录到设备上：
- esptool.py
- Flash 下载工具（仅适用于 Windows）。下载后解压，然后按照 doc 文件夹中的说明操作。
- 使用定制的生产工具直接烧录程序

准备工作

该程序依赖于 esp-idf 的 NVS 分区程序

- 操作系统要求:
  - Linux、MacOS 或 Windows（标准版）
- 安装依赖包:
  - Python

注释:

使用该程序之前，请确保:
- Python 路径已添加到 PATH 环境变量中;
- 已经安装 requirement.txt 中的软件包。requirement.txt 在 esp-idf 根目录下。
Chapter 2. API 参考

具体流程

CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。
配置文件中数据格式如下（REPEAT 标签可选）:

```yaml
name1,namespace,       # 第一个条目应该为 "namespace" 类型
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

注解：文件第一行应始终为 namespace 条目。

每行应包含三个参数：key, type 和 encoding，并以逗号分隔。如果有 REPEAT 标签，则主 CSV 文件中所有设备此键值均相同。
有关各个参数的详细说明，请参阅 NVS 分区生成程序的 README 文件。

CSV 配置文件示例如下:

```yaml
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

注解：
请确保:
- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。

主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行均对应一个设备实体。

主 CSV 文件的数据格式如下:

```yaml
key1,key2,key3,....
value1,value2,value3,....
```

注解：文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列（键），这些列将被视为元数据，而不会编译进最终二进制文件。
Chapter 2. API 参考

每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行（即第一个条目）输入对应的值，后面其他行为空。

参数描述如下：

value Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6fee,,103
```

注解：如果出现 REPEAT 标签，则会在相同目录下生成一个新的主 CSV 文件用于主输入文件，并在每行为带有 REPEAT 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。中间 CSV 文件的格式如下：

```
key,type,encoding,value
key,namespace,,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

运行量产程序

使用方法：

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

可选参数：

```
序号 参数 描述
1 -h, --help 显示帮助信息并退出
```

命令：

运行 mfg_gen.py {command} -h 查看更多帮助信息

```
序号 参数 描述
1 generate 生成 NVS 分区
2 generate-key 生成加密密钥
```

为每个设备生成工厂镜像（默认）

使用方法：

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
    [--keyfile KEYFILE] [--inputkey INPUTKEY]
    [--outdir OUTDIR]
    conf values prefix size
```
位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>待解析的 CSV 配置文件路径</td>
</tr>
<tr>
<td>values</td>
<td>待解析的主 CSV 文件路径</td>
</tr>
<tr>
<td>prefix</td>
<td>每个输出文件名前缀的唯一名称</td>
</tr>
<tr>
<td>size</td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>每个文件名后缀的唯一文件标识符（主 CSV 文件中的任意键），默认为数值 1、2、3…</td>
</tr>
<tr>
<td>--version [1,2]</td>
<td>• 设置多页 Blob 版本。 • 1 - 禁用多页 Blob； • 2 - 启用多页 Blob； • 默认版本：版本 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>生成 NVS 分区加密密钥</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>内含 NVS 分区加密密钥的文件</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>

请运行以下命令为每个设备生成工厂镜像，量产程序同时提供了一个 CSV 示例文件:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000
```

主要 CSV 文件应在 file 类型下设置一个相对路径，相对于运行该程序的当前目录。

为每个设备生成工厂加密镜像

运行以下命令为每一设备生成工厂加密镜像，量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen
```

注解：创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参见NVS 密钥分区。

- 提供加密密钥用作二进制输入文件来进行加密:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keyfile keys/sample_keys.bin
```

仅生成加密密钥

使用方法:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数：+

```
+ -h, --help | 显示帮助信息并退出 |
+ --keyfile KEYFILE | 加密密钥文件的输出路径 |
+ --outdir OUTDIR | 输出目录，用于存储创建的文件（默认当前目录） |
```

Espressif Systems 1097 Release v5.0-dev-489-gef98a36

Submit Document Feedback
运行以下命令仅生成加密密钥:
```
python mfg_gen.py generate-key
```

**注解:** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为：`%m-%d_%H-%M`。如需自定义目标文件名，请使用 `keyfile` 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂镜像加密。

`fileid` 参数的默认值为 1、2、3… 与主 CSV 文件中的行一一对应，内含设备配置值。

运行量产程序时，将在指定的 `outdir` 目录下创建以下文件夹：

- `bin`/ 存储生成的二进制文件
- `csv`/ 存储生成的中间 CSV 文件
- `keys`/ 存储加密密钥（创建工厂加密密钥时会用到）

### 2.6.3 非易失性存储库

**简介**

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

**底层存储** NVS 库通过调用 `esp_partition` API 使用主 flash 的部分空间，包括 data 类型和 nvs 子类型的所有分区。应用程序可调用 `nvs_open()` API 选择使用带有 nvs 标签的分区，也可以通过调用 `nvs_open_from_partition()` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端，来将数据保存至其他 flash 芯片（SPI 或 I2C 接口）、RTC 或 FRAM 中。

**注解:** 如果 NVS 分区被截断（例如，更改分区表布局时），则应擦除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

**注解:** NVS 最适合存储一些较小的数据，而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串，请考虑使用基于磨损均衡的 FAT 文件系统。

**键值对** NVS 的操作对象为键值对，其中键是 ASCII 字符串，当前支持的最大键长为 15 个字符。值可以为以下几种类型：

- 整 数 型: `uint8_t, int8_t, uint16_t, int16_t, uint32_t, int32_t, uint64_t` 和 `int64_t`;
- 以 `'0'` 结尾的字符串;
- 可变长度的二进制数据 (BLOB)

**注解:** 字符串值当前上限为 4000 字节，其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6%，减去 4000 字节，以较低值为准。

后续可能会增加对 `float` 和 `double` 等其他类型数据的支持。

键必须唯一。为现有的键写入新的值可能产生如下结果：

- 如果新旧值数据类型相同，则更新值；
- 如果新旧值数据类型不同，则返回错误。
读取时也会执行数据类型检查。如果读取操作的数据类型与该值的数据类型不匹配，则返回错误。

命名空间 为了减少不同组件之间命名的潜在冲突，NVS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则：例如，最多可占 15 个字符。命名空间的名称在调用 nvs_open() 或 nvs_open_from_partition 中指定，调用后将返回一个不透明句柄，用于后续调用 nvs_get_*、nvs_set_* 和 nvs_commit 函数。这样，一个句柄关联一个命名空间，键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVS 分区内具有相同名称的命名空间将被视为不同的命名空间。

NVS 迭代器 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVS 中存储的键值对。

您可以使用以下函数，执行相关操作：

- nvs_entry_find：返回一个不透明句柄，用于后续调用 nvs_entry_next 和 nvs_entry_info 函数；
- nvs_entry_next：返回指向下一个键值对的迭代器；
- nvs_entry_info：返回每个键值对的信息。

如果未找到符合标准的键值对，则 nvs_entry_find 和 nvs_entry_next 将返回 NULL，此时不必释放迭代器。若不再需要迭代器，可使用 nvs_release_iterator 释放迭代器。

安全性、篡改性及鲁棒性 NVS 与 ESP32 flash 加密系统不直接兼容。但如果 NVS 加密与 ESP32 flash 加密一起使用时，数据仍可以加密形式存储。详情请参阅 NVS 加密。

如果未启用 NVS 加密，任何对 flash 芯片有物理访问权限的用户都可修改、删除或添加键值对。NVS 加密启用后，如果不知道相应的 NVS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对错误操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVS 库会尝试恢复。在任何时间点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库还应当能对 flash 中的任意数据进行正确初始化。

NVS 加密

NVS 分区内存储的数据可使用 AES-XTS 进行加密，类似于 IEEE P1619 磁盘加密标准中提到的加密方式。为了实现加密，每个条目被均视为一个扇区，并将条目相对地址（相对于分区开头）传递给加密算法，用作扇区号。可通过 CONFIG_NVSS_ENCRYPTION 启用 NVS 加密。NVS 加密所需的密钥存储于其他分区，并进行了 flash 加密。因此，在使用 NVS 加密前应先启用 flash 加密。

启用 Flash 加密时，默认启用 NVS 加密。这是因为 Wi-Fi 驱动在默认的 NVS 分区内存储了凭证（如 SSID 和口令）。启用平台级加密后，仍需将它们作为默认选项进行加密。

使用 NVS 加密，分区表必须包含 NVS 密钥分区。在分区表选中 menuconfig->Partition Table 下，为 NVS 加密提供了两个包含 NVS 密钥分区的分区表。您可以通过工程配置菜单（idf.py menuconfig）进行选择。请参考 security/flash_encryption 中的例子，了解如何配置和使用 NVS 加密功能。

NVS 密钥分区

应用程序如果想使用 NVS 加密，则需要编译进一个类型为 data，子类型为 key 的密钥分区。该分区应标记为加密且最小为 4096 字节。如需了解更多详细信息，请参考分区表。在分区表选中 menuconfig->Partition Table 下提供了两个包含 NVS 密钥分区的额外分区表，可以直接用于 NVS 加密。这些分区的具体结构见下表：

```
| +---------------------------------------------+          |
| +---------------------------------------------+          |
| XTS encryption key (32)                     |          |
| +---------------------------------------------+          |
| XTS tweak key (32)                           |          |
| +---------------------------------------------+          |
| CRC32 (4)                                    |          |
```
可以通过以下两种方式生成NVS密钥分区中的XTS加密密钥：

1. 在ESP芯片上生成密钥：
   启用NVS加密时，可用nvs_flash_init() API函数来初始化加密的默认NVS分区。在内部生成ESP芯片上的XTS加密密钥。在找到NVS密钥分区后，API函数调用nvs_flash/include/nvs.flash.h提供的nvs_flash_generate_keys()函数，自动生成并存储该分区中的NVS密钥。只有当各自的密钥分区为空时，才会生成并存储新的密钥。可以借助nvs_flash_secure_init_partition()函数来初始化一个特定的加密NVS分区。API函数nvs_flash_secure_init()和nvs_flash_secure_init_partition()不在内部产生密钥。当这些API函数用于初始化加密的NVS分区时，可以在启动时调用nvs_flash.h提供的nvs_flash_generate_keys()函数生成密钥，以加密的形式把密钥写到密钥分区上。

2. 使用预先生成的密钥分区：
   若NVS密钥分区中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用NVS分区生成工具生成包含XTS加密密钥的NVS密钥分区。用户可以借助以下两个命令，将预先生成的密钥分区储存在flash上：
   i) 建立并烧录分区表
      ```
      idf.py partition_table partition_table-flash
      ```
   ii) 调用parttool.py，将密钥存放在flash上的NVS密钥分区中。有关分区表<apidguides/partition-tables>的分区工具部分。

由于分区已标记为加密，而且启用了Flash加密，引导程序在首次启动时将使用flash加密对密钥分区进行加密。

应用程序可以使用不同的密钥对不同的NVS分区进行加密，这样就会需要多个加密密钥分区。应用程序应为加解密操作提供正确的密钥或密钥分区。

加密读取/写入 nvs_get_*和nvs_set_*等API函数同样可以对NVS加密分区执行读写操作。

加密默认的NVS分区：无需额外步骤即可启用默认NVS分区的加密。启用CONFIG_NVSENCRIPTION时，nvs_flash_init() API函数会在内部使用找到的第一个NVS密钥分区执行额外步骤，以启用默认NVS分区的加密（详情请参考API文档）。另外，nvs_flash_secure_init() API函数也可以用来启用默认NVS分区的加密。

加密一个自定义的NVS分区：使用nvs_flash_secure_init_partition() API函数启用自定义NVS分区的加密，而非nvs_flash_secure_init_partition()。

使用nvs_flash_secure_init()和nvs_flash_secure_init_partition() API函数时，应用程序需在加密状态下执行NVS读写操作，应遵循以下步骤：
1. 使用esp_partition_find API查找密钥分区和NVS数据库分区；
2. 使用nvs_flash_read_security_cfg或nvs_flash_generate_keys API填充nvs_sec_cfg.t结构；
3. 使用nvs_flash_secure_init或nvs_flash_secure_init_partition API初始化NVS flash分区；
4. 使用nvs_open或nvs_open_from_partition API打开命名空间；
5. 使用nvs_get_*或nvs_set_* API执行NVS读取/写入操作；
6. 使用nvs_flash_deinit API释放已初始化的NVS分区。

NVS分区生成程序

NVS分区生成程序帮助生成NVS分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由CSV文件提供，详情请参考NVS分区生成程序。
应用示例

ESP-IDF storage 目录下提供了数个代码示例:

storage/nvs_rw_value

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将
这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。
诊断程序以纯文本形式提供，帮助您追踪程序流程，及时发现问题。

storage/nvs_rw_blob

演示如何读取及写入 NVS 单个整数值和 Blob（二进制大对象），并在 NVS 中存储这一数值，
即便 ESP32 模组重启也不会消失。

- value - 记录 ESP32 模组软重启次数和硬重启次数。
- blob - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。
每次手动软重启后，该表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉
GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

storage/nvs_rw_value_cxx

这个例子与 storage/nvs_rw_value 完全一样，只是使用了 C++ 的 NVS 处理类。

内部实现

键值对日志 NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在
day志最后增加一对新的键值对，同时将旧的键值对标记为已删除。

页面和条目 NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分
的整体日志。逻辑页面对应 flash 的一个物理扇区，正在使用的页面具有与之相关联的序列号。序列号
赋予了页面顺序，较高的序列号对应较晚创建的页面。页面有以下几种状态:

空或未初始化 页面对应的 flash 扇区为空白状态（所有字节均为 0xff）。此时，页面未存储任何数据且
没有关联的序列号。

活跃状态 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，
可写入数据。任意时刻，至多有一个页面处于活跃状态。

写满状态 Flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入新键值对，但仍可将
一些键值对标记为已删除。

读除状态 未删除的键值对将移至其他页面，以便删除当前页面。这一状态仅为暂时性状态，即 API 调用
返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未删除的键值对移
至其他页面，并继续删除当前页面。

损坏状态 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无
法访问。相应的 flash 扇区并不会被立即删除，而是与其他处于未初始化状态的扇区一起等待后续
使用。这一状态可能对调试有用。

Flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序
列号组织页面。
页面结构 当前，我们假设 flash 块区大小为 4096 字节，并且 ESP32 flash 加密硬件在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适配具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息详见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其变更为 擦除状态。

头部中的 version 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 0xff 开始依次递减（例如，version-1 为 0x01，version-2 为 0x02，以此类推）。

头部中 CRC32 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 0xff 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

条目和条目状态位图 每个条目可处于以下三种状态之一，每个状态在条目状态位图中用两位表示，位图中的最后四位（256 - 2 * 126）未使用。

空 (2’b11) 条目还未写入任何内容，处于未初始化状态（全部字节为 0xff）。
写入 (2’b10) 一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。
擦除 (2’b00) 条目中的键值对已丢失，条目内容不再解析。

条目结构 如果键值类型为基础类型，即 1 - 8 个字节长度的整数型，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。
BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，即以新格式储存至条目。
条目结构中各个字段含义如下：

**命名空间 (NS, Namespace)** 该条目的命名空间索引。详细信息参见命名空间实现章节。

**类型 (Type)** 一个字节表示的值的数据类型。nvs_flash/include/nvs_handle.hpp 下的 ItemTyp 数举了可能的类型。

**跨度 (Span)** 该键值对所用的条目数量。如果键值为整数型，条目数量即为 1。如果键值为字符串或 BLOB，则条目数量取决于值的长度。

**块索引 (ChunkIndex)** 用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 0xff。

**CRC32** 对条目下所有字段进行校验后，所得的校验和。CRC32 字段不计算在内。

**键 (Key)** 即以零结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字符的零终止符。

**数据 (Data)** 如果键值类型为整数型，则数据字段仅包含键值。如果键值小于八个字节，则使用 0xff 填充未使用的部分（右侧）。

如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- **块大小** 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。
- **ChunkCount** 存储过程中 BLOB 分成的数据块总量。该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块索引，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：

- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，则该字段也应将零终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字节的校验和。该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 Span 字段将指明使用了多少条目。

**命名空间** 如上所述，每个键值对属于一个命名空间。命名空间标识符 (字符串) 也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。
条目哈希列表 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。

Page::findItem 首先从哈希列表中检索条目哈希值，如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目、两个链表指针和一个 32 位计数字段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

API 参考

Header File
- components/nvs_flash/include/nvs_flash.h

Functions

esp_err_t nvs_flash_init (void)
Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

1. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
2. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
3. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

Return
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

esp_err_t nvs_flash_init_partition (const char *partition_label)
Initialize NVS flash storage for the specified partition.

Return
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures

Espressif Systems 1104 Release v5.0-dev-489-gef98a36
Submit Document Feedback
• one of the error codes from the underlying flash storage driver

Parameters
• [in] partition_label: Label of the partition. Must be no longer than 16 characters.

```
extp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)
```
Initialize NVS flash storage for the partition specified by partition pointer.

Return
• ESP_OK if storage was successfully initialized
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_INVALID_ARG in case partition is NULL
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

Parameters
• [in] partition: pointer to a partition obtained by the ESP partition API.

```
extp_err_t nvs_flash_deinit(void)
```
Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Return
• ESP_OK on success (storage was deinitialized)
• ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```
extp_err_t nvs_flash_deinit_partition(const char *partition_label)
```
Deinitialize NVS storage for the given NVS partition.

Return
• ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

Parameters
• [in] partition_label: Label of the partition

```
extp_err_t nvs_flash_erase(void)
```
Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
• different error in case de-initialization fails (shouldn’t happen)

```
extp_err_t nvs_flash_erase_partition(const char *part_name)
```
Erase specified NVS partition.

Erase all content of a specified NVS partition

Note If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
• different error in case de-initialization fails (shouldn’t happen)

Parameters
• [in] part_name: Name (label) of the partition which should be erased

```
extp_err_t nvs_flash_erase_partition_ptr(const esp_partition_t *partition)
```
Erase custom partition.

Erase all content of specified custom partition.
**Chapter 2. API**

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] partition: pointer to a partition obtained by the ESP partition API.

```c
esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)
```

Initialize the default NVS partition.

This API initializes the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVSD_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

```c
esp_err_t nvs_flash_secure_init_partition(const char* partition_label, nvs_sec_cfg_t *cfg)
```

Initialize NVS flash storage for the specified partition.

**Return**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVSD_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] partition_label: Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- [in] cfg: Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption/decryption is used.

```c
esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Generate and store NVS keys in the provided esp partition.

**Return** -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from esp_partition_write/erase APIs.

**Parameters**
- [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

```c
esp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Read NVS security configuration from a partition.

**Note** Provided partition is assumed to be marked ‘encrypted’.

**Return** -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -ESP_ERR_NVSD_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVSD_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from esp_partition_read API.

**Parameters**
- [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.
• [in] partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures

struct nvs_sec_cfg_t
  Key for encryption and decryption.

  Public Members

  uint8_t *eky[NVS_KEY_SIZE]
    XTS encryption and decryption key

  uint8_t *tky[NVS_KEY_SIZE]
    XTS tweak key

Macros

NVS_KEY_SIZE

Header File

  • components/nvs_flash/include/nvs.h

Functions

esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)
  set int8_t value for given key

  Return

  • ESP_OK if value was set successfully
  • ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
  • ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
  • ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
  • ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
  • ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

  Parameters

  • [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
  • [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
  • [in] value: The value to set.

esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
  set uint8_t value for given key

  This function is the same as nvs_set_i8 except for the data type.

esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
  set int16_t value for given key

  This function is the same as nvs_set_i8 except for the data type.
```
esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)
set uint16_t value for given key

This function is the same as nvs_set_i8 except for the data type.

esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)
set int32_t value for given key

This function is the same as nvs_set_i8 except for the data type.

esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)
set uint32_t value for given key

This function is the same as nvs_set_i8 except for the data type.

esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)
set int64_t value for given key

This function is the same as nvs_set_i8 except for the data type.

esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)
set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called.

Return
- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters
- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

esp_err_t nvs_get_i8 (nvs_handle_t handle, const char *key, int8_t *out_value)
get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

out_value has to be a pointer to an already allocated variable of the given type.

// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
```
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.

Return

• ESP_OK if the value was retrieved successfully
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

• [in] handle: Handle obtained from nvs_open function.
• [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
• out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char* key, uint8_t* out_value)
get uint8_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char* key, int16_t* out_value)
get int16_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char* key, uint16_t* out_value)
get uint16_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char* key, int32_t* out_value)
get int32_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char* key, uint32_t* out_value)
get uint32_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char* key, int64_t* out_value)
get int64_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char* key, uint64_t* out_value)
get uint64_t value for given key
```

This function is the same as nvs_get_i8 except for the data type.

```c
esp_err_t nvs_get_str (nvs_handle_t handle, const char* key, char *out_value, size_t *length)
get string value for given key
```

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and
has to point to the length available in \texttt{out\_value}. It is suggested that \texttt{nvs\_get/set\_str} is used for zero-terminated \texttt{C} strings, and \texttt{nvs\_get/set\_blob} used for arbitrary data structures.

```c
// Example (without error checking) of using \texttt{nvs\_get\_str} to get a string into a dynamic array:
size_t required_size;
nvs\_get\_str(my\_handle, "server\_name", NULL, \&required_size);
char* server\_name = malloc(required\_size);
nvs\_get\_str(my\_handle, "server\_name", server\_name, \&required\_size);

// Example (without error checking) of using \texttt{nvs\_get\_blob} to get a binary data into a static array:
uint8_t mac\_addr[6];
size_t size = sizeof(mac\_addr);
nvs\_get\_blob(my\_handle, "dst\_mac\_addr", mac\_addr, \&size);
```

Return

- ESP\_OK if the value was retrieved successfully
- ESP\_ERR\_NVS\_NOT\_FOUND if the requested key doesn’t exist
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn’t satisfy constraints
- ESP\_ERR\_NVS\_INVALID\_LENGTH if length is not sufficient to store data

Parameters

- \texttt{\[in\]} handle: Handle obtained from \texttt{nvs\_open} function.
- \texttt{\[in\]} key: Key name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn’t be empty.
- \texttt{\[out\]} out\_value: Pointer to the output value. May be NULL for \texttt{nvs\_get\_str} and \texttt{nvs\_get\_blob}, in this case required length will be returned in length argument.
- \texttt{\[inout\]} length: A non-zero pointer to the variable holding the length of \texttt{out\_value}. In case out\_value a zero, will be set to the length required to hold the value. In case out\_value is not zero, will be set to the actual length of the value written. For \texttt{nvs\_get\_str} this includes zero terminator.

```c
esp\_err\_t nvs\_get\_blob(nvs\_handle\_t handle, const char* key, void* out\_value, size\_t*\ length)
get\ blob\ value\ for\ given\ key
```

This function behaves the same as \texttt{nvs\_get\_str}, except for the data type.

```c
esp\_err\_t nvs\_open(const char* name, nvs\_open\_mode\_t\ open\_mode, nvs\_handle\_t*\ out\_handle)
Open\ non\-volatile\ storage\ with\ a\ given\ namespace\ from\ the\ default\ NVS\ partition.
```

Multiple internal ESP-\textsc{idf} and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Return

- ESP\_OK if storage handle was opened successfully
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label “nvs” is not found
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND id namespace doesn’t exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn’t satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

Parameters

- \texttt{\[in\]} name: Namespace name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn’t be empty.
- \texttt{\[in\]} open\_mode: NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- \texttt{\[out\]} out\_handle: If successful (return code is zero), handle will be returned in this argument.

```c
esp\_err\_t nvs\_open\_from\_partition(const char* part\_name, const char* name, 
nvs\_open\_mode\_t\ open\_mode, nvs\_handle\_t*\ out\_handle)
Open\ non\-volatile\ storage\ with\ a\ given\ namespace\ from\ specified\ partition.
```
The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

Return

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- other error codes from the underlying storage driver

Parameters

- [in] part_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out_handle: If successful (return code is zero), handle will be returned in this argument.

```
esp_err_t nvs_set_blob (nvs_handle_t handle, const char* key, const void* value, size_t length)
```

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

Return

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

Parameters

- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- [in] value: The value to set.
- [in] length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

```
esp_err_t nvs_erase_key (nvs_handle_t handle, const char* key)
```

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

Return

- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

Parameters

- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
**esp_err_t nvs_erase_all (nvs_handle_t handle)**

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

**Return**
- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

**Parameters**
- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**esp_err_t nvs_commit (nvs_handle_t handle)**

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**
- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**Parameters**
- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**void nvs_close (nvs_handle_t handle)**

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**
- [in] handle: Storage handle to close

**esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)**

Fill structure nvs_stats_t. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free...
const char *part_name = "some_partition";
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
       nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);
```

**Return**
- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

**Parameters**
• [in] part_name: Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
• [out] nvs_stats: Returns filled structure nvs_states_t. It provides info about used memory the partition.

**esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t *used_entries)**

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value used_entries (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs...--in one namespace:
   nvs_handle_t handle;
   nvs_open("namespace1", NVS_READWRITE, &handle);
   ...
   size_t used_entries;
   size_t total_entries_namespace;
   if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
       // the total number of entries occupied by the namespace
       total_entries_namespace = used_entries + 1;
   }
```

**Return**

- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_INVALID_ARG if used_entries equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

**Parameters**

- [in] handle: Handle obtained from nvs_open function.
- [out] used_entries: Returns amount of used entries from a namespace.

**nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)**

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified...
--partition and namespace
   nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
   while (it != NULL) {
       nvs_entry_info_t info;
       nvs_entry_info(it, &info);
       it = nvs_entry_next(it);
       printf("key '%s', type '%d' \n", info.key, info.type);
   }
// Note: no need to release iterator obtained from nvs_entry_find function when
--other
// element for specified criteria was found.
```

**Return** Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found.

Iterator obtained through this function has to be released using nvs_release_iterator when not used any more.

**Parameters**

- [in] part_name: Partition name
- [in] namespace_name: Set this value if looking for entries with a specific namespace. Pass
Chapter 2. API

**nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)**

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid nvs_iterator_t otherwise.

**Parameters**

- [in] iterator: Iterator obtained from nvs_entry_find function. Must be non-NULL.

**void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)**

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.

**Parameters**

- [in] iterator: Iterator obtained from nvs_entry_find or nvs_entry_next function. Must be non-NULL.
- [out] out_info: Structure to which entry information is copied.

**void nvs_release_iterator (nvs_iterator_t iterator)**

Release iterator.

**Parameters**

- [in] iterator: Release iterator obtained from nvs_entry_find function. NULL argument is allowed.

**Structures**

**struct nvs_entry_info_t**

Information about entry obtained from nvs_entry_info function

**Public Members**

- char namespace_name[16]
  Namespace to which key-value belong
- char key[16]
  Key of stored key-value pair
- nvs_type_t type
  Type of stored key-value pair

**struct nvs_stats_t**

Note Info about storage space NVS.

**Public Members**

- size_t used_entries
  Amount of used entries.
- size_t free_entries
  Amount of free entries.
- size_t total_entries
  Amount all available entries.
- size_t namespace_count
  Amount name space.
Macros

**ESP_ERR_NVS_BASE**
Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED**
The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND**
Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH**
The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY**
Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE**
There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME**
Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE**
Handle has been closed or is NULL.

**ESP_ERR_NVS_REMOVE_FAILED**
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG**
Key name is too long

**ESP_ERR_NVS_PAGE_FULL**
Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE**
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH**
String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES**
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG**
String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND**
Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND**
XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED**
NVS encryption is not supported in this version
Chapter 2. API 參考

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
Maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE
Maximal length of NVS key name (including null terminator)

**Type Definitions**

```c
typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvsOpaque_iterator_t*nvs_iterator_t
Opaque pointer type representing iterator to nvs entries
```

**Enumerations**

```c
enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:

NVS_READONLY
Read only

NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.

Values:

NVS_TYPE_U8 = 0x01
Type uint8_t

NVS_TYPE_I8 = 0x11
Type int8_t

NVS_TYPE_U16 = 0x02
Type uint16_t

NVS_TYPE_I16 = 0x12
Type int16_t

NVS_TYPE_U32 = 0x04
Type uint32_t

NVS_TYPE_I32 = 0x14
Type int32_t
```

2.6.4 NVS 分区生成程序

介绍

NVS 分区生成程序 (nvs_flash/nvs_partition_generator/nvs_partition_gen.py) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与非易失性存储器 (NVS) 中定义的 NVS 结构兼容。NVS 分区生成程序适合用于生成二进制数据 (Blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个固件的基础上，通过自定义参数，如序列号等，为每个设备生成不同配置。

准备工作

在加密模式下使用该程序，需安装下列软件包：

* cryptography package

根目录下的 requirements.txt 包含必需 python 包，请预先安装。

CSV 文件格式

.csv 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表:

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>主键，应用程序可通过查询此键来获取数据。</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>支持 file, data 和 namespace。</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>支持 u8, i8, u16, i32, string, hex2bin, base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。</td>
<td>file 类型当前仅支持 hex2bin, base64, string 和 binary 编码。</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>namespace 字段的 encoding 和 value 字节为固定值，不可设置。这些单元格中的所有值都不可设置。</td>
</tr>
</tbody>
</table>

注解：CSV 文件的第一行应为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

Espressif Systems 1117 Release v5.0-dev-489-gef98a36
Submit Document Feedback
Chapter 2. API 参考

```
key, type, encoding, value  <--- 列标题
namespace_name, namespace,  <--- 第一个条目为 "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

注解:

请确保：
- 逗号 ‘,’ 前后无空格;
- CSV 文件每行末尾无空格。

**NVS 条目和命名空间 (namespace)**

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都会被视为新命名空间的一部分。

注解：CSV 文件中第一个条目应始终为 namespace。

**支持多页 Blob**

默认情况下，二进制 Blob 可跨多页，格式参考条目结构 章节。如需使用旧版格式，可在程序中禁用该功能。

**支持加密**

NVS 分区生成程序还可使用 AES-XTS 加密生成二进制加密文件。更多信息详见NVS 加密。

**支持解密**

如果 NVS 二进制文件采用了 AES-XTS 加密，该程序还可对此类文件进行解密。更多信息详见NVS 加密。

**运行程序**

使用方法：

```
python nvs_partition_gen.py [-h] (generate, generate-key, encrypt, decrypt) ...
```

可选参数：

```
序号 参数  描述
1  -h, --help 显示帮助信息并退出
```

命令：

运行 nvs_partition_gen.py {command} -h 查看更多帮助信息

```
序号 参数  描述
1  generate 生成 NVS 分区
2  generate-key 生成加密密钥
3  encrypt 加密 NVS 分区
4  decrypt 解密 NVS 分区
```
生成 NVS 分区（默认模式）

使用方法:

```bash
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
  input output size
```

位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input</code></td>
<td>待解析的 CSV 文件路径</td>
</tr>
<tr>
<td><code>output</code></td>
<td>NVS 二进制文件的输出路径</td>
</tr>
<tr>
<td><code>size</code></td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h, --help</code></td>
<td>显示帮助信息并退出</td>
</tr>
</tbody>
</table>
| `--version {1,2}` | \+ 设置多页 Blob 版本。  
\+ 版本 1: 禁用多页 Blob;  
\+ 版本 2: 启用多页 Blob;  
\+ 默认版本: 版本 2。 |
| `--outdir OUTDIR` | 输出目录，用于存储创建的文件。（默认当前目录） |

运行如下命令创建 NVS 分区，该程序同时会提供 CSV 示例文件:

```bash
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

仅生成加密密钥

使用方法:

```bash
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h, --help</code></td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td><code>--keyfile KEYFILE</code></td>
<td>加密密钥文件的输出路径</td>
</tr>
<tr>
<td><code>--outdir OUTDIR</code></td>
<td>输出目录，用于存储创建的文件。（默认当前目录）</td>
</tr>
</tbody>
</table>

运行以下命令仅生成加密密钥:

```bash
python nvs_partition_gen.py generate-key
```

生成 NVS 加密分区 使用方法:

```bash
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
  input output size
```
位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>待解析 CSV 文件的路径</td>
</tr>
<tr>
<td>output</td>
<td>NVS 二进制文件的输出路径</td>
</tr>
<tr>
<td>size</td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>-version [1,2]</td>
<td>- 版本多页 Blob 版本。</td>
</tr>
<tr>
<td></td>
<td>- 版本 1：禁用多页 Blob；</td>
</tr>
<tr>
<td></td>
<td>- 版本 2：启用多页 Blob；</td>
</tr>
<tr>
<td></td>
<td>- 默认版本：版本 2。</td>
</tr>
<tr>
<td>-keygen</td>
<td>生成 NVS 分区加密密钥</td>
</tr>
<tr>
<td>-keyfile KEYFILE</td>
<td>密钥文件的输出路径</td>
</tr>
<tr>
<td>-inputkey INPUTKEY</td>
<td>内含 NVS 分区加密密钥的文件</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:
  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin--0x3000--keygen
  ```

注解：创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

- 通过 NVS 分区生成程序生成加密密钥，并将密钥存储于自定义的文件中:
  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin--0x3000--keygen--keyfile sample_keys.bin
  ```

注解：创建的加密密钥格式为 <outdir>/keys/keys-<timestamp>.bin。

注解：加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区结构兼容。更多信息请参考 NVS 密钥分区。

- 将加密密钥用作二进制输入文件来进行加密:
  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin--0x3000--inputkey sample_keys.bin
  ```

解密 NVS 分区 使用方法:

``` python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output ```

位置参数:
## 可选参数

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>待解析的 NVS 加密分区文件路径</td>
</tr>
<tr>
<td>key</td>
<td>含有解密密钥的文件路径</td>
</tr>
<tr>
<td>output</td>
<td>已解密的二进制文件输出路径</td>
</tr>
</tbody>
</table>

运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

您可以自定义格式版本号:
- 版本 1：禁用多页 Blob
- 版本 2：启用多页 Blob

**版本 1：禁用多页 Blob** 如需禁用多页 Blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序，该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**版本 2：启用多页 Blob** 如需启用多页 Blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序，该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**注解**: NVS 分区最小为 0x3000 字节。

**注解**: 将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

### 说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键；
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

### 2.6.5 SD/SDIO/MMC 驱动程序

#### 概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动（driver/include/driver/sdmmc_host.h 和 driver/include/driver/sdspi_host.h）为以下功能提供 API:
Chapter 2. API 参考

- 发送命令至从设备
- 接收和发送数据
- 处理解析错误

初始化函数及配置函数:
- 如需初始化和配置 SDMMC 主机，请参阅 SDMMC 主机 API
- 如需初始化和配置 SD SPI 主机，请参阅 SD SPI 主机 API

本文档中所述的 SDMMC 协议层仅处理 SD 协议相关事项，例如卡初始化和数据传输命令。

协议层通过 sdmmc_host_t 结构体和主机协同工作，该结构体包含指向主机各类函数的指针。

应用示例

ESP-IDF storage/sd_card 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡写入数据。请参考示例目录下 README.md 文件，查看更多详细信息。

复合卡（存储 + IO）该驱动程序不支持 SD 复合卡，复合卡会被视为 IO 卡。

线程安全 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 sdmmc_card_t 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时便不会任何类型的锁。这种锁通常在较高级层实现，例如文件系统驱动程序。

协议层 API

协议层具备 sdmmc_host_t 结构体。此结构体描述了 SD/MMC 主机驱动，列出了其功能，并提供指向驱动程序函数的指针。协议层将卡信息结构于 sdmmc_card_t 结构体中，向 SD/MMC 主机发送命令时，协议层调用时需要一个 sdmmc_card_t 结构体来描述命令、参数、预期返回值和需传输的数据（如有）。

用于 SD 存储卡的 API

1. 初始话主机遇时需调用主机驱动函数，例如 sdmmc_host_init() 和 sdmmc_host_init_slot();
2. 初始化卡，请调用 sdmmc_card_init()，并将参数 host（主机驱动信息）和参数 card（指向 sdmmc_card_t 结构体的指针）传递给此函数。函数运行结束后，将会向 sdmmc_card_t 结构体填充此卡的信息；
3. 读卡或写入卡的区域，请分别调用 sdmmc_read_sectors() 和 sdmmc_write_sectors()，并将参数 card（指向卡信息结构的指针）传递给函数；
4. 如果不再使用该卡，请调用主机驱动函数，例如 sdmmc_host_deinit()，以禁止主机外设，并释放驱动程序分配的资源。

用于 eMMC 芯片的 API 从协议层的角度而言，eMMC 存储芯片与 SD 存储卡相同。尽管 eMMC 是芯片，不具备卡的外形，但协议层协议相似 (sdmmc_card_t, sdmmc_card_init)，用于 SD 卡的一些概念同样适用于 eMMC 芯片。注意，eMMC 芯片不可通过 SPI 使用，因此它与 SD API 主机驱动不兼容。

如需初始化 eMMC 内存并执行读/写操作，请参照上一章节 SD 卡操作步骤。

用于 SDIO 卡的 API SDIO 卡初始化和检测过程与 SD 存储卡相同，唯一的区别是 SDIO 模式下数据传输命令不同。

在卡初始化和检测（通过运行 sdmmc_card_init()）期间，驱动仅配置 IO 卡如下寄存器:

1. I/O 中止 (0x06) 寄存器：在该寄存器中设置 RES 位可重置卡的 IO 部分;
2. 总线接口控制 (0x07) 寄存器：如果主机和插槽配置中启用 4 线模式，则驱动程序会尝试在该寄存器中设置总线宽度字段。如果字段设置成功，则从机支持 4 线模式，主机也切换至 4 线模式;
3. 高速 (0x13) 寄存器：如果主机配置中启用高速模式，则会在该寄存器中设置 HS 位。

Espressif Systems 1122 Release v5.0-dev-489-gef98a36
Submit Document Feedback
注意，驱动程序不会在 (1) I/O 使能寄存器和 Int 使能寄存器，及 (2) I/O 块大小中，设置任何位。应用程
序可通过调用 `sdmmc_io_write_byte()` 来设置相关位。

如需设置卡配置或传输数据，请根据您的具体情况选择下表中的函数：

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

使用 `sdmmc_io_enable_int()` 函数，应用程序可启用 SDIO 中断。在单线模式下使用 SDIO 时，还需
要连接 D1 线来启用 SDIO 中断。

如果您需要应用程序保持等待直至发生 SDIO 中断，请使用 `sdmmc_io_wait_int()` 函数。

如果您需要与 ESP32 的 SDIO 从设备通信，请使用 ESSL 组件（ESP 串行从设备链接）。请参阅 `ESP Serial Slave Link` 和 example `peripherals/sdio/host`

### API 参考

### Header File

- `components/sdmmc/include/sdmmc_cmd.h`

### Functions

```c
esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)
```

- **Probe and initialize SD/MMC card using given host**

  **Note** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be
  added later.

  **Return**

  - ESP_OK on success
  - One of the error codes from SDMMC host controller

  **Parameters**

  - `host`: pointer to structure defining host controller
  - `out_card`: pointer to structure which will receive information about the card when the function
    completes

```c
void sdmmc_card_print_info(FILE *stream, const sdmmc_card_t *card)
```

- **Print information about the card to a stream.**

  **Parameters**

  - `stream`: stream obtained using fopen or fdopen
  - `card`: card information structure initialized using sdmmc_card_init

```c
esp_err_t sdmmc_get_status(sdmmc_card_t *card)
```

- **Get status of SD/MMC card**

  **Return**

  - ESP_OK on success
  - One of the error codes from SDMMC host controller

  **Parameters**

  - `card`: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_write_sectors(sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```

- **Write given number of sectors to SD/MMC card**

  **Return**
Chapter 2. API

ESP_OK on success
One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **dst**: pointer to data buffer to read data from; data size must be equal to sector_count * card-
  >csd.sector_size
- **start_sector**: sector where to start writing
- **sector_count**: number of sectors to write

```c
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```

Read given number of sectors from the SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **dst**: pointer to data buffer to write into; buffer size must be at least sector_count * card-
  >csd.sector_size
- **start_sector**: sector where to start reading
- **sector_count**: number of sectors to read

```c
esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **reg**: byte address within IO function
- **[out] out_byte**: output, receives the value read from the card

```c
esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
```

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
- **function**: IO function number
- **reg**: byte address within IO function
- **in_byte**: value to be written
- **[out] out_byte**: if not NULL, receives new byte value read from the card (read-after-write).

```c
esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sd-
mmc_io_read_blocks.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using sdmmc_card_init
Chapter 2. API

- function: IO function number
- addr: byte address within IO function where reading starts
- dst: buffer which receives the data read from card
- size: number of bytes to read

\[
\text{esp_err_t } \text{sdmmc_io_write_bytes}(\text{sdmmc_card_t} *\text{card}, \text{uint32_t} \text{function}, \text{uint32_t} \text{addr}, \text{const void *} \text{src}, \text{size_t} \text{size})
\]

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- \text{card}: pointer to card information structure previously initialized using sdmmc_card_init
- \text{function}: IO function number
- \text{addr}: byte address within IO function where writing starts
- \text{src}: data to be written
- \text{size}: number of bytes to write

\[
\text{esp_err_t } \text{sdmmc_io_read_blocks}(\text{sdmmc_card_t} *\text{card}, \text{uint32_t} \text{function}, \text{uint32_t} \text{addr}, \text{void *} \text{dst}, \text{size_t} \text{size})
\]

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- \text{card}: pointer to card information structure previously initialized using sdmmc_card_init
- \text{function}: IO function number
- \text{addr}: byte address within IO function where writing starts
- \text{dst}: buffer which receives the data read from card
- \text{size}: number of bytes to read, must be divisible by the card block size.

\[
\text{esp_err_t } \text{sdmmc_io_write_blocks}(\text{sdmmc_card_t} *\text{card}, \text{uint32_t} \text{function}, \text{uint32_t} \text{addr}, \text{const void *} \text{src}, \text{size_t} \text{size})
\]

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

Return
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters
- \text{card}: pointer to card information structure previously initialized using sdmmc_card_init
- \text{function}: IO function number
- \text{addr}: byte address within IO function where writing starts
- \text{src}: data to be written
- \text{size}: number of bytes to read, must be divisible by the card block size.

\[
\text{esp_err_t } \text{sdmmc_io_enable_int}(\text{sdmmc_card_t} *\text{card})
\]

Enable SDIO interrupt in the SDMMC host

Return
- ESP_OK on success
Chapter 2. API

ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init

esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)

Block until an SDIO interrupt is received

Return
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- timeout_ticks: time to wait for the interrupt, in RTOS ticks

esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this functions store as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Return
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc_io_read_bytes

Parameters
- card: pointer to card information structure previously initialized using sdmmc_card_init
- out_buffer: Output buffer of the CIS data
- buffer_size: Size of the buffer.
- inout_cis_size: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)

Parse and print the CIS information of a SDIO card.

Note Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

Chapter 2. API 参考

**Structures**

```c
struct sdmmc_csd_t
    Decoded values from SD card Card Specific Data register

    **Public Members**

    int csd_ver
        CSD structure format

    int mmc_ver
        MMC version (for CID format)

    int capacity
        total number of sectors

    int sector_size
        sector size in bytes

    int read_block_len
        block length for reads

    int card_command_class
        Card Command Class for SD

    int tr_speed
        Max transfer speed
```

```c
struct sdmmc_cid_t
    Decoded values from SD card IDentification register

    **Public Members**

    int mfg_id
        manufacturer identification number

    int oem_id
        OEM/product identification number

    char name[8]
        product name (MMC v1 has the longest)

    int revision
        product revision

    int serial
        product serial number

    int date
        manufacturing date
```

```c
struct sdmmc_scr_t
    Decoded values from SD Configuration Register

    **Public Members**

    int sd_spec
        SD Physical layer specification version, reported by card

    int bus_width
        bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus
```

```c
struct sdmmc_ext_csd_t
    Decoded values of Extended Card Specific Data
```
Public Members

uint8_t power_class
Power class used by the card

struct sdmmc_switch_func_rsp_t
SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
response data

struct sdmmc_command_t
SD/MMC command information

Public Members

uint32_t opcode
SD or MMC command index

uint32_t arg
SD/MMC command argument

sdmmc_response_t response
response buffer

void *data
buffer to send or read into

size_t datalen
length of data buffer

size_t blklen
block length

int flags
see below

esp_err_t error
error returned from transfer

int timeout_ms
response timeout, in milliseconds

struct sdmmc_host_t
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
flags defining host properties

int slot
slot number, to be passed to host functions

int max_freq_khz
max frequency supported by the host
float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t(*init) (void)
Host function to initialize the driver

esp_err_t(*set_bus_width) (int slot, size_t width)
host function to set bus width

size_t(*get_bus_width) (int slot)
host function to get bus width

esp_err_t(*set_bus_ddr_mode) (int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t(*set_card_clk) (int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t(*do_transaction) (int slot, sdmmc_command_t *cmdinfo)
host function to do a transaction

esp_err_t(*deinit) (void)
host function to deinitialize the driver

esp_err_t(*deinit_p) (int slot)
host function to deinitialize the driver, called with the slot

esp_err_t(*io_int_enable) (int slot)
Host function to enable SDIO interrupt line

esp_err_t(*io_int_wait) (int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

sdmmc_csd_t csd
decoded CSD (Card-Specific Data) register value

sdmmc_scr_t scr
decoded SCR (SD card Configuration Register) value

sdmmc_ext_csd_t ext_csd
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)

uint16_t max_freq_khz
Maximum frequency, in kHz, supported by the card
Chapter 2. API

uint32_t is_mem : 1
    Bit indicates if the card is a memory card

uint32_t is_sdio : 1
    Bit indicates if the card is an IO card

uint32_t ismmc : 1
    Bit indicates if the card is MMC

uint32_t num_io_functions : 3
    If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width : 2
    log2(bus width supported by card)

uint32_t is_ddr : 1
    Card supports DDR mode

uint32_t reserved : 23
    Reserved for future expansion

**Macros**

SDMMC_HOST_FLAG_1BIT
    host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
    host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT
    host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI
    host supports SPI protocol

SDMMC_HOST_FLAG_DDR
    host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG
    host deinit function called with the slot argument

SDMMC_FREQ_DEFAULT
    SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED
    SD High speed (limited by clock divider)

SDMMC_FREQ_PROBING
    SD/MMC probing speed

SDMMC_FREQ_52M
    MMC 52MHz speed

SDMMC_FREQ_26M
    MMC 26MHz speed

**Type Definitions**

typedef uint32_t sdmmc_response_t[4]
    SD/MMC command response buffer

2.6.6 SPI Flash API
### 概述

`Spi_flash` 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数，同时也提供了更高层级的，面向分区的 API 函数（定义在分区表 中）。

与 ESP-IDF V4.0 之前的 API 不同，这一版 `esp_flash_*` API 功能并不局限于主 SPI Flash 芯片（即运行程序的 SPI Flash 芯片）。使用不同的芯片指针，您可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

#### 注解：
大多数 `esp_flash_*` API 使用 SPI1、SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅能访问主 flash，也能访问外部 flash。

而由于 cache 的限制，所有经过 cache 的档案都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap，加密读写，执行代码或者访问在 flash 中的变量。

#### 注解：
ESP-IDF V4.0 之后的 flash API 不再是原子的。因此，如果 flash 操作地址有重叠，且写操作与读操作同时执行，该操作可能会改变一部分写入之前的数据和一部分写入之后的数据。

**Kconfig** 选项 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` 可将 `spi_flash_*` 函数切换至 ESP-IDF V4.0 之前的实现。但是，如果同时使用新旧 API，代码量可能会增多。

即便未启用 `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`，加密读取和加密写入操作也均使用旧实现。因此，仅有主 flash 芯片支持加密操作。外接（经 SPI1 使用其他不同类型访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。也仅有主 flash 支持从 cache 当中读取，因为这是由硬件决定的。

### Flash 特性支持情况

不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 Flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO/DOUT)，因为他们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT):

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

当前驱动支持以下厂家/型号的 flash 的 32 位地址范围的访问:

1. W25Q256
2. GD25Q256

如果有需要，也可以自定义 flash 芯片驱动，参见 **Overriding Default Chip Drivers**

### 警告：
Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers**

During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:
1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
   * `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
   * Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   * `CMakeLists.txt` and `linker.lf` files

Modify the files above properly.

### 注解:

* When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***/(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***/get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***/(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***/(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

* You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
set_property(TARGET $<TARGET>$ APPEND PROPERTY INTERFACE_LIBRARIES $<COMPONENT_LIB>))
```

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [链接器脚本生成机制](#) for more details. Make sure this file covers all the source files that you add.
6. Build your project, and you will see the new flash driver is used.
### 初始化 Flash 设备

在使用 esp_flash_* API 之前，您需要在 SPI 总线上初始化芯片。

1. 调用 `spi_bus_initialize()` 初始化 SPI 总线，此函数将初始化总线上设备间共享的资源，如 I/O、DMA 及中断等。
2. 调用 `spi_bus_add_flash_device()` 将 flash 设备连接到总线上，然后分配内存，填充 esp_flash_t 结构体，同时初始化 CS I/O。
3. 调用 `esp_flash_init()` 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

注: 当前，多个 flash 芯片可连接到同一总线。但尚不支持在同一个 SPI 总线上使用 esp_flash_* 和 spi_device_* 设备。

### SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：

- `esp_flash_read()`: 将数据从 flash 读取到 RAM；
- `esp_flash_write()`: 将数据从 RAM 写入到 flash；
- `esp_flash_erase_region()`: 擦除 flash 中指定区域的数据；
- `esp_flash_erase_chip()`: 擦除整个 flash；
- `esp_flash_get_chip_size()`: 返回 menuconfig 中设置的 flash 芯片容量 (以字节为单位)。

一般来说，请尽量避免对主 SPI flash 芯片直接使用原始 SPI flash 函数，如需对主 SPI flash 芯片进行操作，请使用分区专用函数。

### SPI Flash 容量

SPI flash 容量存储于引导程序映像头部（烧录偏移量为 0x1000）的一个字段。

默认情况下，引导程序写入 flash 时，esptool.py 将引导程序写入 flash 时，会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以在工程配置中设置 CONFIG_ESPTOOLPY_FLASHSIZE，生成指定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 g_rom_flashchip 结构中的 chip_size。esp_flash_* 函数使用此容量（于软件和 ROM 中）进行边界检查。

### SPI1 Flash 并发约束

#### SPI1 Flash 并发约束

指令/数据 cache (用以执行固件) 与 SPI1 外设 (由像 SPI Flash 驱动一样的驱动程序控制) 共享 SPI0/1 总线。因此，对 SPI1 外设的操作会对整个系统造成显著的影响。这类操作包括调用 SPI Flash API 或者其他 SPI1 总线上的驱动，任何 flash 操作 (如读取、写入、擦除) 或者其他用户定义的 SPI 操作，无论是对主 flash 或者其他各类的 SPI 从机。

在 ESP32 上，flash 读取/写入/擦除时 cache 必须被禁用。

#### 当 cache 被禁用时

这意味着当 flash 操作发生时，所有的 CPU 都只能执行 IRAM 中的代码。而且必须从 DRAM 中读取数据。如果您使用本文档中 API 函数，上述限制将自动生效且透明 (无需您额外关注)，但这些限制可能会影响系统中的其他任务的性能。

除 SPI0/1 以外的 SPI 总线上的其它 flash 芯片则不受这种限制。

请参阅应用程序内存分布，查看 IRAM、DRAM 和 flash cache 的区别。
为避免意外读取 flash cache，一个 CPU 在启动 flash 写入或擦除操作时，另一个 CPU 将阻塞，并且在 flash 操作完成前，所有 CPU 上，所有的非 IRAM 安全的中断都会被禁用。
另请参阅 OS 函数 和 SPI Bus Lock。

**IRAM 安全中断处理程序** 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在注册中断处理程序 时设置 ESP_INTR_FLAG_IRAM。
请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。有两种方法可供使用：

### 使用属性宏
为函数添加 IRAM_ATTR 属性：

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

为常量添加 DRAM_ATTR 和 DRAM_STR 属性：

```c
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char* MSG = DRAM_STR("I am a string stored in RAM");
}
```

辨别哪些数据应标记为 DRAM_ATTR 可能会比较困难，除非明确标记为 DRAM_ATTR，否则编译器依然可能将某些变量或表达式当做常量（即便没有 const 标记），并将其放入 flash。

### 使用链接脚本
参见链接器脚本生成机制。

如果函数或符号未被正确放入 IRAM/DRAM 中，当中断处理程序在 flash 操作期间从 flash cache 中读取数据，则会产生非法指令异常（这是因为代码未被正确放入 IRAM）或读取垃圾数据（这是因为常数未被正确放入 DRAM），而导致崩溃。

注意：指令/数据 cache（用以执行固件）与 SPI1 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI Flash API（包括访问主 flash）会对整个系统造成显著的影响。更多细节，请参见 SPII Flash 开发文档。

### 分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参考 [here](#) 查看详细信息。

该组件在 esp_partition.h 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- `esp_partition_find()`：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- `esp_partition_get()`：返回一个结构，描述给定迭代器的分区；
- `esp_partition_next()`：将迭代器移至下一个找到的分区；
- `esp_partition_iterator_release()`：释放 `esp_partition_find` 中返回的迭代器；
- `esp_partition_find_first()`：返回描述 `esp_partition_find` 中找到的第一个分区的结构；
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 等同于 `spi_flash_read()`、`spi_flash_write()` 和 `spi_flash_erase_range()`，但在分区边界内执行。
SPI Flash 加密

您可以对 SPI flash 内容进行加密，并在硬件层对其进行透明解密。请参阅 Flash 加密文档，查看详细信息。

内存映射 API

ESP32 内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间，此映射仅用于读操作。不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

Flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间，也能映射到指令地址空间。请查看技术参考手册，了解内存映射硬件的详细信息及有关限制。

请注意，有些页被用于将应用程序映射到内存中，因此实际可用的页会少于硬件提供的总数。

启用 Flash 加密时，使用内存映射区域从 flash 读取数据是解密 flash 的唯一方法，解密需在硬件层进行。

内存映射 API 在 esp_spi_flash.h 和 esp_partition.h 中声明：

- spi_flash_mmap(): 将 flash 物理地址区域映射到 CPU 指令空间或数据空间;
- spi_flash_munmap(): 取消上述区域的映射;
- esp_partition_mmap(): 将分区的一部分映射至 CPU 指令空间或数据空间;
- spi_flash_mmap() 和 esp_partition_mmap() 的区别如下：
  - spi_flash_mmap(): 需要给定一个 64 KB 对齐的物理地址;
  - esp_partition_mmap(): 给定分区内的任意偏移量即可，此函数根据需要将返回的指针调整至指向映射内存。

内存映射以页为单位，即使传递给 esp_partition_mmap 的是一个分区，分区外的数据也是也可以被读取到的，不会受到分区边界的影响。

注解：由于 mmap 是由 cache 支持的，因此，mmap 也仅能用在主 flash 上。

SPI Flash 实现

esp_flash_t 结构包含芯片数据和该 API 的三个重要部分：

1. 主机驱动，为访问芯片提供硬件支持；
2. 芯片驱动，为不同芯片提供兼容性服务；
3. OS 函数，在不同阶段（一级或二级 Boot 或者应用程序阶段）为部分 OS 函数（如锁、延迟）提供支持。

主机驱动 主机驱动依赖 hal/include/hal 文件夹下 spi_flash_types.h 定义的 spi_flash_host_driver_t 接口。该接口提供了一些常用的函数，用于与芯片通信。

在 SPI HAL 文件中，有些函数是基于现有的 ESP32 memory-spi 来实现的。但是，由于 ESP32 的速度限制，HAL 层无法提供某些读命令的高速实现（所以这些命令根本不在 HAL 的文件中被实现）。memspi_host_driver.h 和 .c 文件使用 HAL 提供的 common_command 函数实现上述读命令的高速版本，并将所有它实现的以及 HAL 函数封装为 spi_flash_host_driver_t 供上层调用。

您甚至可以仅通过 GPIO 来实现自己的主机驱动。只要实现了 spi_flash_host_driver_t 中所有函数，不管底层硬件是什么，esp_flash API 都可以访问 flash。
芯片驱动

芯片驱动在 spi_flash_chip_driver.h 中进行定义，并将主机驱动提供的基本函数进行封装以供 API 层使用。

有些操作需在执行前先发送命令，或在执行后读取状态。因此有些芯片需要不同的命令或值以及通信方式。

generic chip 芯片代表了常见的 flash 芯片。其他芯片驱动可以在此通用芯片的基础上进行开发。

芯片驱动依赖主机驱动。

**OS 函数**

OS 函数层目前提供访问锁和延迟的方法。

锁（见 SPI Bus Lock）用于解决同一 SPI 总线上的设备访问和 SPI Flash 芯片访问之间的冲突。例如：

1. 经 SPI 总线访问 flash 芯片时，应当禁用 cache（平时用于取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当禁用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。

延时则用于某些长时操作，需要主机处于等待状态或执行轮询。

顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。

另请参考

- 分区表
- OTA API 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- NVS API 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码，实现细节如下：

- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。双核模式下，实现细节较为复杂，SDK 需确保两个 CPU 均未运行 flash 代码。

如果有 SPI flash API 在 CPU A（PRO 或 APP）上应用，它使用 esp_ipc_call API 在 CPU B 上运行 spi_flash_op_block_func 函数。esp_ipc_call API 在 CPU B 上唤醒一个优先级任务，即运行 spi_flash_op_block_func 函数。运行该函数将禁用 CPU B 上的 cache，并使用 s_flash_op_can_start 信号来标志 cache 已禁用。然后，CPU A 上的任务也会禁用 cache 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后，CPU A 上的函数将设置另一标志位，即 s_flash_op_complete，用以通知 CPU B 上的任务可以重新启用 cache 并释放 CPU。接着，CPU A 上的函数也重新启用 cache，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 s_flash_op_mutex 保护。

在单核环境中，（启用 CONFIG_FREERTOS_UNICORE），您需要禁用上述两个 cache 以防发生 CPU 间通信。

- components/spi_flash/include/esp_flash_spi_init.h
Functions

```c
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

Return

- ESP_ERR_INVALID_ARG: `out_chip` is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

Parameters

- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

```c
esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)
```

Remove a SPI Flash device from the SPI bus.

Return

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

Parameters

- `chip`: The flash device to remove.

Structures

```c
struct esp_flash_spi_device_config_t
```

Configurations for the SPI Flash to init.

Public Members

- `host_id` of `spi_host_device_t`
  - Bus to use.
- `cs_io_num` of `int`
  - GPIO pin to output the CS signal.
- `io_mode` of `esp_flash_io_mode_t`
  - IO mode to read from the Flash.
- `speed` of `esp_flash_speed_t`
  - Speed of the Flash clock.
- `input_delay_ns` of `int`
  - Input delay of the data pins, in ns. Set to 0 if unknown.
- `cs_id`
  - CS line ID, ignored when not `host_id` is not SPI1_HOST, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

Header File

- `components/spi_flash/include/esp_flash.h`

Functions

```c
esp_err_t esp_flash_init(esp_flash_t *chip)
```

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

Note: Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.
Note If the chip->drv pointer is NULL, chip_driv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

Return ESP_OK on success, or a flash error code if initialisation fails.

Parameters
- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

bool esp_flash_chip_driver_initialized(const esp_flash_t *chip)

Check if appropriate chip driver is set.

Return true if set, otherwise false.

Parameters
- chip: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

esp_err_t esp_flash_read_id(esp_flash_t *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- [out] out_id: Pointer to receive ID value.

Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t *out_size)

Detect flash size based on flash ID.

Note Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- [out] out_size: Detected size in bytes.

esp_err_t esp_flash_read_unique_chip_id(esp_flash_t *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- [out] out_id: Pointer to receive unique ID value.

Return
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

esp_err_t esp_flash_erase_chip(esp_flash_t *chip)

Erase flash chip contents.

Return
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

Parameters
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Parameters
- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- start: Address to start erasing flash. Must be sector aligned.
Chapter 2. API

• len: Length of region to erase. Must also be sector aligned.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Return
• ESP_OK on success.
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• Other flash error code if operation failed.

`esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)`

Read if the entire chip is write protected.

Note A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] write_protected: Pointer to boolean, set to the value of the write protect flag.

`esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protect)`

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• write_protect: Boolean value for the write protect flag

Return ESP_OK on success, or a flash error code if operation failed.

`esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)`

Read the list of individually protectable regions of this SPI flash chip.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• [out] out_regions: Pointer to receive a pointer to the array of protectable regions of the chip.
• [out] out_num_regions: Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

`esp_err_t esp_flash_get_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)`

Detect if a region of the SPI flash chip is protected.

Note It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

Note Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Return ESP_OK on success, or a flash error code if operation failed.

Parameters
• chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• region: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(⋯).
Chapter 2. API

• [out] out_protected: Pointer to a flag which is set based on the protected status for this region.

```c
esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- protect: Write protection flag to set.

```c
esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- buffer: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- address: Address on flash to read from. Must be less than chip->size field.
- length: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Return**

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

```c
esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size

**Return**

- ESP_OK: on success
Chapter 2. API

- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi_flash_write_encrypted().

**Parameters**

- **chip**: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address**: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer**: Pointer to a buffer with the data to write.
- **length**: Length (in bytes) of data to write. 16 byte aligned.

```c
esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, void *buffer, uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Return**

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- or other flash error code from spi_flash_write_encrypted().

**Parameters**

- **chip**: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address**: Address on flash to read from.
- **out_buffer**: Pointer to a buffer for the data to read to.
- **length**: Length (in bytes) of data to read.

```c
static bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return**

- true if flash works in quad mode, otherwise false

**Parameters**

- **chip**: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Structures**

```c
struct esp_flash_region_t
```

Structure for describing a region of flash.

**Public Members**

- **uint32_t offset**: Start address of this region.
- **uint32_t size**: Size of the region.

```c
struct esp_flash_os_functions_t
```

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

```c
esp_err_t (*start)(void *arg)
```

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).
esp_err_t (*end) (void *arg)
   Called after completing any flash operation.

esp_err_t (*region_protected) (void *arg, size_t start_addr, size_t size)
   Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (*delay_us) (void *arg, uint32_t us)
   Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void (*get_temp_buffer) (void *arg, size_t request_size, size_t *out_size)
   Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (*release_temp_buffer) (void *arg, void *temp_buf)
   Called for release temp buffer.

esp_err_t (*check_yield) (void *arg, uint32_t chip_status, uint32_t *out_request)
   Yield to other tasks. Called during erase operations.
   Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (*yield) (void *arg, uint32_t *out_status)
   Yield to other tasks. Called during erase operations.

int64_t (*get_system_time) (void *arg)
   Called for get system time.

struct esp_flash_t
   Structure to describe a SPI flash chip connected to the system.

   Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

   For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t *host
   Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
   Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
   Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
   Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
   Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
   Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32_t chip_id
   Detected chip id.

uint32_t busy : 1
   This flag is used to verify chip’s status.

uint32_t reserved_flags : 31
   reserved.
Macros

SPI_FLASH_YIELD_REQ_YIELD
SPI_FLASH_YIELD_REQ_SUSPEND
SPI_FLASH_YIELD_STA_RESUME

Type Definitions

typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t

Header File

- components/hal/include/hal/spi_flash_types.h

Structures

struct spi_flash_trans_t
Definition of a common transaction. Also holds the return value.

Public Members

uint8_t reserved
Reserved, must be 0.

uint8_t mosi_len
Output data length, in bytes.

uint8_t miso_len
Input data length, in bytes.

uint8_t address_bitlen
Length of address in bits, set to 0 if command does not need an address.

uint32_t address
Address to perform operation on.

const uint8_t *mosi_data
Output data to salve.

uint8_t *miso_data
[out] Input data from slave, little endian

uint32_t flags
Flags for this transaction. Set to 0 for now.

uint16_t command
Command to send.

uint8_t dummy_bitlen
Basic dummy bits to use.

uint32_t io_mode
Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
Configuration structure for the flash chip suspend feature.

Public Members

uint32_t sus_mask
SUS/SUS1/SUS2 bit in flash register.
uint32_t cmd_rdsr : 8  
Read flash status register(2) command.

uint32_t sus_cmd : 8  
Flash suspend command.

uint32_t res_cmd : 8  
Flash resume command.

uint32_t reserved : 8  
Reserved, set to 0.

struct spi_flash_encryption_t  
Structure for flash encryption operations.

**Public Members**

void (*flash_encryption_enable) (void)  
Enable the flash encryption.

void (*flash_encryption_disable) (void)  
Disable the flash encryption.

void (*flash_encryption_data_prepare) (uint32_t address, const uint32_t *buffer, uint32_t size)  
Prepare flash encryption before operation.

*Note*  
address and buffer must be 8-word aligned.

**Parameters**

- address: The destination address in flash for the write operation.
- buffer: Data for programming
- size: Size to program.

void (*flash_encryption_done) (void)  
Flash data encryption operation is done.

void (*flash_encryption_destroy) (void)  
Destroy encrypted result

bool (*flash_encryption_check) (uint32_t address, uint32_t length)  
Check if is qualified to encrypt the buffer

**Parameters**

- address: the address of written flash partition.
- length: Buffer size.

struct spi_flash_host_inst_t  
SPI Flash Host driver instance

**Public Members**

const struct spi_flash_host_driver_s *driver  
Pointer to the implementation function table.

struct spi_flash_host_driver_s  
Host driver configuration and context structure.

**Public Members**

esp_err_t (*dev_config) (spi_flash_host_inst_t *host)  
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously
esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
Disable write protection.

void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
Check whether given buffer can be directly used to write

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for write data. The program_page should be called iteratively with the return value of this function.

Return Length that can be actually written in one program_page call

Parameters
• address: Beginning flash address to write
• len: Length request to write
• align_addr: Output of the aligned address to write to
• page_size: Physical page size of the flash chip

esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
Check whether given buffer can be directly used to read

int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for read data. The read should be called iteratively with the return value of this function.

Return Length that can be actually read in one read call

Parameters
• address: Beginning flash address to read
• len: Length request to read
• align_addr: Output of the aligned address to read
• page_size: Physical page size of the flash chip

uint32_t (*host_status)(spi_flash_host_inst_t *host)
Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.
void (*poll_cmd_done)(spi_flash_host_inst_t *host)
Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be
flushed. Left NULL if not supported.

void (*check_suspend)(spi_flash_host_inst_t *host)
Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*resume)(spi_flash_host_inst_t *host)
Resume flash from suspend manually

void (*suspend)(spi_flash_host_inst_t *host)
Set flash in suspend status manually

esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
Suspend feature setup for setting cmd and status register mask.

Macros
SPI_FLASH_TRANS_FLAG_CMD16
Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

ESP_FLASH_SPEED_MIN
Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_CONFIG_CONF_BITS
OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits
into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG
A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this
value in any API.

SPI_FLASH_READ_MODE_MIN
Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations
enum esp_flash_speed_t
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may
be appended into the list).
A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or
highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

ESP_FLASH_5MHZ = 0
The flash runs under 5MHz.

ESP_FLASH_10MHZ
The flash runs under 10MHz.

ESP_FLASH_20MHZ
The flash runs under 20MHz.
ESP_FLASH_26MHZ
The flash runs under 26MHz.

ESP_FLASH_40MHZ
The flash runs under 40MHz.

ESP_FLASH_80MHZ
The flash runs under 80MHz.

ESP_FLASH_120MHZ
The flash runs under 120MHz. 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

ESP_FLASH_SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t
Mode used for reading from SPI flash.

Values:

SPI_FLASH_SLOWRD = 0
Data read using single I/O, some limits on speed.

SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

SPI_FLASH_DOUT
Data read using dual I/O.

SPI_FLASH_DIO
Both address & data transferred using dual I/O.

SPI_FLASH_QOUT
Data read using quad I/O.

SPI_FLASH_QIO
Both address & data transferred using quad I/O.

SPI_FLASH_OPI_STR = SPI_FLASH_OPI_FLAG
Only support on OPI flash, flash read and write under STR mode.

SPI_FLASH_OPI_DTR
Only support on OPI flash, flash read and write under DTR mode.

SPI_FLASH_READ_MODE_MAX
The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

Header File

- components/spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
Find partition based on one or more parameters.

Return
Iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found.

Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

Parameters
- type: Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
• **subtype**: Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.

• **label**: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

```c
const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)
```

Find first partition based on one or more parameters.

**Return** pointer to `esp_partition_t` structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

**Parameters**
- **type**: Partition type, one of `esp_partition_type_t` values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype**: Partition subtype, one of `esp_partition_subtype_t` values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label**: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

```c
const esp_partition_t *esp_partition_get(esp_partition_iterator_t iterator)
```

Get `esp_partition_t` structure for given partition.

**Return** pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

**Parameters**
- **iterator**: Iterator obtained using `esp_partition_find`. Must be non-NULL.

```c
esp_partition_iterator_t esp_partition_next(esp_partition_iterator_t iterator)
```

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Return** NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

**Parameters**
- **iterator**: Iterator obtained using `esp_partition_find`. Must be non-NULL.

```c
void esp_partition_iterator_release(esp_partition_iterator_t iterator)
```

Release partition iterator.

**Parameters**
- **iterator**: Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

```c
const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)
```

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**Return**
- If partition not found, returns NULL.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

**Parameters**
- **partition**: Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

```c
esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition.
Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

**Return** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- `partition`: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst`: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `src_offset`: Address of the data to be read, relative to the beginning of the partition.
- `size`: Size of data to be read, in bytes.

```c
esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the spi_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the spi_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.

**Note** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Return** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- `partition`: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size`: Size of data to be written, in bytes.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note** This function is essentially the same as esp_partition_write() above. It just never encrypts data but writes it as is.

**Return** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- `partition`: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `src_offset`: Address of the data to be read, relative to the beginning of the partition.
- `size`: Size of data to be read, in bytes.

```c
esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition without any transformation/decryption.

**Note** This function is essentially the same as esp_partition_read() above. It just never decrypts data but returns it as is.

**Return** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

**Parameters**
- `partition`: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `dst_offset`: Address where the data should be written, relative to the beginning of the partition.
- `src`: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size`: Size of data to be written, in bytes.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note** This function is essentially the same as esp_partition_write() above. It just never encrypts data but writes it as is.

**Note** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.
Return ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

\[ \text{esp_err_t} \ \text{esp_partition_write_range}(\text{const esp_partition_t *} \text{partition}, \text{size_t offset, size_t size}) \]

Erase part of the partition.

Return ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

\[ \text{esp_err_t} \ \text{esp_partition_mmap}(\text{const esp_partition_t *} \text{partition, size_t offset, size_t size}, \text{spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t*out_handle}) \]

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

Return ESP_OK, if successful

Parameters

- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where mapping should start.
- size: Size of the area to be mapped.
- memory: Memory space where the region should be mapped
- out_ptr: Output, pointer to the mapped memory region
- out_handle: Output, handle which should be used for spi_flash_munmap call

\[ \text{esp_err_t} \ \text{esp_partition_get_sha256}(\text{const esp_partition_t *} \text{partition, uint8_t *sha_256}) \]

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Return

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

Parameters
• [in] partition: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
• [out] sha_256: Returned SHA-256 digest for a given partition.

bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Return
• True: In case of the two firmware is equal.
• False: Otherwise

Parameters
• [in] partition_1: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
• [in] partition_2: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters
• flash_chip: Pointer to the structure identifying the flash chip
• offset: Address in bytes, where the partition starts
• size: Size of the partition in bytes
• label: Partition name
• type: One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
• [out] out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)

Deregister the partition previously registered using esp_partition_register_external.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Parameters
• partition: pointer to the partition structure obtained from esp_partition_register_external.

Structures

struct esp_partition_t
partition information structure

This is not the format in flash, that format is esp_partition_info_t.
However, this is the format used by this API.

**Public Members**

```c
esp_flash_t *flash_chip
    SPI flash chip on which the partition resides

datatype_type_t type
    partition type (app/data)

datatype_subtype_t subtype
    partition subtype

uint32_t address
    starting address of the partition in flash

uint32_t size
    size of the partition, in bytes

cchar [17] label
    partition label, zero-terminated ASCII string

bool encrypted
    flag is set to true if partition is encrypted
```

**Macros**

```c
ESP_PARTITION_SUBTYPE_OTA (i)
    Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.
```

**Type Definitions**

```c
typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t
    Opaque partition iterator type.
```

**Enumerations**

```c
enum esp_partition_type_t
    Partition type.

Note: Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

ESP_PARTITION_TYPE_APP = 0x00
    Application partition type.

ESP_PARTITION_TYPE_DATA = 0x01
    Data partition type.

ESP_PARTITION_TYPE_ANY = 0xff
    Used to search for partitions with any type.
```

```c
enum esp_partition_subtype_t
    Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

Note: These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

ESP_PARTITION_SUBTYPE_APP_FACTORY = 0x00
    Factory application partition.
```
Chapter 2. API 参考

ESP_PARTITION_SUBTYPE_APP_OTA_MIN = 0x10
Base for OTA partition subtypes.

ESP_PARTITION_SUBTYPE_APP_OTA_0 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 0
OTA partition 0.

ESP_PARTITION_SUBTYPE_APP_OTA_1 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1
OTA partition 1.

ESP_PARTITION_SUBTYPE_APP_OTA_2 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2
OTA partition 2.

ESP_PARTITION_SUBTYPE_APP_OTA_3 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3
OTA partition 3.

ESP_PARTITION_SUBTYPE_APP_OTA_4 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4
OTA partition 4.

ESP_PARTITION_SUBTYPE_APP_OTA_5 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5
OTA partition 5.

ESP_PARTITION_SUBTYPE_APP_OTA_6 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6
OTA partition 6.

ESP_PARTITION_SUBTYPE_APP_OTA_7 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7
OTA partition 7.

ESP_PARTITION_SUBTYPE_APP_OTA_8 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8
OTA partition 8.

ESP_PARTITION_SUBTYPE_APP_OTA_9 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9
OTA partition 9.

ESP_PARTITION_SUBTYPE_APP_OTA_10 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.

ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA_OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.
ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
Partition for emulate eFuse bits.

ESP_PARTITION_SUBTYPE_DATA_UNDEFINED = 0x06
Undefined (or unspecified) data partition.

ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
SPIFFS partition.

ESP_PARTITION_SUBTYPE_DATA_ANY = 0xff
Used to search for partitions with any subtype.

Flash 加密 API 参考

Header File

- components/bootloader_support/include/esp_flash_encrypt.h

Functions

static bool esp_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?

Return true if flash encryption is enabled.

esp_err_t esp_flash_encrypt_check_and_update (void)
Encrypt-in-place a block of flash sectors.

Note This function resets RTC_WDT between operations with sectors.

Return ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

Parameters

- src_addr: Source offset in flash. Should be multiple of 4096 bytes.
- data_length: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void esp_flash_write_protect_crypt_cnt (void)
Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

Note On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)
Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

Return
void esp_flash_encryption_init_checks (void)
Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

Note This function is called automatically during app startup, it doesn’t need to be called from the app.
- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

esp_err_t esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.
Return • ESP_OK - Successfully

void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from “Development” to “Release”.
If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:
- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

Enumerations
enum esp_flash_enc_mode_t
Values:
ESP_FLASH_ENC_MODE_DISABLED
ESP_FLASH_ENC_MODE_DEVELOPMENT
ESP_FLASH_ENC_MODE_RELEASE

2.6.7 SPIFFS 文件系统

概述
SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡。文件系统一致性检查等功能。

说明
- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 /spiffs 下，可 /spiffs/
tmp/myfile.txt 路径下创建一个文件则会在 SPIFFS 中生成一个名为 /tmp/myfile.txt 的文
件，而不是在 /spiffs/tmp 下生成名为 myfile.txt 的文件；
- SPIFFS 并非实时找，每次写操作耗时不等；
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。
- SPIFFS 只能稳定地使用约 75% 的指定分区容量。
- 当文件系统空间不足时，垃圾收集器会尝试多次扫描文件系统来寻找可用空间。根据所需空间的
不同，写操作会被调用多次，每次函数调用将花费几秒。同一操作可能会花费不同时长的问题缘
于 SPIFFS 的设计，且已在官方的 SPIFFS github 仓库 或是 <https://github.com/espressif/esp-idf/issues/
1737> 中被多次报告。这个问题可以通过 SPIFFS 配置部分缓解。
- 被删除文件通常不会被完全清除，会在文件系统中遗留下无法使用的部分。

工具
spiffsgen.py  spiffsgen.py:

python spiffsgen.py <image_size> <base_dir> <output_file>
参数（必选）说明如下：

- image_size：分区大小，用于烧录生成的 SPIFFS 镜像；
- base_dir：创建 SPIFFS 镜像的目录；
- output_file：SPIFFS 镜像输出文件。

其他参数（可选）也参与控制镜像的生成，用户可以运行以下帮助命令，查看这些参数的具体信息：

```
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的镜像，请确保使用的参数或配置与构建SPIFFS 时所用的参数或配置相同，运行帮助命令将显示所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

镜像生成后，用户可以使用 esptool.py 或 parttool.py 烧录镜像。

用户可以在命令行开开发环境中调用 spiffsgen.py，也可以直接从构建系统调用 spiffs_create_partition_image 来使用 spiffsgen.py，例如：

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS... __dep dep dep dep ...])
```

在构建系统中使用 spiffsgen.py 更为方便，构建配置会自动传递给 spiffsgen.py 工具，确保生成的镜像可用于构建。比如，单独调用 spiffsgen.py 时需要用到 image_size 参数，但在构建系统中调用 spiffs_create_partition_image 时，仅需要 partition 参数。镜像大小将直接从工程分区表中获取。

使用 spiffs_create_partition_image，必须从组件 CMakeLists.txt 文件调用。

用户也可以指定 FLASH_IN_PROJECT，然后使用 idf.py flash 将镜像与应用程序二进制文件、分区表等一起自动烧录至设备，例如：

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

不指定 FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_INPROJECT 也可以生成镜像，但须使用 esptool.py、parttool.py 或自定义构建系统手动烧录。

有时基本目录中的内容是在构建时生成的，用户可以使用 DEPENDS/SPIFFS_IMAGE_DEPENDS 指定目标，因此可以在生成镜像之前执行此目标：

```
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 storage/spiffsgen，查看示例。

**mkspiffs** 用户也可以使用 mkspiffs 工具创建 SPIFFS 分区镜像，与 spiffsgen.py 相似，mkspiffs 也可以用于从指定文件夹中生成镜像，然后使用 esptool.py 烧录镜像。

该工具需要获取以下参数：

- Block Size：4096（SPI flash 标准）
- Page Size：256（SPI flash 标准）
- Image Size：分区大小（以字节为单位，可从分区表中获取）
- Partition Offset：分区起始地址（可从分区表中获取）

运行以下命令，将文件夹打包成 1 MB 大小的镜像：

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

运行以下命令，将镜像烧录到 ESP32（偏移量：0x110000）：

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000_\n--spiffs.bin
```
选择合适的 SPIFFS 工具

上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。

以下情况优先选用 spiffsgen.py 工具：

1. 仅需在构建时简单生成 SPIFFS 镜像，请选择使用 spiffsgen.py，因为 spiffsgen.py 可以直接在构建系统中使用函数或命令生成 SPIFFS 镜像。
2. 主机没有可用的 C/C+ 编译器时，可以选择使用 spiffsgen.py 工具，因为 spiffsgen.py 不需要编译。

以下情况优先选用 mkspiffs 工具：

1. 如果用户除了需要生成镜像外，还需要拆包 SPIFFS 镜像，请选择使用 mkspiffs 工具，因为 spiffsgen.py 目前尚不支持此功能。
2. 如果用户当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 mkspiffs 二进制文件，此时请选择使用 mkspiffs 工具。但是，mkspiffs 本身没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 mkspiffs（如果未使用预编译的二进制文件），为输出文件创建构建规则或目标，将适当的参数传递给工具等。

另请参阅

- 分区表

应用示例

storage/spiffs 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库 API 写入和读取数据。请参考 example 目录下的 README.md 文件，获取详细信息。

高级 API 参考

Header File

- components/spiffs/include/esp_spiffs.h

Functions

**esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)**

Register and mount SPIFFS to VFS with given path prefix.

**Return**

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

**Parameters**

- conf: Pointer to esp_vfs_spiffs_conf_t configuration structure

**esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)**

Unregister and unmount SPIFFS from VFS

**Return**

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

**Parameters**

- partition_label: Same label as passed to esp_vfs_spiffs_register.

**bool esp_spiffs_mounted(const char *partition_label)**

Check if SPIFFS is mounted

**Return**

- true if mounted
- false if not mounted
Parameters
  * partition_label: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

```c
esp_err_t esp_spiffs_format(const char *partition_label)
```
Format the SPIFFS partition

Return
  * ESP_OK if successful
  * ESP_FAIL on error

Parameters
  * partition_label: Same label as passed to esp_vfs_spiffs_register.

```c
esp_err_t esp_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)
```
Get information for SPIFFS

Return
  * ESP_OK if success
  * ESP_ERR_INVALID_STATE if not mounted

Parameters
  * partition_label: Same label as passed to esp_vfs_spiffs_register
  * [out] total_bytes: Size of the file system
  * [out] used_bytes: Current used bytes in the file system

Structures
```c
struct esp_vfs_spiffs_conf_t
```
Configuration structure for esp_vfs_spiffs_register.

Public Members
```c
const char *base_path
```
File path prefix associated with the filesystem.

```c
const char *partition_label
```
Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

```c
size_t max_files
```
Maximum files that could be open at the same time.

```c
bool format_if_mount_failed
```
If true, it will format the file system if it fails to mount.

### 2.6.8 虚拟文件系统组件

**概述**

虚拟文件系统 (VFS) 组件可为一些驱动提供一个统一接口。有了该接口，用户可像操作普通文件一样操作虚拟文件。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是与文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 fopen 和 fprintf 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径前缀相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给该驱动程序。

例如，您可以使用 /fat 前缀注册 FAT 文件系统驱动，之后即可调用 fopen("/fat/file.txt", "w")。之后，VFS 将调用 FAT 驱动的 open 函数，并将参数 /file.txt 和合适的打开模式传递给 open 函数；后续对返回的 FILE* 数据流调用 C 库函数也同样会传递给 FAT 驱动。
注册 FS 驱动程序

如需注册 FS 驱动程序，首先要定义一个 esp_vfs_t 结构体实例，并用指向 FS API 的函数指针填充它。

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

在上述代码中需要用到 read, write 或 read_p, write_p，具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1：声明 API 函数时不带额外的上下文指针参数，即 FS 驱动程序为单例模式，此时使用 write

```c
ssize_t myfs_write(int fd, const void *data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

示例 2：声明 API 函数时需要一个额外的上下文指针作为参数，即可支持多个 FS 驱动程序实例，此时使用 write_p

```c
ssize_t myfs_write(myfs_t* fs, int fd, const void *data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized
// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));

myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

同步输入/输出多路复用 如需通过 select() 使用同步输入/输出多路复用，首先需要把 start_select() 和 end_select() 注册到 VFS，如下所示:

```c
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

调用 start_select() 设置环境，用以检测某一 VFS 文件描述符的读取/写入/错误条件。调用 end_select() 终止、析构或释放 start_select() 设置的资源。请在 vfs/vfs_uart.c 中查看 UART 外设参考实现，esp_vfs_dev_uart_register()、uart_start_select() 和 uart_end_select() 函数。
请参考以下示例，查看如何使用 VFS 文件描述符调用 `select()`:

- `peripherals/uart/uart_select`
- `system/select`

如果 `select()` 用于套接字文件描述符，您可以启用 `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` 选项来减少代码量，提高性能。

路径

已注册的 FS 驱动程序均有一个路径前缀与之关联，此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点，则在打开文件时使用具有最长匹配路径前缀的挂载点。例如，假设以下文件系统已在 VFS 中注册:

- 在 `data` 下注册 FS 驱动程序 1
- 在 `data/static` 下注册 FS 驱动程序 2

那么:

- 打开 `/data/log.txt` 会调用驱动程序 FS 1;
- 打开 `/data/static/index.html` 会调用 FS 驱动程序 2;
- 即使 FS 驱动程序 2 中没有 `/index.html`，也不会在 FS 驱动程序 1 中查找 `/static/index.html`。

挂载点名称必须以路径分隔符 (`/`) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支持空的挂载点名称：
1. 应用程序需要提供一个“下使用的文件系统”；
2. 应用程序需要同时覆盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。

VFS 不会对路径中的点 (`.`) 进行特殊处理，也不会将 `..` 视为相对目录的引用。在上述示例中，使用 `/data/static/.../log.txt` 路径不会调用 FS 驱动程序 1 打开 `/log.txt`。特定的 FS 驱动程序（如 FATFS）可能以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径（挂载点前缀已经被去除）:

1. 以 `/data` 为路径前缀注解 mysfs 驱动;
2. 应用程序调用 fopen("/data/config.json", ..);
3. mysfs 调用 myfs_open("/config.json", ..);
4. mysfs 驱动打开 `/config.json` 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 ESP_VFS_PATH_MAX 限制。即路径前缀上限为 ESP_VFS_PATH_MAX。各个文件系统驱动则可能会对自已的文件名长度设置一些限制。

文件描述符

文件描述符是一组很小的正整数，从 0 到 FD_SETSIZE - 1。FD_SETSIZE 在 `newlib/sys/types.h` 中定义。最大文件描述符由 `CONFIG_LWIP_MAX_SOCKETS` 定义，且为套接字保留。VFS 中包含一个名为 `s_fd_table` 的查找表，用于将全局文件描述符映射至 `s_vfs` 数组中注册的 VFS 驱动索引。

标准 IO 流 (stdin, stdout, stderr)

如果 `menuconfig` 中 UART for console output 选项没有设置为 None，则 stdin, stdout 和 stderr 将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，TX 管脚为 GPIO1，RX 管脚为 GPIO3。您可以在 `menuconfig` 中更改上述参数。

对 stdout 或 stderr 执行写入操作将会向 UART 发送 FIFO 发送字符，对 stdin 执行读取操作则会从 UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作将处于 busy-wait 状态。读操作处于非阻塞状态，仅返回 FIFO 中已有数据。由于读操作为非阻塞，高层级 C 库函数调用（如 `fscanf("%d\n", &var);`）可能获取不到所需结果。
如果应用程序使用 UART 驱动，则可以调用 esp_vfs_dev_uart_use_driver 函数来指导 VFS 使用
驱动中断、读写阻塞功能等。您也可以调用 esp_vfs_dev_uart_use_nonblocking 来恢复非阻塞
函数。

VFS 还为输入和输出提供换行符转换功能（可选）。多数应用程序在程序内部发送或接收以
LF（‘n’）结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF。应
用程序可以通过 menuconfig 或者调用 esp_vfs_dev_uart_port_set_rx_line_endings 和
esp_vfs_dev_uart_port_set_tx_line_endings 为输入输出配置换行符。

标准流和 FreeRTOS 任务 stdin、stdout 和 stderr 的 FILE 对象在所有 FreeRTOS 任务之间共享，
指向这些对象的指针分别存储在每个任务的 struct __reent 中。

预处理器把如下代码：

```c
fprintf(stderr, "42\n");
```

解释为：

```c
fprintf(__getreent()->stderr, "42\n");
```

其中 __getreent() 函数为每个任务返回一个指向 struct __reent 的指针。每个任务的 TCB 均拥
有一个 struct __reent 结构体，任务初始化后，struct __reent 结构体中的 __stdin、__stdout 和
__stderr 将会被赋予 __GLOBAL_REENT 中 __stdin、__stdout 和 __stderr 的值，__GLOBAL_REENT 即
为 FreeRTOS 启动之前所用结构体。

这样设计带来的结果是：
- 允许重定向给定任务的 stdin，stdout 和 stderr，而不影响其他任务，例如通过 stdin =
  fopen("/dev/uart/1", "r");
- 但使用 fclose 关闭默认 stdin，stdout 或 stderr 将同时关闭相应的 FILE 流对象，因此会影
  响其他任务；
- 如需更改新任务的默认 stdin，stdout 和 stderr 流，请在创建新任务之前修改
  __GLOBAL_REENT->__stdin(__stdout，__stderr)。

应用示例

指南（未完成）

API 参考

Header File

- components/vfs/include/esp_vfs.h

Functions

- ssize_t esp_vfs_write(struct __reent *, int fd, const void *data, size_t size)
  这些函数是用于在 newlib syscall 表的。它们将被 newlib 调用。当 newlib 需要使用
  该 syscall 时。
- off_t esp_vfs_lseek(struct __reent *, int fd, off_t size, int mode)
- ssize_t esp_vfs_read(struct __reent *, int fd, void *dst, size_t size)
- int esp_vfs_open(struct __reent *, const char *path, int flags, int mode)
- int esp_vfs_close(struct __reent *, int fd)
- int esp_vfs_fstat(struct __reent *, int fd, struct stat *st)
- int esp_vfs_stat(struct __reent *, const char *path, struct stat *st)
- int esp_vfs_link(struct __reent *, const char *n1, const char *n2)
esp_err_t esp_vfs_unregister(char *base_path)
Unregister a virtual filesystem for given path prefix
Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered
Parameters
• base_path: file prefix previously used in esp_vfs_register call

esp_err_t esp_vfs_unregister_with_id(esp_vfs_id_t vfs_id)
Unregister a virtual filesystem with the given index
Return ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered
Parameters
• vfs_id: The VFS ID returned by esp_vfs_register_with_id
esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)
Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
- vfs_id: VFS identificator returned by esp_vfs_register_with_id.
- fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_register_fd_with_local_fd(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)
Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
- vfs_id: VFS identificator returned by esp_vfs_register_with_id.
- local_fd: The fd in the local vfs. Passing -1 will set the local_fd as the (*fd) value.
- permanent: Whether the fd should be treated as permanent (not removed after close())
- fd: The registered file descriptor will be written to this address.

esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)
Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

Return ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

Parameters
- vfs_id: VFS identificator returned by esp_vfs_register_with_id.
- fd: File descriptor which should be unregistered.

int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Return The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

Parameters
- nfds: Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- readfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- writefds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- errorfds: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- timeout: If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

Parameters
- sem: semaphore structure which was passed to the driver by the start_select call

void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
Notification from a VFS driver about a read/write/error condition (ISR version)
This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**
- `sem`: semaphore structure which was passed to the driver by the start_select call
- `woken`: is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pread()`

**Return** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

**Parameters**
- `fd`: File descriptor used for read
- `dst`: Pointer to the buffer where the output will be written
- `size`: Number of bytes to be read
- `offset`: Starting offset of the read

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pwrite()`

**Return** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Parameters**
- `fd`: File descriptor used for write
- `src`: Pointer to the buffer from where the output will be read
- `size`: Number of bytes to write
- `offset`: Starting offset of the write

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for `select()`

**Public Members**

```c
bool is_sem_local
```

`type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise`

```c
void *sem
```

semaphore instance

```c
struct esp_vfs_t
```

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

**Public Members**

```c
int flags
```

`ESP_VFS_FLAG_CONTEXT_PTR` or `ESP_VFS_FLAG_DEFAULT`
**Chapter 2. API 参考**

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
  Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)
  Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
  Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)
  Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
  Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)
  Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
  pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
  pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
  pwrite with context pointer

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
  pwrite without context pointer

int (*open_p)(void *ctx, const char *path, int flags, int mode)
  open with context pointer

int (*open)(const char *path, int flags, int mode)
  open without context pointer

int (*close_p)(void *ctx, int fd)
  close with context pointer

int (*close)(int fd)
  close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
  fstat with context pointer

int (*fstat)(int fd, struct stat *st)
  fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
  stat with context pointer

int (*stat)(const char *path, struct stat *st)
  stat without context pointer

int (*link_p)(void *ctx, const char *n1, const char *n2)
  link with context pointer

int (*link)(const char *n1, const char *n2)
  link without context pointer

int (*unlink_p)(void *ctx, const char *path)
  unlink with context pointer

int (*unlink)(const char *path)
  unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
  rename with context pointer

Submit Document Feedback

Espressif Systems 1165 Release v5.0-dev-489-gef98a36
int (*rename)(const char *src, const char *dst)
rename without context pointer

DIR *(*opendir_p)(void *ctx, const char *name)
opendir with context pointer

DIR *(*opendir)(const char *name)
opendir without context pointer

mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
mkdir without context pointer

int (*rmkdir_p)(void *ctx, const char *name)
rmkdir with context pointer

int (*rmkdir)(const char *name)
rmkdir without context pointer

int (*fctl_p)(void *ctx, int fd, int cmd, int arg)
fctl with context pointer

int (*fctl)(int fd, int cmd, int arg)
fctl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
fsync with context pointer

int (*fsync)(int fd)
fsync without context pointer
int (*access_p) (void *ctx, const char *path, int amode)
   access with context pointer

int (*access) (const char *path, int amode)
   access without context pointer

int (*truncate_p) (void *ctx, const char *path, off_t length)
   truncate with context pointer

int (*truncate) (const char *path, off_t length)
   truncate without context pointer

int (*utime_p) (void *ctx, const char *path, const struct utimbuf *times)
   utime with context pointer

int (*utime) (const char *path, const struct utimbuf *times)
   utime without context pointer

int (*tcsetattr_p) (void *ctx, int fd, int optional_actions, const struct termios *p)
   tcsetattr with context pointer

int (*tcsetattr) (int fd, int optional_actions, const struct termios *p)
   tcsetattr without context pointer

int (*tcgetattr_p) (void *ctx, int fd, const struct termios *p)
   tcgetattr with context pointer

int (*tcgetattr) (int fd, const struct termios *p)
   tcgetattr without context pointer

int (*tcdrain_p) (void *ctx, int fd)
   tcdrain with context pointer

int (*tcdrain) (int fd)
   tcdrain without context pointer

int (*tcflush_p) (void *ctx, int fd, int select)
   tcflush with context pointer

int (*tcflush) (int fd, int select)
   tcflush without context pointer

int (*tcflow_p) (void *ctx, int fd, int action)
   tcflow with context pointer

int (*tcflow) (int fd, int action)
   tcflow without context pointer

pid_t (*tcgetsid_p) (void *ctx, int fd)
   tcgetsid with context pointer

pid_t (*tcgetsid) (int fd)
   tcgetsid without context pointer

int (*tcsendbreak_p) (void *ctx, int fd, int duration)
   tcsendbreak with context pointer

int (*tcsendbreak) (int fd, int duration)
   tcsendbreak without context pointer

esp_err_t (*start_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
                           esp_vfs_select_sem *sem, void **end_select_args)
   start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in
   the given VFS

int (*socket_select) (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
   socket select function for socket FDs with the functionality of POSIX select(); this should be set only for
   the socket VFS
void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore)(void)
end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select
for the given VFS

esp_err_t (*end_select)(void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket
driver

Macros

MAX_FDS
Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions
typedef int esp_vfs_id_t

Header File

• components/vfs/include/esp_vfs_dev.h

Functions

void esp_vfs_dev_uart_register (void)
add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void esp_vfs_dev_uart_set_rx_line_endings(esp_line_endings_t mode)
Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (‘
’, LF) passed into
stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note this function is not thread safe w.r.t. reading from UART

Parameters
• mode: line endings expected on UART

void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
Set the line endings to sent to UART.

This specifies the conversion between newlines (‘
’, LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification
**Chapter 2. API**

### Note

This function is not thread safe w.r.t. writing to UART

**Parameters**

- **mode**: line endings to send to UART

```c
int esp_vfs_dev_uart_port_set_rx_line_endings(int uart_num, esp_line_endings_t mode)
```

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (‘
’, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. reading from UART

**Return** 0 if succeeded, or -1 when an error (specified by errno) have occurred.

**Parameters**

- **uart_num**: the UART number
- **mode**: line endings to send to UART

### int esp_vfs_dev_uart_port_set_tx_line_endings

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (‘
’, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note** this function is not thread safe w.r.t. writing to UART

**Return** 0 if succeeded, or -1 when an error (specified by errno) have occurred.

**Parameters**

- **uart_num**: the UART number
- **mode**: line endings to send to UART

### void esp_vfs_dev_uart_use_nonblocking

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- **uart_num**: UART peripheral number

### void esp_vfs_dev_uart_use_driver

set VFS to use UART driver for reading and writing

**Note** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

**Parameters**

- **uart_num**: UART peripheral number

### void esp_vfs_usb_serial_jtag_use_driver

set VFS to use USB-Serial-JTAG driver for reading and writing

**Note** application must configure USB-Serial-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

### void esp_vfs_usb_serial_jtag_use_nonblocking

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**2.6.9 磨損均衡 API**
概述

ESP32 所使用的 flash，特别是 SPI flash 多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除和存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与 FAT 文件系统 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区。扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整个扇区（4096 字节）数据将全部丢失。
- **安全模式**：数据先保存在 flash 中空余扇区，擦除扇区后，数据即存储回去。如果设备断电，上电后可立即恢复数据。

设备默认设置如下：

- 定义扇区大小为 512 字节
- 默认使用性能模式

您可以使用配置菜单更改设置。

磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash，函数返回后，flash 即完成修改。

磨损均衡访问 API

处理 flash 数据常用的 API 如下所示：

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wlUnmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小（以字节为单位）
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数，建议您使用文件系统特定的函数。

内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得。由于模块使用 flash 部分扇区存储内部数据，因此计算所得内存大小有少许偏差。

另请参阅

- FAT 文件系统
- 分区表

应用示例

`storage/wear_levelling` 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动，挂载 FAT 文件系统分区，并使用 POSIX（可移植操作系统接口）和 C 库 API 从中写入和读取数据。如需了解更多信息，请参考 `storage/wear_levelling/README.md`。
## Chapter 2. API 参考

### 头文件

- fatfs/vfs/esp_vfs_fat.h

### 函数

```
esp_err_t esp_vfs_fat_spiflash_mount(const char *base_path, const char *partition_label,
                                     const esp_vfs_fat_mount_config_t *mount_config,
                                     wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

**Parameters**

- **base_path**: path where FATFS partition should be mounted (e.g. "/spiflash"
- **partition_label**: label of the partition which should be used
- **mount_config**: pointer to structure with extra parameters for mounting FATFS
- **[out] wl_handle**: wear levelling driver handle

```
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

### Public Members

#### bool format_if_mount_failed

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

#### int max_files

Max number of open files.

#### size_t allocation_unit_size

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 \* sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```
esp_err_t esp_vfs_fat_spiflashUnmount(const char *base_path, wl_handle_t *wl_handle)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

**Parameters**
Chapter 2. API 参考

- base_path: path where partition should be registered (e.g. “/spiflash”)
- wl_handle: wear levelling driver handle returned by esp_vfs_atSPIflash_mount

### 中层 API 参考

#### Header File

- components/wear_levelling/include/wear_levelling.h

#### Functions

**esp_err_t wl_mount(const esp_partition_t *partition, wl_handle_t *out_handle)**

Mount WL for defined partition.

**Return**

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

**Parameters**

- partition: that will be used for access
- out_handle: handle of the WL instance

**esp_err_t wl_unmount(wl_handle_t handle)**

Unmount WL for defined partition.

**Return**

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

**Parameters**

- handle: WL partition handle

**esp_err_t wl_erase_range(wl_handle_t handle, size_t start_addr, size_t size)**

Erase part of the WL storage.

**Return**

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- handle: WL handle that are related to the partition
- start_addr: Address where erase operation should start. Must be aligned to the result of function
  `wl_sector_size(...)`.
- size: Size of the range which should be erased, in bytes. Must be divisible by result of function
  `wl_sector_size(...)`.

**esp_err_t wl_write(wl_handle_t handle, size_t dest_addr, const void *src, size_t size)**

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using
wl_erase_range function.

**Note** Prior to writing to WL storage, make sure it has been erased with wl_erase_range call.

**Return**

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**

- handle: WL handle that are related to the partition
- dest_addr: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
Chapter 2. API

• size: Size of data to be written, in bytes.

```c
esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)
```
Read data from the WL storage.

**Return**
- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**Parameters**
- handle: WL module instance that was initialized before
- dest: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- src_addr: Address of the data to be read, relative to the beginning of the partition.
- size: Size of data to be read, in bytes.

```c
size_t wl_size (wl_handle_t handle)
```
Get size of the WL storage.

**Return** usable size, in bytes

**Parameters**
- handle: WL module handle that was initialized before

```c
size_t wl_sector_size (wl_handle_t handle)
```
Get sector size of the WL instance.

**Return** sector size, in bytes

**Parameters**
- handle: WL module handle that was initialized before

### Macros

```c
WL_INVALID_HANDLE
```

### Type Definitions

```c
typedef int32_t wl_handle_t
```

wear levelling handle

此部分 API 代码示例详见 ESP-IDF 项下 storage 目录。

2.7 System API

#### 2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

   - offset for 0 Segment = sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`).
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(`esp_image_segment_header_t`).
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + sizeof(`esp_image_segment_header_t`).
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`. 

Submit Document Feedback
To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32 image_info build/app.bin
```

You can also see the information on segments in the IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00000000 vaddr=0x3f400000 size=0x13ce0 ...
I (489) esp_image: segment 1: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (530) esp_image: segment 2: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (571) esp_image: segment 3: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (612) esp_image: segment 4: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (654) esp_image: segment 5: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (695) esp_image: segment 6: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (737) esp_image: segment 7: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (847) esp_image: segment 8: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (888) esp_image: segment 9: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (929) esp_image: segment 10: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (971) esp_image: segment 11: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
I (1012) esp_image: segment 12: paddr=0x00000000 vaddr=0x3f380000 size=0x13ce0 ...
```

For more details on the type of memory segments and their address ranges, see ESP32 Technical Reference Manual > System and Memory > Embedded Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash appened field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
• version word (4 bytes),
• signature data (64 bytes).

Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

• `magic_word` - the magic word for the `esp_app_desc` structure.
• `secure_version` - see Anti-rollback.
• `version` - see App version.
• `project_name` is filled from PROJECT_NAME.
• `time` and `date` - compile time and date.
• `idf_ver` - version of ESP-IDF.
• `app_elf_sha256` - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

Adding a Custom Structure to an Application

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```
const __attribute__((section("rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`) + sizeof(`esp_app_desc_t`).

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into CMakeLists.txt.

API Reference

Header File

• `components/bootloader_support/include/esp_app_format.h`

Structures

`struct esp_image_header_t`

Main header of binary image.

**Public Members**

`uint8_t magic`

`Magic word ESP_IMAGE_HEADER_MAGIC`

`uint8_t segment_count`

`Count of memory segments`
uint8_t spi_mode
    flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t spi_speed : 4
    flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t spi_size : 4
    flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
    Entry address

uint8_t wp_pin
    WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pin_drv[3]
    Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t chip_id
    Chip identification number

uint8_t min_chip_rev
    Minimum chip revision supported by image

uint8_t reserved[8]
    Reserved bytes in additional header space, currently unused

uint8_t hash_appended
    If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t
    Header of binary image segment.

Public Members

uint32_t load_addr
    Address of segment

uint32_t data_len
    Length of data

struct esp_app_desc_t
    Description about application.

Public Members

uint32_t magic_word
    Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t secure_version
    Secure version

uint32_t reserv1[2]
    reserv1

char version[32]
    Application version

char project_name[32]
    Project name
Chapter 2. API 参考

char time[16]
Compile time

char date[16]
Compile date

char idf_ver[32]
Version IDF

uint8_t app_elf_sha256[32]
sha256 of elf file

uint32_t reserv2[20]
reserv2

Macros

ESP_IMAGE_HEADER_MAGIC
The magic word for the esp_image_header_t structure.

ESP_IMAGE_MAX_SEGMENTS
Max count of segments in the image.

ESP_APP_DESC_MAGIC_WORD
The magic word for the esp_app_desc structure that is in DROM.

Enumerations

enum esp_chip_id_t
ESP chip ID.

Values:

ESP_CHIP_ID_ESP32 = 0x0000
chip ID: ESP32

ESP_CHIP_ID_ESP32S2 = 0x0002
chip ID: ESP32-S2

ESP_CHIP_ID_ESP32C3 = 0x0005
chip ID: ESP32-C3

ESP_CHIP_ID_ESP32S3 = 0x0009
chip ID: ESP32-S3

ESP_CHIP_ID_ESP32H2 = 0x000A
chip ID: ESP32-H2

ESP_CHIP_ID_ESP8684 = 0x000C
chip ID: ESP32-8684

ESP_CHIP_ID_INVALID = 0xFFFF
Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
SPI flash mode, used in esp_image_header_t.

Values:

ESP_IMAGE_SPI_MODE_QIO
SPI mode QIO

ESP_IMAGE_SPI_MODE_QOUT
SPI mode QOUT

ESP_IMAGE_SPI_MODE_DIO
SPI mode DIO

ESP_IMAGE_SPI_MODE_DOUT
SPI mode DOUT
Chapter 2. API

ESP_IMAGE_SPI_MODE_FAST_READ
SPI mode FAST_READ

ESP_IMAGE_SPI_MODE_SLOW_READ
SPI mode SLOW_READ

enum esp_image_spi_freq_t
SPI flash clock frequency.

Values:

ESP_IMAGE_SPI_SPEED_40M
SPI clock frequency 40 MHz

ESP_IMAGE_SPI_SPEED_26M
SPI clock frequency 26 MHz

ESP_IMAGE_SPI_SPEED_20M
SPI clock frequency 20 MHz

ESP_IMAGE_SPI_SPEED_80M = 0xF
SPI clock frequency 80 MHz

enum esp_image_flash_size_t
Supported SPI flash sizes.

Values:

ESP_IMAGE_FLASH_SIZE_1MB = 0
SPI flash size 1 MB

ESP_IMAGE_FLASH_SIZE_2MB
SPI flash size 2 MB

ESP_IMAGE_FLASH_SIZE_4MB
SPI flash size 4 MB

ESP_IMAGE_FLASH_SIZE_8MB
SPI flash size 8 MB

ESP_IMAGE_FLASH_SIZE_16MB
SPI flash size 16 MB

ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.7.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with minimal overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see 特定应用程序的跟踪
2. Lightweight logging to the host, see 记录日志到主机
3. System behaviour analysis, see 基于 SEGGER SystemView 的系统行为分析

API Reference

Header File

- components/app_trace/include/esp_app_trace.h
Chapter 2. API

Functions

\texttt{esp\_err\_t \textbf{esp\_apptrace\_init} (void)}

Initializes application tracing module.

\textbf{Note} Should be called before any \texttt{esp\_apptrace\_xxx} call.

\textbf{Return} ESP\_OK on success, otherwise see \texttt{esp\_err\_t}

\texttt{void \textbf{esp\_apptrace\_down\_buffer\_config} (uint8\_t \*buf, uint32\_t size)}

Configures down buffer.

\textbf{Note} Needs to be called before initiating any data transfer using \texttt{esp\_apptrace\_buffer\_get} and \texttt{esp\_apptrace\_write}. This function does not protect internal data by lock.

\textbf{Parameters}

- \texttt{buf}: Address of buffer to use for down channel (host to target) data.
- \texttt{size}: Size of the buffer.

\texttt{uint8\_t \*\textbf{esp\_apptrace\_buffer\_get} (esp\_apptrace\_dest\_t dest, uint32\_t size, uint32\_t tmo)}

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, \texttt{esp\_apptrace\_buffer\_put} must be called to indicate it.

\textbf{Return} non-NULL on success, otherwise NULL.

\textbf{Parameters}

- \texttt{dest}: Indicates HW interface to send data.
- \texttt{size}: Size of data to write to trace buffer.
- \texttt{tmo}: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

\texttt{esp\_err\_t \textbf{esp\_apptrace\_buffer\_put} (esp\_apptrace\_dest\_t dest, uint8\_t \*ptr, uint32\_t tmo)}

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by \texttt{esp\_apptrace\_buffer\_get}.

\textbf{Return} ESP\_OK on success, otherwise see \texttt{esp\_err\_t}

\textbf{Parameters}

- \texttt{dest}: Indicates HW interface to send data. Should be identical to the same parameter in call to \texttt{esp\_apptrace\_buffer\_get}.
- \texttt{ptr}: Address of trace buffer to release. Should be the value returned by call to \texttt{esp\_apptrace\_buffer\_get}.
- \texttt{tmo}: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

\texttt{esp\_err\_t \textbf{esp\_apptrace\_write} (esp\_apptrace\_dest\_t dest, \textbf{const} void \*data, uint32\_t size, uint32\_t tmo)}

Writes data to trace buffer.

\textbf{Return} ESP\_OK on success, otherwise see \texttt{esp\_err\_t}

\textbf{Parameters}

- \texttt{dest}: Indicates HW interface to send data.
- \texttt{data}: Address of data to write to trace buffer.
- \texttt{size}: Size of data to write to trace buffer.
- \texttt{tmo}: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

\texttt{int \textbf{esp\_apptrace\_vprintf\_to} (esp\_apptrace\_dest\_t dest, uint32\_t tmo, \textbf{const} char \*fmt, va\_list ap)}

\texttt{vprintf-like function to send log messages to host via specified HW interface.}

\textbf{Return} Number of bytes written.

\textbf{Parameters}

- \texttt{dest}: Indicates HW interface to send data.
- \texttt{tmo}: Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.
- \texttt{fmt}: Address of format string.
- \texttt{ap}: List of arguments.

\texttt{int \textbf{esp\_apptrace\_vprintf} (\textbf{const} char \*fmt, va\_list ap)}

\texttt{vprintf-like function to send log messages to host.}

\textbf{Return} Number of bytes written.

\textbf{Parameters}

- \texttt{fmt}: Address of format string.
Chapter 2. API

eap: List of arguments.

\textbf{esp_err_t esp_apprace_flush (esp_apptrace_dest_t dest, uint32_t tmo)}
Flushes remaining data in trace buffer to host.

\textbf{Return} ESP_OK on success, otherwise see esp_err_t

\textbf{Parameters}
- dest: Indicates HW interface to flush data on.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

\textbf{esp_err_t esp_apprace_flush_nolock (esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)}
Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apprace_flush which should be called from panic handler.

\textbf{Return} ESP_OK on success, otherwise see esp_err_t

\textbf{Parameters}
- dest: Indicates HW interface to flush data on.
- min_sz: Threshold for flushing data. If current filling level is above this value, data will be flushed.
- TRAX destinations only.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

\textbf{esp_err_t esp_apprace_read (esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)}
Reads host data from trace buffer.

\textbf{Return} ESP_OK on success, otherwise see esp_err_t

\textbf{Parameters}
- dest: Indicates HW interface to read the data on.
- data: Address of buffer to put data from trace buffer.
- size: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

\textbf{uint8_t *esp_apprace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)}
Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apprace_down_buffer_put must be called to indicate it.

\textbf{Return} non-NULL on success, otherwise NULL.

\textbf{Parameters}
- dest: Indicates HW interface to receive data.
- size: Address to store size of available data in down buffer. Must be initialized with requested value.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

\textbf{esp_err_t esp_apprace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)}
Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apprace_down_buffer_get.

\textbf{Return} ESP_OK on success, otherwise see esp_err_t

\textbf{Parameters}
- dest: Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apprace_down_buffer_get.
- ptr: Address of trace buffer to release. Should be the value returned by call to esp_apprace_down_buffer_get.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

\textbf{bool esp_apprace_host_is_connected (esp_apptrace_dest_t dest)}
Checks whether host is connected.

\textbf{Return} true if host is connected, otherwise false

\textbf{Parameters}
- dest: Indicates HW interface to use.

\textbf{void *esp_apprace_fopen (esp_apptrace_dest_t dest, const char *path, const char *mode)}
Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.
Return  non zero file handle on success, otherwise 0

Parameters
• dest: Indicates HW interface to use.
• path: Path to file.
• mode: Mode string. See fopen for details.

int esp_aptrace_fclose (esp_aptrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

Return  Zero on success, otherwise non-zero. See fclose for details.

Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_aptrace_fopen.

size_t esp_aptrace_fwrite (esp_aptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

Return  Number of written items. See fwrite for details.

Parameters
• dest: Indicates HW interface to use.
• ptr: Address of data to write.
• size: Size of an item.
• nmemb: Number of items to write.
• stream: File handle returned by esp_aptrace_fopen.

size_t esp_aptrace_fread (esp_aptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

Return  Number of read items. See fread for details.

Parameters
• dest: Indicates HW interface to use.
• ptr: Address to store read data.
• size: Size of an item.
• nmemb: Number of items to read.
• stream: File handle returned by esp_aptrace_fopen.

int esp_aptrace_fseek (esp_aptrace_dest_t dest, void *stream, long offset, int whence)
Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

Return  Zero on success, otherwise non-zero. See fseek for details.

Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_aptrace_fopen.
• offset: Offset. See fseek for details.
• whence: Position in file. See fseek for details.

int esp_aptrace_ftell (esp_aptrace_dest_t dest, void *stream)
Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

Return  Current position in file. See ftell for details.

Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_aptrace_fopen.

int esp_aptrace_fstop (esp_aptrace_dest_t dest)
Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Return  ESP_OK on success, otherwise see esp_err_t

Parameters
• dest: Indicates HW interface to use.
void esp_gcov_dump (void)
    Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t
    Application trace data destinations bits.
    Values:
    ESP_APPTRACE_DEST_JTAG = 1
        JTAG destination.
    ESP_APPTRACE_DEST_TRAX = ESP_APPTRACE_DEST_JTAG
        xxx_TRAX name is obsolete, use more common xxx_JTAG
    ESP_APPTRACE_DEST_UART0
        UART0 destination.
    ESP_APPTRACE_DEST_MAX = ESP_APPTRACE_DEST_UART0
    ESP_APPTRACE_DEST_NUM

Header File

• components/app_trace/include/esp_sysview_trace.h

Functions

static esp_err_t esp_sysview_flush (uint32_t tmo)
    Flushes remaining data in SystemView trace buffer to host.
    Return ESP_OK.
    Parameters
        • tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

int esp_sysview_vprintf (const char *format, va_list args)
    vprintf-like function to sent log messages to the host.
    Return Number of bytes written.
    Parameters
        • format: Address of format string.
        • args: List of arguments.

esp_err_t esp_sysview_heap_trace_start (uint32_t tmo)
    Starts SystemView heap tracing.
    Return ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.
    Parameters
        • tmo: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

esp_err_t esp_sysview_heap_trace_stop (void)
    Stops SystemView heap tracing.
    Return ESP_OK.

void esp_sysview_heap_trace_alloc (void *addr, uint32_t size, const void *callers)
    Sends heap allocation event to the host.
    Parameters
        • addr: Address of allocated block.
        • size: Size of allocated block.
        • callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void esp_sysview_heap_trace_free (void *addr, const void *callers)
    Sends heap de-allocation event to the host.
### 2.7.3 控制台终端

ESP-IDF 提供了 `console` 组件，它包含了开发基于串口的交互式控制终端所需要的所有模块，主要支持以下功能：

- 行编辑：由 `linenoise` 库具体实现，它支持处理退格键和方向键，支持回看命令的历史记录，支持命令的自动补全和参数提示。
- 将命令行拆分为参数列表。
- 参数解析，由 `argtable3` 库具体实现，该库提供解析 GNU 样式命令行参数的 API。
- 用于注册和调动命令的函数。
- 帮助创建 REPL (Read-Evaluate-Print-Loop) 环境的函数。

**注释**：这些功能模块可以一起使用也可以独立使用，例如仅使用行编辑和命令注册的功能，然后使用 `getopt` 函数或者自定义的函数来实现参数解析。而不直接使用 `argtable3` 库。同样地，还可以使用更简单的命令输入方法（比如 `fgets` 函数）和其他用于命令分割和参数解析的方法。

#### 行编辑

行编辑功能允许用户通过按键输入来编辑命令，使用退格键删除符号，使用左/右键在命令中移动光标，使用上/下键导航到之前输入的命令，使用制表键（“Tab”）来自动补全命令。

**注释**：此功能依赖于终端应用程序对 ANSI 转义符的支持。因此，显示原始 UART 数据的串口监视器不能与行编辑库一同使用。如果运行 `system/console` 示例程序的时候看到的输出结果显示在 `6n` 或者类似的转义字符而不是命令行提示符 `esp>` 时，就表明当前的串口监视器不支持 ANSI 转义字符。已知可用的串口监视器有 GNU `screen`, `minicom` 和 `idf_monitor.py`（可以通过在项目目录下执行 ```idf.py monitor```来调用）。

前往这里可以查看 `linenoise` 库提供的所有函数的描述。

#### 配置

`Linenoise` 库不需要显式地初始化，但是在调用行编辑函数之前，可能需要对某些配置的默认值稍作修改。

- `linenoiseClearScreen()`
  - 使用转义字符清除终端屏幕，并将光标定位在左上角。

- `linenoiseSetMultiLine()`
  - 在单行和多行编辑模式之间进行切换。单行模式下，如果命令的长度超过终端的宽度，会在行内滚动命令文本以显示文本的结尾。在这种情况下，文本的开头部分会被隐藏。单行模式在每次按下按键时发送给屏幕刷新的数据比较少，与多行模式相比更不容易发生故障。另一方面，在单行模式下编辑命令和复制命令将变得更加困难。默认情况下开启的是单行模式。

- `linenoiseAllowEmpty()`
  - 设置 `linenoise` 库收到的解析行为。设置为 `true` 时返回长度为零的字符串 `""`，设置为 `false` 时返回 `NULL`。默认情况下，将返回长度为零的字符串。

- `linenoiseSetMaxLineLen()`
  - 设置 `linenoise` 库中每行的最大长度。默认长度为 `4096`。如果需要优化 RAM 内存的使用，则可以通过这个函数设置一个小于默认 `4 KB` 的值来实现。
主循环 linenoise()
在大多数情况下，控制台应用程序都会具有相同的工作形式——在某个循环中不断读取输入的内容。然后解析再处理。linenoise() 是专门用来获取用户按键输入的函数。当按回车键被按下后便会返回完整的一行内容。因此可以用它来完成前面循环中的“读取”任务。

linenoiseFree()
必须调用此函数才能释放从 linenoise() 函数获取的命令行缓冲区。

提示和补全 linenoiseSetCompletionCallback()
当用户按下制表键时，linenoise 会用 补全回调函数，该回调函数会检查当前已经输入的内容，然后调用 linenoiseAddCompletion() 函数来提供所有可能的补全后的命令列表。启用补全功能，需要事先调用 linenoiseSetCompletionCallback() 函数来注册补全回调函数。

console 组件提供了一个现成的函数来为注册的命令提供补全功能 esp_console_get_completion()（见下文）。

linenoiseAddCompletion()
补全回调函数会通过调用此函数来通知 linenoise 库当前键入命令所有可能的补全结果。

linenoiseSetHintsCallback()
每当用户的输入改变时，linenoise 就会调用此回调函数，检查到目前为止输入的命令行内容，然后提供带有提示信息的字符串（例如命令参数列表），然后会在同一行上用不同的颜色显示出该文本。

linenoiseSetFreeHintsCallback()
如果提示回调函数返回的提示字符串是动态分配的或者需要以其它方式回收，就需要使用 linenoiseSetFreeHintsCallback() 注册具体的清理函数。

历史记录 linenoiseHistorySetMaxLen()
该函数用于设置要在内存中的最近输入命令的数量。用户通过使用向上/向下箭头来导航历史记录。

linenoiseHistoryAdd()
Linenoise 不会自动向历史记录中添加命令，应用程序需要调用此函数来将命令字符串添加到历史记录中。

linenoiseHistorySave()
该函数将命令的历史记录从 RAM 中保存为文本文件，例如保存到 SD 卡或者 Flash 的文件系统中。

linenoiseHistoryLoad()
与 linenoiseHistorySave 相对应，从文件中加载历史记录。

linenoiseHistoryFree()
释放用于存储命令历史记录的内存。当使用完 linenoise 库后需要调用此函数。

将命令行拆分成参数列表
console 组件提供 esp_console_split_argv() 函数来将命令行字符串拆分为参数列表。该函数会返回参数的数量 (argc) 和一个指针数组，该指针数组可以作为 argv 参数传递给任何接受 argc, argv 格式参数的函数。

根据以下规则来将命令行拆分成参数列表：
- 参数由空格分隔

• 如果参数本身需要使用空格，可以使用 `\` (反斜杠) 对它们进行转义
• 其它能被识别的转义字符有 `\"` (显示双引号)和 `\` (显示反斜杠本身)
• 可以使用双引号来引用参数，引号只可能出现在参数的开头和结尾。参数中的引号必须如上述进行转义。参数周围的引号会被 `esp_console_split_argv()` 函数删除

示例:

- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123 456, def]`
- `\`a\ b\"c\"` → `[a b"c"]`

参数解析

对于参数解析，console 组件使用 argtable3 库。有关 argtable3 的介绍请查看 教程 或者 Github 仓库中的示例代码。

命令的注册与调度

console 组件包含了一些工具函数，用来注册命令，将用户输入的命令和已经注册的命令进行匹配，使用命令行输入的参数调用命令。

应用 首先 调用 `esp_console_init()` 来初始化命令 注册 模块。 然后 调用 `esp_console_cmd_register()` 函数注册命令处理器。

对于每个命令，应用程序需要提供以下信息（需要以 `esp_console_cmd_t` 结构体的形式给出）：

- 命令名字 (不含空格的字符串)
- 帮助文档，解释该命令的用途
- 可选的提示文本，列出命令的参数。如果应用程序使用 Argtable3 库来解析参数，则可以通过提供指向 argtable 参数定义结构体的指针来自动生成提示文本
- 命令处理函数

命令注册模块还提供了其它函数：

- `esp_console_run()`
  该函数接受命令行字符串，使用 `esp_console_split_argv()` 函数将其拆分为 argv/argv 形式的参数列表，在已经注册的命令列表中查找命令，如果找到，则执行其对应的处理程序。

- `esp_console_register_help_command()`
  将 help 命令添加到已注册命令列表中，此命令将会以列表的方式打印所有注册的命令及其参数和帮助文本。

- `esp_console_get_completion()`
  与 linenoise 库中的 linenoiseSetCompletionCallback() 一同使用的回调函数，根据已经注册的命令列表为 linenoise 提供补全功能。

- `esp_console_register_help_command()`
  与 linenoise 库中 linenoiseSetHintsCallback() 一同使用的回调函数，为 linenoise 提供已经注册的命令的参数提示功能。

初始化 REPL 环境

除了上述的各种函数，console 组件还提供了一些 API 来帮助创建一个基本的 REPL 环境。

在一个典型的 console 应用中，你只需要调用 `esp_console_new_repl_uart()`，它会为你初始化好构建在 UART 基础上的 REPL 环境，其中包括安装 UART 驱动，基本的 console 配置，创建一个新的线程来执行 REPL 任务，注册一些基本的命令（比如 help 命令）。

之后你可以使用 `esp_console_cmd_register()` 来注册其它命令。REPL 环境在初始化后需要再调用 `esp_console_start_repl()` 函数才能开始运行。
应用程序示例

system/console 目录下提供了 console 组件的示例应用程序，展示了具体的使用方法。该示例介绍了如何初始化 UART 和 VFS 的功能，设置 linenoise 库。从 UART 中读取命令并加以处理，然后将历史命令存储到 Flash 中。更多信息，请参阅示例代码目录中的 README.md 文件。

此外，ESP-IDF 还提供了众多基于 console 组件的示例程序，它们可以辅助应用程序的开发。例如，peripherals/uart/i2c_tools，wifi/perf 等等。

API 参考

Header File

- components/console/esp_console.h

Functions

```c
esp_err_t esp_console_init(const esp_console_config_t *config)
```
initialize console module

**Note**  Call this once before using other console module features

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

**Parameters**

- config: console configuration

```c
esp_err_t esp_console_deinit(void)
```
de-initialize console module

**Note**  Call this once when done using console module functions

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

```c
esp_err_t esp_console_cmd_register(const esp_console_cmd_t *cmd)
```
Register console command.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

**Parameters**

- cmd: pointer to the command description; can point to a temporary value

```c
esp_err_t esp_console_run(const char *cmdline, int *cmd_ret)
```
Run command line.

**Return**

- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

**Parameters**

- cmdline: command line (command name followed by a number of arguments)
- [out] cmd_ret: return code from the command (set if command was run)

```c
size_t esp_console_split_argv(char *line, char **argv, size_t argv_size)
```
Split command line into arguments in place.
- This function finds whitespace-separated arguments in the given input line.
- 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3 ']
- Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.
- 'abc "123 456" def' -> ['abc', '123 456', 'def ']
- Escape sequences may be used to produce backslash, double quote, and space:
- 'a\ b\c"' -> ['a b\c" ']

**Note**  Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

**Return**  number of arguments found (argc)

**Parameters**
- line: pointer to buffer to parse; it is modified in place
- argv: array where the pointers to arguments are written
- argv_size: number of elements in argv_array (max. number of arguments)

```c
void esp_console_get_completion(const char *buf, linenoiseCompletions *lc)
```

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```c
linenoiseSetCompletionCallback(&.esp_console_get_completion);
```

**Parameters**
- buf: the string typed by the user
- lc: linenoiseCompletions to be filled in

```c
const char *esp_console_get_hint(const char *buf, int *color, int *bold)
```

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```c
linenoiseSetHintsCallback((linenoiseHintsCallback *)&esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

**Return**  string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

**Parameters**
- buf: line typed by the user
- [out] color: ANSI color code to be used when displaying the hint
- [out] bold: set to 1 if hint has to be displayed in bold

```c
esp_err_t esp_console_register_help_command(void)
```

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

```c
esp_err_t esp_console_new_repl_uart(const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over UART driver.

**Note**  This is an all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
Chapter 2. API

- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

**Return**
- ESP_OK on success
- ESP_FAIL Parameter error

**Parameters**
- [in] dev_config: UART device configuration
- [in] repl_config: REPL configuration
- [out] ret_repl: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_new_repl_usb_cdc(const esp_console_dev_usb_cdc_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over USB CDC.

**Note** This is a all-in-one function to establish the environment needed for REPL, includes:
- Initializes linenoise
- Spawn new thread to run REPL in the background

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

**Return**
- ESP_OK on success
- ESP_FAIL Parameter error

**Parameters**
- [in] dev_config: USB CDC configuration
- [in] repl_config: REPL configuration
- [out] ret_repl: return REPL handle after initialization succeed, return NULL otherwise

```c
esp_err_t esp_console_start_repl(esp_console_repl_t *repl)
```

Start REPL environment.

**Note** Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

**Parameters**
- [in] repl: REPL handle returned from esp_console_new_repl_xxx

**Structures**

```c
struct esp_console_config_t
Parameters for console initialization.
```

**Public Members**

```c
size_t max_cmdline_length
length of command line buffer, in bytes
```

```c
size_t max_cmdline_args
maximum number of command line arguments to parse
```

```c
int hint_color
ASCII color code of hint text.
```

```c
int hint_bold
Set to 1 to print hint text in bold.
```

```c
struct esp_console_repl_config_t
Parameters for console REPL (Read Eval Print Loop)
```
Public Members

`uint32_t max_history_len`
maximum length for the history

`const char* history_save_path`
file path used to save history commands, set to NULL won’t save to file system

`uint32_t task_stack_size`
repl task stack size

`uint32_t task_priority`
repl task priority

`const char* prompt`
prompt (NULL represents default: “esp> “)

`size_t max_cmdline_length`
maximum length of a command line. If 0, default value will be used

`struct esp_console_dev_uart_config_t`
Parameters for console device: UART.

Public Members

`int channel`
UART channel number (count from zero)

`int baud_rate`
Communication baud rate.

`int tx_gpio_num`
GPIO number for TX path, -1 means using default one.

`int rx_gpio_num`
GPIO number for RX path, -1 means using default one.

`struct esp_console_dev_usb_cdc_config_t`
Parameters for console device: USB CDC.

Note It’s an empty structure for now, reserved for future

`struct esp_console_cmd_t`
Console command description.

Public Members

`const char* command`
Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to esp_console_deinit.

`const char* help`
Help text for the command, shown by help command. If set, the pointer must be valid until the call to esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

`const char* hint`
Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

`esp_console_cmd_func_t func`
Pointer to a function which implements the command.
void *argtable
Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of esp_console_cmd_register call.

struct esp_console_repl_s
Console REPL base structure.

Public Members

esp_err_t (*del)(esp_console_repl_t *repl)
Delete console REPL environment.

Return
• ESP_OK on success
• ESP_FAIL on errors

Parameters
• [in] repl: REPL handle returned from esp_console_new_repl_xxx

Macros

ESP_CONSOLE_CONFIG_DEFAULT()
Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT()
Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT()

typedef struct linenoiseCompletions linenoiseCompletions
typedef int (*esp_console_cmd_func_t)(int argc, char **argv)
Console command main function.

Return console command return code, 0 indicates “success”

Parameters
• argc: number of arguments
• argv: array with argc entries, each pointing to a zero-terminated string argument

typedef struct esp_console_repl_s esp_console_repl_t
Type defined for console REPL.

2.7.4 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This section introduces some concepts used by eFuse Manager.

Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.
ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- **EFUSE_BLK0** is used entirely for system purposes;
- **EFUSE_BLK1** is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- **EFUSE_BLK2** is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- **EFUSE_BLK3** can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

**eFuse Manager component**

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source use the tool *efuse_table_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the *common* CSV file.

**CSV files:**

- **common** (*esp_efuse_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- **custom** (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

**Description CSV file**

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```markdown
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name** Name of field. The prefix `ESP_EFUSE_` will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The `field_name` supports structured format using . to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

**efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available `EFUSE_BLK0..EFUSE_BLK3`.

**bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to `bit_start + bit_count` from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

**bit_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for `ESP_EFUSE_SECURE_BOOT_KEY` and `ESP_EFUSE_ENCRYPT_FLASH_KEY` fields). The value `MAX_BLK_LEN` depends on `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.
Chapter 2. API

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

<table>
<thead>
<tr>
<th># Factory MAC address #</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]</td>
</tr>
<tr>
<td>, EFUSE_BLK0, 64, 8, Factory MAC addr [1]</td>
</tr>
<tr>
<td>, EFUSE_BLK0, 56, 8, Factory MAC addr [2]</td>
</tr>
<tr>
<td>, EFUSE_BLK0, 48, 8, Factory MAC addr [3]</td>
</tr>
<tr>
<td>, EFUSE_BLK0, 40, 8, Factory MAC addr [4]</td>
</tr>
<tr>
<td>, EFUSE_BLK0, 32, 8, Factory MAC addr [5]</td>
</tr>
<tr>
<td>MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address</td>
</tr>
</tbody>
</table>

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

Structured efuse fields

| WR_DIS, EFUSE_BLK0, 0, 32, Write protection |
| WR_DIS.RD_DIS, EFUSE_BLK0, 0, 1, Write protection for... |
| WR_DIS.FIELD_1, EFUSE_BLK0, 1, 1, Write protection for... |
| WR_DIS.FIELD_2, EFUSE_BLK0, 2, 4, Write protection for... |
| WR_DIS.FIELD_2.B1, EFUSE_BLK0, 2, 2, Write protection for... |
| WR_DIS.FIELD_2.B2, EFUSE_BLK0, 4, 2, Write protection for... |
| WR_DIS.FIELD_3, EFUSE_BLK0, 5, 1, Write protection for... |
| WR_DIS.FIELD_3.ALIAS, EFUSE_BLK0, 5, 1, Write protection for... |
| WR_DIS.FIELD_4, EFUSE_BLK0, 7, 1, Write protection for... |

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.

The IDF names for structured eFuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by _. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RD_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.

efuse_table_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:

```
cd $IDF_PATH/components/efuse/.
efuse_table_gen.py esp32/esp_efuse_table.csv
```
Chapter 2. API 参考

After generation in the folder $IDF_PATH/components/efuse.esp32 create:

- `esp_efuse_table.c` file.
- In include folder `esp_efuse_table.h` file.

To generate a custom files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
../efuse_table_gen.py esp32/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- `esp_efuse_custom_table.c` file.
- In include folder `esp_efuse_custom_table.h` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

**Supported coding scheme**

eFuse have three coding schemes:

- **None** (value 0).
- **3/4** (value 1).
- **Repeat** (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p PORT summary` command.
- from esptool utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `CONFIG_EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks `esp_efuse_read_...` operations.
After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**eFuse API**

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

**How to add a new field**

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py` `show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

```
eFuse coding scheme: NONE
#    field_name     efuse_block bit_start bit_count
1    WR_DIS_FLASH_CRYPT_CNT  EFUSE_BLK0 2   1
2    WR_DIS_BLK1           EFUSE_BLK0 7   1
3    WR_DIS_BLK2           EFUSE_BLK0 8   1
4    WR_DIS_BLK3           EFUSE_BLK0 9   1
5    RD_DIS_BLK1           EFUSE_BLK0 16  1
6    RD_DIS_BLK2           EFUSE_BLK0 17  1
7    RD_DIS_BLK3           EFUSE_BLK0 18  1
8    FLASH_CRYPT_CNT      EFUSE_BLK0 20  7

Used bits in eFuse table:

EFUSE_BLK0
[2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188_191] [194 194] [196 196] [198 201]

EFUSE_BLK1
[0 255]

EFUSE_BLK2
[0 255]

EFUSE_BLK3
[0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif).

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv.

Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

1. Fill all line for field: field_name, efuse_block, bit_start, bit_count, comment.
2. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.
Debug eFuse & Unit tests

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse` partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

**espefuse.py** esptool includes a useful tool for reading/writing ESP32 eFuse bits - `espefuse.py`.

### Header File

- components/efuse/include/esp_efuse.h

### Functions

**esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)**

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**

- [in] field: A pointer to the structure describing the fields of efuse.
- [out] dst: A pointer to array that will contain the result of reading.
- [in] dst_size_bits: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])**

Read a single bit eFuse field as a boolean value.

**Note** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

**Note** If assertions are enabled and the parameter is invalid, execution will abort

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

**Parameters**

- [in] field: A pointer to the structure describing the fields of efuse.

**esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t* out_cnt)**

Reads bits from EFUSE field and returns number of bits programmed as “1”.

If the bits are set not sequentially, they will still be counted.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**Parameters**

- [in] field: A pointer to the structure describing the fields of efuse.
Chapter 2. API

• [out] out_cnt: A pointer that will contain the number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)
```

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Return

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters

• [in] field: A pointer to the structure describing the fields of efuse.
• [in] src: A pointer to array that contains the data for writing.
• [in] src_size_bits: The number of bits required to write.

```c
esp_err_t esp_efuse_write_field_cnt(const esp_efuse_desc_t *field[], size_t cnt)
```

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Return

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

Parameters

• [in] field: A pointer to the structure describing the fields of efuse.
• [in] cnt: Required number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_bit(const esp_efuse_desc_t *field[])
```

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Return

• ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
• ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the efuse field is not 1 bit wide.

Parameters

• [in] field: Pointer to the structure describing the efuse field.

```c
esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)
```

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Return

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
• ESP_ERR_NOT_SUPPORTED: The block does not support this command.

Parameters

• [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)
**esp_err_t esp_efuse_set_read_protect**(esp_efuse_block_t blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**Parameters**
- **[in]** blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**int esp_efuse_get_field_size**(const esp_efuse_desc_t *field[])

Returns the number of bits used by field.

**Parameters**
- **[in]** field: A pointer to the structure describing the fields of eFuse.

**uint32_t esp_efuse_read_reg**(esp_efuse_block_t blk, unsigned int num_reg)

Returns value of eFuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return** Value of register

**Parameters**
- **[in]** blk: Block number of eFuse.
- **[in]** num_reg: The register number in the block.

**esp_err_t esp_efuse_write_reg**(esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)

Write value to eFuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**
- **[in]** blk: Block number of eFuse.
- **[in]** num_reg: The register number in the block.
- **[in]** val: Value to write.

**esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme**(esp_efuse_block_t blk)

Return eFuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return** Return eFuse coding scheme for blocks

**Parameters**
- **[in]** blk: Block number of eFuse.

**esp_err_t esp_efuse_read_block**(esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to eFuse block starting at the offset and the required size.

**Note** Please note that reading in the batch mode does not show uncommitted changes.

**Return**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
Chapter 2. API

- **[in] blk**: Block number of eFuse.
- **[in] dst_key**: A pointer to array that will contain the result of reading.
- **[in] offset_in_bits**: Start bit in block.
- **[in] size_bits**: The number of bits required to read.

```c
esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to eFuse block starting at the offset and the required size.

**Return**
- **ESP_OK**: The operation was successfully completed.
- **ESP_ERR_INVALID_ARG**: Error in the passed arguments.
- **ESP_ERR_CODING**: Error range of data does not match the coding scheme.
- **ESP_ERR_EFUSE_REPEATED_PROG**: Error repeated programming of programmed bits

**Parameters**
- **[in] blk**: Block number of eFuse.
- **[in] src_key**: A pointer to array that contains the key for writing.
- **[in] offset_in_bits**: Start bit in block.
- **[in] size_bits**: The number of bits required to write.

```c
uint8_t esp_efuse_get_chip_ver(void)
```

Returns chip version from eFuse.

**Return** chip version

```c
uint32_t esp_efuse_get_pkg_ver(void)
```

Returns chip package from eFuse.

**Return** chip package

```c
void esp_efuse_reset(void)
```

Reset eFuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note** This function is not threadsafe, if calling code updates eFuse values from multiple tasks then this is caller’s responsibility to serialise.

```c
void esp_efuse_disable_basic_rom_console(void)
```

Disable BASIC ROM Console via eFuse.

By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

Call this function (from bootloader or app) to permanently disable the console on this chip.

```c
esp_err_t esp_efuse_disable_rom_download_mode(void)
```

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note** If ROM Download Mode is already disabled, this function does nothing and returns success.

**Return**
- **ESP_OK** If the eFuse was successfully burned, or had already been burned.
- **ESP_ERR_NOT_SUPPORTED** (ESP32 only) This SoC is not capable of disabling UART download mode
- **ESP_ERR_INVALID_STATE** (ESP32 only) This eFuse is write protected and cannot be written

```c
esp_err_t esp_efuse_set_rom_log_scheme(esp_effuse_log_scheme_t log_scheme)
```

Set boot ROM log scheme via eFuse.

**Note** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

**Return**
- **ESP_OK** If the eFuse was successfully burned, or had already been burned.
Chapter 2. API

- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

Parameters
- log_scheme: Supported ROM log scheme

`uint32_t esp_efuse_read_secure_version (void)`
Return secure_version from efuse field.

Return Secure version from efuse field

bool `esp_efuse_check_secure_version (uint32_t secure_version)`
Check secure_version from app and secure_version and from efuse field.

Return
- True: If version of app is equal or more then secure_version from efuse.

Parameters
- secure_version: Secure version from app.

`esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)`
Write efuse field by secure_version value.
Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

Return
- ESP_OK: Successful.
- ESP_FAIL: secure_version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

Parameters
- [in] secure_version: Secure version from app.

`esp_err_t esp_efuse_batch_write_begin (void)`
Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usual the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

Note Please note that reading in the batch mode does not show uncommitted changes.

```c
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write((ESP_EFUSE_1, 3)); // ESP_EFUSE_1 == 1, here we write a new --value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1. --because uncommitted changes are not readable, it will be available only... --after commit.
...
```
Esperrif_batch_write APIs can be called recursively.

```c
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit();  // the burn will be skipped here, it will be done in the last commit() .
...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 3.
```

Return
- ESP_OK: Successful.

```c
typedef esp_err_t esp_efuse_batch_write_cancel (void)
```
Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

```c
typedef esp_err_t esp_efuse_batch_write_commit (void)
```
Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

```c
bool esp_efuse_block_is_empty (esp_efuse_block_t block)
```
Checks that the given block is empty.

Return
- True: The block is empty.
- False: The block is not empty or was an error.

```c
bool esp_efuse_get_key_dis_read (esp_efuse_block_t block)
```
Returns a read protection for the key block.

Return True: The key block is read protected False: The key block is readable.

Parameters
- [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

```c
typedef esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)
```
Sets a read protection for the key block.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters
- [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

```c
bool esp_efuse_get_key_dis_write (esp_efuse_block_t block)
```
Returns a write protection for the key block.

Return True: The key block is write protected False: The key block is writeable.

Parameters
- [in] block: A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
**Chapter 2. API**

- **[in] block**: A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

```c
esp_err_t esp_efuse_set_key_dis_write(esp_efuse_block_t block)
```
Sets a write protection for the key block.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- **[in] block**: A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

```c
bool esp_efuse_key_block_unused(esp_efuse_block_t block)
```
Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

**Return**
- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

**Parameters**
- **block**: key block to check.

```c
bool esp_efuse_find_purpose(esp_efuse_purpose_t purpose, esp_efuse_block_t* block)
```
Find a key block with the particular purpose set.

**Return**
- True: If found,
- False: If not found (value at block pointer is unchanged).

**Parameters**
- **[in] purpose**: Purpose to search for.
- **[out] block**: Pointer in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX` which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

```c
bool esp_efuse_get_keypurpose_dis_write(esp_efuse_block_t block)
```
Returns a write protection of the key purpose field for an efuse key block.

**Note** For ESP32: no keypurpose, it returns always True.

**Return** True: The key purpose is write protected. False: The key purpose is writeable.

**Parameters**
- **[in] block**: A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

```c
esp_efuse_purpose_t esp_efuse_get_key_purpose(esp_efuse_block_t block)
```
Returns the current purpose set for an efuse key block.

**Return**
- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

**Parameters**
- **[in] block**: A key block in the range `EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX`

```c
esp_err_t esp_efuse_write_key(esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void* key, size_t key_size_bytes)
```
Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
Chapter 2. API

- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- **[in] block**: Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- **[in] purpose**: Purpose to set for this key. Purpose must be already unset.
- **[in] key**: Pointer to data to write.
- **[in] key_size_bytes**: Bytes length of data to write.

`esp_err_t esp_efuse_write_keys(const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)`

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**Parameters**
- **[in] purposes**: Array of purposes (purpose[number_of_keys]).
- **[in] keys**: Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- **[in] number_of_keys**: The number of keys to write (up to 6 keys).

**Structures**

`struct esp_efuse_desc_t`  
Type definition for an efuse field.

**Public Members**

`esp_efuse_block_t esp_efuse_block: 8`
Block of efuse

`uint8_t bit_start`
Start bit [0..255]

`uint16_t bit_count`
Length of bit field [1..-]

**Macros**

`ESP_ERR_EFUSE`  
Base error code for efuse api.

`ESP_OK_EFUSE_CNT`  
OK the required number of bits is set.

`ESP_ERR_EFUSE_CNT_IS_FULL`  
Error field is full.

`ESP_ERR_EFUSE_REPEATED_PROG`  
Error repeated programming of programmed bits is strictly forbidden.

`ESP_ERR_CODING`  
Error while a encoding operation.
Chapter 2. API

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to
the efuse component and not returned by any public API.

Enumerations

enum esp_efuse_rom_log_scheme_t
Type definition for ROM log scheme.

Values:

ESP_EFUSE_ROM_LOG_ALWAYS_ON
Always enable ROM logging

ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
ROM logging is enabled when specific GPIO level is low during start up

ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
ROM logging is enabled when specific GPIO level is high during start up

ESP_EFUSE_ROM_LOG_ALWAYS_OFF
Disable ROM logging permanently

2.7.5 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see Error Handling.

For the full list of error codes defined in ESP-IDF, see Error Code Reference.

API Reference

Header File

• components/esp_common/include/esp_err.h

Functions

const char *esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time
an esp_err_t error is modified, created or removed from the IDF project.

Return string error message

Parameters

• code: esp_err_t error code

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)
Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string
representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time
an esp_err_t error is modified, created or removed from the IDF project.

Return buf containing the string error message

Parameters
Chapter 2. API 参考

- **code**: esp_err_t error code
- **[out] buf**: buffer where the error message should be written
- **buflen**: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Macros**

- **ESP_OK**
  - esp_err_t value indicating success (no error)
- **ESP_FAIL**
  - Generic esp_err_t code indicating failure
- **ESP_ERR_NO_MEM**
  - Out of memory
- **ESP_ERR_INVALID_ARG**
  - Invalid argument
- **ESP_ERR_INVALID_STATE**
  - Invalid state
- **ESP_ERR_INVALID_SIZE**
  - Invalid size
- **ESP_ERR_NOT_FOUND**
  - Requested resource not found
- **ESP_ERR_NOT_SUPPORTED**
  - Operation or feature not supported
- **ESP_ERR_TIMEOUT**
  - Operation timed out
- **ESP_ERR_INVALID_RESPONSE**
  - Received response was invalid
- **ESP_ERR_INVALID_CRC**
  - CRC or checksum was invalid
- **ESP_ERR_INVALID_VERSION**
  - Version was invalid
- **ESP_ERR_INVALID_MAC**
  - MAC address was invalid
- **ESP_ERR_NOT_FINISHED**
  - There are items remained to retrieve
- **ESP_ERR_WIFI_BASE**
  - Starting number of WiFi error codes
- **ESP_ERR_MESH_BASE**
  - Starting number of MESH error codes
- **ESP_ERR_FLASH_BASE**
  - Starting number of flash error codes
- **ESP_ERR_HW_CRYPTO_BASE**
  - Starting number of HW cryptography module error codes
- **ESP_ERROR_CHECK**(x)
  - Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.
  - Disabled if assertions are disabled.
ESP_ERROR_CHECK WITHOUT_ABORT(x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions

typedef int esp_err_t

2.7.6 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

def do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}

Partial Image Download over HTTPS

To use partial image download feature, enable partial_http_download configuration in esp_https_ota_config_t. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting max_http_request_size to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using partial_http_download with max_http_request_size of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer...
Chapter 2. API 参考

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

```c
esp_err_t esp_https_ota(const esp_http_client_config_t *config)
```

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

**Return**

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image
- `ESP_ERR_NO_MEM`: Cannot allocate memory for OTA operation.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**Parameters**

- `[in]` `config`: pointer to `esp_http_client_config_t` structure.

```c
esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)
```

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

**Return**

- `ESP_OK`: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- `ESP_FAIL`: For generic failure.
- `ESP_ERR_INVALID_ARG`: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.

**Parameters**

- `[in]` `ota_config`: pointer to `esp_https_ota_config_t` structure
- `[out]` `handle`: pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

```c
esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)
```

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Return**

- `ESP_ERR_HTTPS_OTA_IN_PROGRESS`: OTA update is in progress, call this API again to continue.
Chapter 2. API

• ESP_OK: OTA update was successful
• ESP_FAIL: OTA update failed
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
• ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• For other return codes, refer OTA documentation in esp-idf’s app_update component.

Parameters
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

bool esp_https_ota_is_complete_data_received (esp_https_ota_handle_t https_ota_handle)

Checks if complete data was received or not.

Note This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

Return
• false
• true

Parameters
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_finish (esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

Note If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

Return
• ESP_OK: Clean-up successful
• ESP_ERR_INVALID_STATE
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

Parameters
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_abort (esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

Note esp_https_ota_abort should not be called after calling esp_https_ota_finish

Return
• ESP_OK: Clean-up successful
• ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
• ESP_FAIL: OTA not started
• ESP_ERR_NOT_FOUND: OTA handle not found
• ESP_ERR_INVALID_ARG: Invalid argument

Parameters
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

esp_err_t esp_https_ota_get_img_desc (esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

Note This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

Return
• ESP_ERR_INVALID_ARG: Invalid arguments
• ESP_FAIL: Failed to read image descriptor
• ESP_OK: Successfully read image descriptor
Parameters
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure
• [out] new_app_info: pointer to an allocated esp_app_desc_t structure

`int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)`
This function returns OTA image data read so far.

**Note** This API should be called only if `esp_https_ota_perform()` has been called at least once or if `esp_https_ota_get_img_desc` has been called before.

**Return**
• -1 On failure
• total bytes read so far

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

`int esp_https_ota_get_image_size(esp_https_ota_handle_t https_ota_handle)`
This function returns OTA image total size.

**Note** This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

**Return**
• -1 On failure or chunked encoding
• total bytes of image

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

Structures
`struct esp_https_ota_config_t`
ESP HTTPS OTA configuration.

**Public Members**

`const esp_http_client_config_t *http_config`
ESP HTTP client configuration

`http_client_init_cb_t http_client_init_cb`
Callback after ESP HTTP client is初始化

`bool bulk_flash_erase`
Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

`bool partial_http_download`
Enable Firmware image to be downloaded over multiple HTTP requests

`int max_http_request_size`
Maximum request size for partial HTTP download

 Macros
`ESP_ERR_HTTPS_OTA_BASE`
`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

**Type Definitions**
`typedef void *esp_https_ota_handle_t`
`typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)`
2.7.7 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain libc. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- `pthread_create()` - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until `pthread_join()` is called on it.
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a thread.
- `pthread_equal()`

Thread Attributes

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn’t need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).
Chapter 2. API

- pthread_attr_getstacksize() / pthread_attr_setstacksize()
- pthread_attr_getdetachstate() / pthread_attr_setdetachstate()

**Ones**

- pthread_once()

Static initializer constant PTHREAD_ONCE_INIT is supported.

注解：This function can be called from tasks created using either pthread or FreeRTOS APIs

**Mutexes**

POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with xSemaphoreCreateMutex().

- pthread_mutex_init()
- pthread_mutex_destroy()
- pthread_mutex_lock()
- pthread_mutex_timedlock()
- pthread_mutex_trylock()
- pthread_mutex_unlock()
- pthread_mutexattr_init()
- pthread_mutexattr_destroy()
- pthread_mutexattr_gettype() / pthread_mutexattr_settype()

Static initializer constant PTHREAD_MUTEX_INITIALIZER is supported, but the non-standard static initializer constants for other mutex types are not supported.

注解：These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Condition Variables**

- pthread_cond_init() - The attr argument is not implemented and is ignored.
- pthread_cond_destroy()
- pthread_cond_signal()
- pthread_cond_broadcast()
- pthread_cond_wait()
- pthread_cond_timedwait()

Static initializer constant PTHREAD_COND_INITIALIZER is supported.

- The resolution of pthread_cond_timedwait() timeouts is the RTOS tick period (see CONFIG_FREERTOS_HZ). Timeouts may be delayed up to one tick period after the requested timeout.

注解：These functions can be called from tasks created using either pthread or FreeRTOS APIs

**Read/Write Locks**

- pthread_rwlock_init() - The attr argument is not implemented and is ignored.
- pthread_rwlock_destroy()
- pthread_rwlock_rdlock()
- pthread_rwlock_wrlock()
- pthread_rwlock_unlock()
Chapter 2. API 参考

Static initializer constant PTHREAD_RWLOCK_INITIALIZER is supported.

注解：These functions can be called from tasks created using either pthread or FreeRTOS APIs

### Thread-Specific Data

- `pthread_key_create()` - The destr_function argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

注解：These functions can be called from tasks created using either pthread or FreeRTOS APIs

注解：There are other options for thread local storage in ESP-IDF, including options with higher performance. See *Thread Local Storage*.

### Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub <https://github.com/espressif/esp-idf/issues> with the details.

### ESP-IDF Extensions

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

### Examples

- `system/pthread` demonstrates using the pthreads API to create threads
- `cxx/pthread` demonstrates using C++ Standard Library functions with threads
Chapter 2. API 参考

API Reference

Header File

- components/pthread/include/esp_pthread.h

Functions

```c
esp_pthread_cfg_t esp_pthread_get_default_config (void)
```

Creates a default pthread configuration based on the values set via menuconfig.

**Return** A default configuration structure.

```c
esp_err_t esp_pthread_set_cfg (const esp_pthread_cfg_t *cfg)
```

Configure parameters for creating pthread.

This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

**Note** Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

**Return**
- ESP_OK if configuration was successfully set
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

**Parameters**
- `cfg`: The pthread config parameters

```c
esp_err_t esp_pthread_get_cfg (esp_pthread_cfg_t *p)
```

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

**Return**
- ESP_OK if the configuration was available
- ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

**Parameters**
- `p`: Pointer to the pthread config structure that will be updated with the currently configured parameters

```c
esp_err_t esp_pthread_init (void)
```

Initialize pthread library.

Structures

```c
struct esp_pthread_cfg_t
```

pthread configuration structure that influences pthread creation

**Public Members**

```c
size_t stack_size
```

The stack size of the pthread.

```c
size_t prio
```

The thread’s priority.

```c
bool inherit_cfg
```

Inherit this configuration further.

```c
const char *thread_name
```

The thread name.
int pin_to_core
    The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros
PTHREAD_STACK_MIN

2.7.8 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers – code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as esp_event_handler_t.
2. An event loop is created using esp_event_loop_create(), which outputs a handle to the loop of type esp_event_loop_handle_t. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here. Components register event handlers to the loop using esp_event_handler_register_with(). Handlers can be registered with multiple loops, more on that here.
3. Event sources post an event to the loop using esp_event_post_to().
4. Components wanting to remove their handlers from being called can do so by unregistering from the loop using esp_event_handler_unregister_with().
5. Event loops which are no longer needed can be deleted using esp_event_loop_delete().

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data) {
    // Event handler logic
}

void app_main() {
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
    // specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is
    // needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,;
```
### Declaring and defining events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

#### Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

#### Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

注解：在IDF中，系统事件的基标识符为大写，并且后缀为EVENT。例如，Wi-Fi事件的基标识符为WIFI_EVENT，以太网事件基标识符为ETHERNET_EVENT。
and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```c
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

**Default Event Loop**

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loop equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>esp_event_loop_create()</code></td>
<td><code>esp_event_loop_create_default()</code></td>
</tr>
<tr>
<td><code>esp_event_loop_delete()</code></td>
<td><code>esp_event_loop_delete_default()</code></td>
</tr>
<tr>
<td><code>esp_event_handler_register_with()</code></td>
<td><code>esp_event_handler_register()</code></td>
</tr>
<tr>
<td><code>esp_event_handler_unregister_with()</code></td>
<td><code>esp_event_handler_unregister()</code></td>
</tr>
<tr>
<td><code>esp_event_post_to()</code></td>
<td><code>esp_event_post()</code></td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. `ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:
If the hypothetical event `MY_EVENT_BASE`, `MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order**

The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- `components/esp_event/include/esp_event.h`

**Functions**

```c
esp_err_t esp_event_loop_create(esp_event_loop_args_t *event_loop,
                                esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
**Parameters**

- **{in} event_loop_args**: configuration structure for the event loop to create
- **{out} event_loop**: handle to the created event loop

**esp_err_t esp_event_loop_delete**(esp_event_loop_handle_t event_loop)

Delete an existing event loop.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- **{in} event_loop**: event loop to delete, must not be NULL

**esp_err_t esp_event_loop_create_default**(void)

Create default event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete_default**(void)

Delete the default event loop.

**Return**

- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_run**(esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note**

encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- **{in} event_loop**: event loop to dispatch posted events from, must not be NULL
- **{in} ticks_to_run**: number of ticks to run the loop

**esp_err_t esp_event_handler_register**(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.
**Chapter 2. API**

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called.

**Return**

- **ESP_OK**: Success
- **ESP_ERR_NO_MEM**: Cannot allocate memory for the handler
- **ESP_ERR_INVALID_ARG**: Invalid combination of `event_base` and `event_id`
- Others: Fail

**Parameters**

- **[in]** `event_base`: the base ID of the event to register the handler for
- **[in]** `event_id`: the ID of the event to register the handler for
- **[in]** `event_handler`: the handler function which gets called when the event is dispatched
- **[in]** `event_handler_arg`: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

**Note** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called.

**Return**

- **ESP_OK**: Success
- **ESP_ERR_NO_MEM**: Cannot allocate memory for the handler
- **ESP_ERR_INVALID_ARG**: Invalid combination of `event_base` and `event_id`
- Others: Fail

**Parameters**

- **[in]** `event_loop`: the event loop to register this handler function to, must not be NULL
- **[in]** `event_base`: the base ID of the event to register the handler for
- **[in]** `event_id`: the ID of the event to register the handler for
- **[in]** `event_handler`: the handler function which gets called when the event is dispatched
- **[in]** `event_handler_arg`: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg, esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event...
base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

**Parameters**
- **[in]** event_loop: the event loop to register this handler function to, must not be NULL
- **[in]** event_base: the base ID of the event to register the handler for
- **[in]** event_id: the ID of the event to register the handler for
- **[in]** event_handler: the handler function which gets called when the event is dispatched
- **[in]** event_handler_arg: data, aside from event data, that is passed to the handler when it is called
- **[out]** instance: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

```c
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg, esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

**Parameters**
- **[in]** event_base: the base ID of the event to register the handler for
- **[in]** event_id: the ID of the event to register the handler for
- **[in]** event_handler: the handler function which gets called when the event is dispatched
- **[in]** event_handler_arg: data, aside from event data, that is passed to the handler when it is called
- **[out]** instance: An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.
**esp_err_t** `esp_event_handler_unregister` (esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)

Unregisters a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister()` instead.

**Note** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**
- **[in]** event_base: the base of the event with which to unregister the handler
- **[in]** event_id: the ID of the event with which to unregister the handler
- **[in]** event_handler: the handler to unregister

**esp_err_t** `esp_event_handler_unregister_with` (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)

Unregisters a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

**Note** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister_with()` instead.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**
- **[in]** event_loop: the event loop with which to unregister this handler function, must not be NULL
- **[in]** event_base: the base of the event with which to unregister the handler
- **[in]** event_id: the ID of the event with which to unregister the handler
- **[in]** event_handler: the handler to unregister

**esp_err_t** `esp_event_handler_instance_unregister_with` (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)

Unregisters a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

**Note** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will
also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_loop: the event loop with which to unregister this handler function, must not be NULL
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

```c
esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_base: the base of the event with which to unregister the handler
- [in] event_id: the ID of the event with which to unregister the handler
- [in] instance: the instance object of the registration to be unregistered

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

Return
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

Parameters
- [in] event_base: the event base that identifies the event
- [in] event_id: the event ID that identifies the event
- [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
- [in] event_data_size: the size of the event data
- [in] ticks_to_wait: number of ticks to block on a full event queue

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

Return
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
-- Chapter 2. API

- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

**Parameters**

- **[in]** `event_loop`: the event loop to post to, must not be NULL
- **[in]** `event_base`: the event base that identifies the event
- **[in]** `event_id`: the event ID that identifies the event
- **[in]** `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** `event_data_size`: the size of the event data
- **[in]** `ticks_to_wait`: number of ticks to block on a full event queue

```c
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of `esp_event_post` for posting events from interrupt handlers.

**Note** this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled.

**Note** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`.

**Return**

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

**Parameters**

- **[in]** `event_base`: the event base that identifies the event
- **[in]** `event_id`: the event ID that identifies the event
- **[in]** `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** `event_data_size`: the size of the event data; max is 4 bytes
- **[out]** `task_unblocked`: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

```c
esp_err_t esp_event_isr_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

**Note** this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled.

**Note** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`.

**Return**

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

**Parameters**

- **[in]** `event_loop`: the event loop to post to, must not be NULL
- **[in]** `event_base`: the event base that identifies the event
- **[in]** `event_id`: the event ID that identifies the event
- **[in]** `event_data`: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** `event_data_size`: the size of the event data
- **[out]** `task_unblocked`: an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:
event loop
  handler
  handler...

where:

  event loop
    format: address, name rx:total_received dr:total_dropped
    where:
      address - memory address of the event loop
      name - name of the event loop, 'none' if no dedicated task
      total_received - number of successfully posted events
      total_dropped - number of events unsuccessfully posted due to queue...

  handler
    format: address ev:base, id inv:total_invoked run:total_runtime
    where:
      address - address of the handler function
      base, id - the event specified by event base and ID this handler...

    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

Return

  - ESP_OK: Success
  - ESP_ERR_NO_MEM: Cannot allocate memory for event loop list
  - Others: Fail

Parameters

  - [in] file: the file stream to output to

Structures

struct esp_event_loop_args_t
  Configuration for creating event loops.

Public Members

  int32_t queue_size
    size of the event loop queue

  const char *task_name
    name of the event loop task; if NULL, a dedicated task is not created for event loop

  UBaseType_t task_priority
    priority of the event loop task, ignored if task name is NULL

  uint32_t task_stack_size
    stack size of the event loop task, ignored if task name is NULL

  BaseType_t task_core_id
    core to which the event loop task is pinned to, ignored if task name is NULL

### API Reference

#### Header File

- components/esp_event/include/esp_event_legacy.h

#### Functions

- **esp_err_t** `esp_event_send(system_event_t *event)`
  - Send an event to event task.
  - Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task
  - **Note** This API is part of the legacy event system. New code should use event library API in esp_event.h
  - **Return** ESP_OK : succeed
  - **Return** others : fail
  - **Parameters**
    - `event`: Event to send
- **esp_err_t** `esp_event_send_internal(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)`
  - Send an event to event task.
  - Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task
  - **Note** This API is used by Wi-Fi Driver only.
  - **Return** ESP_OK : succeed
  - **Return** others : fail
  - **Parameters**
    - `[in] event_base`: the event base that identifies the event
• [in] event_id: the event ID that identifies the event
• [in] event_data: the data, specific to the event occurrence, that gets passed to the handler
• [in] event_data_size: the size of the event data
• [in] ticks_to_wait: number of ticks to block on a full event queue

```c
esp_err_t esp_event_process_default(system_event_t *event)
```
Default event handler for system events.

This function performs default handling of system events. When using esp_event_loop APIs, it is called automatically before invoking the user-provided callback function.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h Applications which implement a custom event loop must call this function as part of event processing.

**Return** ESP_OK if an event was handled successfully

**Parameters**

- `event`: pointer to event to be handled

```c
void esp_event_set_default_eth_handlers(void)
```
Install default event handlers for Ethernet interface.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

```c
void esp_event_set_default_wifi_handlers(void)
```
Install default event handlers for Wi-Fi interfaces (station and AP)

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

```c
esp_err_t esp_event_loop_init(system_event_cb_t cb, void *ctx)
```
Initialize event loop.

Create the event handler and task

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

**Return**

- ESP_OK: succeed
- others: fail

**Parameters**

- `cb`: application specified event callback, it can be modified by call esp_event_set_cb
- `ctx`: reserved for user

```c
system_event_cb_t esp_event_loop_set_cb(system_event_cb_t cb, void *ctx)
```
Set application specified event callback function.

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h

**Attention** 1. If cb is NULL, means application don’t need to handle If cb is not NULL, it will be call when an event is received, after the default event callback is completed

**Return** old callback

**Parameters**

- `cb`: application callback function
- `ctx`: argument to be passed to callback

**Unions**

```c
union system_event_info_t

#include <esp_event_legacy.h> Union of all possible system_event argument structures
```

**Public Members**

```c
system_event_sta_connected_t connected
```
ESP32 station connected to AP

```c
system_event_sta_disconnected_t disconnected
```
ESP32 station disconnected to AP
Chapter 2. API参考

system_event_sta_scan_done_t **scan_done**
ESP32 station scan (APs) done

system_event_sta_authmode_change_t **auth_change**
the auth mode of AP ESP32 station connected to changed

system_event_sta_got_ip_t **got_ip**
ESP32 station got IP, first time got IP or when IP is changed

system_event_sta_wps_er_pin_t **sta_er_pin**
ESP32 station WPS enrollee mode PIN code received

system_event_sta_wps_fail_reason_t **sta_er_fail_reason**
ESP32 station WPS enrollee mode failed reason code received

system_event_sta_wps_er_success_t **sta_er_success**
ESP32 station WPS enrollee success

system_event_ap_staconnected_t **sta_connected**
a station connected to ESP32 soft-AP

system_event_ap_stadisconnected_t **sta_disconnected**
a station disconnected to ESP32 soft-AP

system_event_ap_probe_req_rx_t **ap_probereqrecv**
ESP32 soft-AP receive probe request packet

system_event_ftm_report_t **ftm_report**
Report of FTM procedure

system_event_ap_staipassigned_t **ap_stapass**
ESP32 soft-AP assign an IP to the station

system_event_got_ip6_t **got_ip6**
ESP32 station or ap or ethernet ipv6 addr state change to preferred

**Structures**

**struct system_event_t**
Event, as a tagged enum

**Public Members**

system_event_id_t **event_id**
event ID

system_event_info_t **event_info**
event information

**Macros**

SYSTEM_EVENT_AP_STA_GOT_IP6

**Type Definitions**

typedef wifi_event_sta_wps_fail_reason_t **system_event_sta_wps_fail_reason_t**
Argument structure of SYSTEM_EVENT_STA_WPS_ER_FAILED event

Argument structure of event

typedef wifi_event_ap_stadisconnected_t system_event_ap_stadisconnected_t
Argument structure of event

typedef wifi_event_ap_probe_req_rx_t system_event_ap_probe_req_rx_t
Argument structure of event

typedef wifi_event_ftm_report_t system_event_ftm_report_t
Argument structure of SYSTEM_EVENT_FTM_REPORT event

typedef ip_event_ap_staipassigned_t system_event_ap_staipassigned_t
Argument structure of event

typedef ip_event_got_ip_t system_event_got_ip_t
Argument structure of event

typedef ip_event_got_ip6_t system_event_got_ip6_t
Argument structure of event

typedef esp_err_t (*system_event_handler_t)(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
Event handler function type

typedef esp_err_t (*system_event_cb_t)(void *ctx, system_event_t *event)
Application specified event callback function.

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h
Return
• ESP_OK: succeed
• others: fail
Parameters
• ctx: reserved for user
• event: event type defined in this file

Enumerations
enum system_event_id_t
System event types enumeration

Values:
SYSTEM_EVENT_WIFI_READY = 0
ESP32 Wi-Fi ready

SYSTEM_EVENT_SCAN_DONE
ESP32 finish scanning AP

SYSTEM_EVENT_STA_START
ESP32 station start

SYSTEM_EVENT_STA_STOP
ESP32 station stop

SYSTEM_EVENT_STA_CONNECTED
ESP32 station connected to AP
SYSTEM_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

SYSTEM_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

SYSTEM_EVENT_STA_GOT_IP
ESP32 station got IP from connected AP

SYSTEM_EVENT_STA_LOST_IP
ESP32 station lost IP and the IP is reset to 0

SYSTEM_EVENT_STA_BSS_RSSI_LOW
ESP32 station connected BSS rssi goes below threshold

SYSTEM_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

SYSTEM_EVENT_AP_START
ESP32 soft-AP start

SYSTEM_EVENT_AP_STOP
ESP32 soft-AP stop

SYSTEM_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

SYSTEM_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

SYSTEM_EVENT_AP_STAIPASSIGNED
ESP32 soft-AP assign an IP to a connected station

SYSTEM_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

SYSTEM_EVENT_ACTION_TX_STATUS
Receive status of Action frame transmitted

SYSTEM_EVENT_ROC_DONE
Indicates the completion of Remain-on-Channel operation status

SYSTEM_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

SYSTEM_EVENT_FTM_REPORT
Receive report of FTM procedure

SYSTEM_EVENT_GOT_IP6
ESP32 station or ap or ethernet interface v6IP addr is preferred

SYSTEM_EVENT_ETH_START
ESP32 ethernet start

SYSTEM_EVENT_ETH_STOP
ESP32 ethernet stop
Chapter 2. API

SYSTEM_EVENT_ETH_CONNECTED
ESP32 ethernet phy link up

SYSTEM_EVENT_ETH_DISCONNECTED
ESP32 ethernet phy link down

SYSTEM_EVENT_ETH_GOT_IP
ESP32 ethernet got IP from connected AP

SYSTEM_EVENT_ETH_LOST_IP
ESP32 ethernet lost IP and the IP is reset to 0

SYSTEM_EVENT_MAX
Number of members in this enum

2.7.9 FreeRTOS

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Note: ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.4.3

For more information about FreeRTOS features specific to ESP-IDF, see ESP-IDF FreeRTOS SMP Changes and ESP-IDF FreeRTOS Additions.

Task API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/task.h

Functions

BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- usStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- pvCreatedTask: Used to pass back a handle by which the created task can be referenced.
• **xCoreID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

```c
static BaseType_t xTaskCreate( TaskFunction_t pvTaskCode, const char *pcName, const uint32_t usStackDepth, void *pvParameters, UBaseType_t uxPriority, TaskHandle_t *pxCreatedTask)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

**Example usage:**

```c
// Task to be created.
void vTaskCode( void *pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter...
    ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared...
    // static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have...
    // been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    // PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

**Return** `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

**Note** If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

**Parameters**

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e.
continuous loop), or should be terminated using vTaskDelete function.

- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **ulStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pvCreatedTask**: Used to pass back a handle by which the created task can be referenced.

```c
static TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)
```

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

**Return** If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

**Parameters**

- **pvTaskCode**: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName**: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth**: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters**: Pointer that will be used as the parameter for the task being created.
- **uxPriority**: The priority at which the task will run.
- **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID**: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

```c
static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

**Example usage:**
// Dimensions the buffer that the task being created will use as its stack. 
// NOTE: This is the number of bytes the stack will hold, not the number of 
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created. 
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is 
// an array of StackType_t variables. The size of StackType_t is dependent on 
// the RTOS port. 
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created. 
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the 
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task. 
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation. 
    xHandle = xTaskCreateStatic{
        vTaskCode, // Function that implements the task. 
        "NAME", // Text name for the task. 
        STACK_SIZE, // Stack size in bytes, not words. 
        ( void * ) 1, // Parameter passed into the task. 
        tskIDLE_PRIORITY, // Priority at which the task is created. 
        &xStack, // Array to use as the task's stack. 
        &xTaskBuffer ); // Variable to hold the task's data_
            ...

    if( pxStackBuffer and pxTaskBuffer were not NULL, so the task will have 
    // been created, and xHandle will be the task's handle. Use the handle 
    // to suspend the task. 
    vTaskSuspend( xHandle );
}

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

Note If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

Parameters
  • pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
  • pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
  • ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
  • pvParameters: Pointer that will be used as the parameter for the task being created.
• **uxPriority**: The priority at which the task will run.
• **pxStackBuffer**: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
• **pxTaskBuffer**: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskAllocateMPURegions(TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
```

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See `vTaskCreateRestrictedStatic()` for a version that does not use any dynamic memory allocation.

Return `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

**Parameters**

- **pxTaskDefinition**: Pointer to a structure that contains a member for each of the normal `xTaskCreate()` parameters (see the `xTaskCreate()` API documentation) plus an optional stack buffer and the memory region definitions.
- **pxCreatedTask**: Used to pass back a handle by which the created task can be referenced.

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,    // pvTaskCode - the function that implements the task.
    "ATask",  // pcName - just a text name for the task to assist debugging.
    100,      // usStackDepth - the stack size DEFINED IN WORDS.
    NULL,     // pvParameters - passed into the task function as the function parameters.
    // parameters.
    (UL | portPRIVILEGE_BIT ), // uxPriority - task priority, set the portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by the task, with appropriate access permissions. Different processors have different memory alignment requirements - refer to the FreeRTOS documentation
    // for full information.
    { Base address Length Parameters
        { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
        { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_WRITE }
    }
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle is requested (the second parameter is not NULL) but in this case just for demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );
}
Start the scheduler.

vTaskStartScheduler();

Will only get here if there was insufficient memory to create the idle
// and/or timer task.
for( ;; );
}

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the task’s data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used to hold the task’s data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Parameters

• pxTaskDefinition: Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPPORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask_t - which is then used to hold the task’s data structure.
• pxCreatedTask: Used to pass back a handle by which the created task can be referenced.

Example usage:

// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
  vATask, // pvTaskCode - the function that implements the task.
  "ATask", // pcName - just a text name for the task to assist debugging.
  100, // usStackDepth - the stack size DEFINED IN BYTES.
  NULL, // pvParameters - passed into the task function as the function...
  ...parameters.
  { 1UL | portPRIVILEGE_BIT },// uxPriority - task priority, set the...
  ...portPRIVILEGE_BIT if the task should run in a privileged state.
  cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

  // xRegions - Allocate up to three separate memory regions for access by
  // the task, with appropriate access permissions. Different processors have
  // different memory alignment requirements - refer to the FreeRTOS...
  ...documentation
  // for full information.
  {
    // Base address Length Parameters
    { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
    { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
    { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_
      ...WRITE }
  }
}

Espressif Systems 1237 Release v5.0-dev-489-gef98a36
Submit Document Feedback
Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```c
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[portNUM_CONFIGURABLE_REGIONS] =
    {{ ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
     { 0, 0, 0 },
     { 0, 0, 0 }};

void vATask(void *pvParameters)
{
    // This task was created such that it has access to certain regions of
    // memory as defined by the MPU configuration. At some point it is
    // desired that these MPU regions are replaced with that defined in the
    // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
    // for this purpose. NULL is used as the task handle to indicate that this
    // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions(NULL, xAltRegions);

    // Now the task can continue its function, but from this point on can only
    // access its stack and the ucOneKByte array (unless any other statically
    // defined or shared regions have been declared elsewhere).
}
```

**Parameters**

- `xTask`: The handle of the task being updated.
- `pxRegions`: A pointer to an MemoryRegion_t structure that contains the new memory region definitions.

void `vTaskDelete(TaskHandle_t xTaskToDelete)`

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from
all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

**Parameters**

- `xTaskToDelete`: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

**void vTaskDelay(const TickType_t xTicksToDelay)**

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant `portTICK_PERIOD_MS` can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE `vTaskDelay` must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See `xTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void *pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;
    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

**Parameters**

- `xTicksToDelay`: The amount of time, in tick periods, that the calling task should block.

**BaseType_t xTaskDelayUntil(TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)**

INCLUDE `xTaskDelayUntil` must be defined as 1 for this function to be available. See the configuration section for more information.
Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path through the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, xTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
  TickType_t xLastWakeTime;
  const TickType_t xFrequency = 10;
  BaseType_t xWasDelayed;

  // Initialise the xLastWakeTime variable with the current time.
  xLastWakeTime = xTaskGetTickCount();
  for( ;; )
  {
    // Wait for the next cycle.
    xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );
    // Perform action here. xWasDelayed value can be used to determine
    // whether a deadline was missed if the code here took too long.
  }
}
```

Return Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task way delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

Parameters

- **pxPreviousWakeTime**: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil().
- **xTimeIncrement**: The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

BaseType_t xTaskAbortDelay( TaskHandle_t xTask )

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function called placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

Return If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

Parameters

- **xTask**: The handle of the task to remove from the Blocked state.
Chapter 2. API

**UBaseType_t uxTaskPriorityGet(const TaskHandle_t xTask)**

INCLUDE uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }
    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

Return  The priority of xTask.
Parameters
- xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**UBaseType_t uxTaskPriorityGetFromISR(const TaskHandle_t xTask)**

A version of uxTaskPriorityGet() that can be used from an ISR.

**eTaskState eTaskGetState(TaskHandle_t xTask)**

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

Return  The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

Parameters
- xTask: Handle of the task to be queried.

**void vTaskGetInfo(TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)**

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction( void )
{
```

(下页继续)
TaskHandle_t xHandle;
TaskStatus_t xTaskDetails;

// Obtain the handle of a task from its name.
xHandle = xTaskGetHandle("Task_Name");

// Check the handle is not NULL.
configASSERT(xHandle);

// Use the handle to obtain further information about the task.
vTaskGetInfo(xHandle,
    &xTaskDetails,
    pdTRUE, // Include the high water mark in xTaskDetails.
    eInvalid); // Include the task state in xTaskDetails.
}

Parameters

- **xTask**: Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus**: A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace**: The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState**: The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void **vTaskPrioritySet** (TaskHandle_t xTask, UBaseType_t uxNewPriority)

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_--);

    // ...

    // Use the handle to raise the priority of the created task.
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```
Parameters

- `xTask`: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- `uxNewPriority`: The priority to which the task will be set.

```c
void vTaskSuspend (TaskHandle_t xTaskToSuspend)
```

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend()` twice on the same task still only requires one call to `vTaskResume()` to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

Parameters

- `xTaskToSuspend`: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

```c
void vTaskResume (TaskHandle_t xTaskToResume)
```

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to `vTaskSuspend()` will be made available for running again by a single call to `vTaskResume()`.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
```

(下頁続き)
Chapter 2. API

Create a task, storing the handle.

```c
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );
```

// ... 

Use the handle to suspend the created task.

```c
vTaskSuspend( xHandle );
```

// ... 

The created task will not run during this period, unless another task calls vTaskResume( xHandle ).

//... 

Resume the suspended task ourselves.

```c
vTaskResume( xHandle );
```

// The created task will once again get microcontroller processing time in accordance with its priority within the system.

### Parameters

- **xTaskToResume**: Handle to the task being readied.

**BaseType_t xTaskResumeFromISR** *(TaskHandle_t xTaskToResume)*

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ()

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

### Return

pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

**Parameters**

- **xTaskToResume**: Handle to the task being readied.

**void vTaskStartScheduler** *(void)*

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

**NOTE**: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

**Example usage:**

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler();
}
```
void vTaskEndScheduler (void)
NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements
this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either pre-
emptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was
called, as if vTaskStartScheduler () had just returned.

See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler ()
.

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler
() in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free
resources allocated by application tasks.

Example usage:

```c
void vTaskCode( void *pvParameters )
{
    for ( ;; )
    {
        // Task code goes here.
        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler ();
    }
}
```

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );
    // Start the real time kernel with preemption.
    vTaskStartScheduler ();
    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}
```

void vTaskSuspendAll (void)
Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is
suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out
until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(),
etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void *pvParameters )
{
    for ( ;; )
```
BaseType_t xTaskResumeAll (void)
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().
xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}
```
Return If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t xTaskGetTickCount (void)

Return The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

Return The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

Return The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)

Return The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Return The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Return The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

Parameters

• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.
Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Return  The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

Parameters

• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check
  the stack of the calling task.

uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)
Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

Return  A pointer to the start of the stack.

Parameters

• xTask: Handle of the task associated with the stack returned. Set xTask to NULL to return the
  stack of the calling task.

void vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)
Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters

• xTask: Handle of the task to set the hook function for. Passing xTask as NULL has the effect of
  setting the calling tasks hook function.

• pxHookFunction: Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)
Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine -
call xTaskGetApplicationTaskTagFromISR() instead.

 TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)
Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void vTaskSetThreadLocalStoragePointer (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

• xTaskToSet: Task to set thread local storage pointer for

• xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

• pvValue: Pointer value to set.

void *pvTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)
Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Return  Pointer value

Parameters
• `xTaskToQuery`: Task to get thread local storage pointer for
• `xIndex`: The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

```c
void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)
```

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

**Parameters**
• `xTaskToSet`: Task to set thread local storage pointer for
• `xIndex`: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• `pvValue`: Pointer value to set.
• `pvDelCallback`: Function to call to dispose of the local storage pointer when the task is deleted.

```c
void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

**Parameters**
• `ppxIdleTaskTCBBuffer`: A handle to a statically allocated TCB buffer
• `ppxIdleTaskStackBuffer`: A handle to a statically allocated Stack buffer for the idle task
• `pulIdleTaskStackSize`: A pointer to the number of elements that will fit in the allocated stack buffer

```c
BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)
```

Calls the hook function associated with `xTask`. Passing `xTask` as NULL has the effect of calling the Running tasks (the calling task) hook function.

**Parameters**
• `xTask`: Handle of the task to call the hook for.
• `pvParameter`: Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

```c
TaskHandle_t xTaskGetIdleTaskHandle (void)
```

`xTaskGetIdleTaskHandle()` is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call `xTaskGetIdleTaskHandle()` before the scheduler has been started.

```c
UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)
```

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for `uxTaskGetSystemState()` to be available.

`uxTaskGetSystemState()` populates an `TaskStatus_t` structure for each task in the system. `TaskStatus_t` structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the `TaskStatus_t` structure definition in this file for the full member list.
NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```c
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer.
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
                                             ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter
                                      / ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu\%
",     
                      pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                      ulStatsAsPercentage );
                }
                else
                {
                    // If the percentage is zero here then the task has
                    // consumed less than 1% of the total run time.
                    sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1\%
",     
                      pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
                }

                pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
            }
        }
    }
}
```
// The array is no longer needed, free the memory it consumes.
vPortFree( pxTaskStatusArray );

Return  The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

Parameters
- pxTaskStatusArray: A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- uxArraySize: The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- pulTotalRunTime: If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see https://www.FreeRTOS.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

void vTaskList (char *pcWriteBuffer)
List all the current tasks.

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

PLEASE NOTE:
This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

vTaskList() has a dependency on the snprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of snprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

Parameters
- pcWriteBuffer: A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void vTaskGetRunTimeStats (char *pcWriteBuffer)
Get the state of running tasks as a string

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE()
to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRuntimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:
This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRuntimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRuntimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full sprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRuntimeStats().

Parameters
- pcWriteBuffer: A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

uint32_t ulTaskGetIdleRunTimeCounter(void)

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRuntimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

Return
The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.
Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

Parameters

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.
- ulValue: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- eAction: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.
  - eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.
  - eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.
  - eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.
  - pvPreviousNotificationValue - Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

Return Dependent on the value of eAction. See the description of the eAction parameter.
**Chapter 2. API**

BaseType_t xTaskGenericNotifyFromISR(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or to be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

**Parameters**

- **uxIndexToNotify**: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify**: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue**: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction**: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - **eIncrement**: The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - **eSetValueWithOverwrite**: The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.
eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

• pxHigherPriorityTaskWoken: xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskGenericNotifyWait (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t* pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

Return If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

Parameters

• uxIndexToWaitOn: The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
• **ulBitsToClearOnEntry**: Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

• **ulBitsToClearOnExit**: If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

• **pulNotificationValue**: Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.

• **xTicksToWait**: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
void vTaskGenericNotifyGiveFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t* pxHigherPriorityTaskWoken )
```

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.
Parameters

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- pxHigherPriorityTaskWoken: vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

uint32_t ulTaskGenericNotifyTake (UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait)

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.
Return The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

Parameters

• uxIndexToWaitOn: The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.

• xClearCountOnExit: if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

• xTicksToWait: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClearIndexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

Return pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

Parameters

• xTask: The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().

• uxIndexToClear: The index within the target task’s array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.
ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClearIndexed() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

Return The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

Parameters
- xTask: The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- uxIndexToClear: The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- ulBitsToClear: Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

```c
void vTaskSetTimeOutState (TimeOut_t *const pxTimeOut)
```

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```c
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT – at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
```
// The buffer didn't contain enough data so this task is going to
// enter the Blocked state. Adjusting xTicksToWait to account for
// any time that has been spent in the Blocked state within this
// function so far to ensure the total amount of time spent in the
// Blocked state does not exceed MAX_TIME_TO_WAIT.
if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
{
    //Timed out before the wanted number of bytes were available,
    // exit the loop.
    break;
}

// Wait for a maximum of xTicksToWait ticks to be notified that the
// receive interrupt has placed more data into the buffer.
ulTaskNotifyTake( pdTRUE, xTicksToWait );

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                          pucBuffer,
                                          uxWantedBytes );

return uxReceived;

Return If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait
is updated to reflect the number of remaining ticks.
See [https://www.FreeRTOS.org/xTaskCheckForTimeOut.html](https://www.FreeRTOS.org/xTaskCheckForTimeOut.html)

Parameters
• pxTimeOut: The time status as captured previously using vTaskSetTimeOutState. If the timeout
  has not yet occurred, it is updated to reflect the current time status.
• pxTicksToWait: The number of ticks to check for timeout i.e. if pxTicksToWait ticks have
  passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckFor-
  TimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated
  to reflect the number of remaining ticks.

BaseType_t xTaskCatchUpTicks (TickType_t xTicksToCatchUp)

Macros
  tskKERNEL_VERSION_NUMBER
  tskKERNEL_VERSION_MAJOR
  tskKERNEL_VERSION_MINOR
  tskKERNEL_VERSION_BUILD
  tskMPU_REGION_READ_ONLY
  tskMPU_REGION_READ_WRITE
  tskMPU_REGION_EXECUTE_NEVER
  tskMPU_REGION_NORMAL_MEMORY
  tskMPU_REGION_DEVICE_MEMORY
  tskDEFAULT_INDEX_TO_NOTIFY
  tskNO_AFFINITY
  tskIDLE_PRIORITY

  Defines the priority used by the idle task. This must not be modified.
taskYIELD()  
Macro for forcing a context switch.

taskENTER_CRITICAL()  
Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note This may alter the stack (depending on the portable implementation) so must be used with care!

taskENTER_CRITICAL_FROM_ISR()  

taskENTER_CRITICAL_ISR()  

Note This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL()  
Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

Note This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR()  

taskEXIT_CRITICAL_ISR()  

Note This may alter the stack (depending on the portable implementation) so must be used with care!

taskDISABLE_INTERRUPTS()  
Macro to disable all maskable interrupts.

taskENABLE_INTERRUPTS()  
Macro to enable microcontroller interrupts.

taskSCHEDULER_SUSPENDED  
taskSCHEDULER_NOT_STARTED  
taskSCHEDULER_RUNNING  
vTaskDelayUntil (pxPreviousWakeTime, xTimeIncrement)  

xTaskNotify (xTaskToNotify, ulValue, eAction)  
xTaskNotifyIndexed (xTaskToNotify, uxIndexToNotify, ulValue, eAction)  
xTaskNotifyAndQuery (xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)  

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyFromISR (xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)  
xTaskNotifyIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)  
xTaskNotifyAndQueryIndexedFromISR (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)  

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.
xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQueryFromISR (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGive (xTaskToNotify)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGive().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.

Return xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

Parameters

• xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

• uxIndexToNotify: The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)

vTaskNotifyGiveFromISR (xTaskToNotify, pxHigherPriorityTaskWoken)
vTaskNotifyGiveIndexedFromISR(xTaskToNotify, uxIndexToNotify, pxHigherPriorityTaskWoken)

ulTaskNotifyTake(xClearCountOnExit, xTicksToWait)

ulTaskNotifyTakeIndexed(uxIndexToWaitOn, xClearCountOnExit, xTicksToWait)

xTaskNotifyStateClear(xTask)

xTaskNotifyStateClearIndexed(xTask, uxIndexToClear)

ulTaskNotifyValueClear(xTask, ulBitsToClear)

ulTaskNotifyValueClearIndexed(xTask, uxIndexToClear, ulBitsToClear)

Type Definitions

typedef struct tskTaskControlBlock *TaskHandle_t
typedef BaseType_t(* TaskHookFunction_t)(void *)

Defines the prototype to which the application task hook function must conform.

typedef void(* TlsDeleteCallbackFunction_t)(int, void *)

Prototype of local storage pointer deletion callback.

Enumerations

enum eTaskState
    Task states returned by eTaskGetState.

    Values:
    eRunning = 0
    eReady
    eBlocked
    eSuspended
    eDeleted
    eInvalid

enum eNotifyAction
    Values:
    eNoAction = 0
    eSetBits
    eIncrement
    eSetValueWithOverwrite
    eSetValueWithoutOverwrite

enum eSleepModeStatus
    Possible return values for eTaskConfirmSleepModeStatus().

    Values:
    eAbortSleep = 0
    eStandardSleep
    eNoTasksWaitingTimeout

Queue API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h
**Functions**

` BaseType_t xQueueGenericSend( QueueHandle_t xQueue, const void* const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition )`

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage {
    char ucMessageID;
    char ucData[20];
} xMessage;
uint32_t ulVar = 10UL;

void vATask( void *pvParameters ) {
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    if( xQueue1 != 0 ) {
        // Send an uint32_t.
        // Wait for 10 ticks for space to become available if necessary.
        if( xQueueGenericSend( xQueue1, ( void* ) &ulVar, ( TickType_t ) 10, xqueueSEND_TO_BACK ) != pdPASS )
            // Failed to post the message, even after 10 ticks.
    }

    if( xQueue2 != 0 ) {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void* ) &pxMessage, ( TickType_t ) 0, xqueueSEND_TO_BACK );
    }

    // ... Rest of task code.
}
```

**Return** pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

**Parameters**

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become available.
available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant \texttt{portTICK_PERIOD_MS} should be used to convert to real time if this is required.

- \texttt{xCopyPosition}: Can take the value \texttt{queue\_SEND\_TO\_BACK} to place the item at the back of the queue, or \texttt{queue\_SEND\_TO\_FRONT} to place the item at the front of the queue (for high priority messages).

\begin{verbatim}
BaseType_t xQueuePeek ( QueueHandle_t xQueue, void *pvBuffer, TickType_t xTicksToWait )
\end{verbatim}

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to \texttt{xQueueReceive()}. This macro must not be used in an interrupt service routine. See \texttt{xQueuePeekFromISR()} for an alternative that can be called from an interrupt service routine.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );

    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, ( void * ) pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }
```

(下页继续)
Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

BaseType_t xQueuePeekFromISR(QueueHandle_t xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.

BaseType_t xQueueReceive(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
```
// Send a pointer to a struct AMessage object. Don't block if the queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

// Task to receive from the queue.
void vADifferentTask( void * pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueueReceive( xQueue, & ( pxRxedMessage ), ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted by vATask.
        }
    }

    // ... Rest of task code.
}

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
• xQueue: The handle to the queue from which the item is to be received.
• pvBuffer: Pointer to the buffer into which the received item will be copied.
• xTicksToWait: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
Return the number of messages stored in a queue.

Return The number of messages available in the queue.

Parameters
• xQueue: A handle to the queue being queried.

UBaseType_t uxQueueSpacesAvailable (const QueueHandle_t xQueue)
Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

Return The number of spaces available in the queue.

Parameters
• xQueue: A handle to the queue being queried.

void vQueueDelete (QueueHandle_t xQueue)
Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters
• xQueue: A handle to the queue to be deleted.

BaseType_t xQueueGenericSendFromISR(QueueHandle_t xQueue, const void * const pvItemToQueue, BaseType_t * const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)
It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendTo-
BackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        taskYIELD_YIELD_FROM_ISR();
    }
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
- xCopyPosition: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

BaseType_t xQueueGiveFromISR( QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken )

BaseType_t xQueueReceiveFromISR( QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken )

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:
```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
```
Chapter 2. API

```c
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ... Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.
    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, &
                                 xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was
        // posting onto the queue xTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }

    if( cTaskWokenByPost != ( char ) pdFALSE;
    {               
        taskYIELD ();
    }
}
```

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
- [out] pxHigherPriorityTaskWoken: A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

```c
BaseType_t xQueueIsQueueEmptyFromISR( const QueueHandle_t xQueue )
```
BaseType_t xQueueIsQueueFullFromISR(const QueueHandle_t xQueue)

UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)

void vQueueAddToRegistry(QueueHandle_t xQueue, const char* pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() to add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

Parameters

• xQueue: The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.

• pcQueueName: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void vQueueUnregisterQueue(QueueHandle_t xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the registry. If you are not using a kernel aware debugger then this function can be ignored.

Parameters

• xQueue: The handle of the queue being removed from the registry.

const char* pcQueueGetName(QueueHandle_t xQueue)

The queueregistryisprovidedasameansforkernelawaredebuggerstolocatequeues,semaphoresandmutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

Return If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

Parameters

• xQueue: The handle of the queue the name of which will be returned.

QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.
Chapter 2. API

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

Parameters
  - uxEventQueueLength: Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
    - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to (5 + 12 + 1), or 18.
    - If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to (1 + 1 + 1), or 3.
    - If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to (5 + 3), or 8.

BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

Parameters
  - xQueueOrSemaphore: The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
  - xQueueSet: The handle of the queue set to which the queue or semaphore is being added.

BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Return If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

Parameters
  - xQueueOrSemaphore: The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
  - xQueueSet: The handle of the queue set in which the queue or semaphore is included.

QueueSetMemberHandle_t xQueueSelectFromSet (QueueHandle_t xQueueSet, const TickType_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet()
effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

Return  xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

Parameters
- **xQueueSet**: The queue set on which the task will (potentially) block.
- **xTicksToWait**: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**QueueSetMemberHandle_t xQueueSelectFromSetFromISR (QueueSetHandle_t xQueueSet)**

A version of xQueueSelectFromSet() that can be used from an ISR.

**Macros**

**xQueueCreate (uxQueueLength, uxItemSize)**

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a0111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
}```
if( xQueue2 == 0 )
{
    // Queue was **not** created and must **not** be used.
}
// ... Rest of task code.

**Return** If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

**Parameters**
- **uxQueueLength**: The maximum number of items that the queue can contain.
- **uxItemSize**: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * (queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
                           ITEM_SIZE, // The size of each item in the queue
                           & ucQueueStorage[ 0 ] ), // The buffer that will...

               // hold the items in the queue.
                      &xQueueBuffer ); // The buffer that will hold the...

             // queue structure.

    // The queue **is** guaranteed to be created successfully **as** no dynamic memory
    // allocation **is** used. Therefore xQueue1 **is** now a handle to a valid queue.
```
Return If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

Parameters

- **uxQueueLength**: The maximum number of items that the queue can contain.
- **uxItemSize**: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage**: If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemsSize) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- **pxQueueBuffer**: Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

**xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage 
{ 
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void * pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage * pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
```
// queue is already full.
pxMessage = & xMessage;
xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

xQueueSendToBack(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }
```
if( xQueue2 != 0 )
{
   // Send a pointer to a struct AMessage object. Don't block if the
   // queue is already full.
   pxMessage = & xMessage;
   xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

xQueueSend(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Error handling...
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = & xMessage;
        xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }
```
Failed to post the message, even after 10 ticks.

```c
if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}
```

Return: pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters:
- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  `pvItemToQueue` into the queue storage area.
- `xTicksToWait`: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

`xQueueOverwrite(xQueue, pvItemToQueue)`

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is
queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an
alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }
}
```
Return  
xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

Parameters

• xQueue: The handle of the queue to which the data is being sent.
• pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

Examples usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while ( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
```

(续上页)
Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
  char cIn;
  BaseType_t xHigherPriorityTaskWoken;

  // We have not woken a task at the start of the ISR.
  xHigherPriorityTaskWoken = pdFALSE;

  // Loop until the buffer is empty.
  do
  {
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
  } while( portINPUT_BYTE( BUFFER_COUNT ) );

  // Now the buffer is empty we can switch context if necessary.
  if( xHigherPriorityTaskWoken )
  {
    portYIELD_FROM_ISR ( );
  }
}
```

Return  pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
**xQueueOverwriteFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended 'not' to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    xHigherPriorityTaskWoken = pdFALSE;
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    // ...
    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a...
        // context
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}
```

**Return**

xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**Parameters**

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out]** pxHigherPriorityTaskWoken: xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked
task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

\textbf{xQueueSendFromISR} (\texttt{xQueue, pvItemToQueue, pxHigherPriorityTaskWoken})

This is a macro that calls \texttt{xQueueGenericSendFromISR()}. It is included for backward compatibility with versions of FreeRTOS.org that did not include the \texttt{xQueueSendToBackFromISR()} and \texttt{xQueueSendToFrontFromISR()} macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer \textit{is} empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer \textit{is} empty we can switch context \textbf{if} necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here \textit{is} port specific.
        portYIELD_FROM_ISR();
    }
}
```

\textbf{Return} pdTRUE if the data was successfully sent to the queue, otherwise err\textbf{QUEUE FULL}.

\textbf{Parameters}
- \texttt{xQueue}: The handle to the queue on which the item is to be posted.
- \texttt{pvItemToQueue}: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from \texttt{pvItemToQueue} into the queue storage area.
- [out] \texttt{pxHigherPriorityTaskWoken}: \texttt{xQueueSendFromISR()} will set \texttt{*pxHigherPriorityTaskWoken} to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If \texttt{xQueueSendFromISR()} sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

\textbf{xQueueReset} (\texttt{xQueue})

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

\textbf{Type Definitions}
\texttt{typedef struct QueueDefinition *QueueHandle_t}
\texttt{typedef struct QueueDefinition *QueueSetHandle_t}

Type by which queue sets are referenced. For example, a call to \texttt{xQueueCreateSet()} returns an \texttt{xQueueSet} variable that can then be used as a parameter to \texttt{xQueueSelectFromSet()}, \texttt{xQueueAddToSet()}, etc.
typedef struct QueueDefinition *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API

Header File

• components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH
semSEMAPHORE_QUEUE_ITEM_LENGTH
semGIVE_BLOCK_TIME

vSemaphoreCreateBinary(xSemaphore)

xSemaphoreCreateBinary()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so on task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Return Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.
**xSemaphoreCreateBinaryStatic**( `pxStaticSemaphore` )

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

**NOTE:** In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
    // xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

**Return** If the semaphore is created then a handle to the created semaphore is returned. If `pxSemaphoreBuffer` is NULL then NULL is returned.

**Parameters**

- `pxStaticSemaphore`: Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreTake**( `xSemaphore`, `xBlockTime` )

Macro to obtain a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`.

**param xSemaphore** A handle to the semaphore being taken - obtained when the semaphore was created.

**param xBlockTime** The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of `portMAX_DELAY` can be used to block indefinitely (provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`).

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
```

(下页继续)
Create the semaphore to guard a shared resource.
vSemaphoreCreateBinary( xSemaphore );

A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t )10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...
            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

Return  pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore
becoming available.

xSemaphoreTakeRecursive( xMutex, xBlockTime )
Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been
created using a call to xSemaphoreCreateRecursiveMutex();
configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.
This macro must not be used on mutexes created using xSemaphoreCreateMutex().
A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available
again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task
until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
// ... Do other things.

if( xMutex != NULL )
{
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.
        
        // ... For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, but instead buried in a more complex
        // call structure. This is just for illustrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    } else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}

Return  pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore
becoming available.

Parameters
- xMutex: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
- xBlockTime: The time in ticks to wait for the semaphore to become available. The macro
  portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used
  to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will
  return immediately no matter what the value of xBlockTime.

xSemaphoreGive( xSemaphore )
Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using
xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}

Return pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

Parameters
• xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

xSemaphoreGiveRecursive(xMutex)
Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
A task that uses the mutex.

```c
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ... For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Return pdTRUE if the semaphore was given.

Parameters

- xMutex: A handle to the mutex being released, or ‘given’. This is the handle returned by
  xSemaphoreCreateMutex();

**xSemaphoreGiveFromISR(xSemaphore, pxHigherPriorityTaskWoken)**

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR.

Example usage:
```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for(;;)
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.
        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.
    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}
```

**Return** pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

**Parameters**
- xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- pxHigherPriorityTaskWoken: xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken*.
TaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Return** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**Parameters**
- **xSemaphore**: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **[out] pxHigherPriorityTaskWoken**: xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xSemaphoreCreateMutex** ()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.
**xSemaphoreCreateMutexStatic**(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );
    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Return** If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Parameters**

• pxMutexBuffer: Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreCreateRecursiveMutex()**

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.
This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

*xSemaphoreCreateRecursiveMutexStatic*(pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
```
Chapter 2. API

recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()`. The address of `xMutexBuffer` is passed into the function, and will hold the mutexes data structures - so no dynamic memory allocation will be attempted.

```c
xSemaphore = xSemaphoreCreateRecursiveMutexStatic( xMutexBuffer );
```

As no dynamic memory allocation was performed, `xSemaphore` cannot be NULL, so there is no need to check it.

Return If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If `pxMutexBuffer` was NULL then NULL is returned.

Parameters

- `pxStaticSemaphore`: Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

`xSemaphoreCreateCounting`(uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );
```

Espressif Systems 1292
Submit Document Feedback

Release v5.0-dev-489-gef98a36
if ( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}

Return Handle to the created semaphore. Null if the semaphore could not be created.

Parameters

• uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
• uxInitialCount: The count value assigned to the semaphore when it is created.

xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;
void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
}
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.
}

**Return** If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

**Parameters**
- **uxMaxCount**: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount**: The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer**: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**vSemaphoreDelete** (xSemaphore)
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

**Parameters**
- **xSemaphore**: A handle to the semaphore to be deleted.

**xSemaphoreGetMutexHolder** (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

**xSemaphoreGetMutexHolderFromISR** (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

**uxSemaphoreGetCount** (xSemaphore)
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

**Type Definitions**

typedef QueueHandle_t SemaphoreHandle_t

**Timer API**

**Header File**
- components/freertos/FreeRTOS-Kernel/include/freertos/timers.h

**Functions**

```c
TimerHandle_t xTimerCreate( const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction )
```

TimerHandle_t xTimerCreate( const char *const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction );

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.
Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[NUM_TIMERS];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[NUM_TIMERS] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback( TimerHandle_t pxTimer )
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT( pxTimer );

    // Which timer expired?
    lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[ lArrayIndex ] += 1;

    // If the timer has expired 10 times then stop it from running.
    if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop( pxTimer, 0 );
    }
}

void main( void )
{
    int32_t x;

    // Create then start some timers. Starting the timers before the...
    // scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( 100 * x, // The timer period...
                                    pdTRUE, // auto-reload themselves when they expire.
                                    "Timer", // Just a text name, not used by the kernel.
                                    xTimers, // in ticks.
                                    xMaxExpiryCountBeforeStopping, // Do not use a block time if calling a timer API function from a
                                    );
    }
    // scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( 100 * x, // The timer period...
                                    pdTRUE, // auto-reload themselves when they expire.
                                    "Timer", // Just a text name, not used by the kernel.
                                    xTimers, // in ticks.
                                    xMaxExpiryCountBeforeStopping, // Do not use a block time if calling a timer API function from a
                                    );
    }
```

(下页続き)
Return If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

Parameters

- **pcTimerName**: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks**: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timerperiodmust be greater than 0.
- **uxAutoReload**: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID**: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction**: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction( TimerHandle_t xTimer );”.

(continued)
TimerHandle_t xTimerCreateStatic(const char * const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void * const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
// The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

// A variable that will be incremented by the software timer's callback function.
UBaseType_t uxVariableToIncrement = 0;

// A software timer callback function that increments a variable passed to it when the software timer was created. After the 5th increment the callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(xExpiredTimer);

    // Increment the variable to show the timer callback has executed.
    (*puxVariableToIncrement)++;

    // If this callback has executed the required number of times, stop the timer.
    if( *puxVariableToIncrement == 5 )
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }

    void main( void )
    {
        // Create the software time. xTimerCreateStatic() has an extra parameter
        // than the normal xTimerCreate() API function. The parameter is a
        // pointer to the StaticTimer_t structure that will hold the software timer
    }
```

(下页続き)
Chapter 2. API

void xTimerCreateStatic(const char *pcTimerName, uint32_t xTimerPeriod, pdFunc_t prvTimerCallback, StaticTimer_t *pxTimerBuffer);

Return If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

Parameters

- pcTimerName: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- xTimerPeriodInTicks: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.

- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

- pvTimerID: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- pxCallbackFunction: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is "void vCallbackFunction(TimerHandle_t xTimer);".

- pxTimerBuffer: Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.
Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

Return  The ID assigned to the timer being queried.

Parameters
- xTimer: The timer being queried.

See the xTimerCreate() API function example usage scenario.

void vTimerSetTimerID(TimerHandle_t xTimer, void* pvNewID);

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

Parameters
- xTimer: The timer being updated.
- pvNewID: The ID to assign to the timer.

See the xTimerCreate() API function example usage scenario.

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

    * // This function assumes xTimer has already been created.
    * void vAFunction( TimerHandle_t xTimer )
    * {
    *     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
    *     // equivalently "if( xTimerIsTimerActive( xTimer ) )"
    *     {
    *         // xTimer is active, do something.
    *     }
    *     else
    *     {
    *         // xTimer is not active, do something else.
    *     } else {
    *     }
    *

Return  pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

Parameters
- xTimer: The timer being queried.
### Chapter 2. API 参考

**TaskHandle_t xTimerGetTimerDaemonTaskHandle (void)**

xTimerGetTimerDaemonTaskHandle() is only available if INCLUDE_xTimerGetTimerDaemonTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

**BaseType_t xTimerPendFunctionCallFromISR (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t* pxHigherPriorityTaskWoken)**

xTimerPendFunctionCallFromISR( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken );

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```c
* // The callback function that will execute in the context of the daemon...
* xInterfaceToService;
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*   BaseType_t xInterfaceToService;
*   // The interface that requires servicing is passed in the second
*   // parameter. The first parameter is not used in this case.
*   xInterfaceToService = ( BaseType_t ) ulParameter2;
*   // ...Perform the processing here...
* }
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*   BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*   // Query the hardware to determine which interface needs processing.
*   xInterfaceToService = prvCheckInterfaces();
*   // The actual processing is to be deferred to a task. Request the
*   // vProcessInterface() callback function is executed, passing in the
*   // number of the interface that needs processing. The interface to
*   // service is passed in the second parameter. The first parameter is
*   // not used in this case.
*   xHigherPriorityTaskWoken = pdFALSE;
*   xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
*   --xInterfaceToService, &xHigherPriorityTaskWoken );
*   // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*   // switch should be requested. The macro used is port specific and will
*   // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*   // the documentation page for the port being used.
*   portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
*```

(下頁続き)
Return pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

Parameters
- xFunctionToPend: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- pvParameter1: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- ulParameter2: The value of the callback function’s second parameter.
- pxHigherPriorityTaskWoken: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait );

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Return pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

Parameters
- xFunctionToPend: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- pvParameter1: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- ulParameter2: The value of the callback function’s second parameter.
- xTicksToWait: Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

const char *pcTimerGetName(TimerHandle_t xTimer);

Returns the name that was assigned to a timer when the timer was created.

Return The name assigned to the timer specified by the xTimer parameter.

Parameters
- xTimer: The handle of the timer being queried.

void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

Parameters
- xTimer: The handle of the timer being updated.
- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate())
API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```c
UBaseType_t uxTimerGetReloadMode(TimerHandle_t xTimer);
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Return** If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

**Parameters**
- xTimer: The handle of the timer being queried.

```c
TickType_t xTimerGetPeriod(TimerHandle_t xTimer);
```

Returns the period of a timer.

**Return** The period of the timer in ticks.

**Parameters**
- xTimer: The handle of the timer being queried.

```c
TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer);
```

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Return** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

**Parameters**
- xTimer: The handle of the timer being queried.

```c
void vApplicationGetTimerTaskMemory(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize);
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

**Parameters**
- ppxTimerTaskTCBBuffer: A handle to a statically allocated TCB buffer
- ppxTimerTaskStackBuffer: A handle to a statically allocated Stack buffer for this idle task
- pulTimerTaskStackSize: A pointer to the number of elements that will fit in the allocated stack buffer

**Macros**
- `tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR`
- `tmrCOMMAND_EXECUTE_CALLBACK`
- `tmrCOMMAND_START_DONT_TRACE`
- `tmrCOMMAND_START`
- `tmrCOMMAND_RESET`
- `tmrCOMMAND_STOP`
- `tmrCOMMAND_CHANGE_PERIOD`
- `tmrCOMMAND_DELETE`
- `tmrFIRST_FROM_ISR_COMMAND`
- `tmrCOMMAND_START_FROM_ISR`
- `tmrCOMMAND_RESET_FROM_ISR`
Chapter 2. API

tmrCOMMAND_STOP_FROM_ISR

tmrCOMMAND_CHANGE_PERIOD_FROM_ISR

xTimerStart (xTimer, xTicksToWait)

BaseType_t xTimerStart(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

Return pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

• xTimer: The handle of the timer being started/restarted.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

xTimerStop (xTimer, xTicksToWait)

BaseType_t xTimerStop(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

Return pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
• **xTimer**: The handle of the timer being stopped.
• **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

**xTimerChangePeriod**

```
BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait);
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

**Example usage:**

```
// This function assumes xTimer has already been created. If the timer is
// referenced by xTimer is already active when it is called, then the timer
// is deleted. If the timer referenced by xTimer is not active when it is
// called, then the period of the timer is set to 500ms and the timer is
// started.
void vAPFunction( TimerHandle_t xTimer )
{
    if( !xTimerIsTimerActive( xTimer ) ) // or more simply and
    {
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    }
    else
    {
        // xTimer is not active, change its period to 500ms. This will also
        // cause the timer to start. Block for a maximum of 100 ticks if the
        // change period command cannot immediately be sent to the timer
        // command queue.
        if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS )
        {
            // The command was successfully sent.
        }
        else
        {
            // The command could not be sent, even after waiting for 100
            // ticks to pass. Take appropriate action here.
        }
    }
}
```

**Return**  pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
Parameters

- **xTimer**: The handle of the timer that is having its period changed.
- **xNewPeriod**: The new period for **xTimer**. Timer periods are specified in tick periods, so the constant **portTICK_PERIOD_MS** can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then **xNewPeriod** should be set to 100. Alternatively, if the timer must expire after 500ms, then **xNewPeriod** can be set to \( \frac{500}{\text{configTICK_RATE_HZ}} \) provided **configTICK_RATE_HZ** is less than or equal to 1000.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when **xTimerChangePeriod()** was called. **xTicksToWait** is ignored if **xTimerChangePeriod()** is called before the scheduler is started.

**xTimerDelete** (**xTimer**, **xTicksToWait**)  
`BaseType_t xTimerDelete( TimerHandle_t xTimer, TickType_t xTicksToWait );`

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the **configTIMER_QUEUE_LENGTH** configuration constant.

**xTimerDelete()** deletes a timer that was previously created using the **xTimerCreate()** API function.

The **configUSE_TIMERS** configuration constant must be set to 1 for **xTimerDelete()** to be available.

Example usage:

**Return**  
**pdFAIL** will be returned if the delete command could not be sent to the timer command queue even after **xTicksToWait** ticks had passed. **pdPASS** will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the **configTIMER_TASK_PRIORITY** configuration constant.

**Parameters**

- **xTimer**: The handle of the timer being deleted.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when **xTimerDelete()** was called. **xTicksToWait** is ignored if **xTimerDelete()** is called before the scheduler is started.

See the **xTimerChangePeriod()** API function example usage scenario.

**xTimerReset** (**xTimer**, **xTicksToWait**)  
`BaseType_t xTimerReset( TimerHandle_t xTimer, TickType_t xTicksToWait );`

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the **configTIMER_QUEUE_LENGTH** configuration constant.

**xTimerReset()** re-starts a timer that was previously created using the **xTimerCreate()** API function. If the timer had already been started and was already in the active state, then **xTimerReset()** will cause the timer to re-evaluate its expiry time so that it is relative to when **xTimerReset()** was called. If the timer was in the dormant state then **xTimerReset()** has equivalent functionality to the **xTimerStart()** API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after **xTimerReset()** was called, where ‘n’ is the timers defined period.

It is valid to call **xTimerReset()** before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when **xTimerReset()** was called.

The **configUSE_TIMERS** configuration constant must be set to 1 for **xTimerReset()** to be available.

Example usage:
* When a key **is** pressed, an LCD back-light **is** switched on. If 5 seconds...
* **pass**
* When a key is pressed, an LCD back-light is switched on. If 5 seconds...
* **/**
* this case, the timer is a one-shot timer.
* **/
* TimerHandle_t xBacklightTimer = NULL;
* **/
* The callback function assigned to the one-shot timer. In this case the **/
* parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {**/
* // The timer expired, therefore 5 seconds must have passed since a key**/
* // was pressed. Switch off the LCD back-light.
* vSetBacklightState( BACKLIGHT_OFF );
* }
* **/
* The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {**/
* // Ensure the LCD back-light is on, then reset the timer that is**/
* // responsible for turning the back-light off after 5 seconds of**/
* // key inactivity. Wait 10 ticks for the command to be successfully sent**/
* // if it cannot be sent immediately.
* vSetBacklightState( BACKLIGHT_ON );
* if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
* {**/
* // The reset command was not executed successfully. Take appropriate**/
* // action here.
* }
* **/
* // Perform the rest of the key processing here.
* }
* void main( void )
* {**/
* int32_t x;
* *
* // Create then start the one-shot timer that is responsible for turning**/
* // the back-light off if no keys are pressed within a 5 second period.
* xBacklightTimer = xTimerCreate( "BacklightTimer", **/
* /* Just a text name, not used by the kernel. */ **/
* 5000 / portTICK_PERIOD_MS), // The **/
* timer period in ticks. **/
* pdFALSE, // The timer...
* 0, // The id is...
* not used by the callback so can take any value. **/
* vBacklightTimerCallback // The...
* callback function that switches the LCD back-light off. **/
* );
* *
* if( xBacklightTimer == NULL )
* {**/
* // The timer was not created.
* }
* else
* {**/
* // Start the timer. No block time is specified, and even if one was**/
* // it would be ignored because the scheduler has not yet been**/
* // started.
* if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
* {**/
The timer could not be set into the Active state.

Starting the scheduler will start the timer running as it has already been set into the active state.

vTaskStartScheduler();

Should not reach here.

for (;;) ;

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being reset/started/restarted.
- xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

xTimerStartFromISR (xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerStartFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    // Ensure the LCD back-light is on, then restart the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only
* call FreeRTOS API functions that end in "FromISR".
* ```
* vSetBacklightState( BACKLIGHT_ON );
* ```
* xTimerStartFromISR() or xTimerResetFromISR() could be called here
* ```
* as both cause the timer to re-calculate its expiry time.
* ```
* ```
* xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
* ```
* if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
* {
*     // The start command was not executed successfully. Take appropriate action here.
* }
* ```
* ```
* Perform the rest of the key processing here.
* ```
* ```
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
*     // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
* }
* ```
* Return pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer being started/restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**xTimerStopFromISR**(xTimer, pxHigherPriorityTaskWoken)
```
BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );
```
A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:
```
* // This scenario assumes xTimer has already been created and started. When an interrupt occurs, the timer should be simply stopped.
* ```
* ```
* // The interrupt service routine that stops the timer.
* ```
* ```
* void vAnExampleInterruptServiceRoutine( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
* ```
* ```
The interrupt has occurred - simply stop the timer.

If higherPriorityTaskWoken equals 0, then a context switch

from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.

if (higherPriorityTaskWoken != 0)
{
    // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
}

Return pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

xTimer: The handle of the timer being stopped.
pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then "pxHigherPriorityTaskWoken will get set to 0 internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to 0 then a context switch should be performed before the interrupt exits.

xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

BaseType_t xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t *pxHigherPriorityTaskWoken );

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

* // This scenario assumes xTimer has already been created and started. When an interrupt occurs, the period of xTimer should be changed to 500ms.
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*     BaseType_t higherPriorityTaskWoken = pdFALSE;
*     // The interrupt has occurred - change the period of xTimer to 500ms.
*     // higherPriorityTaskWoken was set to pdFALSE where it was defined
*     // (within this function). As this is an interrupt service routine, only FreeRTOS API functions that end in "FromISR" can be used.
* }
if ( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS ) {
    // The command to change the timers period was <i>not</i> executed
    // successfully. Take appropriate action here.
}

if ( xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* should be performed. The syntax required to perform a context switch
* from inside an ISR varies from port to port, and from compiler to
* compiler. Inspect the demos for the port you are using to find the
* actual syntax required.
* if ( xHigherPriorityTaskWoken != pdFALSE ) {
    // Call the interrupt safe <i>yield</i> function here (actual function
    // depends on the FreeRTOS port being used).
* }

Return pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the config-TIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer that is having its period changed.
- xNewPeriod: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerResetFromISR (xTimer, pxHigherPriorityTaskWoken)
BaseType_t xTimerResetFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

* // This scenario assumes xBacklightTimer has already been created. When a
* // key <i>is</i> pressed, an LCD back-light <i>is</i> switched on. If 5 seconds <i>pass</i>
* // without a key being pressed, then the LCD back-light <i>is</i> switched off. In
* // this case, the timer <i>is</i> a one-shot timer, <i>and</i> unlike the example given <i>for</i>
* // the xTimerReset() function, the key press event handler <i>is</i> an interrupt
* // service routine.
* // The callback function assigned to the one-shot timer. In this case the
* // parameter <i>is not</i> used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.

```c
vSetBacklightState( BACKLIGHT_OFF );
```

The key press interrupt service routine.

```c
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time.
    // xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
    if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate action here.
    }

    // Perform the rest of the key processing here.
    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch should be performed. The syntax required to perform a context switch from inside an ISR varies from port to port, and from compiler to compiler. Inspect the demos for the port you are using to find the actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
    }
}
```

Return pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
- xTimer: The handle of the timer that is to be started, reset, or restarted.
- pxHigherPriorityTaskWoken: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then "pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h

Functions

EventGroupHandle_t xEventGroupCreate (void)
Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

Return If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See https://www.FreeRTOS.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)
Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.
Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

Return If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

Parameters
- `pxEventGroupBuffer`: pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

`EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_txClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )`

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits( xEventGroup, // The event group being tested.
                                 BIT_0 | BIT_4, // The bits within the event group to wait_
                                 --for.
                                 pdTRUE, // BIT_0 and BIT_4 should be cleared before_
                                 --returning.
                                 pdFALSE, // Don’t wait for both bits, either bit will_
                                 --do.
                                 xTicksToWait ); // Wait a maximum of 100ms for either bit to_
                                 --be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
```
Return  The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

Parameters

- xEventGroup: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- uxBitsToWaitFor: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- xClearOnExit: If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- xWaitForAllBits: If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- xTicksToWait: The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( xEventGroup, BIT_0 | BIT_4 );

    if( uxBits & ( BIT_0 | BIT_4 ) != ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
    }
}
```

EventBits_t xEventGroupClearBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear )

Clear bits within an event group. This function cannot be called from an interrupt.
else if( ( uxBits & BIT_0 ) != 0 )
{
    // Bit 0 was set before xEventGroupClearBits() was called. It will
    // now be clear.
}
else if( ( uxBits & BIT_4 ) != 0 )
{
    // Bit 4 was set before xEventGroupClearBits() was called. It will
    // now be clear.
}
else
{
    // Neither bit 0 nor bit 4 were set in the first place.
}

Return The value of the event group before the specified bits were cleared.

Parameters

- xEventGroup: The event group in which the bits are to be cleared.
- uxBitsToClear: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

EventBits_t xEventGroupSetBits(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits( xEventGroup, // The event group being updated.
                                BIT_0 | BIT_4 ); // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }

```
Return The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

Parameters
- xEventGroup: The event group in which the bits are to be set.
- uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

`EventBits_t xEventGroupSync(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)`

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT   ( 1 << 0 )
#define TASK_1_BIT   ( 1 << 1 )
#define TASK_2_BIT   ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for( ;; )
{
    // Perform task functionality here.

    // Set bit 0 in the event flag to note this task has reached the
    // sync point. The other two tasks will set the other two bits defined
    // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
    // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
    // for this to happen.
    uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
                                  xTicksToWait );
```
if ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS
{
    // All three tasks reached the synchronisation point before the call
    // to xEventGroupSync() timed out.
}
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

Return The value of the event group at the time either the bits being waited for became set, or the block time
expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its
timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because
all the bits it was waiting for were set then the returned value is the event group value before any bits were
automatically cleared.

Parameters

- xEventGroup: The event group in which the bits are being tested. The event group must have
  previously been created using a call to xEventGroupCreate().
- uxBitsToSet: The bits to set in the event group before determining if, and possibly waiting for,
  all the bits specified by the uxBitsToWait parameter are set.
- uxBitsToWaitFor: A bitwise value that indicates the bit or bits to test inside the event group.
  For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1
  and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- xTicksToWait: The maximum amount of time (specified in ‘ticks’) to wait for all of the bits...
specified by uxBitsToWaitFor to become set.

**EventBits_t xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)**

A version of xEventGroupGetBits() that can be called from an ISR.

**Return** The event group bits at the time xEventGroupGetBitsFromISR() was called.

**Parameters**
- xEventGroup: The event group being queried.

**void vEventGroupDelete (EventGroupHandle_t xEventGroup)**

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

**Parameters**
- xEventGroup: The event group being deleted.

**Macros**

**xEventGroupClearBitsFromISR (xEventGroup, uxBitsToClear)**

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

**Example usage:**

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

**Return** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**Parameters**
- xEventGroup: The event group in which the bits are to be cleared.
- uxBitsToClear: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

**xEventGroupSetBitsFromISR (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)**

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.
Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;
    
    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;
    
    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4 // The bits being set.
        &xHigherPriorityTaskWoken );
    
    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}
```

**Return** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**Parameters**
- `xEventGroup`: The event group in which the bits are to be set.
- `uxBitsToSet`: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to 0x08. To set bit 3 and bit 0 set `uxBitsToSet` to 0x09.
- `pxHigherPriorityTaskWoken`: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then `*pxHigherPriorityTaskWoken` will be set to pdTRUE by `xEventGroupSetBitsFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `*pxHigherPriorityTaskWoken` must be initialised to pdFALSE. See the example code below.

**xEventGroupGetBits** *(xEventGroup)*

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

**Return** The event group bits at the time `xEventGroupGetBits()` was called.

**Parameters**
- `xEventGroup`: The event group being queried.

**Type Definitions**
```c
typedef struct EventGroupDef_t *EventGroupHandle_t
typedef TickType_t EventBits_t
```

**Stream Buffer API**

**Header File**
Functions

\[ \text{xStreamBufferSend}(\text{StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait}) \]

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
        sizeof( ucArrayToSend ), x100ms );
    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
        strlen( pcStringToSend ), 0 );
    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

Return  The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

Parameters

- xStreamBuffer: The handle of the stream buffer to which a stream is being sent.
- pvTxData: A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- xDataLengthBytes: The maximum number of bytes to copy from pvTxData into the stream buffer.
Chapter 2. API

- `xTicksToWait`: The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another `xDataLengthBytes` bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. If a task times out before it can write all `xDataLengthBytes` into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

```c
size_t xStreamBufferSendFromISR( StreamBufferHandle_t xStreamBuffer, const void *pvTxData,
    size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
        ( void * ) pcStringToSend,
        strlen( pcStringToSend ),
        &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Return** The number of bytes actually written to the stream buffer, which will be less than `xDataLengthBytes` if the stream buffer didn’t have enough free space for all the bytes to be written.
### Parameters
- **xStreamBuffer**: The handle of the stream buffer to which a stream is being sent.
- **pvTxData**: A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes**: The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken**: It is possible that a stream buffer will have a task blocked on it waiting for data. Calling `xStreamBufferSendFromISR()` can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling `xStreamBufferSendFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xStreamBufferSendFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE`. If `xStreamBufferSendFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the example code below for an example.

```c
size_t xStreamBufferReceive(StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)
```

Receives bytes from a stream buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferReceive()` to read from a stream buffer from a task. Use `xStreamBufferReceiveFromISR()` to read from a stream buffer from an interrupt service routine (ISR).

**Example use:**

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[20];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS(20);

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
            ( void * ) ucRxData,
            sizeof( ucRxData ),
            xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains another xRecievedBytes bytes of data, which can
        // be processed here....
    }
}
```

**Return** The number of bytes actually read from the stream buffer, which will be less than `xBufferLengthBytes` if the call to `xStreamBufferReceive()` timed out before `xBufferLengthBytes` were available.

**Parameters**
- **xStreamBuffer**: The handle of the stream buffer from which bytes are to be received.
- **pvRxData**: A pointer to the buffer into which the received bytes will be copied.
Chapter 2. API

- **xBufferLengthBytes**: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.

- **xTicksToWait**: The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

```
size_t xStreamBufferReceiveFromISR(StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                                 ( void * ) ucRxData,
                                                 sizeof( ucRxData ),
                                                 &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Return**  The number of bytes read from the stream buffer, if any.

**Parameters**

- **xStreamBuffer**: The handle of the stream buffer from which a stream is being received.
- **pvRxData**: A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes**: The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken**: It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make
space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)

  Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

  A stream buffer handle must not be used after the stream buffer has been deleted.

  Parameters
  • xStreamBuffer: The handle of the stream buffer to be deleted.

BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)

  Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

  Return If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

  Parameters
  • xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)

  Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

  Return If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

  Parameters
  • xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)

  Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

  Return If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

  Parameters
  • xStreamBuffer: The handle of the stream buffer being reset.

d size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)

  Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

  Return The number of bytes that can be written to the stream buffer before the stream buffer would be full.

  Parameters
  • xStreamBuffer: The handle of the stream buffer being queried.

d size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)

  Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

  Return The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

  Parameters
  • xStreamBuffer: The handle of the stream buffer being queried.

BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)

  A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a
read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Return** If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer being updated.
- xTriggerLevel: The new trigger level for the stream buffer.

BaseType_t xStreamBufferSendCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t* pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer to which data was written.
- pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

BaseType_t xStreamBufferReceiveCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xStreamBuffer: The handle of the stream buffer from which data was read.
- pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Macros**
Chapter 2. API

**xStreamBufferCreate** (xBufferSizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

    // Create a stream buffer that can hold 100 bytes. The memory used to hold
    // both the stream buffer structure and the data in the stream buffer is
    // allocated dynamically.
    xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

    if( xStreamBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // stream buffer.
    }
    else
    {
        // The stream buffer was created successfully and can now be used.
    }
}
```

**Return** If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**Parameters**

- **xBufferSizeBytes**: The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes**: The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

**xStreamBufferCreateStatic** (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```c
// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
```
void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                              xTriggerLevel,
                                              ucBufferStorage,
                                              &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.
    // Other code that uses the stream buffer can go here.
}

Return If the stream buffer is created successfully then a handle to the created stream buffer is returned. If
either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Parameters
- xBufferSizeBytes: The size, in bytes, of the buffer pointed to by the pucStreamBufferStor-
ageArea parameter.
- xTriggerLevelBytes: The number of bytes that must be in the stream buffer before a task
  that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example,
  if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task
  will be unblocked when a single byte is written to the buffer or the task’s block time expires. As
  another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of
  10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s
  block time expires. If a reading task’s block time expires before the trigger level is reached then
  the task will still receive however many bytes are actually available. Setting a trigger level of 0 will
  result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than
  the buffer size.
- pucStreamBufferStorageArea: Must point to a uint8_t array that is at least xBufferSize-
  Bytes + 1 big. This is the array to which streams are copied when they are written to the stream
  buffer.
- pxStaticStreamBuffer: Must point to a variable of type StaticStreamBuffer_t, which will
  be used to hold the stream buffer’s data structure.

Type Definitions
typedef struct StreamBufferDef_t* StreamBufferHandle_t

Message Buffer API

Header File
- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h

Macros
xMessageBufferCreate(xBufferSizeBytes)
    Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a
    version that uses statically allocated memory (memory that is allocated at compile time).
configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

**Return** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

**Parameters**
- `xBufferSizeBytes`: The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the buffer, an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

**xMessageBufferCreateStatic** (`xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer`) Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```c
#define STORAGE_SIZE_BYTES 1000

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                                ucBufferStorage,
                                                &xMessageBufferStruct );
```

(下頁續接)
As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer parameters were NULL, xMessageBuffer will not be NULL, and can be used to reference the created message buffer in other message buffer API calls.

// Other code that uses the message buffer can go here.

Return If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticMessageBuffer are NULL then NULL is returned.

Parameters

- **xBufferSizeBytes**: The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).
- **pucMessageBufferStorageArea**: Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer**: Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

### xMessageBufferSend(xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend, sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
```
Return The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

Parameters
- **xMessageBuffer**: The handle of the message buffer to which a message is being sent.
- **pvTxData**: A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes**: The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait**: The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

xMessageBufferSendFromISR(xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.
```
// Attempt to send the string to the message buffer.
// xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
//     ( void * ) pcStringToSend,
//     strlen( pcStringToSend ),
//     &xHigherPriorityTaskWoken );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );

Return The number of bytes actually written to the message buffer. If the message buffer didn’t have enough
free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

Parameters

- xMessageBuffer: The handle of the message buffer to which a message is being sent.
- pvTxData: A pointer to the message that is to be copied into the message buffer.
- xDataLengthBytes: The length of the message. That is, the number of bytes to copy from
  pvTxData into the message buffer. When a message is written to the message buffer an additional
  sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4
  bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will
  reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to
  be hold the message length).
- pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked
  on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause
  a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR()
  causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently
  executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will
  set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to
  pdTRUE, then normally a context switch should be performed before the interrupt is exited. This
  will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigher-
  PriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code
  example below for an example.

xMessageBufferReceive (xMessageBuffer, pvRxData, xBufferSizeBytes, xTicksToWait)
Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of
the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message
buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task
or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the
buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other
FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to
be multiple different writers then the application writer must place each call to a writing API function (such as
xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be
multiple different readers then the application writer must place each call to a reading API function (such as
xMessageBufferRead()) inside a critical section and set the receive block time to 0.
Use `xMessageBufferReceive()` to read from a message buffer from a task. Use `xMessageBufferReceiveFromISR()` to read from a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                           ( void * ) ucRxData,
                                           sizeof( ucRxData ),
                                           xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}
```

**Return** The length, in bytes, of the message read from the message buffer, if any. If `xMessageBufferReceive()` times out before a message became available then zero is returned. If the length of the message is greater than `xBufferLengthBytes` then the message will be left in the message buffer and zero is returned.

**Parameters**
- `xMessageBuffer`: The handle of the message buffer from which a message is being received.
- `pvRxData`: A pointer to the buffer into which the received message is to be copied.
- `xBufferLengthBytes`: The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum length of the message that can be received. If `xBufferLengthBytes` is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- `xTicksToWait`: The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. `xMessageBufferReceive()` will return immediately if `xTicksToWait` is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. Tasks do not use any CPU time when they are in the Blocked state.

`xMessageBufferReceiveFromISR` (**xMessageBuffer**, `pvRxData`, `xBufferLengthBytes`, `pxHigherPriorityTaskWoken`)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

***NOTE***: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()` inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xMessageBufferRead()` inside a critical section and set the receive block time to 0.

Use `xMessageBufferReceive()` to read from a message buffer from a task. Use `xMessageBufferReceiveFromISR()` to read from a message buffer from an interrupt service routine (ISR).

Example use:
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[20];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
        { void * } ucRxData,
        sizeof( ucRxData ),
        &xHigherPriorityTaskWoken);

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

Return  The length, in bytes, of the message read from the message buffer, if any.

Parameters

- xMessageBuffer: The handle of the message buffer from which a message is being received.
- pvRxData: A pointer to the buffer into which the received message is to be copied.
- xBufferLengthBytes: The length of the buffer pointed to by the pvRxData parameter. This
  sets the maximum length of the message that can be received. If xBufferLengthBytes is too small
  to hold the next message then the message will be left in the message buffer and 0 will be returned.
- pxHigherPriorityTaskWoken: It is possible that a message buffer will have a task blocked
  on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make
  space available, and so cause a task that is waiting for space to leave the Blocked state. If calling
  xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked
  task has a priority higher than the currently executing task (the task that was interrupted), then,
  internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE.
  If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch
  should be performed before the interrupt is exited. That will ensure the interrupt returns directly
  to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE
  before it is passed into the function. See the code example below for an example.

vMessageBufferDelete(xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-
BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBuffer-
Create()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

Parameters

- xMessageBuffer: The handle of the message buffer to be deleted.

xMessageBufferIsFull(xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any
size, until space is made available by a message being removed from the message buffer.

**Return** If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferIsEmpty** (xMessageBuffer)
Tests to see if a message buffer is empty (does not contain any messages).

**Return** If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferReset** (xMessageBuffer)
Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Return** If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a a message to be available, then pdFAIL is returned.

**Parameters**
- xMessageBuffer: The handle of the message buffer being reset.

**xMessageBufferSpaceAvailable** (xMessageBuffer)
Returns the number of bytes of free space in the message buffer.

**Return** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**Parameters**
- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferSpacesAvailable** (xMessageBuffer)
**xMessageBufferNextLengthBytes** (xMessageBuffer)
Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

**Return** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**Parameters**
- xMessageBuffer: The handle of the message buffer being queried.

**xMessageBufferSendCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)
For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**
- xMessageBuffer: The handle of the stream buffer to which data was written.
pxHigherPriorityTaskWoken: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**xMessageBufferReceiveCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Return** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Parameters**

- **xMessageBuffer**: The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken**: *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferReceiveCompletedFromISR(). If calling xMessageBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Type Definitions**

```c
typedef void *MessageBufferHandle_t
```

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns a MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc.

### 2.7.10 FreeRTOS Additions

**Overview**

ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However, various features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

**Ring Buffers**: Ring buffers were added to provide a form of buffer that could accept entries of arbitrary lengths.

**Hooks**: ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric amongst both CPUs.

**Component Specific Properties**: Currently added only one component specific property `ORIG_INCLUDE_PATH`.

**Ring Buffers**

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items must also be returned to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:
No-Split buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. Only this buffer type allows you to get the data item address and write to the item by yourself. Refer the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

Allow-Split buffers will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

注解：No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

注解：Each item stored in No-Split or Allow-Split buffers will **require an additional 8 bytes for a header**. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

Usage

The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type RINGBUF_TYPE_NOSPLIT) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))
```
... //Retrieve space for DMA descriptor and corresponding data buffer //This has to be done with SendAcquire, or the address may be different when we copy
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
} item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
}; //Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

The following example demonstrates retrieving and returning an item from a No-Split ring buffer using xRingbufferReceive() and vRingbufferReturnItem()

... //Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from an Allow-Split ring buffer using xRingbufferReceiveSplit() and vRingbufferReturnItem()

... //Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from a byte buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`...
Chapter 2. API 参考

29: Sending items to No-Split or Allow-Split ring buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

Using SendAcquire and SendComplete Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

30: Sending items to byte buffers

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if SendComplete is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes,
right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

**Wrap around** The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes** with **56 bytes of free space** that **wraps around** and a sent item of **28 bytes**.

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Byte buffers** will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.
Retrieving/Returning. The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

Items in No-Split buffers and Allow-Split buffers are retrieved in strict FIFO order and must be returned for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the 16, 20, and 8 byte items are retrieved in FIFO order. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.
Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to \textit{xRingbufferReceive()} or \textit{xRingbufferReceiveFromISR()} then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets**  Ring buffers can be added to FreeRTOS queue sets using \textit{xRingbufferAddToQueueSetRead()} such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to \textit{xQueueSelectFromSet()}. To check whether the selected queue set member is the ring buffer, call \textit{xRingbufferCanRead()}.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL &\& xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item
    ...
} else {
    ...
}
```

**Ring Buffers with Static Allocation**  The \textit{xRingbufferCreateStatic()} can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the \textit{xRingbufferCreateStatic()} to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type \textit{StaticRingbuffer_t}
- The ring buffer’s storage area of size \textit{xBufferSize}. Note that \textit{xBufferSize} must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

注解：  当删除一个通过 \textit{xRingbufferCreateStatic()} 创建的环缓冲器时，函数 \textit{vRingbufferDelete()} 不会释放任何内存块。这必须由用户在删除环缓冲器之后手动完成。
bufferDelete() is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"
#define BUFFER_SIZE 400    //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...
//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE, MALLOC_CAP_SPIRAM);
//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_structure, buffer_storage);
...
//Delete the ring buffer after used
vRingbufferDelete(handle);
//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

**Ring Buffer API Reference**

**Note:** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the **highest priority task will always be serviced first.** However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second-highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

**Header File**

- components/esp_ringbuf/include/freertos/ringbuf.h

**Functions**
**RingbufHandle_t **`xRingbufferCreate`(size_t `xBufferSize`, RingbufferType_t `xBufType`)  
Create a ring buffer.  

**Note** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.  
**Return** A handle to the created ring buffer, or NULL in case of error.  

**Parameters**  
- **[in]** `xBufferSize`: Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers  
- **[in]** `xBufType`: Type of ring buffer, see documentation.

`RingbufHandle_t **xRingbufferCreateNoSplit`(size_t `xItemSize`, size_t `xItemNum`)  
Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.  

This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.  
**Return** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.  

**Parameters**  
- **[in]** `xItemSize`: Size of each item to be put into the ring buffer  
- **[in]** `xItemNum`: Maximum number of items the buffer needs to hold simultaneously

`RingbufHandle_t **xRingbufferCreateStatic`(size_t `xBufferSize`, RingbufferType_t `xBufType`, uint8_t * `pucRingbufferStorage`, StaticRingbuffer_t * `pxStaticRingbuffer`)  
Create a ring buffer but manually provide the required memory.  

**Note** xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.  
**Return** A handle to the created ring buffer  

**Parameters**  
- **[in]** `xBufferSize`: Size of the buffer in bytes.  
- **[in]** `xBufType`: Type of ring buffer, see documentation  
- **[in]** `pucRingbufferStorage`: Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by xBufferSize  
- **[in]** `pxStaticRingbuffer`: Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**BaseType_t **`xRingbufferSend`(RingbufHandle_t `xRingbuffer`, const void * `pvItem`, size_t `xItemSize`, TickType_t `xTicksToWait`)  
Insert an item into the ring buffer.  

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.  

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.  
**Return**  
- **pdTRUE** if succeeded  
- **pdFALSE** on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**  
- **[in]** `xRingbuffer`: Ring buffer to insert the item into  
- **[in]** `pvItem`: Pointer to data to insert. NULL is allowed if xItemSize is 0.  
- **[in]** `xItemSize`: Size of data to insert.  
- **[in]** `xTicksToWait`: Ticks to wait for room in the ring buffer.

**BaseType_t **`xRingbufferSendFromISR`(RingbufHandle_t `xRingbuffer`, const void * `pvItem`, size_t `xItemSize`, BaseType_t * `pxHigherPriorityTaskWoken`)  
Insert an item into the ring buffer in an ISR.  

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.  

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.  
**Return**
• pdTRUE if succeeded
• pdFALSE when the ring buffer does not have space.

**Parameters**

- **[in]** xRingbuffer: Ring buffer to insert the item into
- **[in]** pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **[in]** xItemSize: Size of data to insert.
- **[out]** pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

```
BaseType_t xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)
```

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

**Note** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**

- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**

- **[in]** xRingbuffer: Ring buffer to allocate the memory
- **[out]** ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **[in]** xItemSize: Size of item to acquire.
- **[in]** xTicksToWait: Ticks to wait for room in the ring buffer.

```
BaseType_t xRingbufferSendComplete(RingbufHandle_t xRingbuffer, void *pvItem)
```

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

**Note** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

**Return**

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

**Parameters**

- **[in]** xRingbuffer: Ring buffer to insert the item into
- **[in]** pvItem: Pointer to item in allocated memory to insert.

```
void *xRingbufferReceive(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
```

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Return**

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

**Parameters**

- **[in]** xRingbuffer: Ring buffer to retrieve the item from
- **[out]** pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
- **[in]** xTicksToWait: Ticks to wait for items in the ring buffer.

```
void *xRingbufferReceiveFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize)
```

Retrieve an item from the ring buffer in an ISR.
Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval.

**Note** A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

**Note** Byte buffers do not allow multiple retrievals before returning an item.

**Note** Two calls to `RingbufferReceiveFromISR()` are required if the bytes wrap around the end of the ring buffer.

**Return**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

**Parameters**
- `[in]` `xRingbuffer`: Ring buffer to retrieve the item from
- `[out]` `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.

```c
BaseType_t xRingbufferReceiveSplit (RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)
```

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

**Note** Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers.

**Return**
- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

**Parameters**
- `[in]` `xRingbuffer`: Ring buffer to retrieve the item from
- `[out]` `ppvHeadItem`: Double pointer to first part (set to NULL if no items were retrieved)
- `[out]` `ppvTailItem`: Double pointer to second part (set to NULL if item is not split)
- `[out]` `pxHeadItemSize`: Pointer to size of first part (unmodified if no items were retrieved)
- `[out]` `pxTailItemSize`: Pointer to size of second part (unmodified if item is not split)
- `[in]` `xTicksToWait`: Ticks to wait for items in the ring buffer.

```c
BaseType_t xRingbufferReceiveSplitFromISR (RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)
```

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

**Note** Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

**Note** This function should only be called on allow-split buffers.

**Return**
- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

**Parameters**
- `[in]` `xRingbuffer`: Ring buffer to retrieve the item from
- `[out]` `ppvHeadItem`: Double pointer to first part (set to NULL if no items were retrieved)
- `[out]` `ppvTailItem`: Double pointer to second part (set to NULL if item is not split)
- `[out]` `pxHeadItemSize`: Pointer to size of first part (unmodified if no items were retrieved)
- `[out]` `pxTailItemSize`: Pointer to size of second part (unmodified if item is not split)

```c
void *xRingbufferReceiveUpTo (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)
```

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.
A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

This function should only be called on byte buffers.

Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

Parameters
- `[in]` `xRingbuffer`: Ring buffer to retrieve the item from
- `[out]` `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
- `[in]` `xMaxSize`: Maximum number of bytes to return.

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

If a split item is retrieved, both parts should be returned by calling this function twice.

Parameters
- `[in]` `xRingbuffer`: Ring buffer the item was retrieved from
- `[in]` `pvItem`: Item that was received earlier

Return a previously-retrieved item to the ring buffer from an ISR.

Parameters
- `[in]` `xRingbuffer`: Ring buffer the item was retrieved from
- `[in]` `pvItem`: Item that was received earlier
- `[out]` `pxHigherPriorityTaskWoken`: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

Delete a ring buffer.

Parameters
- `[in]` `xRingbuffer`: Ring buffer to delete

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note The max item size for a no-split buffer is limited to `((buffer_size/2)-header_size)`. This limit is imposed
so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

**Return** Maximum size, in bytes, of an item that can be placed in a ring buffer.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to query

```c
size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)
```

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

**Warning** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

**Note** An empty no-split buffer has a max current free size for an item that is limited to `((buffer_size/2)-header_size)`. See API reference for `xRingbufferGetMaxItemSize()`.

**Return** Current free size, in bytes, available for an entry

**Parameters**

- [in] `xRingbuffer`: Ring buffer to query

```c
BaseType_t xRingbufferAddToQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
```

Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

**Return**

- pdTRUE on success, pdFALSE otherwise

**Parameters**

- [in] `xRingbuffer`: Ring buffer to add to the queue set
- [in] `xQueueSet`: Queue set to add the ring buffer’s read semaphore to

```c
BaseType_t xRingbufferCanRead(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)
```

Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from `xQueueSelectFromSet()` is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

**Return**

- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

**Parameters**

- [in] `xRingbuffer`: Ring buffer which should be checked
- [in] `xMember`: Member returned from `xQueueSelectFromSet`

```c
BaseType_t xRingbufferRemoveFromQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
```

Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer.

**Return**

- pdTRUE on success
- pdFALSE otherwise

**Parameters**

- [in] `xRingbuffer`: Ring buffer to remove from the queue set
- [in] `xQueueSet`: Queue set to remove the ring buffer’s read semaphore from

```c
void vRingbufferGetInfo(RingbufHandle_t xRingbuffer, BaseType_t *uxFree, BaseType_t *uxRead, BaseType_t *uxWrite, BaseType_t *uxAcquire, BaseType_t *uxItemsWaiting)
```

Get information about ring buffer status.
Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**
- **[in]** xRingbuffer: Ring buffer to remove from the queue set
- **[out]** uxFree: Pointer use to store free pointer position
- **[out]** uxRead: Pointer use to store read pointer position
- **[out]** uxWrite: Pointer use to store write pointer position
- **[out]** uxAcquire: Pointer use to store acquire pointer position
- **[out]** uxItemsWaiting: Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```

Debugging function to print the internal pointers in the ring buffer.

**Parameters**
- xRingbuffer: Ring buffer to show

**Structures**
- **struct xSTATIC_RINGBUFFER**
  Struct that is equivalent in size to the ring buffer’s data structure.
  The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Type Definitions**
- **typedef void* RingbufHandle_t**
  Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

- **typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t**
  Struct that is equivalent in size to the ring buffer’s data structure.
  The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Enumerations**
- **enum RingbufferType_t**
  Values:
  - **RINGBUF_TYPE_NOSPLIT** = 0
    No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.
  - **RINGBUF_TYPE_ALLOW_SPLIT**
    Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.
  - **RINGBUF_TYPE_BYTEBUF**
    Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.
  - **RINGBUF_TYPE_MAX**
Hooks

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

Vanilla FreeRTOS Hooks  Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as Legacy Hooks in ESP-IDF FreeRTOS. To enable legacy hooks, `CONFIG_FREERTOS_LEGACY_HOOKS` should be enabled in the project configuration menu.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32 is dual-core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

ESP-IDF Idle and Tick Hooks  For some use-cases it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time. Furthermore, due to the dual-core nature of the ESP32, it may be necessary for some applications to have separate hooks for each core.

Therefore, ESP-IDF provides its own hooks API in addition to the legacy hooks provided by vanilla FreeRTOS.

The ESP-IDF tick and idle hooks are registered at run time. Each tick hook and idle hook must be registered to a specific CPU. When the idle task runs or a tick interrupt occurs on a particular CPU, the CPU will run each of its registered idle hook and tick hook in turn.

Note: Tick interrupt stays active whilst cache is disabled and hence `vApplicationTickHook()` (legacy case) or ESP-IDF tick hooks must be placed in internal RAM. Please refer to the SPI flash API documentation for more details.

Hooks API Reference

Header File

- components/esp_system/include/esp_freertos_hooks.h

Functions

```c
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

Warning  Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

Return

- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters

- [in] new_idle_cb: Callback to be called
- [in] cpuid: id of the core
**esp_err_t esp_register_freertos_idle_hook (esp_freertos_idle_cb_t new_idle_cb)**

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Return**
- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

**Parameters**
- [in] new_idle_cb: Callback to be called

**esp_err_t esp_register_freertos_tick_hook_for_cpu (esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)**

Register a callback to be called from the specified core’s tick hook.

**Return**
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

**Parameters**
- [in] new_tick_cb: Callback to be called
- [in] cpuid: id of the core

**esp_err_t esp_register_freertos_tick_hook (esp_freertos_tick_cb_t new_tick_cb)**

Register a callback to be called from the calling core’s tick hook.

**Return**
- ESP_OK: Callback registered to the calling core’s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

**Parameters**
- [in] new_tick_cb: Callback to be called

**void esp_deregister_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)**

Unregister an idle callback from the idle hook of the specified core.

**Parameters**
- [in] old_idle_cb: Callback to be unregistered
- [in] cpuid: id of the core

**void esp_deregister_freertos_idle_hook (esp_freertos_idle_cb_t old_idle_cb)**

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters**
- [in] old_idle_cb: Callback to be unregistered

**void esp_deregister_freertos_tick_hook_for_cpu (esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)**

Unregister a tick callback from the tick hook of the specified core.

**Parameters**
- [in] old_tick_cb: Callback to be unregistered
- [in] cpuid: id of the core

**void esp_deregister_freertos_tick_hook (esp_freertos_tick_cb_t old_tick_cb)**

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters**
- [in] old_tick_cb: Callback to be unregistered
Type Definitions

typedef bool (*esp_freertos_idle_cb_t)(void)
typedef void (*esp_freertos_tick_cb_t)(void)

Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

2.7.11 Heap Memory Allocation

Stack and Heap

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be 32-bit aligned.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see 应用程序的内存布局.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.
Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

| (252) heap_init: Initializing. RAM available for dynamic allocation: |
| (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM |
| (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM |
| (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM |
| (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM |
| (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM |

Finding available heap  See *Heap Information*.

**Special Capabilities**

**DMA-Capable Memory** Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

**32-Bit Accessible Memory** If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with `MALLOC_CAP_32BIT` can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

**External SPI Memory** When *external RAM* is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on configuration. See *配置外 RAM* for more details.

To use the region above the 4MiB limit, you can use the `himem API`.
API Reference - Heap Allocation

Header File

- components/heap/include/esp_heap_caps.h

Functions

**esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)**

- registers a callback function to be invoked if a memory allocation operation fails
- Return ESP_OK if callback was registered.
- Parameters
  - callback: caller defined callback to be invoked

**void *heap_caps_malloc (size_t size, uint32_t caps)**

- Allocate a chunk of memory which has the given capabilities.
- Equivalent semantics to libc malloc(), for capability-aware memory.
- In IDF, malloc(p) is equivalent to heap_caps_malloc(p, MALLOC_CAP_8BIT).
- Return A pointer to the memory allocated on success, NULL on failure
- Parameters
  - size: Size, in bytes, of the amount of memory to allocate
  - caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**void heap_caps_free (void *ptr)**

- Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().
- Equivalent semantics to libc free(), for capability-aware memory.
- In IDF, free(p) is equivalent to heap_caps_free(p).
- Parameters
  - ptr: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

**void *heap_caps_realloc (void *ptr, size_t size, uint32_t caps)**

- Reallocation previously allocated via heap_caps_malloc() or heap_caps_realloc().
- Equivalent semantics to libc realloc(), for capability-aware memory.
- In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).
- ‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.
- Return Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.
- Parameters
  - ptr: Pointer to previously allocated memory, or NULL for a new allocation.
  - size: Size of the new buffer requested, or 0 to free the buffer.
  - caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

**void *heap_caps_aligned_alloc (size_t alignment, size_t size, uint32_t caps)**

- Allocate an aligned chunk of memory which has the given capabilities.
- Equivalent semantics to libc aligned_alloc(), for capability-aware memory.
- Return A pointer to the memory allocated on success, NULL on failure
- Parameters
  - alignment: How the pointer received needs to be aligned must be a power of two
  - size: Size, in bytes, of the amount of memory to allocate
  - caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

**void heap_caps_aligned_free (void *ptr)**

- Used to deallocate memory previously allocated with heap_caps_aligned_alloc.
Note  This function is deprecated, please consider using heap_caps_free() instead

Parameters
  • ptr: Pointer to the memory allocated

void *heap_caps_aligned_calloc (size_t alignment, size_t n, size_t size, uint32_t caps)
Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Return  A pointer to the memory allocated on success, NULL on failure

Parameters
  • alignment: How the pointer received needs to be aligned must be a power of two
  • n: Number of continuing chunks of memory to allocate
  • size: Size, in bytes, of a chunk of memory to allocate
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

void *heap_caps_calloc (size_t n, size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc alloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

Return  A pointer to the memory allocated on success, NULL on failure

Parameters
  • n: Number of continuing chunks of memory to allocate
  • size: Size, in bytes, of a chunk of memory to allocate
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

size_t heap_caps_get_total_size (uint32_t caps)
Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

Return  total size in bytes

Parameters
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_free_size (uint32_t caps)
Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note  Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

Return  Amount of free bytes in the regions

Parameters
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_minimum_free_size (uint32_t caps)
Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

Note  Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

Return  Amount of free bytes in the regions

Parameters
  • caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t heap_caps_get_largest_free_block (uint32_t caps)
Get the largest free block of memory able to be allocated with the given capabilities.
Chapter 2. API

Returns the largest value of \( s \) for which `heap_caps_malloc(s, caps)` will succeed.

**Return** Size of the largest free block in bytes.

**Parameters**
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

```c
void heap_caps_get_info ( multi_heap_info_t *info, uint32_t caps )
```

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**
- `info`: Pointer to a structure which will be filled with relevant heap metadata.
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

```c
void heap_caps_print_heap_info ( uint32_t caps )
```

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

```c
bool heap_caps_check_integrity_all ( bool print_errors )
```

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- `print_errors`: Print specific errors if heap corruption is found.

```c
bool heap_caps_check_integrity ( uint32_t caps, bool print_errors )
```

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- `caps`: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory
- `print_errors`: Print specific errors if heap corruption is found.

```c
bool heap_caps_check_integrity_addr ( uintptr_t addr, bool print_errors )
```

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

**Note** The entire heap region around the address is checked, not only the adjacent heap blocks.

**Return** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

**Parameters**
- `addr`: Address in memory. Check for corruption in region containing this address.
• **print_errors**: Print specific errors if heap corruption is found.

```c
void heap_caps_malloc_extmem_enable(size_t limit)
```

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters**

- `limit`: Limit, in bytes.

```c
void* heap_caps_malloc_prefer(size_t size, size_t num, ...)
```

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- `size`: Size, in bytes, of the amount of memory to allocate
- `num`: Number of variable parameters

```c
void* heap_caps_realloc_prefer(void* ptr, size_t size, size_t num, ...)
```

Reallocate a chunk of memory as preference in decreasing order.

**Return** Point to a new buffer of size ‘size’, or NULL if allocation failed.

**Parameters**

- `ptr`: Pointer to previously allocated memory, or NULL for a new allocation.
- `size`: Size of the new buffer requested, or 0 to free the buffer.
- `num`: Number of variable parameters

```c
void* heap_capscalloc_prefer(size_t n, size_t size, size_t num, ...)
```

Allocate a chunk of memory as preference in decreasing order.

**Return** A pointer to the memory allocated on success, NULL on failure

**Parameters**

- `n`: Number of continuing chunks of memory to allocate
- `size`: Size, in bytes, of a chunk of memory to allocate
- `num`: Number of variable parameters

```c
void heap_caps_dump(uint32_t caps)
```

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

**Parameters**

- `caps`: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_dump_all(void)
```

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

```c
size_t heap_caps_get_allocated_size(void* ptr)
```

Return the size that a particular pointer was allocated with.
**Note** The app will crash with an assertion failure if the pointer is not valid.

**Return** Size of the memory allocated at this block.

**Parameters**
- `ptr`: Pointer to currently allocated heap memory. Must be a pointer value previously returned by `heap_caps_malloc`, `malloc`, `calloc`, etc. and not yet freed.

**Macros**

`MALLOC_CAP_EXEC`
- Flags to indicate the capabilities of the various memory systems.
- Memory must be able to run executable code

`MALLOC_CAP_32BIT`
- Memory must allow for aligned 32-bit data accesses.

`MALLOC_CAP_8BIT`
- Memory must allow for 8/16/…-bit data accesses.

`MALLOC_CAP_DMA`
- Memory must be able to be accessed by DMA.

`MALLOC_CAP_PID2`
- Memory must be mapped to PID2 memory space (PIDs are not currently used)

`MALLOC_CAP_PID3`
- Memory must be mapped to PID3 memory space (PIDs are not currently used)

`MALLOC_CAP_PID4`
- Memory must be mapped to PID4 memory space (PIDs are not currently used)

`MALLOC_CAP_PID5`
- Memory must be mapped to PID5 memory space (PIDs are not currently used)

`MALLOC_CAP_PID6`
- Memory must be mapped to PID6 memory space (PIDs are not currently used)

`MALLOC_CAP_PID7`
- Memory must be mapped to PID7 memory space (PIDs are not currently used)

`MALLOC_CAP_SPIRAM`
- Memory must be in SPI RAM.

`MALLOC_CAP_INTERNAL`
- Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

`MALLOC_CAP_DEFAULT`
- Memory can be returned in a non-capability-specific memory allocation (e.g. `malloc()`, `calloc()`) call.

`MALLOC_CAP_IRAM_8BIT`
- Memory must be in IRAM and allow unaligned access.

`MALLOC_CAP_RETENTION`

`MALLOC_CAP_RTCRAM`
- Memory must be in RTC fast memory.

`MALLOC_CAP_INVALID`
- Memory can’t be used / list end marker.

**Type Definitions**

```c
typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
```
- Callback called when an allocation operation fails, if registered.

**Parameters**
- `size`: in bytes of failed allocation
Thread Safety  Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- Heap Information (free space, etc.)
- Heap Corruption Detection
- Heap Tracing (memory leak detection, monitoring, etc.)

API Reference - Initialisation

Header File

- components/heap/include/esp_heap_caps_init.h

Functions

void heap_caps_init (void)
Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void heap_caps_enable_nonos_stack_heaps (void)
Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can’t be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

Return ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

Parameters

- start: Start address of new region.
- end: End address of new region.
**esp_err_t heap_caps_add_region_with_caps (const uint32_t caps[], intptr_t start, intptr_t end)**

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

**Parameters**
- caps: Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- start: Start address of new region.
- end: End address of new region.

**Implementation Notes**

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() or multi_heap_calloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling multi_heap_free() on that particular multi_heap instance.

**API Reference - Multi Heap API**

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

**Header File**
- components/heap/include/multi_heap.h

**Functions**

void *multi_heap_aligned_alloc (multi_heap_handle_t heap, size_t size, size_t alignment)

allocate a chunk of memory with specific alignment

**Return** pointer to the memory allocated, NULL on failure

**Parameters**
- heap: Handle to a registered heap.
- size: size in bytes of memory chunk
- alignment: how the memory must be aligned

void *multi_heap_malloc (multi_heap_handle_t heap, size_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

**Return** Pointer to new memory, or NULL if allocation fails.

**Parameters**
• heap: Handle to a registered heap.
• size: Size of desired buffer.

void **multi_heap_aligned_free** (multi_heap_handle_t heap, void *p)

def() a buffer aligned in a given heap.

**Note** This function is deprecated, consider using multi_heap_free() instead

**Parameters**
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void **multi_heap_free** (multi_heap_handle_t heap, void *p)

def() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void **multi_heap_realloc** (multi_heap_handle_t heap, void *p, size_t size)
 realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Return** New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

**Parameters**
• heap: Handle to a registered heap.
• p: NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
• size: Desired new size for buffer.

size_t **multi_heap_get_allocated_size** (multi_heap_handle_t heap, void *p)

Return the size that a particular pointer was allocated with.

**Return** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

**Parameters**
• heap: Handle to a registered heap.
• p: Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

**multi_heap_handle_t** **multi_heap_register** (void *start, size_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Return** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

**Parameters**
• start: Start address of the memory to use for a new heap.
• size: Size (in bytes) of the new heap.

void **multi_heap_set_lock** (multi_heap_handle_t heap, void *lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.
Parameters

- **heap**: Handle to a registered heap.
- **lock**: Optional pointer to a locking structure to associate with this heap.

```c
void multi_heap_dump (multi_heap_handle_t heap)
```

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters**

- **heap**: Handle to a registered heap.

```c
bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)
```

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAILPRINTF in multi_heap_platform.h.

**Return** true if heap is valid, false otherwise.

**Parameters**

- **heap**: Handle to a registered heap.
- **print_errors**: If true, errors will be printed to stderr.

```c
size_t multi_heap_free_size (multi_heap_handle_t heap)
```

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

**Return** Number of free bytes.

**Parameters**

- **heap**: Handle to a registered heap.

```c
size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)
```

Return the lifetime minimum free heap size.

Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returns the lifetime “low watermark” of possible values returned from multi_free_heap_size(), for the specified heap.

**Return** Number of free bytes.

**Parameters**

- **heap**: Handle to a registered heap.

```c
void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)
```

Return metadata about a given heap.

Fills a multi_heap_info_t structure with information about the specified heap.

**Parameters**

- **heap**: Handle to a registered heap.
- **info**: Pointer to a structure to fill with heap metadata.

**Structures**

```c
struct multi_heap_info_t
```

Structure to access heap metadata via multi_heap_get_info.
Public Members

size_t total_free_bytes
    Total free bytes in the heap. Equivalent to multi_free_heap_size().

size_t total_allocated_bytes
    Total bytes allocated to data in the heap.

size_t largest_free_block
    Size of the largest free block in the heap. This is the largest malloc-able size.

size_t minimum_free_bytes
    Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

size_t allocated_blocks
    Number of (variable size) blocks allocated in the heap.

size_t free_blocks
    Number of (variable size) free blocks in the heap.

size_t total_blocks
    Total number of (variable size) blocks in the heap.

Type Definitions

typedef struct multi_heap_info *multi_heap_handle_t
    Opaque handle to a registered heap.

2.7.12 Heap Memory Debugging

Overview

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the Heap Memory Allocation page.

Heap Information

To obtain information about the state of the heap:

- xPortGetFreeHeapSize() is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling heap_caps_get_free_size(MALLOC_CAP_8BIT).
- heap_caps_get_free_size() can also be used to return the current free memory for different memory capabilities.
- heap_caps_get_largest_free_block() can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- xPortGetMinimumEverFreeHeapSize() and the related heap_caps_get_minimum_free_size() can be used to track the heap “low watermark” since boot.
- heap_caps_get_info() returns a multi_heap_info_t structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- heap_caps_print_heap_info() prints a summary to stdout of the information returned by heap_caps_get_info().
- heap_caps_dump() and heap_caps_dump_all() will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.
Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory.

Assertions The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL.

If a heap integrity assertion fails, a line will be printed like CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling heap_caps_check_integrity_all() or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Memory Allocation Failed Hook Users can use heap_caps_register_failed_alloc_callback() to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config - Heap Memory Debugging and select Abort if memory allocation fails option (see CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS).

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char* function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main()
{
    ...  
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}
```

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to heap_caps_check_integrity_all() or heap_caps_check_integrity_addr() in your code will help you pin down the exact time
that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.

- Based on the memory address which is being corrupted, you can use **JTAG debugging** to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function `- esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.

  - For buffer overflows, **heap tracing** in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See [Heap Tracing To Find Heap Corruption](#) for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.

  - Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

### Configuration

Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under **Component config** there is a menu **Heap memory debugging**. The setting `CONFIG_HEAP_CORRUPTION_DETECTION` can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.
Comprehensive This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

Crashes in Comprehensive Mode If an application crashes reading/writing an address related to 0xCECECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the xPortGetFreeHeapSize(), heap_caps_get_free_size(), or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.
**Standalone Mode**  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see `CONFIG_HEAP_TRACING_DEST`).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in internal RAM
...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller __0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.//blink.c:27
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.//blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller __0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.//blink.c:29
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.//blink.c:52
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.
In \texttt{HEAP_TRACE_LEAKS} mode, for each traced memory allocation which has not already been freed a line is printed with:

- \texttt{XX bytes} is the number of bytes allocated.
- \texttt{@ 0x...} is the heap address returned from \texttt{malloc}/\texttt{calloc}.
- \texttt{CPU x} is the CPU (0 or 1) running when the allocation was made.
- \texttt{ccount 0x...} is the \texttt{CCOUNT} (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- \texttt{caller 0x...} gives the call stack of the call to \texttt{malloc()}/\texttt{free()}, as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under \texttt{Heap Memory Debugging -\rightarrow Enable heap tracing -\rightarrow Heap tracing stack depth}. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each \texttt{heap_trace_record_t} record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

\textbf{Host-Based Mode}  
Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to \texttt{Component settings -\rightarrow Heap Memory Debugging -\rightarrow CONFIG_HEAP_TRACING_DEST} and select \texttt{Host-Based}.
- In the project configuration menu, navigate to \texttt{Component settings -\rightarrow Application Level Tracing -\rightarrow CONFIG_APPTRACE_DESTINATION} and select Trace memory.
- In the project configuration menu, navigate to \texttt{Component settings -\rightarrow Application Level Tracing -\rightarrow FreeRTOS SystemView Tracing} and enable \texttt{CONFIG_APPTRACE_SV_ENABLE}.
- Call the function \texttt{heap_trace_init_tohost()} early in the program, to initialize JTAG heap tracing module.
- Call the function \texttt{heap_trace_start()} to begin recording all \texttt{malloc}/\texttt{free}s in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like \texttt{HEAP_TRACE_ALL} was passed: all allocations and deallocations are sent to the host.
- Call the function \texttt{heap_trace_stop()} to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"

... void app_main()
{
    ... 
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ... 
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACELeaks) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```
To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

### Note
In order to use this feature you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

   ```
   target remote :3333
   mon reset halt
   flushregs
   tb heap_trace_start
   commands
   mon esp sysview start file:///tmp/heap.svdat
   c
   tb heap_trace_stop
   commands
   mon esp sysview stop
   end
   c
   ```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command `xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:

```plaintext
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '/tmp/heap.svdat'...

Heap Tracing To Find Heap Corruption

Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact

Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks

Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses `stdio` - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- components/heap/include/esp_heap_trace.h
Chapter 2. API 参考

Functions

`esp_err_t heap_trace_init_standalone (heap_trace_record_t *record_buffer, size_t num_records)`

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);`

Return

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

Parameters

- `record_buffer`: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- `num_records`: Size of the heap trace buffer, as number of record structures.

`esp_err_t heap_trace_init_tohost (void)`

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

Return

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

`esp_err_t heap_trace_start (heap_trace_mode_t mode)`

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

Note heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

Note Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

Return

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

Parameters

- `mode`: Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

`esp_err_t heap_trace_stop (void)`

Stop heap tracing.

Return

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped..

`esp_err_t heap_trace_resume (void)`

Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

Return

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

`size_t heap_trace_get_count (void)`

Return number of records in the heap trace buffer.
It is safe to call this function while heap tracing is running.

```c
esp_err_t heap_trace_get(size_t index, heap_trace_record_t *record)
```

Return a raw record from the heap trace buffer.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not initialised.
- ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
- ESP_OK Record returned successfully.

**Parameters**
- `index`: Index (zero-based) of the record to return.
- `record`: Record where the heap trace record will be copied.

```c
void heap_trace_dump(void)
```

Dump heap trace record data to stdout.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

**Structures**

```c
struct heap_trace_record_t
```

Trace record data type. Stores information about an allocated region of memory.

**Public Members**

```c
uint32_t ccount
```

C_COUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

```c
void *address
```

Address which was allocated.

```c
size_t size
```

Size of the allocation.

```c
void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
```

Call stack of the caller which allocated the memory.

```c
void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
```

Call stack of the caller which freed the memory (all zero if not freed.)

**Macros**

```c
CONFIG_HEAP_TRACING_STACK_DEPTH
```

**Enumerations**

```c
enum heap_trace_mode_t
```

Values:
- `HEAP_TRACE_ALL`
- `HEAP_TRACE_LEAKS`

---

**2.7.13 High Resolution Timer**

**Overview**

Although FreeRTOS provides software timers, these timers have a few limitations:
• Maximum resolution is equal to RTOS tick period
• Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the `CONFIG_ESP_TIMER_INTERRUPT_LEVEL` option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

Internally, `esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

• To create a timer, call `esp_timer_create()`.  
• To delete the timer when it is no longer needed, call `esp_timer_delete()`.  

The timer can be started in one-shot mode or in periodic mode.

• To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.  
• To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.
Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

**Callback functions**

Callback functions should be kept as short as possible otherwise it will affect all timers.

Timer callbacks which are processed by `ESP_TIMER_ISR` method should not call the context switch call `- portYIELD_FROM_ISR()`. Instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

**esp_timer during the light sleep**

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with `skip_unhandled_events` option will not wake up the system.

**Handling callbacks**

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

**Obtaining Current Time**

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday()` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

**Application Example**

The following example illustrates usage of `esp_timer` APIs: system/esp_timer.
API Reference

Header File
- components/esp_timer/include/esp_timer.h

Functions

- **esp_err_t esp_timer_early_init (void)**
  Minimal initialization of esp_timer.
  
  This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

  **Note** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

  **Return**
  - ESP_OK on success

- **esp_err_t esp_timer_init (void)**
  Initialize esp_timer library.

  **Note** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

  **Return**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if allocation has failed
  - ESP_ERR_INVALID_STATE if already initialized
  - other errors from interrupt allocator

- **esp_err_t esp_timer_deinit (void)**
  De-initialize esp_timer library.

  **Note** Normally this function should not be called from applications

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if not yet initialized

- **esp_err_t esp_timer_create (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)**
  Create an esp_timer instance.

  **Note** When done using the timer, delete it with esp_timer_delete function.

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if some of the create_args are not valid
  - ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
  - ESP_ERR_INVALID_STATE if memory allocation fails

  **Parameters**
  - create_args: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
  - [out] out_handle: Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

- **esp_err_t esp_timer_start_once (esp_timer_handle_t timer, uint64_t timeout_us)**
  Start one-shot timer.

  Timer should not be running when this function is called.

  **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if the handle is invalid
  - ESP_ERR_INVALID_STATE if the timer is already running

  **Parameters**
Chapter 2. API

- timer: timer handle created using esp_timer_create
- timeout_us: timer timeout, in microseconds relative to the current moment

\[
\text{esp_err_t esp_timer_start_periodic}(\text{esp_timer_handle_t timer, uint64_t period})
\]

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every \( \text{period} \) microseconds.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

Parameters

- timer: timer handle created using esp_timer_create
- period: timer period, in microseconds

\[
\text{esp_err_t esp_timer_stop}(\text{esp_timer_handle_t timer})
\]

Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

Parameters

- timer: timer handle created using esp_timer_create

\[
\text{esp_err_t esp_timer_delete}(\text{esp_timer_handle_t timer})
\]

Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running

Parameters

- timer: timer handle allocated using esp_timer_create

\[
\text{int64_t esp_timer_get_time}(\text{void})
\]

Get time in microseconds since boot.

Return number of microseconds since underlying timer has been started

\[
\text{int64_t esp_timer_get_next_alarm}(\text{void})
\]

Get the timestamp when the next timeout is expected to occur.

Return Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

\[
\text{int64_t esp_timer_get_next_alarm_for_wake_up}(\text{void})
\]

Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

Return Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

\[
\text{esp_err_t esp_timer_get_period}(\text{esp_timer_handle_t timer, uint64_t *period})
\]

Get the period of a timer.

This function fetches the timeout period of a timer.

Note The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
Parameters
- **timer**: timer handle allocated using esp_timer_create
- **period**: memory to store the timer period value in microseconds

```c
esp_err_t esp_timer_get_expiry_time(esp_timer_handle_t timer, uint64_t* expiry)
```

Get the expiry time of a one-shot timer.

**Note** This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

**Return**
- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if the arguments are invalid
- **ESP_ERR_NOT_SUPPORTED** if the timer type is periodic

**Parameters**
- **timer**: timer handle allocated using esp_timer_create
- **expiry**: memory to store the timeout value in microseconds

```c
esp_err_t esp_timer_dump(FILE* stream)
```

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

```
name period alarm_time times_armed times_triggered total_callback_run_time
```

where:

- **name**: timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer
- **period**: period of timer, in microseconds, or 0 for one-shot timer
- **alarm_time**: time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

- **times_armed**: number of times the timer was armed via esp_timer_start_X
- **times_triggered**: number of times the callback was called
- **total_callback_run_time**: total time taken by callback to execute, across all calls

**Return**
- **ESP_OK** on success
- **ESP_ERR_NO_MEM** if cannot allocate temporary buffer for the output

**Parameters**
- **stream**: stream (such as stdout) to dump the information to

```c
bool esp_timer_is_active(esp_timer_handle_t timer)
```

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Return**
- **1** if timer is still active
- **0** if timer is not active.

**Parameters**
- **timer**: timer handle created using esp_timer_create

**Structures**

```c
struct esp_timer_create_args_t
```

Timer configuration passed to esp_timer_create.
Public Members

```c
struct esp_timer_cb_t
{
    Function to call when timer expires.

    void *arg
    Argument to pass to the callback.

    esp_timer_dispatch_t dispatch_method
    Call the callback from task or from ISR.

    const char *name
    Timer name, used in esp_timer_dump function.

    bool skip_unhandled_events
    Skip unhandled events for periodic timers.
```

Type Definitions

```c
typedef struct esp_timer *esp_timer_handle_t

Opaque type representing a single esp_timer.

typedef void (*esp_timer_cb_t)(void *arg)

Timer callback function type.
```

Parameters

- **arg**: pointer to opaque user-specific data

Enumerations

```c
enum esp_timer_dispatch_t

Method for dispatching timer callback.

Values:

ESP_TIMER_TASK
    Callback is called from timer task.

ESP_TIMER_MAX
    Count of the methods for dispatching timer callback.
```

2.7.14 The himem allocation API

Overview

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.

In order to use the himem API, you have to enable it in the menuconfig using `CONFIG_SPIRAM_BANKSWITCH_ENABLE`, as well as set the amount of banks reserved for this in `CONFIG_SPIRAM_BANKSWITCH_RESERVE`. This decreases the amount of external memory allocated by functions like `malloc()`, but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.
Example

An example doing a simple memory test of the high memory range is available in esp-idf: `system/himem`

API Reference

Header File

- `components/esp_hw_support/include/soc/esp32/himem.h`

Functions

`esp_err_t esp_himem_alloc(size_t size, esp_himem_handle_t *handle_out)`

Allocate a block in high memory.

Return - ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- `size`: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_alloc_map_range(size_t size, esp_himem_rangehandle_t *handle_out)`

Allocate a memory region to map blocks into.

This allocates a contiguous CPU memory region that can be used to map blocks of physical memory into.

Return - ESP_OK if successful
  - ESP_ERR_NO_MEM if out of memory or address space
  - ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- `size`: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- `[out] handle_out`: Handle to be returned

`esp_err_t esp_himem_map(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)`

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

Note The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

Return - ESP_OK if the memory could be mapped
  - ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
  - ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
  - ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

Parameters
- `handle`: Handle to the block of memory, as given by esp_himem_alloc
- `range`: Range handle to map the memory in
- `ram_offset`: Offset into the block of physical memory of the block to map
- `range_offset`: Offset into the address range where the block will be mapped
- `len`: Length of region to map
- `flags`: One of ESP_HIMEM_MAPFLAG_*
- `[out] out_ptr`: Pointer to variable to store resulting memory pointer in

`esp_err_t esp_himem_free(esp_himem_handle_t handle)`

Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.
Chapter 2. API Reference

Return - ESP_OK if the memory is successfully freed
  • ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

Parameters
  • handle: Handle to the block of memory, as given by esp_himem_alloc

`esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)`
Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

Return - ESP_OK if the memory is successfully freed
  • ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

Parameters
  • handle: Handle to the block range, as given by esp_himem_alloc_map_range

`esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)`
Unmap a region.

Return - ESP_OK if the memory is successfully unmapped,
  • ESP_ERR_INVALID_ARG if ptr or len are invalid.

Parameters
  • range: Range handle
  • ptr: Pointer returned by esp_himem_map
  • len: Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

`size_t esp_himem_get_phys_size (void)`
Get total amount of memory under control of himem API.

Return Amount of memory, in bytes

`size_t esp_himem_get_free_size (void)`
Get free amount of memory under control of himem API.

Return Amount of free memory, in bytes

`size_t esp_himem_reserved_area_size (void)`
Get amount of SPI memory address space needed for bankswitching.

Note This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is used, no memory is reserved.

Return Amount of reserved area, in bytes

Macros

`ESP_HIMEM_BLK_SZ`
`ESP_HIMEM_MAPFLAG_RO`
Indicates that a mapping will only be read from. Note that this is unused for now.

Type Definitions

typedef struct esp_himem_ramdata_t *esp_himem_handle_t

typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t

2.7.15 Inter-Processor Call

Note: The IPC is an Inter-Processor Call and NOT Inter-Process Communication as found on other operating systems.
Overview

Due to the dual core nature of the ESP32, there are instances where a certain callback must be run in the context of a particular CPU such as:

• When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU’s interrupt source as well).
• On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
• Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see High-Level Interrupts for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

IPC in Task Context

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU’s IPC task.

When using IPCs in a task context, users need to consider the following:

• IPC callbacks should ideally be simple and short. An IPC callback should avoid attempting to block or yield.
• The IPC tasks are created at the highest possible priority (i.e., configMAX_PRIORITIES – 1) thus the callback should also run at that priority as a result. However, CONFIG_ESP_IPC_USES_CALLERS_PRIORITY is enabled by default which will temporarily lower the priority of the target CPU’s IPC task to the calling CPU before executing the callback.
• Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via CONFIG_ESP_IPC_TASK_STACK_SIZE.
• The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

API Usage Task Context IPC callbacks have the following restrictions:

• The callback must be of type void func(void *arg)
• The callback should avoid attempting to block or yielding as this will result in the target CPU’s IPC task blocking or yielding.
• The callback must avoid changing any aspect of the IPC task (e.g., by calling vTaskPrioritySet(NULL, x)).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback’s execution has completed, or return immediately once the callback’s execution has started.

• esp_ipc_call() will trigger an IPC call on the target CPU. This function will block until the target CPU’s IPC task begins execution of the callback.
• esp_ipc_call_blocking() will trigger an IPC on the target CPU. This function will block until the target CPU’s IPC task completes execution of the callback.

IPC in ISR Context

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a High Priority Interrupt context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt context.
Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` option.

**When the callback executes:**
- The calling CPU will disable interrupts of level 3 and lower.
- Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

**API Usage**  
High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly.
- The callback is invoked via the `CALLX0` instruction with register windowing disabled, thus the callback:
  - Must not call any register window related instructions (e.g., `entry` and `retw`).
  - Must not call other C functions as register windowing is disabled.
- The callback should be placed in IRAM at a 4-byte aligned address.
- (On invocation of/after returning from) the callback, the registers `a2`, `a3`, `a4` are (saved/restored) automatically thus:
  - `a2` will contain the `void *arg` of the callback
  - `a3/a4` are free to use as scratch registers.

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU’s cycle count.

```c
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
// use only a2, a3 and a4 regs here.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret

unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void *)__wcs_cycle_count);
```

**Note:** The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the `system/ipc/ipc_isr`.
Chapter 2. API 参考

For more examples of High Priority Interrupt IPC callbacks, see components/esp_system/port/arch/xtensa/esp_ipc_isr_routines.S and components/esp_system/test/test_ipc_isr.S

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.
- `esp_ipc_isr_release_other_cpu()` resumes the target CPU.

### API Reference

#### Header File

- components/esp_system/include/esp_ipc.h

#### Functions

- **`esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`**
  
  Execute a callback on a given CPU.
  
  Execute a given callback on a particular CPU. The callback must be of type `esp_ipc_func_t` and will be invoked in the context of the target CPU’s IPC task.
  
  - This function will block the target CPU’s IPC task has begun execution of the callback
  - If another IPC call is ongoing, this function will block until the ongoing IPC call completes
  - The stack size of the IPC task can be configured via the `CONFIG_ESP_IPC_TASK_STACK_SIZE` option
  
  **Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

  **Return**
  
  - ESP_ERR_INVALID_ARG if cpu_id is invalid
  - ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
  - ESP_OK otherwise

- **`esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`**
  
  Execute a callback on a given CPU until and block until it completes.
  
  This function is identical to esp_ipc_call() except that this function will block until the execution of the callback completes.
  
  **Note** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

  **Return**
  
  - ESP_ERR_INVALID_ARG if cpu_id is invalid
  - ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
  - ESP_OK otherwise

- **`typedef void (*esp_ipc_func_t)(void *arg)`**

  IPC Callback.
A callback of this type should be provided as an argument when calling esp_ipc_call() or esp_ipc_call_blocking().

**Header File**

- components/esp_system/include/esp_ipc_isr.h

**Functions**

```c
void esp_ipc_isr_init (void)
```

Initialize the IPC ISR feature.

This function initializes the IPC ISR feature and must be called before any other esp_ipc_isr...() functions. The IPC ISR feature allows for callbacks (written in assembly) to be run on a particular CPU in the context of a High Priority Interrupt.

- This function will register a High Priority Interrupt on each CPU. The priority of the interrupts is dependent on the CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL option.
- Callbacks written in assembly can then run in context of the registered High Priority Interrupts
- Callbacks can be executed by calling esp_ipc_isr_asm_call() or esp_ipc_isr_asm_call_blocking()

```c
void esp_ipc_isr_asm_call (esp_ipc_isr_func_t func, void *arg)
```

Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

**Note** This function is not available in single-core mode.

**Parameters**

- [in] func: Pointer to a function of type void func(void* arg) to be executed
- [in] arg: Arbitrary argument of type void* to be passed into the function

```c
void esp_ipc_isr_asm_call_blocking (esp_ipc_isr_func_t func, void *arg)
```

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

**Note** This function is not available in single-core mode.

**Parameters**

- [in] func: Pointer to a function of type void func(void* arg) to be executed
- [in] arg: Arbitrary argument of type void* to be passed into the function

```c
void esp_ipc_isr_stall_other_cpu (void)
```

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

- This function is internally implemented using IPC ISR
- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

**Note** This function is not available in single-core mode.

```c
void esp_ipc_isr_release_other_cpu (void)
```

Release the other CPU.

This function will release the other CPU that was previously stalled from calling esp_ipc_isr_stall_other_cpu() (void)

- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

**Note** This function is not available in single-core mode.
void esp_ipc_isr_stall_pause (void)

    Pause the CPU stall feature.

    This function will pause the CPU stall feature. Once paused, calls to esp_ipc_isr_stall_other_cpu() and
    esp_ipc_isr_release_other_cpu() will have no effect. If a IPC ISR call is already in progress, this function
    will busy-wait until the call completes before pausing the CPU stall feature.

void esp_ipc_isr_stall_abort (void)

    Abort a CPU stall.

    This function will abort any stalling routine of the other CPU due to a previous call to
    esp_ipc_isr_stall_other_cpu(). This function aborts the stall in a non-recoverable manner, thus should
    only be called in case of a panic().

        • This function is used in panic handling code

void esp_ipc_isr_stall_resume (void)

    Resume the CPU stall feature.

    This function will resume the CPU stall feature that was previously paused by calling esp_ipc_isr_stall_pause().
    Once resumed, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have effect
    again.

Type Definitions

typedef void (*esp_ipc_isr_func_t)(void *arg)

    IPC ISR Callback.

    A callback of this type should be provided as an argument when calling esp_ipc_isr_asm_call() or
    esp_ipc_isr_asm_call_blocking().

2.7.16 Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this
mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage
such as printf. The given function can be called inside the shared stack space which is a callback function deferred
by calling esp_execute_shared_stack_function(), passing that function as parameter

Usage

esp_execute_shared_stack_function() takes four arguments:

        • a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
        • a pointer to the top of stack used for that function
        • the size of stack in bytes
        • a pointer to the shared stack function

The user defined function will be deferred as a callback and can be called using the user allocated space without
taking space from current task stack.

The usage may look like the code below:

void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{ 
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                       shared_stack,
                                       8192,
                                       external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}

API Reference

Header File

- components/esp_system/include/esp_expression_with_stack.h

Functions

`void esp_execute_shared_stack_function(SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)`

Calls user defined shared stack space function.

**Note** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

**Parameters**

- `lock`: Mutex object to protect in case of shared stack
- `stack`: Pointer to user allocated stack
- `stack_size`: Size of current stack in bytes
- `function`: Pointer to the shared stack function to be executed

Macros

`ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)`

Type Definitions

`typedef void(*shared_stack_function)(void)`

2.7.17 Interrupt allocation

Overview

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The `esp_intr_alloc()` abstraction exists to hide all these implementation details.
A driver can allocate an interrupt for a certain peripheral by calling `esp_intr_alloc()` (or `esp_intr_alloc_intrstatus()`). It can use the flags passed to this function to set the type of interrupt allocated, specifying a specific level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code has two different types of interrupts it handles differently: Shared interrupts and non-shared interrupts. The simplest of the two are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering it, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to see if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts (because of the chance of missed interrupts when edge interrupts are used.) (The logic behind this: DevA and DevB share an int. DevB signals an int. Int line goes high. ISR handler calls code for DevA -> does nothing. ISR handler calls code for DevB, but while doing that, DevA signals an int. ISR DevB is done, clears int for DevB, exits interrupt code. Now an interrupt for DevA is still pending, but because the int line never went low (DevA kept it high even when the int for DevB was cleared) the interrupt is never serviced.)

**Multicore issues**

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

**Internal peripheral interrupts** Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in `esp_intr_alloc.h` as `ETS_INTERNAL_*_INTR_SOURCE.`

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have e.g. an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts** The remaining interrupt sources are from external peripherals. These are defined in `soc/soc.h` as `ETS_*_INTR_SOURCE.`

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.
IRAM-Safe Interrupt Handlers

The ESP_INTR_FLAG_IRAM flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the SPI flash API documentation for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the ESP_INTR_FLAG_SHARED flag. They’ll be all allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist 2 ways to stop an interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles the enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits should always be masked before the handler responsible for it is disabled, or the status should be handled in other enabled interrupt properly. You may leave some status bits unhandled if you just disable one of all the handlers without masking the status bits, which causes the interrupt to trigger infinitely resulting in a system crash.

API Reference

Header File

• components/esp_hw_support/include/esp_intr_alloc.h

Functions

esp_err_t esp_intr_mark_shared (int intno, int cpu, bool is_in_iram)
Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

Return ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

Parameters

• intno: The number of the interrupt (0-31)
• cpu: CPU on which the interrupt should be marked as shared (0 or 1)
• is_in_iram: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

esp_err_t esp_intr_reserve (int intno, int cpu)
Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

Return ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

Parameters

• intno: The number of the interrupt (0-31)
• cpu: CPU on which the interrupt should be marked as shared (0 or 1)

esp_err_t esp_intr_alloc (int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)
Allocate an interrupt with the given parameters.
This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**Parameters**

- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_alloc_intrstatus(int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)
```

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

**Parameters**

- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg**: The address of an interrupt status register
- **intrstatusmask**: A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_free(intr_handle_t handle)
```

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt,
blocking and waiting until the resource is successfully released.

**Note** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. See `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

**Return** ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

```c
int esp_intr_get_cpu (intr_handle_t handle)
```
Get CPU number an interrupt is tied to.

**Return** The core number where the interrupt is allocated

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

```c
int esp_intr_get_intno (intr_handle_t handle)
```
Get the allocated interrupt for a certain handle.

**Return** The interrupt number

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

```c
esp_err_t esp_intr_disable (intr_handle_t handle)
```
Disable the interrupt associated with the handle.

**Note**
1. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

```c
esp_err_t esp_intr_enable (intr_handle_t handle)
```
Enable the interrupt associated with the handle.

**Note** For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

```c
esp_err_t esp_intr_set_in_iram (intr_handle_t handle, bool is_in_iram)
```
Set the “in IRAM” status of the handler.

**Note** Does not work on shared interrupts.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- `handle`: The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- `is_in_iram`: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

```c
void esp_intr_noniram_disable (void)
```
Disable interrupts that aren’t specifically marked as running from IRAM.

```c
void esp_intr_noniram_enable (void)
```
Re-enable interrupts disabled by `esp_intr_noniram_disable`.

```c
void esp_intr_enable_source (int inum)
```
enable the interrupt source based on its number

**Parameters**
void esp_intr_disable_source (int inum)
  disable the interrupt source based on its number

Parameters
  • inum: interrupt number from 0 to 31

static int esp_intr_flags_to_level (int flags)
  Get the lowest interrupt level from the flags.

Parameters
  • flags: The same flags that pass to esp_intr_alloc_intrstatus API

Macros

ESP_INTR_FLAG_LEVEL1
  Interrupt allocation flags. These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
  Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
  Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4
  Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5
  Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6
  Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI
  Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
  Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
  Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
  ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
  Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
  Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
  High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
  Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
  Platform timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.
ETS_INTERNAL_TIMER1_INTR_SOURCE
Platform timer 1 interrupt source.

ETS_INTERNAL_TIMER2_INTR_SOURCE
Platform timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly.

ESP_INTR_ENABLE(inum)
Enable interrupt by interrupt number

ESP_INTR_DISABLE(inum)
Disable interrupt by interrupt number

Type Definitions

typedef void(*intr_handler_t)(void *arg)
Function prototype for interrupt handler function

typedef struct intr_handle_data_t intr_handle_data_t
Interrupt handler associated data structure

typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler

2.7.18 Logging library

Overview

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.

- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Vrbose (highest)

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).
Chapter 2. API 参考

How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char * TAG = "MyModule";
```

Then use one of the logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_ - — 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- ESP_LOGE - error (lowest)
- ESP_LOGW - warning
- ESP_LOGI - info
- ESP_LOGD - debug
- ESP_LOGV - verbose (highest)

Additionally, there are ESP_EARLY_LOGx versions for each of these macros, e.g. ESP_EARLY_LOGE. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP_EARLY_LOGx macros.

There are also ESP_DRAM_LOGx versions for each of these macros, e.g. ESP_DRAM_LOGE. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

注解：Inside critical sections interrupts are disabled so it’s only possible to use ESP_DRAM_LOGx (preferred) or ESP_EARLY_LOGx. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```c
target_compile_definitions($(COMPONENT_LIB) PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_ ...
-VERBOSE")
```

To configure logging output per module at runtime, add calls to the function esp_log_level_set() as follows:

```c
esp_log_level_set("*", ESP_LOG_ERROR);  // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN);  // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO);  // enable INFO logs from DHCP client
```

注解：The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling esp_log_level("*", level).

Logging to Host via JTAG By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section 记录日志到主机.
Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

API Reference

Header File

- components/log/include/esp_log.h

Functions

void esp_log_level_set (const char *tag, esp_log_level_t level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

**Note** Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

**Parameters**

- **tag**: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "*" resets log level for all tags to the given value.
- **level**: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

esp_log_level_t esp_log_level_get (const char *tag)

Get log level for a given tag, can be used to avoid expensive log statements.

**Return** The current log level for the given tag

**Parameters**

- **tag**: Tag of the log to query current level. Must be a non-NULL zero terminated string.

vprintf_like_t esp_log_set_vprintf (vprintf_like_t func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Note** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

**Return** func old Function used for output.

**Parameters**

- **func**: new Function used for output. Must have same signature as vprintf.

uint32_t esp_log_timestamp (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Return** timestamp, in milliseconds

char *esp_log_system_timestamp (void)

Function which returns system timestamp to be used in log output.
This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

Return timestamp, in “HH:MM:SS.sss”

```c
uint32_t esp_log_early_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

Return timestamp, in milliseconds

```c
void esp_log_write (esp_log_level_t level, const char *tag, const char *format, ...)
```

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

```c
void esp_log_writev (esp_log_level_t level, const char *tag, const char *format, va_list args)
```

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See esp_log_write()

**Macros**

**ESP_LOG_BUFFER_HEX_LEVEL**(tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

**Parameters**

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOG_BUFFER_CHAR_LEVEL**(tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

**Parameters**

- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOG_BUFFER_HEXDUMP**(tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```
W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74
    |ESP32 is great, |
W (195) log_example: 0x3ffb4290 77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20
    |working along wi|
W (205) log_example: 0x3ffb42a0 74 68 62 74 68 65 20 49 44 46 2e 00
    |th the IDF...|
```

It is highly recommended to use terminals with over 102 text width.
### Parameters
- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes
- **level**: level of the log

**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)
Log a buffer of hex bytes at Info level.

See [esp_log_buffer_hex_level](#)

**Parameters**
- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes

**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)
Log a buffer of characters at Info level. Buffer should contain only printable characters.

See [esp_log_buffer_char_level](#)

**Parameters**
- **tag**: description tag
- **buffer**: Pointer to the buffer array
- **buff_len**: length of buffer in bytes

**portGET_ARGUMENT_COUNT_INNER** (zero, one, count, ...)
Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See [printf, ESP_LOGE, ESP_DRAM_LOGE](#)

**ESP_EARLY_LOGE** (tag, format, ...)
In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT()`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_WARN level.

See [ESP_EARLY_LOGE, ESP_LOGE, printf](#)

**ESP_EARLY_LOGI** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_INFO level.

See [ESP_EARLY_LOGE, ESP_LOGE, printf](#)

**ESP_EARLY_LOGD** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_DEBUG level.

See [ESP_EARLY_LOGE, ESP_LOGE, printf](#)

**ESP_EARLY_LOGV** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_VERBOSE level.

See [ESP_EARLY_LOGE, ESP_LOGE, printf](#)

**_ESP_LOG_EARLY_ENABLED** (log_level)

**ESP_LOG_EARLY_IMPL** (tag, format, log_level, log_tag_letter, ...)

**ESP_LOGE** (tag, format, ...)

**ESP_LOGW** (tag, format, ...)

**ESP_LOGI** (tag, format, ...)

**ESP_LOGD** (tag, format, ...)
ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)

Runtime macro to output logs at a specified level.

See printf

Parameters

- `tag`: tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- `level`: level of the output log.
- `format`: format of the output log. See printf
- `...`: variables to be replaced into the log. See printf

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)

Runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.

See printf, ESP_LOG_LEVEL

ESP_DRAM_LOGE (tag, format, ...)

Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage: ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...), where TAG is a char* that points to a str in the DRAM.

Note Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

See ESP_EARLY_LOGE, the log level cannot be changed per-tag, however esp_log_level_set("*", level) will set the default level which controls these log lines also.

Note Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

See esp_rom_printf, ESP_LOGE

ESP_DRAM_LOGW (tag, format, ...)

Macro to output logs when the cache is disabled at ESP_LOG_WARN level.

See ESP_DRAM_LOGW, ESP_LOGW, esp_rom_printf

ESP_DRAM_LOGI (tag, format, ...)

Macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See ESP_DRAM_LOGI, ESP_LOGI, esp_rom_printf

ESP_DRAM_LOGD (tag, format, ...)

Macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See ESP_DRAM_LOGD, ESP_LOGD, esp_rom_printf

ESP_DRAM_LOGV (tag, format, ...)

Macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See ESP_DRAM_LOGV, ESP_LOGV, esp_rom_printf

Type Definitions

typedef int (*vprintf_like_t)(const char *, va_list)

Enumerations

enum esp_log_level_t

Log level.

Values:

ESP_LOG_NONE

No log output
ESP_LOG_ERROR
Critical errors, software module cannot recover on its own

ESP_LOG_WARN
Error conditions from which recovery measures have been taken

ESP_LOG_INFO
Information messages which describe normal flow of events

ESP_LOG_DEBUG
Extra information which is not necessary for normal use (values, pointers, sizes, etc).

ESP_LOG_VERBOSE
Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.7.19 Miscellaneous System APIs

Software reset

To perform software reset of the chip, \textit{esp_restart()} function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, \textit{esp_register_shutdown_handler()} function is provided to register a routine which needs to be called prior to restart (when done by \textit{esp_restart()}). This is similar to the functionality of \texttt{atexit} POSIX function.

Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call \textit{esp_reset_reason()} function. See description of \textit{esp_reset_reason_t} for the list of possible reset reasons.

Heap memory

Two heap memory related functions are provided:

- \textit{esp_get_free_heap_size()} returns the current size of free heap memory
- \textit{esp_get_minimum_free_heap_size()} returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using \texttt{malloc} family of functions. For further information about heap memory see \textit{Heap Memory Allocation}.

MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), call the function \textit{esp_read_mac()} function.

In ESP-IDF these addresses are calculated from a single \textit{Base MAC address}. By default, the Espressif base MAC address is used. This MAC is pre-programmed into ESP32 eFuse from the factory.
Chapter 2. API 参考

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC address (4 universally administered, default)</th>
<th>MAC address (2 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td>base_mac</td>
<td>base_mac</td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td>base_mac, +1 to the last octet</td>
<td>Local MAC derived from Wi-Fi Station MAC</td>
</tr>
<tr>
<td>Bluetooth</td>
<td>base_mac, +2 to the last octet</td>
<td>base_mac, +1 to the last octet</td>
</tr>
<tr>
<td>Ethernet</td>
<td>base_mac, +3 to the last octet</td>
<td>Local MAC (derived from Bluetooth MAC)</td>
</tr>
</tbody>
</table>

注解：The default configuration is 4 universally administered MAC addresses, and this is recommended when using Espressif-provided MAC addresses.

**Custom Base MAC**  The default Base MAC is pre-programmed by Espressif in eFuse BLK0. To set a custom Base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Configure the option `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC, according to the table above.

注解：It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface, after network initialization. It’s recommended to use the Base MAC approach documented here instead, to avoid the possibility of the original MAC address briefly appearing on the network before it is changed.

**Custom MAC address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others ---valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

注解：If the 3/4 coding scheme is enabled, all eFuse fields in this block must be burnt at the same time.

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Local vs Universal MAC addresses** ESP32 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The specific calculations to derive an interface’s MAC address from the base MAC address is shown in the table above.

When using a custom MAC address scheme, it’s possible that not all interfaces can be assigned a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network, only.

See this article for the definition of local and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:
1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (meaning: the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

Chip version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

SDK version

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```c
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
  // enable functionality present in IDF v4.0
#endif
```

App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set `PROJECT_VER` variable in your project CMakeLists.txt/Makefile:

- In application CMakeLists.txt put `set(PROJECT_VER "0.1.0.1")` before including project. cmake.

If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise, if `PROJECT_VER` variable is not set in the project then it will be retrieved from either `$(PROJECT_PATH)/version.txt` file (if present) else using `git describe` command. If neither is available then `PROJECT_VER` will be set to “1”. Application can make use of this by calling `esp_ota_get_app_description()` or `esp_ota_get_partition_description()` functions.

API Reference

**Header File**

- components/esp_system/include/esp_system.h

**Functions**
### Chapter 2. API 参考

```c
esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)
```

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

**Parameters**

- `handle`: function to execute on restart

```c
esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)
```

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

### void esp_restart (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

### esp_reset_reason_t esp_reset_reason (void)

Get reason of last reset.

**Return** See description of `esp_reset_reason_t` for explanation of each value.

### uint32_t esp_get_free_heap_size (void)

Get the size of available heap.

**Note** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available heap size, in bytes.

### uint32_t esp_get_free_internal_heap_size (void)

Get the size of available internal heap.

**Note** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available internal heap size, in bytes.

### uint32_t esp_get_minimum_free_heap_size (void)

Get the minimum heap that has ever been available.

**Return** Minimum free heap ever available

### void esp_system_abort (const char *details)

Trigger a software abort.

**Parameters**

- `details`: Details that will be displayed during panic handling.

### Type Definitions

```c
typedef void (*shutdown_handler_t)(void)
```

Shutdown handler type

### Enumerations

```c
enum esp_reset_reason_t
```

Reset reasons.

**Values:**
### Chapter 2. API 参考

**ESP_RST_UNKNOWN**
Reset reason can not be determined.

**ESP_RST_POWERON**
Reset due to power-on event.

**ESP_RST_EXT**
Reset by external pin (not applicable for ESP32)

**ESP_RST_SW**
Software reset via esp_restart.

**ESP_RST_PANIC**
Software reset due to exception/panic.

**ESP_RST_INT_WDT**
Reset (software or hardware) due to interrupt watchdog.

**ESP_RST_TASK_WDT**
Reset due to task watchdog.

**ESP_RST_WDT**
Reset due to other watchdogs.

**ESP_RST_DEEPSLEEP**
Reset after exiting deep sleep mode.

**ESP_RST_BROWNOUT**
Brownout reset (software or hardware)

**ESP_RST_SDIO**
Reset over SDIO.

### Header File

- components/esp_common/include/esp_idf_version.h

### Functions

```c
const char* esp_get_idf_version(void)
```

Return full IDF version string, same as `git describe` output.

**Note** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

**Return** constant string from IDF_VER

### Macros

**ESP_IDF_VERSION_MAJOR**
Major version number (X.x.x)

**ESP_IDF_VERSION_MINOR**
Minor version number (x.X.x)

**ESP_IDF_VERSION_PATCH**
Patch version number (x.x.X)

**ESP_IDF_VERSION_VAL** (major, minor, patch)
Macro to convert IDF version number into an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)

**ESP_IDF_VERSION**
Current IDF version, as an integer

To be used in comparisons, such as ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
2.7.20 空中升级 (OTA)

OTA 流程概览

OTA 升级机制可以让设备在固件正常运行时根据接收数据（如通过 Wi-Fi 或蓝牙）进行自我更新。

要运行 OTA 机制，需配置设备的 分区表，该分区表至少包含两个 OTA 应用程序分区（即 ota_0 和 ota_1）和一个 OTA 数据分区。

OTA 功能启动后，向前未用于启动的 OTA 应用程序写入新的应用固件镜像。镜像验证后，OTA 数据分区更新，指定在下一次启动时使用该镜像。

OTA 数据分区

所有使用 OTA 功能项目，其 分区表 必须包含一个 OTA 数据分区（类型为 data，子类型为 ota)。

工厂启动设置下，OTA 数据分区中应没有数据（所有字节填写成 0xFF）。如果分区表中有工厂应用程序，
ESP-IDF 软件引导加载程序会启动工厂应用程序。如果分区表中没有工厂应用程序，则启动第一个可用的
OTA 分区（通常是 ota_0)。

第一次 OTA 升级后，OTA 数据分区更新，指定下一次启动哪个 OTA 应用程序分区。

OTA 数据分区是两个 0x2000 字节大小的 flash 扇区，防止写入时电源故障引发问题。两个扇区单独擦除、
写入匹配数据，若存在不一致，则用计算器字段判断哪个扇区为最新数据。

应用程序回滚

应用程序回滚的主要目的是确保设备在更新后正常工作。如果新版应用程序出现严重错误，该功能可使
设备回滚到之前正常运行的应用版本。在使能回滚并且 OTA 升级应用程序至新版本后，可能出现的结果
如下:

• 应用程序运行正常，esp_ota_mark_app_valid_cancel_rollback() 将正在运行的应用程序
  状态标记为 ESP_OTA_IMG_VALID，启动此应用程序无限制。
• 应用程序出现严重错误，无法继续工作，必须回滚到此前的版本，
  esp_ota_mark_app_invalid_rollback_and_reboot() 将正在运行的版本标记为
  ESP_OTA_IMG_INVALID 然后复位。引导加载程序不会选取此版本，而是启动此前正常运行的版本。
• 如果CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 使能，则无需调用函数便可复位，回滚至之
  前的应用版本。

注解：应用程序的状态不是写到程序的二进制镜像，而是写到 otadata 分区。该分区有一个 ota_seq
计数器，该计数器是 OTA 应用分区的指针，指向下次启动时选取应用所在的分区 (ota_0, ota_1, …)。

应用程序 OTA 状态

状态控制了选取启动应用程序的过程：

<table>
<thead>
<tr>
<th>状态</th>
<th>引导加载程序选取启动应用程序的限制</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>没有限制，可以选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>只有分区表中存在分区时，可以选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>只有分区表中存在分区时，可以选取。</td>
</tr>
</tbody>
</table>
| ESP_OTA_IMG_ABORTED | 如使能 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE，则仅会选取一次。在
  引导加载程序中，状态立即变为 ESP_OTA_IMG_PENDING_VERIFY。 |
| ESP_OTA_IMG_PENDING_VERIFY | 如使能 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE，则不会选取。状态变
  为 “ESP_OTA_IMG_ABORTED”。 |

如果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 没有使能（默认情况），
则 esp_ota_mark_app_valid_cancel_rollback() 和 esp_ota_mark_app_invalid_rollback_and_reboot
为可选功能，ESP_OTA/img_new 和 ESP_OTA/img_pending_verify 不会使用。
Kconfig 中的 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 可以帮助用户追踪新版应用程序的第一次启动。应用程序需调用 `esp_ota_mark_app_valid_cancel_rollback()` 函数确认可以运行，否则将会在重启时滚回至旧版本。该功能可让用户在启动阶段控制应用程序的可操作性。新版应用程序仅有一次机会尝试是否能成功启动。

**回滚过程** `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能时，回滚过程如下：

- 新版应用程序下载成功，`esp_ota_set_boot_partition()` 函数将分区设为可启动，状态设为 `ESP OTA_IMG_NEW`。该状态表示应用程序为新版本，第一次启动需要监测。
- 重新启动 `esp_restart()`。
- 引导加载程序检查 `ESP OTA_IMG_PENDING_VERIFY` 状态，如有设置，则将其写入 `ESP OTA_IMG_ABORTED`。
- 引导加载程序选取一个新版应用程序来引导，这样应用程序状态就不会设置为 `ESP OTA_IMG_INVALID` 或 `ESP OTA_IMG_ABORTED`。
- 引导加载程序检查所选取的新版应用程序，若状态设置为 `ESP OTA_IMG_NEW`，则写入 `ESP OTA_IMG_PENDING_VERIFY`。该状态表示，需确认应用程序的可操作性，如不确认，发生重启，则状态会重写为 `ESP OTA_IMG_ABORTED` (见上文)，该应用程序不可再启动，将回滚至上一版本。
- 新版应用程序启动，应进行自测。
- 若通过自测，则必须调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，因为新版应用程序在等待确认其可操作性 (`ESP OTA_IMG_PENDING_VERIFY` 状态)。
- 若未通过自测，则调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，回滚至之前能正常工作的应用程序版本，同时将无效的新版应用程序设置为 `ESP OTA_IMG_INVALID`。
- 如果新版应用程序可操作性没有确认，则状态一直为 `ESP OTA_IMG_PENDING_VERIFY`。下次启动时，状态变更为 `ESP OTA_IMG_ABORTED`，阻止其再次启动，之后回滚到之前的版本。

**意外复位** 如果在新版应用第一次启动时发生断电或意外崩溃，则会回滚至之前正常运行的版本。

建议：尽快完成自测，防止因断电回滚。

只有 OTA 分区可以回滚。工厂分区不会回滚。

**启动无效/中止的程序** 用户可以启动此前设置为 `ESP OTA_IMG_INVALID` 或 `ESP OTA_IMG_ABORTED` 的应用程序:

- 获取最后一个无效分区 `esp_ota_get_last_invalid_partition()`。
- 将获取的分区传给 `esp_ota_set_boot_partition()`，更新 `otadata`。
- 重启 `esp_restart()`。引导加载程序会启动指定应用程序。

要确定是否在应用程序启动时进行自测，可以调用 `esp_ota_get_state_partition()` 函数。如果结果为 `ESP OTA_IMG_PENDING_VERIFY`，则需要自测，后续确认应用程序的可操作性。

**如何设置状态** 下文简单描述了如何设置应用程序状态：

- `ESP OTA_IMG_VALID` 由函数 `esp_ota_mark_app_valid_cancel_rollback()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能，`ESP OTA_IMG_UNDEFINED` 由函数 `esp_ota_set_boot_partition()` 设置。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 没有使能，`ESP OTA_IMG_NEW` 由函数 `esp_ota_set_boot_partition()` 设置。
- `ESP OTA_IMG_INVALID` 由函数 `esp_ota_mark_app_invalid_rollback_and_reboot()` 设置。
- 如果应用程序的可操作性无法确认，发生重启 (`CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能)，则设置 `ESP OTA_IMG_ABORTED`。
- 如果 `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` 使能，选取的应用程序状态为 `ESP OTA_IMG_NEW`，则在引导加载程序中设置 `ESP OTA_IMG_PENDING_VERIFY`。
防回滚

防回滚机制可以防止回滚到安全版本号低于芯片 eFuse 中烧录程序的应用程序版本。

设置 CONFIG_BOOTLOADER_APP_ANTIROLLBACK 启动防回滚机制。在引导加载程序中选取可启动的应用程序，会额外检查芯片和应用程序镜像的安全版本号。可启动固件中的应用安全版本号必须等于或高于芯片中的应用安全版本号。

CONFIG_BOOTLOADER_APP_ANTIROLLBACK 和 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 一起使用。此时，只有安全版本号等于或高于芯片中的应用安全版本号时才会回滚。

典型的防回滚机制

- 新发布的固件解决了此前版本的安全问题。
- 开发者在确保固件可以运行之后，增加安全版本号，发布固件。
- 下载新版应用程序。
- 运行函数 esp_ota_set_boot_partition()，将新版应用程序设为可启动。如果新版应用程序的安全版本号低于芯片中的应用安全版本号，新版应用程序会被擦除，无法更新到新固件。
- 重新启动。
- 在引导加载程序中选取安全版本号等于或高于芯片中应用安全版本号的应用程序。如果 odata 处于初始阶段，通过串行通道加载了安全版本号高于芯片中应用安全版本号的固件，则引导加载程序中 eFuse 的安全版本号会立即更新。
- 新版应用程序启动，之后进行可操作性检测。如果通过检测，则调用函数 esp_ota_mark_app_valid_cancel_rollback()，将应用程序标记为 ESP_OTA_IMG_VALID，更新芯片中应用程序的安全版本号。注意，如果调用函数 esp_ota_mark_app_invalid_rollback_and_reboot()，可能会因为设备中没有可启动的应用程序而回滚失败，返回 ESP_ERR_OTA_ROLLBACK_FAILED 错误，应用程序状态一直为 ESP_OTA_IMG_PENDING_VERIFY。
- 如果运行的应用程序处于 ESP_OTA_IMG_VALID 状态，则可再次更新。

建议：

如果想避免因服务器应用程序的安全版本号低于运行的应用程序，造成不必要的下载和擦除，必须从镜像的第一个包中获取 new_app_info.secure_version，和 eFuse 的安全版本号比较。如果 esp_efuse_check_secure_version(new_app_info.secure_version) 函数为真，则下载继续，反之则中断。

```c
bool image_header_was_checked = false;
while (1) { 
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }
                image_header_was_checked = true;
                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
    }
}
```

(下页继续)
```c
esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
```

**限制：**
- `secure_version` 字段最多有 32 位。也就是说，同个段最多可以做 32 次。用户可以使用`CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD`减少该 eFuse 字段的长度。
- 防回滚仅在 eFuse 编码机制设置为 NONE 时生效。
- 防回滚不支持工厂和测试分区，因此分区表中不应有设置为工厂或测试的分区。

**security_version:**
- 存储在应用程序镜像中的 esp_app_desc 里。版本号用`CONFIG_BOOTLOADER_APP_SECURE_VERSION`设置。
- ESP32 中版本号存储在 eFuse 的 EFUSE_BLK3_RDATA4_REG 里（若 eFuse 的位烧写为 1，则永远无法恢复为 0），寄存器设置了多少位，应用程序的安全版本号就为多少。

没有安全启动的安全 OTA 升级

即便硬件安全启动没有使能，也可验证已签名的 OTA 升级。可通过设置`CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`和`CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`实现。

具体可参考`Signed App Verification Without Hardware Secure Boot`。

### OTA 工具 (otatool.py)

`app_update` 组件中有 otatool.py 工具，用于在目标设备上完成下列 OTA 分区相关操作：
- 读取 otadata 分区 (read_otadata)
- 擦除 otadata 分区，将设备复位至工厂应用程序 (erase_otadata)
- 切换 OTA 分区 (switch_ota_partition)
- 擦除 OTA 分区 (erase_ota_partition)
- 写入 OTA 分区 (write_ota_partition)
- 读取 OTA 分区 (read_ota_partition)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用该 OTA 工具，或者从 Shell 脚本调用该 OTA 工具。前者可使用工具的 Python API，后者可使用命令行界面。

### Python API

首先，确保已导入 otatool 模块。

```python
import sys
import os

idf_path = os.environ['IDF_PATH']  # 从环境中获取 IDF_PATH 的值
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py 位于 ~$IDF_PATH/components/app_update 下

sys.path.append(otatool_dir)  # 使能 Python 寻找 otatool 模块
from otatool import *  # 导入 otatool 模块内的所有名称
```

要使用 OTA 工具的 Python API，第一步是创建 OtapoolTarget 对象：

```python
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = OtapoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 OtapoolTarget 在目标设备上完成操作：
# 擦除 odata，将设备复位至工厂应用程序
target.erase_otadata()

# 擦除 OTA 应用程序分区 0
target.erase_ota_partition(0)

# 将启动分区切换至 OTA 应用程序分区 1
target.switch_ota_partition(1)

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")

要操作的 OTA 分区通过应用程序分区序号或分区名称指定。
更多关于 Python API 的信息，请查看 OTA 工具的代码注释。

命令行界面  otatool.py 的命令行界面具有如下结构：

otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - 执行主命令（otatool.py）所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数

# 擦除 odata，将设备复位至工厂应用程序
otatool.py --port "/dev/ttyUSB1" erase_otadata

# 擦除 OTA 应用程序分区 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# 将启动分区切换至 OTA 应用程序分区 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin

更多信息可用 -help 指令查看：

# 显示可用的子命令和主命令描述
otatool.py --help

# 显示子命令的描述
otatool.py [subcommand] --help

应用程序示例

端对端的 OTA 固件升级示例请参考 system/ota。

API 参考

Header File
Chapter 2. API

• components/app_update/include/esp_ota_ops.h

**Functions**

```c
const esp_app_desc_t *esp_ota_get_app_description (void)
```

Return esp_app_desc structure. This structure includes app version.

Return description for running app.

```c
int esp_ota_get_app_elf_sha256 (char *dst, size_t size)
```

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

Return Number of bytes written to dst (including null terminator)

**Parameters**

- `dst`: Destination buffer
- `size`: Size of the buffer

```c
esp_err_t esp_ota_begin (const esp_partition_t *partition, size_t image_size, esp_ota_handle_t *out_handle)
```

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

Return

- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.

**Parameters**

- `partition`: Pointer to info for partition which will receive the OTA update. Required.
- `image_size`: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- `out_handle`: On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

```c
esp_err_t esp_ota_write (esp_ota_handle_t handle, const void *data, size_t size)
```

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

Return

- ESP_OK: Data was written to flash successfully.
Chapter 2. API 参考

- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**
- handle: Handle obtained from esp_ota_begin
- data: Data buffer to write
- size: Size of data buffer in bytes

```c
esp_err_t esp_ota_write_with_offset (esp_ota_handle_t handle, const void *data, size_t size, uint32_t offset)
```

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

**Note** While performing OTA, if the packets arrive out of order, esp_ota_write_with_offset() can be used to write data in non-contiguous manner. Use of esp_ota_write_with_offset() in combination with esp_ota_write() is not recommended.

**Return**
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**Parameters**
- handle: Handle obtained from esp_ota_begin
- data: Data buffer to write
- size: Size of data buffer in bytes
- offset: Offset in flash partition

```c
esp_err_t esp_ota_end (esp_ota_handle_t handle)
```

Finish OTA update and validate newly written app image.

**Note** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**
- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**
- handle: Handle obtained from esp_ota_begin().

```c
esp_err_t esp_ota_abort (esp_ota_handle_t handle)
```

Abort OTA update, free the handle and memory associated with it.

**Return**
- ESP_OK: Handle and its associated memory is freed successfully.
- ESP_ERR_NOT_FOUND: OTA handle was not found.

**Parameters**
- handle: obtained from esp_ota_begin().

```c
esp_err_t esp_ota_set_boot_partition (const esp_partition_t *partition)
```

Configure OTA data for a new boot partition.

**Note** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Return**
- ESP_OK: OTA data updated, next reboot will use specified partition.
• ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.  
• ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.  
• ESP_ERR_NOT_FOUND: OTA data partition not found.  
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

Parameters

• partition: Pointer to info for partition containing app image to boot.

const esp_partition_t *esp_ota_get_boot_partition (void)
Get partition info of currently configured boot app.

If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.  
If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

Return Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_running_partition (void)
Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

Return Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)
Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

Return Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

Parameters

• start_from: If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition.  
The result of this function is never the same as this argument.

 esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)
Returns esp_app_desc structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

Return

• ESP_OK Successful.  
• ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.  
• ESP_ERR_NOT_SUPPORTED Partition is not application.
Chapter 2. API

- ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

**Parameters**
- **[in]** partition: Pointer to app partition. (only app partition)
- **[out]** app_desc: Structure of info about app.

`uint8_t esp_ota_get_app_partition_count (void)`

Returns number of OTA partitions provided in partition table.

**Return**
- Number of OTA partitions

`esp_err_t esp_ota_mark_app_valid_cancel_rollback (void)`

This function is called to indicate that the running app is working well.

**Return**
- ESP_OK: if successful.

`esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot (void)`

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

**Return**
- ESP_FAIL: if not successful.
- ESP_ERR_OTA_ROLLBACK_FAILED: The rollback is not possible due to flash does not have any apps.

`const esp_partition_t *esp_ota_get_last_invalid_partition (void)`

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

**Return**
- partition.

`esp_err_t esp_ota_get_state_partition (const esp_partition_t *partition, esp_ota_img_states_t *ota_state)`

Returns state for given partition.

**Return**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have odata or state was not found for given partition.

**Parameters**
- **[in]** partition: Pointer to partition.
- **[out]** ota_state: state of partition (if this partition has a record in odata).

`esp_err_t esp_ota_erase_last_boot_app_partition (void)`

Erase previous boot app partition and corresponding odata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

**Return**
- ESP_OK: Successful, otherwise ESP_ERR.

`bool esp_ota_check_rollback_is_possible (void)`

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in odata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

**Return**
- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.
Chapter 2. API

Macros

OTA_SIZE_UNKNOWN
Used for esp_ota_begin() if new image size is unknown

OTA_WITH_SEQUENTIAL_WRITES
Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

ESP_ERR_OTA_BASE
Base error code for ota_ops API

ESP_ERR_OTA_PARTITION_CONFLICT
Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID
Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED
Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER
Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED
Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t esp_ota_handle_t
Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

OTA 升级失败排查

2.7.21 Performance Monitor

The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

Application Example

An example which combines performance monitor is provided in examples/system/perfmon directory. This example initializes the performance monitor structure and execute them with printing the statistics.

High level API Reference

Header Files

• perfmon/include/perfmon.h

API Reference

图 37: OTA 升级失败时如何排查（点击放大）
Functions

`esp_err_t xtensa_perfmon_init (int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)`

Initialize performance monitor register with define values

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

**Parameters**
- [in] `id`: performance counter number
- [in] `select`: select value from PMCTRLx register
- [in] `mask`: mask value from PMCTRLx register
- [in] `kernelcnt`: kernelcnt value from PMCTRLx register
- [in] `tracelevel`: tracelevel value from PMCTRLx register

`esp_err_t xtensa_perfmon_reset (int id)`

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

**Parameters**
- [in] `id`: performance counter number

```c
void xtensa_perfmon_start (void)
Start PM counters.
Start all PM counters synchronously. Write 1 to the PGM register
```

```c
void xtensa_perfmon_stop (void)
Stop PM counters.
Stop all PM counters synchronously. Write 0 to the PGM register
```

```c
uint32_t xtensa_perfmon_value (int id)
Read PM counter.
Read value of defined PM counter.

**Return**
- Performance counter value

**Parameters**
- [in] `id`: performance counter number
```
```

`esp_err_t xtensa_perfmon_overflow (int id)`

Read PM overflow state.

Read overflow value of defined PM counter.

**Return**
- ESP_OK if there is no overflow (overflow = 0)
- ESP_FAIL if overflow occurs (overflow = 1)

**Parameters**
- [in] `id`: performance counter number

```c
void xtensa_perfmon_dump (void)
Dump PM values.
Dump all PM register to the console.
```

**Header File**
- components/perfmon/include/xtensa_perfmon_apis.h
Functions

```c
esp_err_t xtensa_perfmon_exec(const xtensa_perfmon_config_t *config)
```

Execute PM.

Execute performance counter for dedicated function with defined parameters

Return

- ESP_OK if no errors
- ESP_ERR_INVALID_ARG if one of the required parameters not defined
- ESP_FAIL - counter overflow

Parameters

- [in] config: pointer to the configuration structure

```c
void xtensa_perfmon_view_cb(void *params, uint32_t select, uint32_t mask, uint32_t value)
```

Dump PM results.

Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout

Parameters

- [in] params: used parameters passed from configuration (callback_params). This parameter expected as FILE* hanle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- [in] select: select value for current counter
- [in] mask: mask value for current counter
- [in] value: counter value for current counter

Structures

```c
struct xtensa_perfmon_config
```

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

Public Members

```c
int repeat_count
```

how much times function will be called before the callback will be repeated

```c
float max_deviation
```

Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

```c
void (*call_params)
```

This pointer will be passed to the call_function as a parameter

```c
void (*call_function)(void *params)
```

pointer to the function that have to be called

```c
void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)
```

pointer to the function that will be called with result parameters

```c
void (*callback_params)
```

parameter that will be passed to the callback

```c
int tracelevel
```

trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

```c
uint32_t counters_size
```

amount of counter in the list

```c
const uint32_t *select_mask
```

list of the select/mask parameters
Type Definitions

typedef struct xtensa_perfmon_config xtensa_perfmon_config_t

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

2.7.22 电源管理

概述

ESP-IDF 中集成的电源管理算法可以根据应用程序组件的需求，调整外围总线 (APB) 频率和 CPU 频率，并使芯片进入 Light-sleep 模式，尽可能减少运行应用程序的功耗。

应用程序组件可以通过创建和获取电源管理锁来控制功耗。

例如:

- 对于 APB 外设，APB 时钟频率的外设，其驱动可以要求在使用外设时，将 APB 频率设置为 80 MHz。
- RTOS 可以要求 CPU 在有任务需要时开始运行时以最高配置频率工作。
- 一些外设可能需要中断才能启用，因此其驱动也会要求禁用 Light-sleep 模式。

请求较高的 APB 频率或 CPU 频率以及禁用 Light-sleep 模式会增加功耗，因此请将组件使用的电源管理锁降到最少。

电源管理配置

编译时可使用 CONFIG_PM_ENABLE 选项启用电源管理功能。

启用电源管理功能将会增加中断延迟。额外延迟与多个因素有关，例如：CPU 频率、单/双核模式、是否需要进行频率切换等。CPU 频率为 240 MHz 且未启用频率调节时，最小额外延迟为 0.2 μs；如果启用频率调节，且在中断入口将频率由 40 MHz 调节至 80 MHz，则最大额外延迟为 40 μs。

通过调用 esp_pm_configure() 函数可以在应用程序中启用动态调频 (DFS) 功能和自动 Light-sleep 模式。此函数的参数 esp_pm_config_esp32_t 定义了频率调节的相关设置。此参数结构中，需要初始化以下三个字段：

- max_freq_mhz: 最大 CPU 频率 (MHz)。即获取 ESP_PM_CPU_FREQ_MAX 辅助所使用的频率。该字段通常设置为 CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ。
- min_freq_mhz: 最小 CPU 频率 (MHz)。即获取 ESP_PM_APB_FREQ_MAX 辅助所使用的频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值除以整数。注意，10 MHz 是生成 1 MHz 的 REF_TICK 默认时钟所需的最小频率。
- light_sleep_enable: 没有获取任何管理锁时，决定系统是否需要自动进入 Light-sleep 状态 (true/false)。

如果在 menuconfig 中启用了 CONFIG_PM_DFS_INIT_AUTO 选项，最大 CPU 频率将由 CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ 设置决定，最小 CPU 频率将锁定为 XTAL 频率。

注解：自动 Light-sleep 模式基于 FreeRTOS Tickless Idle 功能，因此如果在 menuconfig 中没有启用 CONFIG_FREERTOS_USE_TICKLESS_IDLE 选项，在请求自动 Light-sleep 时，esp_pm_configure() 将会返回 ESP_ERR_NOT_SUPPORTED 错误。

注解：Light-sleep 状态下，外设设有时钟门控，不会产生来自 GPIO 和内部外设的中断。Sleep Modes 文档中所提到的唤醒源可用于从 Light-sleep 状态触发唤醒。

例如，EXT0 和 EXT1 唤醒源可以通过 GPIO 唤醒芯片。
电源管理

应用程序可以通过获取或释放管理锁来控制电源管理算法。应用程序获取电源管理锁后，电源管理算法的操作将受到下面的限制。释放电源管理锁后，限制解除。

电源管理锁设有获取/释放计数器，如果已多次获取电源管理锁，则需要将电源管理锁释放相同次数以解除限制。

ESP32 支持下表中三种电源管理锁。

### 电源管理锁

<table>
<thead>
<tr>
<th>电源管理锁</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_PM_CPU_FREQ_MAX</td>
<td>请求使用 <code>esp_pm_configure()</code> 将 CPU 频率设置为最大值。ESP32 可以将该值设置为 80 MHz、160 MHz 或 240 MHz。</td>
</tr>
<tr>
<td>ESP_PM_APB_FREQ_MAX</td>
<td>请求将 APB 频率设置为最大值，ESP32 支持的最大频率为 80 MHz。</td>
</tr>
<tr>
<td>ESP_PM_NO_LIGHT_SLEEP</td>
<td>禁止自动切换至 Light-sleep 模式。</td>
</tr>
</tbody>
</table>

ESP32 电源管理算法

下表列出了启用动态调整时如何切换 CPU 频率和 APB 频率。您可以使用 `esp_pm_configure()` 或者 `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ` 指定 CPU 最大频率。

<table>
<thead>
<tr>
<th>CPU 最高频率</th>
<th>电源管理锁获取情况</th>
<th>APB 频率和 CPU 频率</th>
</tr>
</thead>
</table>
| 240          | 获得 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX | CPU: 240 MHz  
APB: 80 MHz |
|              | 无                   | 使用 `esp_pm_configure()` 为二者设置最小值 |
| 160          | 获得 ESP_PM_CPU_FREQ_MAX | CPU: 160 MHz  
APB: 80 MHz |
|              | 获得 ESP_PM_APB_FREQ_MAX, 未获得 ESP_PM_CPU_FREQ_MAX | CPU: 80 MHz  
APB: 80 MHz |
|              | 无                   | 使用 `esp_pm_configure()` 为二者设置最小值 |
| 80           | 获得 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX | CPU: 80 MHz  
APB: 80 MHz |
|              | 无                   | 使用 `esp_pm_configure()` 为二者设置最小值 |

如果没有获取任何管理锁，调用 `esp_pm_configure()` 将启动 Light-sleep 模式。Light-sleep 模式持续时间由以下因素决定：

- 处于阻塞状态的 FreeRTOS 任务数（有限超时）
- 高分辨率定时器 API 注册的计数器数量

您也可以设置 Light-sleep 模式在最近事件（任务解除阻塞，或计时器超时）之前持续多久才唤醒芯片。
为了跳过不必要的唤醒，可以将 `skip_unhandled_events` 选项设置为 true 来初始化 `esp_timer`。带有此标志的定时器不会唤醒系统，有助于减少功耗。

**动态调频和外设驱动**

启用动态调频后，APB 频率在一个 RTOS 滴答周期内多次更改。有些外设不受 APB 频率变更的影响，但有些外设可能会出现问题。例如，Timer Group 外设定时器会继续计数，但定时器计数的速度将随 APB 频率的变更而变更。

以下外设不受 APB 频率变更的影响：

- **UART**：如果 `REF_TICK` 用作时钟源，则 UART 不受 APB 频率变更影响。请查看 `uart_config_t` 中的 `use_ref_tick`。
- **LEDC**：如果 `REF_TICK` 用作时钟源，则 LEDC 不受 APB 频率变更影响。请查看 `ledc_config_t` 结构体中的 flags 成员以及 `RMT_CHANNEL_FLAGS_AWARE_DFS` 宏。

目前以下外设驱动程序可知感知动态调频，并在调频期间使用 `ESP_PM_APB_FREQ_MAX` 钥：

- SPI master
- I2C
- I2S（如果 APLL 锁在使用中，I2S 会启用 `ESP_PM_NO_LIGHT_SLEEP` 钥）
- SDMMC

启用以下驱动程序时，将占用 `ESP_PM_APB_FREQ_MAX` 钥：

- **SPI slave**：从调用 `spi_slave_initialize()` 至 `spi_slave_free()` 期间。
- **Ethernet**：从调用 `esp_eth_driver_install()` 至 `esp_eth_driver_uninstall()` 期间。
- **WiFi**：从调用 `esp_wifi_start()` 至 `esp_wifi_stop()` 期间。如果启用了调制解调器睡眠模式，广播关闭时将释放此管理锁。
- **TWAI**：从调用 `twai_driver_install()` 至 `twai_driver_uninstall()` 期间。
- **Bluetooth**：从调用 `esp_bt_controller_enable()` 至 `esp_bt_controller_disable()` 期间。如果启用了蓝牙调制解调器，广播关闭时将释放此管理锁。但依然占用 `ESP_PM_NO_LIGHT_SLEEP` 钥，除非将 `CONFIG_BTDM_CTRL_LOW_POWER_CLOCK` 选项设置为“外部 32 kHz 晶振”。

以下外设驱动程序无法感知动态调频，应用程序需自己获取/释放管理锁：

- PCNT
- Sigma-delta
- Timer group
- MCPWM

**API 参考**

**Header File**

- components/esp_pm/include/esp_pm.h

**Functions**

```c
esp_err_t esp_pm_configure(const void *config)
```

Set implementation-specific power management configuration.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported，or if `CONFIG_PM_ENABLE` is not enabled in sdkconfig

**Parameters**

- config: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)
**esp_err_t esp_pm_get_configuration (void *config)**

Get implementation-specific power management configuration.

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if the pointer is null

- **Parameters**
  - config: pointer to implementation-specific configuration structure (e.g. esp_pm_config_esp32)

**esp_err_t esp_pm_lock_create (esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)**

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.

- **Return**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if the lock structure cannot be allocated
  - ESP_ERR_INVALID_ARG if out_handle is NULL or type argument is not valid
  - ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

- **Parameters**
  - lock_type: Power management constraint which the lock should control
  - arg: argument, value depends on lock_type, see esp_pm_lock_type_t
  - name: arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the esp_pm_dump_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
  - [out] out_handle: handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

**esp_err_t esp_pm_lock_acquire (esp_pm_lock_handle_t handle)**

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if the handle is invalid
  - ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

- **Parameters**
  - handle: handle obtained from esp_pm_lock_create function

**esp_err_t esp_pm_lock_release (esp_pm_lock_handle_t handle)**

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if the handle is invalid
  - ESP_ERR_INVALID_STATE if lock is not acquired
Chapter 2. API

- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

**Parameters**
- `handle`: handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_lock_delete(esp_pm_lock_handle_t handle)
```
Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

**Parameters**
- `handle`: handle obtained from `esp_pm_lock_create` function

```c
esp_err_t esp_pm_dump_locks(FILE *stream)
```
Dump the list of all locks to stderr

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

**Parameters**
- `stream`: stream to print information to; use stdout or stderr to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

**Type Definitions**

```c
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```
Opaque handle to the power management lock.

**Enumerations**

```c
enum esp_pm_lock_type_t
```
Power management constraints.

**Values:**

- **ESP_PM_CPU_FREQ_MAX**
  - Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

- **ESP_PM_APB_FREQ_MAX**
  - Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

- **ESP_PM_NO_LIGHT_SLEEP**
  - Prevent the system from going into light sleep. Argument is unused and should be set to 0.

**Header File**

- `components/esp_pm/include/esp32/pm.h`
Chapter 2. API 参考

Structures

```c
struct esp_pm_config_esp32_t

Power management config for ESP32.
Pass a pointer to this structure as an argument to esp_pm_configure function.
```

Public Members

- `int max_freq_mhz`
  Maximum CPU frequency, in MHz
- `int min_freq_mhz`
  Minimum CPU frequency to use when no locks are taken, in MHz
- `bool light_sleep_enable`
  Enter light sleep when no locks are taken

### 2.7.23 Random Number Generation

ESP32 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the ESP32 Technical Reference Manual > Random Number Generator (RNG) [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

### Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, I2S, Wi-Fi or Bluetooth.

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**注解:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

**注解:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.
Chapter 2. API 参考

API Reference

Header File

- components/esp_hw_support/include/esp_random.h

Functions

uint32_t esp_random (void)
Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

Return Random value between 0 and UINT32_MAX

void esp_fill_random (void *buf, size_t len)
Fill a buffer with random bytes from hardware RNG.

Note This function is implemented via calls to esp_random(), so the same constraints apply.

Parameters

- buf: Pointer to buffer to fill with random numbers.
- len: Length of buffer in bytes

Header File

- components/bootloader_support/include/bootloader_random.h

Functions

void bootloader_random_enable (void)
Enable an entropy source for RNG if RF is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be used from app code early during operation, if true random numbers are required before RF is initialised. Consult ESP-IDF Programming Guide “Random Number Generation” section for details.

void bootloader_random_disable (void)
Disable entropy source for RNG.

Disables internal entropy source. Must be called after bootloader_random_enable() and before RF features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

void bootloader_fill_random (void *buffer, size_t length)
Fill buffer with ‘length’ random bytes.

Note If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

Parameters

- buffer: Pointer to buffer
- length: This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux getrandom() function is also provided for ease of porting:
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);

This function is implemented by calling esp_fill_random() internally.

The flags argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with errno set to EFAULT) if the buf argument is NULL, and equal to buflen otherwise.

## 2.7.24 Sleep Modes

### Overview

ESP32 is capable of light sleep and deep sleep power saving modes.

In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from APB_CLK are powered off. The only parts of the chip which can still be powered on are:

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory
- RTC slow memory

Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using esp_sleep_enable_X_wakeup APIs and can be disabled using esp_sleep_disable_wakeup_source() API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using esp_sleep_pd_config() API.

Once wakeup sources are configured, application can enter sleep mode using esp_light_sleep_start() or esp_deep_sleep_start() APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see Power Management APIs). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

### WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (esp_bluedroid_disable(), esp_bt_controller_disable(), esp_wifi_stop()). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

### Wakeup sources

**Timer**  
RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW_CLK.

For details on RTC clock options, see ESP32 Technical Reference Manual > ULP Coprocessor [PDF].
This wakeup mode doesn’t require RTC peripherals or RTC memories to be powered on during sleep. `esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

**Touch pad**  
RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. `ESP_PD_DOMAIN_RTC_PERIPH` should be set to `ESP_PD_OPTION_AUTO`).

`esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External wakeup (ext0)**  
RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.

Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions, before calling `esp_sleep_start()`.

In revisions 0 and 1 of the ESP32, this wakeup source is incompatible with ULP and touch wakeup sources.

`esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

⚠️: After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using `rtc_gpio_deinit(gpio_num)` function.

**External wakeup (ext1)**  
RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (`ESP_EXT1_WAKEUP_ANY_HIGH`)
- wake up if all the selected pins are low (`ESP_EXT1_WAKEUP_ALL_LOW`)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using `rtc_gpio_` functions, before entering sleep:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

⚠️: After wake up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using `rtc_gpio_deinit(gpio_num)` function.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

**ULP coprocessor wakeup**  
ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. `ESP_PD_DOMAIN_RTC_PERIPH` should be set to `ESP_PD_OPTION_AUTO`).

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.
GPIO wakeup (light sleep only) In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using gpio_wakeup_enable() function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

esp_sleep_enable_gpio_wakeup() function can be used to enable this wakeup source.

UART wakeup (light sleep only) When ESP32 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using uart_set_wakeup_threshold() function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup, before sending the data.

esp_sleep_enable_uart_wakeup() function can be used to enable this wakeup source.

Power-down of RTC peripherals and memories

By default, esp_deep_sleep_start() and esp_light_sleep_start() functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, esp_sleep_pd_config() function is provided.

Note: in revision 0 of the ESP32, RTC fast memory will always be kept enabled in deep sleep, so that the deep sleep stub can run after reset. This can be overridden, if the application doesn’t need clean reset behaviour after deep sleep.

If some variables in the program are placed into RTC slow memory (for example, using RTC_DATA_ATTR attribute), RTC slow memory will be kept powered on by default. This can be overridden using esp_sleep_pd_config() function, if desired.

Entering light sleep

esp_light_sleep_start() function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

Entering deep sleep

esp_deep_sleep_start() function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

Configuring IOs

Some ESP32 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.
To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

**UART output handling**

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

**Checking sleep wakeup cause**

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad, it is possible to identify touch pad which has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify pin which has caused wakeup using `esp_sleep_get_exti_wakeup_status()` functions.

**Disable sleep wakeup source**

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

**Application Example**

Implementation of basic functionality of deep sleep is shown in `protocols/sntp` example, where ESP module is periodically waken up to retrieve time from NTP server.

More extensive example in `system/deep_sleep` illustrates usage of various deep sleep wakeup triggers and ULP co-processor programming.

**API Reference**

**Header File**

- components/esp_hw_support/include/esp_sleep.h

**Functions**

```c
esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)
```

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in `esp_sleep_start` function.
Chapter 2. API

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**Parameters**
- `source`: - number of source to disable of type esp_sleep_source_t

`esp_err_t esp_sleep_enable_ulp_wakeup (void)`
Enable wakeup by ULP coprocessor.

**Note** In revisions 0 and 1 of the ESP32, ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

`esp_err_t esp_sleep_enable_timer_wakeup (uint64_t time_in_us)`
Enable wakeup by timer.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

**Parameters**
- `time_in_us`: time before wakeup, in microseconds

`esp_err_t esp_sleep_enable_touchpad_wakeup (void)`
Enable wakeup by touch sensor.

**Note** In revisions 0 and 1 of the ESP32, touch wakeup source can not be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note** The FSM mode of the touch button should be configured as the timer trigger mode.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

`touch_pad_t esp_sleep_get_touchpad_wakeup_status (void)`
Get the touch pad which caused wakeup.
If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

**Return** touch pad which caused wakeup

`bool esp_sleep_is_valid_wakeup_gpio (gpio_num_t gpio_num)`
Returns true if a GPIO number is valid for use as wakeup source.

**Note** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Return** True if this GPIO number will be accepted as a sleep wakeup source.

**Parameters**
- `gpio_num`: Number of the GPIO to test for wakeup source capability

`esp_err_t esp_sleep_enable_ext0_wakeup (gpio_num_t gpio_num, int level)`
Enable wakeup using a pin.

This function uses external wakeup feature of RTC_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pin is configured in esp_sleep_start, immediately before entering sleep mode.

**Note** In revisions 0 and 1 of the ESP32, ext0 wakeup source can not be used together with touch or ULP wakeup sources.
Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

Parameters

- gpio_num: GPIO number used as wakeup source. Only GPIOs which have RTC functionality can be used: 0, 2, 4, 12-15, 25-27, 32-39.
- level: input level which will trigger wakeup (0=low, 1=high)

`esp_err_t esp_sleep_enable_ext1_wakeup (uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)`

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

**Note** This function does not modify pin configuration. The pins are configured in esp_sleep_start, immediately before entering sleep mode.

**Note** Internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

Parameters

- mask: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0, 2, 4, 12-15, 25-27, 32-39.
- mode: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

`esp_err_t esp_sleep_enable_gpio_wakeup (void)`

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

**Note** In revisions 0 and 1 of the ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

`esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)`

Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note** ESP32 does not support wakeup from UART2.

Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

Parameters

- uart_num: UART port to wake up from
**esp_err_t esp_sleep_enable_wifi_wakeup (void)**

Enable wakeup by WiFi MAC.

**Return**

- ESP_OK on success

**esp_err_t esp_sleep_disable_wifi_wakeup (void)**

Disable wakeup by WiFi MAC.

**Return**

- ESP_OK on success

**uint64_t esp_sleep_get_ext1_wakeup_status (void)**

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

**Return**

bit mask, if GPIO caused wakeup, BIT(n) will be set

**esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)**

Set power down mode for an RTC power domain in sleep mode.

If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

**Parameters**

- **domain**: power domain to configure
- **option**: power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

**void esp_deep_sleep_start (void)**

Enter deep sleep with the configured wakeup options.

This function does not return.

**esp_err_t esp_light_sleep_start (void)**

Enter light sleep with the configured wakeup options.

**Return**

- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped

**void esp_deep_sleep (uint64_t time_in_us)**

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

**esp_deep_sleep** does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop

This function does not return.

**Note**

The device will wake up immediately if the deep-sleep time is set to 0

**Parameters**

- **time_in_us**: deep-sleep time, unit: microsecond

**esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause (void)**

Get the wakeup source which caused wakeup from sleep.
Return  cause of wake up from last sleep (deep sleep or light sleep)

void \texttt{esp\_wake\_deep\_sleep} (void)
Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void \texttt{esp\_set\_deep\_sleep\_wake\_stub} (esp\_deep\_sleep\_wake\_stub\_fn\_t \texttt{new\_stub})
Install a new stub at runtime to run on wake from deep sleep.

If implementing esp\_wake\_deep\_sleep() then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC\_IRAM\_ATTR, and must obey the same rules given for esp\_wake\_deep\_sleep().

\texttt{esp\_deep\_sleep\_wake\_stub\_fn} / \texttt{esp\_get\_deep\_sleep\_wake\_stub} (void)
Get current wake from deep sleep stub.

\textbf{Return } Return current wake from deep sleep stub, or NULL if no stub is installed.

void \texttt{esp\_default\_wake\_deep\_sleep} (void)
The default esp-idf-provided esp\_wake\_deep\_sleep() stub.

See docs/deep-sleep-stub.rst for details.

void \texttt{esp\_deep\_sleep\_disable\_rom\_logging} (void)
Disable logging from the ROM code after deep sleep.

Using LSB of RTC\_STORE4.

void \texttt{esp\_sleep\_config\_gpio\_isolate} (void)
Configure to isolate all GPIO pins in sleep state.

void \texttt{esp\_sleep\_enable\_gpio\_switch} (bool \texttt{enable})
Enable or disable GPIO pins status switching between slept status and waked status.

\textbf{Parameters }
\begin{itemize}
  \item \texttt{enable}: decide whether to switch status or not
\end{itemize}

\textbf{Type Definitions}
\begin{itemize}
  \item \texttt{typedef esp\_sleep\_source\_t esp\_sleep\_wakeup\_cause\_t}
  \item \texttt{typedef void (esp\_deep\_sleep\_wake\_stub\_fn\_t) (void)}
\end{itemize}

\textbf{Function type for stub to run on wake from sleep.}

\textbf{Enumerations}
\begin{itemize}
  \item \texttt{enum esp\_sleep\_ext1\_wakeup\_mode\_t}
    \textbf{Logic function used for EXT1 wakeup mode.}
    \begin{itemize}
      \item \texttt{ESP\_EXT1\_WAKEUP\_ALL\_LOW} = 0
        Wake the chip when all selected GPIOs go low.
      \item \texttt{ESP\_EXT1\_WAKEUP\_ANY\_HIGH} = 1
        Wake the chip when any of the selected GPIOs go high.
    \end{itemize}
  \item \texttt{enum esp\_sleep\_pd\_domain\_t}
    \textbf{Power domains which can be powered down in sleep mode.}
    \begin{itemize}
    \end{itemize}
\end{itemize}
### ESP_PD_DOMAIN_RTC_PERIPH
RTC IO, sensors and ULP co-processor.

### ESP_PD_DOMAIN_RTC_SLOW_MEM
RTC slow memory.

### ESP_PD_DOMAIN_RTC_FAST_MEM
RTC fast memory.

### ESP_PD_DOMAIN_XTAL
XTAL oscillator.

### ESP_PD_DOMAIN_RTC8M
Internal 8M oscillator.

### ESP_PD_DOMAIN_VDDSDIO
VDD_SDIO.

### ESP_PD_DOMAIN_MAX
Number of domains.

```c
enum esp_sleep_pd_option_t
Power down options.

Values:

- **ESP_PD_OPTION_OFF**
  Power down the power domain in sleep mode.

- **ESP_PD_OPTION_ON**
  Keep power domain enabled during sleep mode.

- **ESP_PD_OPTION_AUTO**
  Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

### enum esp_sleep_source_t
Sleep wakeup cause.

Values:

- **ESP_SLEEP_WAKEUP_UNDEFINED**
  In case of deep sleep, reset was not caused by exit from deep sleep.

- **ESP_SLEEP_WAKEUP_ALL**
  Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

- **ESP_SLEEP_WAKEUP_EXT0**
  Wakeup caused by external signal using RTC IO.

- **ESP_SLEEP_WAKEUP_EXT1**
  Wakeup caused by external signal using RTC_CNTL.

- **ESP_SLEEP_WAKEUP_TIMER**
  Wakeup caused by timer.

- **ESP_SLEEP_WAKEUP_TOUCHPAD**
  Wakeup caused by touchpad.

- **ESP_SLEEP_WAKEUP_ULP**
  Wakeup caused by ULP program.

- **ESP_SLEEP_WAKEUP_GPIO**
  Wakeup caused by GPIO (light sleep only)

- **ESP_SLEEP_WAKEUP_UART**
  Wakeup caused by UART (light sleep only)

- **ESP_SLEEP_WAKEUP_WIFI**
  Wakeup caused by WIFI (light sleep only)
ESP_SLEEP_WAKEUP_COCPU
Wakeup caused by COCPU int.

ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG
Wakeup caused by COCPU crash.

ESP_SLEEP_WAKEUP_BT
Wakeup caused by BT (light sleep only)

2.7.25 Watchdogs

Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using Project Configuration Menu, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

Interrupt watchdog
The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn’t blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can’t get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as “Interrupt wdt timeout on CPU0” or “Interrupt wdt timeout on CPU1” (as applicable).

Configuration
The interrupt watchdog is enabled by default via the CONFIG_ESP_INT_WDT configuration flag. The timeout is configured by setting CONFIG_ESP_INT_WDT_TIMEOUT_MS. The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see CONFIG_FREERTOS_HZ).

Tuning
If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the CONFIG_ESP_INT_WDT_TIMEOUT_MS setting instead.

Task Watchdog Timer
The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. Each watched task must ‘reset’ the TWDT periodically to indicate that they have been allocated CPU time.
If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling `esp_task_wdt_init()` which will configure the hardware timer. A task can then subscribe to the TWDT using `esp_task_wdt_add()` in order to be watched. Each subscribed task must periodically call `esp_task_wdt_reset()` to reset the TWDT. Failure by any subscribed tasks to periodically call `esp_task_wdt_reset()` indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using `esp_task_wdt_delete()`. A task that has been unsubscribed should no longer call `esp_task_wdt_reset()`. Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling `esp_task_wdt_deinit()`.

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_add()` at any time.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

**Interrupt Watchdog API Reference**

**Header File**

- `esp_system/include/esp_int_wdt.h`

**Functions**

void `esp_int_wdt_init` (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

**Task Watchdog API Reference**

A full example using the Task Watchdog is available in esp-idf: `system/task_watchdog`

**Header File**

- `components/esp_system/include/esp_task_wdt.h`
Chapter 2. API

Functions

**esp_err_t esp_task_wdt_init**(uint32_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add()`.

**Return**

- ESP_OK: Initialization was successful
- ESP_ERR_NO_MEM: Initialization failed due to lack of memory

**Note**

`esp_task_wdt_init()` must only be called after the scheduler started

**Parameters**

- **[in]** timeout: Timeout period of TWDT in seconds
- **[in]** panic: Flag that controls whether the panic handler will be executed when the TWDT times out

**esp_err_t esp_task_wdt_deinit**(void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Return**

- ESP_OK: TWDT successfully deinitialized
- ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
- ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

**esp_err_t esp_task_wdt_add**(TaskHandle_t handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

**Return**

- ESP_OK: Successfully subscribed the task to the TWDT
- ESP_ERR_INVALID_ARG: Error, the task is already subscribed
- ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**Parameters**

- **[in]** handle: Handle of the task. Input NULL to subscribe the current running task to the TWDT

**esp_err_t esp_task_wdt_reset**(void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

**Return**

- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- ESP_ERR_NOT_FOUND: Error, the current running task has not subscribed to the TWDT
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**esp_err_t esp_task_wdt_delete**(TaskHandle_t handle)

Unsubscribe a task from the Task Watchdog Timer (TWDT)
This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset(). If the task is an IDLE task, this function will automatically disable the calling of esp_task_wdt_reset() from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

**Return**
- ESP_OK: Successfully unsubscribed the task from the TWDT
- ESP_ERR_INVALID_ARG: Error, the task is already unsubscribed
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**Parameters**
- `[in] handle`: Handle of the task. Input NULL to unsubscribe the current running task.

```c
esp_err_t esp_task_wdt_status(TaskHandle_t handle)
```

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**Return**
- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is currently not subscribed to the TWDT
- ESP_ERR_INVALID_STATE: The TWDT is not initialized, therefore no tasks can be subscribed

**Parameters**
- `[in] handle`: Handle of the task. Input NULL to query the current running task.

## 2.7.26 System Time

### Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an RTC Clock Source and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.
- **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the APB_CLK clock source (typically 80 MHz), which has a frequency deviation of less than ±10 ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32_TIME_SYSCALL` in project configuration.

### RTC Clock Source

The RTC timer has the following clock sources:

- **Internal 150kHz RC oscillator** (default): Features the lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- **External 32kHz crystal**: Requires a 32kHz crystal to be connected to the 32K_XP and 32K_XN pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
Chapter 2. API

- **External 32kHz oscillator at 32K_XN pin**: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the 32K_XN pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of $0.1 < V_{cm} < 0.5 \times V_{amp}$, where $V_{amp}$ is signal amplitude. Additionally, a 1 nF capacitor must be placed between the 32K_XP pin and ground. In this case, the 32K_XP pin cannot be used as a GPIO pin.
- **Internal 8.5MHz oscillator, divided by 256 (~33kHz)**: Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at 32K_XN pin sources can be found in Section Crystal Oscillator of ESP32 Hardware Design Guidelines.

**Get Current Time**

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```c
gettimeofday
time
asctime
clock
cftime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

* – To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```c
time_t now;
char strftime_buf[64];
struct tm timeinfo;
time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);
tzset();
localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```c
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

**SNTP Time Synchronization**

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These
functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- **SNTP_SYNC_MODE_IMMED** (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- **SNTP_SYNC_MODE_SMOOTH** updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- **sntp_set_time_sync_notification_cb()** - use it for setting a callback function that will notify of the time synchronization process.
- **sntp_get_sync_status()** and **sntp_set_sync_status()** - use it to get/set time synchronization status.

To start synchronization via SNTP, just call the following three functions.

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set `CONFIG_LWIP_SNTP_UPDATE_DELAY` in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in the `protocols/sntp` directory.

**Timezones**

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the `TZ` environment variable to the correct value depending on the device location. The format of the time string is the same as described in the GNU libc documentation (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

**API Reference**

**Header File**

- components/lwip/include/apps/esp_sntp.h

**Functions**

```c
void sntp_sync_time(struct timeval *tv)
```

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

**Parameters**

- **tv**: Time received from SNTP server.
void sntp_set_sync_mode (sntp_sync_mode_t sync_mode)
    Set the sync mode.

Modes allowed: SNTP_SYNC_MODE_IMMED and SNTP_SYNC_MODE_SMOOTH.

Parameters
    • sync_mode: Sync mode.

sntp_sync_mode_t sntp_get_sync_mode (void)
    Get set sync mode.

    Return SNTP_SYNC_MODE_IMMED: Update time immediately. SNTP_SYNC_MODE_SMOOTH: Smooth time updating.

sntp_sync_status_t sntp_get_sync_status (void)
    Get status of time sync.

    After the update is completed, the status will be returned as SNTP_SYNC_STATUS_COMPLETED. After that, the status will be reset to SNTP_SYNC_STATUS_RESET. If the update operation is not completed yet, the status will be SNTP_SYNC_STATUS_RESET. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be SNTP_SYNC_STATUS_IN_PROGRESS.

    Return SNTP_SYNC_STATUS_RESET: Reset status. SNTP_SYNC_STATUS_COMPLETED: Time is synchronized. SNTP_SYNC_STATUS_IN_PROGRESS: Smooth time sync in progress.

void sntp_set_sync_status (sntp_sync_status_t sync_status)
    Set status of time sync.

Parameters
    • sync_status: status of time sync (see sntp_sync_status_t)

void sntp_set_time_sync_notification_cb (sntp_sync_time_cb_t callback)
    Set a callback function for time synchronization notification.

Parameters
    • callback: a callback function

void sntp_set_sync_interval (uint32_t interval_ms)
    Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the sntp_restart() function, otherwise, it will be applied after the last interval expired.

Parameters
    • interval_ms: The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32_t sntp_get_sync_interval (void)
    Get the sync interval of SNTP operation.

Return the sync interval

bool sntp_restart (void)
    Restart SNTP.

Return True - Restart False - SNTP was not initialized yet

Type Definitions
typedef void (*sntp_sync_time_cb_t) (struct timeval *tv)
    SNTP callback function for notifying about time sync event.

Parameters
    • tv: Time received from SNTP server.
**Enumerations**

```c
enum sntp_sync_mode_t
    SNTP time update mode.

Values:

SNTP_SYNC_MODE_IMMED
    Update system time immediately when receiving a response from the SNTP server.

SNTP_SYNC_MODE_SMOOTH
    Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between
    SNTP response time and system time is large (more than 35 minutes) then update immediately.
```

```c
enum sntp_sync_status_t
    SNTP sync status.

Values:

SNTP_SYNC_STATUS_RESET
SNTP_SYNC_STATUS_COMPLETED
SNTP_SYNC_STATUS_IN_PROGRESS
```

### 2.7.27 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

**API Reference**

**Header File**

- components/esp_rom/include/esp_rom_sys.h

**Functions**

`int esp_rom_printf(const char *fmt, ...)`

Print formatted string to console device.

**Note** float and long long data are not supported!

**Return** int: Total number of characters written on success; A negative number on failure.

**Parameters**

- fmt: Format string
- ...: Additional arguments, depending on the format string

`void esp_rom_delay_us(uint32_t us)`

Pauses execution for us microseconds.

**Parameters**

- us: Number of microseconds to pause

`void esp_rom_install_channel_putc(int channel, void (*putc)) char c`

`esp_rom_printf` can print message to different channels simultaneously. This function can help install the low
level putc function for `esp_rom_printf`.

**Parameters**

- channel: Channel number (starting from 1)
- putc: Function pointer to the putc implementation. Set NULL can disconnect `esp_rom_printf` with putc.

`void esp_rom_install_uart_printf(void)`

Install UART1 as the default console channel, equivalent to `esp_rom_install_channel_putc(1, esp_rom_uart_putc)`

`soc_reset_reason_t esp_rom_get_reset_reason(int cpu_no)`

Get reset reason of CPU.
**Return**  Reset reason code (see in soc/reset_reasons.h)

**Parameters**

- cpu_no: CPU number

Code examples for this API section are provided in the system directory of ESP-IDF examples.

## 2.8 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the *build system guide*.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

### 2.8.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See *Error Handling* section for more information about error handling approaches. *Error Code Reference* contains the list of error codes returned by ESP-IDF components.

### 2.8.2 Configuration structures

**重要**：Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:
Most ESP-IDF examples use C99 designated initializers for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

C++ language doesn’t support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
esp_timer_create_args_t my_timer_args = {}; /* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

### Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG(); /* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values. 
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

#### 2.8.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain private or esp_private in their name or path. Certain components, such as hal only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

#### 2.8.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in common_components directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via EXTRA_COMPONENT_DIRS build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.
### 2.8.5 API Stability

ESP-IDF uses **Semantic Versioning** as explained in the [versions page](#). Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system [renaming mechanism](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

#### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

#### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don’t fall into the categories below.

- **Private APIs**.
- **Components in example projects**.
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.
- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of Kconfig options in menuconfig.
- Location and names of example projects.

### 2.9 Project Configuration
2.9.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extentions.

2.9.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.

After being updated, this configuration is saved inside sdkconfig file in the project root directory. Based on sdkconfig, application build targets will generate sdkconfig.h file in the build directory, and will make sdkconfig options available to the project build system and source files.

2.9.3 Using sdkconfig.defaults

In some cases, such as when sdkconfig file is under revision control, the fact that sdkconfig file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of sdkconfig.defaults file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the sdkconfig file. Once sdkconfig.defaults is created, sdkconfig can be deleted and added to the ignore list of the revision control system (e.g. .gitignore file for git). Project build targets will automatically create sdkconfig file, populated with the settings from sdkconfig.defaults file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in sdkconfig by ones from sdkconfig.defaults. For more information, see 自定义 sdkconfig 的默认值.

2.9.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of conf-idf which causes that Windows line endings are not recognized after a backslash).

Format checker

tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix .new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.
### 2.9.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. Deprecated options and their replacements are automatically generated by `confgen.py`.

### 2.9.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

#### SDK tool configuration

Contains:

- `CONFIG_SDK_TOOLPREFIX`
- `CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`

**CONFIG_SDK_TOOLPREFIX**

Compiler toolchain path/prefix

*Found in: SDK tool configuration*

The prefix/path that is used to call the toolchain. The default setting assumes a crosstool-ng gcc setup that is in your PATH.

*Default value:*

- `"xtensa-esp32-elf-"`

**CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS**

Toolchain supports time_t wide 64-bits

*Found in: SDK tool configuration*

Enable this option in case you have a custom toolchain which supports time_t wide 64-bits. This option checks time_t is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits time_t.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide time_t. This will change in a future major release, but currently 64-bit time_t requires a custom built toolchain.
Default value:
- No (disabled)

Build type

Contains:
- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```bash
# Connect to a running instance of OpenOCD target remote:3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is complete.
thb *0x40007d54 c # Load the application into RAM
load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```bash
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. `CONFIG_APP_BUILD_TYPE_ELF_RAM` is required, other options help reduce application memory footprint.

```bash
CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=
CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

**Available options:**
- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL) (APP_BUILD_TYPE_ELF_RAM)

**CONFIG_APP_REPRODUCIBLE_BUILD**

Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

**Default value:**
Chapter 2. API 参考

- No (disabled)

**Application manager**

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_TL_GF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

*Default value:*

- Yes (enabled)

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*

- No (disabled)

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*

- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

*Default value:*

- No (disabled)
**CONFIG_APP_PROJECT_VER**

Project version

*Found in:* Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG

Project version

**Default value:**

- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP RETRIEVE LEN ELF SHA**

The length of APP ELF SHA is stored in RAM (chars)

*Found in:* Application manager

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 16

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_reserve_RTC`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

**CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION**

Bootloader optimization Level

*Found in:* Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**
Chapter 2. API

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

**Available options:**
- No output (BOOTLOADER_LOG_LEVEL_NONE)
- Error (BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (BOOTLOADER_LOG_LEVEL_WARN)
- Info (BOOTLOADER_LOG_LEVEL_INFO)
- Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

**CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN**

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: Bootloader config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

**Default value:**
- No (disabled) if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

**Range:**
- from 0 to 33 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**Default value:**
- 7 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT
CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTBZ bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**
- from 0 to 39 if CONFIG_BOOTLOADER_FACTORY_RESET

**Default value:**
- 4 if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.
CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if `CONFIG_BOOTLOADER_FACTORY_RESET`

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**
- 18 if `CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_HOLD_TIME_GPIO

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST`

CONFIG_BOOTLOADER_WDT_ENABLE

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK.
clock source. After changing a frequency slow_clk a time of WDT needs to be reset for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more than the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
Chapter 2. API

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the eFuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

*Default value:*

- 0 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the eFuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the eFuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

*Range:*

- from 1 to 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- from 1 to 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

*Default value:*

- 32 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
- 16 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with eFuse secure version (only test)

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and eFuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_eFuse, data, eFuse, 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

*Default value:*

- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in: Bootloader config*
This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:
- No (disabled) if (CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:
- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: Bootloader config

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

Default value:
- No (disabled)

CONFIG_BOOTLOADER_CUSTOM_reserve_RTC

Reserve RTC FAST memory for custom purposes

Found in: Bootloader config

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.
**CONFIG_BOOTLOADER_CUSTOM_reserve_RTC_SIZE**

Size in bytes for custom purposes

*Found in:* Bootloader config > CONFIG_BOOTLOADER_CUSTOM_reserve_RTC

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

*Range:*
- from 0 to 0x10 if CONFIG_BOOTLOADER_CUSTOM_reserve_RTC

*Default value:*
- 0 if CONFIG_BOOTLOADER_CUSTOM_reserve_RTC

**CONFIG_BOOTLOADER_FLASH_XMC_Support**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in:* Bootloader config

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

*Default value:*
- Yes (enabled)

**Security features**

Contains:
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_MODE
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_UART_ROM_DL_MODE
- CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

**CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT**

Require signed app images

*Found in:* Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can...
be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG_SECURE_SIGNED_APPS_SCHEME**

App Signing Scheme

*Found in: Security features*

**Available options:**

- **ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)**
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.
  Refer to the documentation before enabling.

- **RSA (SECURE_SIGNED_APPS_RSA_SCHEME)**
  Appends the RSA-3072 based Signature block to the application. Refer to `<Secure Boot Version 2 documentation link>` before enabling.

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**

- **No** (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- **Yes** (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*
Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
- No (disabled)

**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

**Available options:**
- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**
- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (SECURE_BOOTLOADER_REFLECTABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed. If enabled (default), these binary files are signed as part of the build process. The file named “Secure boot private signing key” will be used to sign the image.
If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espfuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**

- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*
You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

*Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible. Read Flash before enabling.***

**Default value:**
- No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**
- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options**

*Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`

**CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC**

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.
When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECRET_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

---

**CONFIG_SECURE_BOOT_ALLOW_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECRET_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

---

**CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

---

**CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block.

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is NOT possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application.
**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

**Default value:**

- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

*Found in: Security features*
If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

**Available options:**

- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

  It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.

  Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

  Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.

  Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.

  It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`.

  Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Serial flasher config**

Contains:

- `CONFIG_ESPTOOLPY_MONITOR_BAUD`
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
Chapter 2. API 参考

- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

*Default value:*
- No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

*Available options:*
- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

*Available options:*
- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

*Available options:*
- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes
Available options:
- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)

CONFIG_ESPTOOLPY_FLASHSIZE_DETECT
Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

*Default value:*
- Yes (enabled)

CONFIG_ESPTOOLPY_BEFORE
Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

*Available options:*
- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER
After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

*Available options:*
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

CONFIG_ESPTOOLPY_MONITOR_BAUD
`idf.py monitor` baud rate

*Found in: Serial flasher config*

Baud rate to use when running `idf.py monitor` or `make monitor` to view serial output from a running chip.

If “Same as UART Console baud rate” is chosen then the value will follow the “UART Console baud rate” config item.

Can override by setting the MONITORBAUD environment variable.

*Available options:*
- Same as UART console baud rate (ESPTOOLPY_MONITOR_BAUD_CONSOLE)
Chapter 2. API

- 9600 bps (ESPTOOLPY_MONITOR_BAUD_9600B)
- 57600 bps (ESPTOOLPY_MONITOR_BAUD_57600B)
- 115200 bps (ESPTOOLPY_MONITOR_BAUD_115200B)
- 230400 bps (ESPTOOLPY_MONITOR_BAUD_230400B)
- 921600 bps (ESPTOOLPY_MONITOR_BAUD_921600B)
- 2 Mbps (ESPTOOLPY_MONITOR_BAUD_2MB)
- Custom baud rate (ESPTOOLPY_MONITOR_BAUD_OTHER)

**CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL**

Custom baud rate value

*Found in: Serial flasher config*

**Default value:**

- 115200

**Partition Table**

Contains:

- **CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**
- **CONFIG_PARTITION_TABLE_MD5**
- **CONFIG_PARTITION_TABLE_OFFSET**
- **CONFIG_PARTITION_TABLE_TYPE**

**CONFIG_PARTITION_TABLE_TYPE**

**Partition Table**

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**

- **Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)**
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- **Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)**
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- **Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)**
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- **Custom partition table CSV (PARTITION_TABLE_CUSTOM)**
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
• Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

• Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

• Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME
Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

*Default value:*
  
  • “partitions.csv”

CONFIG_PARTITION_TABLE_OFFSET
Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

*Default value:*
  
  • “0x8000”

CONFIG_PARTITION_TABLE_MD5
Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

*Default value:*
Chapter 2. API

- Yes (enabled) if CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS

Compiler options

Contains:

- CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL
- CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
- CONFIG_COMPILER_DISABLE_GCC8_WARNINGS
- CONFIG_COMPILER_DUMP_RTL_FILES
- CONFIG_COMPILER_WARN_WRITE_STRINGS
- CONFIG_COMPILER_CXX_EXCEPTIONS
- CONFIG_COMPILER_CXX RTTI
- CONFIG_COMPILER_OPTIMIZATION
- CONFIG_COMPILER_HIDE_PATHS_MACROS
- CONFIG_COMPILER_STACK_CHECK_MODE

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

Available options:

- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:
• Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
• Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
• Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
  Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

  Found in: Compiler options

  If enabled, the error messages will be discarded in following check macros:
  - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

  Default value:
  • No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS
  Replace ESP-IDF and project paths in binaries

  Found in: Compiler options

  When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

  This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

  This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

  Default value:
  • Yes (enabled)

CONFIG_COMPILER_CXX_EXCEPTIONS
  Enable C++ exceptions

  Found in: Compiler options

  Enabling this option compiles all IDF C++ files with exception support enabled.

  Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

  Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

  Default value:
  • No (disabled)

  Contains:
  • CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE
CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if `CONFIG_COMPILER_CXX_EXCEPTIONS`

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected—those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

CONFIG_COMPILER_WARN_WRITE_STRINGS

Enable `-Wwrite-strings` warning flag

*Found in: Compiler options*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.
For C++, this warns about the deprecated conversion from string literals to char *.  

**Default value:**  
• No (disabled)

**CONFIG_COMPILER_DISABLE_GCC8_WARNINGS**  
Disable new warnings introduced in GCC 6 - 8  

*Found in:* Compiler options  
Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.  

**Default value:**  
• No (disabled)

**CONFIG_COMPILER_DUMP_RTL_FILES**  
Dump RTL files during compilation  

*Found in:* Compiler options  
If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

**Application Level Tracing**  Contains:

- `CONFIG_APPTRACE_DESTINATION`
- FreeRTOS SystemView Tracing
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`

**CONFIG_APPTRACE_DESTINATION**

Data Destination

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

*Available options:*

- JTAG (APPTRACE_DEST_JTAG)
- None (APPTRACE_DEST_NONE)

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*
Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- **CONFIG_APPTRACE_SV_ENABLE**

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_TS_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**

- CPU cycle counter (CCOUNT) (APPTRACTCE_SV_TS_SOURCE_CCOUNT)
- Timer 0, Group 0 (APPTRACTCE_SV_TS_SOURCE_TIMER_00)
- Timer 1, Group 0 (APPTRACTCE_SV_TS_SOURCE_TIMER_01)
- Timer 0, Group 1 (APPTRACTCE_SV_TS_SOURCE_TIMER_10)
- Timer 1, Group 1 (APPTRACTCE_SV_TS_SOURCE_TIMER_11)
- esp_timer high resolution timer (APPTRACTCE_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE_SV_MAX_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

Configures maximum supported tasks in sysview debug
**CONFIG_APPTRACE_SV_BUF_WAIT_TMO**

Trace buffer wait timeout

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE**

Trace Buffer Overflow Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Trace Buffer Overflow” event.

**CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**

ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR Enter” event.

**CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**

ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR Exit” event.

**CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**

ISR Exit to Scheduler Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “ISR to Scheduler” event.

**CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE**

Task Start Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Start Execution” event.

**CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE**

Task Stop Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Stop Execution” event.
CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE

Enables “Timer Exit” event.
CONFIG_APPTTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

ESP-ASIO  Contains:

•  CONFIG_ASIO_SSL_SUPPORT

CONFIG_ASIO_SSL_SUPPORT

Enable SSL/TLS support of ASIO

*Found in: Component config > ESP-ASIO*

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

Default value:

•  No (disabled)

CONFIG_ASIO_SSL_LIBRARY_CHOICE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-ASIO > CONFIG_ASIO_SSL_SUPPORT*

The ASIO support multiple backend TLS libraries. Currently the mbedTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

•  esp-openssl (ASIO_USE_ESP_OPENSSL)
•  wolfSSL (License info in wolfSSL directory README) (ASIO_USE_ESP_WOLFSSL)

Bluetooth  Contains:

•  Bluedroid Options
•  CONFIG_BT_ENABLED
•  NimBLE Options

CONFIG_BT_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

Bluetooth controller  Contains:

•  CONFIG_BTDM_CTRL_AUTO_LATENCY
•  CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
•  CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
•  CONFIG_BTDM_CTRL_BLE_MAX_CONN
•  CONFIG_BTDM_BLE_SCAN_DUPL
•  CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
•  CONFIG_BTDM_CTRL_MODE
Chapter 2. API

- `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN`
- `CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH`
- `CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN`
- `CONFIG_BTDM_CTRL_HCI_MODE_CHOICE`
- `HCI UART(H4) Options`
- `CONFIG_BTDM_CTRL_HLI`
- `CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT`
- `MODEM SLEEP Options`
- `CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG`
- `CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE`

### `CONFIG_BTDM_CTRL_MODE`

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (`BTDM_CTRL_MODE_BLE_ONLY`)
- BR/EDR Only (`BTDM_CTRL_MODE_BR_EDR_ONLY`)
- Bluetooth Dual Mode (`BTDM_CTRL_MODE_BTDM`)

### `CONFIG_BTDM_CTRL_BLE_MAX_CONN`

BLE Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 9 if (`BTDM_CTRL_MODE_BLE_ONLY` || `BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_ENABLED`

**Default value:**
- 3 if (`BTDM_CTRL_MODE_BLE_ONLY` || `BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_ENABLED`

### `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN`

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 7 if (`BTDM_CTRL_MODE_BR_EDR_ONLY` || `BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_ENABLED`

**Default value:**
- 2 if (`BTDM_CTRL_MODE_BR_EDR_ONLY` || `BTDM_CTRL_MODE_BTDM`) && `CONFIG_BT_ENABLED`

### `CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN`

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*
BR/EDR synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**Default value:**
- 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH**

BR/EDR Synchronous SCO or eSCO) default data path

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

**Available options:**
- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

**CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG**

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

**Default value:**
- Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && CONFIG_BT_ENABLED

**Contains:**
- CONFIG_BTDM_CTRL_PCM_POLAR
- CONFIG_BTDM_CTRL_PCM_ROLE

**CONFIG_BTDM_CTRL_PCM_ROLE**

PCM Role

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

**Available options:**
- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

**CONFIG_BTDM_CTRL_PCM_POLAR**

PCM Polar

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

**Available options:**
- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)
**CONFIG_BTDM_CTRL_AUTO_LATENCY**

Auto latency

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**Default value:**
- No (disabled) if BTDM_CTRL_MODE_BTDM && CONFIG_BT_ENABLED

**CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT**

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCImode

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

Specify HCImode as VHCI or UART(H4)

**Available options:**
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  - Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  - If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options**

Contains:
- CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE
- CONFIG_BTDM_CTRL_HCI_UART_NO

**CONFIG_BTDM_CTRL_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.
Range:
  • from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && \texttt{CONFIG_BT_ENABLED}

Default value:
  • 1 if BTDM_CTRL_HCI_MODE_UART_H4 && \texttt{CONFIG_BT_ENABLED}

\textbf{CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE}

UART Baudrate for HCI

\textit{Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > HCI UART(H4) Options}

UART Baudrate for HCI. Please use standard baudrate.

Range:
  • from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && \texttt{CONFIG_BT_ENABLED}

Default value:
  • 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && \texttt{CONFIG_BT_ENABLED}

\textbf{MODEM SLEEP Options}

Contains:
  • \texttt{CONFIG_BTDM_CTRL_LOW_POWER_CLOCK}
  • \texttt{CONFIG_BTDM_CTRL_MODEM_SLEEP}

\textbf{CONFIG_BTDM_CTRL_MODEM_SLEEP}

Bluetooth modem sleep

\textit{Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options}

Enable/disable bluetooth controller low power mode.

Default value:
  • Yes (enabled) if \texttt{CONFIG_BT_ENABLED}

\textbf{CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE}

Bluetooth Modem sleep mode

\textit{Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options > CONFIG_BTDM_CTRL_MODEM_SLEEP}

To select which strategy to use for modem sleep

Available options:
  • ORIG Mode(sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
    ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
  • EVED Mode(For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
    EVED mode is for BLE only and is only for internal test. Do not use it for production. this mode is not compatible with DFS nor light sleep

\textbf{CONFIG_BTDM_CTRL_LOW_POWER_CLOCK}

Bluetooth low power clock

\textit{Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > MODEM SLEEP Options}
Select the low power clock source for bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

Available options:
- Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the bluetooth low power clock source.
- External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY

BLE Sleep Clock Accuracy

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g., 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

Available options:
- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

CONFIG_BTDM_BLE_SCAN_DUPL

BLE Scan Duplicate Options

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

This select enables parameters setting of BLE scan duplicate.

Default value:
- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && CONFIG_BT_ENABLED

CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL
Scan duplicate have three ways. one is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:
- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

**CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE**

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*
- from 10 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL && CONFIG_BT_ENABLED

*Default value:*
- 200 if CONFIG_BTDM_BLE_SCAN_DUPL && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

*Default value:*
- No (disabled) if CONFIG_BTDM_BLE_SCAN_DUPL && CONFIG_BT_ENABLED

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

*Range:*
- from 10 to 1000 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN && CONFIG_BT_ENABLED

*Default value:*
- 200 if CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN && CONFIG_BT_ENABLED
**CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED**

BLE full scan feature supported

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

**Default value:**

- 100 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**

- from 1 to 1000 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED
Default value:
• 20 if CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_ENABLED

CONFIG_BTDM_CTRL_HLI

High level interrupt

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED > Bluetooth controller

Using Level 4 interrupt for Bluetooth.

Default value:
• Yes (enabled) if CONFIG_BT_ENABLED && CONFIG_BT_ENABLED

CONFIG_BT_HOST

Bluetooth Host

Found in: Component config > Bluetooth > CONFIG_BT_ENABLED

This helps to choose Bluetooth host stack

Available options:
• Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
• NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
• Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

Bluedroid Options

Contains:
• CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
• CONFIG_BT_BLUEDROID_MEM_DEBUG
• CONFIG_BT_BTH_TASK_STACK_SIZE
• CONFIG_BT_BTU_TASK_STACK_SIZE
• CONFIG_BT_BLE_ENABLED
• BT DEBUG LOG LEVEL
• CONFIG_BT_ACL_CONNECTIONS
• CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
• CONFIG_BT_CLASSIC_ENABLED
• CONFIG_BT_HID_ENABLED
• CONFIG_BT_STACK_NO_LOG
• CONFIG_BT_MULTI_CONNECTION_ENABLE
• CONFIG_BT_MAX_DEVICE_NAME_LEN
• CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN
• CONFIG_BT_SSP_ENABLED
• CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE
• CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT
• CONFIG_BT_BLE_RPA_SUPPORTED
• CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
• CONFIG_BT_HFP_WBS_ENABLE

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

Found in: Component config > Bluetooth > Bluedroid Options
This select btct task stack size

**Default value:**
- 3072 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btut task stack size

**Default value:**
- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED
Chapter 2. API

**CONFIG_BT_SPP_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_ROLE**

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Available options:**

- Hands Free Unit (`BT_HFP_CLIENT_ENABLE`)
- Audio Gateway (`BT_HFP_AG_ENABLE`)

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

Audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**

- PCM (`BT_HFP_AUDIO_DATA_PATH_PCM`)
- HCI (`BT_HFP_AUDIO_DATA_PATH_HCI`)

**CONFIG_BT_HFP_WBS_ENABLE**

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if `BT_HFP_AUDIO_DATA_PATH_HCI` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host
**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_ROLE**

Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

**Available options:**
- Classic BT HID Host (BT_HID_HOST_ENABLED)
  This enables the BT HID Host
- Classic BT HID Device (BT_HID_DEVICE_ENABLED)
  This enables the BT HID Device

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**
- Yes (enabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module (GATTs)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_PPCP_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`
CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: Component config > Bluetooth > Bluebroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:
- No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUE_DROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluebroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:
- from 1 to 32 if CONFIG_BT_GATTS_ENABLE && BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

Default value:
- 8 if CONFIG_BT_GATTS_ENABLE && BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE

GATT Service Change Mode

Found in: Component config > Bluetooth > Bluebroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Service change indication mode for GATT Server.

Available options:
- GATTs manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
- GATTs automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)

Let Bluebroid handle the service change indication internally

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: Component config > Bluetooth > Bluebroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

Default value:
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUE_DROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluebroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash
**Default value:**
- No (disabled) if `CONFIG_BT_GATTC_ENABLE` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

*Range:*
- from 0 to 7 if `CONFIG_BT_GATTC_ENABLE` & `BT_BLUEDROID_ENABLED`

*Default value:*
- 3 if `CONFIG_BT_GATTC_ENABLE` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module (SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

*Default value:*
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

*Default value:*
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

*Default value:*
- No (disabled) if `BT_BLUEDROID_ENABLED` & `BT_BLUEDROID_ENABLED`

**BT DEBUG LOG LEVEL**

Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
• CONFIG_BT_LOG_GAP_TRACE_LEVEL
• CONFIG_BT_LOG_GATT_TRACE_LEVEL
• CONFIG_BT_LOG_HCI_TRACE_LEVEL
• CONFIG_BT_LOG_HID_TRACE_LEVEL
• CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
• CONFIG_BT_LOG_MCA_TRACE_LEVEL
• CONFIG_BT_LOG_OSI_TRACE_LEVEL
• CONFIG_BT_LOG_PAN_TRACE_LEVEL
• CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
• CONFIG_BT_LOG_SDP_TRACE_LEVEL
• CONFIG_BT_LOG_SMP_TRACE_LEVEL

CONFIG_BT_LOG_HCI_TRACE_LEVEL

HCI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:
• NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
• API (BT_LOG_HCI_TRACE_LEVEL_API)
• EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:
• NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTM_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

Available options:
• NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_L2CAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:

- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:

- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:

- NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:

- NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (BT_LOG_BNEP_TRACE_LEVEL_API)
Chapter 2. API

- EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

*Available options:*

- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer

*Available options:*

- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVDT layer

*Available options:*

- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer
Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL
AVRClayer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRC layer

Available options:
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL
MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL
HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)
Chapter 2. API

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**

- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

**Available options:**
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

**Available options:**
• NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
• API (BT_LOG_OSI_TRACE_LEVEL_API)
• EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

**Available options:**
• NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
• API (BT_LOG_BLUFI_TRACE_LEVEL_API)
• EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count
Range:
- from 1 to 7 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENBALE**

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

Default value:
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

Default value:
Chapter 2. API

• No (disabled) if BT_BLUE_ DROID_ENABLED && (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_BLUE_ DROID_ENABLED

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: Component config > Bluetooth > Blue_ droid Options

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

Range:
• from 1 to 60 if BT_BLUE_ DROID_ENABLED && BT_BLUE_ DROID_ENABLED
Default value:
• 30 if BT_BLUE_ DROID_ENABLED && BT_BLUE_ DROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

length of bluetooth device name

Found in: Component config > Bluetooth > Blue_ droid Options

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

Range:
• from 32 to 248 if BT_BLUE_ DROID_ENABLED && BT_BLUE_ DROID_ENABLED
Default value:
• 32 if BT_BLUE_ DROID_ENABLED && BT_BLUE_ DROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: Component config > Bluetooth > Blue_ droid Options

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3 and esp32s3, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:
• No (disabled) if BT_BLUE_ DROID_ENABLED && BT_BLUE_ DROID_ENABLED

NimBLE Options
Contains:
• CONFIG_BT_NIMBLE_ACL_BUF_COUNT
• CONFIG_BT_NIMBLE_ACL_BUF_SIZE
• CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
• CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
• CONFIG_BT_NIMBLE_ROLE_BROADCASTER
• CONFIG_BT_NIMBLE_ROLE_CENTRAL
• CONFIG_BT_NIMBLE_MESH
• CONFIG_BT_NIMBLE_ROLE_OBSERVER
• CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
Chapter 2. API

- CONFIG_BT_NIMBLE_BLUFI_ENABLE
- CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
- CONFIG_BT_NIMBLE_USE_ESP_TIMER
- CONFIG_BT_NIMBLE_DEBUG
- CONFIG_BT_NIMBLE_HS_FLOW_CTRL
- CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

- CONFIG_BT_NIMBLE_SM_LEGACY
- CONFIG_BT_NIMBLE_SM_SC
- CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
- CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

**Available options:**

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BT_NIMBLE_LOG_LEVEL**

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity”.

**Available options:**

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
Chapter 2. API

- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

*Range:*

- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

*Default value:*

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

*Default value:*

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

*Range:*

- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*

- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity
Available options:
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_TASK_STACK_SIZE**
NimBLE Host task stack size
*Found in: Component config > Bluetooth > NimBLE Options*
This configures stack size of NimBLE host task
**Default value:**
- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**
Enable BLE Central role
*Found in: Component config > Bluetooth > NimBLE Options*
**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**
Enable BLE Peripheral role
*Found in: Component config > Bluetooth > NimBLE Options*
**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_BROADCASTER**
Enable BLE Broadcaster role
*Found in: Component config > Bluetooth > NimBLE Options*
**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_OBSERVER**
Enable BLE Observer role
*Found in: Component config > Bluetooth > NimBLE Options*
**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_NVS_PERSIST**
Persist the BLE Bonding keys in NVS
*Found in: Component config > Bluetooth > NimBLE Options*
Enable this flag to make bonding persistent across device reboots
**Default value:**
- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SM_LEGACY
Security manager legacy pairing

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC
Security manager secure connections (4.2)

Default value:
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG
Enable extra runtime asserts and host debugging

Default value:
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS
Use predefined public-private key pair

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
BLE GAP default device name

Default value:
- “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
Maximum length of BLE device name in octets

Default value:
- 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**Default value:**
- 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**Default value:**
- 20 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*
This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**
- 30 ifBT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**
- 8 if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT**

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 12 if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

**Default value:**
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL & BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
Chapter 2. API

• 2 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable this option to send number-of-completed-packets event to controller after disconnection

Default value:

• Yes (enabled) if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

Found in: Component config > Bluetooth > NimBLE Options

Time interval between RPA address change. This is applicable in case of Host based RPA

Range:

• from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:

• 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

Found in: Component config > Bluetooth > NimBLE Options

Enable BLE Mesh functionality

Default value:

• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:

• CONFIG_BT_NIMBLE_MESH_PROVISIONER
• CONFIG_BT_NIMBLE_MESH_PROV
• CONFIG_BT_NIMBLE_MESH_GATT_PROXY
• CONFIG_BT_NIMBLE_MESH_FRIEND
• CONFIG_BT_NIMBLE_MESH_LOW_POWER
• CONFIG_BT_NIMBLE_MESH_PROXY
• CONFIG_BT_NIMBLE_MESH_RELAY
• CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
• CONFIG_BT_NIMBLE_MESH_NODE_COUNT

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

Default value:

• No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_PROV
Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_ADV
Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_FRIEND**
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**
• “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_NODE_COUNT**
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**
• 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PROVISIONER**
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**
• 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS**
Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
• Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS**
BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**
Chapter 2. API

• 2000 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT**
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
• No (disabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT**
Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*

Defines maximum number of connection reattempts.

**Range:**
• from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**Default value:**
• 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_BLUFI_ENABLE**
Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

**Default value:**
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_USE_ESP_TIMER**
Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**
• Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_BLE_MESH**
ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:
• BLE Mesh and BLE coexistence support
• CONFIG_BLE_MESH_GATT_PROXY_CLIENT
- CONFIG_BLE_MESH_GATT_PROXY_SERVER
- BLE Mesh NET BUF DEBUG LOG LEVEL
- CONFIG_BLE_MESH_PROV
- CONFIG_BLE_MESH_PROXY
- BLE Mesh specific test option
- BLE Mesh STACK DEBUG LOG LEVEL
- CONFIG_BLE_MESH_NO_LOG
- CONFIG_BLE_MESH_IVU_DIVIDER
- CONFIG_BLE_MESH_FAST_PROV
- CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
- CONFIG_BLE_MESH_CRPL
- CONFIG_BLE_MESH_RX_SDU_MAX
- CONFIG_BLE_MESH_MODEL_KEY_COUNT
- CONFIG_BLE_MESH_APP_KEY_COUNT
- CONFIG_BLE_MESH_MODEL_GROUP_COUNT
- CONFIG_BLE_MESH_LABEL_COUNT
- CONFIG_BLE_MESH_SUBNET_COUNT
- CONFIG_BLE_MESH_TX_SEG_MAX
- CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
- CONFIG_BLE_MESH_TX_SEG_MSG_COUNT
- CONFIG_BLE_MESH_MEM_ALLOC_MODE
- CONFIG_BLE_MESH_MSG_CACHE_SIZE
- CONFIG_BLE_MESH_ADV_BUF_COUNT
- CONFIG_BLE_MESH_PB_GATT
- CONFIG_BLE_MESH_PB_ADV
- CONFIG_BLE_MESH_RELAY
- CONFIG_BLE_MESH_SETTINGS
- CONFIG_BLE_MESH_DEINIT
- CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- CONFIG_BLE_MESH_NODE
- CONFIG_BLE_MESH_PROVISIONER
- CONFIG_BLE_MESH_FRIEND
- CONFIG_BLE_MESH_LOW_POWER
- CONFIG_BLE_MESH_HCI_5_0
- CONFIG_BLE_MESH_IV_UPDATE_TEST
- CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**Default value:**
• Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

• Internal DRAM memory only
• External SPIRAM memory only
• Either internal or external memory based on default malloc() behavior in ESP-IDF
• Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

• Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
• External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
• Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)

Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

• Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

• No (disabled) if (CONFIG_ESP32_SPIRAM_SUPPORT || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**

• External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)

If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack.
when `SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` is enabled. See the SPIRAM options for more details.

- **Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)**
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

**CONFIG_BLE_MESH_DEINIT**

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

**BLE Mesh and BLE coexistence support**

Contains:

- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

**CONFIG_BLE_MESH_SUPPORT_BLE_ADV**

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT**

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUPPORT_BLE_SCAN**

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_FAST_PROV

Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NODE

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
• 10 if \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME}

Maximum number of PB-ADV running at the same time by Provisioner

\textit{Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER}

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

\textbf{Range:}

• from 1 to 10 if \texttt{CONFIG\_BLE\_MESH\_PB\_ADV} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{Default value:}

• 2 if \texttt{CONFIG\_BLE\_MESH\_PB\_ADV} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{CONFIG\_BLE\_MESH\_PB\_GATT\_SAME\_TIME}

Maximum number of PB-GATT running at the same time by Provisioner

\textit{Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER}

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

\textbf{Range:}

• from 1 to 5 if \texttt{CONFIG\_BLE\_MESH\_PB\_GATT} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{Default value:}

• 1 if \texttt{CONFIG\_BLE\_MESH\_PB\_GATT} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT}

Maximum number of mesh subnets that can be created by Provisioner

\textit{Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER}

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

\textbf{Range:}

• from 1 to 4096 if \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{Default value:}

• 3 if \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT}

Maximum number of application keys that can be owned by Provisioner

\textit{Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER}

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

\textbf{Range:}

• from 1 to 4096 if \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}

\textbf{Default value:}

• 3 if \texttt{CONFIG\_BLE\_MESH\_PROVISIONER} \\
\texttt{&&} \texttt{CONFIG\_BLE\_MESH}
**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of `BLE_MESH_FAST_PROV` is selected, the value is better to be 3 seconds, or less.
Range:
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

Default value:
- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PB_GATT`

**CONFIG_BLE_MESH_PB_GATT**

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

**CONFIG_BLE_MESH_PROXY**

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

*Default value:*
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

*Default value:*
- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

*Range:*
- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

*Default value:*
- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

*Range:*

- from 1 to 32767 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

*Default value:*

- 4 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

*Default value:*

- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

*Default value:*

- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

*Range:*

- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

*Default value:*

- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SEQ_STORE_RATE**
How often the sequence number gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:
- No (disabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS
When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`  

**CONFIGBLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh  
*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION`  
This value defines the name of the specified NVS partition used by the mesh stack.  

**Default value:**
- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner  
*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`  
When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.  

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_MAX_NVSNAMESPACE**

Maximum number of NVS namespaces  
*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`  
This option specifies the maximum NVS namespaces supported by Provisioner.  

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`  

**Default value:**
- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network  
*Found in:* `Component config > CONFIG_BLE_MESH`
This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**
- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

*Range:*
- from 2 to 65535 if **CONFIG_BLE_MESH**

*Default value:*
- 10 if **CONFIG_BLE_MESH**

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

*Range:*
- from 2 to 65535 if **CONFIG_BLE_MESH**

*Default value:*
- 10 if **CONFIG_BLE_MESH**

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

*Range:*
- from 6 to 256 if **CONFIG_BLE_MESH**

*Default value:*
- 60 if **CONFIG_BLE_MESH**

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to
happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**
- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**
- 384 if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

*Range:*
  - from 2 to 32 if CONFIG_BLE_MESH

*Default value:*
  - 32 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

*Default value:*
  - No (disabled) if CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

*Range:*
  - from 6 to 256 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

*Default value:*
  - 60 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN node needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
• from 1 to 3600 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

Default value:
• 6 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
• from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

Default value:
• 0 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
• from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

Default value:
• 0 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

Range:
• from 1 to 7 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

Default value:
• 1 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RECV_DELAY

Receive delay requested by the local node

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

Range:
• from 10 to 255 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH

Default value:
• 100 if CONFIG_BLE_MESH_LOW_POWER & CONFIG_BLE_MESH
**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_SCAN_LATENCY**

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_GROUPS**

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`
Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in:* Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

BLE Mesh STACK DEBUG LOG LEVEL

Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**
- NONE (BLE_MESHTRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**
- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
Chapter 2. API

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout (ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**
- from 100 to 1200000 if `CONFIG_BLE_MESH`

**Default value:**
- 4000 if `CONFIG_BLE_MESH`

**Support for BLE Mesh Foundation models**

Contains:

- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG_BLE_MESH_HEALTH_SRV**

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**Support for BLE Mesh Client/Server models**

Contains:

- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH GENERIC_SERVER`
Chapter 2. API

- CONFIG_BLE_MESH_LIGHT_CTL_CLI
- CONFIG_BLE_MESH_LIGHT_HSL_CLI
- CONFIG_BLE_MESH_LIGHT_LC_CLI
- CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
- CONFIG_BLE_MESH_LIGHT_XYL_CLI
- CONFIG_BLE_MESH_LIGHTING_SERVER
- CONFIG_BLE_MESH_SCENE_CLI
- CONFIG_BLE_MESH_SCHEDULER_CLI
- CONFIG_BLE_MESH_SENSOR_CLI
- CONFIG_BLE_MESH_SENSOR_SERVER
- CONFIG_BLE_MESH_TIME_SCENE_SERVER
- CONFIG_BLE_MESH_TIME_CLI

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

CONFIG_BLE_MESH_GENERIC_LEVEL_CLI

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI

Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI

Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI

Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI

Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.
CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
Scheduler Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model

Located in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light CTL Client model.
CONFIG_BLE_MESH_LIGHT_HSL_CLI
Light HSL Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
Light XYL Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI
Light LC Client model
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER
Generic server models
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic server models.
**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_SENSOR_SERVER
Sensor server models
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Sensor server models.
**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER
Time and Scenes server models
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Time and Scenes server models.
**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER
Lighting server models
*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Lighting server models.
**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_IV_UPDATE_TEST
Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option** Contains:
- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_SELF_TEST`

CONFIG_BLE_MESH_SELF_TEST
Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK
Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST
Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SHELL
Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_DEBUG
Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET
Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS
Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON
Beacon debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO
Crypto debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV
Provisioning debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS
Access layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

CoAP Configuration

Contains:

- CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE
- CONFIG_COAP_MBEDTLS_DEBUG

CONFIG_COAP_MBEDTLS_ENCRYPTION_MODE

CoAP Encryption method

*Found in:* Component config > CoAP Configuration

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)

- Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
- Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

Available options:

- Pre-Shared Keys (COAP_MBEDTLS_PSK)
- PKI Certificates (COAP_MBEDTLS_PKI)
CONFIG_COAP_MBEDTLS_DEBUG

Enable CoAP debugging

*Found in: Component config > CoAP Configuration*

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call `coap_set_log_level()` at runtime in order to enable CoAP debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

CONFIG_COAP_MBEDTLS_DEBUG_LEVEL

Set CoAP debugging level

*Found in: Component config > CoAP Configuration > CONFIG_COAP_MBEDTLS_DEBUG*

Set CoAP debugging level

**Available options:**

- Emergency (COAP_LOG_EMERG)
- Alert (COAP_LOG_ALERT)
- Critical (COAP_LOG_CRIT)
- Error (COAP_LOG_ERROR)
- Warning (COAP_LOG_WARNING)
- Notice (COAP_LOG_NOTICE)
- Info (COAP_LOG_INFO)
- Debug (COAP_LOG_DEBUG)
- mbedTLS (COAP_LOG_MBEDTLS)

**Driver configurations**

Contains:

- ADC configuration
- GDMA Configuration
- GPIO Configuration
- MCPWM configuration
- RTCIO configuration
- SPI configuration
- TWAI configuration
- UART configuration

ADC configuration

Contains:

- `CONFIG_ADC_DISABLE_DAC`
- `CONFIG_ADC_FORCE_XPD_FSM`

CONFIG_ADC_FORCE_XPD_FSM

Use the FSM to control ADC power

*Found in: Component config > Driver configurations > ADC configuration*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**Default value:**

- No (disabled)
**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

**MCPWM configuration**  
Contains:

- **CONFIG_MCPWM_ISR_IN_IRAM**

**CONFIG_MCPWM_ISR_IN_IRAM**

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver configurations > MCPWM configuration*

If this option is not selected, the MCPWM interrupt will be deferred when the Cache is in a disabled state (e.g. Flash write/erase operation).

Note that if this option is selected, all user registered ISR callbacks should never try to use cache as well (with IRAM_ATTR)

**Default value:**
- No (disabled)

**SPI configuration**  
Contains:

- **CONFIG_SPI_MASTER_ISR_IN_IRAM**
- **CONFIG_SPI_SLAVE_ISR_IN_IRAM**
- **CONFIG_SPI_MASTER_IN_IRAM**
- **CONFIG_SPI_SLAVE_IN_IRAM**

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.
Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI configuration**

Contains:

- `CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID`
- `CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC`
- `CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT`
- `CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver configurations > TWAI configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

**Default value:**
- No (disabled)
CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC
Add SW workaround for REC change during bus-off

*Found in: Component config > Driver configurations > TWAI configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**
- No (disabled)

CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST
Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

**Default value:**
- No (disabled)

CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID
Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**
- No (disabled)

CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT
Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver configurations > TWAI configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**
- No (disabled)

UART configuration Contains:

- **CONFIG_UART_ISR_IN_IRAM**
Chapter 2. API

**CONFIG_UART_ISR_IN_IRAM**

Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled)

**RTCIO configuration**  Contains:

- **CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC**

**CONFIG_RTCIO_SUPPORT_RTC_GPIO_DESC**

Support array rtc_gpio_desc for ESP32

*Found in: Component config > Driver configurations > RTCIO configuration*

The array rtc_gpio_desc will not compile by default. If this option is selected, the array rtc_gpio_desc can be compile. If user use this array, please enable this configuration.

**Default value:**
- No (disabled)

**GPIO Configuration**  Contains:

- **CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**

**CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**

Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: Component config > Driver configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

**GDMA Configuration**  Contains:

- **CONFIG_GDMA_ISR_IRAM_SAFE**
- **CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

Place GDMA control functions into IRAM

*Found in: Component config > Driver configurations > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)
CONFIG_GDMA_ISR_IRAM_SAFE

GDMA ISR IRAM-Safe

*Found in: Component config > Driver configurations > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**eFuse Bit Manager**  Contains:
- `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`
- `CONFIG_EFUSE_VIRTUAL`
- `CONFIG_EFUSE_CUSTOM_TABLE`

**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if `CONFIG_EFUSE_CUSTOM_TABLE`

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “y” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: “efuse_em, data, efuse, , 0x2000,”
During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**

- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS** Contains:

- `CONFIG_ESP_TLS_INSECURE`
- `CONFIG_ESP_TLS_LIBRARY_CHOOSE`
- `CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS`
- `CONFIG_ESP_DEBUG_WOLFSSL`
- `CONFIG_ESP_TLS_SERVER`
- `CONFIG_ESP_TLS_PSK_VERIFICATION`
- `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`
- `CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY`
- `CONFIG_ESP_TLS_USE_SECURE_ELEMENT`

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

**CONFIG_ESP_TLS_USE_SECURE_ELEMENT**

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

**Default value:**

- No (disabled)

**CONFIG_ESP_TLS_SERVER**

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*
Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS**
Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_SERVER_SESSION_TICKETS**
Enable server session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

**Default value:**
- No (disabled) if `CONFIG_ESP_TLS_SERVER && ESP_TLS_USING_MBEDTLS && CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`

**CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT**
Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**
- 86400 if `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`

**CONFIG_ESP_TLS_PSK_VERIFICATION**
Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**Default value:**
- No (disabled)

**CONFIG_ESP_TLS_INSECURE**
Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.
CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

CONFIG_ESP_DEBUG_WOLFSSL

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**Default value:**
- No (disabled) if ESP_TLS_USING_WOLFSSL

ESP32-specific Contains:

- CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
- CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS
- CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS
- CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ
- CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL
- CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY
- CONFIG_ESP32_ULP_COPROC_ENABLED
- CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP32_BROWNOUT_DET
- CONFIG_ESP32_XTAL_FREQ_SEL
- CONFIG_ESP32_DEBUG_OCDAWARE
- CONFIG_ESP32_REV_MIN
- CONFIG_ESP32_NO_BLOBS
- CONFIG_ESP32_RTC_XTAL_CAL_RETRY
- CONFIG_ESP32_RTC_CLK_CAL_CYCLES
- CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE
- CONFIG_ESP32_RTCDATA_IN_FAST_MEM
- CONFIG_ESP32_RTC_CLK_SRC
- CONFIG_ESP32_SPIRAM_SUPPORT
- CONFIG_ESP32_TIME_SYSCALL
- CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE
**CONFIG_ESP32_TRAX**

**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

*Found in: Component config > ESP32-specific*

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

*Available options:*

- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)

**CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP32-specific*

CPU frequency to be set on application startup.

*Available options:*

- 40 MHz (ESP32_DEFAULT_CPU_FREQ_40)
- 80 MHz (ESP32_DEFAULT_CPU_FREQ_80)
- 160 MHz (ESP32_DEFAULT_CPU_FREQ_160)
- 240 MHz (ESP32_DEFAULT_CPU_FREQ_240)

**CONFIG_ESP32_SPIRAM_SUPPORT**

Support for external, SPI-connected RAM

*Found in: Component config > ESP32-specific*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

*Default value:*

- No (disabled)

**SPI RAM config**

Contains:

- `CONFIG_SPIRAM.Allow_BSS_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM.Allow_NOINIT_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM.Allow_STACK_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_SPIWP_SD3_PIN`
- `CONFIG_SPIRAM_BANKSWITCH_ENABLE`
- `CONFIG_SPIRAM_2T_MODE`
- `CONFIG_SPIRAM_CACHE_WORKAROUND`
- `CONFIG_SPIRAM_BOOT_INIT`
- `CONFIG_SPIRAM_MALLOCP_ALWAYSINTERNAL`
- `PSRAM clock and cs IO for ESP32-D2WD`
- `PSRAM clock and cs IO for ESP32-DOWD`
- `PSRAM clock and cs IO for ESP32-PICO`
- `CONFIG_SPIRAM_MALLOCP_RESERVE_INTERNAL`
- `CONFIG_SPIRAM_MEMTEST`
- `CONFIG_SPIRAM_SPEED`
- `CONFIG_SPIRAM_OCCUPY_SPI_HOST`
- `CONFIG_SPIRAM_USE`
- `SPIRAM cache workaround debugging`
Chapter 2. API

- SPIRAM workaround libraries placement
- CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
- CONFIG_SPIRAM_TYPE
- CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

**Available options:**
- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

*Note: If the third mode (80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY_FLASHFREQ_80M is true)*

**Available options:**
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**Default value:**
- Yes (enabled) if CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psramp initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**Default value:**
Chapter 2. API

### CONFIG_SPIRAM_USE

SPI RAM access method

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

**Available options:**

- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

### CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**Default value:**

- Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_ESP32_SPIRAM_SUPPORT

### CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

**Range:**

- from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**

- 16384 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

### CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**Default value:**

- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**
- From 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**
- 32768 if SPIRAM_USE_MALLOC && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
Allow .bss segment placed in external memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If enabled, variables with EXT_RAM_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS sections of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_ATTR will be zero initialized.

CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY
Allow .noinit segment placed in external memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

CONFIG_SPIRAM_CACHE_WORKAROUND
Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**Default value:**
SPIRAM cache workaround debugging  Contains:

- `CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY`

`CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY`
Workaround strategy

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situations.

**Available options:**

- Insert memw after vulnerable instructions (default) (SPIRAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPIRAM_CACHE_WORKAROUND_STRATEGY_NOPS)

SPIRAM workaround libraries placement  Contains:

- `CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`

`CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`

Put libc’s jump related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`
CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM

Put libc’s math related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config
SPIRAM workaround libraries placement

The functions affected by this option are: abs, div, labs, ldiv, quorem, fclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM

Put libc’s number parsing related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config
SPIRAM workaround libraries placement

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM

Put libc’s I/O related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config
SPIRAM workaround libraries placement

The functions affected by this option are: wcrtomb, fwrite, wbuf, wsetup, fputwc, wcrtomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

Put libc’s time related functions in IRAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config
SPIRAM workaround libraries placement

The functions affected by this option are: asctime, asctime_r, ctime, ctime_r, localtime, localtime_r, gmtime, gmtime_r, strftime, mktime, tzset, tzset_r, time,getzinfo, systimes, month_lengths, timelocal, tzvars, tzlock, tzcalc_limits, and strftime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT
CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM

Put libc’s characters related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPI RAM workaround libraries placement*

The functions affected by this option are: `ctype`, `toupper`, `tolower`, `toascii`, `strupr`, `bzero`, `isalnum`, `isalpha`, `isascii`, `isblank`, `iscntrl`, `isdigit`, `isgraph`, `islower`, `ispunct`, `isspace`, and `isupper`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`

CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM

Put libc’s memory related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPI RAM workaround libraries placement*

The functions affected by this option are: `memcpy`, `memchr`, `memmove`, and `memrchr`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`

CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM

Put libc’s string related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPI RAM workaround libraries placement*

The functions affected by this option are: `strncasecmp`, `strcasestr`, `strchr`, `strcoll`, `strcpy`, `strcspn`, `strdup`, `strdup_r`, `stricmp`, `strlcpy`, `strlen`, `strlwr`, `strnstr`, `strnstr`, `strncpy`, `strncpy`, `strndup`, `strndup_r`, `strrchr`, `strsep`, `strstr`, `strtok_r`, and `strupr`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`

CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM

Put libc’s random related functions in IRAM

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPI RAM workaround libraries placement*

The functions affected by this option are: `srand`, `rand`, and `rand_r`. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_ESP32_SPIRAM_SUPPORT`
**CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM**

Put libc’s environment related functions in IRAM.

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: environ, envlock, and getenv_r. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**

Put libc’s file related functions in IRAM.

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, brk, stdio, syssbrk, syscall, fopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**

Put libc’s miscellaneous functions in IRAM, see help.

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: raise and system. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*  
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_BANKSWITCH_ENABLE**

Enable bank switching for >4MiB external RAM.

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_spiram_writeback_cache needs some kind of mapping of some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

*Default value:*
• Yes (enabled) if \((\text{SPIRAM\_USE\_MEMMAP} \lor \text{SPIRAM\_USE\_CAPS\_ALLOC} \lor \text{SPIRAM\_USE\_Malloc}) \land \text{CONFIG\_ESP32\_SPIRAM\_SUPPORT})

**CONFIG\_SPIRAM\_BANKSWITCH\_RESERVE**

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP32-specific > CONFIG\_ESP32\_SPIRAM\_SUPPORT > SPI RAM config > CONFIG\_SPIRAM\_BANKSWITCH\_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp\_heap\_alloc\_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp\_heap\_alloc\_caps.

**Range:**
• from 1 to 62 if CONFIG\_SPIRAM\_BANKSWITCH\_ENABLE \land \text{CONFIG\_ESP32\_SPIRAM\_SUPPORT}

**Default value:**
• 8 if CONFIG\_SPIRAM\_BANKSWITCH\_ENABLE \land \text{CONFIG\_ESP32\_SPIRAM\_SUPPORT}

**CONFIG\_SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP32-specific > CONFIG\_ESP32\_SPIRAM\_SUPPORT > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

**Default value:**
• No (disabled) if SPIRAM\_USE\_Malloc \land \text{CONFIG\_ESP32\_SPIRAM\_SUPPORT}

**CONFIG\_SPIRAM\_OCCUPY\_SPI\_HOST**

SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP32-specific > CONFIG\_ESP32\_SPIRAM\_SUPPORT > SPI RAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**
• HSPI host (SPI2) (SPIRAM\_OCCUPY\_HSPI\_HOST)
• VSPI host (SPI3) (SPIRAM\_OCCUPY\_VSPI\_HOST)
• Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM\_OCCUPY\_NO\_HOST)

**PSRAM clock and cs IO for ESP32-DOWD**

Contains:
• CONFIG\_DOWD\_PSRAM\_CLK\_IO
• CONFIG\_DOWD\_PSRAM\_CS\_IO
### CONFIG_D0WD_PSRAM_CLK_IO

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**Default value:**
- 17 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

### CONFIG_D0WD_PSRAM_CS_IO

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**Default value:**
- 16 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

### PSRAM clock and cs IO for ESP32-D2WD

Contains:
- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`

### CONFIG_D2WD_PSRAM_CLK_IO

PSRAM CLK IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

**Default value:**
- 9 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP32_SPIRAM_SUPPORT`

### CONFIG_D2WD_PSRAM_CS_IO

PSRAM CS IO number

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
Chapter 2. API

PSRAM clock and cs IO for ESP32-PICO

Contains:

- CONFIG_PICO_PSRAM_CS_IO

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to [https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf](https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf)

*Range:*

- from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

*Default value:*

- 10 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

*Default value:*

- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

*Range:*

- from 0 to 33 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

*Default value:*

- 10 if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT
- from 0 to 33 if (ESP_TOOLPY_FLASHMODE_DIO || ESP_TOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

**Default value:**
- 7 if (ESP_TOOLPY_FLASHMODE_DIO || ESP_TOOLPY_FLASHMODE_DOUT) && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

**Default value:**
- No (disabled) if CONFIG_ESP32_SPIRAM_SUPPORT && CONFIG_ESP32_SPIRAM_SUPPORT

**CONFIG_ESP32_TRAX**

Use TRAX tracing feature

*Found in: Component config > ESP32-specific*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
- No (disabled)

**CONFIG_ESP32_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP32-specific > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**
- No (disabled) if CONFIG_ESP32_TRAX && CONFIG_FREERTOS_UNICORE

**CONFIG_ESP32_ulp_copro_enabled**

Enable Ultra Low Power (ULP) Coprocessor

*Found in: Component config > ESP32-specific*

Set to ‘y’ if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

**Default value:**
- No (disabled)
CONFIG_ESP32_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

*Found in: Component config > ESP32-specific > CONFIG_ESP32_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP coprocessor firmware & data.
Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if `CONFIG_ESP32_ULP_COPROC_ENABLED`
- from 0 to 0 if `CONFIG_ESP32_ULP_COPROC_ENABLED`

**Default value:**
- 512 if `CONFIG_ESP32_ULP_COPROC_ENABLED`
- 0 if `CONFIG_ESP32_ULP_COPROC_ENABLED`

CONFIG_ESP32_DEBUG_OCD AWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP32-specific*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

CONFIG_ESP32_BROWNOUT_DET

Hardware brownout detect & reset

*Found in: Component config > ESP32-specific*

The ESP32 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
- Yes (enabled)

CONFIG_ESP32_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in: Component config > ESP32-specific > CONFIG_ESP32_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP32 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_7)
Chapter 2. API

**CONFIG_ESP32_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > ESP32-specific*

This setting defines which hardware timers are used to implement `gettimeofday` and `time` functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.
- If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (ESP32_TIME_SYSCALL_USE_RTC_FRC1)
- RTC (ESP32_TIME_SYSCALL_USE_RTC)
- High-resolution timer (ESP32_TIME_SYSCALL_USE_FRC1)
- None (ESP32_TIME_SYSCALL_USE_NONE)

**CONFIG_ESP32_RTC_CLK_SRC**

RTC clock source

*Found in: Component config > ESP32-specific*

Choose which clock is used as RTC clock source.

- “Internal 150kHz oscillator” option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- “External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
- “External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin can not be used as a GPIO in this case.
- “Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

**Available options:**

- Internal 150kHz RC oscillator (ESP32_RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (ESP32_RTC_CLK_SRC_EXT_CRYST)
- External 32kHz oscillator at 32K_XN pin (ESP32_RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (ESP32_RTC_CLK_SRC_INT_8MD256)

**CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD**

Additional current for external 32kHz crystal

*Found in: Component config > ESP32-specific*

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the
external 32kHz crystal. Note that the deep sleep current is slightly high (4.5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2. This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, , allow all wakeup sources, and save some code size.

- “None” option will not provide additional current to external crystal
- “Method 1” option can’t ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
- “Method 2” option can solve the external 32k issue, but the touchpad can’t work in this method.

Available options:
- None (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
- Method 1 (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT)
- Method 2 (ESP32_RTC_EXT_CRYST_ADDIT_CURRENT_V2)

CONFIG_ESP32_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

*Found in:* Component config > ESP32-specific

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

*Range:*
- from 0 to 27000 if ESP32_RTC_CLK_SRC_EXT_CRYST || ESP32_RTC_CLK_SRC_EXT_OSC || ESP32_RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

*Default value:*
- 3000 if ESP32_RTC_CLK_SRC_EXT_CRYST || ESP32_RTC_CLK_SRC_EXT_OSC || ESP32_RTC_CLK_SRC_INT_8MD256
- 1024

CONFIG_ESP32_RTC_XTAL_CAL_RETRY

Number of attempts to repeat 32k XTAL calibration

*Found in:* Component config > ESP32-specific

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

*Default value:*
- 1 if ESP32_RTC_CLK_SRC_EXT_CRYST

CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

*Found in:* Component config > ESP32-specific
When ESP32 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

Range:
- from 0 to 5000
Default value:
- 2000

**CONFIG_ESP32_XTAL_FREQ_SEL**

Main XTAL frequency

*Found in: Component config > ESP32-specific*

ESP32 currently supports the following XTAL frequencies:
- 26 MHz
- 40 MHz

Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.

**Available options:**
- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
- Autodetect (ESP32_XTAL_FREQ_AUTO)

**CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE**

Permanently disable BASIC ROM Console

*Found in: Component config > ESP32-specific*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**
- No (disabled)

**CONFIG_ESP32_NO_BLOBS**

No Binary Blobs

*Found in: Component config > ESP32-specific*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED`
**CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Component config > ESP32-specific*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

*Default value:*

- No (disabled)

**CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Component config > ESP32-specific*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

*Default value:*

- No (disabled)

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP32-specific*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

*Default value:*

- No (disabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP32-specific*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

*Default value:*

- No (disabled)
CONFIG_ESP32_FIXED_STATIC_RAM_SIZE

Fixed Static RAM size

Found in: Component config > ESP32-specific > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_RESERVE_DRAM if Bluetooth controller is enabled.

Range:
- from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

Default value:
- “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_DPDK_DIS_INTERRUPT_LVL

Disable the interrupt level for the DPORT workarounds

Found in: Component config > ESP32-specific

To prevent interrupting DPORT workarounds, need to disable interrupt with a maximum used level in the system.

Default value:
- 5

CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY

Enable IRAM as 8 bit accessible memory

Found in: Component config > ESP32-specific

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

ADC-Calibration Contains:

- CONFIG_ADC_CAL_EFUSE_VREF_ENABLE
- CONFIG_ADC_CAL_LUT_ENABLE
- CONFIG_ADC_CAL_EFUSE_TP_ENABLE

CONFIG_ADC_CAL_EFUSE_TP_ENABLE

Use Two Point Values

Found in: Component config > ADC-Calibration

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

Default value:
- Yes (enabled)

CONFIG_ADC_CAL_EFUSE_VREF_ENABLE

Use eFuse Vref

Found in: Component config > ADC-Calibration

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.
Default value:
- Yes (enabled)

**CONFIG_ADC_CAL_LUT_ENABLE**

Use Lookup Tables

*Found in: Component config > ADC-Calibration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

Default value:
- Yes (enabled)

**Common ESP-related**

Contains:
- **CONFIG_ESP_ERR_TO_NAME_LOOKUP**

**CONFIG_ESP_ERR_TO_NAME_LOOKUP**

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

Default value:
- Yes (enabled)

**Ethernet**

Contains:
- **CONFIG_ETH_USE_ESP32_EMAC**
- **CONFIG_ETH_USE_OPENETH**
- **CONFIG_ETH_USE_SPI_ETHERNET**

**CONFIG_ETH_USE_ESP32_EMAC**

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

Default value:
- Yes (enabled)

Contains:
- **CONFIG_ETH_DMA_RX_BUFFER_NUM**
- **CONFIG_ETH_DMA_TX_BUFFER_NUM**
- **CONFIG_ETH_SOFT_FLOW_CONTROL**
- **CONFIG_ETH_DMA_BUFFER_SIZE**
- **CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**
- **CONFIG_ETH_PHY_INTERFACE**
- **CONFIG_ETH_RMII_CLK_OUT_GPIO**
- **CONFIG_ETH_RMII_CLK_MODE**
CONFIG_ETH_PHY_INTERFACE

PHY interface

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Select the communication interface between MAC and PHY chip.

Available options:
• Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

CONFIG_ETH_RMII_CLK_MODE

RMII clock mode

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Select external or internal RMII clock.

Available options:
• Input RMII clock from external (ETH_RMII_CLK_INPUT)
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the
  RMII clock.
• Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external
  PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0

Output RMII clock from GPIO0 (Experimental!)

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure
GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC
peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some
extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental
practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

Default value:
• No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_RMII_CLK_OUT_GPIO

RMII clock GPIO number

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Set the GPIO number to output RMII Clock.

Range:
• from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

Default value:
• 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_DMA_BUFFER_SIZE

Ethernet DMA buffer size (Byte)

Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC

Set the size of each buffer used by Ethernet MAC DMA.
Range:
• from 256 to 1600
Default value:
• 512

**CONFIG_ETH_DMA_RX_BUFFER_NUM**

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

Range:
• from 3 to 30
Default value:
• 10

**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

Range:
• from 3 to 30
Default value:
• 10

**CONFIG_ETH_SOFT_FLOW_CONTROL**

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

Default value:
• No (disabled) if CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_USE_SPI_Ethernet**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

Default value:
• Yes (enabled)

Contains:
• CONFIG_ETH_SPI_Ethernet_DM9051
• CONFIG_ETH_SPI_Ethernet_KSZ8851SNL
• CONFIG_ETH_SPI_Ethernet_W5500
CONFIG_ETH_SPI_ETHERNET_DM9051

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

CONFIG_ETH_USE_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:

- `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

**Default value:**
- 4 if `CONFIG_ETH_USE_OPENETH`
CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

*Range:*
  - from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

*Default value:*
  - 1 if `CONFIG_ETH_USE_OPENETH`

**Event Loop Library** Contains:

- `CONFIG_ESP_EVENT_LOOP_PROFILING`
- `CONFIG_ESP_EVENT_POST_FROM_ISR`

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*
  - No (disabled)

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

*Default value:*
  - Yes (enabled)

**GDB Stub** Contains:

- `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`
**CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

**CONFIG_ESP_GDBSTUB_MAX_TASKS**

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**
- 32 if `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`

**ESP HTTP client**

Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

**CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS**

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**
- Yes (enabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH**

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)

**CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH**

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**
- No (disabled)
HTTP Server Contains:

- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG_HTTPD_MAX_REQ_HDR_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

*Default value:*

  - 512

**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

*Default value:*

  - 512

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

*Default value:*

  - Yes (enabled)

**CONFIG_HTTPD_PURGE_BUF_LEN**

Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

*Default value:*

  - 32
CONFIG_HTTPD_LOG_PURGE_DATA

Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)

CONFIG_HTTPD_WS_SUPPORT

WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

**Default value:**
- No (disabled)

ESP HTTPS OTA Contains:

- CONFIG_OТА_ALLOW_HTTP

CONFIG_OТА_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**
- No (disabled)

ESP HTTPS server Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings Contains:

- MAC Config
- Sleep Config

MAC Config Contains:

- CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES
CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

*Available options:*
- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

**Sleep Config**

Contains:

- CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
- CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured. This option will in fact consider VDD_SDIO auto power value (ESP_PD_OPTION_AUTO) as OFF. Also, it is possible to force a power domain to stay ON during light sleep by using esp_sleep_pd_config() function.

*Default value:*
- Yes (enabled)

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/ floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.
**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

PSRAM leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Flash leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**LCD and Touch Panel**

Contains:
- **LCD Peripheral Configuration**

**LCD Peripheral Configuration**

Contains:
- **CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

**CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**
- 32

**ESP NETIF Adapter**

Contains:
- **CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER**
- **CONFIG_ESP_NETIF_L2_TAP**
- **CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**
- **CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IPAddress lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**

• 120

**CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

*Available options:*
  - LwIP (ESP_NETIF_TCPIP_LWIP)
    lwIP is a small independent implementation of the TCP/IP protocol suite.
  - Loopback (ESP_NETIF_LOOPBACK)
    Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_TCPIP_ADAPTER_COMPATIBLE_LAYER**

Enable backward compatible tcpip_adapter interface

*Found in: Component config > ESP NETIF Adapter*

Backward compatible interface to tcpip_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_NETIF_L2_TAP**

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

**CONFIG_ESP_NETIF_L2_TAP_MAX_FDS**

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

*Range:*
  - from 1 to 10 if `CONFIG_ESP_NETIF_L2_TAP`

*Default value:*
  - 5 if `CONFIG_ESP_NETIF_L2_TAP`

**CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE**

Size of L2 TAP Rx queue

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

*Range:*

---

Espressif Systems 1570 Release v5.0-dev-489-gef98a36
Submit Document Feedback
• from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

Default value:
• 20 if `CONFIG_ESP_NETIF_L2_TAP`

**PHY** Contains:

• `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
• `CONFIG_ESP_PHY_REDUCE_TX_POWER`
• `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
• `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE**

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

*Default value:*
• Yes (enabled)

**CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

*Default value:*
• No (disabled)

Contains:

• `CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID`
• `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN`

**CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

*Default value:*
• No (disabled) if `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`
CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

**Default value:**

- No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION && CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_INIT_DATA_ERROR

Terminate operation when PHY init data error

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MAX_WIFI_TX_POWER

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

CONFIG_ESP_PHY_REDUCE_TX_POWER
Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled)

**Power Management**

Contains:
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PM_RTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled)

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to `DEFAULT_CPU_FREQ_MHZ` setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using `esp_pm_configure` function.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_USE_RTC_TIMER_REF**

Use RTC timer to prevent time drift (EXPERIMENTAL)

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

When APB clock frequency changes, high-resolution timer (esp_timer) scale and base value need to be adjusted. Each adjustment may cause small error, and over time such small errors may cause time drift. If this option is enabled, RTC timer will be used as a reference to compensate for the drift. It is recommended that this option is only used if 32k XTAL is selected as RTC clock source.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE` && `ESP_TIMER_IMPL_FRC2`

**CONFIG_PM_PROFILING**

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be
used to analyze which locks are preventing the chip from going into a lower power state, and see what
time the chip spends in each power saving mode. This feature does incur some run-time overhead, so
should typically be disabled in production builds.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_TRACE**

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit
from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when
analyzing/debugging behavior of power management implementation, and should be kept disabled in
applications.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_SLP_IRAM_OPT**

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep
longer for 760us at most each time. This feature is intended to be used when lower power consumption
is needed while there is enough place in IRAM to place source code.

**CONFIG_PM_RTOS_IDLE_OPT**

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep
longer for 40us at most each time. This feature is intended to be used when lower power consumption
is needed while there is enough place in IRAM to place source code.

**CONFIG_PM_SLP_DISABLE_GPIO**

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automantic sleep to get a lower power mode.
If enabled, chips will disable all GPIO pins at automantic sleep to reduce about 200–300 uA cur-
tent. If you want to specifically use some pins normally as chip wakes when chip sleeps, you
can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this fea-
ture on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different
GPIO configuration at sleep. Waring: If you want to enable this option on ESP32, you should en-
able `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch
pullup/pulldown mode.

**ESP System Settings**

Contains:
- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
Chapter 2. API

• `CONFIG_ESP_TASK_WDT`
• `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
• `CONFIG_ESP_INT_WDT`
• `CONFIG_ESP_MAIN_TASK_AFFINITY`
• `CONFIG_ESP_MAIN_TASK_STACK_SIZE`

Memory protection
• `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
• `CONFIG_ESP_DEBUG_STUBS_ENABLE`
• `CONFIG_ESP_SYSTEM_PANIC`
• `CONFIG_ESP_PANIC_HANDLER_IRAM`
• `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
• `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
• `CONFIG_ESP_CONSOLE_UART_NUM`
• `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
• `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_SYSTEM_PANIC**

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**

- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime. This feature will switch system to single core mode.

**CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*
This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection**
Contains:

- `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**
Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**
Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**
System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**
Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**
Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.
Default value:
  • 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

**Available options:**
  • CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
  • CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
  • No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**
  • 2048

**CONFIG_ESP_CONSOLE_UART**

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

  • Default is to use UART0 on pre-defined GPIOs.
  • If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
  • If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
  • On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
  • On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**
  • Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
  • USB CDC (ESP_CONSOLE_USB_CDC)
  • USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
  • Custom UART (ESP_CONSOLE_UART_CUSTOM)
  • None (ESP_CONSOLE_NONE)

**CONFIG_ESP_CONSOLE_UART_NUM**

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.
Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

**Available options:**
- UART0 (ESP_CONSole_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSole_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSole_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSole_UART_CUSTOM

**Default value:**
- 1 if ESP_CONSole_UART_CUSTOM
- 43 if ESP_CONSole_UART_CUSTOM

**CONFIG_ESP_CONSole_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSole_UART_CUSTOM

**Default value:**
- 3 if ESP_CONSole_UART_CUSTOM
- 44 if ESP_CONSole_UART_CUSTOM

**CONFIG_ESP_CONSole_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE
Default value:

- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`
- 800 if `CONFIG_ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_INT_WDT` && `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_TASK_WDT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)
CONFIG_ESP_TASK_WDT_TIMEOUT_S
Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0
Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1
Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled) if CONFIG_ESP_TASK_WDT && CONFIG_FREERTOS_UNICORE

CONFIG_ESP_PANIC_HANDLER_IRAM
Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

CONFIG_ESP_DEBUG_STUBS_ENABLE
OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.
Default value:

- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if CONFIG_ESP32_TRAX && ESP32S2_TRAX && ESP32S3_TRAX

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**

- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog and other system checks.

IPC (Inter-Processor Call)  Contains:

- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**

- Yes (enabled) if CONFIG_FREERTOS_UNICORE

High resolution timer (esp_timer)  Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_IMPL
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD
CONFIG_ESP_TIMER_PROFILING
Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**
- No (disabled)

CONFIG_ESP_TIMER_TASK_STACK_SIZE
High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of `timer_task` task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**
- from 2048 to 65536

**Default value:**
- 3584

CONFIG_ESP_TIMER_INTERRUPT_LEVEL
Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
- from 1 to 3
- from 1 to 1

**Default value:**
- 1

CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD
Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available).
- ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task.
- ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)
CONFIG_ESP_TIMER_IMPL

Hardware timer to use for esp_timer

*Found in: Component config > High resolution timer (esp_timer)*

esp_timer APIs can be implemented using different hardware timers.

- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for non ESP32 chips.

**Available options:**

- FRC2 (legacy) timer (ESP_TIMER_IMPL_FRC2)
- LAC timer of Timer Group 0 (ESP_TIMER_IMPL_TG0_LAC)
- SYSTIMER (ESP_TIMER_IMPL_SYSTIMER)

Wi-Fi  
**Contains:**

- CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE
- CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN
- CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
- CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM
- CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE
- CONFIG_ESP32_WIFI_SW_CONNECTED_PM_ENABLE
- CONFIG_ESP32_WIFI_TX_BUFFER
- CONFIG_ESP32_WIFI_Ampdu_RX_ENABLED
- CONFIG_ESP32_WIFI_Ampdu_TX_ENABLED
- CONFIG_ESP32_WIFI_Amsdu_TX_ENABLED
- CONFIG_ESP32_WIFI_Csi_ENABLED
- CONFIG_ESP_WIFI_Gmac_SUPPORT
- CONFIG_ESP32_WIFI_IRAM_OPT
- CONFIG_ESP32_WIFI_Mgmt_Sbuf_NUM
- CONFIG_ESP32_WIFI_RX_IRAM_OPT
- CONFIG_ESP_WIFI_SLP_IRAM_OPT
- CONFIG_ESP_WIFI_SOFTAP_SUPPORT
- CONFIG_ESP32_WIFI_TASK_CORE_ID

CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if CONFIG_BT_ENABLED

CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM
Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP32_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP32_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if `CONFIG_SPIRAM.Try_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM.Try_ALLOCATE_WIFI_LWIP`

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP.WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP.WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled. “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled. “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)
CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
  - from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

*Default value:*
  - 16 if ESP32_WIFI_STATIC_TX_BUFFER

CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

*Range:*
  - from 16 to 128 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

*Default value:*
  - 32 if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
  - from 1 to 128

*Default value:*
  - 32

CONFIG_ESP32_WIFI_CSI_ENABLED

WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*
Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**
- No (disabled)

**CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**
- from 2 to 32

**Default value:**
- 6

**CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_RX_BA_WIN**

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED
• 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP32_WIFI_AMSDU_RX_ENABLED

**CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED**

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**

• No (disabled) if CONFIG_ESP32_SPIRAM_SUPPORT || ESP32S2_SPIRAM_SUPPORT || ESP32S3_SPIRAM_SUPPORT

**CONFIG_ESP32_WIFI_NVSM_ENABLED**

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**

• Yes (enabled)

**CONFIG_ESP32_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**

• Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
• Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

• from 752 to 1256

**Default value:**

• 752
CONFIG_ESP32_WIFI_MGMT_SBUF_NUM

WiFi mgmt short buffer number

*Found in:* Component config > Wi-Fi

Set the number of WiFi management short buffer.

*Range:*
  * from 6 to 32

*Default value:*
  * 32

CONFIG_ESP32_WIFI_IRAM_OPT

WiFi IRAM speed optimization

*Found in:* Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

*Default value:*
  * No (disabled) if CONFIG_BT_ENABLED && CONFIG_ESP32_SPIRAM_SUPPORT
  * Yes (enabled)

CONFIG_ESP32_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

*Found in:* Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

*Default value:*
  * No (disabled) if CONFIG_BT_ENABLED && CONFIG_ESP32_SPIRAM_SUPPORT
  * Yes (enabled)

CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

*Found in:* Component config > Wi-Fi

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

*Default value:*
  * Yes (enabled)

CONFIG_ESP_WIFI_SLP_IRAM_OPT

WiFi SLP IRAM speed optimization

*Found in:* Component config > Wi-Fi

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option.
If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)
Chapter 2. API

Core dump Contains:
- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_DECODE`
- `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM`

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

*Available options:*
- Flash (`ESP_COREDUMP_ENABLE_TO_FLASH`)
- UART (`ESP_COREDUMP_ENABLE_TO_UART`)
- None (`ESP_COREDUMP_ENABLE_TO_NONE`)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

*Available options:*
- Binary format (`ESP_COREDUMP_DATA_FORMAT_BIN`)
- ELF format (`ESP_COREDUMP_DATA_FORMAT_ELF`)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

*Available options:*
- Use CRC32 for integrity verification (`ESP_COREDUMP_CHECKSUM_CRC32`)
- Use SHA256 for integrity verification (`ESP_COREDUMP_CHECKSUM_SHA256`)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

*Default value:*
- Yes (enabled) if `ESP_COREDUMP_ENABLE_TO_FLASH`
**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

**CONFIG_ESP_COREDUMP_UART_DELAY**

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**
- 0 if ESP_COREDUMP_ENABLE_TO_UART

**CONFIG_ESP_COREDUMP_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

**Available options:**
- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**

Contains:

- **CONFIG_FATFS_API_ENCODING**
- **CONFIG_FATFS_USE_FASTSEEK**
- **CONFIG_FATFS_LONG_FILENAMES**
- **CONFIG_FATFS_MAX_LFN**

- **CONFIG_FATFS_ALLOC_PREFER_EXTRAM**
- **CONFIG_FATFS_TIMEOUT_MS**
- **CONFIG_FATFS_PER_FILE_CACHE**

**CONFIG_FATFS_VOLUME_COUNT**

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**
- from 1 to 10

**Default value:**
- 2

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.
If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**
- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portugese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

**CONFIG_FATFS_MAX_LFN**

Max long filename length

*Found in: Component config > FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

**Range:**
- from 12 to 255

**Default value:**
- 255

**CONFIG_FATFS_API_ENCODING**

API character encoding

*Found in: Component config > FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.
**Available options:**

- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

**CONFIG_FATFS_FS_LOCK**

Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

**Default value:**

- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)
CONFIG_FATFS_ALLOC_PREFER_EXTRAM
Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

*Default value:*
- Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

CONFIG_FATFS_USE_FASTSEEK
Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

*Default value:*
- No (disabled)

CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE
Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

*Default value:*
- 64 if CONFIG_FATFS_USE_FASTSEEK

**Modbus configuration** Contains:

**CONFIG_FMB_COMM_MODE_TCP_EN**

Enable Modbus stack support for TCP communication mode

*Found in: Component config > Modbus configuration*

Enable Modbus TCP option for stack.

**Default value:**
- Yes (enabled)

**CONFIG_FMB_TCP_PORT_DEFAULT**

Modbus TCP port number

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Modbus default port number used by Modbus TCP stack

**Range:**
- from 0 to 65535

**Default value:**
- 502

**CONFIG_FMB_TCP_PORT_MAX_CONN**

Maximum allowed connections for TCP stack

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

**Range:**
- from 1 to 6

**Default value:**
- 5

**CONFIG_FMB_TCP_CONNECTION_TOUT_SEC**

Modbus TCP connection timeout

*Found in: Component config > Modbus configuration > CONFIG_FMB_COMM_MODE_TCP_EN*

Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

**Range:**
- from 1 to 3600

**Default value:**
- 20

**CONFIG_FMB_COMM_MODE_RTU_EN**

Enable Modbus stack support for RTU mode

*Found in: Component config > Modbus configuration*

Enable RTU Modbus communication mode option for Modbus serial stack.

**Default value:**
- Yes (enabled)
CONFIG_FMB_COMM_MODE.ASCII_EN
Enable Modbus stack support for ASCII mode
*Found in: Component config > Modbus configuration*
Enable ASCII Modbus communication mode option for Modbus serial stack.
*Default value:*
  *Yes (enabled)*

CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND
Slave respond timeout (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a frame which is not broadcast, it has to wait sometime for slave response. if slave is not respond in this time, the master will process timeout error.
*Range:*
  *from 50 to 3000*
*Default value:*
  *150*

CONFIG_FMB_MASTER_DELAY_MS_CONVERT
Slave conversion delay (Milliseconds)
*Found in: Component config > Modbus configuration*
If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.
*Range:*
  *from 50 to 400*
*Default value:*
  *200*

CONFIG_FMB_QUEUE_LENGTH
Modbus serial task queue length
*Found in: Component config > Modbus configuration*
Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.
*Range:*
  *from 0 to 200*
*Default value:*
  *20*

CONFIG_FMB_PORT_TASK_STACK_SIZE
Modbus port task stack size
*Found in: Component config > Modbus configuration*
Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).
*Range:*
  *from 2048 to 8192*
*Default value:*

---

Espressif Systems 1596
Submit Document Feedback
Release v5.0-dev-489-gef98a36
Chapter 2. API 参考

- 4096

**CONFIG_FMB_SERIAL_BUF_SIZE**

Modbus serial task RX/TX buffer size

*Found in: Component config > Modbus configuration*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

*Range:*
  - from 0 to 2048

*Default value:*
  - 256

**CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB**

Number of data bits per ASCII character

*Found in: Component config > Modbus configuration*

This option defines the number of data bits per ASCII character.

*Range:*
  - from 7 to 8

*Default value:*
  - 8

**CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS**

Response timeout for ASCII communication mode (ms)

*Found in: Component config > Modbus configuration*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

*Range:*
  - from 300 to 2000

*Default value:*
  - 1000

**CONFIG_FMB_PORT_TASK_PRIO**

Modbus port task priority

*Found in: Component config > Modbus configuration*

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_PORT_TASK_PRIO - 1).

*Range:*
  - from 3 to 23

*Default value:*
  - 10
**CONFIG_FMB_PORT_TASK_AFFINITY**

Modbus task affinity

*Found in: Component config > Modbus configuration*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

*Available options:*
- No affinity (FMB_PORT_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (FMB_PORT_TASK_AFFINITY_CPU0)
- CPU1 (FMB_PORT_TASK_AFFINITY_CPU1)

**CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT**

Modbus controller slave ID support

*Found in: Component config > Modbus configuration*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

*Default value:*
- Yes (enabled)

**CONFIG_FMB_CONTROLLER_SLAVE_ID**

Modbus controller slave ID

*Found in: Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

*Range:*
- from 0 to 4294967295

*Default value:*
- “0x00112233”

**CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT**

Modbus controller notification timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

*Range:*
- from 0 to 200

*Default value:*
- 20

**CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE**

Modbus controller notification queue size

*Found in: Component config > Modbus configuration*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

*Range:*

Chapter 2. API参考

- from 0 to 200
  
  **Default value:**
  - 20

**CONFIG_FMB_CONTROLLER_STACK_SIZE**

Modbus controller stack size

*Found in: Component config > Modbus configuration*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

*Range:*
- from 0 to 8192
  
  **Default value:**
  - 4096

**CONFIG_FMB_EVENT_QUEUE_TIMEOUT**

Modbus stack event queue timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

*Range:*
- from 0 to 500
  
  **Default value:**
  - 20

**CONFIG_FMB_TIMER_PORT_ENABLED**

Modbus stack use timer for 3.5T symbol time measurement

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

**Default value:**
- No (disabled)

**CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD**

Modbus timer uses ISR dispatch method

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses ISR dispatch method to send timeout events from the callback function called from ISR. This option has dependency with the UART_ISR_IN_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

**Default value:**
- No (disabled)

**FreeRTOS**

Contains:

- `CONFIG_FREERTOS_FPU_IN_ISR`
- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
Chapter 2. API

- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`

- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_LEGACY_HOOKS`
- `CONFIG_FREERTOS_CORETIMER`

### `CONFIG_FREERTOS_UNICORE`

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.

### `CONFIG_FREERTOS_CORETIMER`

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (`FREERTOS_CORETIMER_0`)  
  Select this to use timer 0
- Timer 1 (int 15, level 3) (`FREERTOS_CORETIMER_1`)  
  Select this to use timer 1
- SYSTIMER 0 (level 1) (`FREERTOS_CORETIMER_SYSTIMER_LVL1`)  
  Select this to use syster with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (`FREERTOS_CORETIMER_SYSTIMER_LVL3`)  
  Select this to use syster with the 3 interrupt priority.

### `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
Enable FreeRTOS platform optimized scheduler

*Found in: Component config > FreeRTOS*

On most platforms there are instructions that speed up the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

**Default value:**
- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`

**CONFIG_FREERTOS_HZ**

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*

Some functions in FreeRTOS have not beethoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called `vApplicationStackOverflowHook` when this happens.

**Available options:**
- No checking (`FREERTOS_CHECK_STACKOVERFLOW_NONE`)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW=0)
- Check by stack pointer value (`FREERTOS_CHECK_STACKOVERFLOW_PTRVAL`)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW=1)
- Check using canary bytes (`FREERTOS_CHECK_STACKOVERFLOW_CANARY`)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW=2)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Set a debug watchpoint as a stack overflow check

*Found in: Component config > FreeRTOS*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for
more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

Number of thread local storage pointers

*Found in: Component config > FreeRTOS*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**
- from 1 to 256

**Default value:**
- 1

**CONFIG_FREERTOS_ASSERT**

FreeRTOS assertions

*Found in: Component config > FreeRTOS*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

By default these behave the same as the global project assert settings.

**Available options:**
• abort() on failed assertions (FREERTOS_ASSERT_FAIL_ABORT)
  If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic
  handler can be configured to handle the outcome of an abort() in different ways.
  If assertions are disabled for the entire project, they are also disabled in FreeRTOS and this
  option is unavailable.
• Print and continue failed assertions (FREERTOS_ASSERT_FAIL_PRINT_CONTINUE)
  If a FreeRTOS assertion fails, print it out and continue.
• Disable FreeRTOS assertions (FREERTOS_ASSERT_DISABLE)
  FreeRTOS configASSERT() will not be compiled into the binary.

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

Idle Task stack size

*Found in: Component config > FreeRTOS*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can
be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or
FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage
cleanup hooks that use a lot of stack memory.

*Range:*
  • from 768 to 32768

*Default value:*
  • 1536

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

*Found in: Component config > FreeRTOS*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor
has its own stack, so the total size occupied will be twice this.

*Range:*
  • from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
  • from 1536 to 32768

*Default value:*
  • 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
  • 1536

CONFIG_FREERTOS_LEGACY_HOOKS

Use FreeRTOS legacy hooks

*Found in: Component config > FreeRTOS*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the
esp_register_freertos_xxx_hook system, but for legacy reasons the old hooks can also still be en-
abled. Please enable this only if you have code that for some reason can’t be migrated to the
esp_register_freertos_xxx_hook system.

*Default value:*
  • No (disabled)
CONFIG_FREERTOS_MAX_TASK_NAME_LEN

Maximum task name length

*Found in: Component config > FreeRTOS*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**Range:**
- from 1 to 256

**Default value:**
- 16

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task cleanup hook

*Found in: Component config > FreeRTOS*

Enable this option to make FreeRTOS call the static task cleanup hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```c
void vPortCleanUpTCB ( void *pxTCB ) {  
    // place clean up code here
}
```

**Default value:**
- No (disabled)

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

FreeRTOS timer task priority

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the priority that the timer task will run at.

**Range:**
- from 1 to 25

**Default value:**
- 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

FreeRTOS timer task stack size

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

**Range:**
- from 1536 to 32768

**Default value:**
- 2048
CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

FreeRTOS timer queue length

Found in: Component config > FreeRTOS

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the ‘timer command queue’. The ‘timer command queue’ is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

Range:
- from 5 to 20

Default value:
- 10

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

FreeRTOS queue registry size

Found in: Component config > FreeRTOS

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

Range:
- from 0 to 20

Default value:
- 0

CONFIG_FREERTOS_USE_TRACE_FACILITY

Enable FreeRTOS trace facility

Found in: Component config > FreeRTOS

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

Default value:
- No (disabled)

CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

Enable FreeRTOS stats formatting functions

Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

Default value:
- No (disabled) if CONFIG_FREERTOS_USE_TRACE_FACILITY

CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID

Enable display of xCoreID in vTaskList

Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS
If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS`

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

Enable FreeRTOS to collect run time stats

*Found in: Component config > FreeRTOS*

If enabled, `configGENERATE_RUN_TIME_STATS` will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function `vTaskGetRunTimeStats()` will also be available if `FREERTOS_USE_STATS_FORMATTING_FUNCTIONS` and `FREERTOS_USE_TRACE_FACILITY` are enabled. `vTaskGetRunTimeStats()` will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**
- Use ESP TIMER for run time stats (`FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER`) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (`FREERTOS_RUN_TIME_STATS_USING_CPU_CLK`) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on `ESP32_DEFAULT_CPU_FREQ_MHZ` and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

Tickless idle support

*Found in: Component config > FreeRTOS*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using `FREERTOS_IDLE_TIME_BEFORE_SLEEP` option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.
If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**
- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Default value:**
- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: Component config > FreeRTOS*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPILANCE**

Tests compliance with Vanilla FreeRTOS port*_.CRITICAL calls

*Found in: Component config > FreeRTOS*

If enabled, context of port*_.CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_.CRITICAL from ISR context would cause assert failure

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH**

Place FreeRTOS functions into Flash

*Found in: Component config > FreeRTOS*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.
**Default value:**
- No (disabled)

**CONFIG_FREERTOS_FPU_IN_ISR**

Allow use of float inside Level 1 ISR (EXPERIMENTAL)

*Found in: Component config > FreeRTOS*

When enabled, the usage of float type is allowed inside Level 1 ISRs.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT**

Enable task snapshot functions

*Found in: Component config > FreeRTOS*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS INTO_FLASH**

Place task snapshot functions into flash

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT && CONFIG_ESP_PANIC_HANDLER_I RAM

**Hardware Abstraction Layer (HAL) and Low Level (LL)**

Contains:

- **CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**

**CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**

Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**
- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)
Heap memory debugging  Contains:

- `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`
- `CONFIG_HEAP_TASK_TRACKING`
- `CONFIG_HEAP_CORRUPTION_DETECTION`
- `CONFIG_HEAP_TRACING_DEST`
- `CONFIG_HEAP_TRACING_STACK_DEPTH`

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

*Available options:*

- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

*Available options:*

- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.
**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)

**jsmn** Contains:
- `CONFIG_JSMN_PARENT_LINKS`
- `CONFIG_JSMN STRICT`

**CONFIG_JSMN_PARENT_LINKS**

Enable parent links

*Found in: Component config > jsmn*

You can access to parent node of parsed json

**Default value:**
- No (disabled)

**CONFIG_JSMN STRICT**

Enable strict mode

*Found in: Component config > jsmn*

In strict mode primitives are: numbers and booleans

**Default value:**
- No (disabled)

**libsodium** Contains:
- `CONFIG_LIBSODIUM_USE_MBEDTLS_SHA`

**CONFIG_LIBSODIUM_USE_MBEDTLS_SHA**

Use mbedTLS SHA256 & SHA512 implementations

*Found in: Component config > libsodium*

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium’s API manages SHA state).

**Default value:**
- Yes (enabled)

**Log output** Contains:
- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`
**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**

- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**

- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*
Choose what sort of timestamp is displayed in the log output:

- **Milliseconds since boot** is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- **System time** is taken from POSIX time functions which use the ESP32’s RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- **NOTE**: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

- **Checksums**
- **DHCP server**
  - `CONFIG_LWIP_DHCP_OPTIONS_LEN`
  - `CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID`
  - `CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID`
  - `CONFIG_LWIP_DHCP_DOES_ARP_CHECK`
  - `CONFIG_LWIP_DHCP_RESTORE_LAST_IP`
  - `CONFIG_LWIP_PPP_CHAP_SUPPORT`
  - `CONFIG_LWIP_L2_TO_L3_COPY`
  - `CONFIG_LWIP_IPv6_DHCP6`
  - `CONFIG_LWIP_IP4_FRAG`
  - `CONFIG_LWIP_IP6_FRAG`
  - `CONFIG_LWIP_IP_FORWARD`
  - `CONFIG_LWIP_NETBUF_RECVINFO`
  - `CONFIG_LWIP_AUTOIP`
  - `CONFIG_LWIP_IPv6`
  - `CONFIG_LWIP_ENABLE_LCP_ECHO`
  - `CONFIG_LWIP_ETHARP_TRUST_IP_MAC`
  - `CONFIG_LWIP_ESP_LWIP_ASSERT`
  - `CONFIG_LWIP_DEBUG`
  - `CONFIG_LWIP_IRAM_OPTIMIZATION`
  - `CONFIG_LWIP_STATS`
  - `CONFIG_LWIP_TIMERS_ONDEMAND`
  - `CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES`
  - `CONFIG_LWIP_PPP_MPPE_SUPPORT`
  - `CONFIG_LWIP_PPP_MSDCHP_SUPPORT`
  - `CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT`
  - `CONFIG_LWIP_PPP_PAP_SUPPORT`
  - `CONFIG_LWIP_PPP_DEBUG_ON`
  - `CONFIG_LWIP_PPP_SUPPORT`
  - `CONFIG_LWIP_IP4_REASSEMBLY`
  - `CONFIG_LWIP_IP6_REASSEMBLY`
  - `CONFIG_LWIP_SLIP_SUPPORT`
  - `CONFIG_LWIP_SO_LINGER`
  - `CONFIG_LWIP_SO_REUSE`
  - `CONFIG_LWIP_NETIF_STATUS_CALLBACK`
  - `CONFIG_LWIP_TCPIP_CORE_LOCKING`
  - `CONFIG_LWIP_NETIF_API`
  - **Hooks**
  - **ICMP**
  - `CONFIG_LWIP_LOCAL_HOSTNAME`
Chapter 2. API

- **LWIP RAW API**
- **CONFIG_LWIP_IPV6_NUM_NEIGHBORS**
- **CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE**
- **CONFIG_LWIP_MAX_SOCKETS**
- **CONFIG_LWIP_ESP_GRATUITOUS_ARP**
- **SNTP**
- **CONFIG_LWIP_USE_ONLY_LWIP_SELECT**
- **CONFIG_LWIP_NETIF_LOOPBACK**
- **TCP**
  - **CONFIG_LWIP_TCPIP_TASK_AFFINITY**
  - **CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
  - **CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**
- **UDP**
  - **CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**

**CONFIG_LWIP_LOCAL_HOSTNAME**

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

**Default value:**
- “espressif”

**CONFIG_LWIP_NETIF_API**

Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCPIP_CORE_LOCKING**

Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.

**Default value:**
- No (disabled)

**CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES**

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query
**CONFIG_LWIP_L2_TO_L3_COPY**

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2 (WIFI Driver) will be copied to a new buffer before sending it to layer3 (LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

*Default value:*
  * Yes (enabled)

**CONFIG_LWIP_IRAM_OPTIMIZATION**

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

*Default value:*
  * No (disabled)

**CONFIG_LWIP_TIMERS_ONDEMAND**

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

*Default value:*
  * Yes (enabled)

**CONFIG_LWIP_MAX SOCKETS**

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

*Range:*
  * from 1 to 16

*Default value:*
  * 10
**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Use VFS_SUPPORT_SELECT instead, which is the inverse of this option. The virtual filesystem layer of select() redirects sockets to lwip_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip_select(), therefore, select can be used for sockets only.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_LINGER**

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff=1,l_linger can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_REUSE_RXTOALL**

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_RCVBUF**

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.
Default value:
  • No (disabled)

**CONFIG_LWIP_NETBUF_RECVINFO**

Enable IP_PKTINFO option
*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

Default value:
  • No (disabled)

**CONFIG_LWIP_IP4_FRAG**

Enable fragment outgoing IP4 packets
*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

Default value:
  • Yes (enabled)

**CONFIG_LWIP_IP6_FRAG**

Enable fragment outgoing IP6 packets
*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

Default value:
  • Yes (enabled)

**CONFIG_LWIP_IP4_REASSEMBLY**

Enable reassembly incoming fragmented IP4 packets
*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

Default value:
  • No (disabled)

**CONFIG_LWIP_IP6_REASSEMBLY**

Enable reassembly incoming fragmented IP6 packets
*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

Default value:
  • No (disabled)
CONFIG_LWIP_IP_FORWARD
Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV4_NAPT
Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if `CONFIG_LWIP_IP_FORWARD`

CONFIG_LWIP_STATS
Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

CONFIG_LWIP_ETHARP_TRUST_IP_MAC
Enable LWIP ARP trust

*Found in: Component config > LWIP*

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little latency. The peer “is” in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer.
- The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

**Default value:**
- No (disabled)
Chapter 2. API 参考

**CONFIG_LWIP_ESP_GRATUITOUS_ARP**

Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update its ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update its ARP table.

**Default value:**

- Yes (enabled)

**CONFIG_LWIP_GARP_TMR_INTERVAL**

GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

**CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 64 if *CONFIG_LWIP_WND_SCALE*
- from 6 to 1024 if *CONFIG_LWIP_WND_SCALE*

**Default value:**

- 32

**CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

**CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)
**CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCP_RESTORE_LAST_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**
- No (disabled)

**CONFIG_LWIP_DHCP_OPTIONS_LEN**

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

**Range:**
- from 68 to 255

**Default value:**
- 68

**DHCP server**  Contains:

- **CONFIG_LWIP_DHCPS**

**CONFIG_LWIP_DHCPS**

DHCP: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCPS_LEASE_UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.
Chapter 2. API

**CONFIG_LWIP_DHCPS_MAX_STATION_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

**Range:**
- from 1 to 3600

**Default value:**
- 60

**CONFIG_LWIP_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**
- No (disabled)

**Contains:**
- **CONFIG_LWIP_AUTOIP_TRIES**
- **CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**
- **CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if **CONFIG_LWIP_AUTOIP**

**Default value:**
- 2 if **CONFIG_LWIP_AUTOIP**

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.
**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATELIMIT_INTERVAL**
Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_IPV6**
Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IPV6_AUTOCONFIG**
Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**
Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
- 3

**CONFIG_LWIP_IPV6_FORWARD**
Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
- No (disabled)
CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in:* Component config > LWIP

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**
- 0 if CONFIG_LWIP_IPV6_AUTOCONFIG

CONFIG_LWIP_IPV6_DHCP6

Enable DHCPv6 stateless address autoconfiguration

*Found in:* Component config > LWIP

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

**Default value:**
- No (disabled) if CONFIG_LWIP_IPV6_AUTOCONFIG

CONFIG_LWIP_NETIF_STATUS_CALLBACK

Enable status callback for network interfaces

*Found in:* Component config > LWIP

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
- No (disabled)

CONFIG_LWIP_NETIF_LOOPBACK

Support per-interface loopback

*Found in:* Component config > LWIP

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface.

**Default value:**
- Yes (enabled)

**Contains:**
- CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS

Max queued loopback packets per interface

*Found in:* Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**
- from 0 to 16

**Default value:**
Chapter 2. API

TCP Contains:
- `CONFIG_LWIP_TCP_WND_DEFAULT`
- `CONFIG_LWIP_TCP_SND_BUF_DEFAULT`
- `CONFIG_LWIP_TCP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCP_RTO_TIME`
- `CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES`
- `CONFIG_LWIP_MAX_ACTIVE_TCP`
- `CONFIG_LWIP_MAX_LISTENING_TCP`
- `CONFIG_LWIP_TCP_MAXRTX`
- `CONFIG_LWIP_TCP_SYNMAXRTX`
- `CONFIG_LWIP_TCP_MSL`
- `CONFIG_LWIP_TCP_MSS`
- `CONFIG_LWIP_TCP_OVERSIZE`
- `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- `CONFIG_LWIP_TCP_SACK_OUT`
- `CONFIG_LWIP_WND_SCALE`
- `CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION`
- `CONFIG_LWIP_TCP_TMR_INTERVAL`

**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

*Range:*
- from 1 to 1024

*Default value:*
- 16

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

*Range:*
- from 1 to 1024

*Default value:*
- 16

**CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*
Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**
- from 3 to 12

**Default value:**
- 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

**Range:**
- from 3 to 12

**Default value:**
- 6
- 12

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4

TCP_MSS Range: 576 <= TCP_MSS <= 1460
IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval (ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250
Chapter 2. API

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
- 60000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCP_WND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCP_RECVMBOX_SIZE**

Default TCP receive mailbox size

*Found in: Component config > LWIP > TCP*

Set TCP receive mailbox size. Generally bigger value means higher throughput but more memory. The recommended value is: `LWIP_TCP_WND_DEFAULT/TCP_MSS + 2`, e.g. if `LWIP_TCP_WND_DEFAULT=14360`, `TCP_MSS=1436`, then the recommended receive mailbox size is `(14360/1436 + 2) = 12`.

TCP receive mailbox is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mailbox and the application then fetches the packets from mail box. It means LWIP can caches maximum `LWIP_TCP_RECCVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is...
LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

Range:
- from 6 to 64 if CONFIG_LWIP_WND_SCALE
- from 6 to 1024 if CONFIG_LWIP_WND_SCALE

Default value:
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**
Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*
Queue incoming out-of-order segments for later use.
Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

Default value:
- Yes (enabled)

**CONFIG_LWIP_TCP_SACK_OUT**
Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP*
TCP will support sending selective acknowledgements (SACKs).

Default value:
- No (disabled)

**CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES**
Keep TCP connections when IP changed

*Found in: Component config > LWIP > TCP*
This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2
Disable this option to keep consistent with the original LWIP code behavior.

Default value:
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**
Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*
Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.
This will not make a difference to sockets where Nagle’s algorithm is disabled.
Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.
Available options:
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_LWIP_TCP_RCV_SCALE**

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 0 if `CONFIG_LWIP_WND_SCALE`

**CONFIG_LWIP_TCP_RTO_TIME**

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 3000
- 1500

**UDP** Contains:

- `CONFIG_LWIP_UDP_RECVMBOX_SIZE`
- `CONFIG_LWIP_MAX_UDP_PCBS`

**CONFIG_LWIP_MAX_UDP_PCBS**

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP "connections" (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16
**CONFIG_LWIP_UDP_RECVMBOX_SIZE**

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receiv mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

**Checksums**

Contains:
- `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`
- `CONFIG_LWIP_CHECKSUM_CHECK_IP`
- `CONFIG_LWIP_CHECKSUM_CHECK_UDP`

**CONFIG_LWIP_CHECKSUM_CHECK_IP**

Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_UDP**

Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_ICMP**

Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)
CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
TCP/IP Task Stack Size

*Found in: Component config > LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY
TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)

CONFIG_LWIP_PPP_SUPPORT
Enable PPP support (new/experimental)

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible. PPP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- *CONFIG_LWIP_PPP_ENABLE_IPV6*

CONFIG_LWIP_PPP_ENABLE_IPV6
Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**
- Yes (enabled) if *CONFIG_LWIP_PPP_SUPPORT* && *CONFIG_LWIP_IPV6*

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE
Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.
### Chapter 2. API

**CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS**

- **Description:** Max number of entries in IPv6 neighbor cache
- **Found in:** Component config > LWIP
- **Default value:**
  - No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

- **Description:** Enable Notify Phase Callback
- **Found in:** Component config > LWIP
- **Default value:**
  - No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_PAP_SUPPORT**

- **Description:** Enable PAP support
- **Found in:** Component config > LWIP
- **Default value:**
  - No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_CHAP_SUPPORT**

- **Description:** Enable CHAP support
- **Found in:** Component config > LWIP
- **Default value:**
  - No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_PPP_MSCHAP_SUPPORT**

- **Description:** Enable MSCHAP support
- **Found in:** Component config > LWIP
- **Default value:**
  - No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`
CONFIG_LWIP_PPP_MPPE_SUPPORT
Enable MPPE support

Found in: Component config > LWIP
Enable Microsoft Point-to-Point Encryption (MPPE) support

Default value:
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_ENABLE_LCP_ECHO
Enable LCP ECHO

Found in: Component config > LWIP
Enable LCP echo keepalive requests

Default value:
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_LCP_ECHO_INTERVAL
Echo interval (s)

Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Interval in seconds between keepalive LCP echo requests, 0 to disable.

Range:
- from 0 to 1000000 if CONFIG_LWIP_ENABLE_LCP_ECHO

Default value:
- 3 if CONFIG_LWIP_ENABLE_LCP_ECHO

CONFIG_LWIP_LCP_MAX_ECHO_FAILURES
Maximum echo failures

Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Number of consecutive unanswered echo requests before failure is indicated.

Range:
- from 0 to 100000 if CONFIG_LWIP_ENABLE_LCP_ECHO

Default value:
- 3 if CONFIG_LWIP_ENABLE_LCP_ECHO

CONFIG_LWIP_PPP_DEBUG_ON
Enable PPP debug log output

Found in: Component config > LWIP
Enable PPP debug log output

Default value:
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT
CONFIG_LWIP_SLIP_SUPPORT
Enable SLIP support (new/experimental)

Found in: Component config > LWIP

Enable SLIP stack. Now only SLIP over serial is possible.
SLIP over serial support is experimental and unsupported.

Default value:
• No (disabled)

Contains:
• CONFIG_LWIP_SLIP_DEBUG_ON

CONFIG_LWIP_SLIP_DEBUG_ON
Enable SLIP debug log output

Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT

Enable SLIP debug log output

Default value:
• No (disabled) if CONFIG_LWIP_SLIP_SUPPORT

ICMP  Contains:
• CONFIG_LWIP_ICMP
• CONFIG_LWIP_BROADCAST_PING
• CONFIG_LWIP_MULTICAST_PING

CONFIG_LWIP_ICMP
ICMP: Enable ICMP

Found in: Component config > LWIP > ICMP

Enable ICMP module for check network stability

Default value:
• Yes (enabled)

CONFIG_LWIP_MULTICAST_PING
Respond to multicast pings

Found in: Component config > LWIP > ICMP

Default value:
• No (disabled)

CONFIG_LWIP_BROADCAST_PING
Respond to broadcast pings

Found in: Component config > LWIP > ICMP

Default value:
• No (disabled)
LWIP RAW API  Contains:

- `CONFIG_LWIP_MAX_RAW_PCBS`

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

SNTP  Contains:

- `CONFIG_LWIP_SNTP_MAX_SERVERS`
- `CONFIG_LWIP_SNTP_UPDATE_DELAY`
- `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**CONFIG_LWIP_SNTP_MAX_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of snntp_setserver/snntp_setservername functions is limited to this value.

**Range:**
- from 1 to 16

**Default value:**
- 1

**CONFIG_LWIP_DHCP_GET_NTP_SRV**

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see snntp_servermode_dhcp() func.)

**Default value:**
- No (disabled)

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**Default value:**
- 1 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`
CONFIG_LWIP_SNTP_UPDATE_DELAY

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

*Range:*
- from 15000 to 4294967295

*Default value:*
- 3600000

CONFIG_LWIP_ESP_LWIP_ASSERT

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

*Default value:*
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE

Hooks

Contains:
- CONFIG_LWIP_HOOK_ND6_GET_GW
- CONFIG_LWIP_HOOK_IP6_ROUTE
- CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
- CONFIG_LWIP_HOOK_TCP_ISN

CONFIG_LWIP_HOOK_TCP_ISN

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (tcp_next_iss) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to LWIP_HOOK_TCP_ISN_CUSTOM to provide custom implementation. Set to LWIP_HOOK_TCP_ISN_NONE to use lwIP implementation.

*Available options:*
- No hook declared (LWIP_HOOK_TCP_ISN_NONE)
- Default implementation (LWIP_HOOK_TCP_ISN_DEFAULT)
- Custom implementation (LWIP_HOOK_TCP_ISN_CUSTOM)

CONFIG_LWIP_HOOK_IP6_ROUTE

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

*Available options:*

• No hook declared (LWIP_HOOK_IP6_ROUTE_NONE)
• Default (weak) implementation (LWIP_HOOK_IP6_ROUTE_DEFAULT)
• Custom implementation (LWIP_HOOK_IP6_ROUTE_CUSTOM)

**CONFIG_LWIP_HOOK_ND6_STEP_DOWN**
IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_ND6_GET_GW_NONE)
- Default (weak) implementation (LWIP_HOOK_ND6_GET_GW_DEFAULT)
- Custom implementation (LWIP_HOOK_ND6_GET_GW_CUSTOM)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**
Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_DEBUG**
Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:

- CONFIG_LWIP_API_LIB_DEBUG
- CONFIG_LWIP_DHCP_DEBUG
- CONFIG_LWIP_DHCP_STATE_DEBUG
- CONFIG_LWIP_ETHARP_DEBUG
- CONFIG_LWIP_ICMP_DEBUG
- CONFIG_LWIP_ICMP6_DEBUG
- CONFIG_LWIP_IP_DEBUG
- CONFIG_LWIP_IP6_DEBUG
- CONFIG_LWIP_NETIF_DEBUG
- CONFIG_LWIP_PBUF_DEBUG
- CONFIG_LWIP_SNTP_DEBUG
- CONFIG_LWIP_SOCKETS_DEBUG
- CONFIG_LWIP_TCP_DEBUG
CONFIG_LWIP_NETIF_DEBUG

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_PBUF_DEBUG

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ETHARP_DEBUG

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_API_LIB_DEBUG

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SOCKETS_DEBUG

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP_DEBUG

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*
  - No (disabled) if CONFIG_LWIP_DEBUG & & CONFIG_LWIP_ICMP
Chapter 2. API Reference

**CONFIG_LWIP_DHCP_STATE_DEBUG**
Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_DHCP_DEBUG**
Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_IP6_DEBUG**
Enable IPv6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ICMP6_DEBUG**
Enable ICMPv6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_TCP_DEBUG**
Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_SNTP_DEBUG**
Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**mbedTLS**
Contains:
- `CONFIG_MBEDTLSASYMMETRICCONTENTLEN`
- Certificate Bundle
- Certificates
- `CONFIG_MBEDTLSCHACHA20_C`
- `CONFIG_MBEDTLSDHM_C`
- `CONFIG_MBEDTLS_ECP_C`
- `CONFIG_MBEDTLS_ECDH_C`
Chapter 2. API

- CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_ROM_MD5
- CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in:* Component config > mbedTLS

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,
Chapter 2. API

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:
- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC) Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

*Range:*
- from 512 to 16384

*Default value:*
- 16384

CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

*Default value:*
- Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN
TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAXCONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 16384

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAXCONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 4096

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUTCONTENT_LEN” or “MBEDTLS_SSL_INCONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DYNAMIC_FREE_PEER_CERT**

Free SSL peer certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free peer certificate after its usage in handshake process.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA**

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem: Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.
Chapter 2. API

Default value:
- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT**

Free SSL ca certificate after its usage

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE.CONFIG_DATA*

Free ca certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the ca certificate should once again be registered to the ssl object.

Default value:
- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

**CONFIG_MBEDTLS_DEBUG**

Enable mbedtls debugging

*Found in: Component config > mbedtls*

Enable mbedtls debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp_debug.h" and call mbedtlsesp_enable_debug_log() at runtime in order to enable mbedtls debug output via the ESP log mechanism.

Default value:
- No (disabled)

**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedtls debugging level

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_DEBUG*

Set mbedtls debugging level

Available options:
- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

**Certificate Bundle**  Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

Enable trusted root certificate bundle

*Found in: Component config > mbedtls > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

Default value:
- Yes (enabled)
CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

*Found in:* Component config > mbedtls > Certificate Bundle > CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

**Available options:**
- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Add custom certificates to the default bundle

*Found in:* Component config > mbedtls > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH

Custom certificate bundle path

*Found in:* Component config > mbedtls > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

CONFIG_MBEDTLS_ECP_RESTARTABLE

Enable mbedtls ecp restartable

*Found in:* Component config > mbedtls

Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CMAC_C

Enable CMAC mode for block ciphers

*Found in:* Component config > mbedtls

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES

Enable hardware AES acceleration

*Found in:* Component config > mbedtls

Enable hardware accelerated AES encryption & decryption.
Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_MPI**

Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to 4096 bit results.

These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_SHA**

Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_ROM_MD5**

Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

Found in: Component config > mbedTLS

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

Default value:
  • No (disabled)

CONFIG_MBEDTLS_HAVE_TIME

Enable mbedtls time support

Found in: Component config > mbedTLS

Enable use of time.h functions (time() and gmtime()) by mbedTLS.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE

Enable mbedtls certificate expiry check

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:
  • No (disabled)

CONFIG_MBEDTLS_ECDSA_DETERMINISTIC

Enable deterministic ECDSA

Found in: Component config > mbedTLS

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

Default value:
• Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**
Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*
Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

*Default value:*
  • Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**
TLS Protocol Role

*Found in: Component config > mbedTLS*
mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

*Available options:*
  • Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
  • Server (MBEDTLS_TLS_SERVER_ONLY)
  • Client (MBEDTLS_TLS_CLIENT_ONLY)
  • None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**  Contains:

  • CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
  • CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
  • CONFIG_MBEDTLS_PSK_MODES
  • CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
  • CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

**CONFIG_MBEDTLS_PSK_MODES**
Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*
Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

*Default value:*
  • No (disabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_PSK**
Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*
Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

*Default value:*
  • No (disabled) if CONFIG_MBEDTLS_PSK_MODES
CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK
Enable DHE-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK
Enable ECDHE-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK
Enable RSA-PSK based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES
Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
Enable RSA-only based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods
Enable to support ciphersuites with prefix TLS-RSA-WITH-

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
Enable DHE-RSA based ciphersuite modes

Found in: Component config > mbedTLS > TLS Key Exchange Methods
Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE
Support Elliptic Curve based ciphersuites

Found in: Component config > mbedTLS > TLS Key Exchange Methods
Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**
Enable ECDHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**
Enable ECDHE-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**
Enable ECDH-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**
Enable ECDH-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**
Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
CONFIG_MBEDTLS_SSL_RENEGOTIATION
Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_SSL3
Legacy SSL 3.0 support

*Found in: Component config > mbedTLS*

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1
Support TLS 1.0 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_1
Support TLS 1.1 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1
Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)
*Found in: Component config > mbedTLS*
Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2
*Default value:*
  * No (disabled)

CONFIG_MBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)
*Found in: Component config > mbedTLS*
Disabling this option will save some code size if it is not needed.
*Default value:*
  * Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
TLS: Client Support for RFC 5077 SSL session tickets
*Found in: Component config > mbedTLS*
Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.
*Default value:*
  * Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_KEY_USAGE
Enable verification of the keyUsage extension
*Found in: Component config > mbedTLS*
Disabling this avoids problems with mis-issued and/or misused (intermediate) CA and leaf certificates. Depending on your PKI use, disabling this can be a security risk.
*Default value:*
  * Yes (enabled)

CONFIG_MBEDTLS_X509_CHECK_EXTENDED_KEY_USAGE
Enable verification of the extendedKeyUsage extension
*Found in: Component config > mbedTLS*
Disabling this avoids problems with mis-issued and/or misused certificates. Depending on your PKI use, disabling this can be a security risk.
*Default value:*
  * Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
TLS: Server Support for RFC 5077 SSL session tickets
*Found in: Component config > mbedTLS*
Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.
Default value:
- Yes (enabled)

**Symmetric Ciphers**  Contains:

- `CONFIG_MBEDTLS_AES_C`
- `CONFIG_MBEDTLS_BLOWFISH_C`
- `CONFIG_MBEDTLS_CAMELLIA_C`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_DES_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_NIST_KW_C`
- `CONFIG_MBEDTLS_RC4_MODE`
- `CONFIG_MBEDTLS_XTEA_C`

**CONFIG_MBEDTLS_AES_C**

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CAMELLIA_C**

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_RC4_MODE**

RC4 Stream Cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

**Available options:**
- Disabled (MBEDTLS_RC4_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS_RC4_ENABLED_NO_DEFAULT)
- Enabled (MBEDTLS_RC4_ENABLED)
CONFIG_MBEDTLS_BLOWFISH_C
Blowfish block cipher (read help)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the Blowfish block cipher (not used for TLS sessions.)
The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

Default value:
• No (disabled)

CONFIG_MBEDTLS_XTEA_C
XTEA block cipher

Found in: Component config > mbedTLS > Symmetric Ciphers

Enables the XTEA block cipher.

Default value:
• No (disabled)

CONFIG_MBEDTLS_CCM_C
CCM (Counter with CBC-MAC) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.
Disabling this option saves some code size.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_GCM_C
GCM (Galois/Counter) block cipher modes

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable Galois/Counter Mode for AES and/or Camellia ciphers.
This option is generally faster than CCM.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C
NIST key wrapping (KW) and KW padding (KWP)

Found in: Component config > mbedTLS > Symmetric Ciphers

Enable NIST key wrapping and key wrapping padding.

Default value:
• No (disabled)
CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm.

Found in: Component config > mbedTLS
Enable the RIPEMD-160 hash algorithm.

Default value:
- No (disabled)

Certificates Contains:
- CONFIG_MBEDTLS_PEM_PARSE_C
- CONFIG_MBEDTLS_PEM_WRITE_C
- CONFIG_MBEDTLS_X509_CRL_PARSE_C
- CONFIG_MBEDTLS_X509_CSR_PARSE_C

CONFIG_MBEDTLS_PEM_PARSE_C
Read & Parse PEM formatted certificates.

Found in: Component config > mbedTLS > Certificates
Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_PEM_WRITE_C
Write PEM formatted certificates.

Found in: Component config > mbedTLS > Certificates
Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C
X.509 CRL parsing.

Found in: Component config > mbedTLS > Certificates

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C
X.509 CSR parsing.

Found in: Component config > mbedTLS > Certificates
Support for parsing X.509 Certificate Signing Requests.

Default value:
- Yes (enabled)
**CONFIG_MBEDTLS_ECP_C**

Elliptic Curve Ciphers

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DHM_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: Component config > mbedTLS*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file `mbedtls/dhm.h` file.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECDSA_C**

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECJPAKE_C**

Elliptic curve J-PAKE

*Found in: Component config > mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED**

Enable SECP192R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`
CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
Enable SECP224R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP224R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C}$

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP384R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C}$

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP521R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C}$

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C}$

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP224K1 Elliptic Curve.
Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\n
**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedtls*

Enable support for SECP256K1 Elliptic Curve.

Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\n
**CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\n
**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\n
**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})\n
**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: Component config > mbedtls*

Enable support for CURVE25519 Elliptic Curve.

Default value:

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \lor \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \land \text{CONFIG\_MBEDTLS\_ECP\_C})
CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST ‘modulo p’ optimisations

Found in: Component config > mbedTLS

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

# end of Elliptic Curve options

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

Found in: Component config > mbedTLS

Enable support for Poly1305 MAC algorithm.

Default value:
• No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

Found in: Component config > mbedTLS

Enable support for Chacha20 stream cipher.

Default value:
• No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C

ChaCha20-Poly1305 AEAD algorithm

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C

Enable support for ChaCha20-Poly1305 AEAD algorithm.

Default value:
• No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

Found in: Component config > mbedTLS

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

Default value:
• No (disabled)
CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEYSOFTWARE_MPI

Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SECURITY_RISKS

Show configurations with potential security risks

*Found in: Component config > mbedTLS*

**Default value:**
- No (disabled)

Contains:
- CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT

X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions
Default value:
  - No (disabled) if `CONFIG_MBEDTLS_SECURITY_RISKS`

**mDNS** Contains:
- `CONFIG_MDNS_MAX_SERVICES`
- `CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS`
- `CONFIG_MDNS STRICT_MODE`
- `CONFIG_MDNS TASK AFFINITY`
- `CONFIG_MDNS TASK_PRIORITY`
- `CONFIG_MDNS TASK STACK_SIZE`
- `CONFIG_MDNS_TIMER_PERIOD_MS`
- `CONFIG_MDNS_MULTIPLE_INSTANCE`
- `CONFIG_MDNS_NETWORKING_SOCKET`

**CONFIG_MDNS_MAX_SERVICES**
Max number of services

*Found in: Component config > mDNS*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

*Range:*
  - from 1 to 64

*Default value:*
  - 10

**CONFIG_MDNS_TASK_PRIORITY**
mDNS task priority

*Found in: Component config > mDNS*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

*Range:*
  - from 1 to 255

*Default value:*
  - 1

**CONFIG_MDNS_TASK_STACK_SIZE**
mDNS task stack size

*Found in: Component config > mDNS*

Allows setting mDNS task stacksize.

*Default value:*
  - 4096

**CONFIG_MDNS_TASK_AFFINITY**
mDNS task affinity

*Found in: Component config > mDNS*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.
Available options:

- No affinity (MDNS_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (MDNS_TASK_AFFINITY_CPU0)
- CPU1 (MDNS_TASK_AFFINITY_CPU1)

CONFIG_MDNS_SERVICE_ADD_TIMEOUT_MS

mDNS adding service timeout (ms)

*Found in: Component config > mDNS*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

**Range:**
- from 10 to 30000

**Default value:**
- 2000

CONFIG_MDNS STRICT MODE

mDNS strict mode

*Found in: Component config > mDNS*

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mdns resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

**Default value:**
- No (disabled)

CONFIG_MDNS_TIMER_PERIOD_MS

mDNS timer period (ms)

*Found in: Component config > mDNS*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**Range:**
- from 10 to 10000

**Default value:**
- 100

CONFIG_MDNS_NETWORKING_SOCKET

Use BSD sockets for mdns networking

*Found in: Component config > mDNS*

Enables optional mdns networking implementation using BSD sockets in UDP multicast mode. This option creates a new thread to serve receiving packets (TODO). This option uses additional N sockets, where N is number of interfaces.

**Default value:**
- No (disabled)
CONFIG_MDNS_MULTIPLE_INSTANCE

Multiple instances under the same service type

*Found in: Component config > mDNS*

Enables adding multiple service instances under the same service type.

**Default value:**

- Yes (enabled)

ESP-MQTT Configurations  Contains:

- CONFIG_MQTT_CUSTOM_OUTBOX
- CONFIG_MQTT_TRANSPORT_SSL
- CONFIG_MQTT_TRANSPORT_WEBSOCKET
- CONFIG_MQTT_PROTOCOL_311
- CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
- CONFIG_MQTT_USE_CUSTOM_CONFIG
- CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS
- CONFIG_MQTT_REPORT_DELETED_MESSAGES
- CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED
- CONFIG_MQTT_MSG_ID_INCREMENTAL

CONFIG_MQTT_PROTOCOL_311

Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_SSL

Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET

Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*

Enable MQTT transport over Websocket Secure.
**Default value:**
- Yes (enabled)

**CONFIG_MQTT_MSG_ID_INCREMENTAL**

Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**
- No (disabled)

**CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED**

Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to avoid publishing (enqueuing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

**CONFIG_MQTT_REPORT_DELETED_MESSAGES**

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)

**CONFIG_MQTT_USE_CUSTOM_CONFIG**

MQTT Using custom configurations

*Found in: Component config > ESP-MQTT Configurations*

Custom MQTT configurations.

**Default value:**
- No (disabled)

**CONFIG_MQTT_TCP_DEFAULT_PORT**

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

**Default value:**
- 1883 if *CONFIG_MQTT_USE_CUSTOM_CONFIG*
CONFIG_MQTT_SSL_DEFAULT_PORT
Default MQTT over SSL port

Default value:
  • 8883 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_SSL

CONFIG_MQTT_WS_DEFAULT_PORT
Default MQTT over Websocket port

Default value:
  • 80 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_WSS_DEFAULT_PORT
Default MQTT over Websocket Secure port

Default value:
  • 443 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_WEBSOCKET && CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

CONFIG_MQTT_BUFFER_SIZE
Default MQTT Buffer Size

Default value:
  • 1024 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_STACK_SIZE
MQTT task stack size

Default value:
  • 6144 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_DISABLE_API_LOCKS
Disable API locks

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

Default value:
CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

* 5 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**Default value:**

* "false"

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**

* Core 0 (MQTT_USE_CORE_0)
* Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistant outbox in NVM or similar).

**Default value:**

* No (disabled)

CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

* 30000 if CONFIG_MQTT_USE_CUSTOM_CONFIG

**Newlib** Contains:

* CONFIG_NEWLIB_NANO_FORMAT
* CONFIG_NEWLIB_STDIN_LINE_ENDING
* CONFIG_NEWLIB_STDOUT_LINE_ENDING
**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘
’, LF) appears on stdout. Three options are possible:

- **CRLF**: whenever LF is encountered, prepend it with CR
- **LF**: no modification is applied, stdout is sent as is
- **CR**: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**
- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘
’, LF) on stdin. Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**
- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘--enable-newlib-nano-formatted-io’ : https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**Default value:**
- No (disabled)
Chapter 2. API

NVS Contains:
- `CONFIG_NVS_ENCRYPTION`
- `CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG`

**CONFIG_NVS_ENCRYPTION**
Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**
NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**OpenSSL** Contains:
- `CONFIG_OPENSSL_DEBUG`
- `CONFIG_OPENSSL_ERROR_STACK`
- `CONFIG_OPENSSL_LOWLEVEL_DEBUG`
- `CONFIG_OPENSSL_DEBUG_LEVEL`
- `CONFIG_OPENSSL_ASSERT`

**CONFIG_OPENSSL_DEBUG**
Enable OpenSSL debugging

*Found in: Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL_DEBUG” works.

**Default value:**
- No (disabled)

**CONFIG_OPENSSL_ERROR_STACK**
Enable OpenSSL error structure

*Found in: Component config > OpenSSL*

Enable OpenSSL Error reporting

**Default value:**
- Yes (enabled)
CONFIG_OPENSSL_DEBUG_LEVEL

OpenSSL debugging level

*Found in: Component config > OpenSSL*

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL_DEBUG_LEVEL” works.

For example: If OPENSSL_DEBUG_LEVEL = 2, you use function “SSL_DEBUG(1, “malloc failed”)” . Because 1 < 2, it will not print.

**Range:**
- from 0 to 255 if CONFIG_OPENSSL_DEBUG

**Default value:**
- 0 if CONFIG_OPENSSL_DEBUG

CONFIG_OPENSSL_LOWLEVEL_DEBUG

Enable OpenSSL low-level module debugging

*Found in: Component config > OpenSSL*

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.

**Default value:**
- No (disabled) if CONFIG_OPENSSL_DEBUG

CONFIG_OPENSSL_ASSERT

Select OpenSSL assert function

*Found in: Component config > OpenSSL*

OpenSSL function needs “assert” function to check if input parameters are valid.

If you want to use assert debugging function, “OPENSSL_DEBUG” should be enabled.

**Available options:**
- Do nothing (OPENSSL_ASSERT_DO NOTHING)
  Do nothing and “SSL_ASSERT” does not work.
- Check and exit (OPENSSL_ASSERT_EXIT)
  Enable assert exiting, it will check and return error code.
- Show debugging message (OPENSSL_ASSERT_DEBUG)
  Enable assert debugging, it will check and show debugging message.
- Show debugging message and exit (OPENSSL_ASSERT_DEBUG_EXIT)
  Enable assert debugging and exiting, it will check, show debugging message and return error code.
- Show debugging message and block (OPENSSL_ASSERT_DEBUG_BLOCK)
  Enable assert debugging and blocking, it will check, show debugging message and block by “while (1);”.

OpenThread  Contains:

- CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_ENABLED

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.
Default value:
• No (disabled)

CONFIG_OPENTHREAD_RADIO_TYPE

Config the Thread radio type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Configure how OpenThread connects to the 15.4 radio

*Available options:*
• Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
• Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.

CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

OpenThread can be configured to different device types (FTD, MTD, Radio)

*Available options:*
• Full Thread Device (OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as a router and leader in a Thread network.
• Minimal Thread Device (OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as an end device in a Thread network. This will reduce the code size of the OpenThread stack.
• Radio Only Device (OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which cannot forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_DIAG

Enable diag

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

*Default value:*
• Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_COMMISSIONER

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

*Default value:*
• No (disabled) if CONFIG_OPENTHREAD_ENABLED
**CONFIG_OPENTHREAD_JOINER**

Enable Joiner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_SRP_CLIENT**

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- No (disabled) if **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_BORDER_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_TREL**

Enable Thread Radio Encapsulation Link

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED > CONFIG_OPENTHREAD_BORDER_ROUTER*

Select this option to enable sending 15.4 frames through the backbone interface.

**Default value:**
- No (disabled) if **CONFIG_OPENTHREAD_BORDER_ROUTER**

**CONFIG_OPENTHREAD_ESP_LIB_FROM_INTERNAL_SRC**

Build esp_openthread libraries from source

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Override the shipped libopenthread_br.a and libopenthread_port.a, for internal builds.

**Default value:**
- No (disabled) if **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS**

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

**Range:**
- from 50 to 100 if **CONFIG_OPENTHREAD_ENABLED**
Default value:
  • 65 if CONFIG_OPENTHREAD_ENABLED

**PThreads** Contains:
  • CONFIG_PTHREAD_TASK_NAME_DEFAULT
  • CONFIG_PTHREAD_TASK_CORE_DEFAULT
  • CONFIG_PTHREAD_TASK_PRIO_DEFAULT
  • CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT
  • CONFIG_PTHREAD_STACK_MIN

### CONFIG_PTHREAD_TASK_PRIO_DEFAULT
Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**Range:**
  • from 0 to 255

**Default value:**
  • 5

### CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT
Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**
  • 3072

### CONFIG_PTHREAD_STACK_MIN
Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
  • 768

### CONFIG_PTHREAD_TASK_CORE_DEFAULT
Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**
  • No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
  • Core 0 (PTHREAD_DEFAULT_CORE_0)
  • Core 1 (PTHREAD_DEFAULT_CORE_1)
CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
- “pthread”

**SPI Flash driver** Contains:

- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- CONFIG_SPI_FLASH_SHARE_SPI1_BUS
- CONFIG_SPI_FLASH_USE_LEGACY_IMPL
- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_DANGEROUS_WRITE

**CONFIG_SPI_FLASH_VERIFY_WRITE**

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_LOG_FAILED_WRITE**

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE

**CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE**

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.
Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

**CONFIG_SPI_FLASH_ENABLE_COUNTERS**

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:
- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**
- 0

**CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_DANGEROUS_WRITE**

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the `esp_rom_xxx` SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**
- Aborts (`SPI_FLASH_DANGEROUS_WRITE_ABORTS`)
- Fails (`SPI_FLASH_DANGEROUS_WRITE_FAILS`)
- Allowed (`SPI_FLASH_DANGEROUS_WRITE_ALLOWED`)

**CONFIG_SPI_FLASH_USE_LEGACY_IMPL**

Use the legacy implementation before IDF v4.0

*Found in: Component config > SPI Flash driver*
The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_SHARE_SPI1_BUS**

Support other devices attached to SPI1 bus

*Found in:* Component config > SPI Flash driver

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL`

**CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**

Bypass a block erase and always do sector erase

*Found in:* Component config > SPI Flash driver

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_YIELD_DURING_ERASE**

Enables yield operation during flash erase

*Found in:* Component config > SPI Flash driver

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS**

Duration of erasing to yield CPUs (ms)

*Found in:* Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**
- 20

**CONFIG_SPI_FLASH_ERASE_YIELD_TICKS**

CPU release time (tick) for an erase operation

*Found in:* Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Defines how many ticks will be before returning to continue a erasing.

**Default value:**
CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration option helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

*Range:*
  - from 256 to 8192

*Default value:*
  - 8192

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

*Default value:*
  - No (disabled)

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

*Default value:*
  - No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the default_registered_chips structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

*Default value:*
  - No (disabled) if CONFIG_SPI_FLASH_USE_LEGACY_IMPL

Auto-detect flash chips Contains:

- CONFIG_SPI_FLASH_SUPPORT_GD_CHIP
- CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
- CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP
- CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP
Chapter 2. API

**CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE**

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)
SPIFFS Configuration  Contains:

- Debug Configuration
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_FOLLOW_SYMLINKS
- CONFIG_SPIFFS_MAX_PARTITIONS
- CONFIG_SPIFFS_USE_MTIME
- CONFIG_SPIFFS_GC_MAX_RUNS
- CONFIG_SPIFFS_OBJ_NAME_LEN
- CONFIG_SPIFFS_META_LENGTH
- SPIFFS Cache Configuration
- CONFIG_SPIFFS_PAGE_SIZE
- CONFIG_SPIFFS_MTIME_WIDE_64_BITS

CONFIG_SPIFFS_MAX_PARTITIONS
Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**
- from 1 to 10

**Default value:**
- 3

SPIFFS Cache Configuration  Contains:

- CONFIG_SPIFFS_CACHE

CONFIG_SPIFFS_CACHE
Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disables memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_CACHE_WR
Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS
Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*
Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_PAGE_CHECK**

Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_GC_MAX_RUNS**

Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**
- from 1 to 255

**Default value:**
- 10

**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- from 256 to 1024

**Default value:**
- 256

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.
SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- from 1 to 256

**Default value:**
- 32

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**
- 4
CONFIG_SPIFFS_USE_MTIME

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support time_t 64 bits (see SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS).

**Default value:**
- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

Debug Configuration

Contains:
- CONFIG_SPIFFS_DBG
- CONFIG_SPIFFS_API_DBG
- CONFIG_SPIFFS_CACHE_DBG
- CONFIG_SPIFFS_CHECK_DBG
- CONFIG_SPIFFS_TEST_VISUALISATION
- CONFIG_SPIFFS_GC_DBG

CONFIG_SPIFFS_DBG

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_API_DBG

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_GC_DBG

Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.
**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CACHE_DBG**
Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

*Default value:*
- No (disabled)

**CONFIG_SPIFFS_CHECK_DBG**
Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

*Default value:*
- No (disabled)

**CONFIG_SPIFFS_TEST_VISUALISATION**
Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

*Default value:*
- No (disabled)

**TCP Transport** Contains:
- **Websocket**

**Websocket** Contains:
- **CONFIG_WS_TRANSPORT**

**CONFIG_WS_TRANSPORT**
Enable Websocket Transport

*Found in: Component config > TCP Transport > Websocket*

Enable support for creating websocket transport.

*Default value:*
- Yes (enabled)

**CONFIG_WS_BUFFER_SIZE**
Websocket transport buffer size

*Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT*

Size of the buffer used for constructing the HTTP Upgrade request during connect

*Default value:*
- 1024
Unity unit testing library  Contains:

- CONFIGUNITY_ENABLE_COLOR
- CONFIGUNITY_ENABLE_IDF_TEST_RUNNER
- CONFIGUNITY_ENABLE_FIXTURE
- CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL
- CONFIGUNITY_ENABLE_64BIT
- CONFIGUNITY_ENABLE_DOUBLE
- CONFIGUNITY_ENABLE_FLOAT

CONFIGUNITY_ENABLE_FLOAT

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIGUNITY_ENABLE_DOUBLE

Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIGUNITY_ENABLE_64BIT

Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)

CONFIGUNITY_ENABLE_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIGUNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:
- TEST_CASE macro which performs automatic registration of test functions
• Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
• Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

**CONFIG_UNITY_ENABLE_FIXTURE**

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

**CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL**

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

**Virtual file system** Contains:

- **CONFIG_VFS_SUPPORT_IO**

**CONFIG_VFS_SUPPORT_IO**

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.
open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.
Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:
close, read, write, ioctl, fcntl.

**Default value:**
- Yes (enabled)
CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component.

- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**Default value:**
- Yes (enabled) if CONFIG_VFS_SUPPORT_IO && CONFIG_LWIP_USE_ONLY_LWIP_SELECT

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SUPPORT_TERMIOS

Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

Host File System I/O (Semihosting) Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS
- CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN
Chapter 2. API

**CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

**CONFIG_VFS_SEMIHOSTFS_HOST_PATH_MAX_LEN**

Host FS: Maximum path length for the host base directory

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum path length for the host base directory which is to be mounted. If host path passed to esp_vfs_semihost_register() is longer than this value it will be truncated.

**Default value:**

- 128

**Wear Levelling**

Contains:

- **CONFIG_WL_SECTOR_MODE**
- **CONFIG_WL_SECTOR_SIZE**

**CONFIG_WL_SECTOR_SIZE**

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.
Available options:
- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager** Contains:
- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**
Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

**Range:**
- from 1 to 255

**Default value:**
- 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**
Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**
- from 5 to 600

**Default value:**
- 30

**CONFIG_WIFI_PROV_BLE_BONDING**
Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED`

**Supplicant** Contains:
- `CONFIG_WPA_TESTING_OPTIONS`
- `CONFIG_WPA_11KV_SUPPORT`
- `CONFIG_WPA_SUITE_B_192`
- `CONFIG_WPA_WAPI_PSK`
- `CONFIG_WPA_DEBUG_PRINT`
- `CONFIG_WPA_WPS_STRICT`
- `CONFIG_WPA_MBEDTLS_CRYPTO`
**CONFIG_WPA_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**
- Yes (enabled)

**CONFIG_WPA_WAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**
- No (disabled)

**CONFIG_WPA_SUITE_B_192**

Enable NSA suite B support with 192 bit key

*Found in: Component config > Supplicant*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**
- No (disabled)

**CONFIG_WPA_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**
- No (disabled)

**CONFIG_WPA_TESTING_OPTIONS**

Add DPP testing code

*Found in: Component config > Supplicant*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

**CONFIG_WPA_WPS_STRICT**

Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.
**Default value:**
- No (disabled)

**CONFIG_WPA_11KV_SUPPORT**
Enable 802.11k, 802.11v APIs handling in supplicant

*Found in: Component config > Supplicant*
Select this option to enable 802.11k 802.11v APIs (RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

*Default value:*
- No (disabled)

Contains:
- **CONFIG_WPA_MBO_SUPPORT**
- **CONFIG_WPA_SCAN_CACHE**

**CONFIG_WPA_SCAN_CACHE**
Keep scan results in cache

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*
Keep scan results in cache, if not enabled, those will be flushed immediately.

*Default value:*
- No (disabled) if **CONFIG_WPA_11KV_SUPPORT**

**CONFIG_WPA_MBO_SUPPORT**
Enable MBO support in supplicant

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*
Select this option to enable WiFi Multiband operation certification support.

*Default value:*
- No (disabled) if **CONFIG_WPA_11KV_SUPPORT**

**Compatibility options**
Contains:
- **CONFIG_LEGACY_INCLUDE_COMMON_HEADERS**

**CONFIG_LEGACY_INCLUDE_COMMON_HEADERS**
Include headers across components as before IDF v4.0

*Found in: Compatibility options*
Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It’s not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it’s changed in IDF v4.0.
You can still include these headers in a legacy way until it is totally deprecated by enable this option.

**Default value:**
- No (disabled)

**Deprecated options and their replacements**

• CONFIG_SYSVIEW_TS_SOURCE (CON_SWITCH_SYS_TS_SOURCE)
  – CONFIG_SYSVIEW_TS_SOURCE_CCOUNT
  – CONFIG_SYSVIEW_TS_SOURCE_TIMER_00
  – CONFIG_SYSVIEW_TS_SOURCE_TIMER_01
  – CONFIG_SYSVIEW_TS_SOURCE_TIMER_10
  – CONFIG_SYSVIEW_TS_SOURCE_TIMER_11
  – CONFIG_SYSVIEW_TS_SOURCE_ESP_TIMER
• CONFIG_TASK_WDT (CON_SWITCH_TASK_WDT)
• CONFIG_TASK_WDT_CHECK_IDLE_TASK_CPU0 (CON_SWITCH_TASK_WDT_CHECK_IDLE_TASK_CPU0)
• CONFIG_TASK_WDT_CHECK_IDLE_TASK_CPU1 (CON_SWITCH_TASK_WDT_CHECK_IDLE_TASK_CPU1)
• CONFIG_TASK_WDT_PANIC (CON_SWITCH_TASK_WDT_PANIC)
• CONFIG_TASK_WDT_TIMEOUT_S (CON_SWITCH_TASK_WDT_TIMEOUT_S)
• CONFIG_TCPIP_RECVMBOX_SIZE (CON_SWITCH_TCPIP_RECVMBOX_SIZE)
• CONFIG_TCPIP_TASK_AFFINITY (CON_SWITCH_TCPIP_TASK_AFFINITY)
  – CONFIG_TCPIP_TASK_AFFINITY_NO_AFFINITY
  – CONFIG_TCPIP_TASK_AFFINITY_CPU0
  – CONFIG_TCPIP_TASK_AFFINITY_CPU1
• CONFIG_TCPIP_TASK_STACK_SIZE (CON_SWITCH_TCPIP_TASK_STACK_SIZE)
• CONFIG_TCP_MAXRTX (CON_SWITCH_TCP_MAXRTX)
• CONFIG_TCP_MSL (CON_SWITCH_TCP_MSL)
• CONFIG_TCP_MSS (CON_SWITCH_TCP_MSS)
• CONFIG_TCP_OOSEQ (CON_SWITCH_TCP_OOSEQ)
• CONFIG_TCP_RECVMBOX_SIZE (CON_SWITCH_TCP_RECVMBOX_SIZE)
• CONFIG_TCP_SEND_BUF_DEFAULT (CON_SWITCH_TCP_SEND_BUF_DEFAULT)
• CONFIG_TCP_SYNMAXRTX (CON_SWITCH_TCP_SYNMAXRTX)
• CONFIG_TCP_WND_DEFAULT (CON_SWITCH_TCP_WND_DEFAULT)
• CONFIG_TIMER_QUEUE_LENGTH (CON_SWITCH_TIMER_QUEUE_LENGTH)
• CONFIG_TIMER_TASK_PRIORITY (CON_SWITCH_TIMER_TASK_PRIORITY)
• CONFIG_TIMER_TASK_STACK_DEPTH (CON_SWITCH_TIMER_TASK_STACK_DEPTH)
• CONFIG_TIMER_TASK_STACK_SIZE (CON_SWITCH_TIMER_TASK_STACK_SIZE)
• CONFIG_TOOLPREFIX (CON_SWITCH_TOOLPREFIX)
• CONFIG_UDP_RECVMBOX_SIZE (CON_SWITCH_UDP_RECVMBOX_SIZE)
• CONFIG_ULP_COPROC_ENABLED (CON_SWITCH_ULP_COPROC_ENABLED)
• CONFIG_ULP_COPROC_RESERVE_MEM (CON_SWITCH_ULP_COPROC_RESERVE_MEM)
• CONFIG_USE_ONLY_LWIP_SELECT (CON_SWITCH_USE_ONLY_LWIP_SELECT)
• CONFIG_WARN_WRITE_STRINGS (CON_SWITCH_WARN_WRITE_STRINGS)
• CONFIG_WIFI_LWIP_ALLOCATION_FROM_SPIRAM_FIRST (CON_SWITCH_WIFI_LWIP_ALLOCATION_FROM_SPIRAM_FIRST)
2.10 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.
For general information about error codes in ESP-IDF, see Error Handling.

ESP_FAIL (-1): Generic esp_err_t code indicating failure
ESP_OK (0): esp_err_t value indicating success (no error)
ESP_ERR_NO_MEM (0x101): Out of memory
ESP_ERR_INVALID_ARG (0x102): Invalid argument
ESP_ERR_INVALID_STATE (0x103): Invalid state
ESP_ERR_INVALID_SIZE (0x104): Invalid size
ESP_ERR_NOT_FOUND (0x105): Requested resource not found
ESP_ERR_NOT_SUPPORTED (0x106): Operation or feature not supported
ESP_ERR_TIMEOUT (0x107): Operation timed out
ESP_ERR_INVALID_RESPONSE (0x108): Received response was invalid
ESP_ERR_INVALID_CRC (0x109): CRC or checksum was invalid
ESP_ERR_INVALID_VERSION (0x10a): Version was invalid
ESP_ERR_INVALID_MAC (0x10b): MAC address was invalid
ESP_ERR_NOT_FINISHED (0x10c): There are items remained to retrieve
ESP_ERR_NVS_BASE (0x1100): Starting number of error codes
ESP_ERR_NVS_NOT_INITIALIZED (0x1101): The storage driver is not initialized
ESP_ERR_NVS_NOT_FOUND (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY
ESP_ERR_NVS_TYPE_MISMATCH (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
ESP_ERR_NVS_READ_ONLY (0x1104): Storage handle was opened as read only
ESP_ERR_NVS_NOT_ENOUGH_SPACE (0x1105): There is not enough space in the underlying storage to save the value
ESP_ERR_NVS_INVALID_NAME (0x1106): Namespace name doesn’t satisfy constraints
ESP_ERR_NVS_INVALID_HANDLE (0x1107): Handle has been closed or is NULL
ESP_ERR_NVS_REMOVE_FAILED (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
ESP_ERR_NVS_KEY_TOO_LONG (0x1109): Key name is too long
ESP_ERR_NVS_PAGE_FULL (0x110a): Internal error; never returned by nvs API functions
ESP_ERR_NVS_INVALID_STATE (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.
ESP_ERR_NVS_INVALID_LENGTH (0x110c): String or blob length is not sufficient to store data
ESP_ERR_NVS_NO_FREE_PAGES (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.
ESP_ERR_NVS_VALUE_TOO_LONG (0x110e): String or blob length is longer than supported by the implementation
ESP_ERR_NVS_PARTITION_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table
**ESP_ERR_NVS_NEW_VERSION_FOUND** (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** (0x1111): XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** (0x1112): XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** (0x1113): XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** (0x1114): XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** (0x1115): NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** (0x1116): NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** (0x1117): NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** (0x1119): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** (0x1200): Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG** (0x1201): Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR** (0x1202): Load address is outside of RTC memory reserved for the ULP

**ESP_ERR_ULP_DUPLICATE_LABEL** (0x1203): More than one label with the same number was defined

**ESP_ERR_ULP_UNDEFINED_LABEL** (0x1204): Branch instructions references an undefined label

**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE** (0x1205): Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE** (0x1500): Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT** (0x1501): Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID** (0x1502): Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED** (0x1503): Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER** (0x1504): Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED** (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE** (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**ESP_ERR_EFUSE** (0x1600): Base error code for efuse api.

**ESP_OK_EFUSE_CNT** (0x1601): OK the required number of bits is set.

**ESP_ERR_EFUSE_CNT_IS_FULL** (0x1602): Error field is full.

**ESP_ERR_EFUSE_REPEATED_PROG** (0x1603): Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING** (0x1604): Error while a encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS** (0x1605): Error not enough unused key blocks available

**ESP_ERR_DAMAGED_READING** (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**ESP_ERR_IMAGE_BASE** (0x2000)
ESP_ERR_IMAGE_FLASH_FAIL (0x2001)
ESP_ERR_IMAGE_INVALID (0x2002)
ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVS (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW/Internal (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_DPP_FAILURE (0x3097): Generic failure during DPP Operation
ESP_ERR_DPP_TX_FAILURE (0x3098): DPP Frame Tx failed OR not Acked
ESP_ERR_DPP_INVALID_ATTR (0x3099): Encountered invalid DPP Attribute
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
Chapter 2. API

ESP_ERR_MESH_WIFI_NOT_START (0x4001)
ESP_ERR_MESH_NOT_INIT (0x4002)
ESP_ERR_MESH_NOT_CONFIG (0x4003)
ESP_ERR_MESH_NOT_START (0x4004)
ESP_ERR_MESH_NOT_SUPPORT (0x4005)
ESP_ERR_MESH_NOT_ALLOWED (0x4006)
ESP_ERR_MESH_NO_MEMORY (0x4007)
ESP_ERR_MESH_ARGUMENT (0x4008)
ESP_ERR_MESH_EXCEED_MTU (0x4009)
ESP_ERR_MESH_TIMEOUT (0x400a)
ESP_ERR_MESH_DISCONNECTED (0x400b)
ESP_ERR_MESH_QUEUE_FAIL (0x400c)
ESP_ERR_MESH_QUEUE_FULL (0x400d)
ESP_ERR_MESH_NO_PARENT_FOUND (0x400e)
ESP_ERR_MESH_NO_ROUTE_FOUND (0x400f)
ESP_ERR_MESH_OPTION_NULL (0x4010)
ESP_ERR_MESH_OPTION_UNKNOWN (0x4011)
ESP_ERR_MESH_XON_NO_WINDOW (0x4012)
ESP_ERR_MESH_INTERFACE (0x4013)
ESP_ERR_MESH_DISCARD_DUPLICATE (0x4014)
ESP_ERR_MESH_DISCARD (0x4015)
ESP_ERR_MESH_VOTING (0x4016)
ESP_ERR_MESH_XMIT (0x4017)
ESP_ERR_MESH_QUEUE_READ (0x4018)
ESP_ERR_MESH_PS (0x4019)
ESP_ERR_MESH_RECV_RELEASE (0x401a)
ESP_ERR_ESP_NETIF_BASE (0x5000)
ESP_ERR_ESP_NETIF_INVALID_PARAMS (0x5001)
ESP_ERR_ESP_NETIF_IF_NOT_READY (0x5002)
ESP_ERR_ESP_NETIF_DHCPD_START_FAILED (0x5003)
ESP_ERR_ESP_NETIF_DHCPD_ALREADY_STARTED (0x5004)
ESP_ERR_ESP_NETIF_DHCPD_ALREADY_STOPPED (0x5005)
ESP_ERR_ESP_NETIF_NO_MEM (0x5006)
ESP_ERR_ESP_NETIF_DHCPD_NOT_STOPPED (0x5007)
ESP_ERR_ESP_NETIF_DRIVER_ATTACHMENT_FAILED (0x5008)
ESP_ERR_ESP_NETIF_INIT_FAILED (0x5009)
ESP_ERR_ESP_NETIF_DNS_NOT_CONFIGURED (0x500a)
ESP_ERR_ESP_NETIF_MLD6_FAILED (0x500b)
ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED (0x500c)
**ESP_ERR_FLASH_BASE (0x6000)**: Starting number of flash error codes

ESP_ERR_FLASH_OP_FAIL (0x6001)
ESP_ERR_FLASH_OP_TIMEOUT (0x6002)
ESP_ERR_FLASH_NOT_INITIALISED (0x6003)
ESP_ERR_FLASH_UNSUPPORTED_HOST (0x6004)
ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)
ESP_ERR_FLASH_PROTECTED (0x6006)

**ESP_ERR_HTTP_BASE (0x7000)**: Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection
ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server
ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme
ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn’t been established yet
ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t

**ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008)**: Read FIN from peer and the connection closed

ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn’t be resolved upon tls connection
ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket
ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family
ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8006): new connection in esp_tls_low_level_conn connection timeouted

ESP_ERR_ESP_TLS_SE_FAILED (0x8007)
ESP_ERR_ESP_TLS_TCP_CLOSED_FIN (0x8008)
ESP_ERR_MBEDTLS_CERT_PARTLY_OK (0x8010): mbedtls parse certificates was partly successful
ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED (0x8011): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED (0x8012): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED (0x8013): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8014): mbedtls api returned error
ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED (0x8015): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED (0x8016): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_SETUP_FAILED (0x8017): mbedtls api returned error
ESP_ERR_MBEDTLS_SSL_WRITE_FAILED (0x8018): mbedtls api returned error
ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED (0x8019): mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED (0x801a): mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED (0x801b): mbedtls api returned failed
ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED (0x801c): mbedtls api returned failed
Chapter 2. API

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED (0x8031): wolfSSL api returned error
ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED (0x8032): wolfSSL api returned error
ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED (0x8033): wolfSSL api returned error
ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED (0x8034): wolfSSL api returned failed
ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED (0x8035): wolfSSL api returned failed
ESP_ERR_WOLFSSL_CTX_SETUP_FAILED (0x8036): wolfSSL api returned failed
ESP_ERR_WOLFSSL_SSL_SETUP_FAILED (0x8037): wolfSSL api returned failed
ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x8038): wolfSSL api returned failed

ESP_ERR_HTTPS_OTA_BASE (0x9000)
ESP_ERR_HTTPS_OTA_IN_PROGRESS (0x9001)
ESP_ERR_PING_BASE (0xa000)
ESP_ERR_PING_INVALID_PARAMS (0xa001)
ESP_ERR_PING_NO_MEM (0xa002)

ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated
ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread

ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes
ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem
ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)
ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)
ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)
Chapter 3

ESP32 H/W 硬件参考

3.1 芯片系列对比

下表对比了 ESP-IDF 各系列芯片的主要特性，如需了解更多信息，请参考相关文档中各系列芯片的技术规格书。

API 指南

4.1 应用层跟踪库

4.1.1 概述

为了分析应用程序的行为，IDF 提供了一个有用的功能：应用层跟踪。此功能可以提供一个形式，可以通过 menuconfig 开启。此功能使得用户可以在程序运行时查看某些特定的变量，通过 JTAG 接口在主机和 ESP32 之间传输任意数据。

开发人员可以使用这个功能库将应用程序的运行状态发送给主机，在运行时接收来自主机的命令或其他类型的信息。该库的主要使用场景有：

1. 收集应用程序特定的数据，具体请参阅特定应用程序的跟踪
2. 记录到主机的轻量级日志，具体请参阅记录日志到主机
3. 系统行为分析，具体请参阅基于 SEGGER SystemView 的系统行为分析
4. 源代码覆盖率，具体请参阅 Gcov（源代码覆盖）

使用 JTAG 接口的跟踪组件工作示意图：

4.1.2 运行模式

该库支持两种操作模式：

流模式：这是默认的模式，该模式不需要和主机进行交互。在这种模式下，跟踪模块会根据条件在缓存区中存放数据，待数据达到一定条件时再将数据发往主机。

4.1.3 配置选项与依赖项

使用此功能需要在主机端和目标端设置相应的配置：

1707
1. **主机端**：应用程序跟踪是通过 JTAG 来完成的，因此需要在主机上安装并运行 OpenOCD。相关信息请参阅 JTAG Debugging。

2. **目标端**：在 menuconfig 中开启应用程序跟踪功能。Component config > Application Level Tracing 菜单允许选择跟踪数据的传输目标（具体用于传输的硬件接口），选择任一非 None 的目标都会自动开启 CONFIG_APPTRACE_ENABLE 这个选项。

**注解**：为了实现更高的数据速率并降低丢包率，建议优化 JTAG 的时钟频率，使其达到能够稳定运行的最大值。详细信息请参阅优化 JTAG 的速度。

以下为前述未提及的另外两个 menuconfig 选项：

1. **Threshold for flushing last trace data to host on panic** (CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH)。由于在 JTAG 上工作的性质，此选项是必选项。在该模式下，跟踪数据以 16 KB 数据块的形式暴露给主机。在后验模式中，当一个块被填充时，它会暴露给主机，而之前的块会变得不可用。换句话说，跟踪数据以 16 KB 的粒度进行覆盖。在发生 panic 的时候，当前输入块的最新数据将会被暴露给主机，主机可以读取它们以进行后续分析。如果系统发生 panic 的时候仍有少量数据还没来得及曝光给主机，那么之前收集的 16 KB 的数据将丢失。主机只能看到非常少的最新的跟踪部分，它可能不足以用来诊断问题所在。此 menuconfig 选项允许避免此类情况。它可以控制在发生 panic 时刷新数据的阈值。例如用户可以确定它需要不少于 512 字节的最新跟踪数据，所以如果在发生 panic 时待处理的数据少于 512 字节，它们不会被刷新，也不会覆盖之前的 16 KB。该选项仅在后验模式和 JTAG 工作时有意义。

2. **Timeout for flushing last trace data to host on panic** (CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO)。该选项仅在流模式下才起作用，它控制跟踪模块在发生 panic 时等待主机读取最新数据的最长时间。

### 4.1.4 如何使用这个库

该库提供了用于在主机和 ESP32 之间传输任意数据的 API。当在 menuconfig 中启用时，目标应用程序的跟踪模块会在系统启动时自动初始化，因此用户需要做的就是调用相应的 API 来发送，接收或者刷新数据。
特定应用程序的跟踪

通常，用户需要决定在每个方向上待传输数据的类型以及如何解析（处理）这些数据。要想在目标和主机之间传输数据，用户必须执行以下几个步骤。

1. 在目标端，用户需要实现将跟踪数据写入主机的算法。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!");
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
     ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` 函数使用 `memcpy` 把用户数据复制到内部缓存中。在某些情况下，使用 `esp_apptrace_buffer_get()` 和 `esp_apptrace_buffer_put()` 函数会更加理想，它们允许开发人员自行分配缓冲区并填充。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)&esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
     "tmo in us/");
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo...
     in us*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

另外，根据实际项目的需要，用户可能希望从主机接收数据。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);
/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not...
     wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

`esp_apptrace_read()` 函数使用 `memcpy` 来把主机端的数据复制到用户缓存区。在某些情况下，使用 `esp_apptrace_down_buffer_get()` 和 `esp_apptrace_down_buffer_put()` 函数。
```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, ...
--100/"tmo in us"/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/...
"tmo in us"/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report...
    incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. 下一步是编译应用程序的镜像并将其下载到目标板上，这一步可以参考文档构建并烧写。
3. 运行 OpenOCD（参见 JTAG 调试）。
4. 连接到 OpenOCD 的 telnet 服务器，在终端执行如下命令 telnet <oocd_host> 4444。如果
在运行 OpenOCD 的同一台机器上打开 telnet 会话，您可以使用 localhost 替换上面命令中的
<oocd_host>。
5. 使用特殊的 OpenOCD 命令开始收集跟踪数据，此命令将传输跟踪数据并将其重定向到指定的
文件或套接字（当前仅支持文件作为跟踪数据目标）。相关命令的说明请参阅启动调试器。
6. 最后一步是处理接收到的数据。由于数据格式由用户定义，因此处理阶段超出了本文档的
范围。数据处理的范例可以参考位于 $IDF_PATH/tools/esp_app_trace 下的 Python 脚本
app-trace Proc.py (用于功能测试) 和 logtrace Proc.py (请参阅记录日志到主机 章节中的
details)。

OpenOCD 应用程序跟踪命令  HW UP BUFFER 在用户数据段之间共享，并且会替 API 的调用者（在任
务或者中断上下文中）填充分配到的内存。它在系统环境下，正在填充缓存区的任务/中断可能会被另一
个高优先级的任务/中断抢占，有可能发生主机会接收未准备好的用户数据的情况。为了处理这样的情况，
跟踪模块在所有用户数据段之前添加一个数据头，其中包含有分配的用户缓冲区的大小（2 字节）和实
际写入的数据长度（2 字节），也就是说数据头总共长 4 字节。负责读取跟踪数据的 OpenOCD 命令在读
取到不完整的用户数据段时会报错，但是无论如何它都会将整个用户数据段（包括还未填充的区域）
的内容放到输出文件中。

下面是 OpenOCD 应用程序跟踪命令的使用说明。

注解：目前，OpenOCD 还不支持将任意用户数据发送到目标的命令。

命令用法：

```
esp apptrace [start <options>] | [stop] | [status] | [dump <cores_num>
<outfile>]
```
子命令：
start 开始跟踪（连续流模式）。
stop 停止跟踪。
dump 转储所有后验模式的数据。
Start 子命令的语法：

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt
[skip_size]]]]]
```

outfile 用于保存来自两个 CPU 的数据文件的路径。该参数需要具有以下格式：file://path/to/file。
poll_period 轮询跟踪数据的周期（单位：毫秒），如果大于 0 则以非阻塞模式运行。默认为 1 毫秒。
trace_size 最多要收集的数据量（单位：字节），接收到指定数量的数据后将会停止跟踪。默认情况下是 -1（禁用跟踪大小停止触发器）。
stop_tmo 空闲超时（单位：秒），如果指定的时间段内都没有数据就会停止跟踪。默认为 -1（禁用跟踪超时停止触发器）。还可以将其设置为比目标跟踪命令之间的最短暂停值更长的值（可选）。
wait4halt 如果设置为 0 则立即开始跟踪，否则命令等待目标停止（复位，打断点等），然后自动恢复它并开始跟踪。默认值为 0。
skip_size 开始时要跳过的字节数，默认为 0。

注解：如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令将不可用。必须通过复位电路板或者在 OpenOCD 的窗口中（不是 telnet 会话窗口）按 Ctrl+C。另一种选择是设置 trace_size 并等待。当收集到指定数据量时，跟踪会自动停止。

命令使用示例：

1. 将 2048 个字节的跟踪数据收集到 “trace.log” 文件中。该文件将保存在 “openocd-esp32” 目录中。

```
esp apptrace start file://trace.log 1 2048 5 0 0
```

跟踪数据会被检索并以非阻塞的模式保存到文件中。如果收集满 2048 字节的数据或者在 5 秒内都没有新的数据，那么该过程就会停止。

注解：在将数据提供给 OpenOCD 之前，会对其进行缓冲。如果看到 “Data timeout!” 的消息，则目标可能在超时之前没有发送足够的数据给 OpenOCD 来清空缓冲区。增加超时时间或者使用函数 esp_apptrace_flush() 以特定间隔刷新数据都可以解决这个问题。

2. 在非阻塞模式下无限制地检索跟踪数据。

```
esp apptrace start file://trace.log 1 1 -1 -1 0 0
```

对收集数据的大小没有限制，并且没有设置任何超时时间。可以通过在 OpenOCD 的 telnet 会话窗口中发送 esp apptrace stop 命令，或者在 OpenOCD 窗口中使用快捷键 Ctrl+C 来停止此过程。

3. 检索跟踪数据并无限期保存。

```
esp apptrace start file://trace.log 0 0 -1 -1 0 0
```

在跟踪停止之前，OpenOCD 的 telnet 会话窗口将不可用。要停止跟踪，请在 OpenOCD 的窗口中使用快捷键 Ctrl+C。

4. 等待目标停止，然后恢复目标的操作并开始检索数据。当收集满 2048 字节的数据后就停止：

```
esp apptrace start file://trace.log 0 2048 -1 1 0
```

想要复位后立即开始跟踪，请使用 OpenOCD 的 reset halt 命令。

记载日志到主机

记录日志到主机是 IDF 的一个非常实用的功能：通过应用层跟踪库将日志保存到主机端。某种程度上这也算是一种半主机（semihosting）机制，相较于调用 ESP_LOGx 将待打印的字符串发送到 UART 的日志
Chapter 4. API 指南

记录方式，这个功能的优势在于它减少了本地的工作量，而将大部分工作转移到了主机端。

IDF 的日志库会默认使用类 vprintf 的函数将格式化的字符串输出到专用的 UART。一般来说，它涉及到以下几个步骤：

1. 解析格式字符串以获取每个参数的类型。
2. 根据其类型，将每个参数都转换为字符。
3. 格式字符串与转换后的参数一起发送到 UART。

虽然可以将类 vprintf 函数优化到一定程度，但是上述步骤在任何情况下都是必须要执行的，并且每个步骤都会消耗一定的时间（尤其是步骤3）。所以经常会发现以下这种情况：向程序中添加额外的打印信息以诊断问题，却改变了应用程序的行为，使得问题无法复现。在最差的情况下，程序会无法正常工作，最终导致报错甚至挂起。

解决此类问题的可能方法是使用更高的波特率或者其他更快的接口，并将字符串格式化的工作转移到主机端。

通过应用层跟踪库的 esp_aptrace_vprintf 函数，可以将日志信息发送到主机。该函数不执行格式字符串和参数的完全解析，而仅仅计算传递的参数的数量，并将它们与格式字符串地址一起发送给主机。主机端会通过一个特殊的 Python 脚本来处理并打印接收到的日志数据。

局限 当前通过 JTAG 实现记录日志还存在以下几点局限：

1. 不支持使用 ESP_EARLY_LOGx 宏进行跟踪。
2. 仅支持大于或等于 4 字节的 printf 参数（例如 double 和 uint64_t）。
3. 仅支持 rodata 段中的格式字符串和参数。
4. printf 参数最多 256 个。

如何使用 为了使用跟踪模块来记录日志，用户需要执行以下步骤：

1. 在 目 标 端，需 要 安 装 特 殊 类 的 printf 函数，正 如 前 面 提 到 过 的，这 个 函 数 是 esp_aptrace_vprintf，它会负责将日志数据发送给主机。示例代码参见 system/app_trace_to_host。
2. 按照特定应用程序的跟踪 章节中第 2-5 步骤中的说明进行操作。
3. 打印接收到的日志记录，请在终端运行以下命令：$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file。

Log Trace Processor 命令选项 命令用法：

logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>

位置参数（必要）：

trace_file 日志跟踪文件的路径
elf_file 程序 ELF 文件的路径

可选参数：

-h, --help 显示此帮助信息并退出
--no-errors, -n 不打印错误信息

基于 SEGGER SystemView 的系统行为分析

IDF 中另一个基于应用层跟踪库的实用功能是系统级跟踪，它会生成与 SEGGER SystemView 工具相兼容的跟踪信息。SEGGER SystemView 是一种实时记录和可视化工具，用来分析应用程序运行时的行为。

注解：目前，基于 IDF 的应用程序能够以文件的形式生成与 SystemView 格式兼容的跟踪信息，并可以使用 SystemView 工具软件打开。但是还无法使用该工具控制跟踪的过程。
如何使用：若需使用这个功能，需要在 menuconfig 中开启 `CONFIG_APPTRACE_SV_ENABLE` 选项，具体路径为：Component config > Application Level Tracing > FreeRTOS SystemView Tracing。在同一个菜单栏下还开启了其他几个选项:

1. ESP32 timer to use as SystemView timestamp source （`CONFIG_APPTRACE_SV_TS_SOURCE`）选择 SystemView 事件使用的时间戳来源。在单核模式下，使用 ESP32 内部的循环计数器生成时间戳，其最大的工作频率是 240 MHz （时间戳精度大约为 4 ns）。在双核模式下，使用工作在 40 MHz 的外部定时器，因此时间戳精度为 25 ns。

2. 可以单独启用或禁用的 SystemView 事件集合 （`CONFIG_APPTRACE_SV_EVT_XXX`）：
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

IDF 中已经包含了所有用于生成兼容 SystemView 跟踪信息的代码，用户只需配置必要的项目选项（如上所示），然后构建、烧写映像到目标板，接着参照前面的介绍，使用 OpenOCD 收集数据。

**OpenOCD SystemView 跟踪命令选项** 命令用法：

```sh
esp sysview [start <options>] | [stop] | [status]
```

子命令:

- **start** 开启跟踪 (连续流模式)。
- **stop** 停止跟踪。
- **status** 获取跟踪状态。

Start 子命令语法:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1** 保存 PRO CPU 数据的文件路径。此参数需要具备如下格式：`file://path/to/file`。
- **outfile2** 保存 APP CPU 数据的文件路径。此参数需要具备如下格式：`file://path/to/file`。
- **poll_period** 跟踪数据的轮询周期 (单位：毫秒)。如果该值大于 0，则命令以非阻塞的模式运行，默认为 1 毫秒。
- **trace_size** 最多要收集的数据量 (单位：字节)。当收到指定数量的数据后，将停止跟踪。默认值是 -1 (禁用跟踪大小停止触发器)。
- **stop_tmo** 空闲超时 (单位：秒)。如果指定的时间内没有数据，将停止跟踪。默认值是 -1 (禁用跟踪超时停止触发器)。

**注解**：如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令行将不可用。你需通过复位板卡或者在 OpenOCD 的窗口 (不是 telnet 会话窗口) 输入 Ctrl+C 命令来手动停止它。另一个方法是设置 trace_size 然后等到收集满指定数量的数据后自动停止跟踪。

命令使用示例：

1. 将 SystemView 跟踪数据收集到文件“pro-cpu.SVDat”和“app-cpu.SVDat”中。这些文件会被保存在 “openocd-esp32” 目录中。

```sh
esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
```

跟踪数据被检索并以非阻塞的方式保存。要停止此过程，需要在 OpenOCD 的 telnet 会话窗口输入 esp sysview stop 命令，或者也可以在 OpenOCD 窗口中按下 Ctrl+C。
Chapter 4. API 指南

2. 检索跟踪数据并无限保存。

```plaintext
esp32 sysview start file://pro-cpu.SVD file://app-cpu.SVDat 0 -1 -1
```

OpenOCD 的 telnet 命令行在跟踪停止前会无法使用，要停止跟踪，请在 OpenOCD 窗口按下 Ctrl+C。

数据可视化：收集到跟踪数据后，用户可以使用特殊的工具来可视化结果并分析程序的行为。

遗憾的是，SystemView 不支持从多个核心进行跟踪。所以当追踪双核模式下的 ESP32 时会生成两个文件：一个用于 PRO CPU，另一个用于 APP CPU。用户可以用每个文件加载到工具中单独分析。

在工具中单独分析每个核的跟踪数据是比较棘手的，但是 Eclipse 提供了一个叫 Impulse 的插件可以加载多个跟踪文件，并且可以在同一个视图中检查来自两个内核的事件。此外，与免费版的 SystemView 相比，此插件没有 1,000,000 事件的限制。

关于如何安装、配置 Impulse 并使用它可视化来自单个核心的跟踪数据，请参阅官方教程。

注解：IDF 使用自己的 SystemView FreeRTOS 事件 ID 映射，因此用户需要将`SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt`替换为 `$IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt`。在使用上述链接配置 SystemView 序列化程序时，也应该使用该 IDF 特定文件的内容。

配置 Impulse 实现双核跟踪：在安装好 Impulse 插件并确保 Impulse 能够在单独的选项卡中成功加载每个核心的跟踪数据后，用户可以添加特殊的 Multi Adapter 端口并将这两个文件加载到一个视图中。为此，用户需要在 Eclipse 中执行以下操作：

1. 打开“Signal Ports”视图，前往 Windows->Show View->Other 菜单，在 Impulse 文件夹中找到“Signal Ports”视图，然后双击它。
2. 在“Signal Ports”视图中，右键单击“Ports”并选择“Add ...”，然后选择 New Multi Adapter Port。
3. 在打开的对话框中按下“Add”按钮，选择“New Pipe/File”。
4. 在打开的对话框中选择“SystemView Serializer”并设置 PRO CPU 跟踪文件的路径，按下确定保存设置。
5. 对 APP CPU 的跟踪文件重复步骤 3 和 4。
6. 双击创建的端口，会打开此端口的视图。
7. 单击 Start/Stop Streaming 按钮，数据将会被加载。
8. 使用“Zoom Out”、“Zoom In”和“Zoom Fit”按钮来查看数据。
9. 有关设置测量光标和其他的功能，请参阅 Impulse 官方文档。

注解：如果您在可视化方面遇到了问题（未显示数据或者缩放操作异常），您可以尝试删除当前的信号层次结构，再双击必要的文件或端口。Eclipse 会请求您创建新的信号层次结构。

Gcov（源代码覆盖）

Gcov 和 Gcovr 简介：源代码覆盖率显示程序运行时间内执行的每一条程序执行路径的数量和频率。Gcov 是一个 GCC 工具，与编译器协同使用时，可生成日志文件，显示源文件每行的执行次数。Gcovr 是管理 Gcov 和生成代码覆盖率总结的工具。

一般来说，使用 Gcov 在主机上编译和运行程序会经过以下步骤：

1. 使用 GCC 以及 --coverage 选项编译源代码。这会让编译器在编译过程中生成一个 .gcno 注释文件，该文件包含执行路径块图以及将每个块映射到源代码行号等信息。每个用 --coverage 选项编译的源文件都会有一个同名的 .gcno 文件（如 main.c 在编译时会生成 main.gcno）。
2. 执行程序。在执行过程中，程序会生成 .gcda 数据文件。这些数据文件包含了执行路径的次数统计。程序将为每个用 --coverage 选项编译的源文件生成一个 .gcda 文件（如 main.c 将生成 main gcda）。
3. Gcov 或 Gcovr 可用于生成基于 .gcno、.gcda 和源文件的代码覆盖。Gcov 将以 .gcov 文件的形式为每个源文件生成基于文本的覆盖报告，而 Gcovr 将以 HTML 格式生成覆盖报告。
ESP-IDF 中 Gcov 和 Gcovr 应用
   在 ESP-IDF 中使用 Gcov 比较复杂。因为程序不在主机上运行（即在目标机上运行），代码覆盖率数据（即 .gcda 文件）最初存储在目标机上。然后 OpenOCD 在运行时通过 JTAG 将代码覆盖率数据从目标机转储到主机上。在 ESP-IDF 中使用 Gcov 可以分为以下几个步骤:

1. 为 Gcov 设置项目
2. 转储代码覆盖数据
3. 生成代码覆盖报告

为 Gcov 设置项目

编译器选项
   为了获得项目中的代码覆盖率数据，项目中的一个或多个源文件必须使用 --coverage 选项进行编译。在 ESP-IDF 中，这可以在组件级或单个源文件级实现:
   在组件的 CMakeLists.txt 文件中添加 target_compile_options(${COMPONENT_LIB} PRIVATE -coverage) 可将组件中的所有源文件用 -coverage 选项进行编译。
   在组件的 CMakeLists.txt 文件中添加 set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS -coverage) 可将同一组件中选定的一些源文件（如 source1.c 和 source2.c）通过 -coverage 选项编译。
   当一个源文件用 --coverage 选项编译时（例如 gcov_example.c），编译器会在项目的目标目录下生成 gcov_example.gcno 文件。

项目配置
   在构建一个有源代码覆盖的项目之前，请通过运行 idf.py menuconfig 启用以下项目配置选项。
   - 通过 CONFIG_APPTRACE_DESTINATION 选项选择 Trace Memory 来启用应用程序跟踪模块。
   - 通过 CONFIG_APPTRACE_GCOV_ENABLE 选项启用 Gcov 主机。

转储代码覆盖数据
   一旦一个项目使用 --coverage 选项编译并烧录到目标机上，在应用程序运行时，代码覆盖率数据将存储在目标机内部（即在跟踪存储器中）。将代码覆盖率数据从目标机转储到主机上的过程称为转储。

覆盖率数据的转储通过 OpenOCD 进行（关于如何设置和运行 OpenOCD，请参考 JTAG 试试）。由于是通过向 OpenOCD 发出命令来触发转储，因此必须打开 telnet 会话来向 OpenOCD 发出这些命令（运行 telnet localhost 4444）。GDB 也可以代替 telnet 来向 OpenOCD 发出命令，但是所有从 GDB 发出的命令都需要以 mon <oocd_command> 为前缀。

当目标机转储代码覆盖数据时，.gcda 文件存储在项目的构建目录中。例如，如果 main 组件的 gcov_example_main.c 在编译时使用了 --coverage 选项，那么转储代码覆盖数据将在 build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda 中生成一个 gcov_example_main.gcda 文件。注意，编译过程中产生的 .gcno 文件也放在同一个目录下。

代码覆盖数据的转储可以在应用程序的整个生命周期内多次进行。每次转储都会用最新的代码覆盖率信息更新 .gcda 文件。代码覆盖率数据是累积的，因此最新的数据将包含应用程序整个生命周期中每个代码路径的总执行次数。

ESP-IDF 支持两种将代码覆盖数据从目标机转储到主机的方法:

- 运行中实时转储
- 停机转储

运行中实时转储
   通过 telnet 会话调用 OpenOCD 命令 ESP32 gcov 来触发运行时的实时转储。一旦被调用，OpenOCD 将立即抢占 ESP32 的当前状态，并执行一个内部的 IDF Gcov 调试存根函数。调试存根函数将数据转储到主机。完成后，ESP32 将恢复当前状态。
硬编码转储 硬编码转储是由应用程序本身从程序内部调用 esp_gcov_dump() 函数触发的。在调用时，应用程序将停止并等待 OpenOCD 连接并检查代码覆盖数据。一旦 esp_gcov_dump() 函数被调用，主机会通过 telnet 会话执行 esp gcov dump OpenOCD 命令。esp gcov dump 命令会让 OpenOCD 连接到 ESP32，检查代码覆盖数据，然后断开与 ESP32 的连接，从而恢复应用程序。可以在应用程序的生命周期中多次触发硬编码转储。

通过在必要地方放置 esp_gcov_dump()（如在应用程序初始化后，在应用程序主循环的每次迭代期间），当应用程序在生命周期的某刻需要代码覆盖率数据时，硬编码转储会非常有用。

GDB 可以用来在 esp_gcov_dump() 上设置一个断点，然后通过使用 gdbinit 脚本自动调用 mon esp gcov dump（关于 GDB 的使用可参考使用命令行调试）。

以下 GDB 脚本将在 esp_gcov_dump() 处添加一个断点，然后调用 mon esp gcov dump OpenOCD 命令。

```c
b esp_gcov_dump
commands
mon esp gcov dump
end
```

注解：注意所有的 OpenOCD 命令都应该在 GDB 中以 mon <oocd_command> 方式调用。

生成代码覆盖报告 一旦代码覆盖数据被转储，.gcno、.gcda 和源文件可以用来生成代码覆盖报告。该报告会显示源文件中每行被执行的次数。

Gcov 和 Gcovr 都可以用来生成代码覆盖报告。安装 Xilinx 工具链时会一起安装 Gcov，但 Gcovr 可能需要单独安装。关于如何使用 Gcov 或 Gcovr，请参考 Gcov documentation 和 Gcovr documentation。

在工程中添加 Gcov 构建目标 用户可以在自己的工程中定义额外的构建目标从而更方便地生成报告。可以通过一个简单的构建命令生成这样的报告。

请在您的工程的 CMakeLists.txt 文件中添加以下内容:

```c
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

可使用以下命令:

- cmake --build build/ --target gcovr-report: 在 $(BUILD_DIR_BASE)/coverage_report/html 目录下生成 HTML 格式代码覆盖报告。
- cmake --build build/ --target cov-data-clean: 删除所有代码覆盖数据文件。

### 4.2 应用程序的启动流程

本文将会介绍 ESP32 从上电到运行 app_main 函数中间所经历的步骤（即启动流程）。

宏观上，该启动流程可以分为如下 3 个步骤:

1. 一级引导程序 被固化在了 ESP32 内部的 ROM 中，它会从 flash 的 0x1000 偏移地址处加载一级引导程序至 RAM (IRAM & DRAM) 中。
2. 二级引导程序 从 flash 中加载分区表和主程序镜像至内存中，主程序中包含了 RAM 段和通过 flash 高速缓存映射的只读段。
3. 应用程序启动阶段 运行，这时第二个 CPU 和 RTOS 的调度器启动。

下面会对上述过程进行更为详细的阐述。
4.2.1 一级引导程序

SoC 复位后，PRO CPU 会立即开始运行，执行复位向量代码，而 APP CPU 仍然保持复位状态。在启动过程中，PRO CPU 会执行所有的初始化操作。APP CPU 的复位状态会在应用程序启动代码的 call_start_cpu0 函数中失效。复位向量代码位于 ESP32 芯片掩膜 ROM 处，且不能被修改。

复位向量调用的启动代码会根据 GPIO Strap 规律寄存器的值来确定 ESP32 的启动模式，该寄存器保存着复位后 bootstrap 引脚的电平状态。根据不同的复位原因，程序会执行如下操作：

1. 从深度睡眠模式复位：如果 RTC_CNTL_STORE6_REG 寄存器的值非零，且 RTC_CNTL_STORE7_REG 寄存器中的 RTC 内存的 CRC 校验值有效，那么程序会使用 RTC_CNTL_STORE6_REG 寄存器的值作为入口地址，并立即跳转到该地址进行。如果 RTC_CNTL_STORE6_REG 的值为零，或 RTC_CNTL_STORE7_REG 中的 CRC 校验值无效，又或通过 RTC_CNTL_STORE6_REG 调用的代码返回。则像上电复位一样继续启动。注意：如果想在这里运行自定义的代码，可以参考深度睡眠文档里面介绍的深度睡眠唤醒机制方法。

2. 上电复位，软件 Soc 复位，看门狗 SoC 复位：检查 GPIO Strap 规律寄存器，判断是否请求自定义启动模式。如 UART 下载模式。如果是，ROM 会执行此自定义加载器模式。否则程序会像软件 CPU 复位一样继续启动。请参考 ESP32 技术规格书了解 SoC 启动模式以及具体执行过程。

3. 软件 CPU 复位，看门狗 CPU 复位：根据 EFUSE 中的值配置 SPI flash，然后尝试从 flash 中加载代码，这部分将会在后面的章节详细介绍。

注解：正常启动模式下会使能 RTC 看门狗，因此，如果进程中断或停止，看门狗将自动重置 SOC 并重复启动过程。如果 strapping GPIOs 已更改，则可能导致 SoC 陷入新的启动模式。

4.2.2 二级引导程序

在 ESP-IDF 中，存在于 flash 的 0x1000 偏移地址处的二进制映像就是二级引导程序。二级引导程序的源码可以在 ESP-IDF 的 components/bootloader 目录下找到。ESP-IDF 使用的启动引导程序可以增加 flash 分区的灵活性（使用分区表），并且方便实现 flash 加密，安全引导和空中升级（OTA）等功能。

当一级引导程序校验加载完二级引导程序后，它会从二进制映像的头部找到二级引导程序的入口点，并跳转过去运行。

二级引导程序默认从 flash 的 0x8000 偏移地址处可配置的值）读取分区表。请参考分区表 获取详细信息。引导程序会寻找工厂分区和 OTA 应用程序分区。如果在分区表中找到了 OTA 应用程序分区，引导程序将读取 otadata 分区以确定应引导哪个分区。更多信息请参考空中升级 (OTA)。

关于 ESP-IDF 引导程序可用的配置选项，请参考引导加载程序 (Bootloader)。

对于选定的分区，二级引导程序将从 flash 逐段读取二进制映像：

- 对于在内部 RAM (指令 RAM) 或 DRAM (数据 RAM) 中具有加载地址的段，将把数据从 flash 复制到它们的加载地址处。
- 对于一些加载地址位于 DROM（数据存储在 Flash 中）或 IROM（代码从 Flash 中运行）区域的段，通过配置 flash MMU，可为 flash 加载地址提供正确的映射。

请注意，二级引导程序同时为 PRO CPU 和 APP CPU 配置 flash MMU，不仅使能 PRO CPU 的 flash MMU。原因是二级引导程序代码已加载到 APP CPU 的高速缓存使用的内存区域中。因此使能 APP CPU 高速缓存的任务就交给了应用程序。

一旦处理完所有段（即加载了代码并设置了 flash MMU），二级引导程序将验证应用程序的完整性，并从二进制映像文件的头部寻找入口地址，然后跳转到该地址处运行。

4.2.3 应用程序启动阶段

应用程序启动包含了从应用程序开始执行到 app_main 函数在主任务内部运行前的所有过程。可分为三个阶段：
• 硬件和基本C语言运行环境的端口初始化。
• 软件服务和FreeRTOS的系统初始化。
• 运行主任务并调用app_main。

**注解**：通常不需要了解ESP-IDF应用程序初始化的所有阶段。如果需要仅从应用程序开发人员的角度了解初始化，请跳至运行主任务。

### 端口初始化

ESP-IDF应用程序的入口点是components/esp_system/port/cpu_start.c文件中的call_start_cpu0函数，这个函数由二级引导加载程序执行，并且从不返回。

该端口层的初始化功能会初始化基本的C运行环境（“CRT”），并对SoC的内部硬件进行了初始化。

- 为应用程序重新配置CPU异常（允许应用程序中断处理程序运行，并使用为应用程序配置的选项来处理异常错误，而不是使用ROM提供的异常处理程序处理）。
- 如果没有设置配置CONFIG_BOOTLOADER_WDT_ENABLE，则不会使RTC看门狗定时器。
- 初始化内部存储器（数据和bss）。
- 完成MMU高速缓存配置。
- 如果配置了PSRAM，则能使PSRAM。
- 将CPU时钟设置为项目设置的频率。
- 根据应用程序头部设置重新配置主SPI flash。这是为了与ESP-IDF V4.0之前的引导程序版本兼容，请参考引导加载程序兼容性。
- 如果应用程序被配置为在多个内核上运行，则另一个内核并等待其初始化（在类似“端口层”初始化函数call_start_cpu0内）。

call_start_cpu0完成运行后，将调用在components/esp_system/startup.c中找到的“系统层”初始化函数start_cpu0。其他内核也将完成端口层的初始化，并调用同一文件中的start_other_cores。

### 系统初始化

主要的系统初始化函数是start_cpu0。默认情况下，这个函数与start_cpu0_default函数弱链接。这意味着可以覆盖这个函数，增加一些额外的初始化步骤。

主要的系统初始化阶段包括：

- 如果默认的目录级别允许，则记录该应用程序的相关信息（项目名称、App version等）。
- 初始化堆分配器（在这之前，所有分配必须是静态的或在堆栈上）。
- 初始化newlib组件的系统调用和时间函数。
- 配置断电检测器。
- 根据串行控制台配置设置libc stdin、stdout、和stderr。
- 执行与安全有关的检查，包括该配置烧录efuse（包括禁用ESP32 V3的ROM下载模式，CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE）。
- 初始化SPI flash API支持。
- 调用全局C++构造函数和任何标有_attribute__((constructor))的C函数。

二级系统初始化允许单个组件被初始化。如果一个组件有一个用ESP_SYSTEM_INIT_FN宏注释的初始化函数，它将作为二级初始化的一部分被调用。

### 运行主任务

在所有其他组件都初始化后，主任务会被创建。FreeRTOS调度器开始运行。

做完一些初始化任务后（需要启动调度器），主任务在固件中运行应用程序提供的函数app_main。

运行app_main的主任务有一个固定的RTOS优先级（比最低值高）和一个可配置的堆栈大小。

主任务的内核亲和性也是可以配置的，请参考CONFIG_ESP_MAIN_TASK_AFFINITY。
Chapter 4. API 指南

与普通的 FreeRTOS 任务（或嵌入式 C 的 `main` 函数）不同，`app_main` 任务可以返回。如果 `app_main` 函数返回，那么主任务将会被删除。系统将重复运行其他的 RTOS 任务。因此可以将 `app_main` 实现作为一个创建其他应用任务然后返回的函数，或主应用任务本身。

**APP CPU 的内核启动流程**

**APP CPU 的启动流程类似但更简单：**

当运行系统初始化时，PRO CPU 上的代码会给 APP CPU 设置好入口地址，解除其复位状态，然后等待 APP CPU 上运行的代码设置一个全局标志，以表明 APP CPU 已经正常启动。完成后，APP CPU 跳转到 components/esp_system/port/cpu_start.c 中的 call_start_cpu1 函数。

当 `start_cpu0` 函数对 PRO CPU 进行初始化的时候，APP CPU 运行 `start_cpu_other_cores` 函数。与 `start_cpu0` 函数类似，`start_cpu_other_cores` 函数是弱链接的，认为 `start_cpu_other_cores_default` 函数，但可以由应用程序替换为不同的函数。

`start_cpu_other_cores_default` 函数做了一些与内核相关的系统初始化，然后等待 PRO CPU 启动 FreeRTOS 的调度器，启动完成后，它会执行 `esp_startup_start_app_other_cores` 函数，这是另一个默认为 `esp_startup_start_app_other_cores_default` 的弱链接函数。

默认情况下，`esp_startup_start_app_other_cores_default` 只会自旋，直到 PRO CPU 上的调度器触发中断，以启动 APP CPU 上的 RTOS 调度器。

### 4.3 BluFi

#### 4.3.1 概览

BluFi 是一款基于蓝牙通道的 Wi-Fi 网络配置功能，适用于 ESP32。它通过安全协议将 Wi-Fi 的 SSID、密码等配置信息传输到 ESP32，然后 ESP32 可基于这些信息连接到 AP 或建立 SoftAP。

BluFi 流程的关键部分包括数据的分片、加密、校验和验证。

用户可按需自定义用于对称加密、非对称加密和校验的算法。这里我们采用 DH 算法进行密钥协商、128-AES 算法用于数据加密、CRC16 算法用于校验和验证。

#### 4.3.2 BluFi 流程

BluFi 配网功能包含配置 SoftAP 和 Station 两部分。

下面以配置 Station 为例说明配置步骤。BluFi 配网的配置 Station 包含广播、连接、服务发现、协商共享密钥、传输数据、回找连接状态等步骤。

1. ESP32 开启 GATT Server 模式，发送带有特定 `advertising data` 的广播。你可以自定义该广播，该广播不属于 BluFi Profile。
2. 使用手机 APP 搜索到该特定广播，手机作为 GATT Client 连接 ESP32。你可以决定使用哪款手机 APP。
3. GATT 连接建立成功后，手机会向 ESP32 发送数据帧进行密钥协商（详情见 BluFi 中定义的帧格式）。
4. ESP32 收到密钥协商的数据帧后，会按照使用者自定义的协商方法来解析。
5. 手机与 ESP32 进行密钥协商。协商过程可使用 DH/RSA/ECC 等加密算法。
6. 协商结束后，手机端向 ESP32 发送控制帧，用于设置安全模式。
7. ESP32 收到控制帧后，使用共享密钥以及安全配置对通信数据进行加密和解密。
8. 手机向 ESP32 发送 BluFi 中定义的帧格式中定义的数据帧，包括 SSID、密码等 Wi-Fi 配置信息。
9. 手机向 ESP32 发送 Wi-Fi 连接请求的控制帧。ESP32 收到这个控制帧之后，会认为手机已将必要的信息已传输完毕，准备连接 Wi-Fi。
10. ESP32 连接到 Wi-Fi 后，发送 Wi-Fi 连接状态报告的控制帧到手机，以报告连接状态。至此配网结束。
注解:
1. ESP32 收到安全模式配置的控制帧后，会根据定义的安全模式进行相关操作。
2. 进行对称加密和解密时，加密和解密前后的数据长度必须一致，支持原地加密和解密。

4.3.3 BluFi 流程图

![BluFi Flow Chart](image)

图 2: BluFi Flow Chart

4.3.4 BluFi 中定义的帧格式

手机 APP 与 ESP32 之间的 BluFi 通信格式定义如下：
帧不分片情况下的格式 (8 位):

---

Espressif Systems
1720
Submit Document Feedback

Release v5.0-dev-489-gef98a36
### Chapter 4. API 指南

#### 描述 | 值
---|---
类型字段 (最低有效位) | 1
帧控制字段 | 1
序列号字段 | 1
数据长度字段 | 1
数据字段 | $\text{Data Length}$
校验字段 (最后有效位) | 2

如果使能 帧控制位，则 总长度 位表示帧的剩余部分的总长度，用于报告终端需要分配多少内存。

帧分片格式（8 位）:

#### 描述 | 值
---|---
类型字段 (最低有效位) | 1
帧控制字段（分片） | 1
序列号字段 | 1
数据长度字段 | 1
数据字段 | • Total Content Length: 2  
|  | • Content: $\text{Data Length} - 2$
校验字段 (最后有效位) | 2

通常情况下，控制帧不包含数据位，ACK 帧除外。

ACK 帧格式（8 bit）:

#### 描述 | 值
---|---
类型字段 - ACK（最低有效位） | 1
帧控制字段 | 1
序列号字段 | 1
数据长度字段 | 1
数据字段 | ACK 序列号: 2
校验字段 (最后有效位) | 2

1. **类型字段**
   类型字段，占 1 字节。分为类型字段和子类型字段两部分，类型字段占低 2 位，子类型字段占高 6 位。
   - 控制帧，暂不进行加密，可校验；
   - 数据帧，可加密，可校验。

1.1 **控制帧** (二进制： 0x0 b’ 00)

</tbody>
</table>
注解:

- 备注 1: 数据的长度取决于数据长度字段。当传输方向是 ESP 设备到手机时，表示向手机端提供所需信息。
- 备注 2: 数据的长度取决于数据长度字段。如果数据长度不够，该帧可用分片。

2. Frame Control
帧控制字段，占 1 字节，每个位表示不同含义。

<table>
<thead>
<tr>
<th>位</th>
<th>含义</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>表示帧是否加密。</td>
</tr>
<tr>
<td></td>
<td>• 0 表示加密</td>
</tr>
<tr>
<td></td>
<td>• 1 表示未加密</td>
</tr>
<tr>
<td></td>
<td>该帧的加密部分包括数据字段加密之前的完整明文数据（不包括校验部分）。</td>
</tr>
<tr>
<td></td>
<td>控制帧不加密，故控制帧此位为 0。</td>
</tr>
</tbody>
</table>

| 0x02 | 该数据字段表示帧尾是否包含校验位，如 SHA1、MD5、CRC 等。该数据字段包含序列 + 数据长度 + 明文。控制帧和数据帧都可以选择包含或不包含校验位。 |
| 0x04 | 表示数据方向。 |
|      | • 0 表示传输方向是手机到 ESP 设备   |
|      | • 1 表示传输方向是 ESP 设备到手机   |

| 0x08 | 表示是否要求对方回复 ACK。 |
|      | • 0 表示不要求   |
|      | • 1 表示要求回复 ACK   |

| 0x10 | 表示是否有后续的数据分片。 |
|      | • 0 表示此帧没有后续数据分片   |
|      | • 1 表示还有后续数据分片，用来传输较长的数据   |
|      | 对于分片帧，在数据字段的前两个字节中会给定当前内容部分 + 后续内容部分的总长度（即最大支持 64 K 的数据内容）。 |

| 0x10-0x80 | 保留 |

3. 序列控制
序列控制字段。帧发送时，无论帧的类型是什么，序列都会自动加 1，用来防止重放攻击（Replay Attack）。每次重新连接后，序列清零。

4. 长度
数据字段的长度，不包含校验部分。

5. 数据
对于不同的类型或子类型，数据字段的含义均不同。请参考上方表格。

6. 校验
此字段占两个字节，用来校验“序列 + 数据长度 + 明文数据”。

4.3.5 ESP32 端的安全实现

1. 数据安全
为了保证 Wi-Fi SSID 和密码的传输过程是安全的，需要使用对称加密算法（例如 AES、DES 等）对报文进行加密。在使用对称加密算法之前，需要使用非对称加密算法（DH、RSA、ECC 等）协商出（或生成出）一个共享密钥。

2. 保证数据完整性
为了保证数据完整性，需要加入校验算法，例如 SHA1、MD5、CRC 等。

3. 身份安全（签名）
某些算法如 RSA 可以保证身份安全。有些算法如 DH，本身不能保证身份安全，需要添加其他算法来签名。

4. 防止重放攻击（Replay Attack）
添加其到序列字段中，并且在数据校验过程中使用。
在 ESP32 端的代码中，你可以决定和开发加密钥协商等安全处理的流程。手机应用向 ESP32 发送协商数据，数据会传送给应用层处理。如果应用层不处理，可使用 BluFi 提供的 DH 加密算法来协商密钥。
应用层需向 BluFi 注册以下几个与安全相关的函数：

```c
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t _output_data, int _output_len, bool _need_free)
```

该函数用来接收协商期间的正常数据 (normal data)，数据处理完成后，需要将待发送的数据使用 output_data 和 output_len 传出。

BluFi 会在调用完 Negotiate_data_handler 后，发送 Negotiate_data_handler 传出的 output_data。

这里的两个 “*”，因为需要发出去的数据长度未知，所以需要函数自行分配 (malloc) 或者指向全局变量，并告知是否需要通过 NEED_FREE 释放内存。

```c
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int _crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int _crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

该函数用来进行校验，返回值为校验的值。BluFi 会使用该函数返回值与帧的校验值进行比较。

### 4.3.6 GATT 相关说明

**UUID**

BluFi Service UUID：0xFFFF，16 bit
BluFi (手机 -> ESP32) 特性：0xFF01，主要权限：可写
BluFi (ESP32 -> 手机) 特性：0xFF02，主要权限：可读/可通知

### 4.4 引导加载程序 (Bootloader)

ESP-IDF 软件引导加载程序 (Bootloader) 主要执行以下任务：

1. 内部模块的最小化初始化配置；
2. 如果配置了 `Flash 加密` 和/或 `Secure`，则对其进行初始化。
3. 根据分区表和 ota_data（如果存在）选择需要引导的应用程序 (app) 分区；
4. 将此应用程序镜像加载到 RAM（IRAM 和 DRAM）中，最后将控制权转交给此应用程序。

引导加载程序位于 flash 的 0x1000 偏移地址处。
关于启动过程以及 ESP-IDF 引导加载程序的更多信息，请参考 [应用程序的启动流程](#)

#### 4.4.1 引导加载程序兼容性

建议使用最新发布的 ESP-IDF 版本。OTA (空中升级) 更新可以在现场烧录新的应用程序，但不能烧录一个新的引导加载程序。因此，引导加载程序支持引导从 ESP-IDF 新版本中构建的应用程序。

但不支持引导从 ESP-IDF 旧版本中构建的程序。如果现有产品可能需要将应用程序降级到旧版本，那么在手动更新 ESP-IDF 时，请继续使用旧版本 ESP-IDF 引导加载程序的二进制文件。
ESP-IDF V2.1 之前的版本

与新版本相比，ESP-IDF V2.1 之前的版本构建的引导加载程序对硬件的配置更少。使用这些早期 ESP-IDF 版本的引导加载程序并构建新应用程序时，请启用配置选项`CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS`。

ESP-IDF V3.1 之前的版本

ESP-IDF V3.1 之前的版本构建的引导加载程序不支持分区表二进制文件中的 MD5 校验。使用这些 ESP-IDF 版本的引导加载程序并构建新应用程序时，请启用配置选项`CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`。

配置 SPI Flash

每个 ESP-IDF 应用程序或引导加载程序的二进制文件中都包含一个文件头，其中内置了`CONFIG_ESPTOOLPY_FLASHMODE`、`CONFIG_ESPTOOLPY_FLASHFREQ`和`CONFIG_ESPTOOLPY_FLASHSIZE`。这些是用于在启动时配置 SPI flash。

ROM 中的一级引导程序从 flash 中读取二级引导程序文件头中的配置信息，并使用这些信息来加载剩余的二级引导程序。然而，此时系统的时钟速度低于其被配置的速度，并且在这个阶段，只支持部分 flash 模式。因此，当二级引导程序运行时，它会从当前应用程序的二进制文件头中读取数据（而不是从引导加载程序的文件头中读取数据），并使用这些数据重新配置 flash。这样的配置流程可让 OTA 更新去更改当前使用的 SPI flash 的配置。

ESP-IDF V4.0 版本之前的引导加载程序使用其自身的文件头来配置 SPI flash，这意味着无法在 OTA 更新时更改 SPI flash 配置。为了与旧引导加载程序兼容，应用程序在其启动期间使用应用程序文件头中的配置信息重新初始化 flash 配置。

4.4.2 日志级别

引导加载程序日志的级别默认为“Info”。通过设置`CONFIG_BOOTLOADER_LOG_LEVEL`选项，可以增加或减少这个等级。这个日志级别与应用程序中使用的日志级别是分开的（见`Logging library`）。降低引导加载程序日志的详细程度可以稍微缩短整个项目的启动时间。

4.4.3 恢复出厂设置

在更新出现问题时，最好有一种方法让设备回到已知的正常状态，这时可选择恢复出厂设置。

要回到原始出厂设置并清除所有用户设置，请在引导加载程序中配置`CONFIG_BOOTLOADER_FACTORY_RESET`。

以下两种方式可以将设备恢复出厂设置。

- 清除一个或多个数据分区，`CONFIG_BOOTLOADER_DATA_FACTORY_RESET` 选项允许用户选择哪些数据分区在恢复出厂设置时被擦除。
- 用户可以使用以逗号分隔的列表形式指定分区的名称，为了提高可读性，可以选择添加空格（如：nvs, phy_init, nvs_custom）。请确保选项里指定的分区名称和分区表中的名称相同。此处不能指定“app”类型的分区。
从“工厂”应用分区启动时，当启用 CONFIG_BOOTLOADER_OTA_DATA_ERASE 选项，恢复出厂设置后，设备将从默认的“工厂”应用分区启动（如果分区表中没有“工厂”应用分区，则从默认的OTA应用分区启动）。这个恢复过程是通过擦除OTA数据分区来完成的。OTA数据分区中保存了当前选择的OTA分区槽，当不使用“工厂”应用分区槽时，不会通过OTA更新。因此置为从“工厂”应用分区启动则意味着将固件应用程序恢复为正常状态。

这两个配置选项都可以独立启用。

此外，以下配置选项用于配置触发恢复出厂设置的条件：

- **CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET** - 输入管脚 (GPIO) 的编号。该管脚用于触发恢复出厂设置。它在重置时从管脚拉低或拉高（可配置），然后才能触发出厂重置事件。
- **CONFIG_BOOTLOADER_HOLD_TIME_GPIO** - 管脚电平保持时间（默认为5秒）。当管脚电平必须保持特定时间时，才能执行恢复出厂设置或引导测试分区（如适用）。配置此参数时，必须设置管脚电平低平。设备重置后，设备将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32 的技术规格书。
- **CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL** - 设置管脚电平高低。设备重置后，根据设置将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32 的技术规格书。

### 4.4.4 从测试固件启动

用户可以编写特殊固件用于生产环境中测试，并在需要的时候运行。此时需要在项目分区表中专门申请一块分区用于保存该测试固件，其类型为 app，子类型为 test（详情请参考【分区表】）。

实现该测试应用固件需要为测试应用创建一个完全独立的 ESP-IDF 项目（ESP-IDF 中的每个项目仅构建一个应用程序），该测试应用可以独立于主项目进行开发和测试，然后在生成测试时作为一个预编译的.bin 文件集成到主项目的测试应用程序分区的地址。

为了使主项目的引导加载程序支持这个功能，请设置 **CONFIG_BOOTLOADER_APP_TEST** 并配置以下两个选项：

- **CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET** - 设置启动 TEST 分区的管脚编号。选中的管脚将被配置为启动了内部上拉的输入，当触发测试应用时，必须在重置时将管脚拉低。
  
  当管脚输入被释放（则被拉高）时，设备重置后，配置的应用程序将启动（工厂或任何 OTA 应用的分区）。

- **CONFIG_BOOTLOADER_HOLD_TIME_GPIO** - 设置 GPIO 电平保持的时间（默认为5秒）。当管脚电平保持特定时间（如适用时），设备重置后，管脚在设定的时间内必须保持低电平，然后才会执行出厂重置或引导测试分区（如适用）。

### 4.4.5 回滚

回滚和反回滚功能也必须在驱动程序中配置。

请参考 **OTA API 参考文档** 中的应用程序回滚和反回滚章节。

### 4.4.6 看门狗

默认情况下，硬件 RTC 看门狗定时器在引导加载程序运行时保持运行，如果9秒后没有应用程序成功启动，它将自动重置芯片。

- 可以通过设置 **CONFIG_BOOTLOADER_WDT_TIME_MS** 并重新编译引导加载程序来调整超时时间。
- 可以通过调整应用程序的行为使 RTC 看门狗在应用程序启动后保持运行。看门狗需要由应用程序显示地重置（即“喂狗”），以避免重置。为此，请设置 **CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE** 选项，根据需要修改应用程序，然后重新编译应用程序。
- 通过禁用 **CONFIG_BOOTLOADER_WDT_ENABLE** 设置并重新编译引导加载程序，可以在引导加载程序中禁用 RTC 看门狗，但并不建议这样做。
4.4.7 引导加载程序大小

当需要启用额外的引导加载程序功能，包括Flash boot 密或安全启动，尤其是设置高级别 CONFIG_BOOTLOADER_LOG_LEVEL 时，监控引导加载程序.bin 文件的大小变得非常重要。

当使用默认的 CONFIG_PARTITION_TABLE_OFFSET 值 0x8000 时，二进制文件最大可为 0x7000 (28672) 字节。

如果引导加载程序二进制文件过大，则引导加载程序会构建失败并显示“Bootloader binary size [...] is too large for partition table offset”的错误。如果此二进制文件已经被烧录，那么 ESP32 将无法启动 - 日志中将记录无效分区表或无效引导加载程序校验和的错误。

可以使用如下方法解决此问题：

- 将 bootloader 编译器优化 重新设置默认值“Size”。
- 降低引导加载程序日志级别。将日志级别设置为 Warning, Error 或 None 都会显著减少最终二进制文件的大小（但也会让调试变得更加困难）。
- 将 CONFIG_PARTITION_TABLE_OFFSET 设置为高于 0x8000 的值，以便稍后将分区表放置在 flash 中，这样可以增加引导加载程序的可用空间。如果分区表的 CSV 文件包含明确的分区偏移，这需要修改这些偏移，从而保证没有分区的偏移量低于 CONFIG_PARTITION_TABLE_OFFSET + 0x1000。（这包括随 ESP-IDF 提供的默认分区 CSV 文件）

当启用 Secure Boot V2 时，由于引导加载程序必须加载到固定大小的缓冲区中进行验证，对二进制文件大小的绝对限制为 48KB (0xC000 bytes)（不包括 4 KB 签名）。

4.4.8 从深度睡眠中快速启动

引导加载程序有 CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP 选项，可以减少从深度睡眠中唤醒的时间（有利于降低功耗）。当 CONFIG_SECURE_BOOT 选项禁用时，该选项可用。由于无需镜像校验，唤醒时间减少。在第一次启动时，引导加载程序将启动的应用程序的地址存储在 RTC FAST 存储器中。而在唤醒过程中，这个地址用于启动而无需任何检查，从而实现了快速加载。

4.4.9 自定义引导加载程序

用户可以扩展或修改当前的引导加载程序，具体有两种方法：使用钩子实现或重写覆盖当前程序。这两种方法在 ESP-IDF 示例的 custom_bootloader 文件夹中都有呈现。

- bootloader_hooks 介绍了如何将钩子与引导加载程序初始化连接。
- bootloader_override 介绍了如何覆盖引导加载程序的实现。

在引导加载程序的代码中，用户不能使用其他组件提供的驱动和函数，如果确实需要，请将该功能的实现部分放在项目的 bootloader_components 目录中（注意，这会增加引导加载程序的大小）。

如果引导加载程序过大，则可能与内存中的分区表重叠，分区表默认烧录在偏移量 0x8000 处。增加分区表偏移量，将分区表放在 flash 中靠后的区域，这样可以增加引导程序的可用空间。

4.5 构建系统（CMake 版）

本文档主要介绍 ESP-IDF 构建系统的实现原理以及组件等概念。如需您想了解如何组织和构建新的 ESP-IDF 项目或组件，请阅读本文档。

4.5.1 概述

一个 ESP-IDF 项目可以看作是多个不同组件的集合，例如一个显示当前湿度的网页服务器会包含以下组件：

- ESP-IDF 基础库，包括 libc、ROM bindings 等
- Wi-Fi 驱动
Chapter 4. API 指南

- TCP/IP 协议栈
- FreeRTOS 操作系统
- 网页服务器
- 湿度传感器的驱动
- 负载上述组件整合到一起的主程序

ESP-IDF 可以显式地指定和配置每个组件。在构建项目的时候，构建系统会前往 ESP-IDF 目录、项目目录和用户自定义组件目录（可选）中查找所有组件。允许用户通过文本菜单系统配置 ESP-IDF 项目中用到的每个组件。在所有组件配置结束后，构建系统开始编译整个项目。

概念

- 项目指一个目录，其中包含了构建可执行应用程序所需的全部文件和配置，以及其他支持型文件（例如分区表、数据/文件系统分区和引导程序）。
- 项目配置保存在项目根目录下名为 sdkconfig 的文件中，可以通过 idf.py menuconfig 进行修改，且一个项目只能包含一个项目配置。
- 每个组件是模块化且独立的代码，会被编译成静态库 (.a 文件) 并链接到应用程序。部分组件由 ESP-IDF 官方提供，其他组件则来源于其它开源项目。
- 目标指运行后应用程序的硬件设备，ESP-IDF 当前仅支持 esp32 和 esp32s2 及 esp32c3 这三个目标。

请注意，以下内容并不属于项目的组成部分:

- ESP-IDF 并不是项目的一部分，它独立于项目。通过 IDF_PATH 环境变量（保存 esp-idf 目录的路径）链接到项目，从而将 IDF 框架与项目分离。
- 交叉编译工具链并不是项目的组成部分，它应该被安装在系统 PATH 环境变量中。

4.5.2 使用构建系统

idf.py

idf.py 命令行工具提供了一个前端，可以帮助您轻松管理项目的构建过程，它管理了以下工具:

- CMake，配置构建的项目
- 命令行构建工具（Ninja 或 GNU Make）
- esptool.py，烧录目标硬件设备

入门指南：简要介绍了如何设置 idf.py 用于配置、构建并烧录项目。

idf.py 应运行在 ESP-IDF 的项目目录下，即包含 CMakeLists.txt 文件的目录。仅包含 Makefile 的老式项目并不支持 idf.py。

运行 idf.py --help 查看完整的命令列表。下面总结了最常用的命令:

- idf.py set-target <target> 会设置构建项目的目标 (芯片)。请参考选择目标芯片。
- idf.py menuconfig 会运行 menuconfig 工具来配置项目。
- idf.py build 会构建在当前目录下找到的项目，它包括以下步骤:
  - 根据需要创建 build 构建目录，它用于保存构建过程的输出文件，可以使用 -B 选项修改默认的构建目录。
  - 根据需要运行 CMake 来配置项目，为主构建工具生成构建文件。
  - 运行主构建工具 (Ninja 或 GNU Make)。默认情况下，构建工具会被自动检测，可以使用 -G 选项显式地指定构建工具。
- 构建过程是增量式的，如果自上次构建以来源文件或项目配置没有发生改变，则不会执行任何操作。
- idf.py clean 会把构建输出的文件从构建目录中删除。从而清理整个项目。下次构建时会强制 “重新完整构建” 这个项目。清理时，不会删除 CMake 配置输出及其他文件。
Chapter 4. API 指南

- idf.py fullclean 会将整个 build 目录下的内容全部删除，包括所有 CMake 的配置输出文件。下次构建项目时，CMake 会从头开始配置项目。请注意，该命令会递归删除构建目录下的所有文件，请谨慎使用。项目配置文件不会被删除。
- idf.py flash 会在必要时自动构建项目，并将生成的二进制程序烧录进目标 ESP32 设备中。
- idf.py monitor 用于显示目标 ESP32 设备的串口输出。
- idf.py 支持 bash、zsh 以及 fish shell 的自动补全。
- idf.py --cmake-warn-uninitialized
- idf.py python-clean
- idf.py app
- idf.py -C <dir>
- idf.py app-flash
- idf.py flash
- idf.py app-flash
- idf.py --ccache
- idf.py --help

多个 idf.py 命令可合并成一个。例如，idf.py -p COM4 clean flash monitor 会依次清理源码树，构建项目，烧录进目标 ESP32 设备，最后运行串口监视器。

对于 idf.py 不知道的指令，idf.py 会尝试将其作为构建系统的目标来执行。

idf.py 命令支持 bash、zsh 以及 fish shell 的自动补全。

要实现实现 shell 自动补全，请先确保您安装了 Python 3.5 以及 click 7.1 及以上版本 (请参考这里)。

使用 export 命令来启用 idf.py 的自动补全功能 (请参考这里)。按 TAB 键可实现自动补全。输入 “idf.py -” 后按 TAB 键可自动补全选项。

未来我们也支持 PowerShell 的自动补全功能。

注解：环境变量 ESPPORT 和 ESPPBAUD 可分别用来设置 -p 和 -b 选项的默认值，在命令行中，重新为这两个选项赋值，会覆盖其默认值。

高级命令

- idf.py app, idf.py bootloader, idf.py partition-table 仅可用于从适用的项目中构建应用程序、引导程序或分区表。
- idf.py app-flash 等匹配命令，仅将项目的特定部分烧录至 ESP32。
- idf.py -p PORT erase-flash 会使用 esp tool 擦除 ESP32 的整个 Flash。
- idf.py size 会打印应用程序相关的大小信息，size-components 和 size-files 这两个命令相似，分别用于打印每个组件或源文件的详细信息。如果您在运行 CMake (或 idf.py) 时定义了变量 -DOUTPUT_JSON=1，那么输出的格式会变成 JSON 而不是可读文本。详情请查看 idf.py-size。
- idf.py reconfigure 命令会重新运行 CMake (即便无需重新运行)。正常使用时，并不需要运行此命令，但当源码树中添加/删除文件后或更改 CMake cache 变量时，此命令会非常有用。例如，idf.py -DNAME='VALUE' reconfigure 会将 CMake cache 中的变量 NAME 的值设置为 VALUE。
- idf.py python-clean 会从 IDF 目录中删除生成的 Python 字节码，Python 字节码可能会在切换 IDF 和 Python 版本时引发变化，因此建议在切换 Python 后运行该命令。
- idf.py docs 将在浏览器中直接打开项目目标芯片和对应版本的文档链接。请使用 idf.py docs --help 查看所有选项。

同时调用多个 idf.py 命令时，命令的输入顺序并不重要，它们会按照正确的顺序依次执行，并保证第一条命令都生效 (即先构建后烧录，先擦除后烧录等)。

idf.py 选项
- idf.py --help 命令列出所有顶级选项。运行 idf.py <command> --help 命令列出针对某一命令的选项，如 idf.py monitor --help。下列是一些常用选项：
  - -C <dir> 可用来从默认的当前工作目录覆盖项目目录。
  - -B <dir> 可用来从项目目录默认的 build 目录覆盖构建目录。
  - --ccache 可用来在编译源文件时启用 CCache，安装了 CCache 构工具后可极大缩短编译时间。

请注意，一些旧版本的 CCache 在某些平台上可能会出现 bug，因此如果文件没有按预期重新构建，请尝试禁用 CCache 后再重新构建。通过设置环境变量 IDF_CCACHE_ENABLE 为非零值，可以默认启用 CCache。

- -v 可以让 idf.py 和编译系统产生详细的编译输出，对于调试编译问题会非常有用。
- --cmake-warn-uninitialized`````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````
开始新项目

运行 `idf.py create-project` 命令可以开始创建您的新项目，运行 `idf.py create-project --help` 命令获取更多相关信息。

例如:

```
idf.py create-project --path my_projects my_new_project
```

以上命令会在 `my_projects` 目录下创建一个名为 `my_new_project` 的新项目。

直接使用 CMake

为了方便，`idf.py` 已经封装了 CMake 命令，但是您愿意，也可以直接调用 CMake。

当 `idf.py` 在执行某些操作时，它会打印出其运行的每条命令以便参考。例如运行 `idf.py build` 命令与在 bash shell（或者 Windows Command Prompt）中运行以下命令是相同的:

```
mkdir -p build
cd build
cmake .. -G Ninja  # 或者 'Unix Makefiles'
ninja
```

在上面的命令列表中，`cmake` 命令对项目进行配置，并生成用于最终构建工具的构建文件。在这个例子中，最终构建工具是 Ninja。运行 `ninja` 来构建项目。

没有必要多次运行 `cmake`。第一次构建后，往后每次只需运行 `ninja` 即可。如果项目需要重新配置，`ninja` 会自动重新调用 `cmake`。

若在 CMake 中使用 `ninja` 或 `make`，则多数 `idf.py` 子命令也会有其对应的目标，例如在构建目录下运行 `make menuconfig` 或 `ninja menuconfig` 与运行 `idf.py menuconfig` 是相同的。

**注解**: 如果您已经熟悉了 CMake，那么可能会发现 ESP-IDF 的 CMake 构建系统不同寻常，为了减少样板文件，该系统封装了 CMake 的许多功能。请参考编写或 CMake 组件以编写更多“CMake 风格”的组件。

使用 Ninja/Mk 制程

您可以直接使用 `ninja` 或 `make` 运行如下命令来构建项目并烧录:

```
ninja flash
```

或:

```
make app-flash
```

可用的目标还包括：flash, app-flash (仅用于 app), bootloader-flash (仅用于 bootloader)。

以这种方式烧录时，可以通过设置 `ESPPORT` 和 `ESPBAUD` 环境变量来指定串口设备和波特率。您可以在操作系统或 IDE 项目中设置该环境变量，或者直接在命令行中进行设置:

```
ESPPORT=/dev/ttyUSB0
```

**注解**: 在命令的开头为环境变量赋值属于 Bash shell 的语法，可在 Linux、macOS 和 Windows 的类 Bash shell 中运行，但在 Windows Command Prompt 中无法运行。

或:
在 IDE 中使用 CMake

您还可以使用集成了 CMake 的 IDE，仅需将项目 CMakeLists.txt 文件的路径告诉 IDE 即可。集成 CMake 的 IDE 通常会有自己的构建工具（CMake 称之为“生成器”），它是组成 IDE 的一部分，用来构建源文件。

向 IDE 中添加除 build 目标以外的自定义目标（如添加“Flash”目标到 IDE）时，建议调用 idf.py 命令来执行这些“特殊”的操作。

有关将 ESP-IDF 同 CMake 集成到 IDE 中的详细信息，请参阅构建系统的元数据。

设置 Python 解释器

ESP-IDF 适用于所有支持的 Python 版本。即使您系统中默认的 python 解释器仍是 Python 2.7，ESP-IDF 也可以使用，但建议您升级至 Python 3。

idf.py 和其他的 Python 脚本会使用默认的 Python 解释器运行，如 python。您可以通过 python3 $IDF_PATH/tools/idf.py ... 命令切换到别的 Python 解释器，或者您可以通过设置 shell 别名或其他脚本来简写该命令。

如果直接使用 CMake，运行 cmake -D PYTHON=python3 ...，CMake 会使用传入的值覆盖默认的 Python 解释器。

如果使用集成 CMake 的 IDE，可以在 IDE 的图形用户界面中给名为 PYTHON 的 CMake cache 变量设置新的值来覆盖默认的 Python 解释器。

如果想在命令行中更优雅地管理 Python 的各个版本，请查看 pyenv 或 virtualenv 工具，它们会帮助您更改默认的 python 版本。

潜在问题 使用 idf.py 可能会出现如下 ImportError 错误：

```python
Traceback (most recent call last):
  File "~/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in ...
    from kconfiglib import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

该错误通常是由不同 Python 版本生成的 .pyc 文件引起的，可以通过运行以下命令解决该问题：

```bash
idf.py python-clean
```

4.5.3 示例项目

示例项目的目录结构如下所示:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
```

(下页继续)
该示例项目“myProject”包含以下组成部分：

- 顶层项目 CMakeLists.txt 文件，这是 CMake 用于学习如何构建项目的主要文件，可以在这个文件中设置项目全局的 CMake 变量。顶层项目 CMakeLists.txt 文件会引导/tools/cmake/project.cmake 文件，由它负责实现构建系统的其余部分。该文件最后会设置项目的名称，并定义该项目。
- “sdkconfig”项目配置文件，执行 idf.py menuconfig 时会创建或更新此文件，文件中保存了项目中所有组件（包括 ESP-IDF 本身的）配置信息。sdkconfig 文件可能会也可能不会被添加到项目源代码管理系统中。
- 可选的“components”目录中包含了项目的部分自定义组件，并不是每个项目都需要这种自定义组件。但它有助于构建可复用的代码或者导入第三方（不包含 ESP-IDF）的组件。或者，您也可以在顶层 CMakeLists.txt 中设置 EXTRA_COMPONENT_DIRS 变量以查找其他指定位置处的组件。有关详细信息，请参阅命名 main 组件。如果项目中源文件较多，建议将其归于组件中，而不是全部放在“main”中。
- “main”目录是一个特殊的组件，它包含项目本身的源代码。”main”是默认名称，CMake 变量 COMPONENT_DIRS 默认包含此组件，但您可以修改此变量。
- “build”目录是存放构建输出的地方，如果没有此目录，idf.py 会自动创建。CMake 会配置项目，并在此目录下生成临时的构建文件。此后，在主构建进程的运行期间，该目录还会保存临时目标文件、库文件以及最终输出的二进制文件。此目录通常不会添加到项目的源代码管理系统中，也不会随项目源码一同发布。

每个组件目录都包含一个 CMakeLists.txt 文件，里面会定义一些变量以控制该组件的构建过程，以及其与整个项目的集成。更多详细信息请参阅组件 CMakeLists 文件。

每个组件还可以包含一个 Kconfig 文件。它用于定义 menuconfig 时展示的组件配置选项。某些组件可能还会包含 Kconfig.projbuild 和 project_include.cmake 特殊文件，它们用于覆盖项目的部分设置。

4.5.4 项目 CMakeLists 文件

每个项目都有一个顶层 CMakeLists.txt 文件，包含整个项目的构建设置。默认情况下，项目 CMakeLists 文件会非常小。

最小 CMakeLists 文件示例

最小项目：

cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

必要部分

每个项目都要按照上面显示的顺序添加上述三行代码：

- cmake_minimum_required (VERSION 3.5) 必须放在 CMakeLists.txt 文件的第一行，它会告诉 CMake 构建该项目所需的最小版本号。ESP-IDF 支持 CMake 3.5 或更高版本。
- include($ENV{IDF_PATH}/tools/cmake/project.cmake) 会引入 CMake 的其余功能来完成配置项目、检测组件等任务。
• `project(myProject)` 会创建项目本身，并指定项目名称。该名称会作为最终输出的二进制文件的名字，即 `myProject.elf` 和 `myProject.bin`。每个 `CMakeLists` 文件只能定义一个项目。

可选的项目变量

以下这些变量都有默认值，用户可以覆盖这些变量值以自定义构建行为。更多实现细节，请参阅 `tools/cmake/project.cmake` 文件。

- `COMPONENT_DIRS`：组件的搜索目录。默认为 `IDF_PATH/components`, `PROJECT_DIR/components` 和 `EXTRA_COMPONENT_DIRS`。如果您不想在这些位置搜索组件，请覆盖此变量。
- `EXTRA_COMPONENT_DIRS`：用于搜索组件的其它可选目录列表。路径可以是相对于项目目录的相对路径，也可以是绝对路径。
- `COMPONENTS`：要构建进项目中的组件名称列表。默认为 `COMPONENT_DIRS` 目录下检索到的所有组件。使用此变量可以“精简”项目以缩短构建时间。请注意，如果一个组件通过 `COMPONENT_REQUIRES` 指定了它依赖的另一个组件，则会自动将其添加到 `COMPONENTS` 中，所以 `COMPONENTS` 列表可能会非常短。

以上变量中的路径可以是绝对路径，或者是相对于项目目录的相对路径。

请使用 `cmake` 中的 `set` 命令来设置这些变量，如 `set(VARIABLE "VALUE")`。请注意，`set()` 命令需放在 `include(...)` 之前，`cmake_minimum(...)` 之后。

重命名 main 组件

构建系统会对 `main` 组件进行特殊处理。假如 `main` 组件位于预期的位置（即 `$PROJECT_PATH/main`），那么它会被自动添加到构建系统中。其他组件也会作为其依赖项被添加到构建系统中，这使用户免于处理依赖关系，并提供即时可用的构建功能。重命名 main 组件会减轻上述这些幕后工作量，但要求用户指定重命名后的组件位置，并手动为其添加依赖项。重命名 main 组件的步骤如下：

1. 重命名 main 目录。
2. 在项目 `CMakeLists.txt` 文件中设置 `EXTRA_COMPONENT_DIRS`，并添加重命名后的 main 目录。
3. 在组件的 `CMakeLists.txt` 文件中设置 `COMPONENT_REQUIRES` 或 `COMPONENT_PRIV_REQUIRES` 以指定依赖项。

覆盖默认的构建规范

构建系统设置了一些全局的构建规范（编译标志、定义等），这些规范可用于编译来自所有组件的所有源文件。

例如，其中一个默认的构建规范是编译选项 Wextra。假设一个用户想用 Wno-extra 来覆盖这个选项，应在 `project()` 之后进行：

```cmake
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
idf_build_set_property(COMPILE_OPTIONS "-Wno-error" APPEND)
```

这确保了用户设置的编译选项不会被默认的构建规范所覆盖，因为默认的构建规范是在 `project()` 内设置的。

4.5.5 组件 CMakeLists 文件

每个项目都包含一个或多个组件，这些组件可以是 ESP-IDF 的一部分，可以是项目自身组件目录的一部分，也可以从自定义组件目录添加（见上文）。

组件是 `COMPONENT_DIRS` 列表中包含 CMakeLists.txt 文件的任何目录。
搜索组件

搜索 COMPONENT_DIRS 中的目录列表以查找项目的组件。此列表中的目录可以是组件自身（即包含 CMakeLists.txt 文件的目录），也可以是子目录为组件的顶级目录。

当 CMake 运行项目配置时，它会记录本次构建包含的组件列表，它可用于调试某些组件的添加/排除。

同名组件

ESP-IDF 在搜索所有待构建的组件时，会按照 COMPONENT_DIRS 指定的顺序依次进行。这意味着在默认情况下，首先搜索 ESP-IDF 内部组件（IDF_PATH/components），然后是 EXTRA_COMPONENT_DIRS 中的组件，最后是项目组件（PROJECT_DIR/components）。如果这些目录中的两个或者多个包含具有相同名称的组件，则使用搜索到的最后一个位置的组件。这就允许将组件复制到项目目录中再修改以覆盖 ESP-IDF 组件。如果使用这种方式，ESP-IDF 目录本身可以保持不变。

注解：如果在现有项目中通过将组件移动到一个新位置来覆盖它，项目不会自动看到新组件的路径。请运行 idf.py reconfigure 命令后（或删除项目构建文件夹）再重新构建。

最小组件 CMakeLists 文件

最小组件 CMakeLists.txt 文件通过使用 idf_component_register 将组件添加到构建系统中。

```cmake
idf_component_register(SRCS "foo.c" "bar.c" INCLUDE_DIRS "include" REQUIRES mbedtls)
```

- SRCS 是源文件列表 (*c, *cpp, *cc, *S)，里面所有的源文件都将编译进组件库中。
- INCLUDE_DIRS 是目录列表，里面的路径会被添加到所有需要该组件的组件（包括 main 组件）全局 include 搜索路径中。
- REQUIRES 实际上并不是必需的，但通常需要它来声明该组件需要使用哪些其它组件，请参考组件依赖。

上述命令会构建生成与组件同名的库，并最终被链接到应用程序中。

上述目录通常设置为相对于 CMakeLists.txt 文件的相对路径，当然也可以设置为绝对路径。

还有其它参数可以传递给 idf_component_register，具体可参考 here。

有关更完整的 CMakeLists.txt 示例，请参阅组件依赖示例 和组件 CMakeLists 示例。

创建新组件

使用 idf.py create-component 命令创建新组件。新组件将包含构建组件所需的一组文件。您可以将组件的头文件纳入到您的项目中，并使用其功能。请运行 idf.py create-component --help 命令获取更多信息。

示例:

```bash
idf.py -C components create-component my_component
```

该示例将在当前工作目录下的子目录 components 中创建一个新的组件。更多关于组件的信息，请参考上文。

预设的组件变量

以下专用于组件的变量可以在组件 CMakeLists 中使用，但不建议修改：

- COMPONENT_DIR：组件目录，即包含 CMakeLists.txt 文件的绝对路径，它与 CMAKE_CURRENT_SOURCE_DIR 变量一样，路径中不能包含空格。
Chapter 4. API 指南

- COMPONENT_NAME：组件名，与组件目录名相同。
- COMPONENT_ALIAS：库别名，由构建系统在内部为组件创建。
- COMPONENT_LIB：库名，由构建系统在内部为组件创建。

以下变量在项目级别中被设置，但可在组件 CMakeLists 中使用：
- CONFIG_*：项目配置中的每个值在 cmake 中都对应一个以 CONFIG_ 开头的变量。更多详细信息请参阅 Kconfig。
- ESP_PLATFORM：ESP-IDF 构件系统处理 CMake 文件时，其值设为 1。

构建/项目变量

以下是可作为构建属性的构建/项目变量，可通过组件 CMakeLists.txt 中的 idf_build_get_property 查询其变量值。
- PROJECT_NAME：项目名，在项目 CMakeLists.txt 文件中设置。
- PROJECT_DIR：项目目录（包含项目 CMakeLists 文件）的绝对路径，与 CMAKE_SOURCE_DIR 变量相同。
- COMPONENTS：此次构建中包含的所有组件的名称，具体格式为用分号隔开的 CMake 列表。
- IDF_VER：ESP-IDF 的 git 版本号，由 git describe 命令生成。
- IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH：ESP-IDF 的组件版本，可用于条件表达式。请注意这些信息的精度度不如 IDF_VER 变量，版本号 v4.0-dev-*，v4.0-beta1，v4.0-rc1 和 v4.0 对应的 IDF_VERSION_* 变量值是相同的，但是 IDF_VER 的值是不同的。
- IDF_TARGET：项目的硬件目标名称。
- PROJECT_VER：项目版本号。
  - 如果设置了 CONFIG_APP_PROJECT_VER_FROM_CONFIG 选项，将会使用 CONFIG_APP_PROJECT_VER 的值。
  - 否则，如果在项目 CMakeLists.txt 文件中设置了 PROJECT_VER 变量，则该变量值可以使用。
  - 否则，如果 PROJECT_DIR/version.txt 文件存在，其内容会用作 PROJECT_VER 的值。
  - 否则，如果项目位于某个 Git 仓库中，则使用 git describe 命令的输出作为 PROJECT_VER 的值。
  - 否则，PROJECT_VER 的值为 1。

其它与构建属性有关的信息请参考这里。

组件编译控制

在编译特定组件的源文件时，可以使用 target_compile_options 函数来传递编译器选项：

```cpp
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

如果给单个源文件指定编译器标志，可以使用 CMake 的 set_source_files_properties 命令：

```cpp
set_source_files_properties(mysrc.c
  PROPERTIES COMPILDE_FLAGS
  -Wno-unused-variable)
```

如果上游代码在编译的时候发出了警告，那么这么做可能会很有效。
请注意，上述两条命令只能在组件 CMakeLists 文件的 idf_component_register 命令之后调用。

4.5.6 组件配置

每个组件都可以包含一个 Kconfig 文件，和 CMakeLists.txt 放在同一目录下。Kconfig 文件中包含要添加到该组件配置菜单中的一些配置设置信息。

运行 menuconfig 时，可以在 Component Settings 菜单栏下找到这些设置。
创建一个组件的 Kconfig 文件，最简单的方法就是使用 ESP-IDF 中现有的 Kconfig 文件作为模板，在这基础上进行修改。

有关示例请参阅添加条件配置。

### 4.5.7 预处理器定义

ESP-IDF 构建系统会在命令行中添加以下 C 预处理器定义：

- `ESP_PLATFORM`：可以用来检测在 ESP-IDF 内发生了构建行为。
- `IDF_VER`：定义 git 版本字符串，例如：v2.0 用于标记已发布的版本，v1.0-275-g0efaa4f 则用于标记任意某个的提交记录。

### 4.5.8 组件依赖

编译各个组件时，ESP-IDF 系统会递归评估其依赖项，这意味着每个组件都需要声明它所依赖的组件，即“requires”。

**编写组件**

```cpp
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` 需要包含所有在当前组件的 公共头文件里 #include 的头文件所在的组件。
- `PRIV_REQUIRES` 需要包含被当前组件的源文件 #include 的头文件所在的组件（除非已经被设置在了 `REQUIRES` 中），以及是当前组件正常工作必须要链接的组件。
- `REQUIRES` 和 `PRIV_REQUIRES` 的值不能依赖于任何配置选项 (CONFIG_xxx 宏)。这是因为在配置加载之前，依赖关系就已经被展开。其它组件变量（比如包含路径或源文件）可以依赖配置选择。
- 如果当前组件除了通用组件依赖项 中设置的通用组件（比如 RTOS, libc 等）外，并不依赖其它组件，那么对于上述两个 `REQUIRES` 变量，可以选择其中一个或是两个都不设置。

如果组件仅支持某些硬件目标（IDF_TARGET 的值），则可以在 idf_component_register 中指定 REQUIRED_IDF_TARGETS 来声明这个需求。在这种情况下，如果构建系统导入了不支持当前硬件目标的组件时就会报错。

**注释：** 在 CMake 中，`REQUIRES` 和 `PRIV_REQUIRES` 是 CMake 函数 `target_link_libraries(... PUBLIC ...)` 和 `target_link_libraries(... PRIVATE ...)` 的近似包装。

**组件依赖示例**

假设现在有一个 car 组件，它需要使用 engine 组件，而 engine 组件需要使用 spark_plug 组件：

- autoProject/
  - CMakeLists.txt
  - components/  - car/  - CMakeLists.txt
    - car.c
    - car.h
  - engine/  - CMakeLists.txt
    - engine.c
    - include/  - engine.h
  - spark_plug/  - CMakeLists.txt
    - plug.c
    - plug.h
Car组件
car.h头文件是car组件的公共接口。该头文件直接包含了engine.h，因为它需要使用engine.h中的一些声明:

```c
/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

同时car.c也包含了car.h:

```c
/* car.c */
#include "car.h"
```

这代表文件car/CMakeLists.txt需要声明car需要engine:

```c
idf_component_register(SRCS "car.c"
    INCLUDE_DIRS "." 
    REQUIRES engine)
```

- SRCS提供car组件中源文件列表。
- INCLUDE_DIRS提供该组件公共头文件目录列表，由于car.h是公共接口，所以这里列出了所有包含了car.h的目录。
- REQUIRES给出该组件的公共接口所需的组件列表。由于car.h是一个公共头文件并且包含了来自engine的头文件，所以我们这里包含engine。这样可以确保任何包含car.h的其他组件也能递归地包含所需的engine.h。

Engine组件
eengine组件也有一个公共头文件include/engine.h，但这个头文件更为简单:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start (void);
```

在engine.c中执行:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

在该组件中，engine依赖于spark_plug，但这是私有依赖关系。编译engine.c需要spark_plug.h但不需要包含engine.h。

这代表文件engine/CMakeLists.txt可以使用PRIV_REQUIRES:

```c
idf_component_register(SRCS "engine.c"
    INCLUDE_DIRS "include"
    PRIV_REQUIRES spark_plug)
```

因此，car组件中的源文件不需要在编译器搜索路径中添加spark_plug include目录，这可以加快编译速度，避免编译器命令行过长的冗长。

Spark Plug组件
spark_plug组件没有依赖项，它有一个公共头文件spark_plug.h，但不包含其他组件的头文件。

这代表spark_plug/CMakeLists.txt文件不需要任何REQUIRES或PRIV_REQUIRES:
源文件 Include 目录

每个组件的源文件都是用这些 Include 路径目录编译的，这些路径在传递给 idf_component_register 的参数中指定：

```c
idf_component_register(SRCS "spark_plug.c"
    INCLUDE_DIRS ".")
```

- 当前组件的 INCLUDE_DIRS 和 PRIV_INCLUDE_DIRS。
- REQUIRES 和 PRIV_REQUIRES 参数指定的所有其他组件（即当前组件的所有公共和私有依赖项）所设置的 INCLUDE_DIRS。
- 递归列出所有组件 REQUIRES 列表中 INCLUDE_DIRS 目录（如递归展开这个组件的所有公共依赖项）。

主要组件依赖项

main 组件比较特别，因为它在构建过程中自动依赖所有其他组件。所以不需要向这个组件传递 REQUIRES 或 PRIV_REQUIRES。有关不再使用 main 组件时需要更改哪些内容，请参考 重命名 main 组件。

通用组件依赖项

为避免重复性工作，各组件都用自动依赖一些“通用”IDF 组件，即使它们没有被明确提及。这些组件的头文件会一直包含在构建系统中。

通用组件包括：cxx, newlib, freertos, esp_hw_support, heap, log, lwip, soc, hal, esp_rom, esp_common, esp_system。

在构建中导人组件

- 默认情况下，每个组件都会包含在构建系统中。
- 如果将 COMPONENTS 变量设置为项目直接使用的最小组件列表，那么构建系统会扩展到包含所有组件。完整的组件列表为：
  - COMPONENTS 中明确提及的组件。
  - 这些组件的依赖项（以及递归运算后的组件）。
  - 每个组件都依赖的通用组件。
- 将 COMPONENTS 设置为所需组件的最小列表，可以显著减少项目的构建时间。

循环依赖

一个项目中可能包含组件 A 和组件 B，而组件 A 依赖 (REQUIRES 或 PRIV_REQUIRES) 组件 B，组件 B 又依赖组件 A。这就是所谓的依赖循环或循环依赖。

CMake 通常会在链接器命令行上重复两次组件库名称来自动处理循环依赖。然而这种方法并不总是有效，还是可能构建失败并出现关于 “Undefined reference to …” 的链接器错误，这通常是由于引用了循环依赖中某一组件中定义的符号，如果存在较大的循环依赖关系，即 A->B->C->D->A，这种情况极有可能发生。

最好的解决办法是重构组件以消除循环依赖关系。在大多数情况下，没有循环依赖的软件架构具有模块化和分层清晰的特性，并且从长远来看更容易维护。然而，移除循环依赖关系并不容易做到。
要绕过由循环依赖引起的链接器错误，最简单的解决方法是增加其中一个组件库的 CMake LINK_INTERFACE_MULTIPLICITY 属性。这会让 CMake 在链接器命令行上对此库及其依赖项重复两次以上。

例如：

```
set_property(TARGET $({COMPONENT_LIB}) APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- 这一行应该放在组件 CMakeLists.txt 文件 idf_component_register 之后。
- 可以的话，将此行放置在因依赖其他组件而造成循环依赖的组件中。实际上，该行可以放在循环内的任何一个组件中，但建议将其放置在拥有链接器错误提示信息中显示的源文件的组件中，或是放置在定义了链接器错误提示信息中所列出的符号的组件，先从这些组件开始是个不错的选择。
- 通常将值增加到 3（默认是 2）就足够了，但如果不奏效，可以尝试逐步增加这个数字。
- 注意，增加这个选项会使链接器的命令行变长，链结阶段变慢。

**高级解决方法：未定义符号** 如果只有一两个符号导致循环依赖，而所有其他依赖都是线性的，那么有一种替代方法可以避免链接器错误：在链接时将“反向”依赖所需的特定符号指定为未定义符号。

例如，如果组件 A 依赖于组件 B，但组件 B 也需要引用组件 A 的 reverse_ops（但不依赖组件 A 中的其他内容），那么你可以在组件 B 的 CMakeLists.txt 中添加如下一行，以在链接时避免这出现循环。

```
# 该符号是由“组件 A”在链接时提供
target_link_libraries($({COMPONENT_LIB}) INTERFACE "-u reverse_ops")
```

- `-u` 参数意味着链接器将始终在链接中包含此符号，而不管依赖项顺序如何。
- 该行应该放在组件 CMakeLists.txt 文件中的 idf_component_register 之后。
- 如果“组件 B”不需要访问“组件 A”的任何头文件，只需链接几个符号，那么这一行可以用来代替 B 对 A 的任何“REQUIRES”这样则进一步简化了构建系统中的组件结构。

请参考 target_link_libraries 文档以了解更多关于此 CMake 函数的信息。

**构建系统中依赖处理的实现细节**

- 在 CMake 配置进程的早期阶段会运行 expand_requirements.cmake 脚本，该脚本会为所有组件的 CMakeLists.txt 文件进行局部的运算，得到一张组件依赖关系图（此图可能会有闭环），此图用于在构建目录中生成 component_depeands.cmake 文件。
- CMake 主进程会导入该文件，并以此来确定是否包含到构建系统中的组件列表，内部使用的 BUILD_COMPONENTS 变量。BUILD_COMPONENTS 变量只包含组件名，依赖组件会排在前面，由于组件依赖关系图中可能存在闭环，因此不能保证每个组件都满足该排序规则。如果给定相同的组件集和依赖关系，那么最终的排序结果应该是确定的。
- CMake 会将 BUILD_COMPONENTS 的值以“Component names” 的形式打印出来。
- 然后执行构建系统中包含的组件的配置。
- 每个组件都被正常包含在构建系统中，然后再次执行 CMakeLists.txt 文件，将组件库加入构建系统。

**组件依赖顺序** BUILD_COMPONENTS 变量中组件的顺序决定了构建过程中的其它顺序，包括：

- 项目导入 project_include.cmake 文件的顺序。
- 生成用于编译（通过 -I 参数）的头文件路径列表的顺序。请注意，对于给定组件的源文件，仅需将该组件的依赖组件的头文件路径告知编译器。

**覆盖项目部分设置**

**project_include.cmake** 如果组件的某些构建行为需要在组件 CMakeLists 文件之前被执行，您可以在组件目录下创建名为 project_include.cmake 的文件。project.cmake 在运行过程中会导入此 CMake 文件。

**project_include.cmake** 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 esptool.py 的命令行参数和 bootloader 这个特殊的应用程序。
与组件 CMakeLists.txt 文件有所不同，在导入 “project_include.cmake” 文件的时候，当前源文件目录（即 CMAKE_CURRENT_SOURCE_DIR 和工作目录）为项目目录。如果想获得当前组件的绝对路径，可以用 CMAKE_CURRENT_PATH 变量。

请注意，project_include.cmake 对于大多数常见的组件并不是必需的。例如给项目添加 include 搜索目录，给最终的链接步骤添加 LDFLAGS 选项等都可以通过 CMakeLists.txt 文件来自定义。详细信息请参考可选的项目变量。

project_include.cmake 文件会按照 BUILD_COMPONENTS 变量中组件的顺序（由 CMake 记录）依次导入。即只有在当前组件所有依赖组件的 project_include.cmake 文件都被导入后，当前组件的 project_include.cmake 文件才会被导入，除非两个组件在同一个依赖闭环中。如果某个 project_include.cmake 文件依赖于另一组件设置的变量，则要特别注意上述情况。更多详情请参阅构建系统中依赖处理的实现细节。

在 project_include.cmake 文件中设置变量或目标时要格外小心，这些值被包含在项目的顶层 CMake 文件中，因此他们会影响或破坏所有组件的功能。

KConfigProjbuild 与 project_include.cmake 类似，也可以为组件定义一个 KConfig 文件以实现全局的配置。如果要在 menuconfig 的顶层添加配置选项，而不是在 “Component Configuration” 子菜单中，则可以在 CMakeLists.txt 文件所在目录的 KConfigProjbuild 文件中定义这些选项。

在此文件中添加配置时要小心，因为这些配置会包含在整个项目配置中。在可能的情况下，请为配置创建 KConfig 文件。

project_include.cmake 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 esptool.py 的命令行参数和 bootloader 这个特殊的应用程序。

仅配置组件 仅配置组件是一类不包含源文件的特殊组件，仅包含 KconfigProjbuild、KConfig 和 CMakeLists.txt 文件，该 CMakeLists.txt 文件仅有一行代码，调用了 idf_component_register() 函数。此函数会将组件导入到项目构建中，但不会构建任何库，也不会将头文件添加到任何 include 搜索路径中。

CMake 调试

请查看 CMake v3.5 官方文档 获取更多关于 CMake 和 CMake 命令的信息。

调试 ESP-IDF CMake 构建系统的一些技巧：

- CMake 运行时，会打印大量诊断信息，包括组件列表和组件路径。
- 运行 cmake --DDEBUG=1，IDF 构建系统会生成更详细的诊断输出。
- 运行 cmake 时指定 --trace 或 --trace-expand 选项会提供大量有关控制流信息。详情请参考 CMake 命令行文档。

当从项目 CMakeLists 文件导入时，project.cmake 文件会定义工具模块和全局变量，并在系统环境中没有设置 IDF_PATH 时设置 IDF_PATH。

同时还定义了一个自定义版本的内置 CMake project 函数，这个函数被覆盖，以添加所有 ESP-IDF 特定的项目功能。

警告未定义的变量 默认情况下，idf.py 在调用 CMake 时会给它传递 --warn-uninitialized 标志，如果在构建的过程中引用了未定义的变量，CMake 会打印警告。这对查找有错误的 CMake 文件非常有用。

如果您不想启用此功能，可以给 idf.py 传递 --no-warnings 标志。

更多信息，请参考文件 /tools/cmake/project.cmake 以及 /tools/cmake/ 中支持的函数。
4.5.9 组件 CMakeLists 示例

因为构建环境试图设置大多数情况都能工作的合理默认值，所以组件 CMakeLists.txt 文件可能非常小，甚至可能是空的，所以组件 CMakeLists 文件没有提供很多功能。有些功能往往需要覆盖预设的组件变量才能实现。

以下是组件 CMakeLists 文件的更高级的示例。

添加条件配置

配置系统可用于根据项目配置中选择的选项有条件地编译某些文件。

Kconfig:

```c
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
      This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```c
set(srcs "foo.c" "more_foo.c"
if(CONFIG_FOO_ENABLE_BAR)
  list(APPEND srcs "bar.c"
endif()
idf_component_register(SRCS "${srcs}"
```

上述示例使用了 CMake 的 if 函数和 list APPEND 函数。

也可用于选择或删除某一实现，如下所示：

Kconfig:

```c
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
      Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
      Select this to output debugging output to the LCD
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
      Select this to output temperature plots
```

CMakeLists.txt:

```c
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
```

Espressif Systems 1742

Submit Document Feedback
硬件目标的条件判断

CMake 文件可以使用 IDF_TARGET 变量来获取当前的硬件目标。

此外，如果当前的硬件目标是 xyz (即 IDF_TARGET=xyz)，那么 Kconfig 变量 CONFIG_IDF_TARGET_XYZ 同样也会被设置。

请注意，组件可以依赖 IDF_TARGET 变量，但不能依赖这个 Kconfig 变量。同样也不可在 CMake 文件的 include 语句中使用 Kconfig 变量，在这种上下文中可以使用 IDF_TARGET。

生成源代码

有些组件的源文件可能并不是由组件本身提供，而必须从另外的文件生成。假设组件需要一个头文件，该文件由 BMP 文件转换后（使用 bmp2h 工具）的二进制数据组成，然后将头文件包含在名为 graphics_lib.c 的文件中:

```cmake
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)
add_custom_target(logo
    DEPENDS log.h)
add_dependencies(${COMPONENT_LIB} logo)
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
    ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

这个示例改编自 CMake 的一则 FAQ，其中还包含了一些同样适用于 ESP-IDF 构建系统示例。

这个示例会在当前目录（构建目录）中生成 logo.h 文件，而 logo.bmp 会随组件一起提供在组件目录中。因为 logo.h 是一个新生成的文件，一旦项目需要清理，该文件也应该被清除。因此，要将该文件添加到 ADDITIONAL_MAKE_CLEAN_FILES 属性中。

注解: 如果需要生成文件作为项目 CMakeLists.txt 的一部分，而不是作为组件 CMakeLists.txt 的一部分，此时需要使用 $(PROJECT_PATH) 替代 $(COMPONENT_DIR)，使用 $(PROJECT_NAME).elf 替代 $(COMPONENT_LIB)。

如果某个源文件是从其他组件中生成，且包含 logo.h 文件，则需要调用 add_dependencies，在这两个组件之间添加一个依赖项，以确保组件源文件按照正确顺序进行编译。

嵌入二进制数据

有时您的组件希望使用一个二进制文件或者文本文件，但是您又不希望将它们重新格式化为 C 源文件。

这时，您可以在组件注册中指定 EMBED_FILES 参数，用空格分隔要嵌入的文件名称:

```cmake
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

或者，如果文件是字符串，则可以使用 EMBED_TXTFILES 变量，把文件的内容转成以 null 结尾的字符串嵌入:
文件的内容会被添加到 Flash 的.rodata 段，用户可以通过符号名来访问，如下所示:

```
//server_root_cert.pem_start
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
<-pem_start");
//server_root_cert.pem_end
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_
<-pem_end");
```

符号名会根据文件全名生成，如 EMBED_FILES 中所示，字符 /、等都会被下划线替代。符号名称中的_binary 前缀由 objcopy 命令添加，对文本文件和二进制文件都是如此。

如果要将文件嵌入到项目中，而非组件中，可以调用 target_add_binary_data 函数:

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

并将这行代码放在项目 CMakeLists.txt 的 project() 命令之后，修改 myproject.elf 为你自己的项目名。如果最后一个参数是 TEXT，那么构建系统会嵌入以 null 结尾的字符串，如果最后一个参数被设置为 BINARY，则将文件内容按照原样嵌入。

有关使用此技术的示例，请查看 file_serving 示例 protocols/http_server/file_serving/main/CMakeLists.txt 中的 main 组件，两个文件会在编译时加载并链接到固件中。

也可以嵌入生成的文件:

```
add_custom_command(OUTPUT my_processed_file.bin
  COMMAND my_process_file_cmd
  my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

上述示例中，my_processed_file.bin 是通过命令 my_process_file_cmd 从文件 my_unprocessed_file.bin 中生成，然后嵌入到目标中。

使用 DEPENDS 参数来指明对目标的依赖性:

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

target_add_binary_data 的 DEPENDS 参数确保目标首先执行。

### 代码和数据的存放

ESP-IDF 还支持自动生成链接脚本，它允许组件通过链接片段文件定义其代码和数据在内存中的存放位置。构建系统会处理这些链接片段文件，并将处理后的结果扩充进链接脚本，从而指导应用程序二进制文件的链接过程。更多详细信息与快速上手指南，请参阅链接脚本生成机制。

### 完全覆盖组件的构建过程

当然，在有些情况下，上面提到的方法不一定够用。如果组件封装了另一个第三方组件，而这个第三方组件并不能直接在 ESP-IDF 的构建系统中工作。在这种情况下，就需要放弃 ESP-IDF 的构建系统，改为使用 CMake 的 ExternalProject 功能。组件 CMakeLists 示例如下:

```
# 用于 quirc 的外部构建过程，在源目录中运行
# 并生成 libquirc.a
externalproject_add(quirc_build
  PREFIX ${COMPONENT_DIR}
  SOURCE_DIR ${COMPONENT_DIR}/quirc
  CONFIGURE_COMMAND"
  BUILD_IN_SOURCE 1
  BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
```

(下页继续)
(上述 CMakeLists.txt 可用于创建名为 quirc 的组件，该组件使用自己的 Makefile 构建 quirc 项目。)

- **externalproject_add** 定义了一个外部构建系统。
  - 设置 `SOURCE_DIR`、`CONFIGURE_COMMAND`、`BUILD_COMMAND` 和 `INSTALL_COMMAND`。如果外部构建系统没有配置这一步骤，可以将 `CONFIGURE_COMMAND` 设置为空字符串。在 ESP-IDF 的构建系统中，一般会将 `INSTALL_COMMAND` 变量设置为空。
  - 设置 `BUILD_IN_SOURCE`，即构建目录与源目录相同。否则，您也可以设置 `BUILD_DIR` 变量。
  - 有关 `externalproject_add` 命令的详细信息，请参阅 [ExternalProject](https://esp-idf.readthedocs.io/en/latest/analyze_externalproject.html)。
- 第二组命令添加了一个目标库，指向外部构建系统生成的库文件。为了添加 `include` 目录，并告知 CMake 该文件的位置，需要再设置一些属性。
- 最后，生成的库被添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 中，即执行 `make clean` 后会删除该库。请注意，构建系统中的其他目标文件不会被删除。

### 备注
当外部构建系统使用 PSRAM 时，请记得将 `-mfix-esp32-psram-cache-issue` 添加到 C 编译器的参数中。关于该标志的更多信息，请参考 `CONFIG_SPIRAM_CACHE_WORKAROUND`。

**ExternalProject 的依赖与构建清理**

对于外部项目的构建，CMake 会有一些不同寻常的行为：

- `ADDITIONAL_MAKE_CLEAN_FILES` 仅在使用 `Make` 构建系统时有效。如果使用 `Ninja` 或 IDE 自带的构建系统，执行项目清理时，这些文件不会被删除。
- `ExternalProject` 会在 clean 运行后自动重新运行配置和构建命令。

可以采用以下两种方法来配置外部构建命令：

1. 将外部 `BUILD_COMMAND` 命令设置为对所有源代码完整的重新编译。如果传递给 `externalproject_add` 命令的 `DEPENDS` 的依赖项发生了改变，或者当前执行的是项目清理操作（即运行了 `idf.py clean`），那么就会执行该命令。
2. 将外部 `BUILD_COMMAND` 命令设置为增量式构建命令，并给 `externalproject_add` 传递 `BUILD_ALWAYS` 参数。即不管实际的依赖情况，每次构建时，都会构建外部项目。这种方式仅当外部构建系统具备增量式构建的能力，且运行时间不会很长时才推荐。

构建外部项目的最佳方法取决于项目本身，其构建系统，以及是否需要频繁重新编译项目。

#### 4.5.10 自定义 `sdkconfig` 的默认值

对于示例工程或其他您不想指定完整 `sdkconfig` 配置的项目，但是您确实希望覆盖 ESP-IDF 默认值中的某些键值，则可以在项目中创建 `sdkconfig.defaults` 文件。重新创建新配置时将会用到此文件，另外在 `sdkconfig` 没有设置新配置时，上述文件也会被用到。

如若需要覆盖此文件的名称或指定多个文件，请设置 `SDKCONFIG_DEFAULTS` 环境变量或在顶层 CMakeLists.txt 文件中设置 `SDKCONFIG_DEFAULTS`。在指定多个文件时，使用分号作为分隔符。未指定完整路径的文件名将以当前项目的相对路径来解析。
一些IDF示例中包含了sdkconfig.ci文件。该文件是CI（持续集成）测试框架的一部分，在正常构建过程中会被忽略。

### 依赖于硬件目标的sdkconfig默认值

除了sdkconfig.defaults之外，构建系统还将从sdkconfig.defaults.TARGET_NAME文件加载默认值。其中IDF_TARGET的值为TARGET_NAME。例如，对于ESP32这个硬件目标，sdkconfig的默认值会首先从sdkconfig.defaults获取，然后再从sdkconfig.defaults.esp32获取。

如果使用SDKCONFIG_DEFAULTS覆盖了sdkconfig默认文件的名称，则硬件目标的sdkconfig默认文件名也会从SDKCONFIG_DEFAULTS值中派生。

### 4.5.11 Flash参数

有些情况下，我们希望在没有IDF时也能烧写目标板，为此，我们希望可以保存已构建的二进制文件、esptool.py和esptool write flash命令的参数。可以通过编写一段简单脚本来保存二进制文件和esptool.py。

运行项目构建之后，构建目录将包含项目二进制输出文件（.bin文件），同时也包含以下烧录数据文件:

- flash_project_args包含烧录整个项目的参数，包括应用程序（app）、引导程序（bootloader）、分区表，如果设置了PHY数据，也会包含此数据。
- flash_app_args只包含烧录应用程序的参数。
- flash_bootloader_args只包含烧录引导程序的参数。

您可以参照如下命令将任意烧录参数文件传递给esptool.py:

```bash
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

也可以手动复制参数文件中的数据到命令行中执行。

构建目录中还包含生成的flasher_args.json文件，此文件包含JSON格式的项目烧录信息，可用于idf.py和其它需要项目构建信息的工具。

### 4.5.12 构建Bootloader

引导程序默认作为idf.pybuild的一部分被构建，也可以通过idf.pybootloader来单独构建。

引导程序是/components/bootloader/subproject内部独特的“子项目”，它有自己的CMakeLists.txt文件，能够构建独立于主项目的.ELF和.BIN文件，同时它又与主项目共享配置和构建目录。

子项目通过/components/bootloader/project_include.cmake文件作为外部项目插入到项目的顶层设计，主构建进程会运行子项目的CMake，包括查找组件（主项目使用的组件的子集），生成引导程序专用的配置文件（从主sdkconfig文件中派生）。

### 4.5.13 选择目标芯片

ESP-IDF支持多款芯片，它们通过在软件中使用不同的“目标”（target）名进行区分。具体对应关系如下:

- esp32—适用于ESP32-D0WD、ESP32-D2WD、ESP32-S0WD（ESP-SOLO）、ESP32-U4WDH、ESP32-PICO-D4
- esp32s2—适用于ESP32-S2
- esp32c3—适用于ESP32-C3

在构建项目前，请首先根据您的芯片选择正确的软件目标。具体命令为idf.pyset-target<target>。例如

```bash
idf.py set-target esp32s2
```
4.5.14 编写纯 CMake 组件

ESP-IDF 构建系统用“组件”的概念“封装”了 CMake，并提供了很多帮助函数来自动将这些组件集成到项目构建当中。

然而，“组件”概念的背后是完整的 CMake 构建系统，因此可以制作纯 CMake 组件。

下面是使用纯 CMake 语法来json 组件编写的最小 CMakeLists 文件的示例：

```cmake
add_library(json STATIC cJSON/cJSON.c cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- 这实际上与 IDF 中的 json 组件是等效的。
- 因为组件中的源文件不多，所以这个 CMakeLists 文件非常简单。对于具有大量源文件的组件而言，ESP-IDF 支持的组件的组件文件可以选择使用 CMakeLists 的样式。
- 每当组件中新增一个与组件同名的库目标时，ESP-IDF 构建系统会自动将其添加到构建中，并公开公共的 include 目录。如果组件想要添加一个与组件同名的库目标，就需要使用 CMake 命令手动添加依赖关系。

4.5.15 组件中使用第三方 CMake 项目

CMake 在许多开源的 C/C++ 项目中广泛使用，用户可以在自己的应用程序中使用开源代码。CMake 构建系统的一大好处就是可以导入这些第三方的项目，有有时候甚至不用做任何改动。这就允许用户使用当前 ESP-IDF 组件尚未提供的功能，或者使用其它库来实现相同的功能。

假设 main 组件需要导入一个假想库 foo，相应的组件 CMakeLists 文件如下所示：

```cmake
# 注册组件
idf_component_register(...)

# 设置 “foo” 项目中的一些 CMake 变量，以控制 “foo”的构建过程
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)
```

(下页继续)
实际的案例请参考 `build_system/cmake/import_lib`。请注意，导入第三方库所需要做的工作可能会因库的不同而有所差异。建议仔细阅读第三方库的文档，了解如何将其导入到其它项目中。阅读第三方库的 `CMakeLists.txt` 文件以及构建结构也会有所帮助。

用这种方法还可以将第三方库封装成 ESP-IDF 的组件。例如 `mbedts` 组件就是封装了 `mbedts` 项目的。详情请参考 `mbedts` 组件的 `CMakeLists.txt` 文件。

每当使用 ESP-IDF 构建系统时，CMake 变量 `ESP_PLATFORM` 都会被设置为 1。如果要在通用的 CMake 代码加入 IDF 特定的代码时，可以采用 `if (ESP_PLATFORM)` 的形式加以分隔。

### 外部库中使用 ESP-IDF 组件

上述示例中假设的是外部库 `foo`（或 `import_lib` 示例中的 `tinyxml` 库）除了常见的 API 如 `libc`、`libstdc++` 等外不需要使用其它 ESP-IDF API。如果外部库需要使用其它 ESP-IDF 组件提供的 API，则需要在外部 `CMakeLists.txt` 文件中通过添加对库目标 `idf::<componentname>` 的依赖关系。

例如，在 `foo/CMakeLists.txt` 文件:

```cmake
add_library(foo bar.c fizz.cpp buzz.cpp)

if (ESP_PLATFORM)
    # 在 ESP-IDF 中，bar.c 需要包含 spi_flash 组件中的 esp_spi_flash.h
    target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

### 4.5.16 组件中使用预建库

还有一种情况是您有一个由其它构建过程生成预建静态库（.a 文件)。

ESP-IDF 构建系统为用户提供了一个实用函数 `add_prebuilt_library`，能够轻松导入并使用预建库:

```cmake
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES... --req1 req2 ...])
```

其中:

- `target_name`: 用于引用导入库的名称，如链接到其它目标时
- `lib_path`: 预建库的路径，可以是绝对路径或是相对于组件目录的相对路径
- 可选参数 `REQUIRES` 和 `PRIV_REQUIRES` 指定对其它组件的依赖性。这些参数与 `idf_component_register` 的参数的意义相同。

注意预建库的编译目标需与目前的项目相同。预建库的相关参数也要匹配。如果不特别注意，这两个因素可能会导致应用程序中出现 bug。

请查看示例 `build_system/cmake/import_prebuilt`。

### 4.5.17 在自定义 CMake 项目中使用 ESP-IDF

ESP-IDF 提供了一个模板 CMake 项目，可以基于此轻松创建应用程序。然而在有些情况下，用户可能已有一个现成的 CMake 项目，或者想自己创建一个 CMake 项目，此时就希望将 IDF 中的组件以库的形式链接到用户目标（库/可执行文件）。

可以通过 `tools/cmake/idf.cmake` 提供的 `build system APIs` 实现该目标。例如:

```cmake
# 导入提供 ESP-IDF CMake 构建系统 API 的 CMake 文件
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# 在构建中导入 ESP-IDF 组件，可以视作等同 add_subdirectory()
# 但为 ESP-IDF 构建增加额外的构建过程
idf_build_process(esp32)

# 创建项目可执行文件
# 使用其别名 idf::newlib 将其链接到 newlib 组件
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

build_system/cmake/idf_as_lib 中的示例演示了如何在自定义的 CMake 项目创建一个类似于 Hello World 的应用流程。

**注解**：IDF 构建系统只能为其构建的源文件设置编译器标志。当使用外部 CMakeLists.txt 文件并启用 PSRAM 时，记得在 C 编译器参数中添加 mfix-esp32-psram-cache-issue。参见 ref:CONFIG_SPIRAM_CACHE_WORKAROUND 了解更多信息。

### 4.5.18 ESP-IDF CMake 构建系统 API

**idf 构建命令**

```cmake
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

检索一个构建属性 property，并将其存储在当前作用域可访问的 var 中。特定 GENERATOR_EXPRESSION 将检索该属性的生成器表达式字符串（不是实际值）。它可与支持生成器表达式的 CMake 命令一起使用。

```cmake
idf_build_set_property(property val [APPEND])
```

设置构建属性 property 的值为 val。特定 APPEND 将把指定的值附加到属性当前值之后。如果该属性之前不存在或当前为空，则指定的值将变为第一个元素/成员。

```cmake
idf_build_component(component_dir)
```

向构建系统提交一个包含组件的 component_dir 目录。相对路径会转换为相对于当前目录的绝对路径。所有对该命令的调用必须在 idf_build_process 之前执行。

该命令并不保证组件在构建过程中会被处理（参见 idf_build_process 中 COMPONENTS 参数说明）

```cmake
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

导入 ESP-IDF 组件执行大量的幕后工作，包括组件配置、库创建、依赖性扩展和解析。在这些功能中，对于用户最重要的可能是通过调用每个组件的 idf_component_register 来创建库。该命令为每个
组件创建库，这些库可以使用别名来访问，其形式为 `idf:component_name`。这些别名可以用来将组件链接到用户自己的目标库或可执行文件上。

该调用要求用 `target` 参数指定目标芯片。调用的可选参数包括：

- `PROJECT_DIR` - 项目目录，默认为 `CMAKE_SOURCE_DIR`。
- `PROJECT_NAME` - 项目名称，默认为 `CMAKE_PROJECT_NAME`。
- `PROJECT_VER` - 项目版本/版本号，默认为“1”。
- `SDKCONFIG` - 生成的 `sdkconfig` 文件的输出路径，根据是否设置 `PROJECT_DIR`，默认为 `PROJECT_DIR/sdkconfig` 或 `CMAKE_SOURCE_DIR/sdkconfig`。
- `SDKCONFIG_DEFAULTS` - 包含默认配置的文件列表（列表中必须包含完整的路径），默认为空；对于列表中的每个值 `filename`，如果存在的话，也会加载文件 `filename.target` 中的配置。对于列表中的 `filename` 的每一个值，也会加载文件 `filename.target` （如果存在的话）中的配置。
- `BUILD_DIR` - 用于放置 ESP-IDF 构建相关工具的目录，如生成的二进制文件、文本文件、组件；默认为 `CMAKE_BINARY_DIR`。
- `KCONFIGS` - 从构建系统已知的组件中选择要处理的组件（通过 `idf_build_component` 添加）。这个参数用于精简构建过程。如果在依赖链中需要其它组件，则会自动添加，即自动添加这个列表中组件的公共和私有依赖项，进而添加这些依赖项的公共和私有依赖，以此类推。如果不指定，则会处理构建系统已知的所有组件。

```c
idf_build_executable(executable)
```

指定 ESP-IDF 构建的可执行文件 `executable`。这将添加额外的目标，如与 flash 相关的依赖关系，生成额外的二进制文件等。应在 `idf_build_process` 之后调用。

```c
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

获取指定配置的值。就像构建属性一样，特定 `GENERATOR_EXPRESSION` 将检索该配置的生成器表达式字符串，而不是实际值。即可用于支持生成器表达式的 CMake 命令一起使用。然而，实际的配置值只有在调用 `idf_build_process` 后才能知道。

**idf 构建属性**

可以通过使用构建命令 `idf_build_get_property` 来获取构建属性的值。例如，以下命令可以获取构建过程中使用的 Python 解释器的相关信息。

```c
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: \${python}\n")
```

- `BUILD_DIR` - 建目录：由 `idf_build_process` 的 `BUILD_DIR` 参数设置。
- `BUILD_COMPONENTS` - 包含在构建中的组件列表：由 `idf_build_process` 设置。
- `BUILD_COMPONENT_ALIASES` - 包含在构建中的组件的库别名列表：由 `idf_build_process` 设置。
- `C_COMPILE_OPTIONS` - 适用于所有组件的 C 源代码文件的编译选项。
- `CMAKE_COMPILE_OPTIONS` - 适用于所有组件的源文件（无论是 C 还是 C++）的编译选项。
- `CMAKE_COMPILE_DEFINITIONS` - 适用于所有组件源文件的编译定义。
- `CXX_COMPILE_OPTIONS` - 适用于所有组件的 C++源文件的编译选项。
- `EXECUTABLE` - 项目可执行文件：通过调用 `idf_build_executable` 设置。
- `EXECUTABLE_NAME` - 不含扩展名的项目可执行文件的名称：通过调用 `idf_build_executable` 设置。
- `EXECUTABLE_DIR` - 输出的可执行文件的路径。
- `IDF_PATH` - ESP-IDF 路径：由 `IDF_PATH` 环境变量设置；或者从 `idf.cmake` 的位置推断。
- `IDF_TARGET` - 构建的目标芯片：由 `idf_build_process` 的目标参数设置。
- `IDF_VER` - ESP-IDF 版本：由版本文件或 `IDF_PATH` 仓库的 Git 版本设置。
- `INCLUDE_DIRECTORIES` - 包含所有组件源文件的目录。
- `KCONFIGS` - 构建过程中组件的 `Kconfig` 文件的列表：由 `idf_build_process` 设置。
- `KCONFIG_PROJBUilds` - 构建过程中组件中的 Kconfig projbuild 文件的列表：由 `idf_build_process` 设置。
- `PROJECT_NAME` - 项目名称：由 `idf_build_process` 的 `PROJECT_NAME` 参数设置。
Chapter 4. API 指南

- PROJECT_DIR - 项目的目录：由 idf_build_process 的 PROJECT_DIR 参数设置。
- PROJECT_VER - 项目的版本：由 idf_build_process 的 PROJECT_VER 参数设置。
- PYTHON - 用于构建的 Python 解释器；如果没有则从 PYTHON 环境变量中设置，如果没有，则使用“python”。
- SDKCONFIG - 输出的配置文件的完整路径：由 idf_build_process SDKCONFIG 参数设置。
- SDKCONFIG_DEFAULTS - 包含默认配置的文件列表：由 idf_build_process SDKCONFIG_DEFAULTS 参数设置。
- SDKCONFIG_HEADER - 包含组件配置的 C/C++ 头文件的完整路径：由 idf_build_process 设置。
- SDKCONFIG_CMAKE - 包含组件配置的 CMake 文件的完整路径：由 idf_build_process 设置。
- SDKCONFIG_JSON - 包含组件配置的 JSON 文件的完整路径：由 idf_build_process 设置。
- SDKCONFIG_JSON_MENUS - 包含配置菜单的 JSON 文件的完整路径：由 idf_build_process 设置。

idf 组件命令

idf_component_get_property(var component property [GENERATOR_EXPRESSION])

检索一个指定的 component 的组件属性 property，并将其存储在当前作用域可访问的 var 中。指定 GENERATOR_EXPRESSION 将检索该属性的生成器表达式字符串（不是实际值），它可以在支持生成器表达式的 CMake 命令中使用。

idf_component_set_property(component property val [APPEND])

设置指定的 component 的组件属性 property 的值为 val。特定 APPEND 将把指定的值追加到属性的当前值后。如果该属性之前不存在或当前为空，指定的值将成为第一个元素/成员。

idf_component_register([ [SRCS src1 src2 ... ] | [ [SRC_DIRS dir1 dir2 ... ] [EXCLUDE_SRCS src1 src2 ... ] ] ] [INCLUDE_DIRS dir1 dir2 ... ] [PRIV_INCLUDE_DIRS dir1 dir2 ... ] [REQUIRES component1 component2 ... ] [PRIV_REQUIRES component1 component2 ... ] [LDFRAGMENTS ldfragment1 ldfragment2 ... ] [REQUIRED_IDF_TARGETS target1 target2 ... ] [EMBED_FILES file1 file2 ... ] [EMBED_TXTFILES file1 file2 ... ] [KCONFIG kconfig] [KCONFIG_PROJBUILD kconfig_projbuild])

将一个组件注册到构建系统中。就像 project() CMake 命令一样，该命令应该直接从组件的 CMake-Lists.txt 中调用（而不是通过函数或宏），且建议在其他命令之前调用该命令。下面是一些关于在 idf_component_register 之前不能调用哪些命令的指南：

- 在 CMake 脚本模式下无效的命令。
- 在 project() 中定义的自定义命令。
- 除了 idf_build_get_property 之外，构建系统的 API 命令：但要考虑该属性是否有被设置。

对变量进行设置和操作的命令，一般可在 idf_component_register 之前调用。

idf_component_register 的参数包括：

- SRCS - 组件的源文件，用于为组件创建静态库；如果没有指定，组件将被视为仅配置组件，从而创建可执行文件。
- SRC_DIRS、EXCLUDE_SRCS - 用于通过指定目录来 glob 源文件 (.c, .cpp, .s)，而不是通过 SRCS 手动指定源文件。请注意，这对 CMake 中配置的限制，在 EXCLUDE_SRCS 中指定的源文件会从被 glob 的文件中移除。
- INCLUDE_DIRS - 相对于组件目录的路径，该路径将会被添加到需要当前组件的所有其他组件的 include 搜索路径中。
- PRIV_INCLUDE_DIRS - 必须是相对于组件目录的目录路径，它仅被添加到这个组件源文件的 include 搜索路径中。

Espressif Systems  1751  Release v5.0-dev-489-gef98a36  Submit Document Feedback
• REQUIRES - 组件的公共依赖项。
• PRIV_REQUIRES - 组件的私有依赖项；仅用于配置的组件上会被忽略。
• LDFRAGMENTS - 组件链接器片段文件。
• REQUIRED_IDF_TARGETS - 指定该组件唯一支持的目标。
• KCONFIG - 覆盖默认的 Kconfig 文件。
• KCONFIG_PROJBUILD - 覆盖默认的 Kconfig.projbuild 文件。

以下内容用于将数据嵌入到组件中，并在确定组件是否仅用于配置时被视为源文件。这意味着，即使组件没有指定源文件，如果组件指定了以下之一，仍然会在内部为组件创建一个静态库。

• EMBED_FILES - 嵌入组件的二进制文件
• EMBED_TXTFILES - 嵌入组件的文本文件

idf 组件属性

组件的属性值可以通过使用构建命令 idf_component_get_property 来获取。例如，以下命令可以获取 freertos 组件的目录。

```bash
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: $(dir)"
```

• COMPONENT_ALIAS - COMPONENT_LIB 的别名，用于将组件链接到外部目标；由 idf_build_component 设置，别名库本身由 idf_component_register 创建。
• COMPONENT_DIR - 组件目录；由 idf_build_component 设置。
• COMPONENT_OVERRIDEN_DIR - 如果这个组件覆盖了另一个组件，则包含原组件的目录。
• COMPONENT_LIB - 所创建的组件静态/接口库的名称；由 idf_build_component 设置，库本身由 idf_component_register 创建。
• COMPONENT_NAME - 组件的名称；由 idf_build_component 根据组件的目录名设置。
• COMPONENT_TYPE - 组件的类型 (LIBRARY 或 CONFIG_ONLY)。如果一个组件指定了源文件或嵌入了一个文件，那么它的类型就是 LIBRARY。
• EMBED_FILES - 要嵌入组件的文件列表；由 idf_component_register EMBED_FILES 参数设置。
• EMBED_TXTFILES - 要嵌入组件的文本文件列表；由 idf_component_register EMBED_TXTFILES 参数设置。
• INCLUDE_DIRS - 组件 include 目录列表；由 idf_component_register INCLUDE_DIRS 参数设置。
• KCONFIG - 组件 Kconfig 文件；由 idf_build_component 设置。
• KCONFIG_PROJBUILD - 组件 Kconfig.projbuild；由 idf_build_component 设置。
• LDFRAGMENTS - 组件链接器片段文件列表；由 idf_component_register LDFRAGMENTS 参数设置。
• PRIV_INCLUDE_DIRS - 组件私有 include 目录列表；在 LIBRARY 类型的组件 idf_component_register PRIV_INCLUDE_DIRS 参数中设置。
• PRIV_REQUIRES - 私有组件依赖关系列表；由 idf_component_register PRIV_REQUIRES 参数设置。
• REQUIRED_IDF_TARGETS - 组件支持的目标列表；由 idf_component_register REQUIRED_IDF_TARGETS 参数设置。
• SRCS - 组件源文件列表；由 idf_component_register 的 SRCS 或 SRC_DIRS/EXCLUDE_SRCS 参数设置。

4.5.19 文件通配 & 增量构建

在 ESP-IDF 组件中添加源文件的首选方法是在 COMPONENT_SRCS 中手动列出它们：

```bash
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...
```

Espressif Systems 1752 Release v5.0-dev-489-gef98a36
Submit Document Feedback
Chapter 4. API 指南

这是在 CMake 中手动列出源文件的最佳实践。然而，当有许多源文件需要添加到构建中时，这种方法就会很不方便。ESP-IDF 构建系统因此提供了另一种替代方法，即使用 SRC_DIRS 来指定源文件:

```
idf_component_register(SRC_DIRS library platform ...
```

后台会使用通配符在指定的目录中查找源文件。请注意，在使用这种方法的时候，如果组件中添加了一个新的源文件，CMake 并不知道重新运行配置，最终该文件也没有被加入构建中。

如果是自己添加的源文件，这种折衷还是可以接受的，因为用户可以触发一次干净的构建，或者运行 idf.py reconfigure 来手动重启 CMake。但是，如果你需要与其他使用 Git 等版本控制工具的开发人员共享项目时，问题就会变得更加复杂，因为开发人员有可能会拉取新的版本。

ESP-IDF 中的组件使用了第三方的 Git CMake 集成模块(/tools/cmake/third_party/GetGitRevisionDescription.cmake)，任何时候源码仓库的提交记录发生了改变，该模块就会自动重新运行 CMake，即只要拉取了新的 ESP-IDF 版本，CMake 就会重新运行。

对于不属于 ESP-IDF 的项目组件，有以下几个选项供参考:

- 如果项目文件保存在 Git 中，ESP-IDF 会自动跟踪 Git 修订版本，并在它发生变化时重新运行 CMake。
- 如果一些组件保存在第三方 Git 仓库中（不在项目仓库或 ESP-IDF 仓库），则可以在组件 CMakeLists 文件中调用 git_describe 函数，以便在 Git 修订版本发生变化时自动重启 CMake。
- 如果没有使用 Git，请记住在源文件发生变化时手动运行 idf.py reconfigure。
- 使用 idf_component_register 的 SRCS 参数来列出项目组件中的所有源文件则可以完全避免这一问题。

具体选择哪一种方式，就要取决于项目本身，以及项目用户。

### 4.5.20 构建系统的元数据

为了将 ESP-IDF 集成到 IDE 或者其它构建系统中，CMake 在构建的过程中会在 build/ 目录下生成大量元数据文件。运行 cmake 或 idf.py reconfigure（或任何其它 idf.py 构建命令），可以重新生成这些元数据文件。

- compile_commands.json 是标准格式的 JSON 文件，它描述了在项目中参与编译的每个源文件。
- project_description.json 包含有关 ESP-IDF 项目、已配置路径等的一些常规信息。
- flasher_args.json 包含 esptool.py 工具用于烧录项目二进制文件的参数，此外还有 flash_*_args 文件，可直接与 esptool.py 一起使用。更多详细信息请参阅 Flash 参数。
- CMakeCache.txt 是 CMake 的缓存文件，包含 CMake 进程、工具链等其它信息。
- config/sdkconfig.json 包含 JSON 格式的项目配置结果。
- config/kconfig_menus.json 是在 menuconfig 中显示菜单的 JSON 格式版本，用于外部 IDE 的 UI。

### JSON 配置服务器

confserver.py 工具可以帮助 IDE 轻松地与配置系统的逻辑进行集成，它运行在后台，通过使用 stdin 和 stdout 读写 JSON 文件的方式与构造函数交互。

您可以通过 idf.py confserver 或 ninja confserver 从项目中运行 confserver.py，也可以使用不同的构建生成器来触发类似的目标。

有关 confserver.py 的更多信息，请参阅 tools/kconfig_new/README.md

### 4.5.21 构建系统内部

**CMake**

ESP-IDF 构建系统的列表文件位于 /tools/cmake 中。实现构建系统核心功能的模块如下：

```
ESP-IDF
```
Chapter 4. API

• build.cmake - 构建相关命令，即构建初始化、检素/设置构建属性、构建处理。
• component.cmake - 组件相关命令，如添加组件、检素/设置组件属性、注册组件。
• kconfig.cmake - 从 Kconfig 文件中生成配置文件（sdkconfig、sdkconfig.h、sdkconfig.cmake 等）。
• ldgen.cmake - 从链接器片段生成最终链接器脚本。
• target.cmake - 设置构建目标和工具链文件。
• utilities.cmake - 其它帮助命令。

除了这些文件，还有两个重要的 CMake 脚本在 /tools/cmake 中：
• idf.cmake - 设置构建参数并导入上面列出的核心模块。之所以包括在 CMake 项目中，是为了方便访问 ESP-IDF 构建系统功能。
• project.cmake - 导入 idf.cmake，并提供了一个自定义的 "project()" 命令，该命令负责处理建立可执行文件时所有的繁重工作。包含在标准 ESP-IDF 项目的顶层 CMakeLists.txt 中。

/tools/cmake 中的其它文件都是构建过程中的支持性文件或第三方脚本。

构建过程

本节介绍了标准的 ESP-IDF 应用构建过程。构建过程可以大致分为四个阶段：

初始化

该阶段为构建设置必要的参数。

• 在将 idf.cmake 导入 project.cmake 后，将执行以下步骤：
  - 在环境变量中设置 IDF_PATH 或从顶层 CMakeLists.txt 中包含的 project.cmake 路径推断相对路径。
  - 将 /tools/cmake 添加到 CMAKE_MODULE_PATH 中，并导入核心模块和各种辅助/第三方脚本。
  - 设置构建工具/可执行文件，如默认的 Python 解释器。
  - 获取 ESP-IDF git 修订版，并存储为 IDF_VER。
  - 设置全局构建参数，即编译选项、编译定义、包括所有组件的 include 目录。
  - 将 components 中的组件添加到构建中。

• 自定义 project() 命令的初始部分执行以下步骤：
  - 在环境变量或 CMake 缓存中设置 IDF_TARGET 以及设置相应要使用的 “CMAKE_TOOLCHAIN_FILE”。
  - 添加 EXTRA_COMPONENTS_DIRS 中的组件至构建中
  - 从 COMPONENTS/EXCLUDE_COMPONENTS、SDKCONFIG、SDKCONFIG_DEFAULTS 等变量中为调用命令 idf_build_process() 准备参数。

调用 idf_build_process() 命令标志着这个阶段的结束。

枚举

这个阶段会建立一个需要在构建过程中处理的组件列表，该阶段在 idf_build_process() 的前半部分进行。
处理

该阶段处理构建中的组件，是 idf_build_process() 的后半部分。

- 从 sdkconfig 文件中加载项目配置，并生成 sdkconfig.cmake 和 sdkconfig.h 头文件。这两个文件分别定义了可以从构建脚本和 C/C++ 源文件/头文件中访问的配置变量/宏。
- 导入各组件的 project_include.cmake。
- 将每个组件添加为一个子目录，处理其 CMakeLists.txt。组件 CMakeLists.txt 调用注册命令 idf_component_register 添加源文件、导入目录、创建组件库、链接依赖关系等。

完成

该阶段是 idf_build_process() 剩余的步骤。

- 创建可执行文件并将其链接到组件库中。
- 生成 project_description.json 等项目元数据文件并且显示所建项目等相关信息。

请参考 /tools/cmake/project.cmake 获取更多信息。

4.5.22 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统

ESP-IDF CMake 构建系统与旧版的 GNU Make 构建系统在某些方面非常相似，开发者都需要提供 include 目录、源文件等。然而，有一个语法上的区别：即对于 ESP-IDF CMake 构建系统，开发者需要将这些作为参数传递给注册命令 idf_component_register。

CMake 中不可用的功能

有些功能已从 CMake 构建系统中移除，或者已经发生很大改变。GNU Make 构建系统中的以下变量已从 CMake 构建系统中删除：

- COMPONENT_BUILD_DIR: 由 CMAKE_CURRENT_BINARY_DIR 替代。
- COMPONENT_LIBRARY: 默认为 $(COMPONENT_NAME).a 但是库名可以被组件覆盖。在 CMake 构建系统中，组件库名称不能再被组件覆盖。
- CC, LD, AR, OBJCOPY: gcc xtensa 交叉工具链中每个工具的完整路径。CMake 使用 CMAKE_C_COMPILER, CMAKE_C_LINK_EXECUTABLE 和 CMAKE_OBJCOPY 进行替代。完整列表请参阅 CMake 语言变量。
- HOSTCC, HOSTLD, HOSTAR: 宿主机本地工具链中每个工具的全名。CMake 系统不再提供此变量，外部项目需要手动检测所需的宿主机工具链。
- COMPONENT_ADD_LDFLAGS: 用于覆盖链接标志。CMake 中使用 target_link_libraries 命令替代。
- COMPONENT_ADD_LINKER_DEPS: 链接过程依赖的文件列表。target_link_libraries 通常会自动推断这些依赖。对于链接脚本，可以使用自定义的 CMake 函数 target_linker_scripts。
- COMPONENT_SUBMODULES: 不再使用。CMake 会自动枚举 ESP-IDF 仓库中所有的子模块。
- COMPONENT_EXTRA_INCLUDES: 曾是 COMPONENT_PRIV_INCLUDEDIRS 变量的替代版本，仅支持绝对路径。CMake 系统中统一使用 COMPONENT_PRIV_INCLUDEDIRS（可以是相对路径，也可以是绝对路径）。
- COMPONENT_OBJS: 以前，可以以目标文件列表的方式指定组件源，现在，可以通过 COMPONENT_SRCS 以源文件列表的形式指定组件源。
- COMPONENT_OBJEXCLUDE: 已被 COMPONENT_SRCEXCLUDE 替换。用于指定源文件（绝对路径或组件目录的相对路径）。
- COMPONENT_EXTRA_CLEAN: 已被 ADDITIONAL_MAKE_CLEAN_FILES 属性取代，注意，CMake 对此功能有部分限制。
4.6 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

4.6.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.6.2 Implementing A Stub

The wake stub in esp-idf is called esp_wake_deep_sleep(). This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named esp_wake_deep_sleep() then this will override the default.
If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under components/esp32.

### 4.6.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways. The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. File names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix "normal" and "RTC" code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.6.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named `CONFIG_ESP32_RTCDATA_IN_FAST_MEM`. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the `CONFIG_FREERTOS_UNICORE` because RTC fast memory can be accessed only by PRO_CPU.

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with `RTC_FAST_ATTR` is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count);
}

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP Kconfig option, see more information in Fast boot from Deep Sleep.

4.7 预处理

4.7.1 概述

在应用程序开发中，及时发现并处理在运行时期的错误，对于保证应用程序的健壮性非常重要。常见的运行时错误有如下几种:

- 可恢复的错误:
  - 通过函数的返回值（错误码）表示的错误
  - 使用 throw 关键字抛出的 C++ 异常
- 不可恢复（严重）的错误:
  - 断言失败（使用 assert 宏或者其它类似方法）或者直接调用 abort() 函数造成的错误
  - CPU 异常：访问受保护的内存区域、非法指令等
  - 系统级检查：看门狗超时、缓存访问错误、堆栈溢出、堆栈粉碎、堆栈损坏等

本文将介绍 ESP-IDF 中针对可恢复错误的错误处理机制，并提供一些常见错误的处理模式。

关于如何处理不可恢复的错误，请查阅 不可恢复错误。

4.7.2 错误码

ESP-IDF 中大多数函数会返回 esp_err_t 类型的错误码，esp_err_t 实质上是带符号的整型，ESP_OK 代表成功（没有错误），具体值定义为 0。

在 ESP-IDF 中，许多头文件都会使用预处理器，定义可能出现的错误代码。这些错误代码通常均以 ESP_ERR_ 前缀开头，一些常见错误（比如内存不足、超时、无效参数等）的错误代码则已经在 esp_err.h 文件中定义好了。此外，ESP-IDF 中的各种组件 (component) 也都可以针对具体情况，自行定义更多错误代码。

完整错误代码列表，请见 错误代码参考 中查看完整的错误列表。

4.7.3 错误码到错误消息

错误码并不直观，因此 ESP-IDF 还可以使用 esp_err_to_name() 或者 esp_err_to_name_r() 函数，将错误代码转换为具体的错误消息。例如，我们可以调用 esp_err_to_name() 函数传递错误代码 0x101，可以得到返回字符串 “ESP_ERR_NO_MEM”。这样一来，我们可以在日志中输出更加直观的错误消息，而不是简单的错误码，从而帮助研究人员更快理解发生了何种错误。

此外，如果出现找不到匹配的 ESP_ERR_ 值的情况，函数 esp_err_to_name_r() 则会尝试将错误码作为一种 标准 POSIX 错误码 进行解释。具体过程为：POSIX 错误代码（例如 ENOENT, ENOMEM）定义在errno.h 文件中，可以通过 errno 变量获得。进而调用 strerror_r 函数实现。在 ESP-IDF 中，errno 是一个基于进程的局部变量，即每个 FreeRTOS 任务都有自己的 errno 副本，通过函数修改 errno 也只会作用于当前任务中的 errno 变量值。

该功能（即在无法匹配 ESP_ERR_ 值时，尝试用标准 POSIX 解释错误码）默认启用。用户也可以禁用该功能，从而减小应用程序的二进制文件大小。详情可见 CONFIG_ESP_ERR_TO_NAME_LOOKUP。注意，
该功能对禁用并不影响 esp_err_to_name() 和 esp_err_to_name_r() 函数的定义，用户仍可调用这两个函数处理错误码。在这种情况下，esp_err_to_name() 函数在遇到无法匹配错误码的情况会返回 UNKNOWN ERROR，而 esp_err_to_name_r() 函数会返回 Unknown error 0xXXXX(YYYYY)，其中 0xXXXX 和 YYYY 分别代表错误代码的十六进制和十进制表示。

4.7.4 ESP_ERROR_CHECK 宏

宏 ESP_ERROR_CHECK() 的功能和 assert 类似，不同之处在于：这个宏会检查 esp_err_t 的值，而非判断 bool 条件。如果传给 ESP_ERROR_CHECK() 的参数不等于 ESP_OK，则会在控制台上打印错误消息，然后调用 abort() 函数。

错误消息通常如下所示:

```
ESP_ERROR_CHECK failed: esp_err 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf
```

- 第一行打印错误代码的十六进制表示，及该错误在源代码中的标识符。这个标识符取决于 CONFIG_ESP_ERR_TO_NAME_LOOKUP 选项的设定。最后，第一行还会打印程序中该错误发生的具体位置。
- 下面几行显示了程序中调用 ESP_ERROR_CHECK() 宏的具体位置，以及传递给该宏的参数。
- 最后一行打印错误结果。对于所有不可恢复错误，这里在应急处理程序中打印的内容都是一样的。更多有关回溯结果的详细信息，请参阅不可恢复错误。

注解：如果使用 IDF monitor，则最后一行回溯结果中的地址将会被替换为相应的文件名和行号。

4.7.5 ESP_ERROR_CHECK WITHOUT_ABORT 宏

宏 ESP_ERROR_CHECK WITHOUT_ABORT() 的功能和 ESP_ERROR_CHECK 类似，不同之处在于它不会调用 abort()。

4.7.6 ESP_RETURN_ON_ERROR 宏

宏 ESP_RETURN_ON_ERROR() 用于错误码检查，如果错误码不等于 ESP_OK，该宏会打印错误信息，并使原函数立刻返回。

4.7.7 ESP_GOTO_ON_ERROR 宏

宏 ESP_GOTO_ON_ERROR() 用于错误码检查，如果错误码不等于 ESP_OK，该宏会打印错误信息，并使局部变量 ret 赋值为该错误码，并使原函数跳转至给定的 goto_tag。

4.7.8 ESP_RETURN_ON_FALSE 宏

宏 ESP_RETURN_ON_FALSE() 用于条件检查，如果给定条件不等于 true，该宏会打印错误信息，并使原函数立刻返回，返回值为给定的 err_code。
4.7.9 **ESP_GOTO_ON_FALSE** 宏

宏 ESP_GOTO_ON_FALSE() 用于条件检查。如果给定条件不等于 true，该宏会打印错误信息，将局部变量 ret 赋值为给定的 err_code，并使原函数跳转至给定的 goto_tag。

### 4.7.10 CHECK 宏使用示例

示例:

```c
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message
    ESP_ERROR_CHECK WITHOUT_ABORT(x); // err message
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message
    ESP_RETURN_ON_FALSE(a, "fail reason 2"); // err message
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 3"); // err message
    ESP_GOTO_ON_FALSE(a, "fail reason 4"); // err message
}
```

**注解**：如果 Kconfig 中的 CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT 选项被打开，CHECK 宏将不会打印错误信息，其他功能不变。

ESP_RETURN_xx 和 ESP_GOTO_xx 宏不可以在中断服务程序里被调用。如需要在中断中使用类似功能，请使用 xx_ISR 宏，如 ESP_RETURN_ON_ERROR_ISR 等。

### 4.7.11 错误处理模式

1. 尝试恢复。根据具体情况不同，我们具体可以:
   - 在一段时间后，重新调用该函数;
   - 尝试删除该驱动，然后重新进行“初始化”;
   - 采用其他带外机制，修改导致错误发生的条件（例如，对一直没有响应的外设进行复位等）。

示例:

```c
esp_err_t err;
do{
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // 如果发送队列已满就不断重试
} while (err != ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // 处理其他错误
}
```
2. 将错误传递回调用程序。在某些中间件组件中，采用此类处理模式代表函数必须以相同的错误码退出，这样才能确保所有分配的资源都能得到释放。
示例:

```c
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // 释放内存
    free(card);
    // 将错误码传递给上层（例如通知用户）
    // 或者应用程序可以自定义错误代码并返回
    return err;
}
```

3. 转为不可恢复错误，比如使用 ESP_ERROR_CHECK，详情请见 `ESP_ERROR_CHECK` 章节。
对于中间件组件而言，通常并不希望在发生错误时中断应用程序。不过，有时在应用程序级别，这种做法是可以接受的。在 ESP-IDF 的示例代码中，很多都会使用 ESP_ERROR_CHECK 来处理各种 API 引发的错误，虽然这不是应用程序的最佳做法，但可以让示例代码看起来更加简洁。
示例:

```c
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.7.12 C++ 异常

默认情况下，ESP-IDF 会禁用对 C++ 异常的支持，但是可以通过 `CONFIG_COMPILER_CXX_EXCEPTIONS` 选项启用。

通常情况下，启用异常处理会增加应用程序的二进制文件大小几 kB。此外，启用该功能时还应为异常事故池预留一定内存。当应用程序无法从堆中分配异常对象时，就可以使用该池中的内存。该内存池的大小可以通过 `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` 来设定。

如果 C++ 程序抛出了异常，但是程序中并没有 catch 代码块来捕获该异常，那么程序的运行就会被 `abort` 函数中止，然后打印回溯信息。有关回溯的更多信息，请参阅不可恢复错误。

### 4.8 ESP-BLE-MESH

#### 4.8.1 概述

蓝牙 mesh 网络实现了无线设备的“多对多”通讯，其可用于建立包含大量设备的网络。

设备能将数据中继至不在初始设备无线电覆盖范围内的其他设备。这样，mesh 网络就能够覆盖非常大的物理区域，并且囊括大量设备。Mesh 网络非常适合于楼宇自动化、传感器网络和其他物联网解决方案，这些情景下数以十计、百计、千计的设备需要与其他设备进行安全可靠的通信。

蓝牙 mesh 并非无线通信技术，而是一种网络技术。该技术基于一种无线通讯协议栈，即低功耗蓝牙。

ESP-BLE-MESH 基于 Zephyr，蓝牙 Mesh 协议栈的顶端，其实现支持设备配网和节点控制，同时也实现了代理、中继、低功耗和朋友等节点功能。

有关 ESP-BLE-MESH 架构实现的信息，请参见 `ESP-BLE-MESH 架构`；有关各自 API 的信息，请参见 `ESP-BLE-MESH API Reference`。

ESP-BLE-MESH 的实现和认证基于最新的 Mesh Profile v1.0.1。有关 ESP-BLE-MESH 认证的细节，请参考 [此处](#)。
4.8.2 ESP-BLE-MESH 快速入门

该章旨在帮助您根据 ESP32 开发板搭建 ESP-BLE-MESH 网络。

我们将会展示如何搭建并运行一个包含 3 个节点的小型 ESP-BLE-MESH 网络，其中包含设备配网、节点配置，以及向特定节点上的 Generic OnOff Server Model 发送开关灯命令。

如果您是第一次接触 ESP-IDF，请参阅 es-idf 快速入门来设置开发环境，编译、烧写和运行示例应用程序。

硬件及软件准备

硬件:

- 3 块 ESP32 开发板，参见 options。
- 连接开发板的 USB 线。
- ESP-IDF 开发环境。
- 运行 Android 或 iOS 的手机或平板。

软件:

- 下载至 ESP32 开发板的示例应用 bluetooth/esp_ble_mesh/ble_mesh_node。
- 手机 App: nRF Mesh Android 或 iOS 版本。除 nRF Mesh 的 App，以下 App 也支持 ESP-BLE-MESH:
  - EspBleMesh Android App
  - Silicon Labs Android 或 iOS App

安装

以下详细步骤可指导您完成安装过程。

步骤 1. 检查硬件 ESP32-DevKitC 和 ESP-WROVER-KIT 开发板均支持 ESP-BLE-MESH。您可以通过 menuconfig:idf.py menuconfig>Example Configuration>Board selection for ESP-BLE-MESH 选择特定的开发板。

注解：如果您打算使用 ESP32-DevKitC 开发板，请将 RGB 灯焊接至 GPIO 管脚 25、26 和 27。

步骤 2. 配置软件 进入 bluetooth/esp_ble_mesh/ble_mesh_node 示例文件夹，运行 idf.py menuconfig 选择所使用的开发板，然后运行 idf.py build 编译示例。

步骤 3. 下载应用

bluetooth/esp_ble_mesh/ble_mesh_node 示例编译成功后，用户可以运行 idf.py flash 将编译生成的二进制文件下载至 3 块开发板中。

当开发板上电后，RGB 灯会变为绿色。

步骤 4. 设备配网 在该章节中，我们将使用 nRF Mesh Android App 演示如何配网设备。用户也可以从 App Store 下载其 iOS 版本。
4.1 扫描 (scanner) 扫描 (Scanner) 是 nRF Mesh App 搜索蓝牙通信范围内未配网设备的功能。打开 App，点击底部的扫描按钮 Scanner。App 就会开始扫描设备，很快，我们便可在屏幕上看到 3 个未配网设备。

4.2 识别 用户可以选择任何一个未配网设备，此时 App 会尝试和该设备建立连接。连接成功（有时可能需要尝试多次），且发现相应的 ESP-BLE-MESH GATT 服务后，用户可以在屏幕上看到识别按钮 IDENTIFY。IDENTIFY 操作告诉用户哪个设备将被配网。

注解：IDENTIFY 需要设备侧的支持，然后才能用来识别当前正在配网的设备。当前如果点击识别按钮 IDENTIFY，除了串口输出的 log，在当前的 example 中设备侧不会有其他现象。

点击识别按钮 IDENTIFY 后，用户可以看到配网按钮 PROVISION。

4.3 配网 点击配网按钮 PROVISION。App 会开始配网设备。当设备配网成功后，开发板上的 RGB 灯会熄灭。此时 App 会执行以下几个步骤:

1. 和该节点（设备配网后成为节点）断开连接
2. 尝试和该节点重新建立连接
3. 连接成功并且发现了相应的 ESP-BLE-MESH GATT 服务
4. 获取节点的 Composition Data 并且给该节点添加 AppKey

当以上所有的步骤完成后，节点初始化配置完成。此时点击 OK，用户可以看到节点的单播地址分配成功，并且其 Composition Data 也被成功解析。

有时在上述步骤 2 中，App 可能与节点连接失败。这种情况下，用户点击 OK 后可以看到，节点只有单播地址被成功分配，Composition data 并没有被成功获取。此时用户需要点击右上角的连接按钮 CONNECT，屏幕上会显示原先配网的节点，用户需要选择该节点并重新建立连接。

连接成功后，App 会显示获取 Composition Data 以及添加 AppKey 的按钮。

图 4: ESP-BLE-MESH 设备上电
Chapter 4. API

图 5: nRF Mesh - 扫描

图 6: nRF Mesh - 识别 - 配网
Chapter 4. API

![Image of API configuration]

**Configuration Complete**
Mesh node has been successfully configured.

- Configuration Complete
- Sending provisioning data
- Provisioning complete received
- Sending composition data get
- Composition data status received
- Receiving block acknowledgements
- App key status received

**Initial Configuration Failed**
Initial configuration of the node has failed. Continue with the following steps to configure the node.

1. Connect to the network.
2. Select the configuration option of the node.
3. Click get composition data.
4. Add app key.

![Image of API configuration error]

**图 7: nRF Mesh - 配置完成**

**图 8: nRF Mesh - 初始配置失败**
图 9: nRF Mesh - 重连 - 初始配置

如果该设备是 App 配网的第二个或第三个节点，此时点击连接按钮 CONNECT 后，用户可以在屏幕上看到 2 个或 3 个节点。这种情况下，用户可以选择其中一个节点建立连接，连接成功后可以返回至主界面选择需要配置的节点。

这里给出了一个 3 个节点的示例。

- 左侧图片表示第三个设备成功配网，但是 App 没有和其成功建立连接。当 App 尝试去重新连接第三个节点时，界面上会显示 3 个节点。
- 右侧图片表示节点成功建立连接后，App 显示这 3 个节点的信息。用户可以看到 App 已经获取了第一个和第二个节点的 Composition Data，但是对于第三个节点，只有单播地址被成功分配而节点的 Composition Data 未知。

### 4.4 配置

当成功配网和初始化配置完成后，用户可以配置节点的其余信息，例如将 AppKey 绑定至每个元素 (element) 的每个模型 (model) 中，设置模型的发布信息等。

下图展示了如何将 AppKey 绑定至 Primary Element 中的 Generic OnOff Server Model 上。

**注释**：用户不需要将 AppKey 绑定至 Configuration Server Model，因为该模型使用 DevKey 在 Upper Transport Layer 中对消息进行加密。

#### Step 5. 运行网络

当 3 个元素中的 Generic OnOff Server Models 均成功绑定 AppKey 后，用户可以使用 App 开关 RBG 灯。

在 bluetooth/esp_ble_mesh/ble_mesh_node 示例中，第一个 Generic OnOff Server Model 用来控制红色，第二个用来控制绿色，同时第三个用来控制蓝色。

下图展示了打开了不同色灯的开发板。

**注释**：对于 nRF Mesh iOS App [version 1.0.4]，当节点包含超过一个元素时，App 表现不正确。如果用户尝试打开或关闭第 2 个或第 3 个 Generic OnOff Server Model，App 会将相应的消息发送至第 1 个...
图 10: nRF Mesh - 重连 - 3 个节点

图 11: nRF Mesh - Model Bind AppKey
图 12: nRF Mesh - 通用开关控制

图 13: 3 个上电的 ESP-BLE-MESH 节点
4.8.3 ESP-BLE-MESH 示例

- **ESP-BLE-MESH 节点** - 展示了将 ESP-BLE-MESH 作为拥有 Configuration Server model 和 Generic OnOff Server model 的节点设备的用法。然后，ESP-BLE-MESH Provisioner 可以配网设备，控制显示开关/关状态的 RGB 灯，示例请见 example code 。
- **ESP-BLE-MESH 客户端模型** - 展示了 Generic OnOff Client model 如何在节点内工作。节点拥有 Configuration Server model、Generic OnOff Server model 和 Generic OnOff Client model，示例请见 example code 。
- **ESP-BLE-MESH Provisioner** - 展示了设备如何充当 ESP-BLE-MESH Provisioner 以配网设备。Provisioner 拥有 Configuration Server model，Configuration Client model 和 Generic OnOff Client model，示例请见 example code 。
- **ESP-BLE-MESH 快速配网 - Client 和 Server** - 该示例用于演示快速配网。配网 100 个设备费时不超过 60 秒，示例请见：example client code 和 example server code 。
- **Wi-Fi 和 ESP-BLE-MESH 共存** - 该示例用于演示 Wi-Fi 和 ESP-BLE-MESH 共存的功能。简而言之，用户可在运行 ESP-BLE-MESH 时使用 Wi-Fi，示例请见 example code 。
- **ESP-BLE-MESH 节点控制台 - Provisioner and Node** 可以扫描、验证节点，节点可以回复 Provisioner 的获取/设置消息，示例请见：example code 。

ESP-BLE-MESH Feature List

Supported Features

**Mesh Core**

- **Provisioning: Node Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Provisioning: Provisioner Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Networking**
  - Relay
– Segmentation and Reassembly
– Key Refresh Procedure
– IV Update Procedure
– Friend
– Low Power
– Proxy Server
– Proxy Client

• **Multiple Client Models Run Simultaneously**
  – Support multiple client models send packets to different nodes simultaneously
  – No blocking between client model and server model

• **NVS Storing**
  – Store provisioning and configuration information of ESP-BLE-MESH Node

**Mesh Models**

• **Foundation models**
  – Configuration Server model
  – Configuration Client model
  – Health Server model
  – Health Client model

• **Generic client models**
  – Generic OnOff Client
  – Generic Level Client
  – Generic Default Transition Time Client
  – Generic Power OnOff Client
  – Generic Power Level Client
  – Generic Battery Client
  – Generic Location Client
  – Generic Property Client

• **Sensor client models**
  – Sensor Client

• **Time and Scenes client models**
  – Time Client
  – Scene Client
  – Scheduler Client

• **Lighting client models**
  – Light Lightness Client
  – Light CTL Client
  – Light HSL Client
  – Light xyL Client
  – Light LC Client

• **Generic server models**
  – Generic OnOff Server
  – Generic Level Server
  – Generic Default Transition Time Server
  – Generic Power OnOff Server
  – Generic Power OnOff Setup Server
  – Generic Power Level Server
  – Generic Power Level Setup Server
  – Generic Battery Server
  – Generic Location Server
  – Generic Location Setup Server
  – Generic User Property Server
  – Generic Admin Property Server
  – Generic Manufacturer Property Server
  – Generic Client Property Server

• **Sensor server models**
  – Sensor Server
Chapter 4. API

ESP-BLE-MESH 架构

本文档将介绍 ESP-BLE-MESH 的架构概览、架构实现和辅助程序。

- **ESP-BLE-MESH 架构概览**
  - 描述了 ESP-BLE-MESH 架构的 5 大部分及每个部分的功能。
- **ESP-BLE-MESH 架构实现**
  - 描述了 ESP-BLE-MESH 文件的基本功能、文件与 ESP-BLE-MESH 架构的对应关系及文件间调用的接口。
- **ESP-BLE-MESH 辅助程序**
  - 描述了 ESP-BLE-MESH 的辅助程序，比如 Mesh 网络管理，Mesh 特性等。

1. **ESP-BLE-MESH 架构概览** 目前，ESP-BLE-MESH 已经实现了 Mesh Profile 的大多数功能及 Mesh Model 规范中定义的所有 Client Model。未支持的功能/模型尚在开发中，会尽快提供。ESP-BLE-MESH 已通过 Bluetooth SIG 蓝牙技术联盟的 认证。

ESP-BLE-MESH 架构主要由以下 5 大部分组成：

- **Mesh 协议栈**
  - Mesh Networking 负责 BLE Mesh 设备的网络消息处理等。
  - Mesh Provisioning 负责 BLE Mesh 设备的启动配置流程。
  - Mesh Models 负责实现 SIG 定义的模型。
- **网络管理**
  - 负责实现网络管理程序，包括节点删除程序、网络索引 (IV Index) 恢复程序等。
- **特性**
  - 包括 BLE Mesh 特性，如低功耗特性、友好特性、中继特性等。
- **Mesh 承载层**
  - 包括 广播承载层和 GATT 承载层。承载层对于 ESP-BLE-MESH 协议栈至关重要，因为协议栈基于蓝牙低功耗技术构建而成，其必须利用承载层通过 BLE 广播通道和连接通道进行数据传输。
- **应用层**
  - 基于 ESP-BLE-MESH 协议栈和 Mesh Models。
  - 通过调用 API 和处理事件，Applications 实现了与 ESP-BLE-MESH 协议栈中的 Mesh Networking 和 Mesh Provisioning 的交互，也实现了与 Mesh Models 中一系列模型的交互。

1.1 Mesh 协议栈

1.1.1 Mesh Networking 协议栈架构中的 Mesh Networking 实现了如下功能:

- **Mesh 网络中节点间的通讯。**
- **Mesh 网络中消息的加解密。**
- **Mesh 网络资源的管理，如网络秘钥 (NetKey)、网络索引等。**
- **Mesh 网络消息的分包与重组。**
- **消息在不同模型间的模型映射。**
- **更多功能，请参见 ESP-BLE-MESH Feature List。**

Mesh Networking 功能的实现是基于层级结构的。每一层的功能如表 1.1 所示：

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>接入层</td>
<td>接入层定义应用程序数据的格式，还需对上层传输层对数据包的加密和解密进行定义和控制。</td>
</tr>
<tr>
<td>上层传输层</td>
<td>上层传输层对接入层进出的应用数据进行加密、解密和认证，同时也处理被称为“传输控制消息”的特殊消息，这种消息包括了与“友谊”和心跳包相关的消息。</td>
</tr>
<tr>
<td>底层传输层</td>
<td>底层传输层处理 PDU 的分包和重组。</td>
</tr>
<tr>
<td>网络层</td>
<td>网络层定义网络消息的地址类型和格式，实现设备的中继功能。</td>
</tr>
</tbody>
</table>
1.1.2 Mesh Provisioning 协议栈架构中的 Mesh Provisioning 实现了如下功能:
• 对未配网设备的配网。
• Mesh 网络资源的分配（单播地址、网络索引和网络秘钥）。
• 配网期间对 4 种验证方法的支持。
• 更多功能，请参见 ESP-BLE-MESH Feature List。

Mesh Provisioning 功能的实现是基于层级结构的。每一层的功能如表 1.2 所示:

表 2: 表 1.2 Mesh Provisioning 框架描述

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>通过配网协议处理不同层级的 Provisioning PDUs。</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>使用 Generic Provisioning 层或代理协议层将 Provisioning PDU 传输到未配网的设备。</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT</td>
<td>这些层级定义了 Provisioning PDUs 作为可分包和重组的消息进行传输的方式。</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>Provisioning bearer 定义了会话建立的方式，该方式用来将 Generic Provisioning 层的传输包传送到设备。</td>
</tr>
</tbody>
</table>

1.1.3 Mesh Models 协议栈架构中的 Mesh Models 实现了如下功能:
• Configuration Client/Server Models
• Health Client/Server Models
• Generic Client/Server Models
• Sensor Client/Server Models
• Time and Scenes Client/Server Models
• Lighting Client/Server Models

每一层的功能如表 1.3 所示:

表 3: 表 1.3 Mesh Models 框架描述

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>模型层</td>
<td>模型层实现用于标准化典型用户场景操作的模型，包括 Generic Client/Server Models，Sensor Client/Server Models，Time and Scenes Client/Server Models，Lighting Client/Server Models 和若干自定义模型。</td>
</tr>
<tr>
<td>基础模型层</td>
<td>基础模型层实现与 ESP-BLE-MESH 网络配置、管理和自我诊断等相关的模型。</td>
</tr>
</tbody>
</table>

1.2 Mesh 网络管理 网络管理实现了如下功能:
• 节点移除程序：用于将节点从网络中移除。
• 网络索引恢复程序：用于恢复节点的网络索引。
• 网络索引更新程序：用于更新节点的网络索引。
• 秘钥更新程序：用于更新节点的网络秘钥、应用秘钥 (AppKey) 等。
• 网络创建程序：用于创建 mesh 网络。
• NVS 存储器：用于存储节点的网络信息。

1.3 Mesh 特性 特性包括以下几项:
• 低功耗特性：用于降低节点的能耗。
• 好友特性：用于为低功耗节点存储消息。
• 中继特性：用于中继转发节点通过广播或转发层收到的网络 PDU。
• Proxy Server/Client 是代理协议中的两个节点角色，其使节点可以通过面向连接的承载层发送 Network PDUs、mesh beacons，代理配置消息和 Provisioning PDU。

1.4 Mesh 承载层 协议栈框架中的 承载层负责 ESP-BLE-MESH 协议栈和低功耗蓝牙核心协议间的数据传输。
承载层可视为是基于蓝牙低功耗核心协议的载体层，其实现了 ESP-BLE-MESH 协议栈数据的接收和传输。

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT</td>
<td>GATT 承载层使用代理协议通过 GATT 连接在两个设备之间发送和接收 Proxy PDUs。</td>
</tr>
<tr>
<td>广播承载层</td>
<td>使用广播承载层时，必须使用低功耗蓝牙广播通道来发送 mesh 数据包，数据包中的 AD Type 需要设置为 mesh 数据包的类型。</td>
</tr>
</tbody>
</table>

表 4: 表 1.3 Mesh 承载层描述

1.5 Mesh 应用层 协议栈框架中的应用层通过调用 ESP-BLE-MESH 协议栈提供的 API 并处理协议栈上报的事件来实现相应的功能，有一些常见应用，比如网关、照明等。

API / 事件之间的交互

- 应用层调用 API
  - 调用配网相关的 API 进行配网。
  - 调用模型相关的 API 发送消息。
  - 调用设备属性相关的 API 获取设备的本地信息。

- 应用层处理事件
  应用层的设计基于事件设计，事件将参数传给应用层。事件主要分为两大类。
  - 调用 API 完成的事件。
    * 比如接收消息的事件。
  - 协议栈自动上报给应用层的事件。
    * 协议栈自动上报的事件。
    * 模型主动上报的事件。

- 事件通过应用层注册的回调函数进行上报，同时回调函数中也会包含对事件的相应处理。

API / 事件与 ESP-BLE-MESH 协议栈的交互

- 用户使用的 API 主要调用 “Mesh Networking”、Mesh Provisioning 和 Mesh Models 提供的函数。
- API / 事件和协议栈的交互不会跨越协议栈的层级进行操作。比如 API 不会调用 Network Layer 相关的函数。

2. ESP-BLE-MESH 架构实现 ESP-BLE-MESH 架构的设计和实现是基于层级和模块的。具体而言，第 2.1 节（Mesh 网络的实现）、第 2.2 节（Mesh 配网实现）和第 2.3 节（Mesh 层级实现）基于层级思想，第 2.4 节（网络模型的实现）基于模块思想。

- 层级思想：基于层级思想，网络架构根据 Mesh Profile Specification 中指定的层级设计而成。每层都有独特的文件，文件包括该层的 API 等。具体设计如图 2.1 所示。
- 模块思想：每个文件实现一个独立的功能，供其它程序调用。

ESP-BLE-MESH 架构采用分层的方式进行设计，数据包的处理所经过的层级顺序是固定的，也就是数据包的处理过程会形成一个消息流。因此，我们可以从图 2.1 的协议栈接口图中看到消息流。

2.1 Mesh 协议栈的实现

2.1.1 Mesh Networking 实现 Mesh Networking 中的文件列表和每个文件实现的功能如表 2.1 所示：

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>BLE Mesh 接入层</td>
</tr>
<tr>
<td>transport.c</td>
<td>BLE Mesh 底层/上层传输层</td>
</tr>
<tr>
<td>net.c</td>
<td>BLE Mesh 网络层</td>
</tr>
<tr>
<td>adv.c</td>
<td>用于发送 BLE Mesh 广播包的任务，一个用于处理收到的广播包的回调以及用于分配 adv 缓冲区的 API</td>
</tr>
</tbody>
</table>
2.1.2 Mesh Provisioning 实现 由于 Node/Provisioner 共存的限制，Mesh Provisioning 的实现分为两大模块。实现 Node 启动配置的特定文件如表 2.2 所示:

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>BLE Mesh 节点配网 (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>BLE Mesh 节点代理服务器相关功能</td>
</tr>
<tr>
<td>beacon.c</td>
<td>用于处理 BLE Mesh Beacon 的 API</td>
</tr>
</tbody>
</table>

实现 Provisioner 配置功能的特定文件如表 2.3 所示:

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>BLE Mesh Provisioner 配置入网 (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>BLE Mesh 代理客户端相关功能</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>BLE Mesh Provisioner 网络相关功能</td>
</tr>
</tbody>
</table>

2.1.3 Mesh Models 实现  Mesh Models 用于实现节点中所包含的模型的具体功能。服务器模型主要用于维护节点状态。客户端模型主要用于获取和修改节点状态。

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg cli.c</td>
<td>发送 Configuration Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>cfg srv.c</td>
<td>接收 Configuration Client 消息，发送应答消息</td>
</tr>
<tr>
<td>health cli.c</td>
<td>发送 Health Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>health srv.c</td>
<td>接收 Health Client 消息，发送应答消息</td>
</tr>
<tr>
<td>client common.c</td>
<td>BLE Mesh 模型相关操作</td>
</tr>
<tr>
<td>generic client.c</td>
<td>发送 BLE Mesh Generic Client 消息，接收应答消息</td>
</tr>
<tr>
<td>lighting client.c</td>
<td>发送 BLE Mesh Lighting Client 消息，接收应答消息</td>
</tr>
<tr>
<td>sensor client.c</td>
<td>发送 BLE Mesh Sensor Client 消息，接收应答消息</td>
</tr>
<tr>
<td>time scene client.c</td>
<td>发送 BLE Mesh Time Scene Client 消息，接收应答消息</td>
</tr>
</tbody>
</table>

2.2 Mesh Bearers 实现 Mesh Bearers 在实现时充分考虑了可移植性。当 ESP-BLE-MESH 协议栈需要移植到其它平台时，用户只需要修改 mesh_bearer_adapter.c 就能移植成功。

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh_bearer_adapter.c</td>
<td>BLE Mesh 承载层适配文件。此文件提供用于接收和发送 BLE Mesh ADV 和 GATT 相关数据包的接口。</td>
</tr>
</tbody>
</table>

注解: mesh_bearer_adapter.c 是对 Mesh 网络框架中 Advertising Bearer 和 GATT Bearer 的实现。

2.3 Mesh Applications 实现 我们提供了一系列用于客户开发的应用示例，用户可以基于 ESP-BLE-MESH 示例 开发产品。

3. ESP-BLE-MESH 辅助程序 辅助程序指的是 ESP-BLE-MESH 协议栈中可选的功能。辅助程序的设计通常通过 CONFIG_BLE_MESH 来实现代码的裁剪。
3.1 特性
- 低功耗
- 好友
- 中继
- 代理客户端/代理服务器

3.2 网络管理
- 节点移除程序
- 网络索引恢复程序
- 网络索引更新程序
- 秘钥更新程序
- 网络创建程序
- NVS 存储器

3.3 辅助程序实现
采用独立模块的设计主要考虑到两个因素:
- 该模块不具备分层结构的条件，其实现可以完全独立，不需要依赖其它模块。
- 模块中的函数会被反复使用到，因此最好设计成独立模块。独立模块如表 3.1 所示:

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpn.c</td>
<td>BLE Mesh 低功耗功能</td>
</tr>
<tr>
<td>friend.c</td>
<td>BLE Mesh 好友功能</td>
</tr>
<tr>
<td>net.c</td>
<td>BLE Mesh 中继功能、网络创建、网络索引更新程序、网络索引恢复程序、秘钥更新程序相关功能</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>BLE Mesh 代理服务器相关功能</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>BLE Mesh 代理客户端相关功能</td>
</tr>
<tr>
<td>settings.c</td>
<td>BLE Mesh NVS 存储器功能</td>
</tr>
<tr>
<td>main.c</td>
<td>BLE Mesh 协议栈初始化，协议栈使能，节点移除相关功能</td>
</tr>
</tbody>
</table>

ESP-BLE-MESH 常见问题手册

本文汇总了 ESP-BLE-MESH 协议栈开发的常见问题及解答，全文分为 7 个章节。
- 1. Provisioner 开发
- 2. 节点开发
- 3. ESP-BLE-MESH 和 Wi-Fi 共存
- 4. 快速配网
- 5. Log 帮助
- 6. 示例帮助
- 7. 其他

用户可以参考这些章节，快速找到问题的答案。该文档会根据各种渠道收集的反馈进行更新。

1. Provisioner 开发

通常而言，Provisioner 用于配网未配网设备并形成 mesh 网络。组网后，设备的角色变成节点。

1.1 未配网设备加入 ESP-BLE-MESH 网络的流程是什么？

设备通过 Provisioner 加入 ESP-BLE-MESH 网络分为两个阶段，配网阶段和配置阶段。
- 配网阶段：为设备分配单播地址，添加网络密钥 (NetKey) 等。通过配网，设备加入 ESP-BLE-MESH 网络，身份未配网设备变为节点。
配置阶段：为节点添加应用密钥(AppKey) 并将应用密钥绑定到相应模型。配置期间，有些选项是可选的，比如为节点添加订阅地址、设置发布地址等。通过配置，该节点实际上可以向 Provisioner 发送消息，也可以接收来自 Provisioner 的消息。

1.2 如果 Provisioner 想要改变节点状态，其需满足什么条件？
- 需要有和节点的服务器模型相对应的客户端模型。
- 需要和节点有相同的、可用于加密消息的网络密钥和应用密钥。
- 需要知道节点的地址，可以是单播地址，也可以是订阅地址。

1.3 如何使用网络密钥和应用密钥？
- 网络密钥用于加密网络层的消息。具有相同网络密钥的节点视作在同一网络中，具有不同网络密钥的节点相互之间不能进行通信。
- 应用密钥用于加密上传传输层中的消息。如果服务器模型和客户端模型绑定的应用密钥不同，则无法实现通信。

1.4 如何生成网络密钥或应用密钥？是否可以采用固定的网络密钥或应用密钥？
- API esp_ble_mesh_provisioner_add_local_net_key() 可以用来添加包含固定值或随机值的网络密钥。
- API esp_ble_mesh_provisioner_add_local_app_key() 可以用来添加包含固定值或随机值的应用密钥。

1.5 Provisioner 的单播地址是不是固定的？

esp_ble_mesh_prov_t 中 prov_unicast_addr 的值用于设置 Provisioner 的单播地址，只能在初始化期间设置一次，此后不能更改。

1.6 Provisioner 的地址是否可以作为节点上报状态消息的目的地址？
Provisioner 的单播地址只能在初始化期间设置一次，此后不能更改。理论上，只要节点知道 Provisioner 的单播地址，此地址便可用作节点上报状态消息的目的地址。节点在网络配置的过程中可以知道 Provisioner 的单播地址，因为 Provisioner 往节点发送消息时，消息的源地址就是 Provisioner 的单播地址。订阅地址也可使用。Provisioner 订阅组地址或者虚拟地址，节点向该订阅地址发送消息。

1.7 被 Provisioner 配网到 ESP-BLE-MESH 网络中的第一个节点的单播地址是不是固定的？

esp_ble_mesh_prov_t 中 prov_start_address 的值用于设置 Provisioner 配网未配网设备的起始地址，即其首先配网的节点的单播地址。单播地址只能在初始化期间设置一次，此后不能修改。

1.8 手机 App 首先配置的节点的单播地址是不是固定的？
该 App 将确定单播地址，目前大多数单播地址是固定的。

1.9 如何知道当前 Provisioner 正在配网哪个未配网设备？

esp_ble_mesh_prov_t 中 prov_attention 的值由 Provisioner 在配网过程中设置给未配网设备。该值只能在初始化期间设置一次，此后不能修改。未配网设备加入 mesh 网络后可以用特定的方式来显示自己正在配网，比如灯光闪烁，以告知 Provisioner 其正在配网。
1.10 请描述几种设备认证方法？提供的示例中 provided examples 使用了什么方法？

共有四种设备认证方法，即 No OOB、Static OOB、Output OOB 和 Input OOB。提供的示例使用了 No OOB 的方式。

1.11 配置网前，未配网设备的广播包可以携带哪些信息？

- Device UUID
- OOB Info
- URL Hash (可选的)

1.12 这些信息可以用于设备识别吗？

是的。每个设备都有独一无二的 Device UUID，用户可以通过 Device UUID 识别设备。

1.13 当 Provisioner 配网的节点包含多个元素时，单播地址是如何分配的？

- Provisioner 会将设备的主元素分配一个单播地址，其余元素的单播地址在此基础上递增。
- 比如：一个未配网设备有三个元素，即主元素、第二元素和第三元素。配网完成后，节点主元素的单播地址为 0x0002，节点第二元素的单播地址为 0x0003，节点第三元素的单播地址为 0x0004。

1.14 Provisioner 如何通过 Configuration Client Model 获取并解析节点的构成数据？

- Provisioner 可以调用 Configuration Client Model API esp_ble_mesh_config_client_set_state() 设置参数，调用 esp_ble_mesh_cfg_client_get_state_t 中的 comp_data_get 获取节点的构成数据。
- 用户可以参考以下代码解析 Composition Data:

```c
#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A000800030000105010000000010001000103103F002A00
//0C00 1A00 0800 0300 0000 01 05 01 00 00 00 00 01 00 03 10 3F 00 2A 00

// CID is 0x0000
// PID is 0x0001
// VID is 0x0000
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000, ...
// 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model...
// Identifier 0x002A

typedef struct {
    int16_t cid;
    int16_t pid;
    int16_t vid;
    int16_t crpl;
    int16_t features;
    int16_t all_models;
    uint8_t sig_models;
    uint8_t vnd_models;
} esp_ble_mesh_composition_head;
```

(下页继续)
typedef struct {
    uint16_t model_id;
    uint16_t vendor_id;
} tsModel;

typedef struct {
    // reserve space for up to 20 SIG models
    uint16_t SIG_models[20];
    uint8_t numSIGModels;
    // reserve space for up to 4 vendor models
    tsModel Vendor_models[4];
    uint8_t numVendorModels;
} esp_ble_mesh_composition_decode;

int decode_comp_data(esp_ble_mesh_composition_head *head, esp_ble_mesh_composition_decode *data, uint8_t *mystr, int size)
{
    int pos_sig_base;
    int pos_vnd_base;
    int i;
    memcpy(head, mystr, sizeof(*head));
    if (size < sizeof(*head) + head->sig_models * 2 + head->vnd_models * 4) {
        return -1;
    }
    pos_sig_base = sizeof(*head) - 1;
    for (i = 1; i < head->sig_models * 2; i = i + 2) {
        data->SIG_models[i/2] = mystr[i + pos_sig_base] | (mystr[i + pos_  
        sig_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, data->SIG_models[i/2]);
    }
    pos_vnd_base = head->sig_models * 2 + pos_sig_base;
    for (i = 1; i < head->vnd_models * 2; i = i + 2) {
        data->Vendor_models[i/2].model_id = mystr[i + pos_vnd_base] | (mystr[i + pos_  
        vnd_base + 1] << 8);
        printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].model_id);
        data->Vendor_models[i/2].vendor_id = mystr[i + pos_vnd_base + 2]  
        | (mystr[i + pos_vnd_base + 3] << 8);
        printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].vendor_id);
    }
    return 0;
}

void app_main(void)
{
    esp_ble_mesh_composition_head head = {0};
    esp_ble_mesh_composition_decode data = {0};
    uint8_t mystr[] = { 0x0C, 0x00, 0x1A, 0x00,  
    0x01, 0x00, 0x08, 0x00,  
    0x03, 0x00, 0x00, 0x01,  
    0x05, 0x01, 0x00, 0x00,  
    0x00, 0x00, 0x01, 0x00, };
0x00, 0x10, 0x03, 0x10,
0x3F, 0x00, 0x2A, 0x00);  

int ret;
ret = decode_comp_data(&head, &data, mystr, sizeof(mystr));
if (ret == -1) {
    printf("decode_comp_data error");
}

1.15 Provisioner 如何通过获取的 Composition Data 进一步配置节点？
Provisioner 通过调用 Configuration Client Model API esp_ble_mesh_config_client_set_state() 来进行如下配置。
- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 app_key_add, 将应用密钥添加到节点中。
- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 model_sub_add, 将订阅地址添加到节点的模型中。
- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 model_pub_set, 将发布地址添加到节点的模型中。

1.16 节点可以自己添加相应的配置吗？
本法可用于特殊情况，如测试阶段。
- 此示例展示了节点如何为自己的模型添加新的组地址。

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t group_addr) {
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;

    if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }

    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
        return ESP_FAIL;
    }

    for (i = 0; i < comp->element_count; i++) {
        element = &comp->elements[i];
        model = esp_ble_mesh_find_sig_model(element, model_id);
        if (!model) {
            continue;
        }
        for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
            if (model->groups[j] == group_addr) {
                break;
            }
        }
        if (j != ARRAY_SIZE(model->groups)) {
            ESP_LOGW(TAG, "%s: Group address already exists, element_index: %d", __func__, i);
            continue;
        }
```
for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
        model->groups[j] = group_addr;
        break;
    }
}
if (j == ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element...", __func__, i);
}
return ESP_OK;

### 1.17 Provisioner 如何通过分组的方式控制节点？

通常而言，在 ESP-BLE-MESH 网络中实现组控制有两种方法：即组地址方法和虚拟地址方法。假设有 10 个设备，即 5 个带蓝灯的设备和 5 个带红灯的设备。

- 方案一：5 个蓝灯设备订阅一个组地址，5 个红灯设备订阅另一个组地址。Provisioner 往不同的组地址发送消息，即可实现分组控制设备。
- 方案二：5 个蓝灯设备订阅一个虚拟地址，5 个红灯设备订阅另一个虚拟地址，Provisioner 往不同的虚拟地址发送消息，即可实现分组控制设备。

### 1.18 Provisioner 如何将节点添加至多个子网？

节点配置期间，Provisioner 可以为节点添加多个网络密钥，拥有相同网络密钥的节点属于同一子网。Provisioner 可以通过不同的网络密钥与不同子网内的节点进行通信。

### 1.19 Provisioner 如何知道网络中的某个设备是否离线？

节点离线通常定义为：电源故障或其他原因导致的节点无法与 mesh 网络中的其他节点正常通信的情况。

ESP-BLE-MESH 网络中的节点间彼此不连接，它们通过广播通道进行通信。

此处示例展示了如何通过 Provisioner 检测节点是否离线。

- 节点定期给 Provisioner 发送心跳包。如果 Provisioner 超过一定的时间未接收到心跳包，则视该节点离线。

**注释:** 心跳包的设计应该采用单包（字节数小于 11 个字节）的方式，这样收发效率会更高。

### 1.20 Provisioner 删除网络中的节点时，需要进行哪些操作？

通常而言，Provisioner 从网络中移除节点主要涉及三个步骤：

- 首先，Provisioner 将需要移除的节点添加至“黑名单”。
- 其次，Provisioner 启动密钥更新程序。
- 最后，节点执行节点重置程序，切换自身身份为未配网设备。

**注释：**
1.21 在密钥更新的过程中，Provisioner 如何更新节点的网络密钥？

- 通过正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `net_key_update`，使用 `Configuration Client Model API esp_ble_mesh_config_client_set_state()`，Provisioner 更新节点的网络密钥。
- 通过正确设置参数 `esp_ble_mesh_cfg_client_set_state_t` 中的 `app_key_update`，使用 `Configuration Client Model API esp_ble_mesh_config_client_set_state()`，Provisioner 更新节点的应用密钥。

1.22 Provisioner 如何管理 mesh 网络中的节点？

ESP-BLE-MESH 在示例中实现了基本的节点管理功能。比如 `esp_ble_mesh_store_node_info()`。ESP-BLE-MESH 还提供可用于设置节点本地名称的 API `esp_ble_mesh_provisioner_set_node_name()` 和可用于获取节点本地名称的 API `esp_ble_mesh_provisioner_get_node_name()`。

1.23 Provisioner 想要控制节点的服务器模型时需要什么？

Provisioner 在控制节点的服务器模型前，必须包括相应的客户端模型。

- Provisioner 应当添加本地的网络密钥和应用密钥。
  - Provisioner 调用 API `esp_ble_mesh_provisioner_add_local_net_key()` 以添加网络密钥。
  - Provisioner 调用 API `esp_ble_mesh_provisioner_add_local_app_key()` 以添加应用密钥。

Provisioner 应当配置自己的客户端模型。

- Provisioner 调用 API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()` 以绑定应用密钥至自己的客户端模型。

1.24 Provisioner 如何控制节点的服务器模型？

ESP-BLE-MESH 支持所有 SIG 定义的客户端模型。Provisioner 可以使用这些客户端模型控制节点的服务器模型。客户端模型分为 6 类，每类有相应的功能。

- Configuration Client Model
  - API `esp_ble_mesh_config_client_get_state()` 可用于获取 `Configuration Server Model` 的 `esp_ble_mesh_cfg_client_set_state_t` 值。
  - API `esp_ble_mesh_config_client_set_state()` 可用于获取 `Configuration Server Model` 的 `esp_ble_mesh_cfg_client_set_state_t` 值。
- Health Client Model
  - API `esp_ble_mesh_health_client_get_state()` 可用于获取 `Health Server Model` 的 `esp_ble_mesh_health_client_get_state_t` 值。
  - API `esp_ble_mesh_health_client_set_state()` 可用于获取 `Health Server Model` 的 `esp_ble_mesh_health_client_set_state_t` 值。
- Generic Client Models
  - API `esp_ble_mesh_generic_client_get_state()` 可用于获取 `Generic Server Model` 的 `esp_ble_mesh_generic_client_get_state_t` 值。
  - API `esp_ble_mesh_generic_client_set_state()` 可用于获取 `Generic Server Model` 的 `esp_ble_mesh_generic_client_set_state_t` 值。
- Lighting Client Models
  - API `esp_ble_mesh_light_client_get_state()` 可用于获取 `Lighting Server Model` 的 `esp_ble_mesh_light_client_get_state_t` 值。
  - API `esp_ble_mesh_light_client_set_state()` 可用于获取 `Lighting Server Model` 的 `esp_ble_mesh_light_client_set_state_t` 值。
- Sensor Client Models
  - API `esp_ble_mesh_sensor_client_get_state()` 可用于获取 `Sensor Server Model` 的 `esp_ble_mesh_sensor_client_get_state_t` 值。
Chapter 4. API

- API `esp_ble_mesh_sensor_client_set_state()` 可用于获取 Sensor Server Model 的 `esp_ble_mesh_sensor_client_set_state_t` 值。

- Time and Scenes Client Models

  - API `esp_ble_mesh_time_scene_client_get_state()` 可用于获取 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_get_state_t` 值。
  
  - API `esp_ble_mesh_time_scene_client_set_state()` 可用于获取 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_set_state_t` 值。

2. 节点开发

2.1 节点包含什么样的模型？

- ESP-BLE-MESH 中，节点由一系列的模型组成，每个模型实现节点的某些功能。
- 模型分为两种，客户端模型和服务器模型。客户端模型可以获取并设置服务器模型的状态。
- 模型也可以分为 SIG 模型和自定义模型。SIG 模型的所有行为都由官方定义，而自定义模型的行为均由用户定义。

2.2 每个模型对应的消息格式是不是固定的？

- 消息由 opcode 和 payload 组成，通过 opcode 进行区分。
- 与模型对应的消息的类型和格式都是固定的，这意味着模型之间传输的消息是固定的。

2.3 节点的模型可以使用哪些函数发送消息？

- 对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` 发送消息。
- 对于服务器模型，用户可以调用 API `esp_ble_mesh_server_model_send_msg()` 发送消息。
- 对于发布，用户可以调用 API `esp_ble_mesh_model_publish()` 发布消息。

2.4 如何实现消息传输不丢失？

如果用户要实现消息传输不丢失，则需有应答的消息。等待应答的默认时间在 `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT` 中设置。如果发送端等待应答超时，就会触发对应的超时事件。

注解：API `esp_ble_mesh_client_model_send_msg()` 中可以设置应答的超时时间。如果参数 `msg_timeout` 设为 0，那么超时时间便会采用默认值（4 秒）。

2.5 如何发送无应答的消息？

对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to false 发送无应答消息。

对于服务器模型，调用 API `esp_ble_mesh_server_model_send_msg()` 发送的消息总是无应答的消息。

2.6 如何为模型添加订阅地址？

通过 Configuration Client Model 添加订阅地址。
2.7 模型发送的消息和发布的消息有何不同？

调用 API esp_ble_mesh_client_model_send_msg() 或 esp_ble_mesh_server_model_send_msg() 发送的消息会在 Network Transmit 状态规定的期限内发送。

调用 API esp_ble_mesh_model_publish() 发布的消息将由模型发布状态决定是否发布。消息的发布一般是周期性的，或者有固定次数。发布周期和发布次数由模型发布状态控制，并且可以通过 Configuration Client Model 进行配置。

2.8 发送不分包消息时，最多可携带多少有效字节？

不分包消息的总有效载荷长度（可由用户设置）为 11 个八位组。因此，如果消息的 opcode 为 2 个八位组，则该消息可以携带 9 个八位组的有效信息。对于 vendor 消息，由于 opcode 是 3 个八位组，剩余的有效负载长度为 8 个八位组。

2.9 什么时候应该使能节点的 Relay 功能？

如果 mesh 网络中检测到的节点很稀疏，用户可以使用节点的 Relay 功能。

如果 mesh 网络中检测到的节点很密集，用户可以选择仅使能一些节点的 Relay 功能。

如果 mesh 网络大小未知，用户可以默认使能 Relay 功能。

2.10 什么时候应该使能节点的 Proxy 功能？

如果未配网设备将由电话配网，则未配网设备应该使能 Proxy 功能，因为当前几乎所有电话都不支持通过广播载波层发送 ESP-BLE-MESH 数据包，并且，未配网设备成功配网成为 Proxy 节点后，其会通过 GATT 载波层和广播载波层与 mesh 网络中的其他节点通信。

2.11 如何使用代理过滤器？

代理过滤器用于减少 Proxy Client（如手机）和 Proxy Server（如节点）之间交换的 Network PDU 的数量。另外，通过代理过滤器，Proxy Client 可以明确请求仅接收来自 Proxy Server 的某些目标地址的 mesh 消息。

2.12 Relay 节点什么时候可以中继消息？

如果要中继消息，消息需满足以下要求。

- 消息存在于 mesh 网络中。
- 消息的目的地址不是节点的单播地址。
- 消息的 TTL 值需大于 1。

2.13 如果一条消息分成几段，那么其他 Relay 节点是接收到一段消息就中继还是等接收到完整的数据包才中继？

Relay 节点收到其中一段消息时就中继，而非一直等到接收所有的消息。

2.14 使用 Low Power 功能降低功耗的原理是什么？

- 开启无线电进行收听时，设备消耗能量。使能节点的低功耗功能后，它将在大多数时间内关闭无线电能。
- 低功耗节点和好友节点需要合作，因此低功耗节点可以以适当或较低的频率接收消息，而无需一直收听。
- 当低功耗节点有一些新消息时，好友节点将为其存储消息。低功耗节点可以间隔固定时间轮询好友节点，以查看是否有新的消息。
2.15 设备断电后上电，如何能继续在网络中进行通讯？
在 menuconfig 中启用配置 Store BLE Mesh Node configuration persistently。

2.16 如何实现将节点自检的信息发送出来？
推荐节点通过 Health Server Model 定期发布其自检结果。

2.17 节点间如何传输消息？
节点间传输信息的可能应用场景是，一旦烟雾警报检测到高浓度的烟雾，就会触发喷淋设备。
有两种实现方法。
- 方法 1：喷淋设备订阅组地址。当烟雾警报器检测到高浓度的烟雾时，它会发布一条消息，该消息的目标地址是喷淋设备已订阅的组地址。
- 方法 2：Provisioner 可以配置喷淋设备的单播地址为烟雾警报器的地址。当检测到高浓度的烟雾时，烟雾警报器以喷淋设备的单播地址为目标地址，将消息发送到喷淋设备。

2.18 设备通信必须要网关吗？
- 情况 1：节点仅在 mesh 网络内通信。这种情况下，不需要网关。ESP-BLE-MESH 网络是一个泛洪的网络，网络中的消息没有固定的路径，节点与节点之间可以随意通信。
- 情况 2：如果用户需要远程控制网络，比如在到家之前打开某些节点，则需要网关。

2.19 何时使用 IV Update 更新程序？
一旦节点的底层检测到发送的消息的序列号达到临界值，IV Update 更新程序便会启用。

2.20 如何启用 IV Update 更新程序？
节点可以使用带有 Secure Network Beacon 的 IV Update 更新程序。

3. ESP-BLE-MESH 和 Wi-Fi 共存

3.1 Wi-Fi 和 ESP-BLE-MESH 共存时，支持哪些模式？
目前，只有 Wi-Fi STA 模式支持共存。

3.2 Wi-Fi 和 ESP-BLE-MESH 共存时，为什么 Wi-Fi 吞吐量很低？
未搭载 PSRAM 的 ESP32-DevKitC 开发版，Wi-Fi 和 ESP-BLE-MESH 共存可以正常运行，但是吞吐率较低。当 Wi-Fi 和 ESP-BLE-MESH 共存时，搭载 PSRAM 的 ESP32-DevKitC 速率可以稳定在 1 Mbps 以上。
应使能 menuconfig 中的一些配置来支持 PSRAM。
- ESP32-specific --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
- Bluetooth --> Bluedriod Enable --> BT/BLE will first malloc the memory from the PSRAM
- Bluetooth --> Bluedriod Enable --> Use dynamic memory allocation in BT/BLE stack.
- Bluetooth --> Bluetooth controller --> BLE full scan feature supported.
- Wi-Fi --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi
Chapter 4. API 指南

4. 快速配网

4.1 为什么需要快速配网？
通常而言，存在少量未配网设备时，用户可以逐个配置。但是如果有大量未配网设备（比如 100 个）时，逐个配置会耗费大量时间。通过快速配网，用户可以在约 50 秒内配网 100 个未配网设备。

4.2 为什么会出现 EspBleMesh App 在快速配网期间长时间等待的情况？
快速配网期间，代理节点在配置完一个节点后会断开与 APP 的连接，待所有节点配网完成后再与 APP 重新建立连接。

4.3 为什么 APP 中显示的节点地址的数量比现有的节点地址更多？
每完成一次快速配网后，开始新一次快速配网前，APP 会存有上次配网的数据，因此 APP 中显示的节点地址的数量比现有的节点地址更多。

4.4 在 EspBleMesh App 中输入的 ** count ** 值有什么用途？
此 count 值提供给 App 配置的代理节点，以决定何时提前开始 Proxy 广播信息。

4.5 运行以下示例 fast_prov_server 的节点的 Configuration Client Model 何时开始工作？
使能了 Temporary Provisioner 功能后，Configuration Client Model 会开始工作。

4.6 Temporary Provisioner 功能会一直处于使能的状态吗？
节点收到打开/关闭电灯的消息后，所有节点会禁用其 Temporary Provisioner 功能并且转化为一般节点。

5. Log 帮助 当 ESP-BLE-MESH 协议栈底层出现错误或者警告时，您可以在这儿找到这些错误和警告的含义。

5.1 ran out of retransmit attempts 代表什么？
节点发送分段消息时，由于某些原因，接收端未收到完整的消息。节点会重传消息。当重传次数达到最大重传次数时，会出现该警告，当前最大重传次数为 4。

5.2 Duplicate found in Network Message Cache 代表什么？
当节点收到一条消息时，它会把该消息与网络缓存中存储的消息进行比较。如果在缓存中找到相同的消息，这意味着之前已接受过该消息，则该消息会被丢弃。

5.3 Incomplete timer expired 代表什么？
当节点在一定时间段（比如 10 秒）内未收到分段消息的所有段时，则 Incomplete 计时器到时，并且出现该警告。

5.4 No matching TX context for ack 代表什么？
当节点收到一个分段 ack 且不能找到任何自己发送的与该 ack 相关的消息时，会出现该警告。
5.5 No free slots for new incoming segmented messages 代表什么？
当节点没有空间来接收新的分段消息时，会出现该警告。用户可以通过配置 `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT` 扩大空间。

5.6 Model not bound to AppKey 0x0000 代表什么？
当节点发送带有模型的消息且模型尚未绑定到索引为 0x0000 的应用密钥时，会出现该错误。

5.7 Busy sending message to DST xxxx 代表什么？
该错误表示节点的客户端模型已将消息发送给目标节点，并且正在等待响应。用户无法将消息发送到单播地址相同的同一节点。接收到相应的响应或计时器到时后，可以发送另一条消息。

6. 示例帮助

6.1 ESP-BLE-MESH 回调函数如何分类？
- API `esp_ble_mesh_register_prov_callback()` 用于注册处理配网和入网相关事件的回调函数。
- API `esp_ble_mesh_register_config_client_callback()` 用于注册处理 Configuration Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_config_server_callback()` 用于注册处理 Configuration Server Model 相关事件的回调函数。
- API `esp_ble_mesh_register_health_client_callback()` 用于注册处理 Health Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_health_server_callback()` 用于注册处理 Health Server Model 相关事件的回调函数。
- API `esp_ble_mesh_register_generic_client_callback()` 用于注册处理 Generic Client Models 相关事件的回调函数。
- API `esp_ble_mesh_register_light_client_callback()` 用于注册处理 Lighting Client Models 相关事件的回调函数。
- API `esp_ble_mesh_register_sensor_client_callback()` 用于注册处理 Sensor Client Model 相关事件的回调函数。
- API `esp_ble_mesh_register_time_scene_client_callback()` 用于注册处理 Time and Scenes Client Models 相关事件的回调函数。
- API `esp_ble_mesh_register_custom_model_callback()` 用于注册处理自定义模型和未实现服务器模型的相关事件的回调函数。

7. 其他

7.1 如何打印数据包？
示例使用如下函数 ESP_LOG_BUFFER_HEX() 打印信息语境，而 ESP-BLE-MESH 协议栈使用 bt_hex() 打印。

7.2 重启 ESP32 应使用哪个 API？
API `esp_restart()`。

7.3 如何监测任务栈的剩余空间？
API `vTaskList()` 可以用于定期打印任务栈的剩余空间。
7.4 如何在不更改 menuconfig 输出级别的情况下改变 log 级别？
无需使用 menuconfig，可以通过 API `esp_log_level_set()` 修改 log 的输出级别。

ESP-BLE-MESH Terminology

<table>
<thead>
<tr>
<th>术语</th>
<th>官方定义</th>
<th>详细说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>未配网设备</td>
<td>“A device that is not a member of a mesh network is known as an unprovisioned device.”</td>
<td>示例：照明装置、温控设备、制造设备和电动门等。</td>
</tr>
<tr>
<td>节点</td>
<td>“A node is a provisioned device.”</td>
<td>经配网加入 ESP-BLE-MESH 网络后，未配网设备的身份转变成节点。节点（如照明装置、温控设备、制造设备和电动门）是指能在蓝牙 ESP-BLE-MESH 网络中发送、接收或中继消息的设备，且节点可以选择性地支持一个或多个子网。</td>
</tr>
<tr>
<td>中继节点</td>
<td>“A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.”</td>
<td>中继节点接收并中继 ESP-BLE-MESH 消息，因此消息可以传输得更远。用户可以根据节点的状态来决定是否使能节点的中继功能。消息可以中继多次，每次中继为“一跳”，消息最多可有 126 跳，足以让消息在广阔的区域内传输。</td>
</tr>
<tr>
<td>代理节点</td>
<td>“A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.”</td>
<td>代理节点从一个承载层（通常包括广播承载层和 GATT 承载层）接收消息，并通过另一个承载层重新发送消息。其目的是将只支持 GATT 承载层的通信设备接入 ESP-BLE-MESH 网络中。通常而言，手机 App 需要一个代理节点才能接入 Mesh 网络。没有代理节点，手机 App 无法与 Mesh 网络中成员通信。</td>
</tr>
<tr>
<td>好友节点</td>
<td>“A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.”</td>
<td>好友节点相当于低功耗节点（LPN）的备份，可存储发送往低功耗节点的消息及安全更新信息；当低功耗节点需要这些存储的信息时，这些信息便被传输至低功耗节点。低功耗节点必须与支持好友特性的另一节点建立“友谊”，以减少其接收器的占空比，从而降低低功耗节点的功耗。低功耗节点需要找到好友节点，与其建立友谊关系，其中涉及的过程称为“友谊建立”。低功耗节点与好友节点的搭配可让低功耗节点规划对无线电的使用，从而以适当或较低的频率接收消息，无需保持收听状态。低功耗节点会轮询好友节点以查看是否有新的消息。</td>
</tr>
<tr>
<td>低功耗节点</td>
<td>“A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.”</td>
<td>低功耗节点通过轮询从好友节点获取信息，比如消息、安全更新等。</td>
</tr>
<tr>
<td>启动配置设备(以下简称 Provisioner)</td>
<td>“A node that is capable of adding a device to a mesh network.”</td>
<td>能够配网未配网设备的设备称为启动配置设备。这一流程通常需要通过产品制造商的提供的 App 来实现，并可在网关、智能手机、平板电脑和其他载体上使用。</td>
</tr>
</tbody>

表 12: 表 2 ESP-BLE-MESH 术语 - 节点构成

<table>
<thead>
<tr>
<th>术语</th>
<th>官方定义</th>
<th>详细说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>状态</td>
<td>“A value representing a condition of an element that is exposed by an element of a node.”</td>
<td>ESP-BLE-MESH 网络中的每台设备都具有一组独立的状态值，表示设备的某些状态，比如照明设备的亮度，颜色等状态。更改状态值会修改设备本身的物理状态，比如更改设备的开关状态值实际是在打开或关闭设备。</td>
</tr>
<tr>
<td>模型</td>
<td>“A model defines the basic functionality of a node.”</td>
<td>一个节点可能包含多个模型，而每个模型定义了节点的基本功能，比如节点所需要的状态、控制状的消息以及处理消息所产生的动作等。节点功能的实现是基于模型的，模型可分为 SIG 模型和自定义模型，前者由 SIG 定义，而后者由用户定义。</td>
</tr>
<tr>
<td>元素</td>
<td>“An addressable entity within a device.”</td>
<td>一个节点可以包含一个或多个元素，每个元素都有一个单播地址和一个或多个模型，并且同一元素所包含的模型不可以出现重复。</td>
</tr>
<tr>
<td>节点构成状态</td>
<td>“The Composition Data state contains information about a node, the elements it includes, and the supported models.”</td>
<td>通过读取节点构成状态的值，用户可以了解节点的基本信息，比如元素的数量及每个元素中的模型。Provisioner 通过获取这个消息对设备进一步配置，比如配置节点的订阅地址与发布地址。</td>
</tr>
</tbody>
</table>

表 13: 表 3 ESP-BLE-MESH 术语 - 特性

<table>
<thead>
<tr>
<th>术语</th>
<th>官方定义</th>
<th>详细说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>低功耗特性</td>
<td>“The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.”</td>
<td>低功耗功能可降低节点的功耗。当低功耗节点寻找好友节点，且附近有多个好友节点时，它会通过算法选择最适合的好友节点。</td>
</tr>
<tr>
<td>好友特性</td>
<td>“The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.”</td>
<td>通过使能好友特性，节点可以存储低功耗节点的信息，使用好友特性时节点可能会产生更大的功耗和内存消耗。</td>
</tr>
<tr>
<td>中继特性</td>
<td>“The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.”</td>
<td>中继特性能让 ESP-BLE-MESH 的消息在节点之间实现多次跳跃，传输距离可超过两个节点之间直接进行无线电传输的范围，从而覆盖整个网络。使能了中继特性时，节点中继消息时，只中继其所在子网的消息，不中继其它子网的消息。中继特性时节点中继分段消息时不考虑数据的完整性。节点每收到一条分段消息便会直接中继，不会等待收到完整的消息。</td>
</tr>
<tr>
<td>代理特性</td>
<td>“The ability to receive and retransmit mesh messages between GATT and advertising bearers.”</td>
<td>代理特性用的目的是允许不具备广播承载层的节点访问 ESP-BLE-MESH 网络。代理特性通常为需要和手机 App 连接的节点所用。</td>
</tr>
</tbody>
</table>
表 14: 表 4 ESP-BLE-MESH 术语 - 配置入网

<table>
<thead>
<tr>
<th>术语</th>
<th>官方定义</th>
<th>详细说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>PB-ADV</td>
<td>“PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.”</td>
<td>PB-ADV 通过广播通道传输配网过程中产生的数据包。只有 Provisioner 和未配网设备都支持 PB-ADV 时才可使用这种方法进行配网。</td>
</tr>
<tr>
<td>PB-GATT</td>
<td>“PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.”</td>
<td>PB-GATT 通过连接通道传输配网过程中产生的数据包。如果未配网设备想使用此方式进行配网，其需要实现相关的 Mesh Provisioning Service。未实现此服务的未配网设备不能通过 PB-GATT 承载层配网接入 mesh 网络。</td>
</tr>
<tr>
<td>配置入网</td>
<td>“Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.”</td>
<td>经过配网，“未配网设备”的身份转变为“节点”，成为 ESP-BLE-MESH 网络中的一员。</td>
</tr>
<tr>
<td>认证方式</td>
<td>“Authentication is a step during the provisioning of nodes.”</td>
<td>未配网设备有四种认证方法：输入带外 (Input OOB)、输出带外 (Output OOB)、静态带外 (Static OOB) 和无带外 (No OOB)。</td>
</tr>
<tr>
<td>输入带外 (Input OOB)</td>
<td>Input Out-of-Band</td>
<td>比如，Provisioner 生成并显示随机数，然后提示用户采取适当操作将随机数输入未配网的设备中。以照明开关为例，用户可以在一定时间内数次按下按钮，以这种形式输入 Provisioner 显示的随机数。输入带外认证方法与输出带外的认证方法类似，但设备的角色相反。</td>
</tr>
<tr>
<td>输出带外 (Output OOB)</td>
<td>Output Out-of-Band</td>
<td>比如，未配网设备会选择一个随机数，并通过与其功能兼容的方式输出该数字。如果未配网设备是一个灯泡，则其能够闪烁指定的次数。如果未配网设备有 LCD 屏幕，则可以将随机数显示为多位数值。启动 Provisioner 的用户需要输入观察到的数字，来认证未配网的设备。</td>
</tr>
<tr>
<td>静态带外 (Static OOB)</td>
<td>Static Out-of-Band</td>
<td>静态 OOB 的认证方法：使用静态 OOB 信息。如果需要使用无 OOB 信息，请将静态 OOB 字段赋值为 0。如果需要使用 OOB 信息，请使用静态 OOB 信息认证正在配网的设备。</td>
</tr>
<tr>
<td>无带外 (No OOB)</td>
<td>No Out-of-Band</td>
<td>无 OOB 的认证方法：将“静态 OOB”字段赋值为 0，采用这种方式相当于不认证未配网的设备。</td>
</tr>
</tbody>
</table>
表 15: 表 5 ESP-BLE-MESH 术语 - 地址

<table>
<thead>
<tr>
<th>术语</th>
<th>官方定义</th>
<th>详细说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>未分配地址</td>
<td>“This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.”</td>
<td>未分配的元素地址或未分配的元素地址都称为未分配地址。对于这些元素没有固定的地址，它们不会用于消息的传输。建议在设置用户代码的地址之前，将该地址的值设为未分配地址。</td>
</tr>
<tr>
<td>单播地址</td>
<td>“A unicast address is a unique address allocated to each element.”</td>
<td>在配网期间，Provisioner 会给网络中处于生命周期内节点的每个元素分配一个单播地址。单播地址可能会出现在消息的源/目标地址字段中。发送到单播地址的消息只能由拥有该单播地址的元素进行处理。</td>
</tr>
<tr>
<td>虚拟地址</td>
<td>“A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.”</td>
<td>虚拟地址与特定的 UUID 标签相关联，可以用作模型的发布地址或订阅地址。UUID 标签与一个或多个节点或元素关联的 128 位值。虚拟地址的第 15 位和第 14 位分别设置为 1 和 0。从第 13 位到第 0 位设置为散列值（提供 16384 个散列值）。散列是 UUID 标签的派生。使用订阅元素检查完整的 128 位 UUID 十分低效，而散列值提供了更有效的方法来确定最终将哪些消息发送到哪些元素。</td>

This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.

A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.

IV update procedures are used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised. When a node detects that a network key has been compromised, it will use an IV update procedure to signal to peer nodes that it is updating the IV Index. This allows the peer nodes to update their IV Index to avoid potential security vulnerabilities.

### 4.9 ESP-WIFI-MESH

本指南提供有关ESP-WIFI-MESH协议的介绍。更多有关API使用的信息，请见ESP-WIFI-MESH API参考。

#### 4.9.1 概述

ESP-WIFI-MESH 是一套建立在Wi-Fi协议之上的网络协议。ESP-WIFI-MESH允许分布在大范围区域内（室内和室外）的大量设备（下文称节点）在同一个WLAN（无线局域网）中相互连接。ESP-WIFI-MESH具有自组网和自修复的特性，也就是说mesh网络可以自主地构建和维护。

本ESP-WIFI-MESH指南分为以下几个部分：

1. 简介
2. ESP-WIFI-MESH概念
3. 建立网络
4. 管理网络
5. 数据传输
6. 信道切换
7. 性能
8. 更多注意事项
4.9.2 简介

图 16: 传统 Wi-Fi 网络架构

传统基础设施 Wi-Fi 网络是一个“单点对多点”的网络。这种网络架构的中心节点为接入点 (AP)，其他节点 (station) 均与 AP 直接相连。其中，AP 负责各个 station 之间的仲裁和转发，一些 AP 还会通过路由器与外部 IP 网络交换数据。在传统 Wi-Fi 网络架构中，1) 由于所有 station 均需与 AP 直接相连，不能距离 AP 太远，因此覆盖区域相对有限；2) 受到 AP 容量的限制，因此网络中允许的 station 数量相对有限，很容易超载。

图 17: ESP-WIFI-MESH 网络架构示意图

ESP-WIFI-MESH 与传统 Wi-Fi 网络的不同之处在于：网络中的节点不需要连接到中心节点，而是可以与相邻节点连接。各节点均负责相连节点的数据中继。由于无需受限于距离中心节点的位置，所有节点仍可互连，因此 ESP-WIFI-MESH 网络的覆盖区域更广。类似地，由于不再受限于中心节点的容量限制，ESP-WIFI-MESH 允许更多节点接入，也不容易超载。
4.9.3 ESP-WIFI-MESH 概念

树型拓扑

ESP-WIFI-MESH 建立在传统 Wi-Fi 协议之上，可被视为一种将多个独立 Wi-Fi 网络组合为一个单一 WLAN 网络的组网协议。在 Wi-Fi 网络中，station 在任何时候都仅限于与 AP 建立单个连接（上行连接），而 AP 则可以同时连接到多个 station（下行连接）。然而，ESP-WIFI-MESH 网络则允许节点同时充当 station 和 AP。因此，ESP-WIFI-MESH 中的节点可以使用其 SoftAP 接口建立多个下行连接，同时使用其 station 接口建立一个上行连接。这将自然产生一个由多层父子结构组成的树型网络拓扑结构。

图 18: ESP-WIFI-MESH 树型拓扑

ESP-WIFI-MESH 是一个多跳网络，也就是说网络中的节点可以通过单跳或多跳向网络中的其他节点传送数据包。因此，ESP-WIFI-MESH 中的节点不仅传输自己的数据包，而且同时充当其他节点的中继。假
设 ESP-WIFI-MESH 网络中的任意两个节点存在物理层上连接（通过单跳或多跳），则这两个节点可以进行通信。

**注释:** ESP-WIFI-MESH 网络中的大小（节点总数）取决于网络中允许的最大层级，以及每个节点可以具有的最大下行连接数。因此，这两个变量可用于配置 ESP-WIFI-MESH 网络的大小。

### 节点类型

- **Root Node**
- **Intermediate Parent Node**
- **Leaf Node**
- **Idle Node**

![图 19: ESP-WIFI-MESH 节点类型](image)

**根节点**：指网络顶部的节点，是 ESP-WIFI-MESH 网络和外部 IP 网络之间的唯一接口，根节点直接连接至传统的 Wi-Fi 路由器，并在 ESP-WIFI-MESH 网络的节点和外部 IP 网络之间中继数据包。ESP-WIFI-MESH 网络中只能有一个根节点，且根节点的上行连接只能是路由器。如图所示，节点 A 即为该 ESP-WIFI-MESH 网络的根节点。

**叶子节点**：指不允许拥有任何子节点（即无下行连接）的节点。因此，叶子节点只能传输或接收自己的数据包，但不能转发其他节点的数据包。如果节点处于 ESP-WIFI-MESH 网络的最大允许层级，则该节点将成为叶子节点。叶子节点不可再生下行连接，这可以防止节点继续生成下行连接，从而确保网络层级不会超出限制。由于建立下行连接必须使用 SoftAP 接口，因此一些没有 SoftAP 接口的节点（仅有限 station 接口）也将被分配为叶子节点。如上图所示，位于网络最外层的 L/M/N 节点即为叶子节点。

**中间父节点**：既不是属于根节点也不属于叶子节点的节点即为中间父节点。中间父节点必须有且仅有一个上行连接（即一个父节点），但可以有 0 个或多个下行连接（即 0 个或多个子节点）。因此，中间父节点可以发送和接收自己的数据包，也可以转发其上行和下行连接的数据包。如上图所示，节点 B 到 J 即为中间父节点。注意，E/F/G/I/J 等没有下行连接的中间父节点并不等同于叶子节点，原因在于这些节点仍允许形成下行连接。

**空闲节点**：尚未加入网络的节点即为空闲节点。空闲节点将尝试与中间父节点形成上行连接，或者在有条件的情况下（参见自动根节点选择）成为一个根节点。如上图所示，K 和 O 节点即为空闲节点。
信标帧和 RSSI 阈值

ESP-WIFI-MESH 中能够形成下行连接的每个节点（即具有 SoftAP 接口）都会定期传输 Wi-Fi 信标帧。节点可以通过信标帧让其他节点检测自己的存在和状态。空闲节点将侦听信标帧以生成一个潜在父节点列表，并与其中一个潜在父节点形成上行连接。ESP-WIFI-MESH 使用“供应商信息元素”来存储元数据，例如：

- 节点类型（根节点、中间父节点、叶子节点、空闲节点）
- 节点当前所处的层级
- 网络允许的最大层级
- 当前于节点数量
- 可接受的最大下行连接数量

潜在上行连接的信号强度可由潜在父节点信标帧的 RSSI 表示。为了防止节点形成弱上行连接，ESP-WIFI-MESH 采用了针对信标帧的 RSSI 阈值控制机制。如果节点检测到某节点的信标帧 RSSI 过低（即低于预设阈值），则会在尝试形成上行连接时忽略该节点。

![Area where RSSI > Threshold](image)

图 20: RSSI 阈值的影响

上图（A 侧）展示了 RSSI 阈值将如何影响空闲节点的候选父节点数量。

上图（B 侧）展示了 RF 屏蔽物如何降低潜在父节点的 RSSI。由于存在 RF 屏蔽物，节点 X 的 RSSI 高于阈值的区域显著减小。这会导致空闲节点忽略节点 X，即使从地理位置上看 X 就在空闲节点附近。相反，该空闲节点将从更远的地方找到一个 RSSI 更高的节点 Y 形成上行连接。

注释：事实上，ESP-WIFI-MESH 网络中的节点在 MAC 层仍可以接收所有的信标帧，但 RSSI 阈值控制功能可以过滤掉所有 RSSI 低于预设阈值的信标帧。

首选父节点

当一个空闲节点有多个候选父节点（潜在父节点）时，空闲节点将与其中的首选父节点形成上行连接。首选父节点基于以下条件确定：

- 候选父节点所处的层级
- 候选父节点当前具有的下行连接（子节点）数量

在网络中所处层级较浅的候选父节点（包括根节点）将优先成为首选父节点。这有助于在形成上行连接时控制 ESP-WIFI-MESH 网络中的总层级使之最小。例如，在位于第二层和第三层的候选父节点间选择时，位于第二层的候选父节点将始终优先成为首选父节点。
如果同一层上存在多个候选父节点，则子节点最少的候选父节点将优先成为首选父节点。这有助于平衡同一层节点的下行连接数量。

图 21：首选父节点选择

上图（A 侧）展示了空闲节点 G 如何在 B/C/D/E/F 五个候选父节点中选择首选父节点：首先，B/C 节点优于 D/E/F 节点，因为这两个节点所处的层级更浅。其次，C 节点优于 B 节点，因为 C 节点的下行连接数（子节点数量）更少。

上图（B 侧）展示了空闲节点 G 如何在根节点 A 和其他候选父节点中选择首选父节点。此时根节点 A 处于空闲节点 G 范围之内（即空闲节点 G 接收到的根节点 A 信标帧 RSSI 强度高于预设阈值）：由于根节点 A 处于网络中浅的层，因此将成为首选父节点。

注解：用户还可以自行定义首选父节点的选择规则，也可以直接指定某个节点为首选父节点（见 Mesh 手动配网示例）。

路由表

ESP-WIFI-MESH 网络中的每个节点均会维护自己的路由表，并按路由表将数据包（请见 ESP-WIFI-MESH 数据包）沿正确的路线发送至正确的目标节点。某个特定节点的路由表将包含该节点的子网中所有节点的 MAC 地址，也包括该节点自己的 MAC 地址。每个路由表会划分为多个子路由表，与每个子节点的子网对应。

以上图为例，节点 B 的路由表中将包含节点 B 到节点 I 的 MAC 地址（即相当于节点 B 的子网）。节点 B 的路由表可划分为节点 C 和 G 的子路由表，分别包含节点 C 到节点 F 的 MAC 地址、节点 G 到节点 I 的 MAC 地址。

ESP-WIFI-MESH 利用路由表来使用以下规则进行转发，确定 ESP-WIFI-MESH 数据包应根据向上行转发还是向下行转发。

1. 如果数据包的目标 MAC 地址处于当前节点的路由表中且不是当前节点本身，则选择包含目标 MAC 地址的子路由表，并将数据包向下转发给子路由表对应的子节点。

2. 如果数据包的目标 MAC 地址不在当前节点的路由表内，则将数据包向上转发给当前节点的父节点，并重复执行该操作直至数据包达到目标地址。此步骤可重复至根节点（根节点包含整个网络的全部节点）。

注解：用户可以通过调用 esp_mesh_get_routing_table() 获取一个节点的路由表。
由表，调用 `esp_mesh_get_routing_table_size()` 获取一个路由表的大小，也可通过调用 `esp_mesh_get_subnet_nodes_list()` 获取某个子节点的子路由表，调用 `esp_mesh_get_subnet_nodes_num()` 获取子路由表的大小。

### 4.9.4 建立网络

**一般过程**

警告：ESP-WIFI-MESH 正式开始构建网络前，必须确保网络中所有节点具有相同的配置（见 `mesh_cfg_t`）。每个节点必须配置相同 MESH 网络 ID、路由器配置和 SoftAP 配置。

ESP-WIFI-MESH 网络将首先选择根节点，然后逐层形成下行连接，直到所有节点均加入网络。网络的布局可能取决于诸如根节点选择、父节点选择和异步上电复位等因素。但简单来说，一个 ESP-WIFI-MESH 网络的构建过程可以概括为以下步骤：

1. **根节点选择**  根节点直接进行指定（见未指定根节点）或通过选举由信号强度最强的节点担任（见自动根节点选择）。一旦选定，根节点将与路由器连接，并开始允许下行连接形成。如上图所示，节点 A 被选为根节点，因此节点 A 上行连接到路由器。

2. **第二层形成**  一旦根节点连接到路由器，根节点范围内的空闲节点将开始与根节点连接，从而形成第二层网络。一旦连接，第二层节点成为中间父节点（假设最大允许层级多于 2 层），并进而形成下一层。如上图所示，节点 B 到节点 D 都在根节点的连接范围内。因此，节点 B 到节点 D 将与根节点形成上行连接，并成为中间父节点。

3. **其余层形成**  剩余的空闲节点将与所处范围内的中间父节点连接，并形成新的层。一旦连接，根据网络的最大允许层级，空闲节点成为中间父节点或叶子节点。此后重复该步骤，直到网络中的所有空闲节点均加入网络或达到网络最大允许层级。如上图所示，节点 E/F/G 分别与节点 B/C/D 连接，并成为中间父节点。
4. 限制树深度 为了防止网络超支允许层级，最大允许层级上的节点将在完成连接后成为叶子节点。这样一来，其他空闲节点将无法与这些最大允许层级上的叶子节点形成连接，因此不会超过最大允许层级。然而，如果空闲节点无法找到其他潜在父节点，则将无限期地保持空闲状态。如上图所示，网络的最大允许层级为四。因此，节点 H 在完成连接后将变为叶子节点，以防止任何下行连接的形成。

自动根节点选择

在自动模式下，根节点的选择取决于相对于路由器的信号强度。每个空闲节点将通过 Wi-Fi 信标帧发送自己的 MAC 地址和路由器 RSSI 值。MAC 地址可以表示网络中的唯一节点，而路由器 RSSI 值代表相对于路由器的信号强度。

此后，每个节点将同时扫描来自其他空闲节点的信标帧。如果节点检测到具有更强的路由器 RSSI 的信标帧，则节点将开始传输该信标帧的内容（相当于为这个节点投票）。经过最小迭代次数（可预先设置，默认为 10 次）后将选出路由器 RSSI 值最强的信标帧。

在达到预设迭代次数后，每个节点将单独检查其得票百分比（得票数/总数）以确定它是否应该成为根节点。如果节点的得票百分比大于预设的阈值（默认为 90%），则该节点将成为根节点。

下图展示了在 ESP-WIFI-MESH 网络中，根节点的自动选择过程。

1. 上电复位时，每个节点开始传输自己的信标帧（包括 MAC 地址和路由器 RSSI 值）。

2. 在多次传输和扫描迭代中，路由器 RSSI 最强的节点将在整个网络中传播。节点 C 具有最强的路由器 RSSI 值（-10 dB），因此它的信标帧将在整个网络中传播。所有参与选举的节点均给节点 C 投票，因此节点 C 的得票百分比为 100%。因此，节点 C 成为根节点，并与路由器连接。

3. 一旦节点 C 与路由器连接，节点 C 将成为节点 A/B/D/E 的首选父节点（即最浅的节点），并与这些节点连接。节点 A/B/D/E 将形成网络的第二层。

4. 节点 F 和节点 G 分别连接节点 D 和节点 E，并完成网络构建过程。

注解：用户可以通过 esp_mesh_set_attempts() 配置选举的最小迭代次数。用户应根据网络内的节点数量配置迭代次数（即 mesh 网络越大，所需的迭代次数越高）。

图 23: ESP-WIFI-MESH 网络构建过程
### 用户指定根节点

根节点也可以由用户指定，即直接让指定的根节点与路由器连接，并放弃选举过程。当根节点指定后，网络内的所有其他节点也必须放弃选举过程，以防止根节点冲突的发生。下图展示了在ESP-WIFI-MESH网络中，根节点的手动选择过程。

1. 节点 A 是由用户指定的根节点，因此直接与路由器连接。此时，所有其他节点放弃选举过程。  
2. 节点 C 和节点 D 将节点 A 选为自己的首选父节点，并与其形成连接。这两个节点将形成网络的第二层。  
3. 类似地，节点 B 和节点 E 将与节点 C 连接，节点 F 将与节点 D 连接。这三个节点将形成网络的第三层。  
4. 节点 G 将与节点 E 连接，形成网络的第四层。然而，由于该网络的最大允许层级已配置为 4，因此节点 G 将成为叶子节点，以防止形成任何新层。

**注解**：一旦指定根节点，该根节点应调用 esp_mesh_set_parent() 使其直接与路由器连接。类似地，所有其他节点都应该调用 esp_mesh_fix_root() 放弃选举过程。

### 选择父节点

默认情况下，ESP-WIFI-MESH 具有可以自组网的特点，也就是每个节点都可以自主选择与其形成上行连接的潜在父节点。自主选择出的父节点被称为首选父节点。用于选择首选父节点的标准旨在减少 ESP-WIFI-MESH 网络的层级，并平衡各个潜在父节点的下行连接数（参见首选父节点）。

警告：得票百分比阈值也可以使用 esp_mesh_set_vote_percentage() 进行配置。得票百分比阈值过低可能导致同一 mesh 网络中两个或多个节点成为根节点，进而分化为多个 mesh 网络。如果发生这种情况，ESP-WIFI-MESH 具有内部机制，可自主解决根节点冲突。这些具有多个根节点的网络将围绕一个根节点形成一个网络。然而，两个或多个路由器 SSID 相同但路由器 BSSID 不同的根节点冲突尚无法解决。
不过，ESP-WIFI-MESH 也允许用户使用自组网功能，即允许用户自己定义父节点选择标准，或直接指定某个节点为父节点（见：Mesh 手动组网示例）。

异步上电复位

ESP-WIFI-MESH 网络构建可能会受到节点上电顺序的影响。如果网络中的某些节点为异步上电（即相隔几分钟上电），网络的最终结构可能与所有节点同步上电时的理想情况不同。延迟上电的节点将遵循以下规则：

**规则 1**：如果网络中已存在根节点，则延迟节点不会尝试选举成为新的根节点。即使自身的路由器 RSSI 更强。相反，延迟节点与其他节点间异，将通过与首置父节点连接来加入网络。如果该延迟节点为用户指定的根节点，则网络中的所有其他节点将保持空闲状态，直到延迟节点完成上电。

**规则 2**：如果延迟节点形成上行连接，并成为中间父节点，则后续也可能成为其他节点（即其他更深的节点）的新首置父节点。此时，其他节点切换上行连接至该延迟节点（见父节点切换）。

**规则 3**：如果空闲节点的指定父节点上电延迟了，则该空闲节点在没有找到指定父节点前不会尝试形成任何上行连接。空闲节点将无限期地保持空闲，直到其指定的父节点上电完成。

下方示例展示了异步上电对网络构建的影响。

1. 节点 A/C/D/F/G/H 同步上电，并通过广播其 MAC 地址和路由器 RSSI 开始选举根节点。节点 A 的 RSSI 最强，因此当选为根节点。

2. 一旦节点 A 成为根节点，其余的节点就开始与首置父节点逐层形成上行连接，并最终形成一个具有五层的网络。

3. 节点 B/E 由于存在上电延迟，因此即使路由器 RSSI 比节点 A 更强（-20 dB 和 -10 dB ）也不会尝试成为根节点。相反，这两个上电延迟节点均将与对应的首置父节点 A 和 C 形成上行连接。加入网络后，节点 B/E 均将成为中间父节点。

4. 节点 B 由于所处层矢变化（现为第二层）而成为新的首置父节点。因此节点 D/G 将切换其上行连接从而选择新的首置父节点。由于切换的发生，最终的网络层次从原来的五层减少至三层。

**同步上电**：如果所有节点均同步上电，节点 E （-10 dB）由于路由器 RSSI 最强而成为根节点。此时形成的网络结构与异步上电的情况截然不同。但是，如果用户手动选择根节点，则仍可以达到同步上电的网络结构（请见 esp_mesh_waive_root）。

Submit Document Feedback

Espressif Systems 1804 Release v5.0-dev-489-gef98a36
图 26: 网络构建（异步电源）示例
注解：从某种程度上，ESP-WIFI-MESH可以自动修复部分因异步上电引起的父节点选择的偏差（请见父节点切换）

环路，检测和处理

环路是指特定节点与其后世节点（特定节点子网中的节点）形成上行连接的情况。因此产生的循环连接路径将破坏mesh网络的拓扑结构。ESP-WIFI-MESH的节点在选择父节点时将主动排除路由表（见路由表）中的节点，从而避免与其子网中的节点建立上行连接并将形成环路。

在存在环路的情况下，ESP-WIFI-MESH可利用路径验证机制和能量传递机制来检测环路的产生。与子节点建立上行连接而导致环路形成的父节点将通知子节点环路的存在，并主动断开连接。

4.9.5 管理网络

作为一个自修复网络，ESP-WIFI-MESH可以检测并修正网络路由中的故障。当具有一个或多个子节点的父节点断开或父节点与其父节点之间的连接不稳定性时，会发生故障。ESP-WIFI-MESH中的子节点将自主选择一个新的父节点，并与其形成上行连接，以维持网络互联。ESP-WIFI-MESH可以处理根节点故障和中间节点故障。

根节点故障

如果根节点断开，则与之连接的节点（第二层节点）将及时检测到该根节点故障。第二层节点将主动尝试与根节点重建，但多次尝试失败后，第二层节点将启动新一轮的根节点选举。第二层中RSSI最强的节点将当选为新的根节点，而剩余的第二层节点将与新的根节点（如果不在范围内的话，也可与相邻父节点连接）形成上行连接。

如果根节点和下面多层的节点（例如根节点、第二层节点和第三层节点）同时断开，则位于最浅层的仍在正常工作的节点将发起根节点选举。下方示例展示了网络从根节点断开故障中进行自修复。

1. 节点C是网络的根节点。节点A/B/D/E是连接到节点C的第二层节点。
2. 节点C断开。在多次重连尝试失败后，第二层节点开始通过广播其路由器RSSI开始新一轮的选举。此时，节点B的路由器RSSI最强。
3. 节点B被选为根节点，并开始建立下层连接。剩余的第二层节点A/D/E形成与节点B的上行连接，从而使网络恢复，并且可以继续正常运行。

图27: 根节点故障的自修复示例

Espressif Systems 1806 Release v5.0-dev-489-gef98a36
Submit Document Feedback
注解：如果是手动指定的根节点断开，则无法进行自动修复。任何节点不会在存在指定根节点的情况下开始选举过程。

### 中间父节点故障

如果中间父节点断开，则与之断开的子节点将主动尝试与该父节点重连。在多次重连尝试失败后，每个
子节点开始扫描潜在父节点（请见判决帧和 RSSI 阈值）。

如果存在其他潜在的父节点，每个子节点将分别给自己选择一个新的首选父节点（请见首选父节点
），并与它形成上行连接。如果特定子节点没有其他潜在的父节点，则将无限期地保持空闲状态。

下方示例展示了网络从中间父节点断开故障中进行自修复。

![图28: 中间父节点故障的自修复](image)

1. 网络中存在节点 A 至 G。
2. 节点 C 断开。节点 F/G 检测到节点 C 的断开故障，并尝试与节点 C 重新连接。在多次重连尝试失败
   后，节点 F/G 将开始选择新的父选父节点。
3. 节点 G 因其范围内不存在任何父节点而暂时保持空闲。节点 F 的范围中 B 和 E 两个节点，但节点 B
   因为所处层级更低而当选新的父节点。节点 F 将与节点 B 连接后，并成为一个中间父节点，节点 G 将于
   节点 F 相连。这样一来，网络已经恢复了，但结构发生了变化（网络层级增加了 1 层）。

注解：如果子节点的父节点已被指定，则子节点不会尝试与其他潜在父节点连接。此时，该子节点将无
限期地保持空闲状态。

### 根节点切换

除非根节点断开，否则 ESP-WIFI-MESH 不会自动切换根节点。即使根节点的路由器 RSSI 降低至必须断
开的情况，根节点也将保持不变。根节点切换是指明确启动新选举过程的行为，即具有更强路由器 RSSI
的节点选为新的根节点。这可以用于应对根节点性能降低的情况。

要触发根节点切换，当前根节点必须明确调用 esp_mesh_waive_root() 以触发新的选举。当下根节
点将指示网络中的所有节点开始发送并扫描判决帧（见自动根节点选择）。但与此同时一直保持联网（即
不会变为空闲节点）。如果另一个节点收到的票数超过当前根节点，则将启动根节点切换过程，否则根
节点将保持不变。

新选出的新节点向当前的根节点发送 切换请求。而原先的根节点将返回一个应答通知，表示已经准备好
切换。一旦接收到应答，新选出的根节点将与其父节点断开连接，并迅速与路由器形成上行连接。进而
成为网络的新根节点。原先的根节点将断开与路由器的连接，并与此同时保持其所有下行连接并进入空闲状态。之前的根节点将开始扫描潜在的父节点并选择首选父节点。

下图说明了根节点切换的示例。

### 切换根节点示例

1. 节点 C 是当前的根节点，但路由器 RSSI 值 (-85 dB) 降低至较低水平。此时，新的选举过程被触发了。所有节点开始传输和扫描信标帧（此时仍保持连接）。

2. 经过多轮传输和扫描后，节点 B 被选为新的根节点。节点 B 向节点 C 发送了一个切换请求，节点 C 回应一个应答。

3. 节点 B 与其父节点断开连接，并与路由器连接，成为网络中的新根节点。节点 C 与路由器断开连接，进入空闲状态，并开始扫描并选择新的首父节点。**节点 C 在整个过程中仍保持其所有的下行连接。**

4. 节点 C 选择节点 B 作为其的首选父节点，与之形成上下连接，并成为一个第二层节点。由于节点 C 仍保持相同的子网，因此根节点切换后的网络结构没有变化。然而，由于切换的发生，节点 C 子网中每个节点的所处层级均增加了一层。如果根节点切换过程中产生了新的根节点，则**父节点切换** 可以随后调整网络结构。

### 注解：根节点切换必须要求选举，因此只有在使用自组网 ESP-WIFI-MESH 网络时才支持。换句话说，如果使用指定的根节点，则不能进行根节点切换。

### 父节点切换

父节点切换是指一个子节点将其上行连接切换到更浅一层的另一个父节点。**父节点切换是自动的**，这意味着如果较低层出现了可用的潜在父节点（因“异步上电复位”产生），子节点将自动更改其上行连接。

所有潜在的父节点将定期发送信标帧（参见**信标帧**和 **RSSI 阈值**），从而使子节点扫描较浅层的父节点的可用性。由于父节点切换，自组网 ESP-WIFI-MESH 网络可以动态调整其网络结构，以确保每个连接均具有良好 RSSI 值，并且网络中的层级最小。

### 4.9.6 数据传输
ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 网络使用 ESP-WIFI-MESH 数据包传输数据。ESP-WIFI-MESH 数据包完全包含在 Wi-Fi 数据帧中。ESP-WIFI-MESH 网络中的多跳数据传输将涉及通过不同 Wi-Fi 数据帧在每个无线跳上传输的单个 ESP-WIFI-MESH 数据包。

下图显示了 ESP-WIFI-MESH 数据包的结构及其与 Wi-Fi 数据帧的关系。

![ESP-WIFI-MESH 数据包结构图](image)

图 29: ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 数据包的**报头**包含源节点和目标节点的 MAC 地址。**选项 (option)** 字段包含有关特殊类型 ESP-WIFI-MESH 数据包的信息，例如组传输或来自外部 IP 网络的数据包（请参阅 MESH_OPT_SEND_GROUP 和 MESH_OPT_RECV_DS_ADDR）。

ESP-WIFI-MESH 数据包的**有效载荷**包含实际的应用数据。该数据可以为原始二进制数据，也可以是使用 HTTP、MQTT 和 JSON 等应用层协议的编码数据（请见：mesh_proto_t）。

**注释**: 作为外部 IP 网络发送 ESP-WIFI-MESH 数据包时，报头的目标地址字段将包含目标服务器的 IP 地址和端口号，而不是节点的 MAC 地址（请见：mesh_addr_t）。此外，根节点将处理外发 TCP/IP 数据包的形成。

**组控制和组播**

组播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的多个节点。ESP-WIFI-MESH 中的组播可以通过“指定一个目标节点列表”或“预配置一个节点组”来实现。这两种组播方式均需调用 esp_mesh_send() 实现。

如果通过“指定目标节点列表”实现组播，用户必须首先将 ESP-WIFI-MESH 数据包的目标地址设置为**组播节点地址**（比如 01:00:5E:xx:xx:xx）。这表明 ESP-WIFI-MESH 数据包是一个拥有一组地址的组播数据包，且该地址应该从报头选项中获得。然后，用户必须将目标节点的 MAC 地址列为选项（请见：mesh_opt_t 和 MESH_OPT_SEND_GROUP）。这种组播方式不需要进行提前设置，但由于每个目标节点的 MAC 地址均需列为报头的选项字段，因此会产生大量开销数据。

分组组播允许 ESP-WIFI-MESH 数据包被发送到一个预先配置的节点组。每个分组都有一个具有唯一性的 ID 标识。用户可通过 esp_mesh_set_group_id() 将节点加入一个组。分组组播需要将 ESP-WIFI-MESH 数据包的目标地址设置为目标组的 ID，还必须设置 MESH_DATA_GROUP 标志位。分组组播产生的开销更小，但必须提前将节点加入分组中。

**注释**: 在组播期间，网络中的所有节点在 MAC 层都会收到 ESP-WIFI-MESH 数据包。然而，不包括在 MAC 地址列表或目标组中的节点将简单地过滤掉这些数据包。

**广播**

广播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的所有节点。每个节点可以将一个广播包转发至其所有上行和下行连接，使得数据包尽可能快地在整个网络中传播。但是，ESP-WIFI-MESH 利
用以下方法来避免在广播期间浪费带宽。
1. 当中间父节点接收到来自其父节点的广播包时，它会将该数据包转发给自己的各个子节点，同时为自己保存一份数据包的副本。
2. 当中间父节点是广播的源节点时，它会将该数据包向上发送至其父节点，并向下发送给自己的各个子节点。
3. 当中间父节点接收到一个来自其子节点的广播包时，它会将该数据包转发给其父节点和其余子节点，同时为自己保存一份数据包的副本。
4. 当叶子节点是广播的源节点时，它会直接将该数据包发送至其父节点。
5. 当根节点是广播的源节点时，它会将该数据包发送至自己的所有子节点。
6. 当根节点接收到来自其子节点的广播包时，它会将该数据包转发给其余子节点，同时为自己保存一份数据包的副本。
7. 当节点接收到一个源地址与自身 MAC 地址匹配的广播包时，它会将该广播包丢弃。
8. 当中间父节点接收到一个来自其父节点的广播包时（该数据包最初来自该父节点的一个子节点），它会将该广播包丢弃。

上行流量控制

ESP-WIFI-MESH 依赖父节点来控制其直接子节点的上行数据流。为了防止父节点的消息缓冲因上传传输数据包而溢出，父节点将为每个子节点分配一个称为接收窗口的上行传输配额。每个子节点均必须申请接收窗口才允许进行上行传输。每个接收窗口的大小可以动态调整。完成从子节点到父节点的上行传输包括以下步骤：
1. 在每次传输之前，子节点向其父节点发送窗口请求。窗口请求中包括一个序号，与子节点的待传输数据包相对应。
2. 父节点接收窗口请求，并将序号与子节点发送的前一个数据包的序号进行比较，用于计算返回给子节点的接收窗口大小。
3. 子节点根据父节点指定的窗口大小发送数据包。如果子节点的接收窗口耗尽，它必须通过发送请求获得另一个接收窗口，然后才允许继续发送。

注解：ESP-WIFI-MESH 不支持任何下行流量控制。

警告：由于父节点切换，数据包可能会在上行传输期间丢失。

由于根节点是通向外部 IP 网络的唯一接口，因此下行节点必须了解根节点与外部 IP 网络的连接状态，否则，节点可能会尝试向一个已经与 IP 网络断开连接的根节点发送数据，从而造成不必要的传输和数据包丢失。ESP-WIFI-MESH 可以基于监测根节点和外部 IP 网络的连接状态，提供一种稳定外发数据吞吐量的机制。根节点可以通过调用 esp_mesh_post_toDS_state() 将自身与外部 IP 网络的连接状态广播给所有其他节点。

双向数据流

下图展示了 ESP-WIFI-MESH 双向数据流涉及的各种网络层。

由于使用路由表，ESP-WIFI-MESH 能够在 mesh 层中完全处理数据包的转发。TCP/IP 层仅与 mesh 网络的根节点有关，可帮助根节点与外部 IP 网络的数据包传送。
4.9.7 信道切换

背景

在传统的 Wi-Fi 网络中，信道代表预设的频率范围。在基础设施基本服务集 (BSS) 中，工作 AP 及与之相连的 station 必须处于传输信标的工作信道（1 到 14）中。物理上相邻的 BSS 使用相同的工作信道会导致干扰产生和性能下降。

为了允许 BSS 适应不断变化的物理层条件并保持性能，Wi-Fi 网络中增加了网络信道切换的机制。网络信道切换是将 BSS 移至新的工作信道，并同时最大限度地减少期间对 BSS 的影响。然而，我们应该认识到，网络信道切换可能不会成功，无法将原信道中的所有 station 均移动至新的信道。

在基础设施 Wi-Fi 网络中，网络信道切换由 AP 触发，目的是将该 AP 及与之相连的所有 station 同步切换到新的信道。网络信道切换是通过在 AP 的周期性发送信标帧内嵌入一个信道切换公告 (CSA) 元素来实现的。在网络信道切换前，该 CSA 元素用于向所有连接的 station 广播有关即将发生的网络信道切换，并且将包含在多个信标帧中。

一个 CSA 元素包含有关 新信道号 和 信道切换计数 的信息。其中，信道切换计数指示在网络信道切换之前剩余的信标帧间隔 (TBTT) 数量。因此，信道切换计数依每个信标帧递减，并且允许与之连接的 station 与 AP 同步进行信道切换。

ESP-WIFI-MESH 网络信道切换

ESP-WIFI-MESH 网络信道切换还利用包含 CSA 元素的信标帧。然而，ESP-WIFI-MESH 作作为一个多跳网络，其信标帧可能无法到达网络中的所有节点（这点与单跳网络不同），因此信道切换过程更加复杂。因此，ESP-WIFI-MESH 网络依赖于通过节点触发 CSA 元素，从而实现在整个网络中的传播。

当具有一个或多个子节点的中间父节点接收到包含 CSA 元素的信标帧时，该节点会将该元素包含在其下一个发送的信标帧 (即具有相同的 新信道号 和 信道切换计数 ) 中，从而实现该 CSA 元素的转发。鉴于 ESP-WIFI-MESH 网络中的所有节点都接收到来自相同的 CSA 元素，这些节点可以使用 信道切换计数 来同步其信道切换，但也会经历因 CSA 元素转发造成的延迟。

ESP-WIFI-MESH 网络信道切换可以由路由器或根节点触发。

根节点触发 由根节点触发的信道切换只能在 ESP-WIFI-MESH 网络未连接到路由器时才会发生。通过调用 esp_mesh_switch_channel()，根节点将设置一个初始 信道切换计数值，并开始在其信标帧中包含 CSA 元素。接着，每个 CSA 元素将抵达第二层节点，并通过第二层节点自己的信标帧继续进行向下转发。
网络信道切换的影响

- 由于 ESP-WIFI-MESH 网络信道切换与路由器的信道切换不同时，ESP-WIFI-MESH 网络和路由器之间会出现临时信道切换。ESP-WIFI-MESH 网络的信道切换时间取决于 ESP-WIFI-MESH 网络的信标间隔和根节点的自定义信道切换计数。
- 在 ESP-WIFI-MESH 网络切换期间，信道差异将阻止根节点和路由器之间的任何数据交换。
- 在 ESP-WIFI-MESH 网络中，根节点和中间父节点将请求与其连接的子节点停止传输，直至信道切换发生（通过将 CSA 元素的信道切换模式字段设置为 1）。
- 信道的路由器触发网络信道切换可能会降低 ESP-WIFI-MESH 网络的性能。请注意，这可能是由 ESP-WIFI-MESH 网络本身造成的（例如由于 ESP-WIFI-MESH 网络的无线介质竞争等原因）。此时，用户应该禁用路由器触发的自主信道切换，并直接指定一个信道。
- 当存在临时信道差异时，根节点从技术上来说仍保持连接至路由器。
  - 如果根节点经过一定数量信标间隔仍无法接到信标帧或探测来自路由器的响应，则断开连接。
  - 断开连接时，根节点将自动重新扫描所有信道以确定是否存在路由器。
- 如果根节点无法接收任何路由器的 CSA 信标帧（例如短暂的路由器切换时间），则路由器将在没有 ESP-WIFI-MESH 网络存在的情况下重新启动信道切换。
  - 在路由器切换信道后，根节点将不再能够接收路由器的信标帧和探测响应，并导致在一定数量的信标间隔后断开连接。
  - 在断开连接后，根节点将重新扫描所有信道，寻找路由器。
  - 根节点将在整个过程中维护与之相连的下行连接。

注解：虽然 ESP-WIFI-MESH 网络信道切换的目的是将网络中的所有节点移动到新的工作信道，但也应该认识到，信道切换可能无法成功移动所有节点（比如由于节点故障等原因）。
4.9.8 性能

ESP-WIFI-MESH 网络的性能可以基于以下多个指标进行评估:

组网时长：从头开始构建 ESP-WIFI-MESH 网络所需的总时长。

修改时间：从网络检测到节点断开到执行适当操作（例如生成新的根节点或形成新的连接等）以修复网络所需的时间。

每跳延迟：数据每经过一次无线 hop 而经历的延迟，即从父节点向子节点（或从子节点向父节点）发送一个数据包所需的时间。

网络节点容量：ESP-WIFI-MESH 网络可以同时支持的节点总数。该指标取决于节点可以接受到的最大下行连接数和网络中允许的最大层级。

ESP-WIFI-MESH 网络的常见性能指标如下表所示：

<table>
<thead>
<tr>
<th>预设信道</th>
<th>允许信道切换</th>
<th>预置路由器</th>
<th>允许路由器切换</th>
<th>存在根节点</th>
<th>允许切换</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>X</td>
<td>N</td>

</tr>
<tr>
<td>Y</td>
<td>N</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>信道与路由器</td>
</tr>
</tbody>
</table>

注解：上述性能指标的测试条件见下。

- 测试设备数量：100
- 最大允许下行连接数量：6
- 最大允许层级：6

注解：吞吐量取决于数据包错误率和 hop 数量。

注解：用户应注意，ESP-WIFI-MESH 网络的性能与网络配置和工作环境密切相关。
4.9.9  更多注意事项

- 数据传输使用 Wi-Fi WPA2-PSK 加密
- Mesh 网络 IE 使用 AES 加密

本文图片中使用的路由器与互联网图标来自 www.flaticon.com 的 Smashicons。

4.10  Core Dump

4.10.1  Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special script espcoredump.py to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- info_corefile - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- dbg_corefile - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

4.10.2  Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (idf.py menuconfig).

Core dump data destination (Components -> Core dump -> Data destination)

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

Core dump data format (Components -> Core dump -> Core dump data format)

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions.

The Binary format is kept for compatibility standpoint, it uses less space in the memory to keep data and provides better performance.

Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)

- Use CRC32 for core dump integrity verification
- Use SHA256 for core dump integrity verification (only work in ELF format)

The CRC32 option provides better calculation performance and consumes less memory for storage.

The SHA256 hash algorithm provides greater probability of detecting corruption than a CRC32 with multiple bit errors.
Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)

Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)

The value is in ms.

Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)

The value is base64 encoded.

- Decode and show summary (info_corefile)
- Don’t decode

4.10.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash, but if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```plaintext
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets...
--to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump,, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: `espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file>`

4.10.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: `espcoredump.py --chip <target_chip_type> info_corefile -t b64 -c </path/to/program/elf/file> or espcoredump.py --chip <target_chip_type> dbg_corefile -t b64 -c </path/to/program/elf/file>`

Base64-encoded body of core dump will be between the following header and footer:

```plaintext
== CORE DUMP START ==
<body of base64-encoded core dump, save it to file on disk>
== CORE DUMP END ==
```

The CORE DUMP START and CORE DUMP END lines must not be included in core dump text file.

4.10.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be
broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32_rom.elf) and pass it to ‘espcoredump.py’.

4.10.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

Supported notations and RAM regions

- **COREDUMP_DRAM_ATTR** places variable into DRAM area which will be included into dump.
- **COREDUMP_RTC_ATTR** places variable into RTC area which will be included into dump.
- **COREDUMP_RTC_FAST_ATTR** places variable into RTC_FAST area which will be included into dump.

Example

1. In *Project Configuration Menu*, enable **COREDUMP TO FLASH**, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

   ```
   // uint8_t global_var;
   COREDUMP_DRAM_ATTR uint8_t global_var;
   ```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

   ```
   global_var = 25;
   assert(0);
   ```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where **PORT** is the device USB port:

   ```
   espcoredump.py -p PORT dbg_corefile <path/to/elf>
   ```

6. In GDB shell, type `p global_var` to get the variable content:

   ```
   (gdb) p global_var
   $1 = 25 '\031'
   ```

4.10.7 Running espcoredump.py

Generic command syntax: `espcoredump.py [options] command [args]`

**Script Options**

- `--chip {auto,esp32,esp32s2,esp32c3}` Target chip type. Default value is “auto”
- `--port PORT, -p PORT` Serial port device. Either “chip” or “port” need to be specified to determine the port when you have multi-target connected at the same time.
- `--baud BAUD, -b BAUD` Serial port baud rate used when flashing/reading
- `--gdb-timeout-sec GDB_TIMEOUT_SEC` Overwrite the default internal delay for gdb responses

**Commands**

- `dbg_corefile` Starts GDB debugging session with specified corefile
- `info_corefile` Print core dump info from file

**Command Arguments**

- `--debug DEBUG, -d DEBUG` Log level (0..3)
- `--gdb gdb, -g gdb` Path to gdb
- `--core CORE, -c CORE` Path to core dump file (if skipped core dump will be read from flash)
--core-format {b64,elf,raw}, -t {b64,elf,raw}  File specified with “-c” is an ELF (‘elf’), raw (raw) or base64-encoded (b64) binary
--off OFF, -o OFF  Offset of coredump partition in flash (type “idf.py partition-table” to see).
--save-core SAVE_CORE, -s SAVE_CORE  Save core to file. Otherwise temporary core file will be deleted. Does not work with “-c”
--rom-elf ROM_ELF, -r ROM_ELF  Path to ROM ELF file. Will use “<target>_rom.elf” if not specified
--print-mem, -m  Print memory dump. Only valid when info_corefile.
<prog>  Path to program ELF file.

4.11 Event Handling

Several ESP-IDF components use events to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

4.11.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of esp_event library, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called legacy event loop. The following sections explain each of the methods.

esp_event Library Event Loop

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in system_event_id_t enumeration and system_event_info_t union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See esp_event library API reference for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the default event loop provided by this library.

Legacy Event Loop

This event loop implementation is started using esp_event_loop_init() function. Application typically supplies an event handler, a function with the following signature:

```c
esp_err_t event_handler(void *ctx, system_event_t *event) {
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to esp_event_loop_init().

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority event task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE and CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE options, respectively.

Event handler receives a pointer to the event structure (system_event_t) which describes current event. This structure follows a tagged union pattern: event_id member indicates the type of event, and event_info member is a union of description structures. Application event handler will typically use switch(event->event_id) to handle different kinds of events.
If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

### 4.11.2 Mesh Events

ESP-WIFI-MESH uses a system similar to the Legacy Event Loop to deliver events to the application. See 系统事件 for details.
4.11.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameter type.

- **BLE GAP**: esp_ble_gap_register_callback(), esp_gap_ble_cb_event_t, esp_ble_gap_cb_param_t.
- **BT GAP**: esp_bt_gap_register_callback(), esp_gap_ble_cb_event_t, esp_gap_ble_cb_param_t.
- **GATT**: esp_ble_gattc_register_callback(), esp_gattc_cb_event_t, esp_gattc_cb_param_t.
- **GATT**: esp_ble_gatts_register_callback(), esp_gatts_cb_event_t, esp_gatts_cb_param_t.
- **SPP**: esp_spp_register_callback(), esp_spp_cb_event_t, esp_spp_cb_param_t.
- **Blufi**: esp_blufi_register_callbacks(), esp_blufi_cb_event_t, esp_blufi_cb_param_t.
- **A2DP**: esp_a2d_register_callback(), esp_a2d_cb_event_t, esp_a2d_cb_param_t.
- **AVRC**: esp_avrc_ct_register_callback(), esp_avrc_ct_event_t, esp_avrc_ct_cb_param_t.
- **HFP Client**: esp_hf_client_register_callback(), esp_hf_client_event_t, esp_hf_client_cb_param_t.
- **HFP AG**: esp_hf_ag_register_callback(), esp_hf_ag_cb_event_t, esp_hf_ag_cb_param_t.

4.12 片外 RAM

4.12.1 简介

ESP32 提供了好几百 KB 的片上 RAM，可以满足大部分需求。但在有些场景可能需要更多 RAM。因此 ESP32 另外提供了高达 4 MB 的片外 SPI RAM 存储器供用户使用。片外 RAM 已经集成到内存映射中，在某些范围内与片上 RAM 使用方式相同。

4.12.2 硬件

ESP32 支持与 SPI Flash 芯片并联的 SPI PSRAM（伪静态随机存储器）。虽然 ESP32 支持多种类型的 RAM 芯片，但 ESP-IDF 当前仅支持乐鑫品牌的 PSRAM 芯片，如 ESP-PSRAM32、ESP-PSRAM64 等。

注解：PSRAM 芯片的工作电压为 1.8 V 和 3.3 V。其工作电压必须与 flash 的工作电压匹配。请查询您 PSRAM 芯片以及 ESP32 的技术规格书获取准确的工作电压。对于 1.8 V 的 PSRAM 芯片，请确保在启动时将 MTDI 管脚设置为高电平，或者将 ESP32 中的 eFuses 设置为始终使用 1.8 V 的 VDD_SIO 电平，否则有可能会损坏 PSRAM 和/或 flash 芯片。

注解：乐鑫同时提供模组和系统级封装芯片，集成了兼容的 PSRAM 和 flash，可直接用于终端产品 PCB 中。如需了解更多信息，请前往乐鑫官网。

有关将 SoC 或模组管脚连接到片外 PSRAM 芯片的具体细节，请查阅 SoC 或模组技术规格书。

4.12.3 配置片外 RAM

ESP-IDF 完全支持将片外 RAM 集成到您的应用程序中。在启动并完成片外 RAM 初始后，可以将 ESP-IDF 配置为用多种方式处理片外 RAM：
集成片外 RAM 到 ESP32 内存映射

在 `CONFIG_SPIRAM_USE` 中选择“Integrate RAM into memory map (集成片外 RAM 到 ESP32 内存映射)”选项。

这是集成片外 RAM 最基础的设置选项，大多数用户需要用到更低级的选项。

ESP-IDF 启动过程中，片外 RAM 被映射到以 0x3F800000 起始的数据地址空间（字节可寻址），空间大小正好为 SPI RAM 的大小 (4 MB)。

应用程序可以通过创建指向该区域的指针手动将数据放入片外存储器，同时应用程序全权负责管理片外 SPI RAM，包括协调 Buffer 的使用，防止发生损坏等。

添加片外 RAM 到堆内存分配器

在 `CONFIG_SPIRAM_USE` 中选择 “Make RAM allocatable using heap_caps_malloc( ..., MAL-LOC_CAP_SPIRAM)” 选项。

启用上述选项后，片外 RAM 被映射到地址 0xF800000，并将该区域添加到携带 `MAL-LOC_CAP_SPIRAM` 标志的堆内存分配器。

程序如果想从片外存储器分配存储空间，则需要调用 `heap_caps_malloc(size, MAL-LOC_CAP_SPIRAM)`，之后可以调用 `free()` 函数释放这部分存储空间。

调用 malloc() 分配片外 RAM

在 `CONFIG_SPIRAM_USE` 中选择 “Make RAM allocatable using malloc() as well” 选项，该选项为默认选项。

启用此选项后，片外存储器将被添加到内存分配程序 (与上一选项相同)，同时也将被添加到由标准 `malloc()` 函数返回的 RAM 中。

应用程序因此可以使用片外 RAM，无需重写代码就能使用 `heap_caps_malloc(..., MAL-LOC_CAP_SPIRAM)`。

如果某次内存分配偏向于片外存储器，您也可以使用 `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL` 设置分配空间的大小阈值，控制分配结果：

- 如果分配的空间小于阈值，分配程序将首先选择内存存储器。
- 如果分配的空间等于或大于阈值，分配程序将首先选择外部存储器。

如果优先考虑的内部或外部存储器中没有可用的存储块，分配程序则会选择其他类型存储。

由于有些内存缓冲器仅在内部存储器中分配，因此需要使用第二配置项 `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL` 定义一个内部内存池，仅限显式的内部存储器分配使用 (例如用于 DMA 的存储器)。常规 `malloc()` 将不会从该池中分配，但可以使用 `MALLOC_CAP_DMA` 和 `MALLOC_CAP_INTERNAL` 标志从该池中分配存储器。

允许 bss 段放入片外存储器

通过勾选 `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` 启用该选项，此选项配置与其它三个选项互不影响。

启用该选项后，从 0x3F800000 起始的地址空间将用于存储来自 lwip、net80211、libpp 和 bluedroid ESP-IDF 库中零初始化的数据 (BSS 段)。
EXT_RAM_ATTR 宏应用于任何静态声明（未初始化为非零值）之后，可以将附加数据从内部 BSS 段移到片外 RAM。

也可以使用链接器片段方案 extram_bss 将组件或库的 BSS 段放到片外 RAM 中。

启用此选项可以减少 BSS 段占用的内部静态存储。

剩余的片外 RAM 也可以通过上述方法添加到堆分配器中。

允许 noinit 段放入片外存储器

通过勾选 CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY 启用该选项。启用该选项后，外部 RAM 中提供的地址空间区域将用于存储未初始化的数据。即使在启动或重新启动期间，放置在该段中的值也不会被初始化或修改。

通过应用 EXT_RAM_NOINIT_ATTR 宏，可以将数据从内部 NOINIT 段移到片外 RAM。剩余的片外 RAM 也可以通过上述方法添加到堆分配器中，具体请参考添加片外 RAM 到堆内存分配。

4.12.4 片外 RAM 使用限制

使用片外 RAM 有下面一些限制：

- Flash cache 禁用时（比如，正在写入 flash），片外 RAM 将无法访问；同样，对片外 RAM 的读写操作也将导致 cache 访问异常。出于这个原因，ESP-IDF 不会在片外 RAM 中分配任务堆栈（详见下文）。
- 片外 RAM 不能用于存储 DMA 事务描述符，也不能用作 DMA 读写操作的缓冲区 (Buffer)。与 DMA 搭配使用的 Buffer 必须先使用 heap_caps_malloc(size, MALLOC_CAP_DMA) 进行分配，之后可以调用标准 free() 回调释放 Buffer。
- 片外 RAM 与片外 flash 使用相同的 cache 区域，这意味着频繁在片外 RAM 访问的变量可以像在片上 RAM 中一样快速读取和修改。但访问大块数据时（大于 32 KB），cache 空间可能会不足，访问速度将回落到片外 RAM 访问速度。此外，访问大块数据会挤出 flash cache，可能降低代码执行速度。
- 一般来说，片外 RAM 不可用作任务堆栈存储器。因此 xTaskCreate() 及类似函数将始终为堆栈和任务 TCB 分配片上存储器，而 xTaskCreateStatic() 类型的函数将检查传递的 Buffer 是否属于片上存储器。

可以使用 CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY 选项将任务堆栈放入片外存储器。这时，必须使用 xTaskCreateStatic() 指定从片外存储器分配的任务堆栈缓冲区，否则任务堆栈将会从片上存储器分配。

4.12.5 初始化失败

默认情况下，片外 RAM 初始化失败将终止 ESP-IDF 启动。如果想禁用此功能，可启用 CONFIG_SPIRAM_IGNORE_NOTFOUND 配置选项。

如果启用 CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY，忽略失败的选项将无法使用，这是因为在链接时，链接器已经向片外存储器分配标志符。

- Regarding stacks in PSRAM: For tasks not calling on code in ROM in any way, directly or indirectly, the menuconfig option CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY will eliminate the check in xTaskCreateStatic, allowing a task’s stack to be in external RAM. Using this is not advised, however.
- When used at 80 MHz clock speed, external RAM must also occupy either the HSPI or VSPI bus. Select which SPI host will be used by CONFIG_SPIRAM_OCCUPY_SPI_HOST.

4.12.6 Chip revisions

There are some issues with certain revisions of ESP32 that have repercussions for use with external RAM. The issues are documented in the ESP32 ECO document. In particular, ESP-IDF handles the bugs mentioned in the following ways:
Chapter 4. API

ESP32 rev v0

ESP-IDF has no workaround for the bugs in this revision of silicon, and it cannot be used to map external PSRAM into ESP32’s main memory map.

ESP32 rev v1

The bugs in this revision of silicon cause issues if certain sequences of machine instructions operate on external memory. (ESP32 ECO 3.2). As a workaround, the GCC compiler received the flag \texttt{-mfix-esp32-psram-cache-issue} to filter these sequences and only output the code that can safely be executed. Enable this flag by checking \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND}.

Aside from linking to a recompiled version of Newlib with the additional flag, ESP-IDF also does the following:

- Avoids using some ROM functions
- Allocates static memory for the WiFi stack

ESP32 rev v3

ESP32 revision 3 ("ECO V3") fixes the PSRAM cache issue found in rev. 1. When \texttt{CONFIG_ESP32_REV_MIN} option is set to rev. 3, compiler workarounds related to PSRAM will be disabled. For more information about ESP32 ECO V3, see ESP32 ECO V3 User Guide.

4.13 严重错误

4.13.1 概述

在某些情况下，程序并不会按照我们的预期运行，在 ESP-IDF 中，这些情况包括:

- CPU 异常: 非法指令，加载/存储时的内存对齐错误，加载/存储时的访问权限错误，双重异常。
- 系统级检查错误:
  - 中断看门狗 超时
  - 任务看门狗 超时（只有打开 \texttt{CONFIG_ESP_TASK_WDT_PANIC} 后才会触发严重错误）
  - 高速缓存访问错误
  - 掉电检测事件
  - 堆栈溢出
  - Stack 粉碎保护检查
  - Heap 完整性检查
  - 未定义行为清理器（UBSAN）检查
- 使用 assert, configASSERT 等类似的宏导致失败。

本指南会介绍 ESP-IDF 中这类错误的处理流程，并给出对应的解决建议。

4.13.2 紧急处理程序

概述 中列举的所有错误都会由 紧急处理程序（Panic Handler）负责处理。

紧急处理程序首先会将出错原因打印到控制台，例如 CPU 异常的错误信息通常会类似于

Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was... unhandled.

对于一些系统级检查错误（如中断看门狗超时，高速缓存访问错误等），错误信息会类似于

Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory... region accessed). Exception was unhandled.
不管哪种情况，错误原因都会被打印在括号中。请参阅《Guru Meditation 错误》以查看所有可能的出错原因。

紧急处理程序接下来的行为将取决于 `CONFIG_ESP_SYSTEM_PANIC` 的设置，支持的选项包括:

- 打印 CPU 寄存器，然后重启 (`CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT`) - 默认选项
- 打印系统发生异常时 CPU 寄存器的值，打印回溯，最后重启芯片。
- 打印 CPU 寄存器，然后暂停 (`CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT`) 与上一个选项类似，但不会重启，而是选择暂停程序的运行。重启程序需要外部执行复位操作。
- **不** 打印 CPU 寄存器的值，也不打印回溯，立即重启芯片。
- 调用 `GDB Stub (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)` 启动 GDB 服务器，通过控制台 UART 接口与 GDB 进行通信。详细信息请参阅 `GDB Stub`。

紧急处理程序的行为还受到另外两个配置项的影响:

- 如果使能了 `CONFIG_ESP32_DEBUG_OCDAWARE` (默认)，紧急处理程序会检测 ESP32 是否已经连接 JTAG 调试器。如果检测成功，程序会暂停运行。并将控制权交给调试器。在这种情况下，寄存器和回溯不会被打印到控制台，并且也不会使用 GDB Stub 和 Core Dump 的功能。
- 如果使能了 `内核转储` 功能，系统状态（任务堆栈和寄存器）会被转储到 Flash 或者 UART 以供后续分析。
- 如果 `CONFIG_ESP_PANIC_HANDLER_IRAM` 被禁用（默认情况下禁用），紧急处理程序的代码会放置在 Flash 而不是 IRAM 中。这意味着，如果 ESP-IDF 在 Flash 高速缓存使用完毕时崩溃，在运行 GDB Stub 和内核转储之前紧急处理程序会自动重新使能 Flash 高速缓存。如果 Flash 高速缓存也崩溃了，这样做会增加一些小风险。
- 如果禁用了该选项，紧急处理程序的代码（包括所需的 UART 函数）会放置在 IRAM 中。当禁用 Flash 高速缓存（例如写入 SPI flash）时或触发异常导致 Flash 高速缓存崩溃时，可用此选项调试一些复杂的崩溃问题。

下图展示了紧急处理程序的行为:

**4.13.3 寄存器转储与回溯**

除非启用了 `CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT` 否则紧急处理程序会将 CPU 寄存器和回溯打印到控制台

```
Core register dump:
PC : 0x400e14ed PS : 0x00060030 A0 : 0x800d0805 A1 : ...
~0x3fff5030
A2 : 0x00000000 A3 : 0x00000001 A4 : 0x00000001 A5 : ...
~0x3fff50dc
A6 : 0x00000000 A7 : 0x00000000 A8 : 0x00000000 A9 : ...
~0x3fff5000
A10 : 0x00000000 A11 : 0x3fff2bac A12 : 0x40082d1c A13 : ...
~0x066eff8
A14 : 0x33fcb7078 A15 : 0x00000000 SAR : 0x00000014 EXCCAUSE : ...
~0x0000001d
EXCVADDR : 0x00000000 LBEQ : 0x4000c46c LEND : 0x4000c477 LCOUNT : ...
~0xffffffff
Backtrace: 0x400e14ed:0x3fff5030 0x400d0802:0x3fff5050
```

仅会打印异常帧中 CPU 寄存器的值，即引发 CPU 异常或者其它严重错误时刻的值。

紧急处理程序如果是因 abort() 而调用，则不会打印寄存器转储。

在某些情况下，例如中断看门狗超时，紧急处理程序会额外打印 CPU 寄存器 (`EPC1-EPC4`) 的值，以及另一个 CPU 的寄存器值和代码回溯。

回溯行包含了当前任务中每个堆栈帧的 PC:SP 对 (PC 是程序计数器，SP 是堆栈指针)。如果在 ISR 中发生了严重错误，回溯会同时包括被打中断任务的 PC:SP 对，以及 ISR 中的 PC:SP 对。

如果使用了 `IDF 监视器`，该工具会将程序计数器的值转换为对应的代码位置 (函数名，文件名，行号)，并加以注释。
图 31: 紧急处理程序流程图（点击放大）
Core 0 register dump:

0x400d0802: main_task at /Users/user/esp/esp-idf/components/esp32/cpu_start.c:470

若要查找发生严重错误的代码位置，请查看“Backtrace”的后面几行，发生严重错误的代码显示在顶层，后续几行显示的是调用堆栈。

### 4.13.4 GDB Stub

如果启用了 CONFIG_ESP_SYSTEM_PANIC_GDBSTUB 选项，在发生严重错误时，紧急处理程序不会复位芯片，相反，它将启动 GDB 远程调试器，通常称为 GDB Stub。发生这种情况时，可以让主机上运行的 GDB 实例通过 UART 端口连接到 ESP32。

如果使用了 IDF 监视器，该工具会在 UART 端口检测到 GDB Stub 提示符后自动启动 GDB，输出会类似于:

Entering gdb stub now.

$70b#6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-
.esp32-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
Find the GDB manual and other documentation resources online at:
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
at /Users/user/esp/example/main/main.cpp:36
36  *((int*) 0) = 0;
(gdb)

在 GDB 会话中，我们可以检查 CPU 寄存器，本地和静态变量以及内存中任意位置的值。但是不支持设置断点，改变 PC 值或者恢复程序的运行。若要复位程序，请退出 GDB 会话，在 IDF 监视器中连续输入 Ctrl-T Ctrl-R，或者按下开发板上的复位按键也可以重新运行程序。
4.13.5  

**Guru Meditation 错误**

本节将对打印在 Guru Meditation Error: Core panic'ed 后面括号中的致错原因进行逐一解释。

**注解：** 想要了解“Guru Meditation”的历史渊源，请阅 维基百科。

**IllegalInstruction**

此 CPU 异常表示当前执行的指令不是有效指令，引起此错误的常见原因包括:

- FreeRTOS 中的任务函数已返回。在 FreeRTOS 中，如果想终止任务函数，需要调用 vTaskDelete() 函数释放当前任务的资源，而不是直接返回。
- 无法从 SPI Flash 中加载下一条指令，这通常发生在:
  - 应用程序将 SPI Flash 的引脚重新配置为其它问题 (如 GPIO, UART 等等)。有关 SPI Flash 引脚的详细信息，请参阅硬件设计指南和芯片/模组的数据手册。
  - 某些外部设备意外连接到 SPI Flash 的引脚上，干扰了 ESP32 和 SPI Flash 之间的通信。

**InstrFetchProhibited**

此 CPU 异常表示 CPU 无法加载指令，因为指令的地址不在 IRAM 或者 IROM 中的有效区域中。

通常这意味着代码中调用了并不指向有效代码块的函数指针。这种情况下，可以查看 FC (程序计数器) 寄存器的值并做进一步判断：若为 0 或者其它非法值 (即只要不是 0x4xxxxxxxx的情况)，则证实确实是该原因。

**LoadProhibited, StoreProhibited**

当应用程序尝试读取或写入无效的内存位置时，会发生此类 CPU 异常。此类无效内存地址可以在寄存器 EXCVADDR 中找到。如果该地址为零，通常意味着应用程序正尝试访问一个 NULL 指针。如果该地址接近于零，则通常意味着应用程序尝试访问某个结构体的成员，但是该结构体的指针为 NULL。如果该地址是其它非法值（不在 0x3fxxxxxxxx - 0x6xxxxxxxx 的范围内），则可能意味着用于访问数据的指针未初始化或者已经损坏。

**IntegerDivideByZero**

应用程序尝试将整数除以零。

**LoadStoreAlignment**

应用程序尝试读取/写入的内存位置不符合加载/存储指令对字节对齐大小的要求。例如，32 位加载指令只能访问 4 字节对齐的内存地址，而 16 位加载指令只能访问 2 字节对齐的内存地址。

**LoadStoreError**

这类异常通常发生于以下几种场合:

- 应用程序尝试从仅支持 32 位加载/存储的内存区域执行 8 位或 16 位加载/存储操作，例如，解引用一个指向指令内存区域（例如 IRAM 或者 IROM）的 char* 指针就会触发这个错误。
- 应用程序尝试保存数据到只读的内存区域（比如 IROM 或者 DROM）也会触发这个错误。
Unhandled debug exception

这后面通常会再跟一条消息:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

此错误表示应用程序写入的位置越过了 task_name 任务堆栈的末尾。请注意，并非每次堆栈溢出都会触发此错误。任务有可能会绕过堆栈金丝雀（stack canary）的位置访问堆栈，在这种情况下，监视点就不会被触发。

Interrupt wdt timeout on CPU0 / CPU1

这表示发生了中断看门狗超时。详细信息请查阅看门狗文档。

Cache disabled but cached memory region accessed

在某些情况下，ESP-IDF 会暂时禁止通过高速缓存访问外部 SPI Flash 和 SPI RAM，例如在使用 spi_flash API 读取/写入/擦除/映射 SPI Flash 的时候。在这些情况下，任务会被挂起，并且未使用 ESP_INTR_FLAG_IRAM 注册的中断处理程序会被禁用。请确保任何使用此标志注册的中断处理程序所访问的代码和数据分别位于 IRAM 和 DRAM 中。更多详细信息请参阅 SPI Flash API 文档。

4.13.6 其它严重错误

欠压

ESP32 内部集成掉电检测电路，并且会默认启用。如果电源电压低于安全值，掉电检测器可以触发系统复位。掉电检测器可以使用 CONFIG_ESP32_BROWNOUT_DET 和 CONFIG_ESP32_BROWNOUT_DET_LVL_SEL 这两个选项进行设置。

当掉电检测器被触发时，会打印如下信息:

```
Brownout detector was triggered
```

芯片会在该打印信息结束后复位。

请注意，如果电源电压快速下降，则只能在控制台上看到部分打印信息。

Heap 不完整

ESP-IDF 堆的实现包含许多运行时的堆结构检查，可以在 menuconfig 中开启额外的检查（“Heap Poisoning”）。如果其中的某项检查失败，则会打印类似如下信息:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/
   ..-multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

更多详细信息，请查阅堆内存调试 文档。

Stack 粉碎

Stack 粉碎保护（基于 GCC -fstack-protector* 标志）可以通过 ESP-IDF 中的 CONFIG_COMPILER_STACK_CHECK_MODE 选项来开启。如果检测到 Stack 粉碎，则会打印类似如下的信息:
Stack smashing protect failure!
abort() was called at PC 0x400d2138 on core 0
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0
0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0
0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910
0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80

回溯信息会指明发生 Stack 粉碎的函数，建议检查函数中是否有代码访问局部数组时发生了越界。

未定义行为清理器 (UBSAN) 检查

未定义行为清理器 (UBSAN) 是一种编译器功能，它会为可能不正确的操作添加运行时检查，例如:
- 溢出（乘法溢出、有符号整数溢出）
- 移位基数或指数错误（如移位超过 32 位）
- 整数转换错误

请参考 GCC 文档 中的 "-fsanitize=undefined" 选项，查看支持检查的完整列表。

使能 UBSAN 默认情况下未启用 UBSAN，可以通过在构建系统中添加编译器选项 -fsanitize=undefined 在文件、组件或项目经理上使能 UBSAN。

在对使用硬件寄存器头文件 (soc/xxx_reg.h) 的代码使能 UBSAN 时，建议使用 -fno-sanitize=shift-base 选项禁用移位基数清理器，这是由于 ESP-IDF 寄存器头文件目前包含的模式会对这个特定的清理器选项造成误报。

要在项目级使能 UBSAN，请在项目 CMakeLists.txt 文件的末尾添加以下内容:

```cmake
idf_build_set_property(COMPILE_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-base" APPEND)
```

或者，通过 EXTRA_CFLAGS 和 EXTRA_CXXFLAGS 环境变量来传递这些选项。

使能 UBSAN 会明显增加代码量和数据大小。当为整个应用程序使能 UBSAN 时，微控制器的可用 RAM 无法容纳大多数应用程序（例如一些微小程序）。因此，建议为特定的待测组件使能 UBSAN。

要在项目 CMakeLists.txt 文件中的特定组件 (component_name) 启用 UBSAN，请在文件末尾添加以下内容:

```cmake
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

**注意**: 关于构建属性和组件属性的更多信息，请查看构建系统文档。

要为同一组件的 CMakeLists.txt 中的特定组件 (component_name) 使能 UBSAN，在文件末尾添加以下内容:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

**UBSAN 输出** 当 UBSAN 检测到一个错误时，会打印一个信息和回溯。例如:
当使用 IDF 监视器时，回溯会被解码为函数名以及源代码位置，并指向问题发生的位置（这里是 main.c:128）：

```
0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367
0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api.c:106
0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/ubsan.c:152
0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/ubsan.c:223
0x400db74f: test_ub at main.c:128
0x400db99c: app_main at main.c:56 (discriminator 1)
```

UBSAN 报告的错误类型为以下几种：

<table>
<thead>
<tr>
<th>名称</th>
<th>含义</th>
</tr>
</thead>
<tbody>
<tr>
<td>type_mismatch, type_mismatch_v1</td>
<td>指针值不正确：空、未对齐、或与给定类型不兼容</td>
</tr>

</table>

### 4.14 Flash 加密

本文档旨在引导用户快速了解 ESP32 的 flash 加密功能，通过应用程序代码示例向用户演示如何在开发及生产过程中测试及验证 flash 加密的相关操作。

#### 4.14.1 概述

flash 加密功能用于加密与 ESP32 搭载使用的片外 flash 中的内容。启用 flash 加密功能后，固件会以明文形式烧录，然后在首次启动时将数据进行加密。因此，物理读取 flash 将无法恢复大部分 flash 内容。

启用 flash 加密后，系统将默认加密下列类型的 flash 数据：

- 固件引导加载程序
- 分区表
- 所有 "app" 类型的分区
其他类型的数据视情况进行加密：

- 任何在分区表中标有“加密”标志的分区。详情请见加密分区标志。
- 如果启用了安全启动，则可以加密安全启动引导程序摘要（见下文）。

安全启动是一个独立的功能，可以与 flash 加密一起使用，从而创建更安全的环境。

重要：对于生产用途，flash 加密仅应在“发布”模式下启用。

重要：启用 flash 加密将限制后续 ESP32 更新。在使用 flash 加密功能前，请务必阅读本文档了解其影响。

### 4.14.2 相关 eFuses

Flash 加密操作由 ESP32 上的多个 eFuse 控制。以下是这些 eFuse 列表及其描述。下表中的各 eFuse 名称也在 esefuse.py 工具中使用，为了能在 eFuse API 中使用，请在名称前加上 ESP_EFUSE_，如：

```python
esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)
```

表 20: Flash 加密过程中使用的 eFuses

<table>
<thead>

<td>设置后，在 UART 固件加载模式运行时禁用 flash 解密操作</td>
<td>1</td>
</tr>
<tr>
<td>FLASH_CRYPT_CNT</td>
<td>在启动时启用/禁用加密。如果设置了偶数个比特位 (0, 2, 4, 6)，则在启动时加密 flash。如果设置了奇数个比特位 (1, 3, 5, 7)，则在启动时不加密 flash</td>
<td>7</td>
</tr>
</tbody>
</table>

注解：

- 上表中列出的所有 eFuse 位都提供读/写访问控制。
- 这些位的默认值是 0。

对上述 eFuse 位的读写访问由 WR_DIS 和 RD_DIS 寄存器中的相应字段控制。有关 ESP32 eFuse 的详细信息，请参考 eFuse 管理器。要使用 esefuse.py 更改 eFuse 字段的保护位，请使用以下两个命令: read_protect_efuse 和 write_protect_efuse。例如 esefuse.py write_protect_efuse DISABLE_DL_ENCRYPT。

### 4.14.3 Flash 的加密过程

假设 eFuse 值处于默认状态，且固件的引导加载程序编译为支持 flash 加密，则 flash 加密的具体过程如下：

1. 第一次开机复位时，flash 中的所有数据都是未加密的（明文）。ROM 引导加载程序加载固件引导加载程序。
2. 固件的引导加载程序将读取 FLASH_CRYPT_CNT eFuse 值 (0b00000000)。因为该值为 0 (偶数位)，固件的引导加载程序将配置并启用 flash 加密，同时将 FLASH_CRYPT_CONFIG eFuse 的值编程为 0xF。关于 flash 加密块的更多信息，请参考 ESP32 技术参考手册 > eFuse 控制器 (eFuse) > flash 加密块 [PDF]。
3. 固件的引导加载程序使用 RNG（随机数生成）模块生成 AES-256 位密钥，然后将其写入 flash_encryption eFuse 中。由于 flash_encryption eFuse 已设置为可写和读取保护位，将无法通过软件访问密钥。Flash 加密操作完全在硬件中完成，无法通过软件访问密钥。

4. Flash 加密块将加密 flash 的内容（固件的引导加载程序、应用程序，以及标有“加密”标志的分区）。

5. 固件引导加载程序将在 FLASH_CRYPT_CNT (060000001) 中设置第一个可用位来对已加密的 flash 内容进行标记。设置奇数个比特位。

6. 对于开发模式，固件引导加载程序仅设置 DISABLE_DL_DECRYPT 和 DISABLE_DL_CACHE 的 eFuse 位，以便 UART 引导加载程序重新烧录加密的二进制文件。此外，FLASH_CRYPT_CNT 的 eFuse 位不受写入保护。

7. 对于发布模式，固件引导加载程序设置 DISABLE_DL_ENCRIPT, DISABLE_DL_DECRIPT 和 DISABLE_DL_CACHE 的 eFuse 位为 1，以防止 UART 引导加载程序解密 flash 内容。它还写入保护 FLASH_CRYPT_CNT eFuse 位。要修改此行为，请参阅使用 UART 引导加载程序加密/解密。

8. 重新启动设备以开始执行加密镜像。固件引导加载程序使用 flash 解密程序来解密 flash 内容，然后将解密的内容加载到 IRAM 中。

在开发阶段常需编写不同的明文 flash 镜像并测试 flash 的加密过程。这要求固件下载模式能够根据需求不断加载新的明文镜像。但是，在制造和生产过程中，出于安全考虑，固件下载模式不应有权限访问 flash 内容。

因此需要有两种不同的 flash 加密配置：一种用于开发，另一种用于生产。详情请参考 Flash 加密设置。

### 4.14.4 Flash 加密设置

提供以下 flash 加密模式：

- 开发模式 - 建议仅在开发过程中使用，因为它不会阻止修改和读取加密的 flash 内容。
- 发布模式 - 建议用于制造和生产，以防止物理读取加密的 flash 内容。

本节将详细介绍上述 flash 加密模式，并且逐步说明如何使用它们。

#### 开发模式

在开发过程中，可使用 ESP32 内部生成的密钥或外部主机生成的密钥进行 flash 加密。

#### 使用 ESP32 生成的密钥

开发模式允许用户使用固件下载模式下载多个明文镜像。

测试 flash 加密过程需完成以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   
   请参考如何检查 ESP32 flash 加密状态。

2. 在项目配置菜单，执行以下操作：
   
   - 启动时使能 flash 加密
   - 选择加密模式（默认是 开发模式）
   - 选择 UART ROM 下载模式（默认是 启用，对于 esp32 芯片，该选项仅在 CONFIG_ESP32_REV_MIN 级别设置为 3 时 (ESP32 V3) 可用）。
   - 选择适当程度的引导加载程序日志
   - 保存配置并退出。

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建和烧录完整的镜像。

```
idf.py flash monitor
```

**注解：** 这个命令不包括任何应该写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。
该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32 将重启。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为“加密”的分区，然后复位。就地加密可能需要时间，对于大分区最多需要一分钟。之后，应用程序在运行时解密并执行命令。

下面是启用 flash 加密后 ESP32 首次启动时的样例输出：

```
--- idf_monitor on /dev/cu.SLAB_USBtoUART 115200 ---
--- Quit: Ctrl+| Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---

```

(续上页)
在此阶段，如果用户需要更新或重新烧录二进制文件，请参考重新烧录更新后的分区。

**使用主机生成的密钥** 可在主机中预生成 flash 加密密钥，并将其烧录到 eFuse 密钥块中。这样，无需明文 flash 更新便可以在主机上加密数据并将其烧录。该功能可在 **开发模式** 和 **发布模式** 两模式下使用。如果没有预生成的密钥，数据将以明文形式烧录，然后 ESP32 对数据进行就地加密。

**注解**：不建议在生产中使用该方法，除非为每个设备都单独生成一个密钥。

使用主机生成的密钥需完成以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   请参考如何检查 ESP32 flash 密钥状态。
2. 通过运行以下命令生成一个随机密钥：
3. **在第一次加密启动前**，使用以下命令将该密钥烧录到设备上，这个操作只能执行一次。

```
espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```

如果未烧录密钥并在启用 flash 加密后启动设备，ESP32 将生成一个软件无法访问或修改的随机密钥。

4. **在项目配置菜单**中进行如下设置：
   - 启动时启用 flash 加密功能
   - 选择加密模式（默认为 开发模式）
   - 选择适当详细程度的引导加载程序目录
   - 保存配置并退出

启用 flash 加密将增加引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

5. 运行以下命令来构建并烧录完整的镜像：

```
idf.py flash monitor
```

**注解：**这个命令不包括任何应该被写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入后应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32 将重置。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为 加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

如果使用开发模式，那么更新和重新烧录二进制文件最简单的方法是重新烧录更新后的分区。

如果使用发布模式，那么可以在主机上预先加密二进制文件，然后将其作为密文烧录。具体请参考手动加密文件。

**重新烧录更新后的分区** 如果用户以明文方式更新了应用程序代码并需要重新烧录，则需要在烧录前对其进行加密。请运行以下命令一次完成应用程序的加密与烧录：

```
idf.py encrypted-app-flash monitor
```

如果所有分区都需要以加密形式更新，请运行：

```
idf.py encrypted-flash monitor
```

**发布模式**

在发布模式下，UART 引导加载程序无法执行 flash 加密操作，只能使用 OTA 方案下载新的明文镜像，该方案将在写入 flash 前加密明文镜像。

使用该模式需要执行以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   请参考如何检查 ESP32 flash 加密状态。

2. 在项目配置菜单，执行以下操作：
   - 启动时使能 flash 加密
   - 选择发布模式（注意一旦选择了发布模式，DISABLE_DL_ENCRYPT 和 DISABLE_DL_DECRYPT eFuse 位将被编程为在 ROM 下载模式下禁用 flash 加密硬件）
Chapter 4. API 指南

- 选择 UART ROM 下载模式（推荐永久性禁用）（注意该选项仅在 CONFIG_ESP32_REV_MIN 级别设置为 3 时 (ESP32 V3) 可用。）默认选项是保持启用 UART ROM 下载模式，然而建议永久禁用该模式，以减少攻击者可用的选项。
- 选择适当详细程度的引导加载程序目录
- 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建并烧录完整的镜像:

```bash
idf.py flash monitor
```

**注释：**这个命令不包括任何应该被写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入加密后的程序、分区表和应用程序。烧录完成后，ESP32 将重置。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标志位 加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

一旦在发布模式下启用 flash 加密，引导加载程序将写保护 FLASH_CRYPT_CNT eFuse。

请使用 OTA 方案 对字段中的明文进行后续更新。

**注释：**如果用户已经预生成了 flash 加密密钥并存储了一个副本，并且 UART 下载模式没有通过 CONFIG_SECURE_UART_ROM_DL_MODE (ESP32 V3 only) 永久禁用，那么可以通过使用 espsecure.py encrypt_flash_data 预加密文件，从而在本地更新 flash，然后烧录密文。请参考手动加密文件。

**最佳实践**

在生产中使用 flash 加密时：

- 不要在多个设备之间重复使用同一个 flash 加密密钥，这样攻击者就无法从一台设备上复制加密数据后再将其转移动到第二台设备上。
- 在使用 ESP32 V3 时，如果生产设备不需要 UART ROM 下载模式，那么则该禁用该模式以增加设备安全性。这可以通过在应用程序启动时调用 esp_efuse_disable_rom_download_mode() 来实现，或者，可将项目 CONFIG_ESP32_REV_MIN 级别配置为 3 (仅针对 ESP32 V3)，然后选择 CONFIG_SECURE_UART_ROM_DL_MODE 为 “永久性的禁用 ROM 下载模式 (推荐)”。在早期的 ESP32 版本上无法禁用 ROM 下载模式。
- 启用安全启动 作为额外的保护层，防止攻击者在启动前有选择地破坏 flash 中某部分。

4.14.5 可能出现的错误

一旦启用 flash 加密，FLASH_CRYPT_CNT 的 eFuse 值将设置为奇数位。这意味着所有标有加密标志的分区都会包含加密的密文。如果 ESP32 错误地加载了明文数据，则会出现以下三种典型的错误情况：

1. 如果通过 明文固件引导加载程序镜像重新烧录了引导加载程序分区，则 ROM 加载器将无法加载固件引导加载程序，并会显示以下错误类型:

```bash
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
flash read err, 1000
ets_main.c 371
ets Jun 8 2016 00:22:57
```

```bash
rst:0x7 (TGOWDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
flash read err, 1000
```

(下页继续)
注解：如果 flash 内容被擦除或损坏，也会出现这个错误。

2. 如果固件的引导加载程序已加密，但通过 明文分区表镜像 重新烧录了分区表，引导加载程序将无法读取分区表，从而出现以下错误：

```
rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
configisip: 0, SPIWP:0xee
clk_drv:0x00, q_drv:0x00, d_drv:0x00, cs0_dr:0x00, hd_drv:0x00, wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0018,len:4
load:0x3fff001c,len:10464
ho 0 tail 12 room 4

E (80) flash_parts: partition 0 invalid magic number 0x94f6
E (86) boot: Failed to verify partition table
E (91) boot: load partition table error!
```

3. 如果引导加载程序和分区表已加密，但使用 明文应用程序镜像 重新烧录了应用程序，引导加载程序将无法加载应用程序，从而出现以下错误：

```
rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
configisip: 0, SPIWP:0xee
clk_drv:0x00, q_drv:0x00, d_drv:0x00, cs0_dr:0x00, hd_drv:0x00, wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0018,len:4
load:0x3fff001c,len:8452
load:0x40078000,len:13616
load:0x40080400,len:6664

4.14.6 ESP32 flash 加密状态

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。

要检查您的 ESP32 设备上是否启用了 flash 加密，请执行以下操作之一：

- 将应用示例 security/flash_encryption 烧录到您的设备上。此应用程序会打印 FLASH_CRYPT_CNT eFuse 值，以及是否启用了 flash 加密。
- 查询设备所连接的串口名称，在以下命令中将 PORT 替换为串口名称后运行：

```
espfuse.py -p PORT summary
```

4.14.7 在加密的 flash 中读写数据

ESP32 应用程序代码可以通过调用函数 esp_flash_encryption_enabled() 来检查当前是否启用了 flash 加密。此外，设备可以通过调用函数 esp_get_flash_encryption_mode() 来识别 flash 加密模式。

一旦启用 flash 加密，使用代码访问 flash 内容时要更加小心。

Flash 加密范围

当 FLASH_CRYPT_CNT eFuse 设置为奇数位的值，所有通过 MMU 的 flash 缓存访问的 flash 内容都将被透明解密。包括：

- Flash 中可执行的应用程序代码 (IROM)。
- 所有存储于 flash 中的只读数据 (DROM)。
- 通过函数 spi_flash_mmap() 访问的任意数据。
- ROM 引导加载程序读取的固件引导加载程序镜像。

重要： MMU flash 缓存将无条件解密所有数据。Flash 中未加密存储的数据将通过 flash 缓存 “被透明解密”，并在软件中存储为随机垃圾数据。

读取加密的 flash

如果需要在不使用 flash 缓存 MMU 映射的情况下读取数据，推荐使用分区读取函数 esp_partition_read()，该函数只会解密从加密分区读取的数据。从未加密分区读取的数据不会被解密。这样，软件便能以相同的方式访问加密和未加密的 flash。

也可以使用以下 SPI flash API 函数：
• 通过函数 `esp_flash_read()` 读取不会被解密的原（加密）数据。
• 通过函数 `esp_flash_read_encrypted()` 读取和解密数据。

ROM 函数 SPIRead() 可以在不解密的情况下读取数据，但是在 esp-idf 应用程序中不支持该函数。
使用非易失性存储器 (NVS) API 存储的数据始终从 flash 加密的角度进行存储和读取解密。如有需要，则由库提供加密功能。详情可参考 NVS 加密。

写入加密的 flash

推荐使用分区写入函数 `esp_partition_write()`。此函数只会在将数据写入加密分区时加密数据，而写入未加密分区的数据不会被加密。通过这种方式，软件可以以相同的方式访问加密和非加密 flash。
也可以使用函数 `esp_flash_write_encrypted()` 加密和写入数据。

此外，esp-idf 应用程序中存在但不支持以下 ROM 函数:

• `esp_rom_spiflash_write_encrypted` 加密并写入 flash
• `SPIWrite` 将未加密的数据写入 flash

由于数据是按块加密的，加密数据最小的写入大小为 16 字节，对齐也是 16 字节。

4.14.8 更新加密的 flash

OTA 更新

如果使用函数 `esp_partition_write()`，对加密分区的 OTA 更新将自动以加密形式写入。
在为已加密设备的 OTA 更新构建应用程序镜像之前，启用项目配置菜单中的 启动时使能 flash 加密 选项。
请参考 OTA 获取更多关于 ESP-IDF OTA 更新的信息。

通过串口更新加密 flash

通过串行引导加载程序烧录加密设备，需要串行引导加载程序下载接口没有通过 eFuse 被永久禁用。
在开发模式下，推荐的方法是 重新烧录更新后的分区。
在发布模式下，如果主机上有存储在 eFuse 中的相同密钥的副本，那么就可以在主机上对文件进行加密，然后进行烧录，具体请参考 手动加密文件。

4.14.9 关闭 flash 加密

如果意外启用了 flash 加密，则明文数据的 flash 会使 ESP32 无法正常启动。设备将不断重启，并报错 flash read err, 1000 或 invalid header: 0XXXXXXXX。

对于开发模式下的 flash 加密，可以通过烧录 FLASH_CRYPT_CNT eFuse 来关闭加密。每个芯片仅有 3 次机会，请执行以下步骤:

1. 在项目配置菜单中，禁用 启动时使能 flash 加密 选项，然后保存并退出。
2. 再次打开项目配置菜单，再次检查你是否已经禁用了该选项，如果这个选项仍被启用，引导加载程序在启动时将立即重新启用加密功能。
3. 在禁用 flash 加密后，通过运行 idf.py flash 来构建和烧录新的引导加载程序和应用程序。
4. 使用 espefuse.py (在 components/esptool_py/esptool 中) 以关闭 FLASH_CRYPT_CNT，运行:

```bash
espefuse.py burn_efuse FLASH_CRYPT_CNT
```

重置 ESP32，flash 加密应处于关闭状态，引导加载程序将正常启动。

### 4.14.10 Flash 加密的要点

- 使用 AES-256 加密 flash。Flash 加密密钥存储于芯片内部的 flash_encryption eFuse 中，并（默认）受保护，防止软件访问。
- Flash 加密算法采用的是 AES-256，其中密钥随着 flash 的每个 32 字节块的偏移地址“调整”。这意味着，每个 32 字节块（2 个连续的 16 字节 AES 块）使用从 flash 加密密钥中产生的一个特殊密钥进行加密。
- 通过 ESP32 的 flash 缓存映射功能，flash 可支持透明访问——任何映射到地址空间的 flash 区域在读取时都将被透明地解密。
  
  为便于访问，某些数据分区最好保持未加密状态，或者也可使用对已加密数据无效的 flash 友好型更新算法。由于 NVS 库无法与 flash 加密直接兼容，因此无法加密非易失性存储器的 NVS 分区。详情可参见 NVS 加密。
- 如果以后可能需要启用 flash 加密，则编程人员在编写使用加密 flash 代码时需小心谨慎。
- 如果已启用安全启动，重新烧录加密设备的引导加载程序则需要“可重新烧录”的安全启动摘要（可参考 Flash 加密与安全启动）。

启用 flash 加密将增大引导加载程序，因此可能需更新分区表偏移量。请参考引导加载程序大小。

| 重要： | 在首次启动加密过程中，请勿切断 ESP32 的电源。如果电源被切断，flash 的内容将受到破坏，并需要重新烧录未加密数据。而这类重新烧录将不计入烧录限制次数。 |

### 4.14.11 Flash 加密的局限性

flash 加密可以保护固件，防止未经授权的读取与修改。了解 flash 加密系统的局限之处亦十分重要：

- Flash 加密功能与密钥同样稳定。然而，推荐您首次启动设备时在设备上生成密钥（默认行为）。如果在设备外生成密钥，请确保遵循正确的后续步骤，不要在所有生产设备之间使用相同的密钥。
- 并非所有数据都是加密存储。因而在 flash 上存储数据时，请检查您使用的存储方式（库、API 等）是否支持 flash 加密。
- Flash 加密无法阻止攻击者获取 flash 的高层次布局信息。这是因为对每对相邻的 16 字节 AES 块都使用相邻的 AES 密钥。当这些相邻的 16 字节块包含相同内容时（如空白或填充区域），这些字节块将加密以产生匹配的加密块对。这让攻击者可在加密设备间进行层次对比（例如，确认两设备是否可能运行相同的固件版本）。
- 出于相同原因，攻击者始终可获取一对相邻的 16 字节块（32 字节对齐）何包含相同的 16 字节序列。因此，在 flash 上存储敏感数据时应牢记这点，可进行相关设置避免该情况发生（可使用计数器字节或每 16 字节设置不同的值即可）。具体请参考 NVS 加密。
- 单独使用 flash 加密可能无法防止攻击者修改本设备的固件。为防止设备上运行未经授权的固件，可搭配 flash 加密使用安全启动。

### 4.14.12 Flash 加密与安全启动

推荐 flash 加密与安全启动搭配使用。但是，如果已启用安全启动，则重新烧录设备时会受到其他限制：

- 如果新的应用程序已使用安全启动签名密钥正确签名，则 OTA 更新 不受限制。
- 只有当选择可再次烧录 安全启动模式，且安全启动密钥已预生成并烧录至 ESP32 时（可参见安全启动），明文串行 flash 更新 才可能实现。在该配置下，idf.py bootloader 将生成简化的引导加载程序和安全启动摘要文件，在偏移量 0x0 处进行烧录。当进行明文串行重新烧录步骤时，需在烧录其他明文数据前重新烧录此文件。
- 如果未重新烧录引导加载程序，则仍然可以使用预生成的 flash 加密密钥重新烧录。重新烧录引导加载程序时，需在安全启动配置中启用相同的可重新烧录 选项。

### 4.14.13 Flash 加密的高级功能

以下部分介绍了 flash 加密的高级功能。
加密分区标志

部分分区默认为已加密。通过在分区的标志字段中添加“encrypted”标志，可在分区表描述中将其他分区标记为需要加密。在这些标记分区中的数据会和应用程序分区一样视为加密数据。

<table>
<thead>
<tr>
<th># Name, Type, SubType, Offset, Size, Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs, data, nvs, 0x9000, 0x6000</td>
</tr>
<tr>
<td>phy_init, data, phy, 0xf000, 0x1000</td>
</tr>
<tr>
<td>factory, app, factory, 0x10000, 1M</td>
</tr>
<tr>
<td>secret_data, 0x40, 0x01, 0x20000, 256K, encrypted</td>
</tr>
</tbody>
</table>

请参考分区表获取更多关于分区表描述的具体信息。

关于分区加密您还需要了解以下信息：

- 默认分区表都不包含任何加密数据分区。
- 启用 flash 加密后，“app”分区一般视为加密分区，因此无需标记。
- 如果未启用 flash 加密，则“encrypted”标记无效。
- 将可选 phy 分区标记为“encrypted”，可以防止物理访问读取或修改 phy_init 数据。
- nvs 分区无法标记为“encrypted”因为 NVS 库与 flash 加密不直接兼容。

启用 UART 引导加载程序加密/解密

在第一次启动时，flash 加密过程默认会烧录以下 eFuse:

- DISABLE_DL_ENCRYPT 在 UART 引导加载程序启动模式下运行时，禁止 flash 加密操作。
- DISABLE_DL_DECRYPT 在 UART 引导加载程序模式下运行时，禁止透明 flash 解密（即使 eFuse FLASH_CRYPT_CNT 已设置为正常操作中启用 flash 透明解密）。
- DISABLE_DL_CACHE 在 UART 引导加载程序模式下运行时禁止整个 MMU flash 缓存。

为了能启用这些功能，可在首次启动前仅烧录部分 eFuse，并用未设置值 0 保护其他部分。例如：

```
esefuse.py --port PORT burn_efuse DISABLE_DL_DECRYPT
esefuse.py --port PORT write_protect_efuse DISABLE_DL_ENCRYPT
```

重要：保持 DISABLE_DL_DECRYPT 未设置 (0) 会使 flash 加密无效。

对芯片具有物理访问权限的攻击者会使用 UART 引导加载程序模式（使用自定义根根代码）读取 flash 的内容。

设置 FLASH_CRYPT_CONFIG

FLASH_CRYPT_CONFIG eFuse 决定 flash 加密密钥中逐块偏移“调整”的位数。详情可参考Flash 加密算法。

首次启动固件引导加载程序时，该值始终设置为最大值 0xF。

可手动写入这些 eFuse，并在首次启动前对其写保护，以便选择不同的调整值。但不推荐该操作。

强烈建议在 FLASH_CRYPT_CONFIG 未设置时，不要对其进行写保护。否则，它的值将永久为零，而 flash 加密密钥中则无调整位。这导致 flash 加密算法等同于 AES ECB 模式。

JTAG 调试

默认情况下，当启用 flash 加密（开发或发布模式）时，将通过 eFuse 禁用 JTAG 调试。引导加载程序在首次启动时执行此操作，同时启用 flash 加密。

请参考 JTAG 与闪存加密和安全引导 了解更多关于使用 JTAG 调试与 flash 加密的信息。
手动加密文件

手动加密或解密文件需要在 eFuse 中预烧录 flash 加密密钥（请参阅使用主机生成的密钥）并在主机上保留一份副本。如果 flash 加密配置在开发模式下，那么则不需要保留密钥的副本或遵循这些步骤，可以使用更简单的重新烧录更新后的分区步骤。

密钥文件应该是单个原始二进制文件（例如：key.bin）。

例如，以下是将文件 build/my-app.bin 进行加密，烧录到偏移量 0x10000 的步骤，运行 espsecure.py，如下所示：

```
espsecure.py encrypt_flash_data --keyfile /path/to/key.bin --address 0x10000 --
```

然后可以使用 esptool.py 将文件 my-app-ciphertext.bin 写入偏移量 0x10000。关于为 esptool.py 推荐的所有命令行选项，请查看 idf.py build 成功时打印的输出。

注解：

如果 ESP32 在启动时无法识别烧录进去的密文文件，请检查密钥是否匹配以及命令行参数是否完全匹配，包括偏移量是否正确。

如果您的 ESP32 在 eFuse 中使用了非默认的 FLASH_CRYPT_CONFIG 值，那么则需要向 espsecure.py 传递 --flash_crypt_conf 参数以设置匹配的值。如果设备自己设置了 flash 加密就不会出现这种情况，但如果手动烧录 eFuse 来启用 flash 加密就可能发生这种情况。

```
espsecure.py decrypt_flash_data 命令可以使用同样的选项（和不同的输入/输出文件）来解密 flash 密文或之前加密的文件。
```

4.14.14 技术细节

以下章节将提供 flash 加密操作的相关信息。

Flash 加密算法

- AES-256 在 16 字节的数据块上运行。Flash 加密引擎在 32 字节的数据（2 个串行 AES 块）上加密或解密数据。
- Flash 加密的主密钥存储于 flash_encryption eFuse 中，默认受保护防止进一步写入或软件读取。
- AES-256 密钥大小为 256 位（32 字节），从 flash_encryption eFuse 中读取。与 flash_encryption 中的存储顺序相比，硬件 AES 引擎使用的是相反的字节顺序的密钥。
  - 如果 CODING_SCHEME eFuse 设置为 0（默认“无”编码方案），则 eFuse 密钥块为 256 位，且密钥按原始存储（反字节序）。
  - 如果 CODING_SCHEME eFuse 设置为 1（3/4 编码），则 eFuse 密钥块为 192 位（反字节序），信息熵总量减少。硬件 flash 加密仍在 256 字节密钥上运行。在读取后（字节序未反向），密钥扩展为 key = key[0:255] + key[64:127]。
- Flash 加密中使用了逆向 AES 算法，因此 flash 加密的“加密”操作相当于 AES 解密，而其“解密”操作则相当于 AES 加密。这是为了优化性能，不会影响算法的有效性。
- 每个 32 字节块（2 个相邻的 16 字节 AES 块）都由一个特殊的密钥进行加密。该密钥由 flash_encryption 中 flash 加密的主密钥产生，并随 flash 中该字节块的偏移进行 XOR 运算（一次“密钥调整”）。
- 具体调整量取决于 FLASH_CRYPT_CONFIG eFuse 的设置。该 eFuse 共 4 位，每位可对特定范围的密钥位进行 XOR 运算；
  - Bit 1，对密钥的 0-66 位进行 XOR 运算。
  - Bit 2，对密钥的 67-131 位进行 XOR 运算。
  - Bit 3，对密钥的 132-194 位进行 XOR 运算。
  - Bit 4，对密钥的 195-256 位进行 XOR 运算。
建议将 FLASH_CRYPT_CONFIG 的值始终保留为默认值 0xF，这样所有密钥位都随块偏移进行 XOR 运算。详情请参见设置 FLASH_CRYPT_CONFIG。

- 块偏移的 19 个高位（第 5-23 位）由 flash 加密的主密钥进行 XOR 运算。选定该范围的原因：flash 的大小最大为 16 MB（24 位），每个块大小为 32 字节，因而 5 个最低有效位始终为 0。
- 从 19 个块偏移位中每个位到 flash 加密密钥的 256 位都有一个特殊的映射，以决定与哪个位进行 XOR 运算。有关完整映射可参见 espsecure.py 源代码中的变量 _FLASH_ENCRYPTION_TWEAK_PATTERN。
- 有关在 Python 中实现的完整 flash 加密算法，可参见 espsecure.py 源代码中的函数 _flash_encryption_operation()。

4.15 ESP-IDF FreeRTOS SMP Changes

4.15.1 Overview

The vanilla FreeRTOS is designed to run on a single core. However the ESP32 is dual core containing a Protocol CPU (known as CPU 0 or PRO_CPU) and an Application CPU (known as CPU 1 or APP_CPU). The two cores are identical in practice and share the same memory. This allows the two cores to run tasks interchangeably between them.

The ESP-IDF FreeRTOS is a modified version of vanilla FreeRTOS which supports symmetric multiprocessing (SMP). ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v10.2.0. This guide outlines the major differences between vanilla FreeRTOS and ESP-IDF FreeRTOS. The API reference for vanilla FreeRTOS can be found via https://www.freertos.org/a00106.html.

For information regarding features that are exclusive to ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS Additions.

Tasks and Task Creation: Use xTaskCreatePinnedToCore() or xTaskCreateStaticPinnedToCore() to create tasks in ESP-IDF FreeRTOS. The last parameter of the two functions is xCoreID. This parameter specifies which core the task is pinned to. Acceptable values are 0 for PRO_CPU, 1 for APP_CPU, or tskNO_AFFINITY which allows the task to run on both.

Round Robin Scheduling: The ESP-IDF FreeRTOS scheduler implements a “Best Effort Round-Robin Scheduling” instead of the ideal Round-RobinschedulinginvanillaFreeRTOS.

Scheduler Suspension: Suspending the scheduler in ESP-IDF FreeRTOS will only affect the scheduler on the calling core. In other words, calling vTaskSuspendAll() on PRO_CPU will not prevent APP_CPU from scheduling, and vice versa. Use critical sections or semaphores instead for simultaneous access protection.

Tick Interrupt Synchronicity: Tick interrupts of PRO_CPU and APP_CPU are not synchronized. Do not expect to use vTaskDelay() or vTaskDelayUntil() as an accurate method of synchronizing task execution between the two cores. Use a counting semaphore instead as their context switches are not tied to tick interrupts due to preemption.

Critical Sections & Disabling Interrupts: In ESP-IDF FreeRTOS, critical sections are implemented using mutexes. Entering critical sections involve taking a mutex, then disabling the scheduler and interrupts of the calling core. However the other core is left unaffected. If the other core attempts to take same mutex, it will spin until the calling core has released the mutex by exiting the critical section.

Floating Point Arithmetic: The ESP32 supports hardware acceleration of single precision floating point arithmetic (float). However the use of hardware acceleration leads to some behavioral restrictions in ESP-IDF FreeRTOS. Therefore, tasks that utilize float will automatically be pinned to a core if not done so already. Furthermore, float cannot be used in interrupt service routines.

Thread Local Storage Pointers & Deletion Callbacks: Deletion callbacks are called automatically during task deletion and are used to free memory pointed to by TLSP. Call vTaskSetThreadLocalStoragePointerAndDelCallback() to set TLSP and Deletion Callbacks.

Configuring ESP-IDF FreeRTOS: Several aspects of ESP-IDF FreeRTOS can be set in the project configuration (idf.py menuconfig) such as running ESP-IDF in Unicore (single core) Mode, or configuring the number of Thread Local Storage Pointers each task will have.
It is not necessary to manually start the FreeRTOS scheduler by calling `vTaskStartScheduler()`. In ESP-IDF the scheduler is started by the 应用程序的启动流程 and is already running when the `app_main` function is called (see 运行主任务 for details).

### 4.15.2 Tasks and Task Creation

Tasks in ESP-IDF FreeRTOS are designed to run on a particular core, therefore two new task creation functions have been added to ESP-IDF FreeRTOS by appending `PinnedToCore` to the names of the task creation functions in vanilla FreeRTOS. The vanilla FreeRTOS functions of `xTaskCreate()` and `xTaskCreateStatic()` have led to the addition of `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS.

For more details see `freertos/FreeRTOS-Kernel/tasks.c`

The ESP-IDF FreeRTOS task creation functions are nearly identical to their vanilla counterparts with the exception of the extra parameter known as `xCoreID`. This parameter specifies the core on which the task should run on and can be one of the following values:

- 0 pins the task to PRO_CPU
- 1 pins the task to APP_CPU
- `tskNO_AFFINITY` allows the task to be run on both CPUs

For example `xTaskCreatePinnedToCore(tsk_callback, "APP_CPU Task", 1000, NULL, 1)` creates a task of priority 10 that is pinned to APP_CPU with a stack size of 1000 bytes. It should be noted that the `uxStackDepth` parameter in vanilla FreeRTOS specifies a task’s stack depth in terms of the number of words, whereas ESP-IDF FreeRTOS specifies the stack depth in terms of bytes.

Note that the vanilla FreeRTOS functions `xTaskCreate()` and `xTaskCreateStatic()` have been defined in ESP-IDF FreeRTOS as inline functions which call `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` respectively with `tskNO_AFFINITY` as the `xCoreID` value.

Each Task Control Block (TCB) in ESP-IDF stores the `xCoreID` as a member. Hence when each core calls the scheduler to select a task to run, the `xCoreID` member will allow the scheduler to determine if a given task is permitted to run on the core that called it.

### 4.15.3 Scheduling

The vanilla FreeRTOS implements scheduling in the `vTaskSwitchContext()` function. This function is responsible for selecting the highest priority task to run from a list of tasks in the Ready state known as the Ready Tasks List (described in the next section). In ESP-IDF FreeRTOS, each core will call `vTaskSwitchContext()` independently to select a task to run from the Ready Tasks List which is shared between both cores. There are several differences in scheduling behavior between vanilla and ESP-IDF FreeRTOS such as differences in Round Robin scheduling, scheduler suspension, and tick interrupt synchronicity.

#### Round Robin Scheduling

Given multiple tasks in the Ready state and of the same priority, vanilla FreeRTOS implements Round Robin scheduling between multiple ready state tasks of the same priority. This will result in running those tasks in turn each time the scheduler is called (e.g. when the tick interrupt occurs or when a task blocks/yields).

On the other hand, it is not possible for the ESP-IDF FreeRTOS scheduler to implement perfect Round Robin due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.
The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin scheduling for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin Scheduling in action. Assume that:

- There are four ready state tasks of the same priority AX, B0, C1, D1 where:
  - The priority is the current highest priority with ready state tasks
  - The first character represents the task’s name (i.e., A, B, C, D)
  - And the second character represents the tasks core pinning (and X means unpinned)
- The task list is always searched from the head

1. Starting state. None of the ready state tasks have been selected to run
   Head [ AX , B0 , C1 , D0 ] Tail

2. Core 0 has tick interrupt and searches for a task to run.
   Task A is selected and is moved to the back of the list
   Core0=|
   Head [ AX , B0 , C1 , D0 ] Tail
   0
   Head [ B0 , C1 , D0 , AX ] Tail

3. Core 1 has a tick interrupt and searches for a task to run.
   Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.
   Task C is selected and is moved to the back of the list
   Core1------|
   0
   Head [ B0 , C1 , D0 , AX ] Tail
   0 1
   Head [ B0 , D0 , AX , C1 ] Tail

4. Core 0 has another tick interrupt and searches for a task to run.
   Task B is selected and moved to the back of the list
   Core0=|
   1
   Head [ B0 , D0 , AX , C1 ] Tail
   1 0
   Head [ D0 , AX , C1 , B0 ] Tail

5. Core 1 has another tick and searches for a task to run.
   Task D cannot be run due to incompatible affinity, so core 1 skips to Task A
   Task A is selected and moved to the back of the list
   Core1------|
   0
   Head [ D0 , AX , C1 , B0 ] Tail
   0 1
   Head [ D0 , C1 , B0 , AX ] Tail
The implications to users regarding the Best Effort Round Robin Scheduling:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin scheduling, users should ensure that all tasks of a particular priority are pinned to the same core.

**Scheduler Suspension**

In vanilla FreeRTOS, suspending the scheduler via `vTaskSuspendAll()` will prevent calls of `vTaskSwitchContext` from context switching until the scheduler has been resumed with `xTaskResumeAll()`. However servicing ISRs are still permitted. Therefore any changes in task states as a result from the current running task or ISRs will not be executed until the scheduler is resumed. Scheduler suspension in vanilla FreeRTOS is a common protection method against simultaneous access of data shared between tasks, whilst still allowing ISRs to be serviced.

In ESP-IDF FreeRTOS, `xTaskSuspendAll()` will only prevent calls of `vTaskSwitchContext()` from switching contexts on the core that called for the suspension. Hence if `PRO_CPU` calls `vTaskSuspendAll()`, `APP_CPU` will still be able to switch contexts. If data is shared between tasks that are pinned to different cores, scheduler suspension is **NOT** a valid method of protection against simultaneous access. Consider using critical sections (disables interrupts) or semaphores (does not disable interrupts) instead when protecting shared resources in ESP-IDF FreeRTOS.

In general, it’s better to use other RTOS primitives like mutex semaphores to protect against data shared between tasks, rather than `vTaskSuspendAll()`.

**Tick Interrupt Synchronicity**

In ESP-IDF FreeRTOS, tasks on different cores that unblock on the same tick count might not run at exactly the same time due to the scheduler calls from each core being independent, and the tick interrupts to each core being unsynchronized.

In vanilla FreeRTOS the tick interrupt triggers a call to `xTaskIncrementTick()` which is responsible for incrementing the tick counter, checking if tasks which have called `vTaskDelay()` have fulfilled their delay period, and moving those tasks from the Delayed Task List to the Ready Task List. The tick interrupt will then call the scheduler if a context switch is necessary.

In ESP-IDF FreeRTOS, delayed tasks are unblocked with reference to the tick interrupt on `PRO_CPU` as `PRO_CPU` is responsible for incrementing the shared tick count. However tick interrupts to each core might not be synchronized (same frequency but out of phase) hence when `PRO_CPU` receives a tick interrupt, `APP_CPU` might not have received it yet. Therefore if multiple tasks of the same priority are unblocked on the same tick count, the task pinned to `PRO_CPU` will run immediately whereas the task pinned to `APP_CPU` must wait until `APP_CPU` receives its out of sync tick interrupt. Upon receiving the tick interrupt, `APP_CPU` will then call for a context switch and finally switches contexts to the newly unblocked task.

Therefore, task delays should **NOT** be used as a method of synchronization between tasks in ESP-IDF FreeRTOS. Instead, consider using a counting semaphore to unblock multiple tasks at the same time.

**4.15.4 Critical Sections & Disabling Interrupts**

Vanilla FreeRTOS implements critical sections with `taskENTER_CRITICAL()` which calls `portDISABLE_INTERRUPTS()`. This prevents preemptive context switches and servicing of ISRs during a critical section. Therefore, critical sections are used as a valid protection method against simultaneous access in vanilla FreeRTOS.

On the other hand, ESP32 has no hardware method for cores to disable each other’s interrupts. Calling `portDISABLE_INTERRUPTS()` will have no effect on the interrupts of the other core. Therefore, disabling interrupts
Chapter 4. API

is NOT a valid protection method against simultaneous access to shared data as it leaves the other core free to access the data even if the current core has disabled its own interrupts.

For this reason, ESP-IDF FreeRTOS implements critical sections using special mutexes, referred to as portMUX_Type objects. These are implemented on top of a specific spinlock component. Calls to taskENTER_CRITICAL or taskEXIT_CRITICAL each provide a spinlock object as an argument. The spinlock is associated with a shared resource requiring access protection. When entering a critical section in ESP-IDF FreeRTOS, the calling core will disable interrupts similar to the vanilla FreeRTOS implementation, and will then take the spinlock and enter the critical section. The other core is unaffected at this point, unless it enters its own critical section and attempts to take the same spinlock. In that case it will spin until the lock is released. Therefore, the ESP-IDF FreeRTOS implementation of critical sections allows a core to have protected access to a shared resource without disabling the other core. The other core will only be affected if it tries to concurrently access the same resource.

The ESP-IDF FreeRTOS critical section functions have been modified as follows...

- taskENTER_CRITICAL(mux), taskENTER_CRITICAL_ISR(mux), portENTER_CRITICAL(mux), portENTER_CRITICAL_ISR(mux) are all macro defined to call internal function vPortEnterCritical()
- taskEXIT_CRITICAL(mux), taskEXIT_CRITICAL_ISR(mux), portEXIT_CRITICAL(mux), portEXIT_CRITICAL_ISR(mux) are all macro defined to call internal function vPortExitCritical()
- portENTER_CRITICAL_SAFE(mux), portEXIT_CRITICAL_SAFE(mux) macro identifies the context of execution, i.e ISR or Non-ISR, and calls appropriate critical section functions (port*_CRITICAL in Non-ISR and port*_CRITICAL_ISR in ISR) in order to be in compliance with Vanilla FreeRTOS.

For more details see esp_hw_support/include/soc/spinlock.h, freertos/FreeRTOS-Kernel/include/freertos/task.h, and freertos/FreeRTOS-Kernel/tasks.c

It should be noted that when modifying vanilla FreeRTOS code to be ESP-IDF FreeRTOS compatible, it is trivial to modify the type of critical section called as they are all defined to call the same function. As long as the same spinlock is provided upon entering and exiting, the exact macro or function used for the call should not matter.

4.15.5 Floating Point Arithmetic

ESP-IDF FreeRTOS implements Lazy Context Switching for FPUs. In other words, the state of a core’s FPU registers are not immediately saved when a context switch occurs. Therefore, tasks that utilize float must be pinned to a particular core upon creation. If not, ESP-IDF FreeRTOS will automatically pin the task in question to whichever core the task was running on upon the task’s first use of float. Likewise due to Lazy Context Switching, only interrupt service routines of lowest priority (that is it the Level 1) can use float, higher priority interrupts do not support FPU usage.

ESP32 does not support hardware acceleration for double precision floating point arithmetic (double). Instead double is implemented via software hence the behavioral restrictions with regards to float do not apply to double. Note that due to the lack of hardware acceleration, double operations may consume significantly larger amount of CPU time in comparison to float.

4.15.6 Task Deletion

In FreeRTOS task deletion the freeing of task memory will occur immediately (within vTaskDelete()) if the task being deleted is not currently running or is not pinned to the other core (with respect to the core vTaskDelete() is called on). TLSP deletion callbacks will also run immediately if the same conditions are met.

However, calling vTaskDelete() to delete a task that is either currently running or pinned to the other core will still result in the freeing of memory being delegated to the Idle Task.

4.15.7 Thread Local Storage Pointers & Deletion Callbacks

Thread Local Storage Pointers (TLSP) are pointers stored directly in the TCB. TLSP allow each task to have its own unique set of pointers to data structures. However task deletion behavior in vanilla FreeRTOS does not automatically
Chapter 4. API

free the memory pointed to by TLSP. Therefore if the memory pointed to by TLSP is not explicitly freed by the user before task deletion, memory leak will occur.

ESP-IDF FreeRTOS provides the added feature of Deletion Callbacks. Deletion Callbacks are called automatically during task deletion to free memory pointed to by TLSP. Each TLSP can have its own Deletion Callback. Note that due to the to Task Deletion behavior, there can be instances where Deletion Callbacks are called in the context of the Idle Tasks. Therefore Deletion Callbacks should never attempt to block and critical sections should be kept as short as possible to minimize priority inversion.

Deletion callbacks are of type void (*TlsDeleteCallbackFunction_t)( int, void * ) where the first parameter is the index number of the associated TLSP, and the second parameter is the TLSP itself.

Deletion callbacks are set alongside TLSP by calling vTaskSetThreadLocalStoragePointerAndDeleteCallback(). Calling the vanilla FreeRTOS function vTaskSetThreadLocalStoragePointer() will simply set the TLSP’s associated Deletion Callback to NULL meaning that no callback will be called for that TLSP during task deletion. If a deletion callback is NULL, users should manually free the memory pointed to by the associated TLSP before task deletion in order to avoid memory leak.

For more details see FreeRTOS API reference.

4.15.8 Configuring ESP-IDF FreeRTOS

The ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see FreeRTOS

CONFIG_FREERTOS_UNICORE will run ESP-IDF FreeRTOS only on PRO_CPU. Note that this is not equivalent to running vanilla FreeRTOS. Note that this option may affect behavior of components other than freertos. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION will trigger a halt in particular functions in ESP-IDF FreeRTOS which have not been fully tested in an SMP context.

CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call vTaskDelete()), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

4.16 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. Architecture
2. LL (Low Level) Layer
3. HAL (Hardware Abstraction Layer)

警告： Hardware abstraction API (excluding the driver and xxx_types.h) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF’s versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.
4.16.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the `hal` component. Each layer is dependent on the layer below it (i.e., driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral `xxx`, its hardware abstraction will generally consist of the header files described in the table below. Files that are Target Specific will have a separate implementation for each target (i.e., a separate copy for each chip). However, the `#include` directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.
Chapter 4. API

### 21: Hardware Abstraction Header Files

<table>
<thead>
<tr>
<th>Include Directive</th>
<th>Target Specific</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
#include 'soc/xxx_caps.h' | Y | This header contains a list of C macros specifying the various capabilities of the ESP32’s peripheral xxx. Hardware capabilities of a peripheral include things such as the number of channels, DMA support, hardware FIFO/buffer lengths, etc. |
| 
#include "soc/xxx_struct.h" 
#include "soc/xxx_reg.h" | Y | The two headers contain a representation of a peripheral’s registers in C structure and C macro format respectively. Users can operate a peripheral at the register level via either of these two header files. |
| 
#include "soc/xxx_pins.h" | Y | If certain signals of a peripheral are mapped to a particular pin of the ESP32, their mappings are defined in this header as C macros. |
| 
#include "soc/xxx_reg.h" | N | This header is mainly used as a convenience header file to automatically include xxx_caps.h, xxx_struct.h, and xxx_reg.h. |
| 
#include "hal/xxx_types.h" | N | This header contains type definitions and macros that are shared among the LL, HAL, and driver layers. Moreover, it is considered public API thus can be included by the application level. The shared types and definitions usually related to non-implementation specific concepts such as the following:  
- Protocol related types/macros such as frames, modes, common bus speeds, etc.  
- Features/characteristics of an xxx peripheral that are likely to be present on any implementation (implementation-independent) such as channels, operating modes, signal amplification or attenuation intensities, etc. |
| 
#include "hal/xxx_ll.h" | Y | This header contains the Low Level (LL) Layer of hardware abstraction. LL Layer API are primarily used to abstract away register operations into readable functions. |
| 
#include "hal/xxx_hal.h" | Y | The Hardware Abstraction Layer (HAL) is used to abstract away peripheral operation steps into functions (e.g., reading a buffer, starting a transmission, handling an event, etc). The HAL is built on top of the LL Layer. |
| 
#include "driver/xxx.h" | N | The driver layer is the highest level of ESP-IDF’s hardware abstraction. Driver layer API are meant to be called from ESP-IDF applications, and internally utilize OS primitives. Thus, driver layer API are event-driven, and can used in a multi-threaded environment. |

### 4.16.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```c
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
        xxx_ll_clk_src_t clock_source,
        uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
    hw->config.clk_sel = (source_clk == XXX_SCLK_APB) ? 0 : 1;
}
```

(下页續讀)
Chapter 4. API

```c
static inline uint32_t xxx_ll_get_rx_byte_count(xxx_dev_t *hw) {
    return hw->status_reg.rx_cnt;
}
```

The code snippet above illustrates typical LL functions for a peripheral `xxx`. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization.
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral’s registers; thus, the first argument is always a pointer to the starting address of the peripheral’s registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

4.16.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral’s register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modelling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT’s operation life cycle, thus illustrating how a HAL abstracts a peripheral’s operation into functional steps.

```c
// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler, _bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);
```

HAL functions will generally have the following characteristics:
• The first argument to a HAL function has the xxx_hal_context_t * type. The HAL context type is used
to store information about a particular instance of the peripheral (i.e. the context instance). A HAL context is
initialized by the xxx_hal_init() function and can store information such as the following:
  – The channel number of this instance
  – Pointer to the peripheral’s (or channel’s) registers (i.e., a xxx_dev_t * type)
  – Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  – Some configuration values for the instance (e.g., channel configurations)
  – Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is
    waiting for transaction to complete)
• HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchro-
nization/concurrency should be handled at higher layers (e.g., the driver).
• Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct
  wrapper (or macro) for an LL function.
• Some HAL functions may be placed in IRAM thus may carry an IRAM_ATTR or be placed in a separate
  xxx_hal_iram.c source file.

4.17 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 8 levels, plus an assortment of exceptions. On the
ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the interrupt allocator.
Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well,
allowing for very low interrupt latencies.

4.17.1 Interrupt Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Symbol</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>Exception and level 0 interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>2-3</td>
<td>N/A</td>
<td>Medium level interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>4</td>
<td>xt_highint4</td>
<td>Free to use (See 1)</td>
</tr>
<tr>
<td>5</td>
<td>xt_highint5</td>
<td>Normally used by ESP-IDF debug logic (See 1)</td>
</tr>
<tr>
<td></td>
<td>NMI</td>
<td>xt_nmi</td>
</tr>
<tr>
<td></td>
<td>dbg</td>
<td>xt_debugexception</td>
</tr>
</tbody>
</table>

The following notes give more information about the items in the tables above.

1. ESP-IDF debug logic can be configured to run on xt_highint4 or xt_highint5 in CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL. Bluetooth’s interrupt can be configured to run on level 4 by enabling CONFIG_BTDM_CTRL_HLI. If CONFIG_BTDM_CTRL_HLI is enabled, ESP-IDF debug logic must be running on level 5 interrupt.
2. If CONFIG_BTDM_CTRL_HLI is enabled, xt_debugexception is used to fix live lock issue in ESP32 ECO3.

Using these symbols is done by creating an assembly file (suffix .S) and defining the named symbols, like this:

```
.section .iram1,"ax"
.global xt_highint5
.type xt_highint5,@function
.align 4
xt_highint5:
... your code here
rsr a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the esp_system/port/soc/esp32/highint_hdl.S file; the panic handler interrupt is imple-
mented there.
4.17.2 Notes

- Do not call C code from a high-level interrupt; because these interrupts still run in critical sections, this can cause crashes. (The panic handler interrupt does call normal C code, but this is OK because there is no intention of returning to the normal code flow afterwards.)
  And if `CONFIG_BTDM_CTRL_HLI` is enabled, it does call normal C code in high-level interrupt, but this is OK because we add some protection for it.
- Make sure your assembly code gets linked in. If the interrupt handlers symbol is the only symbol the rest of the code uses from this file, the linker will take the default ISR instead and not link the assembly file into the final project. To get around this, in the assembly file, define a symbol, like this:
  ```
  .global ld_include_my_isr_file
  ld_include_my_isr_file:
  ```
  The symbol is called `ld_include_my_isr_file` here but can have any arbitrary name not defined anywhere else.
  Then, in the component CMakeLists.txt, add this file as an unresolved symbol to the ld command line arguments:
  ```
  target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")
  ```
  This should cause the linker to always include a file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.
  - High-level interrupts can be routed and handled using `esp_intr_alloc` and associated functions. The handler and handler arguments to `esp_intr_alloc` must be NULL, however.
  - In theory, medium priority interrupts could also be handled in this way. For now, ESP-IDF does not support this.

4.18 JTAG 调试

本文将介绍如何安装 ESP32 的 OpenOCD 调试环境，以及如何使用 GDB 来调试 ESP32 的应用程序。本文结构如下：

引言 介绍本指南主旨。
工作原理 介绍 ESP32、JTAG（Joint Test Action Group）接口、OpenOCD 和 GDB 如何相互连接，从而实现 ESP32 的调试功能。
选择 JTAG 适配器 介绍有关 JTAG 硬件适配器的选择及参照标准。
安装 OpenOCD 介绍如何安装官方编译好的 OpenOCD 软件包并验证是否安装成功。
配置 ESP32 目标板 介绍如何设置 OpenOCD 软件并安装 JTAG 硬件，两项共同构成调试目标。
启动调试器 介绍如何从 Eclipse 集成开发环境 和 命令行终端 启动 GDB 调试会话。
调试范围 如果您不熟悉 GDB，请查看此小节以获取 Eclipse 集成开发环境 以及 命令行终端 提供的调试示例。
从源码构建 OpenOCD 介绍如何在 Windows、Linux 和 macOS 操作系统上从源码构建 OpenOCD。
注意事项和补充内容 介绍使用 OpenOCD 和 GDB 通过 JTAG 接口调试 ESP32 时的注意事项和补充内容。

4.18.1 引言

ESP32 具有两个强大的 Xtensa 内核，支持多种程序架构。ESP-IDF 自带的 FreeRTOS 操作系统支持多核抢占式调度，允许用户以更加直观的方式编写软件。

与此相对地，由于缺乏合适的工具，简便的编程方式也会给程序的调试带来困难，比如找出由两个线程引起的错误，并且这两个线程在单独的 CPU 核上同时运行，那么仅凭 printf 语句会花费很长时间来定位错误。调试此类问题更需要 (往往也更快) 的方法是使用调试器，将其连接到处理器的调试端口。

乐鑫已完成 OpenOCD 移植，以支持 ESP32 处理器和多核 FreeRTOS 架构（此作为大多数 ESP32 应用程序的基础）。此外，乐鑫还提供了一些 OpenOCD 本身并不支持的工具，以进一步丰富调试功能。
本文将介绍如何在 Linux、Windows 和 macOS 环境下为 ESP32 安装 OpenOCD，并使用 GDB 进行软件调试。除部分安装修程有所不同外，所有操作系统的软件用户界面和使用流程都是相同的。

注解：本文使用的图片素材来自于 Ubuntu 16.04 LTS 上 Eclipse Neon 3 软件的截图，不同的操作系统（Windows、macOS 或 Linux）或不同的 Eclipse 软件版本在用户界面上可能会有细微差别。

4.18.2 工作原理

通过 JTAG（Joint Test Action Group）接口使用 OpenOCD 调试 ESP32 时所需要的关键软件和硬件包括 xtensa-esp32-elf-gdb 调试器、OpenOCD 上调试器和连接到 ESP32 目标 JTAG 适配器，如下图 “Application Loading and Monitoring” 标志所示。

![Diagram](image)

图 32: JTAG 调试 - 概述图

“Application Loading and Monitoring” 标志显示一组关键的软件和硬件组件，可用于编译、构建和烧写应用程序到 ESP32 上，以及监视来自 ESP32 的运行诊断信息。

Eclipse 环境集成了 JTAG 调试和应用程序加载、监视的功能，使得软件从编写、编译、加载到调试的迭代过程变得更加简单。Eclipse IDE 及其集成的调试软件均适用于 Windows、Linux 和 macOS 平台。

若使用 ESP-WROVER-KIT 开发板，由于其板载 FT232H 芯片，仅需一根 USB 线即可连接 PC 与 ESP32。FT232H 提供了两路 USB 通道，一路连接到 JTAG，另一路连接到 UART。

根根据用户喜好，除了使用 Eclipse 集成开发环境，还可以直接在命令行终端运行 debugger 和 idf.py build。

4.18.3 选择 JTAG 适配器

上手 JTAG 最快速便捷的方式是使用 ESP-WROVER-KIT 开发板，因为它板载了 JTAG 调试接口，无需使用外部 JTAG 硬件适配器和额外线缆来连接 JTAG 与 ESP32。ESP-WROVER-KIT 采用 FT2232H 提供的 JTAG 接口，可以稳定运行在 20 MHz 的时钟频率，外接的适配器很难达到这个速度。

上手 JTAG 最快速便捷的方式是将一根 USB 线连接到 ESP32 的 D+/D- USB 管脚，无须使用外部 JTAG 适配器和额外线缆。

如果您想使用单独的 JTAG 适配器，请确保其与 ESP32 的电平电压和 OpenOCD 软件都兼容。ESP32 使用的是业界标准的 JTAG 接口，它未使用（实际上也并不需要）TRST 信号线。JTAG 使用的 IO 管脚由
VDD_3P_RTC 电源管脚供电（通常连接到外部 3.3 V 的电源轨），因此 JTAG 硬件适配器的管脚需要能够在这个电压范围内正常工作。

在软件方面，OpenOCD 支持相当多数量的 JTAG 适配器，请参阅 OpenOCD 支持的适配器列表（请注意这一列表并不完整），其中还列出了兼容 SWD 接口的适配器，但请注意，ESP32 目前并不支持 SWD。此外，被硬编码为只支持特定产品的 JTAG 适配器也无法在 ESP32 上工作，例如仅针对 STM32 系列产品的 ST-LINK 适配器。

JTAG 正常工作至少需要连接的信号线有：TDI、TDO、TCK、TMS 和 GND。一些 JTAG 适配器还需要 ESP32 提供一路电源到适配器的某个管脚上（比如 Vtar），用于设置适配器的工作电压。您也可以选择将 SRST 信号线连接到 ESP32 的 CH_PD 管脚上，但请注意，目前 OpenOCD 对该信号线提供的支持相当有限。

ESP-Prog 中展示了使用外部电路板进行调试的实例，方法是将其连接到 ESP32 的 JTAG 管脚上。

### 4.18.4 安装 OpenOCD

如果您已经按照 快速入门 完成了 ESP-IDF 及其 CMake 构建系统的安装，那么 OpenOCD 已经被默认安装到了您的开发系统中。在 设置开发环境 结束后，您应该能够在终端中运行如下 OpenOCD 命令：

```
openocd --version
```

终端会输出以下信息（实际版本号可能会更新）：

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read http://openocd.org/doc/doxygen/bugs.html
```

您还可以检查 OPENOCD_SCRIPTS 环境变量的值，以确认 OpenOCD 配置文件的路径，Linux 和 macOS 用户可以在终端输入 `echo $OPENOCD_SCRIPTS`，Windows 用户需要输入 `echo %OPENOCD_SCRIPTS%`。如果终端输出了有效路径，则表明您已经正确安装 OpenOCD。

如果无法执行上述步骤，请再次阅读快速入门手册，参考 设置安装工具 章节。

**注解**：另外也可以从源代码编译 OpenOCD 工具，详细信息请参阅 从源码构建 OpenOCD 章节。

### 4.18.5 配置 ESP32 目标板

OpenOCD 安装完成后就可以配置 ESP32 目标（即带 JTAG 接口的 ESP32 板），具体分为以下三个步骤：

- 配置并连接 JTAG 接口
- 运行 OpenOCD
- 上传待调试的应用程序

#### 配置并连接 JTAG 接口

此步骤取决于使用的 JTAG 和 ESP32 板，请参考以下两种情况。

**配置 ESP-WROOM-32 上的 JTAG 接口** 所有版本的 ESP-WROOM-32 板子都内置了 JTAG 调试功能，要使其正常工作，还需要设置相关跳线来启用 JTAG 功能，设置 SPI 闪存电压和配置 USB 驱动程序。具体步骤请参考以下说明。
配置硬件

- 根据ESP-WROVER-KIT V4.1入门指南文档中设置选项章节所描述的信息，设置JP8便可以启用JTAG功能。
- 检查ESP32上用于JTAG通信的引脚是否被接到了其它硬件上，这可能会影响JTAG的工作。

<table>
<thead>
<tr>
<th>ESP32引脚</th>
<th>JTAG信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO/GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI/GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK/GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS/GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

配置USB驱动 安装和配置USB驱动，这样OpenOCD才能够与ESP-WROVER-KIT板上的JTAG接口通信，并且使用UART接口上传待烧写的镜像文件。请根据你的操作系统按照以下步骤进行安装配置。

注解：ESP-WROVER-KIT使用了FT2232芯片实现了JTAG适配器，所以以下说明同样适用于其他基于FT2232的JTAG适配器。

Windows

1. 使用标准USB A / micro USB B线将ESP-WROVER-KIT与计算机相连接，并打开板子的电源。
2. 等待Windows识别出ESP-WROVER-KIT并且为其安装驱动。如果驱动没有被自动安装，请前往官网下载并手动安装。
3. 从Zadig官网下载Zadig工具（Zadig_X.X.exe）并运行。
4. 在Zadig工具中，进入“Options”菜单中选中“List All Devices”。
5. 检查设备列表，其中应该包含两条与ESP-WROVER-KIT相关的条目：“Dual RS232-HS (Interface 0)”和“Dual RS232-HS (Interface 1)”。驱动的名字应该是“FTDIBUS (vxxxx)”并且USB ID为：04036010。

图33：在Zadig工具中配置JTAG USB驱动

6. 第一个设备“Dual RS232-HS (Interface 0)”连接到了ESP32的JTAG端口，此设备原来的“FTDIBUS (vxxxx)”驱动需要替换成“WinUSB (v6xxxxx)”。为此，请选择“Dual RS232-HS (Interface 0)”并将驱动重新安装为“WinUSB (v6xxxxx)”，具体可以参考上图。
注解：请勿更改第二个设备“Dual RS232-HS（Interface 1）”的驱动，它被连接到 ESP32 的串口（UART），用于上传应用程序映像给 ESP32 进行烧写。

现在，ESP-WROVER-KIT 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往运行 OpenOCD 章节。

Linux

1. 使用标准 USB A / micro USB B 线将 ESP-WROVER-KIT 与计算机相连接，并打开板子的电源。
2. 打开终端，输入 ls -l /dev/ttyUSB* 命令检查操作系统是否能够识别板子的 USB 端口。类似识别结果如下：

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
   crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
   crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
   ```

3. 根据 OpenOCD README 文档中“Permissions delegation”小节的介绍，设置这两个 USB 端口的访问权限。
4. 注销并重新登录 Linux 系统，然后重新插拔板子的电源使之前的改动生效。在终端再次输入 ls -l /dev/ttyUSB* 命令进行验证，查看这两个设备的组所有者是否已经从 dialout 更改为 plugdev。

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
   crw-rw---- 1 root plugdev 188, 0 Jul 10 19:07 /dev/ttyUSB0
   crw-rw---- 1 root plugdev 188, 1 Jul 10 19:07 /dev/ttyUSB1
   ```

如果看到类似的输出结果，并且你也是 plugdev 组的成员，那么设置工作就完成了。

具有较低编号的 /dev/ttyUSBn 接口用于 JTAG 通信，另一路接口被连接到 ESP32 的串口（UART），用于上传应用程序映像给 ESP32 进行烧写。

现在，ESP-WROVER-KIT 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往运行 OpenOCD 章节。

MacOS 在 macOS 上，同时使用 FT2232 的 JTAG 接口和串口还需另外进行其它操作。当操作系统加载 FTDI 串口驱动的时候，它会对 FT2232 芯片的两个通道做相同的操作。但是，这两个通道中只有一个是被用作串口，而另一个用于 JTAG，如果操作系统已经为用于 JTAG 的通道加载了 FTDI 串口驱动的话，OpenOCD 将无法连接到芯片。有两个方法可以解决这个问题：

1. 在启动 OpenOCD 之前手动卸载 FTDI 串口驱动程序，然后启动 OpenOCD，再加载串口驱动程序。
2. 修改 FTDI 驱动程序的配置，使其不会为 FT2232 芯片的通道 B 进行自我加载，该通道用于 ESP-WROVER-KIT 板上的 JTAG 通道。

手动卸载驱动程序

1. 从 FTDI 官网 安装驱动。
2. 使用 USB 线连接 ESP-WROVER-KIT。
3. 卸载串口驱动

   ```
   sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
   ```

有时，您可能还需要卸载苹果的 FTDI 驱动：

- macOS < 10.15:

   ```
   sudo kextunload -b com.apple.driver.AppleUSBFTDI
   ```

- macOS 10.15:

   ```
   sudo kextunload -b com.apple.DriverKit-AppleUSBFTDI
   ```
警告：对于 FTDI 驱动，如果使用串口的通道不正确，则可能会导致内核崩溃。ESP-WROVER-KIT 将通道 A 用于 JTAG，通道 B 用于串口。

4. 运行 OpenOCD:

```bash
.. include:: esp32.inc
:start-after: run-openocd
:end-before: ---
```

5. 在另一个终端窗口，再一次加载 FTDI 串口驱动:

```
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

注解：如果你需要重启 OpenOCD，则无需再次卸载 FTDI 驱动程序，只需停止 OpenOCD 并再次启动它。只有在重新连接 ESP-WROVER-KIT 或者切换了电源的情况下才需要再次卸载驱动。

你也可以根据自身需求，将此过程包装进 shell 脚本中。

修改 FTDI 驱动 简而言之，这种方法需要修改 FTDI 驱动程序的配置文件，这样可以防止为 FT2232H 的通道 B 自动加载串口驱动。

注解：其他板子可能将通道 A 用于 JTAG，因此请谨慎使用此选项。

警告：此方法还需要操作系统禁止对驱动进行签名验证，因此可能无法被所有的用户所接受。

1. 使用文本编辑器打开 FTDI 驱动的配置文件（注意 sudo）:

```
sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
```

2. 找到并删除以下几行:

```xml
<key>FT2232H_B</key>
<dict>
<key>CFBundleIdentifier</key>
<string>com.FTDI.driver.FTDIUSBSerialDriver</string>
<key>iOLClass</key>
<string>FTDIUSBSerialDriver</string>
<key>iOProviderClass</key>
<string>IOUSBInterface</string>
<key>bConfigurationValue</key>
<integer>1</integer>
<key>bInterfaceNumber</key>
<integer>1</integer>
<key>bcdDevice</key>
<integer>1792</integer>
<key>idProduct</key>
<integer>24592</integer>
<key>idVendor</key>
<integer>1027</integer>
</dict>
```

3. 保存并关闭文件
4. 禁用驱动的签名认证:
   1. 点击苹果的 logo，选择 “Restart…”
   2. 重启后当听到响铃时，立即按下键盘上的 CMD+R 组合键
   3. 进入恢复模式后，打开终端
   4. 运行命令:
5. 再一次重启系统
完成这些步骤后，可以同时使用串口和 JTAG 接口了。
想要进一步设置调试环境，请前往运行 OpenOCD 章节。

配置其它 JTAG 接口：关于适配 OpenOCD 和 ESP32 的 JTAG 接口选择问题，请参考选择 JTAG 适配器章节，确保 JTAG 适配器能够与 OpenOCD 和 ESP32 一同工作。然后按照以下三个步骤进行设置，使其正常工作。

配置硬件
1. 找到 JTAG 接口和 ESP32 板上需要相互连接并建立通信的引脚/信号。
   表 23: ESP32 引脚和 JTAG 接口信号

<table>
<thead>
<tr>
<th>ESP32 引脚</th>
<th>JTAG 信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO/GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI/GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK/GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS/GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

2. 检查 ESP32 上用于 JTAG 通信的引脚是否被连接到了其它硬件上，这可能会影响 JTAG 的工作。
3. 连接 ESP32 和 JTAG 接口上的引脚/信号。

配置驱动：你可能还需要安装软件驱动，才能使 JTAG 在计算机上正常工作，请参阅你所使用的 JTAG 适配器的有关文档，获取相关详细信息。

连接：将 JTAG 接口连接到计算机，打开 ESP32 和 JTAG 接口板上的电源，然后检查计算机是否可以识别到 JTAG 接口。
要继续设置调试环境，请前往运行 OpenOCD 章节。

运行 OpenOCD
配置完目标并将其连接到电脑后，即可启动 OpenOCD。
打开终端，按照快速入门指南中的设置好开发环境章节进行操作，然后运行如下命令，以启动 OpenOCD（该命令适用于 Windows、Linux 和 macOS）：

```
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

注解：上述命令中 -f 选项后跟的配置文件专用于板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板。基于具体使用的硬件，您可能需要选择不同的配置文件，具体内容请参阅根据目标芯片配置 OpenOCD。

例如，对于带有用于 JTAG 连接的 FT2232H 或 FT232H 芯片的定制板，或带有 ESP-Prog 的定制板，可使用 board/esp32c3-ftdi.cfg。

现在您应该可以看到如下输出（此日志来自板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板）：

```
如果出现指示权限问题的错误，请打开 ~/esp/openocd-esp32 目录，参阅 OpenOCD README 文件中关于“Permissions delegation”的说明。

如果遇到无法找到配置文件的错误，例如 Can't find board/esp32-wrover-kit-3.3v.cfg，请检查 OPENOCD_SCRIPTS 环境变量是否设置正确，OpenOCD 根据此环境变量来查找 -f 指定的文件，参见安装 OpenOCD。此外，还需要检查配置文件是否确实位于该路径下。

如果出现 JTAG 错误（例如输出为 ...all ones 或 ...all zeroes），请检查硬件连接是否正确。除了 ESP32 的管脚之外是否还有其他信号连接到了 JTAG，并查看是否所有器件都已经上电。

上传待调试的应用程序

按照正常步骤构建并上传 ESP32 应用程序，具体请参阅第八步：编译工程 章节。

此外，您还可以使用 OpenOCD 通过 JTAG 接口将应用程序镜像烧写到闪存中，命令如下:

codec -f board/esp32-wrover-kit-3.3v.cfg -c "program_esp filename.bin 0x10000 ...verify exit"

其中 OpenOCD 的烧写命令 program_esp 格式如下:

program_esp <image_file> <offset> [verify] [reset] [exit]

- image_file: 程序镜像文件存放的路径
- offset: 镜像烧写到闪存中的偏移地址
- verify: 烧写完成后校验闪存中的内容（可选）
- reset: 烧写完成后重启目标（可选）
- exit: 烧写完成后退出 OpenOCD（可选）

现在可以调试应用程序了，请按照以下章节中的步骤进行操作。

4.18.6 启动调试器

ESP32 的工具链中带有 GNU 调试器（简称 GDB），它和其它工具链软件共同存放于 xtensa-esp32-elf-gdb 中。除了直接在命令行终端中调用并操作 GDB 外，也可以在 IDE（例如 Eclipse, Visual Studio Code 等）中进行调用，使用图形用户界面间接运行 GDB，这一方法无需在终端中输入任何命令。

关于以上两种调试器的使用方法，详见以下链接。

- 使用 Eclipse 调试
- 使用命令行调试

建议首先检查调试器能否在命令行终端下正常工作，然后再使用 Eclipse 集成开发环境 进行调试工作。
4.18.7 调试范例

本节适用于不熟悉 GDB 的用户，下文将使用 get-started/blink 下简单的应用程序来演示调试会话的工作流程，同时会介绍以下常用的调试操作:

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

此外还会提供在命令行终端进行调试下使用 GDB 调试的案例。

在演示之前，请完成 ESP32 目标板设置并加载 get-started/blink 至 ESP32 中。

4.18.8 从源码构建 OpenOCD

以下文档分别介绍了如何在各操作系统平台上从源码构建 OpenOCD。

Windows 环境下从源码编译 OpenOCD

除了从 Espressif 官方直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往安装 OpenOCD 章节查阅。

下载 OpenOCD 源码 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32，请使用以下命令来下载源代码:

```bash
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包。

注解: 依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```bash
pacman -S libtool
pacman -S autoconf
pacman -S automake
pacman -S texinfo
pacman -S mingw-w64-i686-libusb-compat-git
pacman -S pkg-config
```

注解: 安装 pkg-config 会破坏 esp-idf 的工具链。因而在 OpenOCD 构建完成后，应将其卸载。详见文末进一步说明。如果想要再次构建 OpenOCD，你需要再次运行 pacman -S pkg-config。此步骤安装的其他软件包（在 pkg-config 之前）并不会出现这一问题。

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:
你可以选择再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

### 注解:
- 如果发生错误，请解决后再次尝试编译，直到 `make` 成功为止。
- 如果 OpenOCD 存在子模块问题，请 `cd` 到 openocd-esp32 目录，并输入 `git submodule update --init` 命令。
- 如果 `./configure` 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 `./openocd-esp32/doc/INSTALL.txt` 文中的描述使用 `./configure` 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README.Windows。

一旦 `make` 过程成功完成，OpenOCD 的可执行文件会被保存到 `~/esp/openocd-esp32/src/openocd` 目录中。

如安装依赖步骤所述，最后还需要移除 `pkg-config` 软件包:

```
pacman -Rs pkg-config
```

### 下一步：
想要进一步配置调试环境，请前往 配置 ESP32 目标板 章节。

#### Linux 环境下从源码编译 OpenOCD
除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往 安装 OpenOCD 章节查阅。

#### 下载 OpenOCD 源码
支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32。请使用以下命令来下载源代码:

```
cd ~/esp
 git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

#### 安装依赖的软件包
安装编译 OpenOCD 所需的软件包。

### 注解：
依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```
sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0
```
注解:
- pkg-config 应为 0.2.3 或以上的版本。
- autoconf 应为 2.6.4 或以上的版本。
- automake 应为 1.9 或以上的版本。
- 当使用 USB-Blaster，ASIX Presto，OpenJTAG 和 FT2232 作为适配器时，需要下载安装 libFTDI 和 FTD2XX 的驱动。
- 当使用 CMSIS-DAP 时，需要安装 HIDAPI。

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```bash
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 sudo make install，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

注解:
- 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
- 如果 OpenOCD 存在子模块问题，请 cd 到 openocd-esp32 目录，并输入 git submodule update --init 命令。
- 如果 ./configure 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 ../openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README。

一旦 make 过程成功结束，OpenOCD 的可执行文件会被保存到 ~/openocd-esp32/bin 目录中。

下一步 想要进一步配置调试环境，请前往配置 ESP32 目标板 章节。

MacOS 环境下从源码编译 OpenOCD

除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，备份好当前文件，前往安装 OpenOCD 章节查阅。

下载 OpenOCD 源码 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32，使用以下命令来下载源代码:

```bash
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

安装依赖的软件包 使用 Homebrew 安装编译 OpenOCD 所需的软件包:

```bash
brew install automake libtool libusb wget gcc@4.9 pkg-config
```
构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```bash
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 `sudo make install`，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

注解:
- 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
- 如果 OpenOCD 存在子模块问题，请 cd 到 openocd-esp32 目录，并输入 `git submodule update --init` 命令。
- 如果 ./configure 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 ./openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README.OSX。

一旦 make 过程成功结束，OpenOCD 的可执行文件会被保存到 ~/esp/openocd-esp32/src/openocd 目录中。

下一步 想要进一步配置调试环境，请前往配置 ESP32 目标板 章节。

本文档在演示中所使用的 OpenOCD 是预编译好的二进制发行版，在安装 OpenOCD 章节中有所介绍。

如果要使用本地从源代码编译的 OpenOCD 程序，需要将相应可执行文件的路径修改为 src/openocd，并设置 OPENOCD_SCRIPTS 环境变量，使得 OpenOCD 能够找到配置文件。Linux 和 macOS 用户可以执行:

```bash
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

Windows 用户可以执行:

```bash
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

针对 Linux 和 macOS 用户，运行本地编译的 OpenOCD 的示例:

```bash
src/openocd -f board/esp32-wrover-kit-3.3v.cfg
```

Windows 用户的示例如下:

```bash
src\openocd -f board\esp32-wrover-kit-3.3v.cfg
```

4.18.9 注意事项和补充内容

本节列出了上文中提到的所有注意事项和补充内容的链接。

注意事项和补充内容

本节提供了本指南中各部分提到的一些注意事项和补充内容。
可用的断点和观察点：ESP32调试器支持2个硬件断点和64个软件断点。硬件断点是由ESP32芯片内部的逻辑电路实现的，能够设置在代码的任何位置，即内存或者IRAM的代码区域。除了硬件断点，OpenOCD还支持软件断点：当使用menuconfig中的CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK项时会使用第二硬件断点。如果不在OpenOCD或者GDB中再次尝试使用这个观察点，可能会得到预期的结果。

关于断点的补充知识：使用软件的内存模拟部分硬件断点的方式就是当使用GDB命令`hb myFunction`给某个函数设置硬件断点时，如果该函数位于内存中，并且此时还可用的硬件断点，该调试器就会使用硬件断点，否则就使用32个软件内存断点中的一个来模拟。这个规则同样适用于b myFunction之类的命令。在这种情况下，GDB会自己决定使用哪种类型的断点。如果myFunction位于可写区域(IRAM)，那就使用软件内存断点，否则就会像处理 hb 命令一样使用硬件断点或者软件内存断点。

闪存映射 vs 软件内存断点：为了在内存中设置或者清除软件断点，OpenOCD需要知道它们在内存中的地址。为了完成从ESP32的地址空间到内存地址的转换，OpenOCD使用内存中页面代码区域的映射。这些映射被保存在内存映射的头部，位于页目录数据（代码段和数据段）之前，并且保存在写入缓存的每一个应用的映射表中。为了支持软件内存断点，OpenOCD需要知道待调试的内存区域映射在内存中的位置。默认情况下，OpenOCD会在0x8000处读取分区表并使用第一个找到的内存映射映射，但是也可能会存在无法工作的原因，比如分区表不标准的内存位置，甚至可能有多个映射；一个出厂映射和两个OTA映射。你可能需要调试其中的任意一个。为了涵盖所有的调试情况，OpenOCD支持特殊的命令，用于指定待调试的内存映射在内存中的具体位置。该命令具有以下格式：

```
esp appimage_offset <offset>
```

偏移量应为十六进制，若要恢复默认行为，可以将偏移地址设置为-1。

注解：由于GDB在连接OpenOCD时仅仅请求一次内存映射，所以可以在TCL配置文件中指定该命令，或者通过命令行传递给OpenOCD。对于后者，命令示例如下：

```
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "init; halt; esp appimage_offset...-0x210000"
```

另外还可以通过OpenOCD的telnet会话执行该命令，然后再连接GDB，不过这种方式似乎没有那么便捷。

“next”命令无法跳过子程序的原因：当使用next命令单步执行代码时，GDB会在子程序的前面设置一个断点（两个中可用的一个），这样就可以跳过进入子程序内部的细节。如果这两个断点已经用在代码的其它位置，那么next命令将不起作用。在这种情况下，请删除一个断点以使其中一个变得可用。当两个断点都已经被使用时，next命令会像step命令一样工作，调试器就会进入子程序内部。

OpenOCD支持的编译时的选项：ESP-IDF有一些针对OpenOCD调试功能的选项可以在编译时进行设置。

- `CONFIG_ESP32_DEBUG_OCDAware`默认会被能。如果程序抛出了不可修复或者未处理的异常，并且此时已经连接上了JTAG调试器（即OpenOCD正在运行），那么ESP-IDF将会进入调试器工作模式。
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`默认没有使能。在所有任务堆栈的末尾设置观察点，从1号开始索引。这是调试任务堆栈溢出的最准确的方式。

更多有关设置编译时的选项的信息，请参阅项目配置菜单。
Chapter 4. API 指南

支持 FreeRTOS OpenOCD 完全支持 ESP-IDF 自带的 FreeRTOS 操作系统，GDB 会将 FreeRTOS 中的任务当作线程。使用 GDB 命令 i threads 可以查看所有的线程，使用命令 thread n 可以切换到某个具体任务的堆栈，其中 n 是线程的编号。检测 FreeRTOS 的功能可以在配置目标时被禁用。更多详细信息，请参阅根据目标芯片配置 OpenOCD。

在 OpenOCD 的配置文件中设置 SPI 闪存的工作电压 ESP32 的 MTDI 引脚是用于 JTAG 通信的四个引脚之一，同时也是 ESP32 的 bootstrapping 引脚。上电时，ESP32 会在 MTDI 引脚上采样二进制电平，据此来设置内部的稳压器，用于给外部的 SPI 闪存芯片供电。如果上电时 MTDI 引脚上的二进制电平为低电平，则稳压器会被设置为 3.3 V；如果 MTDI 引脚为高电平，则稳压器会被设置为 1.8 V。MTDI 引脚通常需要一个上拉电阻或者直接能使内部的弱下拉电阻（详见 ESP32 系列芯片技术规格书），具体取决于所使用的 SPI 芯片的类型。但是一旦连接上 JTAG 后，原来用于实现 bootstrapping 功能的上拉或下拉电阻会被覆盖掉。

为了解决这个问题，OpenOCD 的板级配置文件（例如 ESP-WROVER-KIT 开发板的 board\esp32-wrover-kit-3.3v.cfg）提供了 ESP32_FLASH_VOLTAGE 参数来设置 TDO 信号线在空闲状态下的二进制电平，这样就减少由于闪存电压不正确而导致的应用程序启动不良的几率。

查看 JTAG 连接的 ESP32 模组的规格书，检查其 SPI 闪存芯片的供电电压值，然后再相应的设置 ESP32_FLASH_VOLTAGE。大多数 WROOM 模块使用 3.3 V 的闪存芯片。早于 ESP32-WROVER-B 的 WROVER 模块使用 1.8 V 闪存芯片，而 ESP32-WROVER-B 和 E 模块使用 3.3 V 闪存芯片。

优化 JTAG 的速度 为了实现更高的数据通信速率同时最小化丢包数，建议优化 JTAG 时钟频率的设置，使其达到 JTAG 能稳定运行的最大值。为此，请参考以下建议。

1. 如果 CPU 以 80 MHz 运行，则 JTAG 时钟频率的上限为 20 MHz：如果 CPU 以 160 MHz 或者 240 MHz 运行，则上限为 26 MHz。
2. 根据特定的 JTAG 适配器和连接电缆的长度，你可能需要将 JTAG 的工作频率降低至 20 / 26 MHz 以下。
3. 在某些特殊情况下，如果你看到 DSR/DIR 错误（并且它并不是由 OpenOCD 试图从一个没有物理存储器映射的地址空间读取数据而导致的），请降低 JTAG 的工作频率。
4. ESP-WROVER-KIT 能够稳定运行在 20 / 26 MHz 频率下。

调试器的启动命令的含义 在启动时，调试器发出一系列命令来复位芯片并使其在特定的代码行停止运行。这个命令序列（如下所示）支持自定义，用户可以选择在最方便合适的代码行开始调试工作。

- set remote hardware-watchpoint-limit 2 —限制 GDB 仅使用 ESP32 支持的两个硬件观察点。更多详细信息，请查阅 GDB 配置远程目标。
- mon reset halt —复位芯片并使 CPU 停止运行。
- flushregs —monitor (mon) 命令无法通知 GDB 目标状态已经更改，GDB 会假设在 mon reset halt 之前所有的任务堆栈仍然有效，实际上，复位后目标状态将发生变化。执行 flushregs 是一种强制 GDB 从目标获取最新状态的方法。
- thb app_main —在 app_main 处插入一个临时的硬件断点，如果有需要，可以将其替换为其他函数。
- c —恢复程序运行，它将会在 app_main 的断点处停止运行。

根据目标芯片配置 OpenOCD OpenOCD 有很多种配置文件 (*.cfg)，它们位于 OpenOCD 安装目录的 share/openocd/scripts 子目录下（或者在 OpenOCD 源码目录的 tcl/scripts 目录中）。本文主要介绍 board, interface 和 target 这三个目录。

- interface 包含了例如 ESPProg, J-Link 这些 JTAG 适配器的配置文件。
- target 包含了目标芯片或者模块的配置文件。
- board 包含有关于 JTAG 适配器的开发板的配置文件，这些配置文件会根据实际的 JTAG 适配器和芯片/模块来构建某个具体的 interface 和 target 配置。

ESP32 可以使用的配置文件如下表所示：
如果你使用的开发板已经有了一份预定义好的配置文件，你只需将该文件通过 -f 参数告诉 OpenOCD。
如果你的开发板不在上述列表中，你需要使用多个 -f 参数来告诉 OpenOCD 你选择的 interface 和 target 配置文件。

自定义配置文件 OpenOCD 的配置文件是用 TCL 语言编写的，包含了定制和编写脚本的各种选项。这在非标准调试的场景中非常有用，更多关于 TCL 脚本的内容请参考 OpenOCD 参考手册。

OpenOCD 中的配置变量 你还可以视情况在导入 target 配置文件之前，设定如下变量的值。可以写在自定义配置文件中，或通过命令行传递。

TCL 语言中为变量赋值的语法是：

```tcl
set VARIABLE_NAME value
```

在命令行中为变量赋值请参考如下示例（请把 .cfg 配置文件替换成你自己的开发板配置）：

```bash
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

请切记，一定要在导入配置文件之前设置这些变量，否则变量的值将不会生效。为多个变量赋值需要重复多次 -c 选项。

### 表 24: ESP32 相关的 OpenOCD 配置文件

<table>
<thead>
<tr>
<th>名字</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>board/esp32-wrover-kit-3.3v.cfg</td>
<td>板载 3.3V 模组（ESP32-WROVER-32, ESP32-WROVER-B, ESP32-WROVER-E）的 ESP-WROVER-KIT 开发板配置文件</td>
</tr>
<tr>
<td>board/esp32-wrover-kit-1.8v.cfg</td>
<td>板载 1.8V 模组（ESP32-WROVER）的 ESP-WROVER-KIT 开发板配置文件</td>
</tr>
<tr>
<td>board/esp32-ethernet-kit-3.3v.cfg</td>
<td>板载 3.3V 模组（ESP32-WROVER-B / ESP32-WROVER-E）的 ESP-Ethernet-KIT 开发板配置文件</td>
</tr>
<tr>
<td>target/esp32.cfg</td>
<td>ESP32 的目标配置文件，可以和某个 interface/ 下的配置文件一同使用</td>
</tr>
<tr>
<td>target/esp32-solo-1.cfg</td>
<td>ESP32-SOLO-1 的目标配置文件，和 esp32.cfg 的差别在于它仅配置一个 CPU</td>
</tr>
<tr>
<td>interface/ftdi/esp32_devkitj_v1.cfg</td>
<td>适用于 ESP-WROVER-KIT 和 ESP-Prog 板子的 JTAG 适配器配置文件</td>
</tr>
</tbody>
</table>

### 表 25: 通用的 ESP 相关的 OpenOCD 变量

<table>
<thead>
<tr>
<th>变量名</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_RTOS</td>
<td>设置成 none 可以关闭 OpenOCD 对 RTOS 的支持。这样的话，你将无法在 GDB 中查看到线程列表。这个功能在调试 FreeRTOS 本身的时候会很有用。可以单步调试调度器的代码。</td>
</tr>
<tr>
<td>ESP_FLASH_SIZE</td>
<td>设置成 0 可以关闭对 Flash 断点的支持。</td>
</tr>
<tr>
<td>ESP_SEMIHOST_BASEDIR</td>
<td>设置 semihosting 在主机端的默认目录。</td>
</tr>
</tbody>
</table>

### 表 26: ESP32 相关的 OpenOCD 变量

<table>
<thead>
<tr>
<th>名字</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32_FLASH_VOLTAGE</td>
<td>如果 ESP32 模组集成的是 1.8V 的 Flash，将该变量设置为 1.8，详情请参考在 OpenOCD 的配置文件中设置 SPI 闪存的工作电压</td>
</tr>
<tr>
<td>ESP32_ONLYCPU</td>
<td>对于多核芯片，将该值设置为 1 可以仅启用单核调试功能</td>
</tr>
</tbody>
</table>
复位 ESP32 通过在 GDB 中输入 `mon reset` 或者 `mon reset halt` 来复位板子。

不要将 JTAG 引脚用于其他功能 如果除了 ESP32 模组和 JTAG 适配器之外的其他硬件也连接到了 JTAG 引脚，那么 JTAG 的操作可能会受到干扰。ESP32 JTAG 使用以下引脚：

<table>
<thead>
<tr>
<th>ESP32 引脚</th>
<th>JTAG 信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTDCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

如果用户应用程序更改了 JTAG 引脚的配置，JTAG 通信可能会失败。如果 OpenOCD 正确初始化（检测到两个 Tensilica 内核），但在程序运行期间失去了同步并报出大量 DTR/DIR 错误，则应用程序可能将 JTAG 引脚重新配置为其他功能或者用户忘记将 Vtar 连接到 JTAG 适配器。

以下是 GDB 在应用程序进入重新配置 MTDI/GPIO15 作为输入代码后报告的一系列错误摘录：

```plaintext
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated. an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated. an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated. an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated. an overrun!
```

**JTAG 与闪存加密和安全引导** 默认情况下，开启了闪存加密和（或者）安全引导后，系统在首次启动时，引导程序会烧写 eFuse 的某个比特，从而将 JTAG 永久关闭。

Kconfig 配置项 `CONFIG_SECURE_BOOT_ALLOW_JTAG` 可以改变这个默认行为，使得用户即使开启了安全引导或者闪存加密，仍会保留 JTAG 的功能。

然而，因为设置 **软件断点** 的需要，OpenOCD 会尝试自动读取 Flash 中的内容，这会带来两个问题：

- 软件断点和闪存加密是不兼容的，目前 OpenOCD 尚不支持对 Flash 中的内容进行加密和解密。
- 如果开启了安全引导功能，设置软件断点会改变被签名的程序的摘要，从而使得签名失效。这也意味着，如果设置了软件断点，系统会在下次重启时的签名验证阶段失败，导致无法启动。

关闭 JTAG 的软件断点功能，可以在启动 OpenOCD 时在命令行额外加一项配置参数 `-c 'set ESP_FLASH_SIZE 0'`，请参考 OpenOCD 中的配置变量。

**注解** 同样地，当启用该选项，并且调试过程中打了软件断点，之后引导程序将无法校验通过应用程序的签名。

**JTAG 和 ESP32-WROOM-32 AT 固件兼容性问题** ESP32-WROOM 系列模块预装了 AT 固件。该固件将 GPIO12 至 GPIO15 管脚配置为 SPI 从属接口，使得无法使用 JTAG。

要想使用 JTAG，需要编译新的固件。新的固件不能使用专门用于 JTAG 通信的管脚 (GPIO12 至 GPIO15)，然后将固件烧录到模组中。请参考不要将 JTAG 引脚用于其他功能。
报告 OpenOCD / GDB 的问题

如果你遇到 OpenOCD 或者 GDB 程序本身的问题，并且在网上没有找到可用的解决方案，请前往 https://github.com/espressif/openocd-esp32/issues 新建一个议题。

1. 请在问题报告中提供你使用的配置的详细信息：
   a. JTAG 适配器类型。
   b. 用于编译和加载正在调试的应用程序的 ESP-IDF 版本号。
   c. 用于调试的操作系统的详细信息。
   d. 操作系统是在本地计算机运行还是在虚拟机上运行？
2. 创建一个能够演示问题的简单示例工程，描述复现该问题的步骤。且这个调试示例不能受到 Wi-Fi 协议栈引入的非确定性行为的影响，因而再次遇到同样问题时，更容易复现。
3. 在启动命令中添加额外的参数来输出调试日志。
   OpenOCD 端：
   ```
   openocd -l openocd_log.txt -d3 -f board/esp32-wrover-kit-3.3v.cfg
   ```
   这种方式会将日志输出到文件，但是它会阻止调试信息打印在终端上，当有大量信息需要输出的时候（比如调试等级提高到 -d3）这是个不错的选择。如果你仍然希望在屏幕上看到调试日志，请改用以下命令：
   ```
   openocd -d3 -f board/esp32-wrover-kit-3.3v.cfg 2>&1 | tee openocd.log
   ```
   Debugger 端：
   ```
   xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
   ```
   也可以将命令 remotelogfile gdb_log.txt 添加到 gdbinit 文件中。
4. 请将 openocd_log.txt 和 gdb_log.txt 文件附在你的问题报告中。

4.18.10 相关文档

使用调试器
本节介绍以下几种配置和运行调试器的方法：

- 使用 Eclipse 调试
- 使用命令行调试
- 使用 idf.py 进行调试

使用 Eclipse 调试
注解：建议您首先通过 idf.py 或命令行 检查调试器是否正常工作，然后再转到使用 Eclipse 平台。

标准的 Eclipse 安装流程默认安装调试功能，另外您还可以使用插件来调试，比如“GDB Hardware Debugging”。这个插件用起来非常方便，本指南会详细介绍该插件的使用方法。首先，打开 Eclipse 并转到“Help” > “Install New Software”来安装“GDB Hardware Debugging”插件。

安装完成后，按照以下步骤配置调试会话。请注意，一些配置参数是通用的，有些则针对特定项目，我们会通过配置“blink”示例项目的调试环境来进行展示，请先按照使用 Eclipse IDE 编译和烧写 介绍的方法将该示例项目添加到 Eclipse 的工作空间。示例项目 get-started/blink 的源代码可以在 ESP-IDF 仓库的 examples 目录下找到。

1. 在 Eclipse 中，进入 Run > Debug Configuration，会出现一个新的窗口。在窗口的左侧窗格中，双击“GDB Hardware Debugging”(或者选择“GDB Hardware Debugging”然后按“New”按钮) 来新建一个配置。
2. 在右边显示的表单中，“Name:” — 框中输入配置的名称，例如：“Blink checking”。
3. 在下面的“Main”选项卡中，点击“Project”边上的“Browse”按钮，然后选择当前的“blink”项目。
4. 在下一行的“C/C++ Application:”中，点击“Browse”按钮，选择“blink.elf”文件。如果“blink.elf”文件不存在，那么很有可能该项目还没有编译，请参考使用 Eclipse IDE 编译和烧写 指南中的介绍。
5. 最后，在“Build (if required) before launching”下面点击“Disable auto build”，

上述步骤 1-5 的示例输入如下图所示。
图 34: GDB 硬件调试的配置 - Main 选项卡
6. 点击“Debugger”选项卡，在“GDB Command”栏中输入 xtensa-esp32-elf-gdb 来调用调试器。
7. 更改“Remote host”的默认配置，在“Port number”下面输入 3333。
   上述步骤 6 - 7 的示例输入如下图所示。

图 35: GDB 硬件调试的配置 - Debugger 选项卡

8. 最后一个需要更改默认配置的选项卡是“Startup”选项卡。在“Initialization Commands”下，取消选中“Reset and Delay (seconds)”和“Halt”，然后在下面一栏中输入以下命令:

   ```
   mon reset halt
   flushregs
   set remote hardware-watchpoint-limit 2
   ```

   **注解:** 如果您想在启动新的调试会话之前自动更新闪存中的镜像，请在“Initialization Commands”文本框的开头添加以下命令行:

   ```
   mon reset halt
   mon program_esp ${workspace_loc:blink/build/blink.bin} 0x10000 verify
   ```

   有关 program_esp 命令的说明请参考上传待调试的应用程序 章节。

9. 在“Load Image and Symbols”下，取消选中“Load image”选项。
10. 在同一个选项卡中继续往下浏览，建立一个初始断点用来在调试器复位后暂停 CPU。插件会根据“Set break point at:”一栏中输入的函数名，在该函数的开头设置断点。选中这一选项，并在相应的字段中输入 app_main。
11. 选中“Resume”选项。这会使程序在每次调用步骤 8 中的 mon reset halt 后恢复，然后在 app_main 的断点处停止。
   上述步骤 8 - 11 的示例输入如下图所示。

   上面的启动序列看起来有些复杂，如果您对其中的初始化命令不太熟悉，请查阅调试器的启动命令的含义 章节获取更多说明。
图 36: GDB 硬件调试的配置 - Startup 选项卡
12. 如果您前面已经完成配置 ESP32 目标板中介绍的步骤，那么目标正在运行并准备与调试器进行对话。按下“Debug”按钮就可以直接调试，否则请按下“Apply”按钮保存配置。返回配置 ESP32 目标板章进行配置，最后再回到这里开始调试。

一旦所有 1-12 的配置步骤都已经完成，Eclipse 就会打开“Debug”视图，如下图所示。

![Eclipse调试视图](image)

图 37: Eclipse 中的调试视图

如果您不太了解 GDB 的常用方法，请查阅使用 Eclipse 的调试示例 文中的调试示例章节调试范例。

使用命令行调试

1. 为了能够启动调试会话，需要先启动并运行目标，如果还没有完成，请按照配置 ESP32 目标板 中的介绍进行操作。

2. 打开一个新的终端会话并前往待调试的项目目录，比如:

   ```
   cd ~/esp/blink
   ```

3. 当启动调试器时，通常需要提供几个配置参数和命令。为了避免每次都在命令行中逐行输入这些命令，您可以新建一个配置文件，并将其命名为 gdbinit:

   ```
   target remote :3333
   set remote hardware-watchpoint-limit 2
   monoreset halt
   flushregs
   thb app_main
   ```

   将此文件保存在当前目录中。

   有关 gdbinit 文件内部的更多信息，请参阅调试器的启动命令的含义 章节。

4. 准备好启动 GDB，请在终端中输入以下内容:
注意上面日志的倒数第三行显示了调试器已经在 app_main() 函数的断点处停止。该断点在 gdbinit 文件中设定。由于处理器已经暂停运行，LED 也不会闪烁。如果这也是您看到的现象，您可以开始调试了。

如果您不太了解 GDB 的常用方法，请查阅 使用命令行的调试示例 文章中的调试示例章节 调试范例。

使用 idf.py 进行调试 您还可以使用 idf.py 更方便地执行上述提到的调试命令，可以使用以下命令：

```bash
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
```
1. `idf.py openocd`

在终端中运行 `OpenOCD`，其配置信息来源于环境变量或命令行，默认会使用 `OPENOCD_SCRIPTS` 环境变量中指定的脚本路径，它是由 ESP-IDF 项目仓库中的导出脚本（如 `export.sh` 或 `export.bat`）添加到系统环境变量中的。当然，您可以在命令行中通过 `--openocd-scripts` 参数来覆盖这个变量的值。

至于当前开发板的 JTAG 配置，请使用环境变量 `OPENOCD_COMMANDS` 或命令行参数 `--openocd-commands`。如果这两者都没有被定义，那么 `OpenOCD` 会使用 `-f board/esp32-wrover-kit-3.3v.cfg` 参数来启动。

2. `idf.py gdb`

根据当前项目的 elf 文件自动生成 GDB 启动脚本，然后会按照使用命令行调试中所描述的步骤启动 GDB。

3. `idf.py gdbtui`

和步骤 2 相同，但是会在启动 GDB 的时候传递 tui 参数，这样可以方便在调试过程中查看源代码。

4. `idf.py gdbgui`

启动 gdbgui，在浏览器中打开调试器的前端界面。

上述这些命令也可以合并到一起使用，`idf.py` 会自动将后台进程（比如 openocd）最先运行，交互式进程（比如 GDB, monitor）最后运行。

常用的组合命令如下所示:

```
idf.py openocd gdbgui monitor
```

上述命令会将 OpenOCD 运行至后台，然后启动 gdbgui 打开一个浏览器窗口，显示调试器的前端界面，最后在活动终端打开串口监视器。

### 调试示例

本节将介绍如何在 Eclipse 和命令行中使用 GDB 进行调试的示例。

使用 Eclipse 的调试示例 请检查目标板是否已经准备好，并加载了 get-started/blink 示例代码，然后按照使用 Eclipse 调试中介绍的步骤配置和启动调试器，最后选择让应用程序在 `app_main()` 建立的断点处停止。

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 停止暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

### 浏览代码，查看堆栈和线程

当目标暂停时，调试器会在“Debug”窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 LED 停止了闪烁。

暂停的程序线程也将被展开，显示函数调用的堆栈，它表示直到目标暂停所在的代码行（下图高亮处）为止的相关函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 `app_main()`，根据下一行显示，它又是在函数 `main_task()` 中被调用的。堆栈的每一行都包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到其中一个调用函数旁边的数字，比如 `0x40000000c`，它代表末以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。

回到 1 号线程中的 `app_main()` 函数所在的 `blink.c` 源码文件。下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。
图 38: Eclipse 中的 Debug 视图
图 39: 调试时目标停止
图 40: 浏览函数调用堆栈
设置和清除断点  在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点，基于以上代码列表，这两处分别为第 33 和 36 代码行。按住键盘上的“Control”键，双击 blink.c 文件中的行号 33，并在弹出的对话框中点击“OK”按钮进行确定。如果你不看到此对话框，双击行号即可。执行同样操作，在第 36 行设置另外一个断点。

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在 app_main() 函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅可用的断点和观察点），你需要将它删除，否则调试会失败。

单击“Resume”（如果“Resume”按钮是灰色的，请先单击第 8 号线程的 blink_task() 函数）后处理器将开始继续运行，并在断点处停止。再一次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到 LED 切换状态。

更多关于断点的信息，请参阅可用的断点和观察点和关于断点的补充知识。

手动暂停目标  在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。

在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也停止闪烁。调试器将展开线程并高亮显示停止的代码行。

在上图所示的情况下，应用程序已经在 freertos_hooks.c 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。
图 42: 设置了三个断点 / 最多允许两个断点
图 43: 手动暂停目标
单步执行代码

我们还可以使用 “Step Into (F5)” 和 “Step Over (F6)” 命令单步执行代码。这两者之间的区别是执行 “Step Into (F5)” 命令会进入调用的子程序，而执行 “Step Over (F6)” 命令则会直接将子程序看成单独源码行，单步就能将其运行结束。

在继续演示此功能之前，请参照上文所述确保只在 blink.c 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下 “Step Over (F6)” 按钮，观察调试器是如何单步执行一行代码的。

如果你改用 “Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 gpio_set_level(BLINK_GPIO, 0) 代码内部，同时代码窗口快速切换到 gpio.c 驱动文件。

请参阅 “next” 命令无法跳过子程序的原因 文档以了解 next 命令的潜在局限。

查看并设置内存

要显示或者设置内存的内容，请使用 “调试” 视图中位于底部的 “Memory” 选项卡。

在 “Memory” 选项卡下，我们将在内存地址 0x3FF44004 处读取和写入内容。该地址也是 GPIO_OUT_REG 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 ESP32 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF] 章节。

同样在 blink.c 项目文件中，在两个 gpio_set_level 语句的后面各设置一个断点，单击 “Memory” 选项卡，然后单击 “Add Memory Monitor” 按钮，在弹出的对话框中输入 0x3FF44004。

按下 F8 按键恢复程序运行，并观察 “Monitor” 选项卡。

每按一下 F8，你就会看到在内存 0x3FF44004 地址处的一个比特位被翻转（并且 LED 会改变状态）。

图 44: 使用 “Step Over (F6)” 单步执行代码
图 45: 使用“Step Into (F5)”单步执行代码

图 46: 观察内存地址 0x3FF44004 处的某个比特被置高
Chapter 4. API

图47：观察内存地址0x3FF4004处的某个比特被置低

要修改内存的数值，请在“Monitor”选项卡中找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将立即看到LED的状态发生了改变。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1)里添加 i++，这样每次LED改变状态的时候，变量i都会增加1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到ESP32中，接着重启调试器。注意，这里不需要我们重启OpenOCD。

一旦程序停止运行，在代码 i++ 处添加一个断点。

下面，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡。如果该选项卡不存在，请在顶部菜单栏的Window > Show View > Expressions中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入i。

按下F8继续运行程序，每次程序停止时，都会看到变量i的值在递增。

如果想更改i的值，可以在“Value”一栏中输入新的数值。按下“Resume(F8)”后，程序将从新输入的数字开始递增i。

设置条件断点 下面的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择“Breakpoint Properties”，将“Type”改选为“Hardware”然后在“Condition”一栏中输入条件表达式，例如i == 2。

如果当前i的值小于2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么LED就会循环闪烁，直到i == 2条件成立，最后程序停止在该处。

使用命令行的调试示例 请检查您的目标板是否已经准备好，并加载了get-started/blink示例代码，然后按照使用命令行调试中介绍的步骤配置和启动调试器，最后选择让应用程序在app_main()建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/.blink.c:43
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,
-5, NULL);
```

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点

Espressif Systems 1884 Release v5.0-dev-489-gef98a36
Submit Document Feedback
图 48: 观察程序变量 “i”
图 49: 设置条件断点
Chapter 4. API 指南

3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

浏览代码、查看堆栈和线程  当看到 (gdb) 提示符的时候，应用程序已停止运行，LED 也停止闪烁。
要找到代码暂停的位置，输入 l 或者 list 命令，调试器会打印出暂停点 (blink.c 代码文件的第 43 行) 附近的几行代码

```c
(gdb) l
38 }
39 }
40 void app_main()
41 {
42 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,
43 -5, NULL);
44 }
(gdb)
```

也可以通过输入 l 30, 40 等命令来查看特定行号范围内的代码。
使用 bt 或者 backtrace 来查看哪些函数最终导致了此代码被调用:

```c
(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/.blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
--esp32/.cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 app_main()。
app_main() 又被位于 cpu_start.c 文件第 339 行的 main_task 函数调用。
想查看 cpu_start.c 文件中 main_task 函数的上下文，需要输入 frame N，其中 N=1，因为根据
前面的输出, main_task 位于 #1 下:

```c
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
--esp32/.cpu_start.c:339
339 app_main();
(gdb)
```

输入 1 将显示一段名为 app_main() 的代码 (在第 339 行):

```c
(gdb) l
334 }
335 }　　//Enable allocation in region where the startup stacks were located.
336 #endif
337 heap_caps_enable_nonos_stack_heaps();
338 app_main();
340 vTaskDelete(NULL);
341 }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 main_task 函数:

```c
(gdb) l 326, 341
326 static void main_task(void* args)
```

(下页继续)
Chapter 4. API

327  
328  // Now that the application is about to start, disable boot watchdogs
329  REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330  REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331  if (!CONFIG_FREERTOS_UNICORE)
332  // Wait for FreeRTOS initialization to finish on APP CPU, before...
333  while (!port_xSchedulerRunning[1]) {}
334  
335  
336  #endif
337  // Enable allocation in region where the startup stacks were located.
338  heap_caps_enable_nonos_stack_heaps();
339  app_main();
340  vTaskDelete(NULL);
341  }

(gdb)

如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表:

(gdb) i threads
   Id Target Id   Frame
  8  Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
<optimized out>)
    at /home/user-name/esp/esp-idf/components/esp32/.dport_access.c:170
  7  Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,...
<pvBuffer=0x0, xTicksToWait=164638200, 
  xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/.queue.
<e:c:1452
  6  Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/.timers.c:1445
  5  Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
  4  Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/.dport_access.c:150
  3  Thread 1073412156 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/.tasks.c:3282
  2  Thread 1073412512 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos/.tasks.c:3282
 * 1  Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
<main/.blink.c:43

(gdb)

线程列表显示了每个线程最后一个被调用的函数以及所在的 C 源文件名（如果存在的话）。
您可以通过输入 `thread N` 进入特定的线程。其中 N 是线程 ID。我们进入 5 号线程来看一下它是如何工作的:

(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0 0x4000bfea in ?? ()

(gdb)

然后查看回溯:

(gdb) bt
#0 0x4000bfea in ?? ()
#1 0x40083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
<esp-idf/components/freertos/.port.c:415
#2 0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
<freertos/.tasks.c:2846
#3 0x4008532b in _frxtDispatch ()

(下页延续)
如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的，像 0x400bfe8 这样的值是被调用函数所在的内存地址。

使用诸如 bt，threads，thread N 和 list 命令可以浏览整个应用程序的代码。给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

**设置和清除断点** 在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量，内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定某行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 break M 设置断点，其中 M 是具体的代码行：

```
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main/./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main/./blink.c, line 36.
```

输入命令 c，处理器将运行并在断点处停止。再次输入 c 将使其再次运行，并在第二个断点处停止。依此类推：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active) APP_CPU: PC=0x400D10D8
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
    blink.c:33
33    gpio_set_level(BLINK_GPIO, 0);
    (gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F8 (active) APP_CPU: PC=0x400D10D8
Target halted. PRO_CPU: PC=0x400DB704 (active) APP_CPU: PC=0x400D10D8
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
    blink.c:36
36    gpio_set_level(BLINK_GPIO, 1);
    (gdb)
```

只有在输入命令 c 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 info break：

```
(gdb) info break
Num Type Disp Enb Address What
2 breakpoint keep y 0x400db6f6 in blink_task at /home/user-name/esp/
    blink/main/./blink.c:33
    breakpoint already hit 1 time
3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/
    blink/main/./blink.c:36
    breakpoint already hit 1 time
```
请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为在调试器启动时执行 thb app_main 命令已经在 app_main() 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。

要删除一个断点，请输入 delete N 命令（或者简写成 d N），其中 N 代表断点序号：

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅可用的断点和观察点 和关于断点的补充知识。

### 暂停和恢复应用程序的运行

在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过重新输入 Ctrl+C 手动中断程序的运行。

在此之前，请删除所有的断点，然后输入 c 恢复程序运行。接着输入 Ctrl+C，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器会打印如下信息：

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00 APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]
Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400D0C00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/!
components/esp32/./freertos_hooks.c:52
52 asm("waiti 0");
(gdb)
```

在上图所示的情况下，应用程序已经在 freertos_hooks.c 文件的第 52 行暂停运行，现在您可以通过输入 c 再次将其恢复运行或者进行如下所述的一些调试工作。

**注解**：在 MSYS2 的 shell 中输入 Ctrl+C 并不会暂停目标的运行，而是会退出调试器；解决这个问题的方法可以通过使用 Eclipse 来调试 或者参考 [http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt](http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt) 里的解决方案。

### 单步执行代码

我们还可以使用 step 和 next 命令（可以简写成 s 和 n）单步执行代码，这两者之间的区别是执行 *step* 命令会进入调用的子程序内部，而执行 *next* 命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 break 和 delete 命令，确保目前只在 blink.c 文件的第 36 行设置了一个断点：

```
(gdb) info break
Num Type Disp Enb Address What
3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/!
    ./blinky/main/./blinky.c:36
    breakpoint already hit 1 time
(gdb)
```

输入 c 恢复程序运行然后等它在断点处停止运行：

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active) APP_CPU: PC=0x400D1128
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blinky/main/.
    ./blinky.c:36
```
然后输入 n 多次，观察调试器是如何单步执行一行代码的:

```
36 gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

```
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
37 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n
Target halted. PRO_CPU: PC=0x400DB75E (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
33 gpio_set_level(BLINK_GPIO, 0);
(gdb)
```

如果你输入 s，那么调试器将进入子程序:

```
(gdb) s
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/.
components/driver/gpio.c:183
183 GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error",
ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 gpio_set_level(BLINK_GPIO, 0) 代码内部，同时代码窗口快速切换到 gpio.c 驱动文件。

请参阅 “next” 命令无法跳过子程序的原因 文档以了解 next 命令的潜在局限。

查看并设置内存 使用命令 x 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 help x 可以查看更多相关细节。与 x 命令配合使用的命令是 set，它允许你将值写入内存。

为了演示 x 和 set 的使用，我们将在内存地址 0x3FF44004 处读取和写入内容。该地址也是 GPIO_OUT_REG 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 ESP32 技术参考手册 > IO MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF] 章节。

同样在 blink.c 项目文件中，在两个 gpio_set_level 语句的后面各设置一个断点。输入两次 c 命令后停止在断点处，然后输入 x /1wx 0x3FF44004 来显示 GPIO_OUT_REG 寄存器的值:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active) APP_CPU: PC=0x400D1128
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
blink.c:34
34 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
```
如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转:

0x3ff44004: 0x00000000
...
0x3ff44004: 0x00000010

在输入 set {unsigned int} 0x3FF44004=0x000010 命令后，你会立即看到 LED 亮起。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值。为了能够演示这个功能，更新 blink.c 文件，在 blink_task 函数的后面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i:

(gdb) watch i
Hardware watchpoint 2: i
(gdb)

这会在所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止:

(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D0811
[New Thread 1073432196]

Program received signal SIGTRAP, Trace/breakpoint trap. 
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
-./blink.c:33
 33 i++;
(gdb)

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i （简写 p i）来看看当前 i 的值:

(gdb) p i
$1 = 3
(gdb)

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出来查看是否修改）：
最多可以使用两个观察点。详细信息请参阅可用的断点和观察点。

设置条件断点 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令:

```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/./blink.c, line 34.
```

以上命令在 blink.c 文件的 34 处设置了一个条件断点，当 i == 2 条件满足时，程序会停止运行。

如果当前 i 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 i == 2 条件成立，程序停止在该处:

```
(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB753 (active) APP_CPU: PC=0x400D112C
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
    blink.c:34
34 gpio_set_level(BLINK_GPIO, 0);
```

获得命令的帮助信息 目前所介绍的都是些非常基础的命令，目的在于让您快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 help 和命令名:

```
(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine, this command does not enter the subroutine, but instead steps over the call, in effect treating it as a single source line.
```

只需输入 help 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf。虽然不是所有命令都适用于嵌入式环境，但还是会有所帮助。

结束调试会话 输入命令 q 可以退出调试器:

```
(gdb) q
A debugging session is active.
Inferior 1 [Remote target] will be detached.
Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```
4.19 架构器脚本生成机制

4.19.1 概述

ESP32 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如为了提高性能，将关键代码存放到 RAM 中，或者将代码存放到 RTC 存储器中以便在唤醒时和 ULP 协处理器中使用。

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理；生成的存放周规则用于链接应用程序。

4.19.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有：

```
- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig
    - src/
      - my_src1.c
      - my_src2.c
      - my_src3.c
      - my_linker_fragment_file.lf
```

- 名为 my_component 的组件，在构建过程中存储为 libmy_component.a 库文件
- 库文件包含的三个源文件: my_src1.c, my_src2.c 和 my_src3.c, 编译后分别为 my_src1.o, my_src2.o 和 my_src3.o
- 在 my_src1.o 中定义 my_function1 函数, 在 my_src2.o 中定义 my_function2 函数
- 在 my_component 下 Kconfig 中存在布尔类型配置 PERFORMANCE_MODE (y/n) 和整数类型配置 PERFORMANCE_LEVEL（范围是 0-3）

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 .lf 的文本文件，想要存放的位置信息写入该文件内。文件创建成功后，需要将其呈现在构建系统中。ESP-IDF 支持的构建系统指南如下：

在组件目录的 CMakeLists.txt 文件中，指定 idf_component_register 调用引数 LDFRAGMENTS 的值。LDFRAGMENTS 可以为绝对路径，也可为组件目录的相对路径，指向已创建的链接器片段文件。

```
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register(
  LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
  another_linker_fragment_file.lf"
)
```

Espressif Systems 1894 Release v5.0-dev-489-gef98a36
指定存放区域

可以按照下列粒度指定存放区域:

- 目标文件 (.obj 或 .o 文件)
- 符号 (函数/变量)
- 库 (.a 文件)

存放目标文件  假设整个 my_src1.o 目标文件对性能至关重要，所以最好将该文件放在 RAM 中。另外，my_src2.o 目标文件包含从深度睡眠唤醒所需的符号，因此需要将其存放到 RTC 存储器中。在链接器片段文件中可以写入以下内容:

```text
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1 (noflash)  # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
  my_src2 (rtc)     # 将所有 my_src2 代码, 数据和只读数据存放到 RTC 快速 RAM 和 RTC...
  --慢速 RAM 中
```

那么 my_src3.o 放在哪里呢? 由于未指定存放区域，my_src3.o 会存放到默认区域。更多关于默认存放区域的信息，请查看这里。

存放符号  继续上文的例子，假设 object1.o 目标文件定义的功能中，只有 my_function1 影响到性能: object2.o 目标文件中只有 my_function2 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容:

```text
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1:my_function1 (noflash)
  my_src2:my_function2 (rtc)
```

my_src1.o 和 my_src2.o 中的其他函数以及整个 object3.o 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如:

```text
my_src1:my_variable (noflash)
```

注意: 按照符号粒度存放代码和数据有一定的极限。为确保存放区域合适，您也可以将相关代码和数据集中在源文件中，参考使用目标文件的存放规则。

存放整个库  在这个例子中，假设整个组件库都需存放到 RAM 中，可以写入以下内容存放整个库:

```text
[mapping:my_component]
archive: libmy_component.a
entries:
  * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中:
根据具体配置存放 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现:

```python
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_MODE == y:
        * (noflash)
    else:
        * (default)
```

来看一种更复杂的情况。假设 “CONFIG_PERFORMANCE_LEVEL == 1” 时，只有 object1.o 存放到 RAM 中; `CONFIG_PERFORMANCE_LEVEL == 2` 时，object1.o 和 object2.o 会存放到 RAM 中; `CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 RAM 中。以上三个条件为假时，整个库会存放到 RTC 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现:

```python
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL == 1:
        my_src1 (noflash)
    elif PERFORMANCE_LEVEL == 2:
        my_src1 (noflash)
        my_src2 (noflash)
    elif PERFORMANCE_LEVEL == 3:
        my_src1 (noflash)
        my_src2 (noflash)
        my_src3 (noflash)
    else:
        * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效:

```python
[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
        if PERFORMANCE_LEVEL >= 2:
            object2 (noflash)
        if PERFORMANCE_LEVEL >= 3:
            object2 (noflash)
    else:
        * (rtc)
```

默认存放区域

到目前为止，“默认存放区域”在未指定 rtc 和 noflash 存放规则时才会作为备选方案使用。需要注意的是，noflash 或者 rtc 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是协议。

与 rtc 和 noflash 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通常存放的区域，即代码和恒量放在 flash 中，变量存放在 RAM 中。更多关于默认协议的信息，请见这里。
API

**注解：** 使用链接器脚本生成机制的 IDF 组件示例，请参阅 freertos/CMakeLists.txt。为了提高性能，freertos 使用链接器脚本生成机制，将其目标文件存放到 RAM 中。

快速入门指南到此结束，下文将详述这个机制的内核，有助于创建自定义存放区域或修改默认方式。

### 4.19.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换成可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的链接器片段文件 和 (2) 链接器脚本模板 动态生成。

**注解：** 执行链接器脚本生成机制的工具存放在 tools/ldgen 之下。

#### 链接器片段文件

如快速入门指南所述，片段文件是拓展名为 .lfe 的简单文本文件，内含想要存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是段、协议和映射。

**语法** 三种片段类型使用同一种语法：

```markdown
[type:name]
key: value
key:
  value
  value
  value
...
```

- 类型：片段类型，可以为 段、协议或 映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。

**注解：** 多个片段的类型和名称相同时会引发异常。

**注解：** 片段名称和键值只能使用字母、数字和下划线。

#### 条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 kconfiglib 脚本的 eval_string，遵循该脚本要求的语法和局限性，支持：

- **比较**
  - 小于 <
  - 小于等于 <=
  - 大于 >
  - 大于等于 =>
  - 等于 =
  - 不等于 !=
- **逻辑**
  - 或 ||
- 和 
- 取反！

• 分组
- 圆括号 ()

条件检查和其他语言中的 if...elseif/elif...else 块作用一样。键值和完整段都可以进行条件检查。以下两个示例效果相同：

```python
# 键值取决于配置
def if CONDITION = y:
    [type:name]
    key_1:
        value_1
    else:
        value_2
    key_2:
        if CONDITION = y:
            value_a
        else:
            value_b
# 完整片段的定义取决于配置
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_b
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b
```

### 注释

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

### 与 ESP-IDF v3.x 链接器脚本片段文件兼容

ESP-IDF v4.0 变更了链接器脚本片段文件使用的一些语法：

- 必须缩进，缩进不当的文件会产生解析异常；旧版本不强制缩进，但之前的文档和示例均遵循了正确的缩进语法
- 条件改用 if...elif...else 结构，可以嵌套检查，将完整片段置于条件内
- 映射片段和其他片段类型一样，需有名称

链接器脚本生成器可解析 ESP-IDF v3.x 版本中缩进正确的链接器片段文件（如 ESP-IDF v3.x 版本中的本文件所示），依然可以向后兼容此前的映射片段语法（可选名称和条件的旧语法），但是会有弃用警告。用户应换成本文档介绍的新语法，因为旧语法将在未来停用。

请注意，ESP-IDF v3.x 不支持使用 ESP-IDF v4.0 新语法的链接器片段文件。

### 类型段

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 .text、.data），也可以是用户通过 __attribute__ 关键字定义的段。

‘+’ 表示段列表开始，且当前段为列表中的第一个段。这种表达方式更加推荐。
Chapter 4. API 指南

示例:

```plaintext
[sections:name]
entries:
  .section+
  .section
...
```

协议

协议定义了每个段对应的 目标。

```plaintext
[scheme:name]
entries:
  sections -> target
  sections -> target
...
```

示例:

```plaintext
[scheme:noflash]
entries:
  text  -> iram0_text  # text 段下的所有条目均入 iram0_text
  rodata -> dram0_data  # rodata 段下的所有条目均入 dram0_data
```

默认协议

注意，有一个 默认的协议很特殊，特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着，如果该协议有一条条目是 text  ->  flash_text，则将为目标 flash_text 生成如下的存放规则:

```plaintext
* (.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定存放规则的情况。

默认协议在 esp_system/app.lf 文件中定义。快速上手指南中提到的内置 noflash 协议和 rtc 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和常数）对应的协议。

```plaintext
[mapping]
archive: archive  # 构建后输出的库文件名称（即 libxxx.a)
entries:
  object:symbol (scheme)  # 符号
  object (scheme)  # 目标
  * (scheme)  # 库
```

有三种存放粒度：
Chapter 4. API

- 符号: 指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标: 只指定目标文件名称。
- 库: 指定*, 即某个库下面所有目标文件的简化表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```object (scheme)
```

根据条目定义，将这个协议展开:

```object (sections -> target,
sections -> target,
...)
```

再根据条目定义，将这个段展开:

```object (.section,
.section,
... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置
.section,
.section,
... -> target, # 同样的方法指定向其他段
...)
```

示例:

```[mapping:map]
archive: libfreertos.a
entries:
* (noflash)
```

除了实体和协议，条目中也支持指定如下标志: (注: <> = 参数名称，[] = 可选参数)

1. **ALIGN**([<alignment>[, pre, post]])
   根据 alignment 中指定的数字对齐存放区域。根据是否指定 pre 和 post, 或两者都
   指定，在输入段描述（生成于映射条目）的前面和/或后面生成:

2. **SORT**([<sort_by_first>, <sort_by_second>])
   在输入段描述中输出 SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY 或 SORT.
   sort_by_first 和 sort_by_second 的值可以是: name, alignment, init_priority.
   如果既没指定 sort_by_first 也没指定 sort_by_second, 则输入段会按照名称
   排序，如果两者都指定了, 那么嵌套排序会遵循 https://sourceware.org/binutils/docs/ld/
   Input-Section-Wildcards.html 中的规则。

3. **KEEP**()
   用 KEEP 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 https:
   //sourceware.org/binutils/docs/ld/Input-Section-Keep.html

4. **SURROUND**(<name>)
   在存放区域的前面和后面生成符号, 生成的符号遵循 `_<name>_start 和 `_<name>_end` 的
   命名方式，例如, 如果 name == sym1

在添加标志时，协议中需要指定具体的 section -> target。对于多个 section -> target，使
用逗号作为分隔符，例如:

```# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
```

(下页继续)
合并后，如下的映射:

```plaintext
[mapping:name]
archive: lib1.a
targets:
  obj1 (noflash);
  rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出:

```plaintext
_ = ALIGN(8)
_my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

注意，正如在 `flag` 描述中提到的，ALIGN 和 SURROUND 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成:

```plaintext
_my_sym_start = ABSOLUTE(.)
_ = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.*) ))
_my_sym_end = ABSOLUTE(.)
```

按符号存放
按符号存放可通过编译器标志 `ffunction-sections` 和 `fdata-sections` 实现。ESP-IDF 默认用这些标志编译。用户若选择移除这些标志，便不能按符号存放。另外，即便有标志，也会受到其他限制，具体取决于编译器输出的段。

比如，使用 `ffunction-sections`，针对每个功能会输出单独的段，段的名称可以预测，即 `.text.{func_name}` 和 `.literal.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `fdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`。因此类型 I 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

### 链接器脚本模板

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法:

```plaintext
mapping[target]
```

示例:

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `.iram0.text` 的标记。

```plaintext
.iram0.text :
{
    /* 标记 IRAM 空间不足 */
    _iram_text_start = ABSOLUTE(.);
    /* 引用 .iram0.text */
    mapping[iram0_text]
}
```
4.20 lwIP

ESP-IDF uses the open source lwIP lightweight TCP/IP stack. The ESP-IDF version of lwIP (esp-lwip) has some modifications and additions compared to the upstream project.
4.20.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- **BSD Sockets API**
- **Netconn API** is enabled but not officially supported for ESP-IDF applications

Adapted APIs

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the **ESP-NETIF** functionality
- Simple Network Time Protocol (SNTP) is supported via the `lwip/include/apps/sntp/sntp.h` functions (see also **SNTP Time Synchronization**)
- ICMP Ping is supported using a variation on the lwIP ping API. See **ICMP Echo**.
- NetBIOS lookup is available using the standard lwIP API. `protocols/http_server/restful_server` has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see **mDNS**), but lwIP can look up mDNS hosts using standard APIs such as `gethostbyname()` and the convention `hostname.local`, provided the `CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES` setting is enabled.

4.20.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

References

A wide range of BSD Sockets reference material is available, including:

- Single UNIX Specification BSD Sockets page
- Berkeley Sockets Wikipedia page

Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- `protocols/sockets/tcp_server`
- `protocols/sockets/tcp_client`
- `protocols/sockets/udp_server`
- `protocols/sockets/udp_client`
- `protocols/sockets/udp_multicast`
- `protocols/http_request` (Note: this is a simplified example of using a TCP socket to send an HTTP request. The **ESP HTTP Client** is a much better option for sending HTTP requests.)

Supported functions

The following BSD socket API functions are supported. For full details see `lwip/lwip/src/include/lwip/sockets.h`.

- `socket()`
- `bind()`
- `accept()`
- `shutdown()`
- `getpeername()`
- `getsockopt()` & `setsockopt()` (see *Socket Options*)
- `close()` (via 虚拟文件系统组件)
- `read()`, `readv()`, `write()`, `writev()` (via 虚拟文件系统组件)
- `recv()`, `recvmsg()`, `recvfrom()`
- `send()`, `sendmsg()`, `sendto()`
- `select()` (via 虚拟文件系统组件)
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)
- `fcntl()` (see *fcntl*)

Non-standard functions:
- `ioctl()` (see *ioctls*)

注解：Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

**Socket Error Handling**

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.
- Getting the error reason code.
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see *Socket API Errors*.
- `select(int maxfdp1, fd_set *readset, fd_set *writset, fd_set *except-set, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see *select() Errors*.

**Socket API Errors**

The error detection
- We can know that the socket API fails according to its return value.

Get the error reason code
- When socket API fails, the return value doesn’t contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see <Socket Error Reason Code>.

Example:

```c
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}
```

**select() Errors**

The error detection
- Socket error when `select()` has exception descriptor

Get the error reason code
If the `select` indicates that the socket fails, we can’t get the error reason code by accessing `errno`, instead we should call `getsockopt()` to get the failure reason code. Because `select()` has exception descriptor, the error code will not be given to `errno`.

**Note:** `getsockopt` function prototype: `int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen)`. Its function is to get the current value of the option of any type, any state socket, and store the result in `optval`. For example, when you get the error code on a socket, you can get it by `getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen)`.

```c
int err;
if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

### Socket Error Reason Code
Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see `newlib errno.h` (<https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h>) and the platform-specific extensions `newlib/platform_include/errno.h`.

<table>

</table>

### Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

**Common options** Used with level argument SOL_SOCKET.

- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RXTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`
Chapter 4. API

* SO_ACCEPTCONN
* SO_RCVBUF (available if CONFIG_LWIP_SO_RCVBUF is set)
* SO_SNDBUF / SO_RCVTIMEO
* SO_ERROR (this option is only used with select(), see Socket Error Handling)
* SO_TYPE
* SO_NO_CHECK (for UDP sockets only)

**IP options**  Used with level argument IPPROTO_IP.

* IP_TOS
* IP_TTL
* IP_PKTINFO (available if CONFIG_LWIP_NETBUF_RECVINFO is set)

For multicast UDP sockets:

* IP_MULTICAST_IF
* IP_MULTICAST_LOOP
* IP_MULTICAST_TTL
* IP_ADD_MEMBERSHIP
* IP_DROP_MEMBERSHIP

**TCP options**  TCP sockets only. Used with level argument IPPROTO_TCP.

* TCP_NODELAY

Options relating to TCP keepalive probes:

* TCP_KEEPALIVE (int value, TCP keepalive period in milliseconds)
* TCP_KEEPIDLE (same as TCP_KEEPALIVE, but the value is in seconds)
* TCP_KEEPINTVL (int value, interval between keepalive probes in seconds)
* TCP_KEEPCNT (int value, number of keepalive probes before timing out)

**IPv6 options**  IPv6 sockets only. Used with level argument IPPROTO_IPV6

* IPV6_CHECKSUM
* IPV6_V6ONLY

For multicast IPv6 UDP sockets:

* IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP
* IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP
* IPV6_MULTICAST_IF
* IPV6_MULTICAST_HOPS
* IPV6_MULTICAST_LOOP

**fcntl**

The `fcntl()` function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the [虚拟文件系统组件] layer is used to implement this function.

When the file descriptor is a socket, only the following `fcntl()` values are supported:

* O_NONBLOCK to set/clear non-blocking I/O mode. Also supports O_NDELAY, which is identical to O_NONBLOCK.
* O_RDONLY, O_WRONLY, O_RDWR flags for different read/write modes. These can read via F_GETFL only, they cannot be set using F_SETFL. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return O_RDWR.
Chapter 4. API

**ioctl**

The ioctl() function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the virtual filesystem layer is used to implement this function.

When the file descriptor is a socket, only the following ioctl() values are supported:

- **FIONREAD** returns the number of bytes of pending data already received in the socket’s network buffer.
- **FIONBIO** is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to fcntl(fd, F_SETFL, O_NONBLOCK, ...).

### 4.20.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

**Important:** Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is **enabled but not supported**. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult lwip/lwip/src/include/lwip/api.h and this wiki page which is part of the unofficial lwIP Application Developers Manual.

### 4.20.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues (“mailboxes”) used to send data to/from the TCP/IP task:

- **CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**
- **CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
- **CONFIG_LWIP_TCPIP_TASK_AFFINITY**

### 4.20.5 IPv6 Support

Both IPv4 and IPv6 are supported as dual stack and enabled by default (IPv6 may be disabled if it’s not needed, see **Minimum RAM usage**). IPv6 support is limited to **Stateless Autoconfiguration** only. **Stateful configuration** is not supported in ESP-IDF (not in upstream lwip). IPv6 Address configuration is defined by means of these protocols or services:

- **SLAAC** IPv6 Stateless Address Autoconfiguration (RFC-2462)
- **DHCPv6** Dynamic Host Configuration Protocol for IPv6 (RFC-8415)

None of these two types of address configuration is enabled by default, so the device uses only Link Local addresses or statically defined addresses.

**Stateless Autoconfiguration Process**

To enable address autoconfiguration using Router Advertisement protocol please enable:

- **CONFIG_LWIP_IPV6_AUTOCONF**
This configuration option enables IPv6 autoconfiguration for all network interfaces (in contrast to the upstream lwIP, where the autoconfiguration needs to be explicitly enabled for each netif with `netif->ip6_autoconfig_enabled=1`)

**DHCPv6**

DHCPv6 in lwIP is very simple and support only stateless configuration. It could be enabled using:

- `CONFIG_LWIP_IPV6_DHCP6`

Since the DHCPv6 works only in its stateless configuration, the **Stateless Autoconfiguration Process** has to be enabled, too, by means of `CONFIG_LWIP_IPV6_AUTOCONFIG`. Moreover, the DHCPv6 needs to be explicitly enabled form the application code using

```c
dhcp6_enable_stateless(netif);
```

**DNS servers in IPv6 autoconfiguration**

In order to autoconfigure DNS server(s), especially in IPv6 only networks, we have these two options

- Recursive domain names system – this belongs to the Neighbor Discovery Protocol (NDP), uses **Stateless Autoconfiguration Process**. Number of servers must be set `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`, this is option is disabled (set to 0) by default.
- DHCPv6 stateless configuration – uses `DHCPv6` to configure DNS servers. Note that the this configuration assumes IPv6 Router Advertisement Flags (RFC-5175) to be set to
  - Managed Address Configuration Flag = 0
  - Other Configuration Flag = 1

### 4.20.6 esp-lwip custom modifications

#### Additions

The following code is added which is not present in the upstream lwIP release:

**Thread-safe sockets** It is possible to `close()` a socket from a different thread to the one that created it. The `close()` call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on `select()` or `poll()` APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

**On demand timers** lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. esp-lwip default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable `CONFIG_LWIP_TIMERS_ONDEMAND`.

**Lwip timers API** When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see `lwip/lwip/src/include/lwip/timeouts.h`.

- `sys_timeouts_init()`
- `sys_timeouts_deinit()`
Abort TCP connections when IP changes  

CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES

is disabled by default. This disables the default lwIP behaviour of keeping TCP connections open if an interface IP changes, in case the interface IP changes back (for example, if an interface connection goes down and comes back up). Enable this option to keep TCP connections open in this case, until they time out normally. This may increase the number of sockets in use if a network interface goes down temporarily.

Additional Socket Options

- Some standard IPV4 and IPV6 multicast socket options are implemented (see Socket Options).
- Possible to set IPV6-only UDP and TCP sockets with IPV6_V6ONLY socket option (normal lwIP is TCP only).

IP layer features

- IPV4 source based routing implementation is different.
- IPV4 mapped IPV6 addresses are supported.

Limitations

Calling send() or sendto() repeatedly on a UDP socket may eventually fail with errno equal to ENOMEM. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don’t wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the Wi-Fi or Ethernet project configuration (as applicable) may also help.

4.20.7 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the wifi/iperf example in an RF sealed enclosure. The wifi/iperf/sdkconfig.defaults file for the iperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project sdkconfig.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Important: Suggest applying changes a few at a time and checking the performance each time with a particular application workload.</td>
<td></td>
</tr>
</tbody>
</table>

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (CONFIG_LWIP_TCPIP_TASK_AFFINITY) and runs at fixed priority ESP_TASK_TCPIP_PRIO (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also Built-In Task Priorities.
- If using select() function with socket arguments only, setting CONFIG_LWIP_USE_ONLY_LWIP_SELECT will make select() calls faster.
- If there is enough free IRAM, select CONFIG_LWIP_IRAM_OPTIMIZATION to improve TX/RX throughput.

If using a Wi-Fi network interface, please also refer to Wi-Fi 缓冲区使用情况.
Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard TCP_NODELAY flag to disable Nagle’s algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing CONFIG_LWIP_MAX_SOCKETS reduces the maximum number of sockets in the system. This will also cause TCP sockets in the WAIT_CLOSE state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing CONFIG_LWIP_TCP_IP_RECVMBBOX_SIZE, CONFIG_LWIP_TCP_RECVMBBOX_SIZE and CONFIG_LWIP_UDP_RECVMBBOX_SIZE reduce memory usage at the expense of throughput, depending on usage.
- Disable CONFIG_LWIP_IPV6 can save about 39 KB for firmware size and 2K RAM when system power up and 7KB RAM when TCP/IP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to Wi-Fi缓冲区使用情况.

Peak Buffer Usage

The peak heap memory that lwIP consumes is the theoretically-maximum memory that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: lwip_udp_conn
- the memory required to create a TCP connection: lwip_tcp_conn
- the number of UDP connections that the application has: lwip_udp_conn_num
- the number of TCP connections that the application has: lwip_tcp_conn_num
- the TCP TX window size: lwip_tcp_tx_win_size
- the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

\[
\text{lwip_dynamic_peak_memory} = (\text{lwip_udp_conn_num} \times \text{lwip_udp_conn}) + (\text{lwip_tcp_conn_num} \times (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))
\]

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.21 OpenThread

OpenThread is a IP stack running on the 802.15.4 MAC layer which features mesh network and low power consumption.

4.21.1 Mode of the OpenThread stack

OpenThread can run under the following modes on Espressif chips:

Standalone node

The full OpenThread stack and the application layer runs on the same chip. This mode is available on chips with 15.4 radio such as ESP32-H2.
Radio Co-Processor (RCP)

The chip will be connected to another host running the OpenThread IP stack. It will send and received 15.4 packets on behalf of the host. This mode is available on chips with 15.4 radio such as ESP32-H2. The underlying transport between the chip and the host can be SPI or UART. For sake of latency, we recommend to use SPI as the underlying transport.

OpenThread host

For chips without 15.4 radio, it can be connected to an RCP and run OpenThread under host mode. This mode enables OpenThread on Wi-Fi chips such as ESP32, ESP32-S2, ESP32-S3 and ESP32-C3. The following diagram shows how devices work under different modes:

![Diagram of OpenThread device modes](image)

**4.21.2 How To Write an OpenThread Application**

The OpenThread openthread/ot_cli example will be a good place to start at. It demonstrates basic OpenThread initialization and simple socket-based server and client.

**Before OpenThread initialization**

- s1.1 The main task calls `esp_vfs_eventfd_register()` to initialize the eventfd virtual filesystem. The eventfd file system is used for task notification in the OpenThread driver.
- s1.2 The main task calls `nvs_flash_init()` to initialize the NVS where the Thread network data is stored.
- s1.3 Optional. The main task calls `esp_netif_init()` only when it wants to create the network interface for Thread.
- s1.4: The main task calls `esp_event_loop_create()` to create the system Event task and initialize an application event’s callback function.

**OpenThread stack initialization**

- s2.1: Call `esp_openthread_init()` to initialize the OpenThread stack.
**OpenThread network interface initialization**

The whole stage is *optional* and only required if the application wants to create the network interface for Thread.
- s3.1: Call `esp_netif_new()` with `ESP_NETIF_DEFAULT_OPENTHREAD` to create the interface.
- s3.2: Call `esp_openthread_netif_glue_init()` to create the OpenThread interface handlers.
- s3.3: Call `esp_netif_attach()` to attach the handlers to the interface.

**The OpenThread main loop**

- s4.3: Call `esp_openthread_launch_mainloop()` to launch the OpenThread main loop. Note that this is a busy loop and will not return until the OpenThread stack is terminated.

**Calling OpenThread APIs**

The OpenThread APIs are not thread-safe. When calling OpenThread APIs from other tasks, make sure to hold the lock with `esp_openthread_lock_acquire()` and release the lock with `esp_openthread_lock_release()` afterwards.

**Deinitialization**

The following steps are required to deinitialize the OpenThread stack:
- Call `esp_netif_destroy()` and `esp_openthread_netif_glue_deinit()` to deinitialize the OpenThread network interface if you have created one.
- Call `esp_openthread_deinit()` to deinitialize the OpenThread stack.

**4.21.3 The OpenThread border router**

The OpenThread border router connects the Thread network with other IP networks. It will provide IPv6 connectivity, service registration and commission functionality. To launch an OpenThread border router on an ESP chip, you need to connect an RCP to a Wi-Fi capable chip such as ESP32. Call `esp_openthread_border_router_init()` during the initialization will launch all the border routing functionalities.

You may refer to the `openthread/ot_br` example and the README for further border router details.

**4.22 应用程序的内存布局**

ESP32 芯片具有灵活的内存映射功能，本小节将介绍 ESP-IDF 默认使用这些功能的方式。

ESP-IDF 应用程序的代码可以在以下内存区域之一。

**4.22.1 IRAM（指令 RAM）**

ESP-IDF 将内部 SRAM0 区域（在技术参考手册中有定义）的一部分分配为指令 RAM。除了开始的 64kB 用作 PRO CPU 和 APP CPU 的高速缓存外，剩余内存区域（从 0x40080000 至 0x400A0000）会被用来存储应用程序中部分需要在 RAM 中运行的代码。

一些 ESP-IDF 的组件和 WiFi 协议栈的部分代码通过链接脚本文件被存放在了这块内存区域。如果一些应用程序的代码需要放在 IRAM 中运行，可以使用 `IRAM_ATTR` 宏定义进行声明。

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg) {
    // ...
}
```
4.22.2 IROM（代码从 Flash 中运行）

如果一个函数没有被显式地声明放在 IROM 或者 RTC 内存中，则将其置于 Flash 中。Flash 技术参考手册中介绍了 Flash MMU 允许代码从 Flash 执行的机制。ESP-IDF 将从 Flash 中执行的代码放在 0x40000000—0x40400000 区域的开始，在启动阶段，二级引导程序会初始化 Flash MMU，将代码在 Flash 中的位置映射到这个区域的开头。对这个区域的访问会被透明地缓存到 0x40070000—0x40080000 范围内的两个 32kB 的块中。

请注意，使用 Window ABI CALLx 指令可能无法访问 0x40000000—0x40400000 区域以外的代码，所以要特别留意应用程序是否使用了 0x40400000—0x40800000 或者 0x40800000—0x40C00000 区域，ESP-IDF 默认不会使用这两个区域。

4.22.3 RTC 快速内存

从深度睡眠模式唤醒后必须要运行的代码要放在 RTC 内存中，更多信息请查阅文档深度睡眠。

4.22.4 DRAM（数据 RAM）

链接器将非常量静态数据和零初始化数据放入 0×3FFB0000 — 0×3FFFF000 这 256kB 的区域。注意，如果使用蓝牙堆栈，此区域会减少 64kB（通过将起始地址移至 0×3FFC0000）。如果使用了内存跟踪的功能，该区域的长度要减少 16kB 或者 32kB。放置静态数据后，留在此区域中的剩余空间都用作运行时堆。

常量数据也可以放在 DRAM 中，例如，用在 ISR 中的常量数据（参见上面 IROM 部分的介绍），为此需要使用 DRAM_ATTR 宏来声明。

```
DRAM_ATTR const char[] format_string = "%p %x";
char buffer[64];
printf(buffer, format_string, ptr, val);
```

毋庸置疑，不建议在 ISR 中使用 printf 和其余输出函数。出于调试的目的，可以在 ISR 中使用 ESP_EARLY_LOGx 来输出日志，不过要确保将 TAG 和格式字符串都放在了 DRAM 中。

宏 __NOINIT_ATTR 可以用来声明将数据放在 .noinit 段中，放在该段中的数据不会在启动时被初始化，并且在软件重启后会保留原来的值。

例子：

```
__NOINIT_ATTR uint32_t noinit_data;
```

4.22.5 DROM（数据存储在 Flash 中）

默认情况下，链接器将常量数据放入一个 4MB 区域 (0x3F400000 — 0x3F800000)。该区域用于通过 Flash MMU 和高速缓存来访问外部 Flash。一种特例情况是，字面量会被编译器嵌入到应用程序代码中。

Espressif Systems 1913 Release v5.0-dev-489-gef98a36
4.22.6 RTC 慢速内存

从 RTC 内存运行的代码（例如深度睡眠模块的代码）使用的全局和静态变量必须要放在 RTC 慢速内存中。更多详细说明请查看文档《深度睡眠》。

宏 RTC_NOINIT_ATTR 用来声明将数据放入 RTC 慢速内存中，该数据在深度睡眠唤醒后将保持不变。

例子：

```c
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

4.23 DMA 能力要求

大多数的 DMA 控制器（例如 SPI, SDMMC 等）都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量中而不是堆栈中。使用 DMA_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 能力，例如：

```c
DMA_ATTR uint8_t buffer[] = "I want to send something";
void app_main()
{
    // 初始化代码...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // 其他程序
}
```

或者：

```c
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // 其他程序
}
```

在堆栈中放置 DMA 缓冲区仍然是允许的，但是你必须记住：

- 如果堆栈在 pSRAM 中，切勿尝试这么做，因为堆栈在 pSRAM 中的话就要按照片外 SRAM 文档介绍的步骤来操作（至少要在 menuconfig 中使能 SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY），所以请确保你的任务不在 PSRAM 中。
- 在函数中使用 WORD_ALIGNED_ATTR 宏来修饰变量，将其放在适当的位置上，比如：

```c
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something";  // 否则 buffer 数组会被存储在 stuff 变量的后面
    // 初始化代码...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    }

SPI 应用程序

```c
};
spi_device_transmit( spi, &temp );
// 其他程序
```

### 4.24 分区表

#### 4.24.1 概述

每片 ESP32 的 flash 可以包含多个应用程序，以及多种不同类型的数据（例如校准数据、文件系统数据、参数存储数据等）。因此，我们使用 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0xC00 字节（最多可以保存 95 条分区表条目）。分区表数据后保存着该表的 MD5 校验和，用于验证分区表的完整性。此外，如果芯片使能了安全启动功能，则该分区表后还会保存签名信息。

分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app、data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单（idf.py menuconfig），并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表。

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table`，即可打印当前使用分区表的信息摘要。

#### 4.24.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要:

```c
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x6000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
```

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用文件，且启动加载器将默认加载该应用文件。
- 分区表中还定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要:

```c
# ESP-IDF Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs, 0x9000, 0x4000,
otadata, data, ota, 0xd000, 0x2000,
phy_init, data, phy, 0xf000, 0x1000,
factory, app, factory, 0x10000, 1M,
ota_0, app, ota_0, 0x110000, 1M,
ota_1, app, ota_1, 0x210000, 1M,
```

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序 (factory)，其余两个为 OTA 应用程序 (ota_0, ota_1)。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。
### 创建自定义分区表

如果在 `menuconfig` 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是在 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件:

<table>
<thead>
<tr>
<th>Name, Type, SubType, Offset, Size, Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs, data, nvs, 0x9000, 0x4000</td>
</tr>
<tr>
<td>otadata, data, ota, 0xd000, 0x2000</td>
</tr>
<tr>
<td>phy_init, data, phy, 0xf000, 0x1000</td>
</tr>
<tr>
<td>factory, app, factory, 0x10000, 1M</td>
</tr>
<tr>
<td>ota_0, app, ota_0, 0, 1M</td>
</tr>
<tr>
<td>ota_1, app, ota_1, 0, 1M</td>
</tr>
<tr>
<td>nvs_key, data, nvs_keys, 0x1000</td>
</tr>
</tbody>
</table>

- 字段之间的空格会被忽略，任何以 # 开头的行 (注释) 也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，`gen_es32part.py` 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

#### Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字符（之后的内容将被截断）。该字段对 ESP32 并不是特别重要。

#### Type 字段

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE)。注意，0x00-0x3F 不得使用（预留给 esp-idf 的核心功能）。

如果您的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 `esp_partition_type_t` 关于 app` 和 `data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分区类型，需要在 `esp_partition_type_t` 中使用整数，从而与分区 API 一起使用。例如:

```c
static const esp_partition_type_t APP_PARTITION_TYPE_A = (esp_partition_type_t)0x40;
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

#### SubType 字段

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考 `esp_partition_subtype_t`，以了解 ESP-IDF 定义的全部子类型列表，包括:

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota_0 (0x10)…ota_15 (0x1F) 或者 test (0x20)。
- factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而判断启动哪个 OTA 镜像文件。
- 假如您希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota_0 分区。
Chapter 4. API

- ota_0 (0x10) - ota_15 (0x1F) 为 OTA 应用程序分区，启动加载器根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序至少拥有 2 个 OTA 应用程序分区（ota_0 和 ota_1）。更多详细信息，请参考 OTA 文档。
- test (0x20) 为预留的子类型，用于简单测试程序。如果没有其他有效 app 分区，test 将作为备选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。更多信息请查阅从测试固件启动。
  - 当 Type 定义为 data 时，SubType 字段可以指定为 ota (0x00), phy (0x01), nvs (0x02), nvs_keys (0x04) 或者其他组件特定的子类型（请参考子类型枚举）。
  - ota (0) 即 OTA 数据分区，用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000，更多详细信息，请参考 OTA 文档。
  - phy (1) 分区用于存放 PHY 初始化数据，从而保证可以为每个设备单独配置 PHY，而非必须采用固化在固件中的统一 PHY 初始化数据。
    * 默认配置下，phy 分区并不启动，而是直接将 phy 初始化数据编译至应用程序中，从而节省分区表空间（直接将此分区删掉）。
    * 如果需要在此分区加载 phy 初始化数据，请打开项目配置菜单（idf.py menuconfig），并且使用 CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION 选项。此时，您还需要手动将 phy 初始化数据烧至设备 flash（esp-idf 编译系统并不会自动完成该操作）。
- nvs (2) 是专门用于非易失性存储 (NVS) API 使用的分区。
  * 用于存储每个设备的 PHY 校准数据（注意，并不是 PHY 初始化数据）。
  * 用于存储 Wi-Fi 数据（如果使用了 esp_wifi_set_storage(WIFI_STORAGE_FLASH) 初始化函数）。
  * NVS API 还可以用于其他应用程序数据。
  * 强烈建议您应为 NVS 分区分配至少 0x3000 字节空间。
  * 如果使用 NVS API 存储大量数据，请增加 NVS 分区的大小（默认是 0x6000 字节）。
- nvs_keys (4) 是 NVS 秘钥分区。更多信息，请参考非易失性存储 (NVS) API 文档。
  * 用于存储加密密钥（如果启用了 NVS 加密功能）。
  * 此分区应至少设定为 4096 字节。
- ESP-IDF 还支持其它预定义的子类型用于数据存储，包括：
  - FAT 文件系统 (ESP_PARTITION_SUBTYPE_DATA_FAT)
  - SPIFFS (ESP_PARTITION_SUBTYPE_DATA_SPIFFS)

另外数据子类型已预留给 esp-idf 未来使用。
  - 如果分区类型是应用程序定义的任意值 (0x40-0xFE)，那么 subtype 字段可以是由应用程序选择的任何值 (0x00-0xFE)。

请注意如果用 C++ 编写，应用程序定义的子类型值需要转换为 esp_partition_type_t，从而与分区 API 一起使用。

Offset 和 Size 字段

分区若偏移地址为空，则会紧跟着前一个分区之后开始；若为首分区，则将紧跟着分区表开始。

app 分区的偏移地址必须与 0x10000 (64K) 对齐，如果将偏移字段留空，gen Esp32part.py 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64K) 对齐，则该工具会报错。

app 分区的大小和偏移地址可以采用十进制数，以 0x 为前缀的十六进制数，且支持 K 或 M 的倍数单位（分别代表 1024 和 1024*1024 字节）。

如果您希望允许分区表中的分区采用任意起始偏移量 (CONFIG_PARTITION_TABLE_OFFSET)，请将分区表 (CSV 文件) 中所有分区的偏移字段留空。注意，此时，如果您更改了分区表中任意分区的偏移地址，则其他分区的偏移地址也会跟着改变。这种情况下，如果您之前曾设定某个分区采用固定偏移地址，则可能造成分区表冲突，从而导致报错。

Flags 字段

当前仅支持 encrypted 标记。如果 Flags 字段设置为 encrypted，且已启用 Flash 加密功能，则该分区将会被加密。

Espressif Systems  1917
Release v5.0-dev-489-gef98a36

Submit Document Feedback
4.24.4 生成二进制分区表

烧写到 ESP32 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，partition_table/gen_esp32part.py 工具可以实现 CSV 和二进制文件之间的转换。

如果您在项目配置菜单 (idf.py menuconfig) 中设置了分区表 CSV 文件的名称，然后构建项目或执行 idf.py partition-table。这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件:

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件:

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

在标准输出 (stdout) 上，打印二进制分区表的内容（运行 idf.py partition-table 时展示的信息摘要也是这样生成的）：

```
python gen_esp32part.py binary_partitions.bin
```

4.24.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查：

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考引导加载程序大小。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

注解：即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

MD5 校验和

二进制格式的分区表中含一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 gen_esp32part.py 的 --disable-md5sum 选项或者 CONFIG_PARTITION_TABLE_MD5 选项关闭 MD5 校验。对于 ESP-IDF v3.1 版本前的引导加载程序，因为它不支持 MD5 校验，所以无法正常启动并报错 invalid magic number 0xebeb，此时用户可以使用此选项关闭 MD5 校验。

4.24.6 烧写分区表

- idf.py partition-table-flash：使用 esptool.py 工具烧写分区表。
- idf.py flash：会烧写所有内容，包括分区表。
Chapter 4. API

在执行 idf.py partition-table 命令时，手动烧写分区表的命令也将打印在终端上。

注解：分区表的更新并不会擦除根据旧分区表存储的数据。此时，您可以使用 idf.py erase-flash 命令或者 esptool.py erase_flash 命令来擦除 flash 中的所有内容。

4.24.7 分区工具 (parttool.py)

partition_table 组件中有分区工具 parttool.py，可以在目标设备上完成分区相关操作。该工具有如下用途：

- 读取分区，将内容存储到文件中 (read_partition)
- 将文件中的内容写至分区 (write_partition)
- 擦除分区 (erase_partition)
- 检索特定分区的名称、偏移、大小和 flag（“加密”）标志等信息 (get_partition_info)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API

首先请确保已导入 parttool 模块。

```python
import sys
import os

idf_path = os.environ['IDF_PATH']  # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table")  # parttool.py 位于 $IDF_PATH/components/partition_table 下
sys.path.append(parttool_dir)  # 允许 Python 寻找 parttool 模块
from parttool import *  # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 ParttoolTarget：

```python
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 ParttoolTarget 在目标设备上完成操作：

```python
# 擦除名为 ‘storage’ 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 ‘data’、子类型为 ‘spiffs’ 的分区，保存至文件 ‘spiffs.bin’
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 ‘factory.bin’ 文件的内容写至 ‘factory’ 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 PartitionName、PartitionType 或 PARTITION_BOOT_DEFAULT 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。
4.25 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

4.25.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.

4.25.2 Guides

Maximizing Execution Speed

Overview Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as Minimizing Binary Size.
Choose What To Optimize  If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

Measuring Performance  The first step to improving something is to measure it.

Basic Performance Measurements  If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples wifi/iperf and ethernet/iperf for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```c
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();

    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // This is the thing you need to measure
    }

    uint64_t end = esp_timer_get_time();

    printf("%u iterations took %ull milliseconds (%ull microseconds per invocation)\n", MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}
```

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using `esp_timer_get_time()` generates “wall clock” timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It’s also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision.
- The CPU cycles are counted per-core, so only use this method from an interrupt handler, or a task that is pinned to a single core.
- If making “microbenchmarks” (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see Targeted Optimizations).

External Tracing  The 应用层跟踪库 allows measuring code execution with minimal impact on the code itself.

Tasks  If the option `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS` is enabled then the FreeRTOS API `vTaskGetRunTimeStats()` can be used to retrieve runtime information about the processor time used by each FreeRTOS task.
SEGGER SystemView is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

Improving Overall Speed  The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set `CONFIG_ESPTOOLPY_FLASHFREQ` to 80 MHz. This is double the 40 MHz default value and will double the speed at which code is loaded or executed from flash. You should verify that the board or module that connects the ESP32 to the flash chip is rated for 80 MHz operation at the relevant temperature ranges, before changing this setting. The hardware datasheet(s) will have this information.

- Set `CONFIG_ESPTOOLPY_FLASHMODE` to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32 and the flash chip must support quad I/O modes or the SoC will not work correctly.

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for performance (-O2)”. This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.

- Avoid using floating point arithmetic (`float`). Even though ESP32 has a single precision hardware floating point unit, floating point calculations are always slower than integer calculations. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.

- Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

Reduce Logging Overhead Although standard output is buffered, it’s possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

- Reduce the volume of log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL` (the equivalent bootloader setting is `CONFIG_BOOTLOADER_LOG_LEVEL`). This also reduces the binary size, and saves some CPU time spent on string formatting.

- Increase the speed of logging output by increasing the `CONFIG_ESP_CONSOLE_UART_BAUDRATE`

Not Recommended  The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

- Set `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

Targeted Optimizations  The following changes will increase the speed of a chosen part of the firmware application:

- Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it’s possible for the CPU to have to wait on a “cache miss” while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.

IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See [IRAM](https://www.espressif.com/technical-reference/espressif-system-api) for more information.

- Jump table optimizations can be re-enabled for individual source files that don’t need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the `-fjump-tables -ftree-switch-conversion` options when compiling individual source files, see [组件编译控制](https://www.espressif.com/technical-reference/espressif-system-api)
Improving Startup Time  In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

- Minimizing the `CONFIG_LOG_DEFAULT_LEVEL` and `CONFIG_BOOTLOADER_LOG_LEVEL` has a large impact on startup time. To enable more logging after the app starts up, set the `CONFIG_LOG_MAXIMUM_LEVEL` as well and call `esp_log_set_level()` to restore higher level logs. The `system/startup_time` main function shows how to do this.
- If using deep sleep, setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.
- Setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON` will skip verifying the binary on every boot from power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the config item for an explanation and recommendations if using this option.
- It’s possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set `CONFIG_ESP32_RTC_CLK_CAL_CYCLES` to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project `system/startup_time` is pre-configured to optimize startup time. The files `system/startup_time/sdkconfig.defaults` and `system/startup_time/sdkconfig.defaults.esp32` contain all of these settings. You can append these to the end of your project’s own `sdkconfig` file to merge the settings, but please read the documentation for each setting first.

Task Priorities  As ESP-IDF FreeRTOS is a real-time operating system, it’s necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling `xTaskCreate()` or `xTaskCreatePinnedToCore()` and can be changed at runtime by calling `vTaskPrioritySet()`.

It’s also necessary to ensure that tasks yield CPU (by calling `vTaskDelay()`, `sleep()`, or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The Task Watchdog Timer provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

Built-In Task Priorities  ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header `components/esp_system/include/esp_task.h` contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:

- **Main task that executes app_main function** has minimum priority (1). This task is pinned to Core 0 by default (configurable).
- **High Resolution Timer** system task to manage high precision timer events and execute callbacks has high priority (22, `ESP_TASK_TIMER_PRIO`). This task is pinned to Core 0.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, configurable). This task is pinned to Core 0.
- **Event Handling** system task to manage the default system event loop and execute callbacks has high priority (20, `ESP_TASK_EVENT_PRIO`) and pinned to Core 0. This configuration is only used if the application calls `esp_event_loop_create_default()`, it’s possible to call `esp_event_loop_create()` with a custom task configuration instead.
- **lwIP TCP/IP** task has high priority (18, `ESP_TASK_TCPIP_PRIO`) and is not pinned to any core (configurable).
• **Wi-Fi Driver** task has high priority (23) and is pinned to Core 0 by default (*configurable*).

Wi-Fi wpa_supplicant component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2) and are not pinned to any core.

• **Bluetooth Controller** task has high priority (23, `ESP_TASK_BT_CONTROLLER_PRIO`) and is pinned to Core 0 by default (*configurable*). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task assigned to a single CPU.

• **NimBLE Bluetooth Host** host task has high priority (21) and is pinned to Core 0 by default (*configurable*).

• **Bluedroid Bluetooth Host** creates multiple tasks when used:
  – Stack event callback task (“BTC”) has high priority (19).
  – Stack BTU layer task has high priority (20).
  – Host HCI host task has high priority (22).

All Bluedroid Tasks are pinned to the same core, which is Core 0 by default (*configurable*).

• The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the priority is medium-high (15) and the task is not pinned to any core. These settings can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.

• If using the `mDNS` component, it creates a task with default low priority 1 (*configurable*) and pinned to CPU0 (*configurable*).

• If using the `MQTT` component, it creates a task with default priority 5 (*configurable*, depends on `CONFIG_MQTT_USE_CUSTOM_CONFIG`) and not pinned to any core (*configurable*).

### Choosing application task priorities

With a few exceptions (most importantly the lwIP TCP/IP task), in the default configuration most built-in tasks are pinned to Core 0. This makes it quite easy for the application to place high priority tasks on Core 1. Using priority 19 or higher will guarantee an application task can run on Core 1 without being preempted by any built-in task. To further isolate the tasks running on each CPU, configure the lwIP task to only run on Core 0 instead of either core (this may reduce total TCP/IP throughput depending on what other tasks are running).

In general, it’s not recommended to set task priorities on Core 0 higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. Choosing priority 19 and Core 0 will allow lower layer Wi-Fi/BT functionality to run without delays, but still pre-empts the lwIP TCP/IP stack and other less time-critical internal functionality - this is an option for time-critical tasks that don’t perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

### Improving Interrupt Performance

ESP-IDF supports dynamic *Interrupt allocation* with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones.

Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it’s important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

- Assign more important interrupts a higher priority using a flag such as `ESP_INTR_FLAG_LEVEL2` or `ESP_INTR_FLAG_LEVEL3` when calling `esp_intr_alloc()`.

---

**Note:** Setting a task to always run in preference to built-in ESP-IDF tasks does not require pinning to Core 1. The task can be left unpinned - at priority 17 or lower - to optionally run on Core 0 as well, if no higher priority built-in task is running there. Using unpinned tasks can improve the overall CPU utilization, however it makes reasoning about task scheduling more complex.

**Note:** Task execution is always completely suspended when writing to the built-in SPI flash chip. Only IRAM 安全中断处理程序 will continue executing.
• Assign the interrupt on a CPU where built-in Wi-Fi/BT tasks are not configured to run (this means assigning on Core 1 by default, see Built-In Task Priorities). Interrupts are assigned on the same CPU where the `esp_intr_alloc()` function call is made.

• If you’re sure the entire interrupt handler can run from IRAM (see IRAM 安全中断处理程序) then set the ESP_INTR_FLAG_IRAM flag when calling `esp_intr_alloc()` to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.

• Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see Targeted Optimizations). It’s possible to do this without adding the ESP_INTR_FLAG_IRAM flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

Improving Network Speed

• For Wi-Fi, see 如何提高 Wi-Fi 性能 and Wi-Fi 缓冲区使用情况
• For lwIP TCP/IP (Wi-Fi and Ethernet), see Performance Optimization
• The wifi/iperf example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files wifi/iperf/sdkconfig.defaults, wifi/iperf/sdkconfig.defaults.esp32 and wifi/iperf/sdkconfig.ci.99 to your project `sdkconfig` file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

Measuring Static Sizes  To optimize both firmware binary size and memory usage it’s necessary to measure statically allocated RAM (“data”, “bss”), code (“text”) and read-only data (“rodata”) in your project.

Using the `idf.py` sub-commands `size`, `size-components` and `size-files` provides a summary of memory used by the project:

```
$ idf.py size
[...]
  Total sizes:
  DRAM .data size: 14956 bytes
  DRAM .bss size: 15808 bytes
  Used static DRAM: 30764 bytes (149972 available, 17.0% used)
  Used static IRAM: 83918 bytes (47154 available, 64.0% used)
  Flash code: 559943 bytes
  Flash rodata: 176736 bytes
  Total image size: 835553 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

• DRAM .data size is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.
• DRAM .bss size is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn’t use any space in the binary file.
• Used static DRAM is the total DRAM used by .data + .bss. The available size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).
API

- Used static IRAM is the total size of executable code executed from IRAM. This uses space in the binary file and also reduces IRAM and/or DRAM (depending on sizes) available as heap memory at runtime. See Optimizing IRAM Usage.
- Flash code is the total size of executable code executed from flash cache (IROM). This uses space in the binary file.
- Flash rodata is the total size of read-only data loaded from flash cache (DROM). This uses space in the binary file.
- Total image size is the estimated total binary file size, which is the total of all the used memory types except for .bss.

Component Usage Summary (idf.py size-components) The summary output provided by idf.py size does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use idf.py size-components

$ idf.py size-components
 [...] Total sizes:
 DRAM .data size:  14956 bytes
 DRAM .bss size:  15808 bytes
Used static DRAM:  30764 bytes (149972 available, 17.0% used)
Used static IRAM:  83918 bytes (47154 available, 64.0% used)
 Flash code:  559943 bytes
 Flash rodata:  176736 bytes
Total image size: ~835553 bytes (.bin may be padded larger)

Per-archive contributions to ELF file:

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see [构建系统（CMake 版）](#)), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- DRAM .data & .bss & other - .data and .bss are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but .bss doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- IRAM - is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces IRAM that can be dynamically allocated at runtime using `HEAP_CAP_32BIT`.
- D/IRAM - Shows IRAM space which, due to occupying D/IRAM space, is also reducing available DRAM available as heap at runtime.
- Flash code & rodata - these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

**Source File Usage Summary (idf.py size-files)** For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```bash
$ idf.py size-files
[...,]
Total sizes:
   DRAM .data size:    14956 bytes
   DRAM .bss size:     15808 bytes
Used static DRAM:   30764 bytes ( 149972 available, 17.0% used)
Used static IRAM:   83918 bytes ( 47154 available, 64.0% used)
   Flash code:      559943 bytes
   Flash rodata:    176736 bytes
Total image size:  835553 bytes (.bin may be padded larger)
Per-file contributions to ELF file:
   Object File   DRAM .data & .bss & other   IRAM   D/IRAM   Flash code &...
       x509_crt_bundle.S.o          0       0       0       0       0       64212
       wl_cnx.o                       2      3183       0      221       0      13119
     phy_chip_v7.o                    721     614       0     1642       0      16820
       ieee80211_ioctl.o              740      96       0     437       0      15325
       pp.o                           1142     45       0     8871       0      5030
```

(continued)
After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed.

The columns are the same as shown above for `idy.py size-components`, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file `x509_crt_bundle.S.o` contributed 64212 bytes to the total firmware size, all as `.rodata` in flash. Therefore we can guess that this application is using the `ESP x509 Certificate Bundle` feature and not using this feature would save at least this many bytes from the firmware size.
Some of the object files are linked from binary libraries and therefore you won’t find a corresponding source file. To locate which component a source file belongs to, it’s generally possible to search in the ESP-IDF source tree or look in the Linker Map File for the full path.

Comparing Two Binaries If making some changes that affect binary size, it’s possible to use an ESP-IDF tool to break down the exact differences in size. This operation isn’t part of idf.py, it’s necessary to run the idf-size.py Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name PROJECTNAME.map. The idf-size.py tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding .map file saved from the build directory.

For example, to compare two builds: one with the default CONFIG_COMPILER_OPTIMIZATION setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)”:

```
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means that <CURRENT> is larger.
Total sizes of <CURRENT>:
  <REFERENCE> Difference
DRAM .data size: 14516 bytes
  14956 -440
DRAM .bss size: 15792 bytes
  15808 -16
Used static DRAM: 30308 bytes (150428 available, 16.8% used)
  30764 -456 ( +456 available, +0 total)
Used static IRAM: 78498 bytes (52574 available, 59.9% used)
  83918 -5420 ( +5420 available, +0 total)
  509183 Flash code: 509183 bytes
  559943 -50760
  170592 Flash rodata: 170592 bytes
  176736 -6144
  835553 Total image size: 772789 bytes (.bin may be padded larger)
  835553 -62764

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It’s also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

```
$ $IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_Os/https_request.map
```

Also at the individual source file level:

```
$ $IDF_PATH/tools/idf_size.py --files --diff build_Og/https_request.map build_Os/https_request.map
```

Other options (like writing the output to a file) are available, pass --help to see the full list.

Showing Size When Linker Fails If too much static memory is used, then the linker will fail with an error such as DRAM segment data does not fit, region `iram0_0_seg' overflowed by 44 bytes, or similar.

In these cases, idf.py size will not succeed either. However it is possible to run idf_size.py manually in order to view the partial static memory usage (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)
The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

**Linker Map File**  
*This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to \ref{reducing-overall-size} and possibly come back to this later.*

The `idf.py size` analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created (“linked”) the final firmware binary file.

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- **Archive member included to satisfy reference by file (symbol).** This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the Cross Reference Table at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the Discarded input sections list instead.
- **Allocating common symbols** - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.
- **Discarded input sections** - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options `-ffunction-sections -fdata-sections` and linker option `--gc-sections`). Items mentioned in this list do not contribute to the final binary.
- **Memory Configuration, Linker script and memory map** These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the CMake build system. The linker script is partially generated from the ESP-IDF project using the 链接器脚本生成机制 feature.

As the output of the Linker script and memory map part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and the source file).

Following all of the output sections that take up space in the final .bin file, the memory map also includes some sections in the ELF file that are only used for debugging (ELF sections `.debug_*`, etc.). These don’t contribute to the final binary size. You’ll notice the address of these symbols is a very low number (starting from 0x0000000000000000 and counting up).

- **Cross Reference Table**. This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you’re wondering why a particular thing is included in the binary, this will help determine what included it.

**Note:** Unfortunately, the Cross Reference Table doesn’t only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn’t mean that it was included in the final binary - this needs to be checked separately.

**Note:** Linker map files are generated by the GNU binutils linker “ld”, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.
Reducing Overall Size

The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for size (-Os)”. In some cases, “Optimize for performance (-O2)” will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don’t happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to “Silent”. This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It’s still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- If the binary needs to run on only certain revision(s) of ESP32, increasing `CONFIG_ESP32_REV_MIN` to match can result in a reduced binary size. This will make a large difference if setting ESP32 minimum revision 3, and PSRAM is enabled.
- Don’t enable `CONFIG_COMPILER_CXX_EXCEPTIONS`, `CONFIG_COMPILER_CXX_RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see Error Numbers) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to “Silent reboot” will save a small amount of binary size, however this is only recommended if no one will use UART output to debug the device.

Targeted Optimizations

The following binary size optimizations apply to a particular component or a function:

**Wi-Fi**

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` will save some Wi-Fi binary size if soft-AP support is not needed.

**ADC**

- Disabling ADC calibration features `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, `CONFIG_ADC_CAL_LUT_ENABLE` will save a small amount of binary size if ADC driver is used, at expense of accuracy.

**Bluetooth NimBLE**

If using NimBLE Bluetooth Host then the following modifications can reduce binary size:

- Set `CONFIG_BTDM_CTRL_BLE_MAX_CONN` to 1 if only one BLE connection is needed.
- Set `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
• Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in *Reducing Overall Size* then this also reduces the NimBLE log level.

lwIP IPv6

• Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

注解: IPv6 is required by some components such as *coap* and *ASIO port*, These components will not be available if IPv6 is disabled.

Newlib nano formatting  By default, ESP-IDF uses newlib “full” formatting for I/O (printf, scanf, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32 ROM, so it doesn’t need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls printf() or another string formatting function, see *Reducing Stack Sizes*.

“Nano” formatting doesn’t support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the Newlib README file.

mbedTLS features  Under Component Config -> *mbedTLS* there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

• `CONFIG_MBEDTLS_HAVE_TIME`
• `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
• `CONFIG_MBEDTLS_SHA512_C`
• `CONFIG_MBEDTLS_SSL_PROTO_TLS1`
• `CONFIG_MBEDTLS_SSL_PROTO_TLS1_1`
• `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
• `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
• `CONFIG_MBEDTLS_SSL_ALPN`
• `CONFIG_MBEDTLS_CCM_C`
• `CONFIG_MBEDTLS_GCM_C`
• `CONFIG_MBEDTLS_ECP_C` (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
• `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
• Change `CONFIG_MBEDTLS_TLS_MODE` if both Server & Client are not needed
• Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`)

The help text for each option has some more information.

重要: It is strongly not recommended to disable all these mbedTLS options. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

• Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
• Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.
If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32 device may become inaccessible if support changes.

**FreeModBus** If using Modbus, enable or disable `CONFIG_FMB_COMM_MODE_TCP_EN`, `CONFIG_FMB_COMM_MODE_RTU_EN`, `CONFIG_FMB_COMM_MODE_ASCII_EN` as applicable for the necessary functionality.

**VFS** Virtual filesystem feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (open, read, write, etc.) and C library functions (fopen, fread, fwrite, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- **CONFIG_VFS_SUPPORT_TERMIOS** — can be disabled if the application doesn’t use termios family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- **CONFIG_VFS_SUPPORT_SELECT** — can be disabled if the application doesn’t use select function with file descriptors. Currently, only the UART and eventfd VFS drivers implement select support. Note that when this option is disabled, select can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- **CONFIG_VFS_SUPPORT_DIR** — can be disabled if the application doesn’t use directory related functions, such as readdir (see the description of this option for the complete list). Applications which only open, read and write specific files and don’t need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- **CONFIG_VFS_SUPPORT_IO** — can be disabled if the application doesn’t use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, console can’t be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

**Bootloader Size** This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF 二级引导程序.

For a discussion of ESP-IDF bootloader binary size, see 引导加载程序大小.

**IRAM Binary Size** If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See Optimizing IRAM Usage.

**Minimizing RAM Usage**

In some cases, a firmware application’s available RAM may run low or run out entirely. In these cases, it’s necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

**Background** Before optimizing ESP-IDF RAM usage, it’s necessary to understand the basics of ESP32 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in Heap Memory Allocation.
Measuring Static Memory Usage  The \textit{idf.py} tool can be used to generate reports about the static memory usage of an application. Refer to the \textit{Binary Size} chapter for more information.

Measuring Dynamic Memory Usage  ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See \textit{Heap Memory Debugging}.

---

注解： 在嵌入式系统中，堆碎片化可能是一个显著的问题，同时总RAM使用量。堆测量API提供了一种测量“最大空闲块”的方法。监控这个值，同时跟踪总数量的空闲字节可以给出一个快速的指示，堆碎片化是否成为一个问题。

---

Reducing Static Memory Usage

- Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
- Generally speaking, minimizing static memory usage requires monitoring the .data and .bss sizes. For tools to do this, see \textit{Measuring Static Sizes}.
- Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

- Declare structures, buffers, or other variables \texttt{const} whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take \texttt{const *} arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
- If using Bluedroid, setting the option \texttt{CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY} will cause Bluedroid to allocate memory on initialization and free it on deinitialization. This doesn’t necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

Reducing Stack Sizes  In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to \texttt{xTaskCreate()}). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

- Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
- Consolidate task functions. String formatting functions (like \texttt{printf}) are particularly heavy users of stack, so any task which doesn’t ever call these can usually have its stack size reduced.
- Enabling \texttt{Newlib nano formatting} will reduce the stack usage of any task that calls \texttt{printf()} or other C string formatting functions.
- Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.
- Avoid deep recursive function calls. Individual recursive function calls don’t always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.
- At runtime, call the function \texttt{uxTaskGetStackHighWaterMark()} with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call \texttt{uxTaskGetStackHighWaterMark(NULL)} to get the current task’s high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and
then call `uxTaskGetStackHighWaterMark()`). Often, it’s possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.

- Call `uxTaskGetSystemState()` at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.
- When debugger watchpoints are not being used, set the `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` option of “Check using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it’s possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

**Internal Stack Sizes** ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

**Important:** If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

- **Main task that executes app_main function** has stack size `CONFIG_ESP_MAIN_TASK_STACK_SIZE`.
- **High Resolution Timer** system task which executes callbacks has stack size `CONFIG_ESP_TIMER_TASK_STACK_SIZE`.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`.
- **Event Handling** system task to execute callbacks for the default system event loop has stack size `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`.
- **lwIP** TCP/IP task has stack size `CONFIG_LWIP_TCPPIP_TASK_STACK_SIZE`.
- **Bluedroid Bluetooth Host** have task stack sizes `CONFIG_BT_BTC_TASK_STACK_SIZE, CONFIG_BT_BTU_TASK_STACK_SIZE`.
- **NimBLE Bluetooth Host** has task stack size `CONFIG_BT_NIMBLE_TASK_STACK_SIZE`.
- The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config `ETH_MAC_DEFAULT_CONFIG` then the task stack size is 4 KB. This setting can be changed by passing a custom `eth_mac_config_t` struct when initializing the Ethernet MAC.
- FreeRTOS idle task stack size is configured by `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`.
- If using the mDNS and/or MQTT components, they create tasks with stack sizes configured by `CONFIG_MDNS_TASK_STACK_SIZE` and `CONFIG_MQTT_TASK_STACK_SIZE`, respectively. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.

**Note:** Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

**Reducing Heap Usage** For functions that assist in analyzing heap usage at runtime, see Heap Memory Debugging.

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren’t being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:
lwIP documentation has a section to configure **Minimum RAM usage**.

Wi-Fi缓冲区使用情况 describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.

The Ethernet driver allocates DMA buffers for the internal Ethernet MAC when it is initialized - configuration options are `CONFIG_ETH_DMA_BUFFER_SIZE`, `CONFIG_ETH_DMA_RX_BUFFER_NUM`, `CONFIG_ETH_DMA_TX_BUFFER_NUM`.

mbedTLS TLS session memory usage can be minimized by enabling the ESP-IDF feature `CONFIG_MBEDTLS_DYNAMIC_BUFFER`.

In single core mode only, it’s possible to use IRAM as byte accessible memory (added to the regular heap) by enabling `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`. Note that this option carries a performance penalty and the risk of security issues caused by executable data. If this option is enabled then it’s possible to set other options to prefer certain buffers be allocated from this memory: mbedTLS, NimBLE.

Reduce `CONFIG_BTDM_CTRL_BLE_MAX_CONN` if using BLE.

Reduce `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN` if using Bluetooth Classic.

There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

### Optimizing IRAM Usage

If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section `.iram0.text' will not fit in region `iram0_0_seg', IRAM0 segment data does not fit and region `iram0_0_seg' overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use *Measuring Static Sizes*. If the firmware failed to link, steps to analyze are shown at *Showing Size When Linker Fails*.

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH`. Enabling this option will place snapshot-related functions, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, in flash.
- Disable Wi-Fi options `CONFIG_ESP32_WIFI_IRAM_OPT` and/or `CONFIG_ESP32_WIFI_RX_IRAM_OPT`. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- Disable `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH` disabling this option will free some IRAM but is only available in some flash configurations (see the configuration item help text).
- Disable `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR` prevents posting `esp_event` events from IRAM安全中断处理程序 but will save some IRAM.
- Disable `CONFIG_SPI_MASTER_ISR_IN_IRAM` prevents spi_master interrupts from being serviced while writing to flash, and may otherwise reduce spi_master performance, but will save some IRAM.
- Setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

When compiling for ESP32 revisions older than ECO3 (`CONFIG_ESP32_REV_MIN`), PSRAM cache bug workaround (`CONFIG_SPIRAM_CACHE_WORKAROUND`) option is enabled, and the C library functions normally located in ROM are recompiled with the workaround and placed into IRAM instead. For most applications, it is safe to move many of the C library functions into Flash, reclaiming some IRAM. Corresponding options include:

- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`: affects the functions `longjmp` and `setjmp`.
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`: affects the functions `abs`, `div`, `labs`, `ldiv`, `quorem`, `fpclassify` and `nan`.
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`: affects the functions `utoa`, `itoa`, `atoi`, `atol`, `strtol` and `strtoul`.
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`: affects the functions `wcrtomb`, `fwrite`, `wbuf`, `wsetup`, `fputc`, `wctomb_r`, `ungetc`, `makebuf`, `fflush`, `refill`, and `sccl`.
• **CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM**: affects the functions `asctime`, `asctime_r`, `ctime`, `ctime_r`, `lcftime`, `lcltime_r`, `gmtime`, `gmtime`, `gmtime_r`, `strftime`, `mktime`, `tzset_r`, `tzset`, `time`, `gettimeofday`, `systimes`, `month_lengths`, `timelocal`, `tzvars`, `tzlock`, `tzcalc_limits`, and `strptime`.

• **CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM**: affects the functions `ctype`, `toupper`, `tolower`, `toascii`, `strupr`, `bzero`, `isalnum`, `isalpha`, `isascii`, `isblank`, `iscntrl`, `isdigit`, `isgraph`, `islower`, `isprint`, `ispunct`, `isspace`, and `isupper`.

• **CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM**: affects the functions `memccpy`, `memchr`, `memmove`, and `memrchr`.

• **CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM**: affects the functions `strcasecmp`, `strcasestr`, `strchr`, `strcoll`, `strcpy`, `strcspn`, `strdup`, `strdup_r`, `strlcat`, `strlcpy`, `strlcn`, `strlwr`, `strncasecmp`, `strncat`, `strncpy`, `strndup`, `strndup_r`, `strrchr`, `strsep`, `strspn`, `strstr`, `strtok_r`, and ```strupr`.

• **CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM**: affects the functions `srand`, `rand`, and `rand_r`.

• **CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM**: affects the functions `environ`, `envlock`, and `getenv_r`.

• **CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**: affects the functions `lock```, `isatty`, `fclose`, `open`, `close`, `creat`, `read`, `rshift`, `sbrk`, `stdio`, `syssbrk`, `sysclose`, `sysopen`, `creat`, `sysread`, `syswrite`, `impure`, `fwalk`, and `findfp`.

• **CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**: affects the functions `raise` and `system`.

The exact amount of IRAM saved will depend on how much C library code is actually used by the application. In addition to these, the following options may be used to move more of the C library code into Flash, however note that this may result in reduced performance. Also take care to not use corresponding C library functions from interrupts which may be called while cache is disabled (allocated with `ESP_INTR_FLAG_IRAM` flag), refer to IRAM 移动 for more details. For these reasons, the functions `itoa`, `memcpy`, `memcmp`, `memset`, `strcat`, `strcmp`, and `strlen` are always put in IRAM.

### 4.26 RF calibration

ESP32 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

#### 4.26.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to menuconfig and enable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`.

#### 4.26.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
Chapter 4. API

2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use
the full calibration method. To switch to the full calibration method, go to menuconfig and disable
CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE. If you use the default method of RF calibration, there are
two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don’t mind all of the data stored in the NVS partition is erased. That is indeed
   the easiest way.
2. Call API esp_phy_erase_cal_data_in_nvs() before initializing WiFi and BT/BLE based on some
   conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS
   partition is erased.

4.26.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

4.26.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file components/esp_phy/esp32/include/phy_init_data.h.

It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the
default initialization data, please go to menuconfig and disable CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION.

Another is the initialization data which is stored in a partition. When using a custom partition table, make
sure that PHY data partition is included (type: data, subtype: phy). With default partition table, this is done
automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime er-
ror will occur. To switch to the initialization data stored in a partition, go to menuconfig and enable CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION.

4.27 Secure Boot

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each
reset.

Secure Boot is separate from the Flash Encryption feature, and you can use secure boot without encrypting the flash
contents. However, for a secure environment both should be used simultaneously. See Secure Boot & Flash Encryption
for more details.

Important: Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document
throughly and understand the implications of enabling secure boot.
4.27.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (ABS_DONE_0) is burned (written to 1) to permanently enable secure boot on the chip. For more details on Efuses, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF].
- To understand the secure boot process, first familiarise yourself with the standard ESP-IDF boot process.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.

4.27.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under How To Enable Secure Boot. Further in-depth details are supplied under Technical Details:

1. The options to enable secure boot are provided in the Project Configuration Menu, under “Secure Boot Configuration”.
2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.
3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.
4. On first boot, the software bootloader follows the following process to enable secure boot:
   - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
   - The secure digest is flashed at offset 0x0 in the flash.
   - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
   - Bootloader permanently enables secure boot by burning the ABS_DONE_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)
5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see Secure Boot Hardware Support.
6. When running in secure boot mode, the software bootloader uses the secure boot signing key (the public key of which is embedded in the bootloader itself, and therefore validated as part of the bootloader) to verify the signature appended to all subsequent partition tables and app images before they are booted.

4.27.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see Re-Flashable Software Bootloader). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
  - By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING_SCHEME efuse has value 1) and a 192 bit key must be stored in this block.
For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) > System Parameter coding_scheme [PDF].
The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits (details).
- “secure boot signing key” is a standard ECDSA public/private key pair (see Image Signing Algorithm) in PEM format.
Chapter 4. API

− The public key from this key pair (for signature verification but not signature creation) is compiled into
  the software bootloader and used to verify the second stage of booting (partition table, app image) before
  booting continues. The public key can be freely distributed, it does not need to be kept secret.
− The private key from this key pair must be securely kept private, as anyone who has this key can authenticate
  to any bootloader that is configured with secure boot and the matching public key.

4.27.4 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating
partition table offset. See 引导加载程序大小.

4.27.5 How To Enable Secure Boot

1. Open the Project Configuration Menu, navigate to “Secure Boot Configuration” and select the option “One-time
   Flash”. (To understand the alternative “Reflashable” choice, see Re-Flashable Software Bootloader.)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file
   can be anywhere on your system. A relative path will be evaluated from the project directory. The file does
   not need to exist yet.
3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you
   can only flash the bootloader once. Then exit menuconfig and save your configuration
4. The first time you run make, if the signing key is not found then an error message will be printed with a
   command to generate a signing key via espsecure.py generate_signing_key.

重要: A signing key generated this way will use the best random number source available to the OS and its Python
installation (/dev/arandom on OS/X/Linux and CryptGenRandom() on Windows). If this random number source is
weak, then the private key will be weak.

重要: For production environments, we recommend generating the keypair using openssl or another industry standard
encryption program. See Generating Secure Boot Signing Key for more details.

5. Run idf.py bootloader to build a secure boot enabled bootloader. The build output will include a
   prompt for a flashing command, using esptool.py write_flash.
6. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step
   is not performed by make) and then wait for flashing to complete. Remember this is a one time flash, you
   can’t change the bootloader after this!
7. Run idf.py flash to build and flash the partition table and the just-built app image. The app image will
   be signed using the signing key you generated in step 4.

注解: idf.py flash doesn’t flash the bootloader if secure boot is enabled.

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable
   secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the
   serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to
   the build configuration.

注解: Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to
prevent accidents before the system is fully configured.

注解: If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.
9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).

### 4.27.6 Re-Flashable Software Bootloader

Configuration “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode Secure Boot: Reflashable is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digests for them.

In the esp-idf build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the generating Secure Boot Signing Key step below). This private key’s SHA-256 digest is used as the secure bootloader key in efuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.

Although it’s possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

To enable a reflashable bootloader:

1. In the Project Configuration Menu, select “Bootloader Config” -> CONFIG_SECURE_BOOT -> CONFIG_SECURE_BOOT_V1_ENABLED -> CONFIG_SECURE_BOOTLOADER_MODE -> Reflashable.
2. If necessary, set the CONFIG_SECURE_BOOTLOADER_KEY_ENCODING based on the coding scheme used by the device. The coding scheme is shown in the Features line when esptool.py connects to the chip, or in the espefuse.py summary output.

3. Follow the steps shown above to choose a signing key file, and generate the key file.
4. Run idf.py bootloader. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an espefuse.py burn_key secure_boot_v1 path_to/secure-bootloader-key-xxx.bin command which is used to write the bootloader key to efuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).

4. Resume from Step 6 of the one-time flashing process, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

### 4.27.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via espsecure.py generate_signing_key. This uses the python-ecdsa library, which in turn uses Python’s os.urandom() as a random number source.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the openssl command line:
```
`openssl ecparam -name prime256v1 -genkey -noout -out my_secure_boot_signing_key.pem`
```

Remember that the strength of the secure boot system depends on keeping the signing key private.
4.27.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates).

To extract the public key from the private key:

```
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_KEY
```

The path to the public signature verification key needs to be specified in the menuconfig under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the --output argument to write the signed binary to a separate file:

```
.espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY --output SIGNED_BINARY_FILE
```

4.27.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

4.27.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

**Secure Boot Hardware Support**

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32’s Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see Secure Bootloader Digest Algorithm. The digest can only be read back by software if Efuse ABS_DONE_0 is not burned (ie still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse ABS_DONE_0 is burned.
Secure Bootloader Digest Algorithm

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the espsecure.py tool in the components/esptool_py directory (specifically, the digest_secure_bootloader command).

Items marked with (*) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.

1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in Flash 保密算法.
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (*)
4. For each 16 byte plaintext block of the input image: - Reverse the byte order of the plaintext input block (*) - Apply AES256 in ECB mode to the plaintext block. - Reverse the byte order of the ciphertext output block. (*) - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (*)
6. Calculate SHA-512 of the ciphertext.

Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.

Image Signing Algorithm

Deterministic ECDSA as specified by RFC 6979.

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
  - In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

Manual Commands

Secure boot is integrated into the esp-idf build system, so make will automatically sign an app image if secure boot is enabled. idf.py bootloader will produce a bootloader digest if menuconfig is configured for it.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./image_signed.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```
espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the espsecure.py digest_secure_bootloader command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:

```
esptool.py write_flash 0x0 bootloader-digest.bin
```
4.27.11 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.27.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See How To Enable Signed App Verification for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
- Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features -> Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you’ll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key”. In this case, private signing key should be generated by following instructions in Generating Secure Boot Signing Key; public verification key and signed image should be generated by following instructions in Remote Signing of Images.

4.27.13 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.28 Secure Boot V2

This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards). Except for ESP32, it is the only supported Secure Boot scheme.

For ESP32 before ECO3, refer to Secure Boot. It is recommended that users use Secure Boot V2 if they have a chip version that supports it. Secure Boot V2 is safer and more flexible than Secure Boot V1.
Secure Boot V2 uses RSA based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA scheme without signing the bootloader.

**Secure Boot V2 and RSA scheme (App Signing Scheme) options are available for ESP32 from ECO3 onwards. To use these options in menuconfig, set CONFIG_ESP32_REV_MIN greater than or equal to Rev 3.**

### 4.28.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

A new RSA based Secure Boot verification scheme (Secure Boot V2) has been introduced on the ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3 and ESP32-C3 (ECO3 onwards).

The Secure Boot process on the ESP32 involves the following steps: 1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader’s RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed. 2. When the second stage bootloader loads a particular application image, the application’s RSA-PSS signature is verified. If the verification is successful, the application image is executed.

### 4.28.2 Advantages

* The RSA public key is stored on the device. The corresponding RSA private key is kept at a secret place and is never accessed by the device.
* Only one public key can be generated and stored in the chip during manufacturing.
* Same image format and signature verification method is applied for applications and software bootloader.
* No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.28.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section *How To Enable Secure Boot V2.*

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated signature block. Each image has a separately generated signature block which is appended to the end of the image.

Only one signature block can be appended to the bootloader or application image in ESP32 ECO3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key. For more details about the format, refer to *Signature Block Format.* A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader’s signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image’s signature block (**Verifying a Signature Block**). If this fails, the boot process will be aborted.

6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse (**Verifying an Image**). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.

7. The bootloader executes the verified application image.

### 4.28.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

The content of each signature block is shown in the following table:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>Magic byte</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>Version number byte (currently 0x02), 0x01 is for Secure Boot V1.</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>Padding bytes, Reserved. Should be zero.</td>
</tr>
<tr>
<td>4</td>
<td>32</td>
<td>SHA-256 hash of only the image content, not including the signature block.</td>
</tr>
<tr>
<td>36</td>
<td>384</td>
<td>RSA Public Modulus used for signature verification. (value ‘n’ in RFC8017).</td>
</tr>
<tr>
<td>420</td>
<td>4</td>
<td>RSA Public Exponent used for signature verification (value ‘e’ in RFC8017).</td>
</tr>
<tr>
<td>424</td>
<td>384</td>
<td>Pre-calculated R, derived from ‘n’.</td>
</tr>
<tr>
<td>808</td>
<td>4</td>
<td>Pre-calculated M’, derived from ‘n’.</td>
</tr>
<tr>
<td>812</td>
<td>384</td>
<td>RSA-PSS Signature result (section 8.1.1 of RFC8017) of image content, computed using following PSS parameters: SHA256 hash, MFG1 function, 0 length salt, default trailer field (0xBC).</td>
</tr>
<tr>
<td>1196</td>
<td>4</td>
<td>CRC32 of the preceding 1095 bytes.</td>
</tr>
<tr>
<td>1200</td>
<td>16</td>
<td>Zero padding to length 1216 bytes.</td>
</tr>
</tbody>
</table>

**Note:** R and M’ are used for hardware-assisted Montgomery Multiplication.

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

### 4.28.5 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

### 4.28.6 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
Chapter 4. API

3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

4.28.7 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See 引导加载程序大小.

4.28.8 eFuse usage

ESP32-ECO3:

- ABS_DONE_1 - Enables Secure Boot protection on boot.
- BLK2 - Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M values (represented as 776 bytes – offsets 36 to 812 - as per the Signature Block Format) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

4.28.9 How To Enable Secure Boot V2

1. Open the Project Configuration Menu, in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.
2. For ESP32, Secure Boot V2 is available only ESP32 ECO3 onwards. To view the “Secure Boot V2” option the chip revision should be changed to revision 3 (ESP32-ECO3). To change the chip revision, set “Minimum Supported ESP32 Revision” to Rev 3 in “Component Config” -> “ESP32-Specific”.
3. Specify the path to Secure Boot signing key, relative to the project directory.
4. Select the desired UART ROM download mode in “UART ROM download mode”. By default the UART ROM download mode has been kept enabled in order to prevent permanently disabling it in the development phase, this option is a potentially insecure option. It is recommended to disable the UART download mode for better security.
5. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.
6. The first time you run idf.py build, if the signing key is not found then an error message will be printed with a command to generate a signing key via espsecure.py generate_signing_key.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (/dev/urandom on OSX/Linux and CryptGenRandom() on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See Generating Secure Boot Signing Key for more details.

7. Run idf.py bootloader to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using esptool.py write_flash.
8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.
9. Run idf.py flash to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.
10. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

4.28.10 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If Flash is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.

4.28.11 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`. The `version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA key generation utilities.

For example, to generate a signing key using the openssl command line:

```
` openssl genrsa -out my_secure_boot_signing_key.pem 3072 `
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

4.28.12 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf Secure Boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:
4.28.13 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with flash encryption to prevent local readout of the flash contents.

4.28.14 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands

Secure boot is integrated into the esp-idf build system, so idf.py build will sign an app image and idf.py bootloader will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_signed.bin image_unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.28.15 Secure Boot & Flash Encryption

If Secure Boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.28.16 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn’t verified during the update process, it’s assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it’s essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn’t verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.
How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features
2. Ensure App Signing Scheme is RSA. For ESP32 ECO3 chip, select CONFIG_ESP32_REV_MIN to Rev 3 to get RSA option available
3. Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named “Secure boot private signing key” will be used to sign the image.
5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in Remote Signing of Images.

警告： It is very important that all apps flashed have been signed, either during the build or after the build.

4.28.17 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG 与闪存加密和安全引导 for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.29 Thread Local Storage

4.29.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- FreeRTOS Native API: ESP-IDF FreeRTOS native API.
- Pthread API: ESP-IDF’s pthread API.
- C11 Standard: C11 standard introduces special keyword to declare variables as thread local.

4.29.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- vTaskSetThreadLocalStoragePointer()
- pvTaskGetThreadLocalStoragePointer()
- vTaskSetThreadLocalStoragePointerAndDelCallback()

In this case maximum number of variables that can be allocated is limited by CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.
If size of the variable is more than 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

### 4.29.3 Pthread API

The ESP-IDF provides the following `pthread API` to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some of its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

### 4.29.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see [https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local](https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local). Storage for that kind of variables is allocated on the task’s stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

### 4.30 工具

#### 4.30.1 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others. Installing the tools using an OS-specific package manager (like apt, yum, brew, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as "tools". Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as `idf.py`)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

---

**注解:** This document is provided for advanced users who need to customize their installation, users who wish to understand the installation process, and ESP-IDF developers.

If you are looking for instructions on how to install the tools, see the *Getting Started Guide.*
Chapter 4. API

Tools metadata file

The list of tools and tool versions required for each platform is located in `tools/tools.json`. The schema of this file is defined by `tools/tools_schema.json`.

This file is used by `tools/idf_tools.py` script when installing the tools or setting up the environment variables.

Tools installation directory

`IDF_TOOLS_PATH` environment variable specifies the location where the tools are to be downloaded and installed. If not set, `IDF_TOOLS_PATH` defaults to `HOME/.espressif` on Linux and macOS, and `%USER_PROFILE%\.espressif` on Windows.

Inside `IDF_TOOLS_PATH`, the scripts performing tools installation create the following directories:

- `dist` — where the archives of the tools are downloaded.
- `tools` — where the tools are extracted. The tools are extracted into subdirectories: `tools/TOOL_NAME/VERSION/`. This arrangement allows different versions of tools to be installed side by side.

GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it’s possible to configure a GitHub assets mirror.

To use Espressif’s download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

*注解：* The Espressif download server doesn’t currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

**idf_tools.py script**

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- **install**: Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`.
  
  Install command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format.
  
  If all is given, all the tools (required and optional ones) are installed. If no argument or required is given, only the required tools are installed.

- **download**: Similar to `install` but doesn’t extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.

- **export**: Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables.

  The environment variables can be listed in either of shell or key-value formats, set by `--format` parameter:

  - `shell` produces output suitable for evaluation in the shell. For example,

    ```
    export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
    ```

    on Linux and macOS, and
Chapter 4. API

Set "PATH=C:\Users\user\espressif\tools\v1.0.0\bin;%PATH%"

on Windows.

Exporting environment variables in Powershell format is not supported at the moment. key-value format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```
 eval $(IDF_PATH/tools/idf_tools.py export)
```

-- key-value produces output in VARIABLE=VALUE format, suitable for parsing by other scripts:

```
PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
```

Note that the script consuming this output has to perform expansion of $VAR or %VAR% patterns found in the output.

- list: Lists the known versions of the tools, and indicates which ones are installed.
- check: For each tool, checks whether the tool is available in the system path and in IDF_TOOLS_PATH.

**Install scripts**

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

- `install.bat` for Windows Command Prompt
- `install.ps1` for Powershell
- `install.sh` for Bash

Aside from downloading and installing the tools into IDF_TOOLS_PATH, these scripts prepare a Python virtual environment, and install the required packages into that environment.

**Export scripts**

Since the installed tools are not permanently added into the user or system PATH environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

- `export.bat` for Windows Command Prompt
- `export.ps1` for Powershell
- `export.sh` for Bash

Note: To modify the shell environment in Bash, `export.sh` must be “sourced”: `./export.sh` (note the leading dot and space).

`export.sh` may be used with shells other than Bash (such as zsh). However in this case the IDF_PATH environment variable must be set before running the script. When used in Bash, the script will guess the IDF_PATH value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the PATH.

**Other installation methods**

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- **IDF Tools installer for Windows** can download and install the tools. Internally the installer uses `idf_tools.py`. 

• **Eclipse plugin for ESP-IDF** includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
• Visual Studio Code extension for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

### Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the `PATH`.

### List of IDF Tools

### 4.30.2 IDF Docker Image

IDF Docker image (espressif/idf) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). IDF_PATH environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up PATH environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.
The image can also be used as a base for custom images, if additional utilities are required.

**Tags**

Multiple tags of this image are maintained:

- `latest`: tracks master branch of ESP-IDF
- `vX.Y`: corresponds to ESP-IDF release vX.Y
- `release-vX.Y`: tracks release/vX.Y branch of ESP-IDF

**Usage**

**Setting up Docker** Before using the `espressif/idf` Docker image locally, make sure you have Docker installed. Follow the instructions at [https://docs.docker.com/install/](https://docs.docker.com/install/), if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

**Building a project with CMake** In the project directory, run:

```
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- `docker run`: runs a Docker image. It is a shorter form of the command `docker container run`.
- `--rm`: removes the container when the build is finished.
- `-v $PWD:/project`: mounts the current directory on the host ($PWD) as /project directory in the container.
- `espressif/idf`: uses Docker image `espressif/idf` with tag `latest` (implicitly added by Docker when no tag is specified).
- `idf.py build`: runs this command inside the container.

To build with a specific docker image tag, specify it as `espressif/idf:TAG`, for example:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.0 idf.py --build
```

You can check the up-to-date list of available tags at [https://hub.docker.com/r/espressif/idf/tags](https://hub.docker.com/r/espressif/idf/tags).

**Using the image interactively** It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use `idf.py` as usual:

```
idf.py menuconfig
idf.py build
```

**Note:** Commands which communicate with the development board, such as `idf.py flash` and `idf.py monitor` will not work in the container unless the serial port is passed through into the container. However currently
this is not possible with Docker for Windows (https://github.com/docker/for-win/issues/1018) and Docker for Mac (https://github.com/docker/for-mac/issues/900).

### 4.30.3 IDF Windows Installer

#### Command-line parameters

Windows Installer `esp-idf-tools-setup` provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to ini configuration file to override default configuration of the installer. Default: config.ini.
- `/HELP` - Display command line options provided by Inno Setup installer.
- `/IDFDIR=[PATH]` - Path to directory where it will be installed. Default: {userdesktop}\esp-idf
- `/OFFLINE=[yes|no]` - Execute installation of Python packages by PIP in offline mode. The same result can be achieved by setting the environment variable PIP_NO_INDEX. Default: no.
- `/PYTHONNOUSERSITE=[yes|no]` - Set PYTHONNOUSERSITE variable before launching any Python command to avoid loading Python packages from AppDataRoaming. Default: yes.
- `/PYTHONWHEELSURL=[URL]` - Specify URLs to PyPi repositories for resolving binary Python Wheel dependencies. The same result can be achieved by setting the environment variable PIP_EXTRA_INDEX_URL. Default: https://dl.espressif.com/pypi
- `/VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL` - Perform silent installation.

#### Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -id $InstallerProcess.id
```

#### Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror. Following parameters allow to select custom Python and custom location of Python wheels:
4.30.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from the component registry or from a git repository.

A list of components can be found on https://components.espressif.com/

Activating the Component Manager

If CMake is started using idf.py or ESP-IDF VSCode Extension then the component manager will be activated by default.

If CMake is used directly or with some CMake-based IDE like CLion, it’s necessary to set the IDF_COMPONENT_MANAGER environment variable to 1 to enable the component manager integration with the build system.

Using with a project

Dependencies for each component in the project are defined in a separate manifest file named idf_component.yml placed in the root of the component. The manifest file template can be created for a component by running idf.py create-manifest --component=my_component. When a new manifest is added to one of the components in the project it’s necessary to reconfigure it manually by running idf.py reconfigure. Then build will track changes in idf_component.yml manifests and automatically triggers CMake when necessary.

There is an example application: example/build_system/cmake/component_manager that uses components installed by the component manager.

It’s not necessary to have a manifest for components that don’t need any managed dependencies.

When CMake configures the project (e.g. idf.py reconfigure) component manager does a few things:

- Processes idf_component.yml manifests for every component in the project and recursively solves dependencies
- Creates a dependencies.lock file in the root of the project with a full list of dependencies
- Downloads all dependencies to the managed_components directory

The lock-file dependencies.lock and content of managed_components directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it’s possible to re-run the component manager by triggering CMake with idf.py reconfigure

Defining dependencies in the manifest

```
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"
  # # Other ways to define dependencies
  #
  # # For components maintained by Espressif only name can be used.
```

(下页繼續)
4.30.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses clang-tidy to run static analysis on your current app.

### Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh` / `export.bat` / ...) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install xtensa-clang` to install the clang-tidy required binaries
   
   **Note:** This toolchain is still under development. After the final release, you don’t have to install them manually.

4. Get file from the llvm repository and add the folder of this script to the `PATH`. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`.
   
   **Note:** This file would be bundled in future toolchain releases. This is a temporary workaround.

5. Run the export scripts (`export.sh` / `export.bat` / ...) again to refresh the environment variables.

### Extra Commands
**clang-check**  Run `idf.py clang-check` to re-generate the compilation database and run `clang-tidy` under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

**clang-html-report**

1. Run `pip install codereport` to install the additional dependency.
2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

**Bug Report**

This tool is hosted in `espressif/clang-tidy-runner`. If you faced any bugs or have any feature request, please report them via github issues.

### 4.31 ULP 协处理器编程

#### 4.31.1 ESP32 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP coprocessor assembler.

ULP coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing**

ESP32 ULP coprocessor’s JUMP, ST, LD instructions which take register as an argument (jump address, store/load base address) expect the argument to be expressed in 32-bit words.

Consider the following example program:

```
entry:
    NOP
    NOP
    NOP
loop:
    MOVE R1, loop
    JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However `JUMP` instruction expects the address stored in register to be expressed in 32-bit words. To account for this common use case, assembler will convert the address of label `loop` from bytes to words, when generating `MOVE` instruction, so the code generated code will be equivalent to:
The other case is when the argument of MOVE instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```assembly
.set val, 0x10
MOVE R1, val
```

In this case, value loaded into R1 will be 0x10.

Similar considerations apply to LD and ST instructions. Consider the following code:

```assembly
.global array
array: .long 0
   .long 0
   .long 0
   .long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0 // write value of R2 into the first array element,
               // i.e. array[0]

ST R2, R1, 4 // write value of R2 into the second array element
              // (4 byte offset), i.e. array[1]

ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
ST R2, R1, 0 // write value of R2 into the third array element,
              // i.e. array[2]
```

### Note about instruction execution time

ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:

- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.
NOP - no operation

**Syntax** NOP  
**Operands** None  
**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction  
**Description** No operation is performed. Only the PC is incremented.

**Example:**

```
1: NOP
```

ADD - Add to register

**Syntax** ADD Rdst, Rsrc1, Rsrc2  
**ADD** Rdst, Rsrc1, imm  

**Operands**  
- **Rdst** - Register R[0..3]  
- **Rsrc1** - Register R[0..3]  
- **Rsrc2** - Register R[0..3]  
- **Imm** - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction  
**Description** The instruction adds source register to another source register or to a 16-bit signed value and stores result to the destination register.

**Examples:**

```
1: ADD R1, R2, R3 //R1 = R2 + R3
2: Add R1, R2, 0x1234 //R1 = R2 + 0x1234
3: .set value1, 0x03 //constant value1 = 0x03
    Add R1, R2, value1 //R1 = R2 + value1
4: .global label //declaration of variable label
    Add R1, R2, label //R1 = R2 + label
    ...
    label: nop //definition of variable label
```

SUB - Subtract from register

**Syntax** SUB Rdst, Rsrc1, Rsrc2  
**SUB** Rdst, Rsrc1, imm  

**Operands**  
- **Rdst** - Register R[0..3]  
- **Rsrc1** - Register R[0..3]  
- **Rsrc2** - Register R[0..3]  
- **Imm** - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction  
**Description** The instruction subtracts the source register from another source register or subtracts 16-bit signed value from a source register, and stores result to the destination register.

**Examples:**

```
1: SUB R1, R2, R3 //R1 = R2 - R3
2: sub R1, R2, 0x1234 //R1 = R2 - 0x1234
```
### AND - Logical AND of two operands

**Syntax**  
AND \( Rdst, Rsrc1, Rsrc2 \)  
AND \( Rdst, Rsrc1, imm \)

**Operands**
- \( Rdst \) - Register R[0..3]  
- \( Rsrc1 \) - Register R[0..3]  
- \( Rsrc2 \) - Register R[0..3]  
- \( imm \) - 16-bit signed value

**Cycles**  
2 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction does logical AND of a source register and another source register or 16-bit signed value and stores result to the destination register.

**Examples:**

1. \`AND R1, R2, R3\`  
   // \( R1 = R2 \land R3 \)

2. \`AND R1, R2, 0x1234\`  
   // \( R1 = R2 \lor 0x1234 \)

3. \`set value1, 0x03\`  
   //constant value1=0x03  
   AND R1, R2, value1  
   // \( R1 = R2 \land value1 \)

4. \`global label\`  
   //declaration of variable label  
   AND R1, R2, label  
   // \( R1 = R2 \land label \)

### OR - Logical OR of two operands

**Syntax**  
OR \( Rdst, Rsrc1, Rsrc2 \)  
OR \( Rdst, Rsrc1, imm \)

**Operands**
- \( Rdst \) - Register R[0..3]  
- \( Rsrc1 \) - Register R[0..3]  
- \( Rsrc2 \) - Register R[0..3]  
- \( imm \) - 16-bit signed value

**Cycles**  
2 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction does logical OR of a source register and another source register or 16-bit signed value and stores result to the destination register.

**Examples:**

1. \`OR R1, R2, R3\`  
   // \( R1 = R2 \lor R3 \)

2. \`OR R1, R2, 0x1234\`  
   // \( R1 = R2 \lor 0x1234 \)

3. \`set value1, 0x03\`  
   //constant value1=0x03  
   OR R1, R2, value1  
   // \( R1 = R2 \lor value1 \)

4. \`global label\`  
   //declaration of variable label
Chapter 4. API

ORS R1, R2, label  // R1 = R2 \| label
...
label: nop  // definition of variable label

LSH - Logical Shift Left

Syntax  

| LSH Rdst, Rsrc1, Rsrc2  
| LSH Rdst, Rsrc1, imm |

Operands

- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does logical shift to left of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

Examples:

1:    LSH R1, R2, R3  // R1 = R2 << R3
2:    LSH R1, R2, 0x03 // R1 = R2 << 0x03
3:    .set value1, 0x03 // constant value1=0x03
     LSH R1, R2, value1  // R1 = R2 << value1
4:    .global label  // declaration of variable label
     LSH R1, R2, label  // R1 = R2 << label
...
label: nop  // definition of variable label

RSH - Logical Shift Right

Syntax  

| RSH Rdst, Rsrc1, Rsrc2  
| RSH Rdst, Rsrc1, imm |

Operands

- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does logical shift to right of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

Examples:

1:    RSH R1, R2, R3  // R1 = R2 >> R3
2:    RSH R1, R2, 0x03 // R1 = R2 >> 0x03
3:    .set value1, 0x03 // constant value1=0x03
     RSH R1, R2, value1  // R1 = R2 >> value1
4:    .global label  // declaration of variable label
     RSH R1, R2, label  // R1 = R2 >> label
label: nop  // definition of variable label

MOVE – Move to register

Syntax  

| MOVE Rdst, Rsrc  
| MOVE Rdst, imm |

Espressif Systems  Release v5.0-dev-489-gef98a36
Operands

- **Rdst** – Register R[0..3]
- **Rsrc** – Register R[0..3]
- **Imm** – 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction move to destination register value from source register or 16-bit signed value.

Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because **LD**, **ST**, and **JUMP** instructions expect the address register value to be expressed in words rather than bytes. To avoid using an extra instruction

Examples:

```plaintext
1:   MOVE R1, R2  //R1 = R2
2:   MOVE R1, 0x03 //R1 = 0x03
3:   .set value1, 0x03  //constant value1=0x03
     MOVE R1, value1 //R1 = value1
4:   .global label  //declaration of label
     MOVE R1, label //R1 = address_of(label) / 4
... label: nop  //definition of label
```

ST – Store data to the memory

Syntax **ST Rsrc, Rdst, offset**

Operands

- **Rsrc** – Register R[0..3], holds the 16-bit value to store
- **Rdst** – Register R[0..3], address of the destination, in 32-bit words
- **Offset** – 13-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction stores the 16-bit value of **Rsrc** to the lower half-word of memory with address **Rdst+offset**. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with **Rdst (0..3):**

```
Mem[Rdst+offset/4](31:0) = {PC[10:0], 3'b0, Rdst, Rsrc[15:0]}
```

The application can use higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

Examples:

```plaintext
1:   ST R1, R2, 0x12  //MEM[R2+0x12] = R1
2:   .data
     Addr1: .word 123  // Define label Addr1 16 bit
              .set offs, 0x00 // Define constant offs
              .text //Text section definition
     MOVE R1, 1  // R1 = 1
     MOVE R2, Addr1 // R2 = Addr1
     ST R1, R2, offs // MEM[R2 + 0] = R1
              // MEM[Addr1 + 0] will be 32'h600001
```

LD – Load data from the memory

Syntax **LD Rdst, Rsrc, offset**

Operands **Rdst** – Register R[0..3], destination

- **Rsrc** – Register R[0..3], holds address of destination, in 32-bit words
- **Offset** – 13-bit signed value, offset in bytes
Chapter 4. API

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction loads lower 16-bit half-word from memory with address Rsre+ofset into the destination register Rdst:

\[
\text{Rdst}[15:0] = \text{Mem[Rsrc + offset / 4][15:0]}
\]

Examples:

1: \( \text{LD R1, R2, 0x12} \) //R1 = MEM[R2+0x12]

2: 

<table>
<thead>
<tr>
<th>.data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addr1: .word 123</td>
</tr>
<tr>
<td>.set offs, 0x00</td>
</tr>
<tr>
<td>.text</td>
</tr>
<tr>
<td>MOVE R1, 1</td>
</tr>
<tr>
<td>MOVE R2, Addr1</td>
</tr>
</tbody>
</table>

\( \text{LD R1, R2, offs} \) // R1 = MEM[R2 + 0] // R1 will be 123

JUMP – Jump to an absolute address

Syntax JUMP Rdst

JUMP ImmAddr

JUMP Rdst, Condition

JUMP ImmAddr, Condition

Operands

• \( \text{Rdst} \) – Register R[0..3] containing address to jump to (expressed in 32-bit words)
• \( \text{ImmAddr} \) – 13 bits address (expressed in bytes), aligned to 4 bytes
• \( \text{Condition} \):
  – EQ – jump if last ALU operation result was zero
  – OV – jump if last ALU has set overflow flag

Cycles 2 cycles to execute, 2 cycles to fetch next instruction

Description The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

Examples:

1: \( \text{JUMP R1} \) // Jump to address in R1 (address in R1 is in 32-bit words)

2: \( \text{JUMP 0x120, EQ} \) // Jump to address 0x120 (in bytes) if ALU result is zero

3: \( \text{JUMP label} \) // Jump to label

... label: \( \text{nop} \) // Definition of label

4: 

<table>
<thead>
<tr>
<th>.global</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
</tr>
<tr>
<td>MOVE R1, label</td>
</tr>
<tr>
<td>JUMP R1</td>
</tr>
</tbody>
</table>

\( \text{label: nop} \) // Definition of label

JUMPR – Jump to a relative offset (condition based on R0)

Syntax JUMPR Step, Threshold, Condition

Operands

Espressif Systems 1970

Submit Document Feedback

Release v5.0-dev-489-gef98a36
Chapter 4. API

- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition:**
  - **EQ** (equal) – jump if value in R0 == threshold
  - **LT** (less than) – jump if value in R0 < threshold
  - **LE** (less or equal) – jump if value in R0 <= threshold
  - **GT** (greater than) – jump if value in R0 > threshold
  - **GE** (greater or equal) – jump if value in R0 >= threshold

**Cycles**  Conditions **LT, GE, LE and GT**: 2 cycles to execute, 2 cycles to fetch next instruction

**Cycles**  Conditions **LE and GT**: 2 cycles to execute, 2 cycles to fetch next instruction

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>EQ</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>LE</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>GT</strong></td>
<td>2</td>

<tr>
<td><strong>GE</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>LT</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>GE</strong></td>
<td>2</td>
</tr>
</tbody>
</table>

**Description**  The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples:**

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if value in R0 >= 20

2: // Down counting loop using R0 register
   MOVE R0, 16 // load 16 into R0
   label: SUB R0, R0, 1 // R0--
   NOP // do something
   JUMPR label, 1, GE // jump to label if R0 >= 1

**JUMPS** – Jump to a relative address (condition based on stage count)

**Syntax**  **JUMPS**  **Step, Threshold, Condition**

**Operands**
- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition:**
  - **EQ** (equal) – jump if value in stage_cnt == threshold
  - **LT** (less than) – jump if value in stage_cnt < threshold
  - **LE** (less or equal) – jump if value in stage_cnt <= threshold
  - **GT** (greater than) – jump if value in stage_cnt > threshold
  - **GE** (greater or equal) – jump if value in stage_cnt >= threshold

**Cycles**  Conditions **LE, LT, GE**: 2 cycles to execute, 2 cycles to fetch next instruction

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LE</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>LT</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>GE</strong></td>
<td>2</td>
</tr>
<tr>
<td><strong>GT</strong></td>
<td>2</td>
</tr>
</tbody>
</table>

**Cycles**  Conditions **EQ, GT**: 2 cycles to execute, 2 cycles to fetch next instruction

**Examples:**

1: pos: JUMPS 16, 20, EQ // Jump to address (position + 16 bytes) if value in R0 == 20

2: // Down counting loop using R0 register
   MOVE R0, 16 // load 16 into R0
   label: SUB R0, R0, 1 // R0--
   NOP // do something
   JUMPS label, 1, EQ // jump to label if R0 == 1

(未完成)
Chapter 4. API

JUMPS next, threshold, LT
JUMPS target, threshold, LE

next:

// JUMPS target, threshold, GT is implemented as:

JUMPS next, threshold, LE
JUMPS target, threshold, GE

next:

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**

1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt...

2: // Up counting loop using stage count register
STAGE_RST // set stage_cnt to 0
label: STAGE_INC 1 // stage_cnt++
NOP // do something
JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_RST** – Reset stage count register

**Syntax** STAGE_RST

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

1: STAGE_RST // Reset stage count register

**STAGE_INC** – Increment stage count register

**Syntax** STAGE_INC Value

**Operands**

- **Value** – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments stage count register by given value.

**Examples:**

1: STAGE_INC 10 // stage_cnt += 10

2: // Up counting loop example:
STAGE_RST // set stage_cnt to 0
label: STAGE_INC 1 // stage_cnt++
NOP // do something
JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_DEC** – Decrement stage count register

**Syntax** STAGE_DEC Value
Chapter 4. API

Operands

• Value -8 bits value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction decrements stage count register by given value.

Examples:

1: STAGE_DEC 10 // stage_cnt -- 10;

2: // Down counting loop example
   STAGE_RST    // set stage_cnt to 0
   STAGE_INC 16 // increment stage_cnt to 16
   label: STAGE_DEC 1 // stage_cnt--;
   NOP          // do something
   JUMPS label, 0, GT // jump to label if stage_cnt > 0

HALT -End the program

Syntax HALT

Operands No operands

Cycles 2 cycles to execute

Description The instruction halts the ULP coprocessor and restarts ULP wakeup timer, if it is enabled.

Examples:

1: HALT // Halt the coprocessor

WAKE -Wake up the chip

Syntax WAKE

Operands No operands

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction sends an interrupt from ULP to RTC controller.

• If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
• If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set
  in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Note that before using WAKE instruction, ULP program may needs to wait until RTC controller
is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP
bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while
RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

Examples:

1: is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
    WAKE // Trigger wake up
    REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP_
    -->SLP_TIMER_EN)
    HALT // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.

SLEEP -set ULP wakeup timer period

Syntax SLEEP sleep_reg

Operands
• sleep_reg – 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction selects which of the SENS_ULP_CP_SLEEP_CYCx_REG \((x = 0..4)\) register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

**Examples:**

```c
1: SLEEP 1 // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG
2: .set sleep_reg, 4 // Set constant
    SLEEP sleep_reg // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG
```

---

**WAIT** – wait some number of cycles

**Syntax** WAIT **Cycles**

**Operands**

- **Cycles** – number of cycles for wait

**Cycles** 2 + **Cycles** cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction delays for given number of cycles.

**Examples:**

```c
1: WAIT 10 // Do nothing for 10 cycles
2: .set wait_cnt, 10 // Set a constant
    WAIT wait_cnt // wait for 10 cycles
```

---

**TSENS** – do measurement with temperature sensor

**Syntax**

- **TSENS** \(Rdst, \) \(Wait\_Delay\)

**Operands**

- **Rdst** – Destination Register R[0..3], result will be stored to this register
- **Wait\_Delay** – number of cycles used to perform the measurement

**Cycles** 2 + **Wait\_Delay** + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction

**Description** The instruction performs measurement using TSENS and stores the result into a general purpose register.

**Examples:**

```c
1: TSENS R1, 1000 // Measure temperature sensor for 1000 cycles,
    // and store result to R1
```

---

**ADC** – do measurement with ADC

**Syntax**

- **ADC** \(Rdst, Sar\_sel, Mux\)
- **ADC** \(Rdst, Sar\_sel, Mux, 0\) – deprecated form

**Operands**

- **Rdst** – Destination Register R[0..3], result will be stored to this register
- **Sar\_sel** – Select ADC: 0 = SARADC1, 1 = SARADC2
- **Mux** - Enable ADC channel. Channel number is \([Mux-1]\). If the user passes Mux value 1, then ADC channel 0 gets used.

**Cycles** 23 + max(1, SAR\_AMP\_WAIT1) + max(1, SAR\_AMP\_WAIT2) + max(1, SAR\_AMP\_WAIT3) + SARx\_SAMPLE\_CYCLE + SARx\_SAMPLE\_BIT cycles to execute, 4 cycles to fetch next instruction
Description  The instruction makes measurements from ADC.

Examples:

```
1:   ADC  R1, 0, 1  // Measure value using ADC1 channel 0 and store...
```

**I2C_RD - read single byte from I2C slave**

**Syntax**

• **I2C_RD** *Sub_addr*, *High*, *Low*, *Slave_sel*

**Operands**

• *Sub_addr* — Address within the I2C slave to read.
• *High*, *Low* — Define range of bits to read. Bits outside of [High, Low] range are masked.
• *Slave_sel* - Index of I2C slave address to use.

**Cycles**  Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description**  I2C_RD instruction reads one byte from I2C slave with index *Slave_sel*. Slave address (in 7-bit format) has to be set in advance into *SENS_I2C_SLAVE_ADDRx* register field, where x == *Slave_sel*. 8 bits of read result is stored into *R0* register.

**Examples:**

```
1:   I2C_RD  0x10, 7, 0, 0  // Read byte from sub-address 0x10 of...
```

**I2C_WR - write single byte to I2C slave**

**Syntax**

• **I2C_WR** *Sub_addr*, *Value*, *High*, *Low*, *Slave_sel*

**Operands**

• *Sub_addr* — Address within the I2C slave to write.
• *Value* — 8-bit value to be written.
• *High*, *Low* — Define range of bits to write. Bits outside of [High, Low] range are masked.
• *Slave_sel* - Index of I2C slave address to use.

**Cycles**  Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description**  I2C_WR instruction writes one byte to I2C slave with index *Slave_sel*. Slave address (in 7-bit format) has to be set in advance into *SENS_I2C_SLAVE_ADDRx* register field, where x == *Slave_sel*.

**Examples:**

```
1:   I2C_WR  0x20, 0x33, 7, 0, 1  // Write byte 0x33 to sub-address...
```

**REG_RD — read from peripheral register**

**Syntax**  **REG_RD** *Addr*, *High*, *Low*

**Operands**

• *Addr* — Register address, in 32-bit words
• *High* — Register end bit number
• *Low* — Register start bit number

**Cycles**  4 cycles to execute, 4 cycles to fetch next instruction

**Description**  The instruction reads up to 16 bits from a peripheral register into a general purpose register: *R0 = REG[Addr][High:Low]*.

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the target register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:
Chapter 4. API

addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4

Examples:

1: REG_RD 0x120, 7, 4 // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}

REG_WR –write to peripheral register

Syntax REG_WR Addr, High, Low, Data

Operands

• Addr – Register address, in 32-bit words.
• High – Register end bit number
• Low – Register start bit number
• Data – Value to write, 8 bits

Cycles 8 cycles to execute, 4 cycles to fetch next instruction

Description The instruction writes up to 8 bits from an immediate data value into a peripheral register:

REG[Addr][High:Low] = data.

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4

Examples:

1: REG_WR 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10

Convenience macros for peripheral registers access

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in soc/soc_ulp.h header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in soc/rtc_cntl_reg.h, soc/rtc_io_reg.h, soc/sens_reg.h, and soc/rtc_i2c_reg.h.

READ_RTC_REG(rtc_reg, low_bit, bit_width) Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

READ_RTC_FIELD(rtc_reg, field) Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value) Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)

WRITE_RTC_FIELD(rtc_reg, field, value) Write immediate value into a field in rtc_reg, up to 8 bits. For example:

#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)

### 4.31.2 Programming ULP coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),  // R3 <- 16
    I_LD(R0, R3, 0), // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1), // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),  // R2 <- R0 + R1
    I_ST(R2, R3, 2),   // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()
};
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, size);
ulp_run(load_addr);
```

The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0—R3) and literal constants. See **ULP coprocessor instruction defines** section for descriptions of instructions and arguments they take.

注解：Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

Load and store instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM (which is address 0x50000000 as seen by the main CPUs).

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),  // R0 <- 34
    M_LABEL(1),     // label_1

    // continue
};
```

(下页继续)
Application Example

Demonstration of entering into deep sleep mode and waking up using several wake up sources: system/deep_sleep.

API Reference

Header File

- ulp/include/esp32/ulp.h

Functions

`esp_err_t ulp_process_macros_and_load(uint32_t load_addr, const ulp_insn_t* program, size_t *psize)`

Resolve all macro references in a program and load it into RTC memory.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or cannot be loaded

Parameters

- load_addr: address where the program should be loaded, expressed in 32-bit words
- program: ulp_insn_t array with the program
- psize: size of the program, expressed in 32-bit words

`esp_err_t ulp_run(uint32_t entry_point)`

Run the program loaded into RTC memory.

Return ESP_OK on success

Parameters

- entry_point: entry point, expressed in 32-bit words

Error codes

`ESP_ERR_ULP_BASE`

Offset for ULP-related error codes

`ESP_ERR_ULP_SIZE_TOO_BIG`

Program doesn’ t fit into RTC memory reserved for the ULP

`ESP_ERR_ULP_INVALID_LOAD_ADDR`

Load address is outside of RTC memory reserved for the ULP
ESP_ERR_ULP_DUPLICATE_LABEL
More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL
Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE
Branch target is out of range of B instruction (try replacing with BX)

ULP coprocessor registers
ULP co-processor has 4 16-bit general purpose registers. All registers have same functionality, with one exception. R0 register is used by some of the compare-and-branch instructions as a source register.

These definitions can be used for all instructions which require a register.

R0
general purpose register 0

R1
general purpose register 1

R2
general purpose register 2

R3
general purpose register 3

ULP coprocessor instruction defines

I_DELAY (cycles_)
Delay (nop) for a given number of cycles

I_HALT ()
Halt the coprocessor.

This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

I_END ()
Stop ULP program timer.

This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

I_ST (reg_val, reg_addr, offset_)
Store value from register reg_val into RTC memory.

The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:
• bits [31:21] hold the PC of current instruction, expressed in 32-bit words
• bits [20:18] = 3’b0
• bits [17:16] reg_addr (0..3)
• bits [15:0] are assigned the contents of reg_val

RTC_SLOW_MEM[addr + offset_] = { insn_PC[10:0], 3’b0, reg_addr, reg_val[15:0] }

I_LD (reg_dest, reg_addr, offset_)
Load value from RTC memory into reg_dest register.

Loads 16 LSBs from RTC memory word given by the sum of value in reg_addr and value of offset_.

Espressif Systems 1979 Release v5.0-dev-489-gef98a36
Submit Document Feedback
I_WR_REG (reg, low_bit, high_bit, val)
Write literal value to a peripheral register
reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_RD_REG (reg, low_bit, high_bit)
Read from peripheral register into R0
R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_BL (pc_offset, imm_value)
Branch relative if R0 less than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BGE (pc_offset, imm_value)
Branch relative if R0 greater or equal than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BXR (reg_pc)
Unconditional branch to absolute PC, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXI (imm_pc)
Unconditional branch to absolute PC, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXZR (reg_pc)
Branch to absolute PC if ALU result is zero, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXZI (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)
Branch to absolute PC if ALU overflow, address in register
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I BXFI (imm_pc)
Branch to absolute PC if ALU overflow, immediate address
Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)
Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)
Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)
Logical OR: dest = src1 | src2

I_MOVR (reg_dest, reg_src)
Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)
Logical shift left: dest = src « shift
Chapter 4. API

**I_RSHR** (reg_dest, reg_src, reg_shift)

Logical shift right: dest = src \(\gg\) shift

**I_ADDI** (reg_dest, reg_src, imm_)

Add register and an immediate value: dest = src1 + imm

**I_SUBI** (reg_dest, reg_src, imm_)

Subtract register and an immediate value: dest = src - imm

**I_ANDI** (reg_dest, reg_src, imm_)

Logical AND register and an immediate value: dest = src & imm

**I_ORI** (reg_dest, reg_src, imm_)

Logical OR register and an immediate value: dest = src | imm

**I_MOVI** (reg_dest, imm_)

Copy an immediate value into register: dest = imm

**I_LSHI** (reg_dest, reg_src, imm_)

Logical shift left register value by an immediate: dest = src \(\ll\) imm

**I_RSHI** (reg_dest, reg_src, imm_)

Logical shift right register value by an immediate: dest = val \(\gg\) imm

**M_LABEL** (label_num)

Define a label with number label_num.

This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.

**M_BL** (label_num, imm_value)

Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BGE** (label_num, imm_value)

Macro: branch to label label_num if R0 is greater or equal than immediate value

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BX** (label_num)

Macro: unconditional branch to label

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXZ** (label_num)

Macro: branch to label if ALU result is zero

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BXF** (label_num)

Macro: branch to label if ALU overflow

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.
Chapter 4. API

Defines

RTC_SLOW_MEM
RTC slow memory, 8k size

ULP (Ultra Low Power 超低功耗) 协处理器是一种简单的有限状态机 (FSM)，可以在主处理器处于深度睡眠模式时，使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问 RTC_SLOW_MEM 内存区域及 RTC_CNTL、RTC_IO、SARADC 外设中的寄存器。ULP 协处理器使用 32 位固定宽度的指令，32 位内存寻址，配备 4 个 16 位通用寄存器。

4.31.3 安装工具链

ULP 协处理器代码是用汇编语言编写的，并使用 binutils-esp32ulp 工具链 进行编译。

如果你已经按照 快速入门指南 中的介绍安装好了 ESP-IDF 及其 CMake 构建系统，那么 ULP 工具链已经被默认安装到了你的开发环境中。

4.31.4 编译 ULP 代码

若需要将 ULP 代码编译为某组件的一部分，则必须执行以下步骤:

1. 用汇编语言编写的 ULP 代码必须导入到一个或多个 .S 扩展文件中，且这些文件必须放在组件目录中一个独立的目标中，例如 ulp/。

2. 注册后从组件 CMakeLists.txt 中调用 ulp_embed_binary 示例如下:

```
...  
idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary("${ulp_app_name}" "${ulp_s_sources}" "${ulp_exp_dep_srcs}")
```

ulp_embed_binary 的第一个参数为 ULP 二进制文件名称。指定的此名称也用于生成的其他文件，如: ELF 文件、.map 文件、头文件和链接器导出文件。第二个参数指定 ULP 程序集源文件。第三个参数指定组件源文件列表，其中包括被生成的头文件。此列表用以建立正确的依赖项，并确保在编译这些文件之前先创建生成的头文件。有关 ULP 应用程序生成的头文件等相关概念，请参考下文。

3. 使用常规方法（例如 idf.py app）编译应用代码

在内部，构建系统将按照以下步骤编译 ULP 程序:

1. 通过 C 预处理器运行每个程序集文件 (foo.S) 。此步骤在组件编译目录中生成预处理的程序集文件 (foo.ulp.S)，同时生成依赖文件 (foo.ulp.d)。

2. 通过汇编器运行预处理过的汇编源码。 此步骤会生成目标文件 (foo.ulp.o) 和清单文件 (foo.ulp.lst)。清单文件仅用于测试，不用于编译进程的后续步骤。

3. 通过 C 预处理器运行链接器脚本模板。 模板位于 components/ulp/ld 目录中。

4. 将目标文件链接到 ELF 输出文件 (ulp_app_name.elf)。 此步骤生成的.map 文件 (ulp_app_name.map) 默认用于调试。

5. 将 ELF 文件中的内容转储为二进制文件 (ulp_app_name.bin)，以便嵌入到应用程序中。

6. 使用 esp32ulp-elf-nm 在 ELF 文件中生成全局符号列表 (ulp_app_name.sym)。

7. 创建 LD 导出脚本和头文件 (ulp_app_name.ld 和 ulp_app_name.h)。 包含来自 ulp_app_name.sym 的符号。此步骤可借助 esp32ulp_mapgen.py 工具来完成。

8. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

4.31.5 访问 ULP 程序变量

在 ULP 程序中定义的全局符号也可以在主程序中使用。

Espressif Systems 1982 Release v5.0-dev-489-gef98a36
Submit Document Feedback
例如，ULP 程序可以定义 `measurement_count` 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数:

```c
.global measurement_count
measurement_count: .long 0
/* later, use measurement_count */
move r3, measurement_count
ld r3, r3, 0

XYZ
```

主程序需要在启动 ULP 程序之前初始化 `measurement_count` 变量，构建系统会通过生成定义 ULP 编程中全局符号的 `$ULP_APP_NAME`.h 和 `$ULP_APP_NAME`.ld 文件实现上述操作。这些文件包含了在 ULP 程序中定义的所有全局符号，文件以 ulp_ 开头。

头文件包含对此类符号的声明:

```c
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 `uint32_t`。对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了 RTC_SLOW_MEM 中的符号位置:

```c
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 `include` 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 ulp 程序变量。操作如下:

```c
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

注意，ULP 程序在 RTC 内存中只能使用 32 位字的低 16 位，因为寄存器是 16 位的，并且不具备从字的高位加载的指令。

同样，ULP 储存指令将寄存器值写入 32 位字的低 16 位中。高 16 位写入的值取决于储存指令的地址，因此在读取 ULP 写的变量时，主应用程序需要屏蔽高 16 位，例如:

```c
printf("Last measurement value: \%d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.31.6 启动 ULP 程序

要运行 ULP 程序，主应用程序需要调用 `ulp_load_binary` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run` 函数，启动 ULP 程序。

注意，在 menuconfig 中必须启用 “Enable Ultra Low Power (ULP) Coprocessor” 选项，以便为 ULP 预留内存。”RTC slow memory reserved for coprocessor” 选项设置的值必须足够储存 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以二进制 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 `ULP_APP_NAME` 已被定义为 `ulp_app_name`）:

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
    );
```

(下页acz接)
bin_start,
    (bin_end - bin_start) / sizeof(uint32_t)));
}

\textbf{esp_err_t ulp_load_binary} (uint32_t load_addr, const uint8_t *program_binary, size_t program_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

\textbf{Return}

- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

\textbf{Parameters}

- load_addr: address where the program should be loaded, expressed in 32-bit words
- program_binary: pointer to program binary
- program_size: size of the program binary

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 \textbf{ulp_run} 函数:

\begin{verbatim}
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
\end{verbatim}

\textbf{esp_err_t ulp_run} (uint32_t entry_point)

Run the program loaded into RTC memory.

\textbf{Return} ESP_OK on success

\textbf{Parameters}

- entry_point: entry point, expressed in 32-bit words

上述生成的头文件 $(ULP_APP_NAME)_h 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 .global:

\begin{verbatim}
.entry:
    /* code starts here */
\end{verbatim}

\section*{4.31.7 ESP32 ULP 程序流}

ESP32 ULP 协处理器由定时器启动，而调用 ulp_run 则可启动此定时器。定时器为 RTC_SLOW_CLK 的 Tick 事件计数（默认情况下，Tick 由内部 150 Khz RC 振荡器生成）。使用 SENS_ULP_CP_SLEEP_CYC0_REG 寄存器 ($x = 0.4$) 设置 Tick 数值。第一次启动 ULP 时，使用 SENS_ULP_CP_SLEEP_CYC0_REG 设置定时器 Tick 数值，之后，ULP 程序可以使用 sleep 指令来选择另一个 SENS_ULP_CP_SLEEP_CYC0_REG 寄存器。

此应用程序可以调用 ulp_set_wakeup_period 函数来设置 ULP 定时器周期值 (SENS_ULP_CP_SLEEP_CYC0_REG, $x = 0.4$)。
**Chapter 4. API**

**esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)**

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC_CNTL_ULP_CPTIMER_1_REG register for ESP32-S2. By default, for ESP32, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

**Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

**Parameters**
- period_index: wakeup period setting number (0 - 4)
- period_us: wakeup period, us

一旦定时器计数到 SENS_ULP_CP_SLEEP_CYCx_REG 寄存器设定的 Tick 数值，ULP 协处理器就会启动，并调用 ulp_run 的入口点开始运行程序。

程序保持运行，直到遇到 halt 指令或非法指令。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（有效防止 ULP 程序再次运行），可在 ULP 代码或主程序中清除 RTC_CNTL_STATE0_REG 寄存器中的 RTC_CNTL_ULP_CP_SLP_TIMER_EN 位。

### 4.32 ESP32 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是在目标芯片上运行并基于 Unity 测试框架的应用程序。这些单元测试用例都保存在 ESP-IDF 仓库中，分别存放于每个组件的 test 子目录中。本文主要介绍这种单元测试方法。
- 另一种是基于 Linux 主机的单元测试，其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，只有一小部分 IDF 组件支持了 Mock，具体请参考基于 Linux 主机的单元测试。

#### 4.32.1 添加常规测试用例

单元测试被添加在相应组件的 test 子目录中，测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 unity.h 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加。如下所示：

```c
TEST_CASE("test name", ",[module name]*)
{
   // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数用方括号中的标识符来表示，标识符用来对相关测试或具有特定属性的测试进行分组。
### 注解
没有必要在每个测试用例中使用 `UNITY_BEGIN()` 和 `UNITY_END()` 来声明主函数的区域，`unity_platform.c` 会自动调用 `UNITY_BEGIN()`，然后运行测试用例，最后调用 `UNITY_END()`。

`test` 子目录应包含源文件 `CMakeLists.txt`，因为它们本身就是一种组件（即测试组件）。ESP-IDF 使用了 `Unity` 测试框架，位于 `unity` 组件里。因此，每个测试组件都通过 `REQUIRES` 参数将 `unity` 组件设为依赖项。通常，组件需要手动指定待编译的源文件，但是，对于测试组件来说，这个要求被放宽为仅建议将参数 `SRC_DIRS` 用于 `idf_component_register`。

总的来说，`test` 子目录下最小的 `CMakeLists.txt` 文件可能如下所示:

```c
idf_component_register(SRC_DIRS "."
    INCLUDE_DIRS "."
    REQUIRES unity)
```

更多关于如何在 `Unity` 下编写测试用例的信息，请查阅 [http://www.throwswitch.org/unity](http://www.throwswitch.org/unity)。

### 4.32.2 添加多设备测试用例
常规测试用例会在一个 DUT（Device Under Test，在试设备）上执行。但是，那些需要互相通信的组件（比如 GPIO、SPI）需要其他设备与之通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 进行运行测试。

以下是一个多设备测试用例:

```c
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", 
    "[driver]", gpio_--master_test, gpio_slave_test);
```

宏 `TEST_CASE_MULTIPLE_DEVICES` 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例，通常会要求它们之间进行同步。我们提供 `unity_wait_for_signal` 和 `unity_send_signal` 这两个函数来使用 UART 去支持同步操作。如果场景中，`slave` 应该在 `master` 设置好 GPIO 电平后再去读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。
DUT1（master）终端:
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.

DUT2（slave）终端:
Send signal: [output high level]!

一旦DUT2发送了该信号，您需要在DUT1的终端按回车键，然后DUT1会从unity_wait_for_signal函数中解除阻塞，并开始更改GPIO的电平。

4.32.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码，例如，我们想在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，我们可以定义多阶段测试用例来将这些测试函数组合在一起。

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}
void check_deepsleep_reset_reason()
{
    soc_reset_reason_t reason = esp_rom_get_reset_reason(0);
    TEST_ASSERT(reason == RESET_REASON_CORE_DEEP_SLEEP);
}
TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", "[esp32]", trigger_deepsleep, check_deepsleep_reset_reason);
```

多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

4.32.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）无法在所有的芯片上执行。请参照本节让你的单元测试只在其中一部分芯片上执行。

1. 使用宏！(TEMPORARY_)DISABLED_FOR_TARGETS() 包装你的测试代码，并将其放在原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会被编译器处理。例:

```c
#if !TEMPORARY_DISABLED_FOR_Targets(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "[]")
{
}
#endif // !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

一旦你需要其中一个测试在某个芯片上被编译，只需要修改禁止的芯片列表。我们更鼓励使用一些通用的概念（能在soc_caps.h中被清楚描述）来禁止某些单元测试。如果你已经这样做，但有一些测试还没有在新的芯片版本中被调试通过，请同时使用上述两种方法，当调试完成后再移除!(TEMPORARY_)DISABLED_FOR_TARGETS()。例:

```c
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "[sdio_slave]")
```

(下页继续)
Chapter 4. API 指南

{  
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED

2. 对于某些你确定不会支持的测试（例如，芯片根本没有该外设），使用 DISABLED_FOR_TARGETS 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 runner 资源等），使用 TEMPORARY_DISABLED_FOR_TARGETS 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 test/芯片版本目录下面，然后用 CMakeLists.txt 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果你将一些代码放在 test/esp32 目录下来避免 esp32s2 芯片执行它，一旦你需要在新的芯片（比如 esp32s3）中启用该测试，你会发现这种结构非常难以保持代码的整洁。
- 请勿继续使用 CONFIG_IDF_TARGET_xxx 宏来禁止某些测试在一些芯片上编译。这种方法会让被禁止的测试项目难以追踪和重新打开，并且，相比于自名单的 #if CONFIG_IDF_TARGET_xxx，黑名单式的 #if !disabled 能避免新芯片引入时这些测试被自动关闭。但对于用于测试的一些实现，#if CONFIG_IDF_TARGET_xxx 仍可用于给不同芯片版本选择实现代码。测试项目和测试实现区分如下：
  - 测试项目：那些会在一些芯片上执行，而另外一些不执行的项目。例如：
    有三个测试项目 SD 1-bit, SD 4-bit 和 SDSPI。对于不支持 SD Host 外设的 ESP32-S2 芯片，只有 SDSPI 一个项目需要被执行。
  - 测试实现：一些最终发生代码的，但采取不同的实现方式。例如：
    ESP8266 芯片虽然有 SDIO_PKT_LEN 寄存器。如果在测试过程中需要获取从设备的数据长度，你可以用不同的方式取的 #if CONFIG_IDF_TARGET_xxx 宏来保护不同的实现代码。但请注意避免使用 #else 宏。这样当新芯片被引人时，测试就会在编译阶段失败，提示编译者去显示选择一个正确的测试实现。

4.32.5 编译单元测试程序

按照 esp-idf 顶层目录的 README 文件中的说明进行操作，确保 IDF_PATH 环境变量已经设置指向了 esp-idf 的顶层目录。

切换到 tools/unit-test-app 目录下进行配置和编译：

- idf.py menuconfig 配置单元测试程序。
- idf.py -T all build - 编译单元测试程序，测试每个组件 test 子目录下的用例。
- idf.py -T "xxx yyy" build - 编译单元测试程序，测试指定的组件。（如idf.py -T heap build - 仅对 heap 组件目录下的单元测试程序进行编译）
- idf.py -T all -E "xxx yyy" build - 编译单元测试程序，测试除指定组件之外的所有组件。（例如 idf.py -T all -E "ulp mbedtls" build - 编译所有的单元测试，不包括 ulp 和 mbedtls 组件。）

注解：由于 Windows 命令提示符固有限制，需使用以下语法来编译多个组件的单元测试程序：idf.py -T xxx -T yyy build 或者在 PowerShell 中使用 idf.py -T \"xxx yyy\" build，在 Windows 命令提示符中使用 idf.py -T -\"\"ssd1306 hts221\"\" build。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 idf.py flash 即可烧写所有编译输出的文件。

您还可以运行 idf.py -T all flash 或者 idf.py -T xxx flash 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 menuconfig 可以设置烧写测试程序所使用的串口。
4.32.6 运行单元测试

烧写完成后重启 ESP32，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

<table>
<thead>
<tr>
<th>Here’s the test menu, pick your combo:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1) “esp_ota_begin() verifies arguments” [ota]</td>
</tr>
<tr>
<td>(2) “esp_ota_get_next_update_partition logic” [ota]</td>
</tr>
<tr>
<td>(3) “Verify bootloader image in flash” [bootloader_support]</td>
</tr>
<tr>
<td>(4) “Verify unit test app image” [bootloader_support]</td>
</tr>
<tr>
<td>(5) “can use new and delete” [cxx]</td>
</tr>
<tr>
<td>(6) “can call virtual functions” [cxx]</td>
</tr>
<tr>
<td>(7) “can use static initializers for non-POD types” [cxx]</td>
</tr>
<tr>
<td>(8) “static initialization guards work as expected” [cxx]</td>
</tr>
<tr>
<td>(9) “global initializers run in the correct order” [cxx]</td>
</tr>
<tr>
<td>(10) “before scheduler has started, static initializers work correctly” [cxx]</td>
</tr>
<tr>
<td>(11) “adc2 work with wifi” [adc]</td>
</tr>
<tr>
<td>(12) “can use std::vector” [cxx]</td>
</tr>
<tr>
<td>(13) “static initialization guards work as expected” [cxx]</td>
</tr>
<tr>
<td>(14) “SPI Master clockdiv calculation routines” [spi]</td>
</tr>
<tr>
<td>(15) “SPI Master test” [spi] [ignore]</td>
</tr>
<tr>
<td>(16) “SPI Master test, interaction of multiple devs” [spi] [ignore]</td>
</tr>
<tr>
<td>(17) “SPI Master no response when switch from host1 (SPI2) to host2 (SPI3)” [spi]</td>
</tr>
<tr>
<td>(18) “SPI Master DMA test, TX and RX in different regions” [spi]</td>
</tr>
<tr>
<td>(19) “SPI Master DMA test: length, start, not aligned” [spi]</td>
</tr>
<tr>
<td>(20) “reset reason check for deepsleep” [esp32] [test_env=UT_T2_1] [multi_device]</td>
</tr>
<tr>
<td>(21) “trigger_deepsleep”</td>
</tr>
<tr>
<td>(22) “check_deepsleep_reset_reason”</td>
</tr>
</tbody>
</table>

常规测试用例会打印用例名称和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。可以输入以下任意一项来运行测试用例：

- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

[multi_device] 和 [multi_stage] `\` 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 `\` TEST_CASE_MULTIPLE_STAGES 和 TEST_CASE_MULTIPLE_DEVICES 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单:

<table>
<thead>
<tr>
<th>Running gpio master/slave test example...</th>
</tr>
</thead>
<tbody>
<tr>
<td>gpio master/slave test example</td>
</tr>
<tr>
<td>(1) &quot;gpio_master_test&quot;</td>
</tr>
<tr>
<td>(2) &quot;gpio_slave_test&quot;</td>
</tr>
</tbody>
</table>

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单:

<table>
<thead>
<tr>
<th>Running reset reason check for deepsleep...</th>
</tr>
</thead>
<tbody>
<tr>
<td>reset reason check for deepsleep</td>
</tr>
<tr>
<td>(1) &quot;trigger_deepsleep&quot;</td>
</tr>
<tr>
<td>(2) &quot;check_deepsleep_reset_reason&quot;</td>
</tr>
</tbody>
</table>

第一次执行此例用时，输入 1 运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 来运行第二阶段。只有在最后一个阶段通过并且之前所有的阶段都成功触发了复位的情况下，该测试才算通过。
4.32.7 带缓存补偿定时器的定时代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。

然而，如果指令或数据不在缓存中，则需要从外部内存中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 GPU 在等待从外部存储器获取指令或数据时会陷入停滞。这导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即，最大限度地减少缓存缺失）。理论上说这会影响执行速度，但这些因素通常却是无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行和构建时的执行时间可能会有所差异，清除部分差异的方法之一是将代码和数据分别放在指令或数据 RAM（IRAM/DRAM）中。CPU 可以直接访问 IRAM 和 DRAM，从而消除了高速缓存的影响因素。然而，由于 IRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是将要基准测试的代码/数据放置在 IRAM/DRAM 中的替代方法。该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。

```c
// Start the timer
ccomp_timer_start();

// Function to time
func_code_to_time();

// Stop the timer, and return the elapsed time in microseconds relative to
// ccomp_timer_start
int64_t t = ccomp_timer_stop();
```

缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 ccomp_timer_start，使调度器进入睡眠状态。唤醒并在在另一个内核上重新调度，那么对应的 ccomp_timer_stop 将无效。

4.32.8 Mocks

嵌入式系统中单元测试的最大问题之一是硬件依赖性极强。所以 ESP-IDF 有一个集成了 CMock mocking 框架的组件。理想情况下，除了需要被测试的组件（待测组件）之外的所有组件都要被模拟。这样，测试环境就可以完全控制与被测组件之间的所有交互。但是，在实际调试中如果遇到过于具体而导致的困难，用户可以在测试代码中包含“(actual)”（非模拟）代码。

除了常规的 IDF 要求，_background.cpp 中的 Mock 的必要条件。具体请参考 cmock/CMock/docs/CMock_Summary.md 了解 CMock 工作原理以及如何创建和使用 Mock。

在 IDF 中，与编写普通组件或不需要 Mock 的单元测试相比，需要 Mock 的组件以及单元测试内部需要进行一些修改。

修改需要模拟的组件

要被模拟的组件需要一个单独的 mock 目录，用来包含实现模拟的文件。最重要的是，该目录下要包含用于配置 CMock 的 mock_config.yaml 文件。关于此配置文件中选项的含义以及如何编写自己的配置文件，请参考 CMock 文档。mock 目录中可能还需要包括其它与 Mock 有关的文件。

此外，组件的 CMakeLists.txt 文件中需要一个“开关”来决定是否编译 Mock。通常可以通过检查特定组件的属性 USE_MOCK 来实现。例如，spi_flash 组件在其 CMakeLists.txt 中执行以下代码，以检查是否应该编译 Mock。

```cmake
idf_component_get_property(spi_flash_mock ${COMPONENT_NAME} USE_MOCK)
```
在组件的 CMakeLists.txt 中创建组件的 Mock 的 CMake 编译命令可能如下所示:

```cmake
add_custom_command(
  OUTPUT ${MOCK_OUTPUT}
  COMMAND ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_
  -config.yaml ${MOCK_HEADERS}
  COMMAND ${CMAKE_COMMAND} -E env "UNITY_DIR=${IDF_PATH}/components/unity/unity"
  -ruby ${CMOCK_DIR}/lib/cmock.rb -o${CMAKE_CURRENT_SOURCE_DIR}/mock/mock_config.
  -yaml ${MOCK_HEADERS})
)
```

${MOCK_OUTPUT} 包含所有 CMock 生成的输出文件, ${MOCK_HEADERS} 包含所有 Mock 的头文件, ${CMOCK_DIR} 需要设置为 IDF 内的 CMock 目录。${CMAKE_COMMAND} 会由 IDF 构建系统自动设置。

使用 CMock 要特别注意的一个方面是：CMock 通常使用 Unity 作为一个子模块，但由于一些 Espressif 内部 CI 的限制，我们仍然将 Unity 作为一个库模块，要使用 IDF 提供的 Unity 组件，构建系统需要传递一个环境变量UNITY_DIR 给 CMock。该变量仅包含 IDF 中 Unity 目录的路径，如 export "UNITY_DIR=${IDF_PATH}/components/unity/unity"。关于 CMock 中 Unity 目录是如何确定的，请参考 cmock/CMock/lib/cmock_generator.rb。

更多细节可参考 spi_flash 目录下启用 Mock 的 CMakeLists.txt 示例文件。

### 修改单元测试文件

单元测试要为需要模拟的组件设置 USE_MOCK 组件属性。这会让依赖组件编译 Mock，而不是实际的组件。例如，在 NVS 主机测试的 CMakeLists.txt 中，以下代码用于启用 spi_flash Mock。

```cmake
idf_component_set_property(spi_flash USE_MOCK 1)
```

关于如何在单元测试中使用及控制 CMock，请参考 [NVS 主机单元测试](#)。

## 4.33 Unit Testing on Linux

**注解:** Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can’t guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to *target based unit testing*.

### 4.33.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with CMock are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don’t need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the CMock framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.
Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to target based unit testing for more information on target tests (the second kind of tests).

### 4.33.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component’s dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

There are currently two examples for running IDF-built code on Linux host:

- An example hello-world application
- A unit test for NVS.

Inside the component which should be tested, there is a separate directory host_test, besides the “traditional” test directory or the test_apps directory. It has one or more subdirectories:

```
- host_test/
  - fixtures/
    contains test fixtures (structs/functions to do test case set-up-
    and tear-down).
    If there are no fixtures, this can be omitted.
  - `<test_name>/`
    IDF applications which run the tests
  - `<test_name2>/`
    Further tests are possible.
```

The IDF applications inside host_test set the mocking configuration as described in the IDF unit test documentation.

The NVS page unit test provides some illustration of how to control the mocks.

**Requirements**

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)
- libbsd

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

### 4.34 Wi-Fi 驱动程序

#### 4.34.1 ESP32 Wi-Fi 功能列表

- 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
- 支持使用 IEEE 802.11b, IEEE 802.11g, IEEE 802.11n 和 API 配置协议模式
- 支持 WPA/WPA2/WPA3/WPA2-企业版和 WPS
- 支持 AMPDU、HT40、QoS 以及其它主要功能
- 支持 Modem-sleep
- 支持乐鑫专属协议，可实现 1 km 数据通信量
- 中间数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
支持 Sniffer
支持快速扫描和全信道扫描
支持多个天线
支持获取信道状态信息

4.34.2 如何编写 Wi-Fi 应用程序

准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最有效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本章。非强制要求，请依个人情况而定。

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 example 进行参考。

设置 Wi-Fi 编辑时选项

请参阅 Wi-Fi menuconfig。

Wi-Fi 初始化

请参阅 ESP32 Wi-Fi station一般情况、ESP32 Wi-Fi AP 一般情况。

启动/连接 Wi-Fi

请参阅 ESP32 Wi-Fi station一般情况、ESP32 Wi-Fi AP 一般情况。

事件处理

通常，在理想环境下编写代码难度并不大，如 WIFI_EVENT_STA_START、WIFI_EVENT_STA_CONNECTED 中所述，难度在于如何在现实的困难环境下编写代码，如 WIFI_EVENT_STA_DISCONNECTED 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 ESP32 Wi-Fi 事件描述、ESP32 Wi-Fi station一般情况、ESP32 Wi-Fi AP 一般情况。另可参阅 ESP-IDF 中的 事件处理概述。

编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 ESP32 Wi-Fi API 错误代码。

4.34.3 ESP32 Wi-Fi API 错误代码

所有 ESP32 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为：

• 无错误，例如：返回值 ESP_OK 代表 API 成功返回
• 可恢复错误，例如：ESP_ERR_NO_MEM
• 不可恢复的非关键性错误
• 不可恢复的关键性错误
4.34.4 初始化 ESP32 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一：

- 设置该参数的所有字段
- 先使用 get API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取某个结构至少是一项至关重要的任务，因为在大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将根据该结构中增加更多参数，并将这些字段初始化为 0，确保即使 IDF 版本升级后您的应用程序依然能够正常运行。

4.34.5 ESP32 Wi-Fi 编程模型

ESP32 Wi-Fi 编程模型如下图所示：

![Wi-Fi 编程模型](图51)

Wi-Fi 驱动程序可以看作是一个无法感知物理层的结构（如 TCP/IP 堆栈、应用程序任务、事件任务等）的黑匣子。通常，应用程序任务（代码）负责调用 Wi-Fi 驱动程序 APIs 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 esp_event_handler_register 的基础上进行的。Wi-Fi 驱动程序将事件发送到默认事件循环，应用程序便可以使用 esp_event_handler_register() 中的回调函数处理这些事件。除此之外，esp_netif 模块也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接到一个 AP 时，esp_netif 将自动开启 DHCP 客户端服务（系统默认）。
4.34.6 ESP32 Wi-Fi 事件描述

WIFI_EVENT_WIFI_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

WIFI_EVENT_SCAN_DONE

扫描完成事件，由 esp_wifi_scan_start() 函数触发，将在以下情况下产生：

- 扫描已结束，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 esp_wifi_scan_stop() 而终止。
- 在当前扫描完成之前调用了函数 esp_wifi_scan_start()。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻塞。
- 当前扫描是由函数 esp_wifi_connect() 触发的。

接收到此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 esp_wifi_scan_get_ap_num() 和 esp_wifi_scan_get_ap_records() 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放扫描过程中占用的内存空间（切记该步骤）。更多详细信息，请参阅 ESP32 Wi-Fi 扫描。

WIFI_EVENT_STA_START

如果调用函数 esp_wifi_start() 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用 esp_wifi_connect() 来连接已配置的 AP。

WIFI_EVENT_STA_STOP

如果调用函数 esp_wifi_stop() 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址，终止 DHCP 客户端服务，并移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需要做任何响应。

WIFI_EVENT_STA_CONNECTED

如果调用函数 esp_wifi_connect() 后接收到返回值 ESP_OK，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 got ip 事件发生后才可开始。

WIFI_EVENT_STA_DISCONNECTED

此事件将在以下情况下产生：

- 调用了函数 esp_wifi_disconnect() 或 esp_wifi_stop(), 且 Wi-Fi station 已成功连接至 AP。
- 调用了函数 esp_wifi_connect(), 但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP。例如：未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如：station 连续多次丢失 N beacon、AP 踢掉 station、AP 认证模式改变等。
Chapter 4. API 指南

接收到此事件后，事件任务的默认动作作为：

- 关闭 station 的 LwIP netif。
- 启动 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。注意基于套接字编写的应用程序，其回调函数可以在接收到此事件后（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为：调用函数 esp_wifi_connect() 重新连接 Wi-Fi。但是，如果此事件是由函数 esp_wifi_disconnect() 引发的，则应用程序不应调用 esp_wifi_connect() 来重新连接。应用程序须明确区分此事件的引发原因，因为某些情况下应使用其它更好的方式进行重新连接。请参阅 Wi-Fi 重新连接和连接 Wi-Fi 时扫描。

需要注意的另一点是：接收到此事件后，LwIP 的默认动作是终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能除外。例如：

- 应用程序创建一个 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被切断并引发了 WIFI_EVENT_STA_DISCONNECTED 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层不应考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因在应用程序的事件回调函数中调用了 esp_wifi_connect()，Wi-Fi 连接恢复，同时，station 连接至同一个 AP 并获得与之前相同的 IPv4 地址。
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用程序套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

**IP_EVENT_STA_GOT_IP**

当 DHCP 客户端成功从 DHCP 服务器获取 IPv4 地址或 IPv4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPv4 地址可能由于以下原因而发生改变：

- DHCP 客户端无法重新获取/绑定 IPv4 地址，且 station 的 IPv4 重置为 0。
- DHCP 客户端重新绑定了其它地址。
- 静态配置的 IPv4 地址已发生改变。

函数 ip_event_got_ip_t 中的字段 ip_change 说明了 IPv4 地址是否发生改变。

套接字的状态是基于 IPv4 地址的，这意味着，如果 IPv4 地址发生改变，则所有与此 IPv4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPv4 变为有效地址时重新创建应用程序。

**IP_EVENT_GOT_IPv6**

当 IPv6 SLAAC 支持自动为 ESP32 配置一个地址，或 ESP32 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

**IP_STA_LOST_IP**

当 IPv4 地址失时后，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPv4 地址丢失计时器，如果 station 在该计时器超时之前成功获取了 IPv4 地址，则不会发生此事件。否则，此事件将在计时器超时时发生。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPv4 地址已丢失。

**WIFI_EVENT_AP_START**

与 WIFI_EVENT_STA_START 事件相似。
WIFI_EVENT_AP_STOP

与 WIFI_EVENT_STA_STOP 事件相似。

WIFI_EVENT_AP_STACONNECTED

每当有一个 station 成功连接 ESP32 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应，应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 station 的信息等。

WIFI_EVENT_AP_STADISCONNECTED

此事件将在以下情况下发生：
- 应用程序通过调用函数 esp_wifi_disconnect() 或 esp_wifi_deauth_sta() 手动断开 station 连接。
- Wi-Fi 驱动程序由于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可通过函数 esp_wifi_set_inactive_time() 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

WIFI_EVENT_AP_PROBEREQRECVED

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API esp_wifi_set_event_mask() 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。

4.34.7 ESP32 Wi-Fi station 一般情况

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

1. Wi-Fi/LwIP 初始化阶段

- s1.1: 主任务通过调用函数 esp_netif_init() 创建一个 LwIP 核心任务，并初始化 LwIP 相关工作。
- s1.2: 主任务通过调用函数 esp_event_loop_create() 创建一个系统事件任务，并初始化应用程序事件的回调函数。在此情况下，该回调函数唯一的动作就是将事件中继到应用程序任务中。
- s1.3: 主任务通过调用函数 esp_netif_create_default_wifi_ap() 或 esp_netif_create_default_wifi_sta() 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
- s1.4: 主任务通过调用函数 esp_wifi_init() 创建 Wi-Fi 驱动程序任务，并初始化 Wi-Fi 驱动程序。
- s1.5: 主任务通过调用 OS API 创建应用数据任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序针对基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序并非强制，您可以在第 s1.1 步创建应用程序任务，然后在该应用程序任务中进行所有其它初始化操作。不过，如果您的应用程序任务依赖套接字，那么在初始化阶段创建应用程序任务可能并不实用。此时，您可以在接收 IP 后再进行任务创建。

2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后，可以进入到配置阶段。该阶段中，Wi-Fi 驱动程序处于 station 模式。因此，首先您需调用函数 esp_wifi_set_mode() (WIFI_MODE_STA) 将 Wi-Fi 模式配置为 station 模式。
可通过调用其它 esp_wifi_set_xxx API 进行更多设置，例如：协议模式、国家代码、带宽等。请参阅 ESP32 Wi-Fi 配置。

一般情况下，我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序，但这并非强制要求。也就是说，只要 Wi-Fi 驱动程序已成功初始化，您可以在任意阶段进行配置。但是，如果您的 Wi-Fi 在建立连接后不需要更改配置，则应先在此阶段完成配置。因为调用配置 API（例如 esp_wifi_set_protocol()）将导致 Wi-Fi 连接断开，为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash，则不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么，当主板上电/重新启动时，就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 esp_wifi_get_xxx API 获取之前存储的配置信息。当然，如果不想使用之前配置，您依然可以重新配置 Wi-Fi 驱动程序。

3. Wi-Fi 启动阶段

- s3.1: 调用函数 esp_wifi_start() 启动 Wi-Fi 驱动程序。
- s3.2: Wi-Fi 驱动程序将事件 WIFI_EVENT_STA_START 发布到事件任务中，然后，事件任务将执行一些正常操作并调用应用程序的事件回调函数。
- s3.3: 应用程序的事件回调函数将事件 WIFI_EVENT_STA_START 中继到应用程序任务中，推荐您此时调用函数 esp_wifi_connect() 进行 Wi-Fi 连接。当然，您也可以等待在 WIFI_EVENT_STA_START 事件发生后的其它阶段再调用此函数。

4. Wi-Fi 连接阶段

- s4.1: 调用函数 esp_wifi_connect() 后，Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功，将产生 WIFI_EVENT_STA_CONNECTED 事件。然后，事件任务将启动 DHCP 客户端服务，最终触发 DHCP 程序。
- s4.3: 在此情况下，应用程序的事件回调函数将 WIFI_EVENT_STA_CONNECTED 事件中继到应用程序任务中。通常，应用程序不需要进行操作，而您可以执行任何动作，例如：打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败，例如：密码错误、未找到 AP 等。这种情况下，将引发 WIFI_EVENT_STA_DISCONNECTED 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件，请参阅下文阶段 6 的描述。

5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成，Wi-Fi 驱动程序将进入获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址，则将引发 IP_EVENT_STA_GOT_IP 事件，事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 IP_EVENT_STA_GOT_IP 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序，此事件较为特殊，因为它意味着应用程序已准备好，可以开始任务，例如：创建 TCP/UDP 套接字等。此时较为容易犯的一个错误就是在接收到 IP_EVENT_STA_GOT_IP 事件之前就初始化套接字。切勿在收到 IP 之前启动任何套接字相关操作。

6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因（例如：AP 掉电、RSSI 较弱等）连接中断时，将产生 WIFI_EVENT_STA_DISCONNECTED 事件。此事件也可能在上文阶段 3 中发生。在这里，事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然而，所用应用程序套接字都将处于错误状态。也就是说， WIFI_EVENT_STA_DISCONNECTED 事件发生时，任何套接字都无法正常工作。
- s6.2: 上述情况下，应用程序的事件回调函数将 WIFI_EVENT_STA_DISCONNECTED 事件中继到应用程序任务中。推荐您调用函数 esp_wifi_connect() 重新连接 Wi-Fi，关闭所有套接字，并在必要时重新创建套接字。请参阅 WIFI_EVENT_STA_DISCONNECTED。
7. Wi-Fi IP 更新阶段

- s7.1: 如果 IP 地址发生更改，将引发 IP_EVENT_STA_GOT_IP 事件，其中 “ip_change” 被置为 “true”。
- s7.2: 此事件对应用进程至关重要。这一事件发生时，适合关闭所有已创建的套接字并进行重新创建。

8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

### 4.34.8 ESP32 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景，其中包含不同阶段的具体描述。

### 4.34.9 ESP32 Wi-Fi 扫描

目前，仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。

#### 扫描类型

<table>
<thead>
<tr>
<th>模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>主动扫描</td>
<td>通过发送 probe request 进行扫描。该模式为默认的扫描模式。</td>
</tr>
<tr>
<td>被动扫描</td>
<td>不发送 probe request。跳至某一特定信道并等待 beacon。应用程序可通过 wifi_scan_config_t 中的 scan_type 字段使能被动扫描。</td>
</tr>
<tr>
<td>前端扫描</td>
<td>在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描。应用程序无法配置这两种模式。</td>
</tr>
<tr>
<td>后端扫描</td>
<td>在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描。应用程序无法配置这两种模式。</td>
</tr>
<tr>
<td>全信道扫描</td>
<td>扫描所有信道。wifi_scan_config_t 中的 channel 字段为 0 时，当前模式为全信道扫描。</td>
</tr>
<tr>
<td>特定信道扫描</td>
<td>仅扫描特定的信道。wifi_scan_config_t 中的 channel 字段为 1-14 时，当前模式为特定信道扫描。</td>
</tr>
</tbody>
</table>

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式:

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道前端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

#### 扫描配置

扫描类型与其他扫描属性通过函数 `esp_wifi_scan_start()` 进行配置。下表详细描述了函数 wifi_scan_config_t 各字段信息。
图 53: AP 模式下 Wi-Fi 事件流程示例
<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。</td>
</tr>
<tr>
<td>bssid</td>
<td>如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。</td>
</tr>
<tr>
<td>channel</td>
<td>如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。</td>
</tr>
<tr>
<td>show_hidden</td>
<td>如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。</td>
</tr>
<tr>
<td>scan_type</td>
<td>如果该字段值为 WIFI_SCAN_TYPE_ACTIVE，则本次扫描为启动扫描；反之，将被视为被动扫描。</td>
</tr>
<tr>
<td>scan_time</td>
<td>该字段用于控制每个信道的扫描时间。被启动扫描时，scan_time.active 字段负责为每个信道指定扫描时间。在主动扫描时，每个信道的扫描时间如下表所示。其中，min 代表 scan_time.active_min，max 代表 scan_time.active_max。</td>
</tr>
<tr>
<td></td>
<td>min=0, max=0: 每个信道的扫描时间为 120 ms。</td>
</tr>
<tr>
<td></td>
<td>min&gt;0, max=0: 每个信道的扫描时间为 120 ms。</td>
</tr>
<tr>
<td></td>
<td>min=0, max&gt;0: 每个信道的扫描时间为 max ms。</td>
</tr>
<tr>
<td></td>
<td>min&gt;0, max&gt;0: 每个信道扫描的最短时间为 min ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这段时间内找到 AP，则该信道的扫描时间为 max ms。</td>
</tr>
</tbody>
</table>

调用 API esp_wifi_set_config() 可全局配置一些扫描属性，请参阅 station 基本配置。

### 在所有信道中扫描全部 AP（前端）

**场景**:

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

**详细描述**:

#### 扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 esp_wifi_set_country() 进行配置。请参阅 Wi-Fi 国家/地区代码。
- s1.2: 调用函数 esp_wifi_scan_start() 配置扫描信号，可参阅扫描配置。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

#### Wi-Fi 驱动程序内部扫描阶段

- s2.1: Wi-Fi 驱动程序切换至信道 1，此时的扫描类型为 WIFI.Scan_Type.Active，同时发送一个 probe request。反之，Wi-Fi 将等待接收 AP beacon。Wi-Fi 驱动程序将在信道 1 停留一段时间。
- s2.2: Wi-Fi 驱动程序切换至信道 2，并重复进行 s2.1 中的步骤。
- s2.3: Wi-Fi 驱动程序扫描最后的信道 N，N 的具体数值由步骤 s1.1 中配置的国家代码决定。

#### 扫描完成后事件处理阶段

- s3.1: 当所有信道扫描全部完成后，将产生 WIFI.EVENT_SCAN_DONE 事件。
- s3.2: 应用程序的事件回调函数告知应用程序任务已接收到来自 WIFI.EVENT_SCAN_DONE 事件。调用函数 esp_wifi_scan_get_ap_num() 获取在本次扫描中找到的 AP 数量。然后，分配出足够的结构体，并调用函数 esp_wifi_scan_get_ap_records() 获取 AP 记录。请注意，一旦调用 esp_wifi_scan_get_ap_records()，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要在单个扫描完成事件中重复调用 esp_wifi_scan_get_ap_records()。反之，如果扫描完成后未调用 esp_wifi_scan_get_ap_records()，则 Wi-Fi 驱动程序中的 AP 记录不会被释放。因此，请务必确保调用 esp_wifi_scan_get_ap_records()，且仅调用一次。
图 54: 所有 Wi-Fi 信道的前端扫描
在所有信道上扫描全部 AP（后端）

场景:
上述场景为一次信道后端扫描。与在所有信道中扫描全部 AP（前端）相比，信道后端扫描的不同之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回信道停留 30 ms，以便 Wi-Fi 连接有一定的时间发送/接收数据。

在所有信道中扫描特定 AP

场景:
该扫描过程与在所有信道中扫描全部 AP（前端）相似。区别在于:

- s1.1：在步骤 1.2 中，目标 AP 将配置为 SSID/SSID/SSID。
- s2.1~s2.N：每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描类型为 WIFI_FAST_SCAN，且确认已找到目标 AP，则产生扫描完成事件，同时结束本次扫描。反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰巧扫描到两个 SSID 为“ap”的 AP。如果本次扫描类型为 WIFI_ALL_CHANNEL_SCAN，则仅可找到第一个扫描到的“ap”；如果本次扫描类型为 WIFI_ALL_CHANNEL_SCAN，则两个“ap”都将被找到，且 station 将根据配置规则连接至其需要连接的“ap”，请参阅 station 基本配置。

您可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP。这两种扫描过程也较为相似。

在 Wi-Fi 连接模式下扫描

调用函数 esp_wifi_connect() 后，Wi-Fi 驱动程序将首次尝试扫描已配置的 AP。Wi-Fi 连接模式下的扫描过程与在所有信道中扫描特定 AP 过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生 WIFI_EVENT_STA_DISCONNECTED 事件。请参阅在所有信道中扫描特定 AP。

在禁用模式下扫描

如果函数 esp_wifi_scan_start() 中的禁用参数为“true”，则本次扫描为禁用模式下的扫描。在该次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用模式下扫描完成之后将不会出现扫描完成事件。

并行扫描

有时，可能会有两个应用程序任务同时调用函数 esp_wifi_scan_start()，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 esp_wifi_scan_start()，这两种情况都有可能会发生。但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。随着 ESP32 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 esp_wifi_scan_start() 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略是：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延迟重试策略并非万无一失。试想以下场景:

- 如果 station 正在连接一个不存在的 AP，或正在使用错误的密码连接一个 AP，此时将产生事件 WIFI_EVENT_STA_DISCONNECTED。
- 接收到断开连接事件后，应用程序调用函数 esp_wifi_connect() 进行重新连接。
图 55: 所有 Wi-Fi 信道的后端扫描
图 56: 扫描特定的 Wi-Fi 信道
• 而另一个应用程序任务（如，控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每一次扫描都会立即失败，因为 `station` 一直处于正在连接状态。
• 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于正在连接过程中。因此，如果您的应用程序也可能发生相似的场景，那么就需要为其配置一个更佳的重新连接策略，例如：

• 应用程序可以定义一个连续重新连接次数的最大值。当重新连接的次数达到这个最大值时，立刻停止重新连接。
• 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延时一段时间后再进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅 Wi-Fi 重新连接。

4.3.10 ESP32 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅【找到多个 AP 时的 ESP32 Wi-Fi station 连接】。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

字段：

扫描阶段

• s1.1：Wi-Fi 驱动程序开始在“Wi-Fi 连接”模式下扫描。详细信息参阅 【Wi-Fi 连接模式下扫描】。
• s1.2：如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅【Wi-Fi 原因代码】。

认证阶段

• s2.1：发送认证请求数据包并能认证计时器。
• s2.2：如果在认证计时器超时之前未收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅【Wi-Fi 原因代码】。
• s2.3：接收到认证响应数据包，且认证计时器终止。
• s2.4：AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅【Wi-Fi 原因代码】。

关联阶段

• s3.1：发送关联请求并使能关联计时器。
• s3.2：如果在关联计时器超时之前未接收到关联响应，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_ASSOC_EXPIRE`。请参阅【Wi-Fi 原因代码】。
• s3.3：接收到关联响应，且关联计时器终止。
• s3.4：AP 在响应中拒绝关联且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码将在关联响应中指定。请参阅【Wi-Fi 原因代码】。

四次握手阶段

• s4.1：使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅【Wi-Fi 原因代码】。
• s4.2：接收到 1/4 EAPOL。
• s4.3：station 回复 2/4 EAPOL。
• s4.4：如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_HANDSHAKE_TIMEOUT`。请参阅【Wi-Fi 原因代码】。
Chapter 4. API 指南

• s4.5：接收到 3/4 EAPOL。
• s4.6：station 回复 4/4 EAPOL。
• s4.7：station 产生 WIFI_EVENT_STA_CONNECTED 事件。

Wi-Fi 原因代码

下表罗列了 ESP32 中定义的原因代码。其中，第一列为 esp_wifi_types.h 中定义的宏名称。名称中省去了前缀 WIFI_REASON，也就是说，名称 UNSPECIFIED 实际应为 WIFI_REASON_UNSPECIFIED，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2012 中 8.4.1.7 段的标准值。（更多详细信息，请参阅前文描述。）最后一列为这一原因的描述。
<table>
<thead>
<tr>
<th>原因代码</th>
<th>数值</th>
<th>映射值</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNSPECIFIED</td>
<td>1</td>
<td></td>
<td>出现内部错误。例如：内存已满，内部发送失败，或该原因已被远端接收等。</td>
</tr>
<tr>
<td>AUTH_EXPIRE</td>
<td>2</td>
<td></td>
<td>先前的 authentication 已失效。&lt;br&gt;对于 ESP station，出现以下情况时将报告该代码：&lt;br&gt;• authentication 超时；&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;对于 ESP AP，出现以下情况时将报告该代码：&lt;br&gt;• 在过去五分钟之内，AP 未从 station 接收到任何数据包；&lt;br&gt;• 由于调用了函数 esp_wifi_stop() 导致 AP 终止；&lt;br&gt;• 由于调用了函数 esp_wifi_deauth_sta() 导致 station 的 authentication 取消。</td>
</tr>
<tr>
<td>AUTH_BEAVE</td>
<td>3</td>

<td>authentication 取消，因为发送 station 正在离开（或已经离开）&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。</td>
</tr>
<tr>
<td>ASSOC_EXPIRE</td>
<td>4</td>
<td></td>
<td>因为 AP 不活跃，association 取消。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;对于 ESP AP，出现以下情况时将报告该代码：&lt;br&gt;• 在过去五分钟之内，AP 未从 station 接收到任何数据包；&lt;br&gt;• 由于调用了函数 esp_wifi_stop() 导致 AP 终止；&lt;br&gt;• 由于调用了函数 esp_wifi_deauth_sta() 导致 station 的 authentication 取消。</td>
</tr>
<tr>
<td>ASSOC_TOO_MANY</td>
<td>5</td>
<td></td>
<td>association 取消，因为 AP 无法同时处理所有当前已关联的 STA。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;对于 ESP AP，出现以下情况时将报告该代码：&lt;br&gt;• 与 AP 相关联的 station 数量已到达 AP 可支持的最大值。</td>
</tr>
<tr>
<td>NOT_AUTHED</td>
<td>6</td>
<td></td>
<td>从一个未认证 station 接收到 class-2 frame。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;对于 ESP AP，出现以下情况时将报告该代码：&lt;br&gt;• AP 从一个未认证 station 接收到数据包。</td>
</tr>
<tr>
<td>NOT_ASSOCED</td>
<td>7</td>
<td></td>
<td>从一个未关联 station 接收到的 class-3 frame。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;对于 ESP AP，出现以下情况时将报告该代码：&lt;br&gt;• AP 从未关联 station 接收到数据包。</td>
</tr>
<tr>
<td>ASSOC_LEAVE</td>
<td>8</td>
<td></td>
<td>association 取消，因为发送 station 正在离开（或已经离开）BSS。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：&lt;br&gt;• 从 AP 接收到该代码。&lt;br&gt;• 由于调用 esp_wifi_disconnect() 和其它 API，station 断开连接。</td>
</tr>
<tr>
<td>ASSOC_NOTIFY</td>
<td></td>
<td></td>
<td>station 的 reassociation) 请求未被响应 station 认证。&lt;br&gt;对于 ESP station，出现以下情况时报告该代码：</td>
</tr>
</tbody>
</table>

Espressif Systems 由于 ESP 使用 target_layers，ESP 不处理以下情况时将报告该代码：
• AP 从一个已关联，但未认证的 station 接收到数据包。

- **2019** 接收到该代码。 Release v5.0-dev-489-gef98a36

- **2019** 接收到该代码。 Release v5.0-dev-489-gef98a36
4.34.11 找到多个 AP 时的 ESP32 Wi-Fi station 连接

该场景与 ESP32 Wi-Fi station 连接场景相似，不同之处在于该场景中不会产生 WIFI_EVENT_STA_DISCONNECTED 事件，除非 station 无法连接所有找到的 AP。

4.34.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到 WIFI_EVENT_STA_DISCONNECTED 事件后调用函数 esp_wifi_connect()。

但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数 esp_wifi_disconnect() 引发的，那么应用程序可能不希望进行重新连接。
- 如果 station 随时可能调用函数 esp_wifi_scan_start() 开始扫描，此时就需要一个更佳的重新连接方法，请参阅连接 Wi-Fi 时扫描。

另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

4.34.13 Wi-Fi beacon 超时

ESP32 使用 beacon 超时机制检测 AP 是否活跃。如果 station 连续丢失了 60 个所连接 AP 的 beacon，将发生 beacon 超时。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request，如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 WIFI_EVENT_STA_DISCONNECTED 事件。

4.34.14 ESP32 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 Wi-Fi NVS Flash。

Wi-Fi 模式

调用函数 esp_wifi_set_mode() 设置 Wi-Fi 模式。

<table>
<thead>
<tr>
<th>模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIFI_MODE_NULL</td>
<td>NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer。或者您不想通过调用函数 esp_wifi_deinit() 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。</td>
</tr>
<tr>
<td>WIFI_MODE_STA</td>
<td>station 模式：此模式下，esp_wifi_start() 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 esp_wifi_connect() 后，station 将连接到目标 AP。</td>
</tr>
<tr>
<td>WIFI_MODE_AP</td>
<td>AP 模式：在此模式下，esp_wifi_start() 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。</td>
</tr>
<tr>
<td>WIFI_MODE_APSTA</td>
<td>station/AP 共存模式：在此模式下，函数 esp_wifi_start() 将同时初始化 station 和 AP。该步骤在 station 模式和 AP 模式下完成。请注意 ESP station 所连外部 AP 的信道优先于 ESP AP 信道。</td>
</tr>
</tbody>
</table>

station 基本配置

API esp_wifi_set_config() 可用于配置 station。下表详细介绍了各个字段。
### 字段 概述

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>station 想要连接的目标 AP 的 SSID。</td>
</tr>
<tr>
<td>password</td>
<td>目标 AP 的密码。</td>
</tr>
<tr>
<td>scan_method</td>
<td>WiFi_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WiFi_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WiFi_FAST_SCAN。</td>
</tr>
<tr>
<td>bssid_set</td>
<td>如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同、BSSID 与 “bssid” 字段也相同的 AP。</td>
</tr>
<tr>
<td>bssid</td>
<td>只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。</td>
</tr>
<tr>
<td>channel</td>
<td>该字段为 0 时，station 扫描信道 1~N 寻找目标 AP；否则，station 首先扫描与 “channel” 字段相同的信道，再扫描其他信道。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。</td>
</tr>
<tr>
<td>sort_method</td>
<td>该字段仅用于 WiFi_ALL_CHANNEL_SCAN 模式。如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信道强度排序，信道最好的 AP 会是第一个连接。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，且扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -30 dBm，station 首先连接第二个 AP。除失败，才会连接第一个。如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 将会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并且扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先连接第二个 AP。除失败，才会连接第一个。</td>
</tr>
<tr>
<td>threshold</td>
<td>该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。如果 RSSI 设置为 0，则表示默认阈值，默认 RSSI 阈值为 -127 dBm。如果 authmode 阈值设置为 0，则表示默认阈值，默认 authmode 阈值无授权。</td>
</tr>
</tbody>
</table>

**注意：** WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI_AUTH_WPA2_PSK 使用 WPA2 模式

### AP 基本配置

API esp_wifi_set_config() 可用于配置 AP。下表详细介绍了各个字段。

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF，AP 默认 SSID 为 ESP_aabbcc，“aabbcc” 是 AP MAC 的最后三个字节。</td>
</tr>
<tr>
<td>password</td>
<td>AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN，此字段将被忽略。</td>
</tr>
<tr>
<td>ssid_len</td>
<td>SSID 的长度。如果 ssid_len 为 0，检查 SSID 直至出现终止字符。如果 ssid_len 大于 32，请改为 32，或者根据 ssid_len 设置 SSID 长度。</td>
</tr>
<tr>
<td>channel</td>
<td>AP 的信道。如果信道超出范围，Wi-Fi 驱动程序将默认该信道为信道 1。所以，请确保信道在要求的范围内。有关详细信息，请参阅 Wi-Fi 驱动程序使用手册。</td>
</tr>
<tr>
<td>authmode</td>
<td>ESP AP 的身份验证模式。目前，ESP Wi-Fi 不支持 AUTH_WEP。如果 authmode 是一个无效值，AP 默认该值为 WIFI_AUTH_OPEN。</td>
</tr>
<tr>
<td>ssid_hidden</td>
<td>如果 ssid_hidden 为 1，AP 不广播 SSID，若为其他值，则广播。</td>
</tr>
<tr>
<td>max_connection</td>
<td>目前，ESP Wi-Fi 支持 10 个 Wi-Fi 连接。如果 max_connection 大于 10，AP 默认该值为 10。</td>
</tr>
<tr>
<td>beacon_interval</td>
<td>beacon 间隔。值为 100 ~ 60000 ms，默认值为 100 ms。如果该值不在上述范围，AP 默认取 100 ms。</td>

</tbody>
</table>
**Wi-Fi 协议模式**

目前，IDF 支持以下协议模式：

<table>
<thead>
<tr>
<th>协议模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11b</td>
<td>调用函数 esp_wifi_set_protocol(IF, WIFI_PROTOCOL_11B)，将 station/AP 设置为仅 802.11b 模式。</td>
</tr>
<tr>
<td>802.11bg</td>
<td>调用函数 esp_wifi_set_protocol(IF, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11bgn</td>
<td>调用函数 esp_wifi_set_protocol(IF, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGNLR</td>
<td>调用函数 esp_wifi_set_protocol(IF, WIFI_PROTOCOL_11B</td>
</tr>
</tbody>
</table>
| 802.11 LR | 调用函数 esp_wifi_set_protocol(IF, WIFI_PROTOCOL_LR)，将 station/AP 设置为仅乐鑫专属模式。
此模式是乐鑫的专利模式，可以达到 1 公里视线范围。请确保 station 和 AP 同时连接到 ESP 设备。 |

**远程 (LR)**

远程 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式，可达到 1 公里视线范围。与传统 802.11b 模式相比，接收灵敏度更高，抗干扰能力更强，传输距离更长。

**LR 兼容性** 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32 可能会以 LR 速率传输数据，否则，ESP32 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

<table>
<thead>
<tr>
<th>APSTA</th>

</tbody>
</table>

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。” -” 表示 AP 和 station 的 Wi-Fi 模式不兼容。

根据上表，得出以下结论：

- 对于已使能 LR 的 ESP32 AP，由于以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
- 对于已使能 LR 且并非仅 LR 模式的 ESP32 station，与传统 802.11 模式兼容。
- 如果 station 和 AP 都是 ESP32 设备，并且两者都使能 LR 模式，则协商的模式支持 LR。
Chapter 4. API 指南

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率。应用程序无需任何操作。

**LR 对传统 Wi-Fi 设备的影响** 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备，因为：

- LR 模式下的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

**LR 传输距离** LR 的接收灵敏度比传统的 802.11b 模式高 4 dB，理论上，传输距离约为 802.11b 的 2 至 2.5 倍。

**LR 吞吐量** 因为原始 PHY 数据传输速率为 1/2 Mbit 和 1/4 Mbit，LR 的吞吐量有限。

**何时使用 LR** 通常使用 LR 的场景包括：

- AP 和 station 都是 ESP32 设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

**Wi-Fi 国家/地区代码**

调用 esp_wifi_set_country()，设置国家/地区信息。下表详细介绍各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
</table>
  - ASCII 码空格字符，表示 station/AP 所处国家/地区的规定允许当前频段所需的所有频段。
  - ASCII 码 ‘O’ 字符，表示 station/AP 所处国家/地区的规定允许室外环境。
  - ASCII 码 ‘I’ 字符，表示 station/AP 所处国家/地区的规定仅允许室内环境。
  - ASCII 码 ‘X’ 字符，表示 station/AP 位于非国家/地区实体。非国家实体的前两个八位字节是两个 ASCII 码 ‘XX’ 字符。
  - 当前使用的操作模式编号的二进制形式，见 IEEE Std 802.11-2012 附件 E。 |
| nchan | 起始信道。station/AP 所处国家/地区规定的最小信道数。 |
| policy | 国家/地区政策。当配置的国家/地区信息与所连 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多政策相关信息，可参见下文。 |

默认国家/地区信息为 {cc=”CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}，如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同，例如，配置的 station 国家/地区信息为 {cc=”JP”, .schan=1, .nchan=14, policy=WIFI_COUNTRY_POLICY_AUTO}，但所连 AP 的国家/地区信息为 {cc=”CN”, .schan=1, .nchan=13}，此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区政策下使用的国家/地区信息，并描述了对主动扫描的影响。

Espressif Systems 2014  Release v5.0-dev-489-gef98a36

### Wi-Fi 模式

<table>
<thead>
<tr>
<th>模式</th>
<th>政策</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>station</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。与 station 模式，WIFI_COUNTRY_POLICY_AUTO 政策下使用的国家/地区信息相同。</td>
</tr>
<tr>
<td>station</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。与 station 模式，WIFI_COUNTRY_POLICY_AUTO 政策下使用的国家/地区信息相同。</td>
</tr>
<tr>
<td>AP</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。与 station 模式，WIFI_COUNTRY_POLICY_AUTO 政策下使用的国家/地区信息相同。</td>
</tr>
<tr>
<td>AP</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。与 station 模式，WIFI_COUNTRY_POLICY_AUTO 政策下使用的国家/地区信息相同。</td>
</tr>
<tr>
<td>station/AP 共存模式</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。与 station 模式，WIFI_COUNTRY_POLICY_AUTO 政策下使用的国家/地区信息相同。</td>
</tr>
</tbody>
</table>

**主信道** AP 模式下，AP 的信道定义为主信道。station 模式下，station 所连 AP 的信道定义为主信道。station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。比如，初始时，AP 位于信道 6，但 station 连接信道 9 的 AP。因为 station 的主信道具有优先性，该 AP 需要将信道从 6 切换至 9，确保与 station 主信道相同。切换信道时，AP 模式下的 ESP32 将使用信道切换公告 (CSA) 通知连接的 station。支持信道切换的 station 将直接通过，无需与 AP 断连再重新连接。

**Wi-Fi 供应商 IE 配置**

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32 中，esp_wifi_set_vendor_ie() 和 esp_wifi_set_vendor_ie_cb() 负责此类任务。

### 4.34.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™（也称为设备配置协议）是一个安全且标准化的配置协议，用于配置 Wi-Fi 设备，更多信息请参考 doc/esp_dpp.c/api-reference/network/esp_dpp.h 并参阅 ESP32 开发者指南。

**WPA2-Enterprise**

WPA2-Enterprise 是企业无线网络的安全认证机制。在连接到接入点之前，它使用 RADIUS 服务器对网络用户进行身份验证。身份验证过程基于 802.1X 标准，并有不同的扩展身份验证协议 (EAP) 方法，如 TLS、TTLS、PEAP 等。RADIUS 服务器根据用户的凭据（用户名和密码）、数字证书或者两者对用户进行身份验证。当处于 station 模式的 ESP32 尝试连接到企业模式的 AP 时，它将向 AP 发送身份验证请求。AP 会将该请求发送到 RADIUS 服务器以对 station 进行身份验证。根据不同的 EAP 方式，可以通过 idf.py menuconfig 打开配置，并在配置中设置相应的参数。ESP32 仅在 station 模式下支持 WPA2-Enterprise。

为了建立安全连接，AP 和 station 协商并要用使用的最佳密码套件达成一致。ESP32 支持 AKM 的 802.1X/EAP (WPA) 方法和 AES-CCM (高级加密标准-带密码链消息验证码协议的计数器模式) 支持的密码套件。如果设置了 USE_MBEDTLS_CRYPTO 标志，ESP32 也支持 mbedtls 支持的密码套件。
目前，ESP32 支持以下 EAP 方法：
- EAP-TLS: 这是基于证书的方法，只需要 SSID 和 EAP-IDF。
- PEAP - PEAP: 这是受保护的 EAP 方法，用户名和密码是必填项。
- EAP-TTLS: 这是基于凭据的方法。只有服务器身份验证是强制性的，而用户身份验证是可选的。用户名和密码

- PAP: 密码认证协议
- CHAP: 询问握手身份验证协议
- MSCHAP 和 MSCHAP-V2

请查看 wifi/wifi Enterprise 获取关于证书创建以及如何在 ESP32 上运行 wpa2 Enterprise 示例的详细信息。

### 4.3.16 无线网络管理

无线网络管理让客户端设备能够交换有关网络拓扑结构的信息，包括与射频环境相关的信息。这使每个客户端都能感知到网络状况，从而促进无线网络性能的整体改进。这是 802.11v 规范的一部分。它还使客户端能够支持 Wi-Fi 相关。Wi-Fi 能够将 AP 关联，从而使客户端与具有更好链路质量的 AP 关联。这有助于促进负载平衡以及引导连接不良的客户端都使用更好的 AP。

目前 802.11v 的实现支持 BSS 过渡管理帧。

### 4.3.17 无线资源管理

无线电资源测量 (802.11k) 旨在改善网络内流量的分配方式。在无线局域网中，一般情况下，无线设备会连接发送信号最强的接收点 (AP)。根据用户的数量和地理位置，这种分配方式有时会导致某个接收点超负荷而其它接收点利用不足，从而导致整体网络性能下降。在符合 802.11k 规范的网络中，如果信号最强的 AP 已满负载加载，无线设备则转移到其它未充分利用的 AP。尽管信号可能较弱，但由于更有效利用了网络资源，总体吞吐量会更大。

目前 802.11k 的实现支持信标测量报告、链路测量报告和邻居请求。

请参考 IDF 示例程序 examples/wifi/roaming/README.md 来设置和使用这些 API。示例代码只演示了如何使用这些 API，应用程序应根据需要定义自己的算法和案例。

### 4.3.18 ESP32 Wi-Fi 节能模式

#### station 睡眠

目前，ESP32 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 station 模式支持该模式，station 必须先连接到 AP。如果使用了 Modem-sleep 模式，station 将在活动状态和睡眠状态之间切换。在睡眠状态下，RF, PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon。广播数据在 DTIM 之后传输，因此不会丢失。但是，由 DTIM 间隔长短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 间隔内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较短，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API esp_wifi_set_config() 配置监听间隔。

调用 esp_wifi_init() 后，调用 esp_wifi_set_ps(WIFI_PS_MIN_MODEM) 可使能 Modem-sleep 最小节能模式。调用 esp_wifi_set_ps(WIFI_PS_MAX_MODEM) 可使能 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 esp_wifi_set_ps(WIFI_PS_NONE) 可以完全禁用 Modem-sleep 模式。禁用会加大功耗，但可以以最大限度减少实时接收 Wi-Fi 数据的延迟。使能 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与 DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。
默认的 Modem-sleep 模式是 WIFI_PS_MIN_MODEM。

### AP 睡眠

目前，ESP32 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32 AP 将支持所有节能功能。

#### 4.34.19 ESP32 Wi-Fi 吞吐量

下表是在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。

<table>
<thead>
<tr>
<th>类型/吞吐量</th>
<th>实验室空气状况</th>
<th>屏蔽箱</th>
<th>测试工具</th>
<th>IDF 版本 (commit ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>原始 802.11数据包接收数据</td>
<td>N/A</td>
<td>130 MBit/s</td>
<td>内部工具</td>
<td>N/A</td>
</tr>
<tr>
<td>原始 802.11数据包发送数据</td>
<td>N/A</td>
<td>130 MBit/s</td>
<td>内部工具</td>
<td>N/A</td>
</tr>
<tr>
<td>UDP 接收数据</td>
<td>30 MBit/s</td>
<td>85 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
<tr>
<td>UDP 发送数据</td>
<td>30 MBit/s</td>
<td>75 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
<tr>
<td>TCP 接收数据</td>
<td>20 MBit/s</td>
<td>65 MBit/s</td>
<td>iperf example</td>

</tr>
<tr>
<td>TCP 发送数据</td>
<td>20 MBit/s</td>
<td>75 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
</tbody>
</table>

使用 iperf example 测试吞吐量时，sdkconfig 是:idf_file:示例/wifi/iperf/sdkconfig.defaults.esp32。

#### 4.34.20 Wi-Fi 80211 数据包发送

`esp_wifi_80211_tx()` API 可用于:

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式、AP 模式，或 station/AP 共存模式。
- API esp_wifi_set_promiscuous(true) 或 `esp_wifi_start()`，或者二者都返回 ESP_OK。这是为确保在调用函数 `esp_wifi_80211_tx()` 前，Wi-Fi 硬件已经初始化。对于 ESP32，`esp_wifi_set_promiscuous(true)` 和 `esp_wifi_start()` 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的 `esp_wifi_80211_tx()` 参数。

传输速率

- 如果没有 Wi-Fi 连接，传输速率为 1 Mbps。
- 如果有 Wi-Fi 连接，且数据包是从 station 到 AP 或从 AP 到 station，则传输速率与 Wi-Fi 连接相同。否则，传输速率为 1 Mbps。
在不同情况下需要避免的副作用

理论上，如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用，可以通过空中发送一个原始的 802.11 数据包，包括任何目的地的 MAC、任意源地址的 MAC、任何 BSSID，或任何其他类型的的数据包。但是，一个具有强健、有用的程序应该避免这种副作用。下表针对如何避免 `esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

<table>
<thead>
<tr>
<th>场景</th>
<th>描述</th>
</tr>
</thead>
</table>
| 无 Wi-Fi 连接 | 在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 `en_sys_seq==true`，则 Wi-Fi 驱动程序负责序列控制。如果 `en_sys_seq==false`，应用程序需要确保缓冲区的序列正确。理论上，MAC 地址可以是任何地址。但是，这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。例如，AP 模式下，应用程序调用函数 `esp_wifi_80211_tx()` 发送带有 BSSID == mac_x 的 beacon，但是 mac_x 并非 AP 接口的 MAC。而且，还有一个 AP（我们称之为“other-AP”）的 bssid 是 mac_x。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 `esp_wifi_80211_tx()`。就会出现“意外行为”。为了避免上述副作用，我们建议：
- 如果在 station 模式下调用函数 `esp_wifi_80211_tx()`，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。
- 如果在 AP 模式下调用函数 `esp_wifi_80211_tx()`，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。

上述建议仅供避免副作用，在有充分理由的情况下可以忽略。

| 有 Wi-Fi 连接 | 当 Wi-Fi 已连接，且序列由应用程序控制，应用程序可能会影响整个 Wi-Fi 连接的序列控制。因此，en_sys_seq 要为 true，否则将返回 ESP_ERR_WIFI_ARG。

“无 Wi-Fi 连接”情况下的 MAC 地址建议适用于此情况。如果 Wi-Fi 模式是 station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC，那么称数据包是从 station 发送到 AP，另一方面。如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC，那么称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：
- 如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。
- 如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。
- 如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。

如果任何检查失败，将返回 ESP_ERR_WIFI_ARG。

### 4.34.21 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 `esp_wifi_set_promiscuous()` 使能。如果使能 Sniffer 模式，可以向应用程序转储以下数据。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧
- 802.11 CRC 错误帧

不可以向应用程序转储以下数据。

- 802.11 其他错误帧

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 `esp_wifi_set_promiscuous_filter()` 和 `esp_wifi_set_promiscuous_ctrl_filter()` 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。
可以在 WiFi_MODE_NULL，WiFi_MODE_STA，WiFi_MODE_AP，WiFi_MODE_APSTA 等 WiFi 模式下使能 Wi-Fi Sniffer 模式。也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有很大影响。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 wifi_promiscuous_cb 的使用。该回调将直接在 Wi-Fi 驱动程序任务中运行，所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的操作推迟到应用程序任务中完成。

### 4.3.4.22 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程:

<table>
<thead>
<tr>
<th>Enabled</th>
<th>Antenna</th>
<th>0</th>
<th>1</th>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

ESP32 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - antenna_select[0:3]。向 antenna_select[0:3] 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11。antenna_select[3:0] 的默认值为 “0b0000”，表示默认选择了天线 0。

四个高电平有效 antenna_select 管脚有达四个 GPIO 连接。ESP32 可以通过控制 GPIO[0:3] 选择天线。API esp_wifi_set_ant_gpio() 用于配置 antenna_selects 连接哪些 GPIO。如果 GPIO[x] 连接到 antenna_select[x]，gpio config->gpio_cfg[x].gpio_select 应设置为 1，且要提供 gpio_config->gpio_cfg[x].gpio_num 的值。

尽管最多支持 16 根天线，发送和接收数据时，最多仅能同时使能两根天线。API esp_wifi_set_ant() 用于配置使能哪根天线。

使能天线后，选择算法的过程同样可由 esp_wifi_set_ant() 配置。接收/发送数据源的天线模式可以是 WiFi_ANT_MODE_ANT0, WiFi_ANT_MODE_ANT1 或 WiFi_ANT_MODE_AUTO。如果天线模式为 WiFi_ANT_MODE_ANT0，使能的天线 0 用于接收/发送数据。如果天线模式为 WiFi_ANT_MODE_ANT1，使能天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 WiFi_ANT_MODE_AUTO，还需要设置默认天线模式，只有在满足某些条件时，接收/发送天线才会切换。例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 WiFi_ANT_MODE_ANT1，使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑：

- 因为发送数据天线基于 WiFi_ANT_MODE_AUTO 类型的接收数据天线选择算法，只有接收数据的天线模式为 WiFi_ANT_MODE_AUTO 时，发送数据天线才能设置为 WiFi_ANT_MODE_AUTO。
- 目前，Bluetooth 不支持多根天线功能，请不要使用与多根天线有关的 API。

推荐在以下场景中使用多根天线:

- Wi-Fi 模式 WiFi_MODE_STA 下，接收/发送数据的天线模式均配置为 WiFi_ANT_MODE_AUTO。Wi-Fi 驱动程序自动选择更好的接收/发送数据天线。
- 接收数据天线模式配置为 WiFi_ANT_MODE_AUTO。发送数据的天线模式配置为 WiFi_ANT_MODE_ANT0 或 WiFi_ANT_MODE_ANT1。应用程序可以始终选择指定的天线用于发

有关更多详情，请参阅《ESP32 Wi-Fi 指南》。
送数据，也可以执行自身发送数据天线选择算法，如根据信道切换信息选择发送数据的天线模式等。
- 接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_ANT0 或 WIFI_ANT_MODE_ANT1。

**Wi-Fi 多根天线配置**

通常，可以执行以下步骤来配置多根天线:

- 配置 antenna selects 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 antenna select[0]/antenna select[1]，配置如下所示:

```c
wifi_ant_gpio_config_t config = {
    .gpio_select = 1, .gpio_num = 20,
    .gpio_select = 1, .gpio_num = 21
};
```

- 配置使能哪些天线、以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据始终选择天线 3。配置如下所示:

```c
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.34.23 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32 中，该信息由子载波的信道频率响应组成，并在从发送端接收数据包时进行估计。每个子载波信道频率响应由两个字节的签名字符记录，第一个字节是虚部，第二个是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是传统的长训练字段 (LTF)、短训练字段 (HT-LTF) 和空间时间块代号 HT-LTF (STBC-HT-LTF)。对于在不同状态的信道上接收到的不同类型的CSI，CSI 的子载波指数和签名字符的总字节数如下表所示。

<table>
<thead>
<tr>
<th>信道带宽</th>
<th>信道模式</th>

</tbody>
</table>

表中的所有信息可以在 wifi_csi_info_t 结构中找到。
- 辅助信道指 rx_ctrl 字段的 secondary_channel 字段。
Chapter 4. API

- 数据包的信号模式指 rx_ctrl 字段的 sig_mode 字段。
- 信道带宽指 rx_ctrl 字段中的 cwb 字段。
- STBC 指 rx_ctrl 字段的 stbc 字段。
- 总字节数指 len 字段。
- 每个长训练字段 (LTF) 类型对应的 CSI 数据存储在从 buf 字段开始的缓冲区中。每个项目以两个字节的形式存储：虚部和实部。每个项目的顺序与表中的字节序相反。LTF 的顺序是 LLTF、HT-LTF 和 STBC-HT-LTF。但是，根据信道和数据包的信息，3 个 LTF 可能都不存在（见上文）。
- 如果 wifi_csi_info_t 的 first_word_invalid 字段为 true，表示由于 ESP32 的硬件限制，CSI 数据的前四个字节无效。
- 更多信息，如 RSSI，射频的噪声底，接收时间和天线 rx_ctrl 领域。

注解：
- 对于 STBC 数据包，每个空时流都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附加链上的每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF 中只记录第一空时流的 CSD 角度。CSD[100] 是 11 位。范围从 -pi 到 pi。
- 如果调用 API esp_wifi_set_csi_config() 设置 CSI 接收回调函数，ESP32 可以根据 CSI 数据的总字节数会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当接收到上述条件时，对 HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 ((61+60)*2+2=244，结果对齐为四个字节，最后两个字节无效)。

4.34.24 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。

- 在菜单配置中选择 Wi-Fi CSI，方法是“菜单配置 -> 组件配置 -> Wi-Fi -> Wi-Fi CSI（信道状态信息）”。
- 调用 API esp_wifi_set_csi_rx_cb() 设置 CSI 接收回调函数。
- 调用 API esp_wifi_set_csi_config() 配置 CSI。
- 调用 API esp_wifi_set_csi() 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。但是需要将必要的数据发布到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 esp_wifi_set_promiscuous() 使能 Sniffer 模式接收更多 CSI 数据。

4.34.25 Wi-Fi HT20/40

ESP32 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存。调用函数 esp_wifi_set_bandwidth() 可改变 station/AP 的默认带宽。ESP32 station 和 AP 的默认带宽为 HT40。

station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为 HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为 HT40，否则为 HT20。

在 station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由于 ESP32 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6，辅助信道为 2，AP 的实际信道将自动更改为主 6 和辅 2。

理论上，HT40 可以获得更大的吞吐量，因为 HT40 的最大原始 PHY 数据速率为 150 Mbps，而 HT20 为 72 Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。
4.34.26 Wi-Fi QoS

ESP32 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC_VO 拥有最高优先级。

<table>
<thead>
<tr>
<th>IP 优先级</th>
<th>Wi-Fi AC</th>
<th>是否支持 AMPDU</th>
</tr>
</thead>
<tbody>
<tr>
<td>6, 7</td>
<td>AC_VO (Voice)</td>
<td>否</td>
</tr>
<tr>
<td>4, 5</td>
<td>AC_VI (Video)</td>
<td>是</td>
</tr>
<tr>
<td>3, 0</td>
<td>AC_BE (Best Effort)</td>
<td>是</td>
</tr>
<tr>
<td>1, 2</td>
<td>AC_BK (Background)</td>
<td>是</td>
</tr>
</tbody>
</table>

应用程序可以通过套接字选项 IP_TOS 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例：

```c
const int ipprecedence_vi = 4;
const int ipprecedence_offset = 5;
int priority = (ipprecedence_vi << ipprecedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此。下面是一些关于如何使用 Wi-Fi QoS 的建议：

- 可以把一些真正重要的应用程序流量放到 AC_VO 队列中。避免通过 AC_VO 队列发送大流量。一方面，AC_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会受影响同样使用 AC_VO 队列的管理帧。
- 避免使用 AMPDU 支持的。两个以上的不同队列，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

4.34.27 Wi-Fi AMSDU

ESP32 支持接收和发送 AMSDU。

4.34.28 Wi-Fi 分片

支持 Wi-Fi 接收分片，但不支持 Wi-Fi 发送分片。

4.34.29 WPS 注册

在 Wi-Fi 模式 WIFI_MODE_STA 或 WIFI_MODE_APSTA 下，ESP32 支持 WPS 注册功能。目前，ESP32 支持的 WPS enrollee 类型有 PBC 和 PIN。

4.34.30 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。
缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 LwIP 和 Wi-Fi 都与应用程序共享内存。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32 出现“未定义”行为。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓冲类型是“动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

LwIP 还有 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 LwIP 文档内存使用和性能部分。

Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 Wi-Fi 缓冲区配置）。但本节只介绍 Wi-Fi 动态缓冲的使用方法 Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序理论上消耗的最大内存。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi_rx_dynamic_buf_num
- 配置的动态发送数据缓冲区数：wifi_tx_dynamic_buf_num
- Wi-Fi 驱动程序可以接收的最大数据包：wifi_rx_pkt_size_max
- Wi-Fi 驱动程序可以发送的最大数据包：wifi_tx_pkt_size_max

因此，Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算：

\[
\text{wifi_dynamic_peek_memory} = (\text{wifi_rx_dynamic_buf_num} \times \text{wifi_rx_pkt_size_max}) + (
\text{wifi_tx_dynamic_buf_num} \times \text{wifi_tx_pkt_size_max})
\]

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

4.34.31 如何提高 Wi-Fi 性能

ESP32 Wi-Fi 的性能受许多参数的影响，各参数之间存在相互制约。如果配置地合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，您可以根据使用场景选择合适的等级。

协议栈工作模式

ESP32 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区，LWIP 的接收数据缓冲区进行相关协议处理，然后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
在发送过程中，应用程序首先将要发送的消息复制到 LWIP 层的发送数据缓冲区，进行 TCP/IP 封装。然后将消息发送到 Wi-Fi 层的发送数据缓冲区进行 MAC 封装，最后等待发送。

参数

适当增加上述缓冲区的大小或数量，可以提高 Wi-Fi 性能，但同时，会减少应用程序的可用内存。下面我们将介绍您需要配置的参数：

接收数据方向：

- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` 该参数表示硬件层的 DMA 缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高 Wi-Fi 协议栈处理突发流量的能力。
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM` 该参数表示 Wi-Fi 层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与 LWIP 层的接收数据缓冲区大小相匹配。
- `CONFIG_ESP32_WIFI_RX_BA_WIN` 该参数表示接收端 AMPDU BA 窗口的大小，应配置为 `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM` 和 `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM` 的二倍数值中较小的数值。
- `CONFIG_LWIP_TCPWND_DEFAULT` 该参数表示 LWIP 层用于每个 TCP 流的接收数据缓冲区大小，应配置为 `LWIP_DYNAMIC_RX_BUFFER_NUM (KB)` 的值，从而实现高稳定性。同时，在有多个流的情况下，应相应降低该参数值。

发送数据方向：

- `CONFIG_ESP32_WIFI_TX_BUFFER` 该参数表示发送数据缓冲区的类型，建议配置为动态缓冲区，该配置可以充分利用内存。
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM` 该参数表示 Wi-Fi 层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与 LWIP 层的发送数据缓冲区大小相匹配。
- `CONFIG_LWIP_TCPSEND_BUF_DEFAULT` 该参数表示 LWIP 层用于每个 TCP 流的发送数据缓冲区大小，应配置为 `LWIP_DYNAMIC_TX_BUFFER_NUM (KB)` 的值，从而实现高稳定性。在有多个流的情况下，应相应降低该参数值。

通过在 IRAM 中放置代码优化吞吐量：

- `CONFIG_ESP32_WIFI_IRAM_OPT` 如果使能该选项，一些 Wi-Fi 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 15 kB。
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT` 如果使能该选项，一些 Wi-Fi 接收数据功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 16 kB。
• **CONFIG_LWIP_IRAM_OPTIMIZATION** 如果使能该选项，一些 LWIP 功能将被移至 IRAM，从而提高吞吐量，IRAM 使用量将增加 13 kB。

注解：上述的缓冲区大小固定为 1.6 KB。

如何配置参数

ESP32 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

<table>
<thead>
<tr>
<th>等级</th>
<th>Iperf</th>
<th>发送数据优先</th>
<th>高性能</th>
<th>接收数据优先</th>
<th>默认值</th>
<th>节省内存</th>
<th>最小</th>
</tr>

<td>72.4</td>
<td>69.6</td>
<td>64.1</td>
<td>36.5</td>
</tr>
<tr>
<td>UDP 接收数据吞吐量 (Mbit/s)</td>
<td>83.1</td>
<td>66.3</td>
<td>75.1</td>
<td>75.6</td>
<td>73.1</td>
<td>65.3</td>
<td>54.7</td>
</tr>
</tbody>
</table>

注解：以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32 的 CPU 为双核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

等级：

• **Iperf 等级** ESP32 的极端性能等级，用于测试极端性能。
• **高性能等级** ESP32 的高性能配置等级，适用于应用程序占用内存较少且有高性能要求的场景。在该等级中，您可以根据使用场景选择使用接收数据优先等级或发送数据优先等级。
• **默认等级** ESP32 的默认配置等级，兼顾可用内存和性能。
• **节省内存等级** 该等级适用于应用程序需要大量内存的场景。在这一等级下，收发器的性能会有所降低。
• **最小等级** ESP32 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。
使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，`CONFIG_ESP32_WIFI_TX_BUFFER` 被强制为静态。`CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM` 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。以下是使用 PSRAM 时的推荐等级。

<table>
<thead>

### 4.34.32 Wi-Fi Menuconfig

Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

![TX Buffer Allocation Diagram](image)

图 59: TX Buffer Allocation

描述:
- 应用程序分配需要发送的数据。
- 应用程序调用 TCPIP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区:
图 60: 接收数据缓冲区分配

描述:

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据DMA缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”，复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。

### Wi-Fi NVS Flash

如果使用 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置会先被存储到 flash 中。Wi-Fi 驱动程序在下次开启或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中，其配置信息已安全备份，或仅用于某些调试原因等。
Wi-Fi AMPDU

ESP32 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。
通常，应使用 AMPDU。禁用 AMPDU 通常用于调试目的。

4.34.33 故障排除

请见乐鑫 Wireshark 使用指南。

乐鑫 Wireshark 使用指南

1. 概述

1.1 什么是 Wireshark？ Wireshark（原名 Ethereal）是一个网络封包分析软件。网络封包分析软件的功能是捕获网络封包，并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口，直接与网卡进行数据报文交换。

网络封包分析软件的功能可想像成“电工技师使用电表来测量电流、电压、电阻”的工作，只是将场景移植到网络上，并将电线替换成网线。

在过去，网络封包分析软件是非常昂贵，或是专门属于营利的软件。Wireshark 的出现改变了这一切。

在 GNU GPL 通用许可证的保障范围下，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及客制化的权利。

Wireshark 是目前全世界最广泛的网络封包分析软件之一。

1.2 Wireshark 的主要应用 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

1.3 Wireshark 的特性

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等

1.4 Wireshark 的“能”与“不能”？

- 捕捉多种网络接口
  Wireshark 可以捕捉多种网络接口类型的包，哪怕是无线局域网接口。
- 支持多种其它程序捕捉的文件
  Wireshark 可以打开多种网络分析软件捕捉的包。
- 支持多种格式输出
  Wireshark 可以将捕捉文件输出为多种其他捕捉软件支持的格式。
Chapter 4. API 指南

- 对多种协议解码提供支持
  Wireshark 可以支持许多协议的解码。
- Wireshark 不是入侵检测系统
  如果您的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当您希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络
  Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但您也可以禁止解析）。

2. 如何获取 Wireshark 官网链接：https://www.wireshark.org/download.html

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与您所用操作系统匹配的安装文件。

3. 使用步骤 本文档以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

1) 启动 Wireshark

Linux 下，可编写一个 Shell 脚本，运行该文件即可启动 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```bash
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

脚本中有两个参数：$1 和 $2，分别表示网卡和信道。例如，./xxx.sh wlan0 6（此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

2) 运行 Shell 脚本打开 Wireshark，会出现 Wireshark 抓包开始界面

![Wireshark界面](image)

图 61: Wireshark 抓包界面

3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。

可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。

双击 wlan0 即可开始抓包。

4) 设置过滤条件

抓包过程中会抓取到信道所有的空中包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 filter 的位置。
图 62: 设置 Wireshark 过滤条件

</tbody>
</table>

图 63: Display Filter 对话框
点击 Filter 按钮（下图的左上角蓝色按钮）会弹出 display filter 对话框。

点击 Expression 按钮，会出现 Filter Expression 对话框，在此你可以根据需求进行 filter 的设置。

### 图 64: Filter Expression 对话框

**最直接的方法**：直接在工具栏上输入过滤条件。

### 图 65: 过滤条件工具栏

点击在此区域输入或修改显示的过滤字符，在输入过程中会进行语法检查。如果您输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景会变为绿色。你可以点击下拉列表选择您先前编写的过滤字符。列表会一直保留，即使您重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 Apply（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

### 图 66: 在过滤条件工具栏中运用 MAC 地址过滤示例

5) 封包列表

若想查看包的具体信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。

如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。

若要重新开始抓包，点击下图左上角的蓝色按钮即可。

7) 保存当前捕捉包
图67: 封包列表具体信息示例

4.35 Wi-Fi Security

4.35.1 ESP32 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

4.35.2 Protected Management Frames (PMF)

Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.
PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

**API & Usage**

`esp_wifi_set_config()` can be used to configure PMF mode by setting appropriate flags in `pmf_cfg` parameter. Currently, PMF is supported only in Station mode. While setting up a Station, configure PMF using two flags `capable` and `required` like below.

```c
wifi_config_t wifi_config = {
    .sta = {
        .ssid = EXAMPLE_WIFI_SSID,
        .password = EXAMPLE_WIFI_PASSWORD,
        .pmf_cfg = {
            .capable = true,
            .required = false
        }
    }
};
```

ESP32 supports three modes of PMF by combination of these two flags -

- **PMF Optional**: `.capable = true, .required = false`
- **PMF Required**: `.capable = true, .required = true`
- **PMF Disabled**: `.capable = false, .required = false`

Depending on what AP side PMF Mode is, the resulting connection will behave differently. The table below summarises all possible outcomes -

<table>
<thead>
<tr>
<th>STA Setting</th>
<th>AP Setting</th>
<th>Outcome</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMF Optional</td>
<td>PMF Optional/Required</td>
<td>Mgmt Frames Protected</td>
</tr>
<tr>
<td>PMF Optional</td>
<td>PMF Disabled</td>
<td>Mgmt Frames Not Protected</td>
</tr>
<tr>
<td>PMF Required</td>
<td>PMF Optional/Required</td>
<td>Mgmt Frames Protected</td>
</tr>
<tr>
<td>PMF Required</td>
<td>PMF Disabled</td>
<td>STA refuses Connection</td>
</tr>
<tr>
<td>PMF Disabled</td>
<td>PMF Optional/Disabled</td>
<td>Mgmt Frames Not Protected</td>
</tr>
<tr>
<td>PMF Disabled</td>
<td>PMF Required</td>
<td>AP refuses Connection</td>
</tr>
</tbody>
</table>

PMF Optional Mode, which is shown in the example of `wifi_config_t`, is suggested to be used in all Station configurations. This is to take the additional security benefit of PMF whenever possible without breaking connections with legacy AP’s.

**4.35.3 WPA3-Personal**

**Introduction**

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

- **WPA3 uses Simultaneous Authentication of Equals (SAE)**, which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
- **Disallows outdated protocols such as TKIP**, which is susceptible to simple attacks like MIC key recovery attack.
- **Mandates Protected Management Frames (PMF)**, which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt...
an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.

- Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to Security section of Wi-Fi Alliance’s official website for further details.

**Setting up WPA3 with ESP32**

In IDF Menuconfig under Wi-Fi component, a config option “Enable WPA3-Personal” is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to Protected Management Frames (PMF) on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.
Chapter 5

ESP-IDF 5.0 迁移指南

5.1 Migrate Windows Environment to ESP-IDF 5.0

The Msys/Mingw-based Windows environment support got deprecated in ESP-IDF v4.0 and was entirely removed in v5.0. Please use ESP-IDF 工具安装器 to set up a compatible environment. The options include Windows Command Line, Power Shell and the graphical user interface based on Eclipse IDE. In addition, a VS Code-based environment can be set up with the supported plugin: https://github.com/espressif/vscode-esp-idf-extension.

5.2 Migrate Peripherals to ESP-IDF 5.0

5.2.1 Peripheral Clock Gating

As usual, peripheral clock gating is still handled by driver itself, users don’t need to take care of the peripheral module clock gating.

However, for advanced users who implement their own drivers based on hal and soc components, the previous clock gating include path has been changed from driver/periph_ctrl.h to esp_private/periph_ctrl.h.

5.3 Migrate Build System to ESP-IDF 5.0

Please follow the build system guide for migrating make-based projects no longer supported in ESP-IDF v5.0.

5.4 Migrate System to ESP-IDF 5.0

5.4.1 Inter-Processor Call

IPC (Inter-Processor Call) component has been moved to esp_system.

Thus, any project presenting a CMakeLists.txt file with the parameters PRIV_REQUIRES esp_ipc or REQUIRES esp_ipc, should be modified to simply remove these options as esp_system component is included by default.

5.5 Migrate Ethernet Drivers to ESP-IDF 5.0
5.5.1 esp_eth_ioctl() API

`esp_eth_ioctl()` third argument could take `int (bool)` number as an input in some cases. However, it was not properly documented and, in addition, the number had to be “unnaturally” type casted to `void *` data type to prevent compiler warnings as shown in below example:

```c
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

This could lead to misuse of the `esp_eth_ioctl()`. Therefore, ESP-IDF 5.0 unified usage of `esp_eth_ioctl()`. Its third argument now always acts as pointer to a memory location of specific type from/to where the configuration option is read/stored.

Usage example to set Ethernet configuration:

```c
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

Usage example to get Ethernet configuration:

```c
eth_duplex_t duplex_mode;
esp_eth_ioctl(eth_handle, ETH_CMD_G_DUPLEX_MODE, &duplex_mode);
```
Chapter 6

Libraries and Frameworks

6.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks’ agents and examples:

6.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AlIoT development. ESP RainMaker on GitHub.

6.1.2 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32 based on Amazon Web Services’ aws-iot-device-sdk-embedded-C.

6.1.3 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32 based on Microsoft Azure’s azure-iot-sdk-c SDK.

6.1.4 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32 based on Google’s iot-device-sdk-embedded-c SDK.

6.1.5 Aliyun IoT

https://github.com/espressif/esp-aliyun is an open source repository for ESP32 based on Aliyun’s iotkit-embedded SDK.

6.1.6 Joylink IoT

https://github.com/espressif/esp-joylink is an open source repository for ESP32 based on Joylink’s joylink_dev_sdk SDK.
6.1.7  Tencent IoT

https://github.com/espressif/esp-welink is an open source repository for ESP32 based on Tencent’s welink SDK.

6.1.8  Tencentyun IoT

https://github.com/espressif/esp-qcloud is an open source repository for ESP32 based on Tencentyun’s qcloud-iot-sdk-embedded-c SDK.

6.1.9  Baidu IoT

https://github.com/espressif/esp-baidu-iot is an open source repository for ESP32 based on Baidu’s iot-sdk-c SDK.

6.2  Espressif’s Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

6.2.1  Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

- CODEC’s HAL
- Music Players and Recorders
- Audio Processing
- Bluetooth Speakers
- Internet Radios
- Hands-free devices
- Speech Recognition

This framework is available at GitHub: ESP-ADF.

6.2.2  ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See ESP-CSI project for more information about it.

6.2.3  Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

- Matrix multiplication
- Dot product
- FFT (Fast Fourier Transform)
- IIR (Infinite Impulse Response)
- FIR (Finite Impulse Response)
- Vector math operations

This library is available here: ESP-DSP library.
6.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

ESP-MDF.

6.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera. To know more about the project, see ESP-WHO on GitHub.

6.2.6 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

ESP RainMaker on GitHub.

6.2.7 ESP-IoT-Solution

ESP-IoT-Solution contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

ESP-IoT-Solution on GitHub.
Chapter 7

Contributions Guide

We welcome contributions to the esp-idf project!

7.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

7.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it. Please check the Copyright Header Guide for additional information.
- Does any new code conform to the esp-idf Style Guide?
- Have you installed the pre-commit hook for esp-idf project?
- Does the code documentation follow requirements in Documenting Code?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” squashed into previous commits?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

7.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself. Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.
Chapter 7. Contributions Guide

7.4 Legal Part

Before a contribution can be accepted, you will need to sign our Contributor Agreement. You will be prompted for this automatically as part of the Pull Request process.

7.5 Related Documents

7.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared static.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. ie esp_vfs_register() or esp_console_run(). Starting the prefix with esp_ for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with s_ for easy identification. For example, static bool s_invert.
- Avoid unnecessary abbreviations (ie shortening data to dat), unless the resulting name would otherwise be very long.

Indentation       Use 4 spaces for each indentation level. Don’t use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space     Place one empty line between functions. Don’t begin or end a function with an empty line.

```c
void function1()
{
    do_one_thing();
    do_another_thing();
} // INCORRECT, don't place empty line here

void function2()
{
    // INCORRECT, don't use an empty line here
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }

    // place empty line here
```
The maximum line length is 120 characters as long as it doesn’t seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```c
if (condition) {  // correct
    // ...
}

switch (n) {      // correct
    case 0:
        // ...
}

for (int i = 0; i < CONST; ++i) {    // INCORRECT
    // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```c
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);       // correct
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);       // also okay
int y_cur = -y;
++y_cur;
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);       // INCORRECT
```

No space is necessary around . and -> operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```c
esp_rom_gpio_connect_in_signal(PIN_CAM_D6, I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7, I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. PIN_CAM_VSYNC), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

**Braces**

- Function definition should have a brace on a separate line:

  ```c
  // This is correct:
  void function(int arg)
  {
  }
  ```
Within a function, place opening brace on the same line with conditional and loop statements:

```c
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

Comments Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don’t use single comments to disable some functionality:

```c
void init_something()
{
    setup_dma();
    // load_resources(); // WHY is this thing commented, asks...--the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```c
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated...--yet.
    // load_resources();
    start_timer();
}
```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don’t use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.

- Don’t add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```c
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

Line Endings Commits should only contain files with LF (Unix style) endings.
Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. Github has a document about setting this option `<github-line-endings>`.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs --dos2unix &
& git commit -a --amend --no-edit --allow-empty' master
```

(Noted that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it’s possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code**

You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don’t re-format the code you didn’t change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**Type Definitions**

Should be snake_case, ending with _t suffix:

```
typedef int signed_32_bit_t;
```

**Enum**

Enums should be defined through the `typedef` and be namespaced:

```
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

**Assertions**

The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns false or 0 will call `abort()` and trigger a Fatal Error.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it’s not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an error value should be returned.

注解：When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` macro instead of an `assert()`.

It’s possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It’s also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:
int res = do_something();
assert(res == 0);

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```c
int res = do_something();
(void)res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```c
int res __attribute__((unused));
res = do_something();
assert(res == 0);
res = do_something_else();
assert(res != 0);
```

### Header file guards

All public facing header files should have preprocessor guards. A `#pragma` is preferred:

```
#pragma once
```

over the following pattern:

```c
#ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `#pragma once`, then any `#include` statements, then `extern "C"` guards:

```c
#pragma once
#include <stdint.h>

#ifdef __cplusplus
extern "Cplusplus extern "C" {
#endif
/* declarations go here */
#ifdef __cplusplus
}
#endif
```

### Include statements

When writing `#include` statements, try to maintain the following order:
Chapter 7. Contributions Guide

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as sys/queue.h)
- Common IDF headers (esp_log.h, esp_system.h, esp_timer.h, esp_sleep.h, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (#include <stdio.h>).
Use double quotes for all other headers (#include "esp_log.h").

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming  C++ Header files have the extension .hpp. C++ source files have the extension .cpp. The latter is important for the compiler to distinguish them from normal C source files.

Naming  
- Class and struct names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake_case.
- Namespaces shall be in lower snake_case.
- Templates are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix ...Interface. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes  In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```cpp
class ForExample {
public:
    // first constructors, then default constructor, then destructor
    ForExample(double example_factor_arg);
    ForExample();
    ~ForExample();

    // then remaining public methods
    set_example_factor(double example_factor_arg);

    // then public member variables
    uint32_t public_data_member;

private:
    // first private methods
    void internal_method();

    // then private member variables
    double example_factor;
};
```
Spacing

- Don’t indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```cpp
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>
namespace spaceships {

class SpaceShip {
public:
    SpaceShip(size_t crew);
    size_t get_crew_size() const;
private:
    const size_t crew;
};
class SpaceShuttle : public SpaceShip {
public:
    SpaceShuttle();
};
class Sojuz : public SpaceShip {
public:
    Sojuz();
};
template <typename T>
class CargoShip {
public:
    CargoShip(const T &cargo);
private:
    T cargo;
};
} // namespace spaceships
#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"
namespace spaceships {

// Putting the curly braces in the same line for constructors is OK if it only initializes
// values in the initializer list
SpaceShip::SpaceShip(size_t crew) : crew(crew) {
    size_t SpaceShip::get_crew_size() const
    {
        return crew;
    }
```

(下頁繼續)
SpaceShuttle::SpaceShuttle() : SpaceShip(7) {
    // doing further initialization
}

Sojuz::Sojuz() : SpaceShip(3) {
    // doing further initialization
}

template<typename T>
CargoShip<T>::CargoShip(const T &cargo) : cargo(cargo) {
} // namespace spaceships

CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don’t put anything in the optional parentheses after endforeach(), endif(), etc.
- Use lowercase (with underscores) for command, function, and macro names.
- For locally scoped variables, use lowercase (with underscores).
- For globally scoped variables, use uppercase (WITH_UNDERSCORES).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Documenting Code

Please see the guide here: Documenting Code.

Structure

To be written.

Language Features

To be written.

7.5.2 Install pre-commit Hook for ESP-IDF Project

Required Dependency

Python 3.6.1 or above. This is our recommendation python version for IDF developers.
If you still have python versions not compatible, please do not install pre-commit hook and update your python versions.

Install pre-commit

Run `pip install pre-commit`

Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you’re running `git commit` command

Uninstall pre-commit

Run `pre-commit uninstall`

What’s More?

For detailed usage, please refer to the documentation of `pre-commit`.

Common Problems For Windows Users

`/usr/bin/env: python: Permission denied.`

If you’re in Git Bash, please check the python executable location by run `which python`.

If the executable is under `~/AppData/Local/Microsoft/WindowsApps/`, then it’s a link to Windows AppStore, not a real one.

Please install python manually and update this in your `PATH` environment variable.

Your `%USERPROFILE%` contains non-ASCII characters

`pre-commit` may fail when initializing an environment for a particular hook when the path of `pre-commit`’s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running pre-commit.

- CMD: `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- PowerShell: `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- `git bash`: `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`

7.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in `espressif/esp-idf` repository and how to add new documentation.

Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance `@param`, into standard comments blocks, for example:

```
/**
 * @param ratio this is oxygen to air ratio
 */
```
Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.
2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.
3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.
4. If function has void input or does not return any value, then skip @param or @return

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member:

   /* !< how to documented members */

6. To provide well formatted lists, break the line after command (like @return in example below).

   @return
   ESP_OK if erase operation was successful
7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

Go one extra mile

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```c
/* @code{c}
 * // Example of using nvs_get_i32:
 * int32_t max_buffer_size = 4096; // default value
 * esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
 * assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
 * // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
 * // have its default value.
 * @endcode */
```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```c
/* @attention
 * 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
 * 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to...
 * --disconnect.
 */
```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /**@{*/ and /**@}*/* markup commands:

```c
/**@{*/
/**
 * @brief common description of similar functions
 */
void first_similar_function (void);
void second_similar_function (void); /**@}*/
```

For practical example see nvs_flash/include/nvs.h.

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within /** @cond */ and /** @endcond */ commands. Example of such implementation is provided in driver/include/driver/gpio.h.

5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.
6. Prepare one or more complete code examples together with description. Place description to a separate file README.md in specific folder of examples directory.

**Standardize Document Format**

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don’t break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

![Recommend: one line for one paragraph like below](image1)

![Don’t need to break lines here](image2)

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.

**Building Documentation**

The documentation is built with the esp-docs Python package, which is a wrapper around Sphinx.

To install it simply do:
pip install esp-docs

After a successful install then the documentation can be built from the docs folder with:

```bash
build-docs build
```

or for specific target and language with:

```bash
build-docs -t esp32 -l en build
```

For more in-depth documentation about esp-docs features please see the esp-doc documentation.

Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

Related Documents

- API Documentation Template

7.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制到本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- `main` 目录需要包含一个名为 `(something)_example_main.c` 的源文件，里面包含示例项目的主要功能。
- 如果该示例项目包含子任务较多，请根据逻辑将其拆分为 `main` 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 `components` 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 `components` 目录中，使其成为 ESP-IDF 的一部分。
7.5.5 API Documentation Template

注解：INSTRUCTIONS

1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using ..include::
   - README.rst
   - example.rst
   - ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

注解：INSTRUCTIONS

1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.
3. To distinguish between sections, use the following heading levels:
   - # with overline, for parts
   - * with overline, for chapters
Application Example

1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in esp-idf/examples/ folder.
3. Place example in this folder complete with README.md file.
4. Provide overview of demonstrated functionality in README.md.
5. With good overview reader should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in esp-idf/examples/.

API Reference

1. This repository provides for automatic update of API reference documentation using code markup retrieved by Doxygen from header files.
2. Update is done on each documentation build by invoking Sphinx extension: esp_extensions/run_doxygen.py for all header files listed in the INPUT statement of docs/doxygen/Doxyfile.
3. Each line of the INPUT statement (other than a comment that begins with ##) contains a path to header file *.h that will be used to generate corresponding *.inc files:

```bash
## Wi-Fi - API Reference
##
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

1. When the headers are expanded, any macros defined by default in sdkconfig.h as well as any macros defined in SOC-specific include/soc/*_caps.h headers will be expanded. This allows the headers to include/exclude material based on the IDF_TARGET value.
2. The *.inc files contain formatted reference of API members generated automatically on each documentation build. All *.inc files are placed in Sphinx _build directory. To see directives generated for e.g. esp_wifi.h, run python gen-dxd.py esp32/include/esp_wifi.h.
3. To show contents of *.inc file in documentation, include it as follows:

```rst
.. include-build-file:: inc/esp_wifi.inc
```

For example see docs/en/api-reference/network/esp_wifi.rst

1. Optionally, rather that using *.inc files, you may want to describe API in you own way. See docs/en/api-guides/ulp.rst for example.
   Below is the list of common .. doxygen... directives:
   * Functions - .. doxygenfunction:: name_of_function
7.5.6 Contributor Agreement

Individual Contributor Non-Exclusive License Agreement

including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ( “We” or “Us”).
The purpose of this contributor agreement ( “Agreement”) is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at CONTRIBUTING.rst

1. DEFINITIONS

“You” means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

“Contribution” means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at marius.vikhammer@espressif.com.

“Copyright” means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

“Material” means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

“Submit” means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as “Not a Contribution.”

“Submission Date” means the date You Submit a Contribution to Us.

“Documentation” means any non-software portion of a Contribution.

2. LICENSE GRANT

2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

• to publish the Contribution,
• to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
• to reproduce the Contribution in original or modified form,
• to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. PATENTS 3.1 Patent License
Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License
You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER THE CONTRIBUTION IS PROVIDED “AS IS”. MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term 7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous 8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.
8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

You

7.5.7 Copyright Header Guide

ESP-IDF is released under the Apache License 2.0 with some additional third-party copyrighted code released under various licenses. For further information please refer to the list of copyrights and licenses.

This page explains how the source code should be properly marked with a copyright header. ESP-IDF uses The Software Package Data Exchange (SPDX) format which is short and can be easily read by humans or processed by automated tools for copyright checks.

How to Check the Copyright Headers

Please make sure you have installed the pre-commit hooks which contain a copyright header checker as well. The checker can suggest a header if it is not able to detect a properly formatted SPDX header.

What if the Checker’s Suggestion is Incorrect?

No automated checker (no matter how good is) can replace humans. So the developer’s responsibility is to modify the offered header to be in line with the law and the license restrictions of the original code on which the work is based on. Certain licenses are not compatible between each other. Such corner cases will be covered by the following examples.

Common Examples of Copyright Headers

The simplest case is when the code is not based on any licensed previous work, e.g. it was written completely from scratch. Such code can be decorated with the following copyright header and put under the license of ESP-IDF:
Less restrictive parts of ESP-IDF  Some parts of ESP-IDF are deliberately under less restrictive licenses in order to ease their re-use in commercial closed source projects. This is the case for ESP-IDF examples which are in Public domain or under the Creative Commons Zero Universal (CC0) license. The following header can be used in such source files:

```c
/*
 * SPDX-FileCopyrightText: 2015-2021 Espressif Systems (Shanghai) CO LTD
 * SPDX-License-Identifier: Apache-2.0
 */
```

Third party licenses  Code licensed under different licenses, modified by Espressif Systems and included in ESP-IDF cannot be licensed under Apache License 2.0 not even if the checker suggests it. It is advised to keep the original copyright header and add an SPDX before it.

The following example is a suitable header for a code licensed under the “GNU General Public License v2.0 or later” held by John Doe with some additional modifications done by Espressif Systems:

```c
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 * SPDX-License-Identifier: GPL-2.0-or-later
 * SPDX-FileContributor: 2019-2021 Espressif Systems (Shanghai) CO LTD
 */
```

The licenses can be identified and the short SPDX identifiers can be found in the official SPDX license list. Other very common licenses are the GPL-2.0-only, the BSD-3-Clause, and the BSD-2-Clause.
Chapter 8

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 master 分支。如有量产需求，请使用稳定版本。

8.1 发布版本

您可以通过以下链接访问各个版本的配套文档:

ESP-IDF 在 GitHub 平台上的完整发布历史请见发布说明页面。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

8.2 我该选择哪个版本？

- 如有量产需求，请使用最新稳定版本，稳定版本已通过人工测试，后续更新仅修复 bug，主要特性不受影响（更多详情，请见版本管理）。请访问发布说明页面界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的新特性，请使用最新版本（即 master 分支上）。最新版本包含 ESP-IDF 的所有新特性，已通过自动化测试，但尚未全部完成人工测试（因此存在一定风险）。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 master 分支更新的影响，您可以将一个最适合您的稳定版本更新至一个预发布版本或更新至一个发布分支。

有关如何更新 ESP-IDF 本地副本的内容，请参考更新 ESP-IDF 章节。

8.3 版本管理

ESP-IDF 采用了语义版本管理方法，即您可以从字面含义理解每个版本的差异。其中
- 主要版本（例 v3.0）代表有重大更新，包括增加新特性、改变现有特性及移除已废弃的特性。
  - 升级至一个新的主要版本（例 v2.1 升级至 v3.0）意味着您可能需要更新您的工程代码，并重新测试您的工程。具体可参考发布说明页面的重亮变化（Breaking Change）部分。
- 次要版本（例 v3.1）代表有新增特性和 bug 修复，但现有特性不受影响，公开 API 的使用也不受影响。
  - 升级至一个新的次要版本（例 v3.0 升级至 v3.1）意味着您可能不需要更新您的工程代码，但需重新测试您的工程。特别是发布说明页面中专门提到的部分。
- Bugfix 版本（例 v3.0.1）仅修复 bug，并不增加任何新特性。
  - 升级至一个新的 Bugfix 版本（例 v3.0 升级至 v3.0.1）意味着您不需要更新您的工程代码，仅需测试与本次发布修复 bug（列表见发布说明页面）直接相关的特性。
8.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

支持期限政策 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

发布说明页面 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 GitHub 账号，请点击 发布说明页面 界面右上角的 “Watch” 按键，并选中 “Releases only” 选项。GitHub 将会在新版本发布的时候通知您。当您所使用的版本有 Bugfix 版本发布时，请做好升级至该 Bugfix 版本的规划。
- 如可能，请定期（如每年一次）将项目的 IDF 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日算起。

在支持期限内意味着 ESP-IDF 团队将继续在 GitHub 的发布分支上进行 bug 修复、安全修复等，并根据需要定期发布新的 Bugfix 版本。

支持期限分为“服务期”和“维护期”：

<table>
<thead>
<tr>
<th>周期</th>
<th>时长</th>
<th>是否推荐新工程使用</th>
</tr>
</thead>
<tbody>
<tr>
<td>服务期</td>
<td>12 个月</td>
<td>是</td>
</tr>
<tr>
<td>维护期</td>
<td>18 个月</td>
<td>否</td>
</tr>
</tbody>
</table>

在服务期内，Bugfix 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 bug 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 bug 修复。

支持期限不包括预发布版本（betas、预览版、-rc 和 -dev 版等），有时会将某个特性在发布版中标记为 “预览版” 这意味着该特性也不在支持期限内。

关于 不同版本的 ESP-IDF（主要版本、次要版本、Bugfix 版本等）的更多信息，请参考 ESP-IDF 编程指南。
### 8.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 idf.py 命令:

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 IDF_VER 查看 ESP-IDF 的版本 (以字符串的格式)。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本。请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 `compile-time macros` 检查版本。

几个 ESP-IDF 版本的例子:

<table>
<thead>
<tr>
<th>版本字符串</th>
<th>含义</th>
</tr>
</thead>
</table>
| v3.2-dev-306-gbeb3611ca              | master 分支上的预发布版本。
|                                      | - v3.2-dev: 为 v3.2 进行的开发。                                    |
|                                      | - 306: v3.2 开发启动后的 commit 数量。                             |
|                                      | - beb3611ca: commit 标识符。                                      |
| v3.0.2                               | 稳定版本，标签为 v3.0.2。                                        |
| v3.1-beta1-75-g346d6b0ea             | v3.1 的 beta 测试版本 (可参考更新至一个发布分支)。
|                                      | - v3.1-beta1: 预发布标签。                                         |
|                                      | - 75: 添加预发布 beta 标签后的 commit 数量。                        |
|                                      | - 346d6b0ea: commit 标识符。                                      |
| v3.0.1-dirty                         | 稳定版本，标签为 v3.0.1。                                         |
|                                      | - dirty 代表 ESP-IDF 的本地副本有修改。                           |
8.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下：

- 新的改动总是在 master 分支（最新版本）上进行。master 分支上的 ESP-IDF 版本总带有 -dev 标签，表示“正在开发中”，例 v3.1-dev。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 master 分支上进行）并达到进入 beta 测试的标准，则将该版本切换至一个新分支（例 release/v3.1）。此外，该分支还打上预发布标签（例 v3.1-beta1）。您可以在 GitHub 平台上查看 ESP-IDF 的完整 分支列表 和 标签列表。Beta 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 beta 版本的不断测试，bug 修复将同时增加至该发布分支和 master 分支。而且，master 分支可能也已经开始为下个版本开发新特性了。
- 当测试快结束时，该发布分支上将增加一个 rc 标签，代表候选发布（Release Candidate），例 v3.1-rc1。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 bug，则该预发布版本将最终增加“主要版本”（例 v4.0）或“次要版本”标记（例 v3.1），成为正式发布版本，并体现在 发布说明页面。
- 后续，该版本中发现的 bug 都将在该发布分支上进行修复。人工测试完成后，该分支将增加一个 Bugfix 版本标签（例 v3.1.1），并体现在 发布说明页面。

8.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考更新至一个稳定发布版本。
- 如需测试研发/尝试最新特性，建议参考更新至 master 分支。
- 两者折衷建议参考更新至一个发布分支。

注解：在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考 入门指南 中的介绍。

8.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 发布说明页面，了解最新发布情况。
- 如有新发布的 Bugfix 版本（例 v3.0.1 或 v3.0.2）时，请将新的 Bugfix 版本更新至您的 ESP-IDF 目录：

```bash
cd $IDF_PATH
git fetch
git checkout vX.Y.Z
git submodule update --init --recursive
```

- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上方描述一致。

注解：如果您之前在安装 ESP-IDF 时使用了 zip 文件包，而非通过 Git 命令，则您将无法使用 git 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 zip 文件包，并替换掉之前 IDF_PATH 下的全部内容。
8.7.2 更新至一个预发布版本

您也可以将您的本地副本切换（命令 `git checkout`）至一个预发布版本或 rc 版本，具体方法请参考更新至一个稳定发布版本 中的描述。

预发布版本通常不体现在 发布说明页面。更多详情，请查看完整 标签列表。使用预发布版本的注意事项，请参考更新至一个发布分支 中的描述。

8.7.3 更新至 master 分支

注解：ESP-IDF 中 master 分支上的代码会时时更新，因此使用 master 分支相当在 “流血的边缘试探”，存在一定风险。

如需使用 ESP-IDF 的 master 分支，请参考以下步骤：

- 本地切换至 master 分支：
  ```
  cd $IDF_PATH
  git checkout master
  git pull
  git submodule update --init --recursive
  ```

- 此外，您还应在后续工作中不时使用 `git pull` 命令，将远端 master 上的更新同步到本地。注意，在更新 master 分支后，您可能需要更改工程代码，也可能遇到新的 bug。
- 如需从 master 分支切换至一个发布分支或稳定版本，请使用 `git checkout` 命令。

重要：强烈建议您定期使用 `git pull` 和 `git submodule update --init --recursive` 命令，确保本地副本的及时更新。旧的 master 分支相当于一个 “快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考更新至一个发布分支。

8.7.4 更新至一个发布分支

从稳定性来说，使用 “发布分支” 相当于在使用 master 分支和稳定版本之间进行折衷，包含一些 master 分支上的新特性，但同时也保证可通过 beta 测试且基本完成了 bug 修复。

更多详情，请前往 GitHub 查看完整 标签列表。

举例，您可以关注 ESP-IDF v3.1 分支，随时关注该分支上的 Bugfix 版本发布（例 v3.1.1 等）：

```
  cd $IDF_PATH
  git fetch
  git checkout release/v3.1
  git pull
  git submodule update --init --recursive
```

您每次在该分支上使用 `git pull` 时都相当于把最新的 Bugfix 版本发布更新至您的本地副本中。

注解：发布分支并不会有关的配套文档，建议您使用与本分支最接近版本的文档。
Chapter 9

资源

9.1 PlatformIO

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF. Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

9.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

9.1.2 Installation

• PlatformIO IDE is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
• PlatformIO Core (CLI) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services
9.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

9.1.4 Tutorials

- ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

9.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation.

9.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about integrations with other IDEs/Text Editors
- Get help from PlatformIO community

9.2 有用的链接

- 您可以在 ESP32 论坛 中提出您的问题，访问社区资源。
- 您可以通过 GitHub 的 Issues 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 Issues。
- 您可以在 ESP IoT Solution 库中找到基于 ESP-IDF 的解决方案、应用实例、组件和驱动等内容。多数文档均提供中英文版本。
- 通过 Arduino 平台开发应用，请参考 ESP32 Wi-Fi 芯片的 Arduino 内核。
- 关于 ESP32 的书籍列表，请查看 乐鑫 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅 Contributions Guide。
- 关于 ESP32 的其它信息，请查看官网 文档 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 下载。
Chapter 10

Copyrights and Licenses

10.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2021 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

Some examples use external components which are not Apache licensed, please check the copyright description in each example source code.

10.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- **Newlib** is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensa header files** are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of **FreeRTOS** (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in license.txt.
- Original parts of **LWIP** (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.
- **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- **FreeBSD net80211** Copyright (c) 2004-2008 Sam Leffler, Erno Consulting and licensed under the BSD license.
- **JSMN JSON Parser** (components/jsmn) Copyright (c) 2010 Serge A. Zaitsev and licensed under the MIT license.
- **argtable3** argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license.
- **linenoise** line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- **libcoap** COAP library Copyright (c) 2010-2017 Olaf Bergmann and others, is licensed under 2-clause BSD license as described in LICENSE file and COPYING file.
- **libexpat** XML parsing library Copyright (c) 1998-2000 Thai Open Source Software Center Ltd and Clark Cooper, Copyright (c) 2001-2017 Expat maintainers, is licensed under MIT license as described in COPYING file.
- **FatFS** library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license.
- **cJSON** library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file.
Chapter 10. Copyrights and Licenses

- **libsodium** library, Copyright (c) 2013-2018 Frank Denis, is licensed under ISC license as described in LICENSE file.
- **micro-ecc** library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
- **nghttp2** library, Copyright (c) 2012, 2014, 2015, 2016 Tatsuhiro Tsujikawa, Copyright (c) 2012, 2014, 2015, 2016 nghttp2 contributors, is licensed under MIT license as described in COPYING file.
- **Mbed TLS** library, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in LICENSE file.
- **SPIFFS** library, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in LICENSE file.
- **TinyCBOR** library, Copyright (c) 2017 Intel Corporation, is licensed under MIT License as described in LICENSE file.
- **SD/MMC driver** is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
- **Asio**, Copyright (c) 2003-2018 Christopher M. Kohlhoff is licensed under the Boost Software License as described in COPYING file.
- **ESP-MQTT** MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM <tuannpm at live dot com> is licensed under Apache License 2.0 as described in LICENSE file.
- **BLE Mesh** is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
- **mynewt-nimble** Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in LICENSE file.
- **cryptoauthlib** Microchip CryptoAuthentication Library - Copyright (c) 2015 - 2018 Microchip Technology Inc, is licensed under common Microchip software License as described in LICENSE file.
- **TLSF allocator** Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD license.
- **qrcode** QR Code generator library Copyright (c) Project Nayuki, is licensed under MIT license.
- **openthead**, Copyright (c) The OpenThread Authors, is licensed under BSD License as described in LICENSE file.
- **UBSAN runtime** —Copyright (c) 2016, Linaro Limited and Jiří Zárevůcky, licensed under the BSD 2-clause license.

### 10.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- **esptool.py** is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in LICENSE file.
- **KConfig** is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

### 10.1.3 Documentation

- HTML version of the **ESP-IDF Programming Guide** uses the Sphinx theme sphinx_idf_theme, which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on sphinx_rtd_theme. Both are licensed under MIT license.

### 10.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

- **Newlib**, licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensalibhal**, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- **TinyBasic** Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
• **miniz**, by Rich Geldreich - placed into the public domain.
• **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
• **TJpgDec** Copyright (C) 2011, ChaN, all right reserved. See below for license.

### 10.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 10.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED “AS IS”, WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

### 10.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

• The TJpgDec module is a free software and there is NO WARRANTY.
• No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
• Redistributions of source code must retain the above copyright notice.
Chapter 11

关于本指南

本指南为乐鑫公司 ESP32 官方应用开发框架 ESP-IDF 的配套文档。
ESP32 芯片是一款 2.4 GHz Wi-Fi 和蓝牙双模芯片，内置 1 或 2 个 Xtensa® 32 位 LX6 处理器，运算能力最高可达 600 DMIPS。

图 1: 乐鑫物联网综合开发框架

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32 应用程序提供工具链、API、组件和工作流程的支持。
Chapter 12

切换语言

《ESP-IDF 编程指南》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- 英文
- 中文

如下图所示，如果该文档两种语言版本均具备，您可以通过点击文档上方的语言链接轻松进行语言切换。

Fatal Errors

[中文]

Overview

In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:

- genindex
ADC2_CHANNEL_1_GPIO_NUM (C 宏), 637
_ADC_NETIF_SUPPRESS_LEGACY_WARNING_(C 宏), 637
_XFER_2_RD (C 宏), 1024
_XFER_2_WR (C 宏), 1024
_XFER_4_RD (C 宏), 1024
_XFER_4_WR (C 宏), 1024
[anonymous] (C++ enum), 128, 358
A
ADC1_CHANNEL_0 (C++ enumerator), 657
ADC1_CHANNEL_0_GPIO_NUM (C 宏), 660
ADC1_CHANNEL_1 (C++ enumerator), 657
ADC1_CHANNEL_1_GPIO_NUM (C 宏), 660
ADC1_CHANNEL_1_GPIO_NUM (C 宏), 660
ADC1_CHANNEL_2 (C++ enumerator), 657
