1 快速入门 .......................... 3
  1.1 概述 .................................. 3
  1.2 准备工作 .......................... 3
  1.3 开发板简介 .......................... 4
     1.3.1 ESP32-DevKitC V4 入门指南 .......... 4
     1.3.2 ESP-WROVER-KIT V4.1 入门指南 .......... 10
     1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南 .......... 35
     1.3.4 ESP32-Ethernet-Kit V1.2 入门指南 .......... 45
     1.3.5 ESP32-DevKitS(-R) .......................... 71
     1.3.6 ESP32-PICO-KIT-1 .......................... 77
     1.3.7 ESP32-PICO-DevKitM-2 .......................... 82
     1.3.8 ESP32-DevKitM-1 .......................... 87
  1.4 详细安装步骤 .......................... 91
     1.4.1 设置开发环境 .......................... 92
     1.4.2 创建您的第一个工程 .......................... 92
  1.5 第一步：安装准备 .......................... 92
     1.5.1 Windows 平台工具链的标准设置 .......... 92
     1.5.2 Linux 平台工具链的标准设置 .......... 96
     1.5.3 macOS 平台工具链的标准设置 .......... 97
  1.6 第二步：获取 ESP-IDF .......................... 99
     1.6.1 Linux 和 macOS 操作系统 .......................... 99
     1.6.2 Windows 操作系统 .......................... 99
  1.7 第三步：设置工具 .......................... 99
     1.7.1 Windows 操作系统 .......................... 99
     1.7.2 Linux 和 macOS 操作系统 .......................... 99
     1.7.3 下载工具安装包 .......................... 100
     1.7.4 自定义工具安装路径 .......................... 100
  1.8 第四步：设置环境变量 .......................... 100
     1.8.1 Windows 操作系统 .......................... 100
     1.8.2 Linux 和 macOS 操作系统 .......................... 101
  1.9 第五步：开始创建工程 .......................... 101
     1.9.1 Linux 和 macOS 操作系统 .......................... 101
     1.9.2 Windows 操作系统 .......................... 101
  1.10 第六步：连接设备 .......................... 102
  1.11 第七步：配置 .......................... 102
     1.11.1 Linux 和 macOS 操作系统 .......................... 102
     1.11.2 Windows 操作系统 .......................... 102
  1.12 第八步：编译工程 .......................... 102
  1.13 第九步：烧录到设备 .......................... 103
     1.13.1 烧录过程中可能遇到的问题 .......................... 104
     1.13.2 常规操作 .......................... 104
  1.14 第十步：监视器 .......................... 105
  1.15 更新 ESP-IDF .......................... 106
  1.16 相关文档 .......................... 106

4 API 指南 1707
4.1 应用层跟踪库 .......................................................... 1707
4.1.1 概述 ............................................................... 1707
4.1.2 运行模式 .......................................................... 1707
4.1.3 配置选项与依赖项 ................................................. 1707
4.1.4 如何使用这个库 .................................................. 1708
4.2 应用程序的启动流程 .................................................. 1716
4.2.1 一级引导程序 .................................................... 1717
4.2.2 二级引导程序 .................................................... 1717
4.2.3 应用程序启动阶段 ................................................ 1717
4.3 BluFi ................................................................. 1719
4.3.1 概览 ............................................................... 1719
4.3.2 BluFi 流程 ........................................................ 1720
4.3.3 BluFi 流程图 ...................................................... 1720
4.3.4 BluFi 中定义的帧格式 .......................................... 1720
4.3.5 ESP32 嵌的安全实现 ............................................. 1724
4.3.6 GATT 相关说明 ................................................... 1725
4.4 引导加载程序 (Bootloader) ........................................... 1725
4.4.1 引导加载程序兼容性 .............................................. 1725
4.4.2 日志级别 ........................................................ 1726
4.4.3 恢复出厂设置 .................................................... 1726
4.4.4 从测试固件启动 .................................................. 1727
4.4.5 回滚 .............................................................. 1727
4.4.6 看门狗 ........................................................... 1727
4.4.7 引导加载程序大小 ............................................... 1728
4.4.8 从深度睡眠中快速启动 ....................................... 1728
4.4.9 自定义引导加载程序 ........................................... 1728
4.5 构建系统（CMake 版） ............................................... 1728
4.5.1 概述 ............................................................... 1728
4.5.2 使用构建系统 ..................................................... 1729
4.5.3 示例项目 ........................................................ 1732
4.5.4 项目 CMakeLists 文件 ......................................... 1733
4.5.5 组件 CMakeLists 文件 ......................................... 1734
4.5.6 组件配置 ........................................................ 1736
4.5.7 预处理器定义 .................................................... 1737
4.5.8 组件依赖 ........................................................ 1737
4.5.9 组件 CMakeLists 示例 ......................................... 1742
4.5.10 自定义 sdkconfig 的默认值 ................................... 1745
4.5.11 Flash 参数 ........................................................ 1746
4.5.12 构建 Bootloader ................................................ 1746
4.5.13 选择目标芯片 ................................................... 1746
4.5.14 编写纯 CMake 组件 ............................................. 1747
4.5.15 组件中使用第三方 CMake 项目 ............................... 1747
4.5.16 组件中使用预建库 .............................................. 1748
4.5.17 在自定义 CMake 项目中使用 ESP-IDF ....................... 1748
4.5.18 ESP-IDF CMake 构建系统 API ............................... 1749
4.5.19 文件配置 & 增量构建 .......................................... 1752
4.5.20 构建系统的元数据 .............................................. 1753
4.5.21 构建系统内部 ................................................... 1753
4.5.22 从 ESP-IDF GNU Make 构建系统迁移到 CMake 构建系统 1755

4.6 Deep Sleep Wake Stubs ................................................. 1756
4.6.1 Rules for Wake Stubs .............................................. 1756
4.6.2 Implementing A Stub ............................................. 1756
4.6.3 Loading Code Into RTC Memory .................................. 1757
4.6.4 Loading Data Into RTC Memory .............................................. 1757
4.7 错误处理 ................................................................. 1758
  4.7.1 概述 ................................................................. 1758
  4.7.2 错误码 ................................................................. 1758
  4.7.3 错误码到错误消息 .................................................. 1758
  4.7.4 ESP_ERROR_CHECK 宏 ................................................. 1759
  4.7.5 ESP_ERROR_CHECK WITHOUT_ABORT 宏 .................. 1759
  4.7.6 ESP_RETURN_ON_ERROR 宏 ........................................... 1759
  4.7.7 ESP_GOTO_ON_ERROR 宏 ............................................. 1759
  4.7.8 ESP_RETURN_ON_FALSE 宏 .......................................... 1759
  4.7.9 ESP_GOTO_ON_FALSE 宏 ............................................. 1760
  4.7.10 CHECK 宏使用示例 ................................................. 1760
  4.7.11 错误处理模式 ..................................................... 1760
  4.7.12 C++ 异常 ........................................................... 1761
4.8 ESP-BLE-MESH ............................................................ 1761
  4.8.1 概述 ................................................................. 1761
  4.8.2 ESP-BLE-MESH 快速入门 ........................................... 1762
  4.8.3 ESP-BLE-MESH 示例 .................................................. 1769
  4.8.4 ESP-BLE-MESH 演示视频 .......................................... 1769
  4.8.5 ESP-BLE-MESH 常见问题手册 .................................... 1769
  4.8.6 相关文档 ........................................................... 1769
4.9 ESP-WIFI-MESH .......................................................... 1795
  4.9.1 概述 ................................................................. 1795
  4.9.2 简介 ................................................................. 1796
  4.9.3 ESP-WIFI-MESH 概念 ............................................... 1797
  4.9.4 建立网络 ........................................................... 1801
  4.9.5 管理网络 ........................................................... 1806
  4.9.6 数据传输 ........................................................... 1808
  4.9.7 信道切换 ........................................................... 1811
  4.9.8 性能 ................................................................. 1813
  4.9.9 更多注意事项 .................................................... 1814
4.10 Core Dump .............................................................. 1814
  4.10.1 Overview .......................................................... 1814
  4.10.2 Configurations ...................................................... 1814
  4.10.3 Save core dump to flash .......................................... 1815

Chapter 1

快速入门

本文档旨在指导用户搭建 ESP32 硬件开发的软件环境。通过一个简单的示例展示如何使用 ESP-IDF (Espressif IoT Development Framework) 配置菜单，并编译、下载固件至 ESP32 开发板等步骤。

注解：这是 ESP-IDF master 分支（最新版本）的文档，该版本在持续开发中。还有 Stable version 的文档，以及其他版本的文档 ESP-IDF 版本简介 供参考。

1.1 概述

ESP32 SoC 芯片支持以下功能：

- 2.4 GHz Wi-Fi
- 蓝牙
- 高性能 Xtensa® 32 位 LX6 双核处理器
- 超低功耗协处理器
- 多种外设

ESP32 采用 40 nm 工艺制成，具有最佳的功耗性能、射频性能、稳定性和通用性和可靠性，适用于各种应用场景和不同功耗需求。

乐鑫为用户提供完整的软、硬件资源，进行 ESP32 硬件设备的开发。其中，乐鑫的软件开发环境 ESP-IDF 旨在协助用户快速开发物联网 (IoT) 应用，可满足用户对 Wi-Fi、蓝牙、低功耗等方面的要求。

1.2 准备工作

硬件:

- 一款 ESP32 开发板
- USB 数据线 (A 转 Micro-B)
- 电脑（Windows、Linux 或 Mac OS）

软件:

您可以选择下载并手动安装以下软件:

- 设置 工具链，用于编译 ESP32 代码；
- 编译构建工具——CMake 和 Ninja 编译构建工具，用于编译 ESP32 应用程序；
- 获取 ESP-IDF 软件开发框架。该框架已经基本包含 ESP32 使用的 API（软件库和源代码）和运行工具链的脚本；

或者，您也可以通过以下集成开发环境 (IDE) 中的官方插件完成安装流程：

- Eclipse 插件 (安装)
Chapter 1. 快速入门

- VS Code 插件 (安装)

图 1: ESP32 应用程序开发

1.3 开发板简介

请点击下方链接，了解有关开发板的详细信息。

1.3.1 ESP32-DevKitC V4 入门指南

本指南介绍了如何开始使用 ESP32-DevKitC V4 开发板。

准备工作

- ESP32-DevKitC V4 开发板
- USB A / micro USB B 数据线
- PC (Windows、Linux 或 Mac OS)

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述

ESP32-DevKitC V4 是 乐鑫 一款基于 ESP32 的小型开发板。板上模组的绝大部分管脚均已引出，开发人员可根据实际需求，轻松通过跳线连接多种外围器件，或将开发板插在面包板上使用。

为了更好地满足不同用户需求，ESP32-DevKitC V4 还支持以下不同配置:
• 可选多款 ESP32 模组
  – ESP32-WROOM-32E
  – ESP32-WROOM-32UE
  – ESP32-WROOM-32D
  – ESP32-WROOM-32U
  – ESP32-SOLO-1
  – ESP32-WROVER-E
  – ESP32-WROVER-IE
  – ESP32-WROOM-DA
• 可选排针或排母
详情请见乐鑫产品选型工具。

功能说明

ESP32-DevKitC V4 开发板的主要组件、接口及控制方式见下。

</table>

图 2: ESP32-DevKitC V4（板载 ESP32-WROOM-32）

注解：管脚 D0, D1, D2, D3, CMD 和 CLK 用于 ESP32 芯片与 SPI flash 间的内部通信，集中分布在开发
板两侧靠近 USB 端口的位置。通常而言，这些管脚最好不连，否则可能影响 SPI flash / SPI RAM 的工作。

**注解：**管脚 GPIO16 和 GPIO17 仅适用于板载 ESP32-WROOM 系列和 ESP32-SOLO-1 的开发板，保留内部使用。

**电源选项**

开发板可从以下三种供电方式中任选其一:

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

**警告：**上述供电模式 不可同时连接，否则可能会损坏开发板和/或电源。

**排针**

下列表出了开发板两侧排针（J1 和 J3）的名称和功能，排针名称如图 ESP32-DevKitC V4（板载 ESP32-WROOM-32）中所示，排针编号与 ESP32-DevKitC V4 原理图 (PDF) 一致。

有关 C15 的提示

较早版本 ESP32-DevKitC 开发板上的 C15 可能存在以下问题：

- 开发板上电后可能进入下载模式；
- 如果用户通过 GPIO 输出时钟，C15 可能会影响信号。

用户如果认为 C15 可能影响开发板的使用，则可以将 C15 完全移除。C15 在开发板上的具体位置见下图黄色部分。

![图 4: C15（黄色）在 ESP32-DevKitC V4 开发板上的位置](image)

应用程序开发

ESP32-DevKitC V4 上电前，请首先确认开发板完好无损。

现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

开发板尺寸

1.3.2 ESP-WROVER-KIT V4.1 入门指南

本指南介绍了如何开始使用 ESP-WROVER-KIT V4.1 开发板及其功能和相关配置。

准备工作

- ESP-WROVER-KIT V4.1 开发板
- USB 2.0 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 Mac OS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述

ESP-WROVER-KIT 是乐鑫一款基于 ESP32 的开发板。

ESP-WROVER-KIT 开发板已集成了如下组件：

- ESP32-WROOM-32 模组
- LCD 屏
- MicroSD 卡槽

此外, ESP-WROVER-KIT 的独特之处在于集成了一个先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

注释: ESP32 的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述

ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。
图 6: ESP-WROVER-KIT 功能框图

图 7: ESP-WROVER-KIT 开发板布局—俯视图
图 8: ESP-WROVER-KIT 开发板布局—仰视图

功能说明

ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表将从图片右上角开始，以顺时针顺序介绍图 1 中的主要组件，然后按同样顺序介绍图 2 中的主要组件。
## 主要组件

<table>
<thead>
<tr>
<th>组件</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>FT2232</td>
<td>多协议 USB 转串口桥接器。开发人员可通过 USB 接口对 FT2232 芯片进行控制和编程。与 ESP32 建立连接。FT2232 芯片可在通道 A 提供 USB-to-JTAG 接口功能，并在通道 B 提供 USB-to-Serial 接口功能。便利开发人员的应用开发与调试，详见 ESP-WROVER-KIT V4.1 原理图。</td>
</tr>
<tr>
<td>32.768 kHz</td>
<td>32.768 kHz 晶振，可提供 Deep-sleep 下使用的低功耗时钟。</td>
</tr>
<tr>
<td>0 欧电阻</td>
<td>ESP-WROVER-KIT 开发板设计了一个 0 欧电阻，可在测量 ESP32 系列模组在不同功耗模式下的电流量时，直接移除或替换为分流器。</td>
</tr>
<tr>
<td>ESP32-WROVER-E 模组</td>
<td>这款 ESP32 模组内置 64-Mbit PSRAM，可提供灵活的额外存储空间和数据处理能力。</td>
</tr>
<tr>
<td>诊断 LED 信号灯</td>
<td>本开发板 FT2232 芯片的 GPIO 管脚连接了 4 个红色 LED 信号灯，以便启动。</td>
</tr>
<tr>
<td>UART</td>
<td>串口。FT2232 和 ESP32 的串行 TX/RX 信号已引出至 JP2 的两端。默认情况下，这两路信号由跳线帽连接。如果仅需使用 ESP32 模组串口，则可移除相关跳线帽，将模组连接至其他外部串口设备。</td>
</tr>
<tr>
<td>SPI</td>
<td>默认情况下 ESP32 使用 SPI 接口访问内嵌 flash 和 PSRAM。使用这些引脚连接 ESP32 和其他 SPI 设备。这种情况下，需增加额外的片选 (CS) 信号。注 本接口的工作电压为 3.3 V。</td>
</tr>
<tr>
<td>CTS/RTS</td>
<td>串口流量控制信号。管脚默认不连接至电路。为了使能该功能，必须用跳线帽断掉 JP14 的相应管脚。</td>
</tr>
<tr>
<td>JTAG</td>
<td>JTAG 插口。FT2232 和 ESP32 的 JTAG 信号已引出至 JP2 的两端。默认情况下，这两路信号不连接。如需使能 JTAG，请按照设置选项的介绍，连接跳线帽。</td>

ESP32 管脚分配

ESP32 模组的部分管脚/端口已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可用作他用。比如，摄像头/JP4 排针未连接相应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用。比如 GPIO0 和 GPIO2。由于管脚限制，一些外设设备不可同时使用。比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的卡检测信号。如无需使用卡检测功能，开发人员还可以通过移除 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

### 主要 I/O 连接器 / JP1

JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间 “I/O” 列的介绍。两侧的“共用” 列则介绍了这些管脚在板上的其他用途。

说明:

- NC/XTAL - 32.768 kHz 晶振
- JTAG - JTAG / JP2
- Boot - Boot 按键 / SW2
- 摄像头 - 摄像头 / JP4
- LED - RGB LED
- MicroSD - MicroSD Card / J4
- LCD - LCD / U5
- PSRAM - ESP32-WROVER-E 的 PSRAM

#### 32.768 kHz 晶振

<table>
<thead>
<tr>
<th></th>
<th>ESP32 管脚</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>GPIO32</td>
</tr>
<tr>
<td>2.</td>
<td>GPIO33</td>
</tr>
</tbody>
</table>

### 注解：默认情况下，管脚 GPIO32 和 GPIO33 已连接至晶振。因此，为了保证信号的完整性，这两个管脚并未连接至 JP1 I/O 连接器。用户可通过将 R11/R23 处的 0 欧电阻移至 R12/R24 处，以将 GPIO32 和
GPIO33 的连接从晶振移至 JP1。

### SPI Flash / JP2

<table>
<thead>
<tr>

</tr>
<tr>
<td>5.</td>
<td>SD3 / GPIO10</td>
<td></td>
</tr>
<tr>
<td>6.</td>
<td>CMD / GPIO11</td>
<td></td>
</tr>
</tbody>
</table>

**重要：** 模组的 flash 总线已通过 0 欧电阻 R140 ~ R145 连接至排针 JP2。如果需要将 flash 的工作频率控制在 80 MHz，以达到保证总线信号完整性等目的，建议移除 R140 ~ R145 电阻，将模组的 flash 总线与排针 JP2 断开。

## 应用程序开发

ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。

### 初始设置
请严格按照下图所示连接跳线帽，注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP2 连接器，使能 UART 通信。

<table>
<thead>
<tr>
<th>USB 供电</th>
<th>使能 UART 通信</th>
</tr>
</thead>
</table>

注意不要连接其他跳线帽。

打开电源开关，5V Power On LED 应点亮。

### 正式开始开发
现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

### ESP-WROVER-KIT V3 入门指南
本指南介绍了如何开始使用 ESP-WROVER-KIT V3 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：ESP32 H/W 硬件参考。

### 准备工作

- ESP-WROVER-KIT V3 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows，Linux 或 macOS）

您可以跳过介绍部分，直接前往应用程序开发 章节。
概述  ESP-WROVER-KIT 是一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选配以下 ESP32 模组:
- ESP32-WROOM-32
- ESP32-WROVER 系列模组

此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

注解：该版本 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述  ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

![ESP-WROVER-KIT 功能框图](image)

图 9: ESP-WROVER-KIT 功能框图

功能说明  ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍图 2 中的主要组件。

**ESP32管脚分配**

ESP32模块的部分管脚/端口已被板上组件占用或用于外部硬件设备。如果某管脚对应的特定硬件未连接，则该管脚可能用于其他用途。比如，摄像头/JP4 排针未连接对应硬件，则这些 GPIO 可用于其他用途。

部分管脚具备多个功能，可供板上组件或外部硬件设备同时使用，比如 GPIO0 和 GPIO2。由于管脚限制，一些外围设备不可同时使用。比如，由于 JTAG 和 SD 卡槽需共用部分管脚，因此一些使用 SD 卡功能的应用无法同时进行 JTAG 调试。

其他情况下，不同外设可同时使用。比如，LCD 屏幕和 SD 卡仅共用一个 GPIO21 管脚，可以同时使用。该管脚可为 LCD 屏幕提供 D/C（数据/控制）信号，并用于读取来自 SD 卡槽的 CD 信号（卡检测信号）。如无需使用卡检测功能，开发人员还可以通过跳线 R167 来禁用该功能。此时，LCD 和 SD 卡槽可同时使用。

更多外设共享管脚的介绍，请见下一章节中的表格。

### 主要 I/O 连接器 / JP1

JP1 连接器包括 14 x 2 个排针，具体功能可见下表中间 “I/O” 列的介绍。两侧的 “共用” 列则介绍了这些管脚在板上的其他用途。

应用程序开发 ESP-WROVER-KIT 上电前，请首先确认开发板完好无损。
Chapter 1. 快速入门

初始设置 请严格按照下图所示连接跳线帽。注意不要额外连接其他跳线帽。

- 使用 JP7 连接器，选择 USB 为开发板供电。
- 使用 JP11 连接器，使能 UART 通信。

注意不要连接其他跳线帽。

打开 电源开关，5V Power On LED 应点亮。

正式开始开发 现在，请前往 快速入门 中的 详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

ESP-WROVER-KIT V2 入门指南 本指南介绍了如何开始使用 ESP-WROVER-KIT V2 开发板及其功能和相关配置。有关 ESP-WROVER-KIT 其他版本的介绍，请见：ESP32 H/W 硬件参考。

准备工作

- ESP-WROVER-KIT V2 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 macOS）

您可以跳过介绍部分，直接前往 应用程序开发 章节。

概述 ESP-WROVER-KIT 是 乐鑫 一款基于 ESP32 的开发板，集成了 LCD 屏幕和 MicroSD 卡槽。

ESP-WROVER-KIT 可选配以下 ESP32 模组：

- ESP32-WROOM-32
- ESP32-WROVER 系列模组
此外，ESP-WROVER-KIT 的独特之处在于集成了一款先进多协议 USB 桥接器 (FTDI FT2232HL)，允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 调试器。ESP-WROVER-KIT 可为开发人员提供简单、便捷且极具成本效益的开发体验。

为了便于使用，板上模组的绝大部分管脚均已引出至开发板的引脚。

注解：ESP-WROVER-KIT V2 板载 ESP32-WROVER 模组的 GPIO16 和 GPIO17 管脚用作 PSRAM 的片选和时钟信号。默认情况下，为了给用户提供可靠的性能，这两个 GPIO 管脚不引出至开发板引脚。

功能概述  ESP-WROVER-KIT 开发板的主要组件和连接方式如下图所示。

图 12: ESP-WROVER-KIT 功能框图

功能说明  ESP-WROVER-KIT 开发板的主要组件、接口及控制方式见下。

下表从图片右上角开始，以顺时针顺序介绍了图 1 中的主要组件，然后以同样的顺序介绍了图 2 中的主要组件。

1.3.3 ESP32-PICO-KIT V4/V4.1 入门指南

本指南介绍了如何开始使用 ESP32-PICO-KIT V4 / V4.1 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：ESP32 H/W 硬件参考。

本指南仅适用于 ESP32-PICO-KIT V4 和 V4.1。ESP32-PICO-KIT V4.1 与 V4 的最大差别在于桥接器，其中 V4 搭载的 CP2102 USB-to-UART 桥接器最高速率为 1 Mbps，V4.1 搭载的 CP2102N 桥接器最高传输速率为 3 Mbps。

准备工作

- ESP32-PICO-KIT 迷你开发板
- USB 2.0 线（A 型转 Micro-B 型）
- PC（Windows，Linux 或 Mac OS）

您可以跳过介绍部分，直接前往 应用程序开发 章节。
概述

ESP32-PICO-KIT 是一款来自乐鑫的迷你开发板，其核心是具有完整 Wi-Fi 和蓝牙功能的 ESP32 系列 SiP 模组 ESP32-PICO-D4。与其他 ESP32 系列模组相比，ESP32-PICO-D4 模组已集成以下外围器件:

- 40 MHz 晶体振荡器
- 4 MB flash
- 滤波电容
- 射频匹配网络等

这大大降低了用户额外采购和安装这些元器件的费用和成本，及额外组装测试的复杂度，并增加了可用性。

ESP32-PICO-KIT 集成了 USB 转 UART 桥接电路，允许开发人员直接通过 PC 的 USB 端口进行下载和调试。

为了便于连接，ESP32-PICO-D4 上的所有 IO 信号和系统电源管脚均通过开发板两侧焊盘（每侧 20 个 x 0.1 英寸间隔）引出。为了方便地交换使用，ESP32-PICO-KIT 开发板每侧的 20 个焊盘中，有 17 个引出至排针。另外 3 个靠近天线的焊盘未引出，可供用户日后焊接使用。

注解:

1. 每排未引出至排针的 3 个管脚已连接至 ESP32-PICO-D4 SiP 模组的内置 flash 模块。更多信息，请见相关文档 中的模组技术规格书。
2. ESP32-PICO-D4 开发板默认采用排针。

功能概述

ESP32-PICO-KIT 开发板的主要组件和连接方式见下。
功能说明

ESP32-PICO-KIT 开发板的主要组件、接口及控制方式见下。

电源选项

开发板可任一选用以下三种供电方式：

- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电
警告：上述供电模式不可同时连接，否则可能会损坏开发板和/或电源。

管脚说明

下表介绍了开发板 I/O 管脚的名称和功能，具体布局请见相关文档中的原理图。请参考ESP32-PICO-KIT开发板布局。

*Espressif Systems*

*Release v5.0-dev-489-gef98a36*
有关上表的说明:
1. 该管脚已连接至 ESP32-PICO-D4 的内置 flash 管脚。
2. 32.768 kHz 晶振：(a) 输入；(b) 输出。
3. 该管脚已连接至开发板的 USB 桥接器芯片。
4. ESP32-PICO-KIT 内置 SPI flash 的工作电压为 3.3V。因此，strapping 管脚 MTDI 在模组上电复位过程中应保持低电平。如连接该管脚，请确保该管脚在复位时不要保持高电平。

**应用程序开发**

ESP32-PICO-KIT 上电前，请首先确认开发板完好无损。

现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

**开发板尺寸**

ESP32-PICO-KIT 的尺寸为 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”）。
ESP32-PICO-KIT V3 入门指南 本指南介绍了如何开始使用 ESP32-PICO-KIT V3 迷你开发板。有关 ESP32-PICO-KIT 其他版本的介绍，请见：ESP32 H/W 硬件参考。

准备工具

1.3.4 ESP32-Ethernet-Kit V1.2 入门指南

本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

ESP32-Ethernet-Kit 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

图 20: ESP32-Ethernet-Kit V1.2 概图（点击放大）

准备工作

- ESP32-Ethernet-Kit V1.2 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows, Linux 或 Mac OS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述

ESP32-Ethernet-Kit 是一款来自 乐鑫 的开发板。

它由以太网母板（A 板）和 PoE 子板（B 板）两部分组成。其中以太网母板（A 板）集成蓝牙/Wi-Fi 双模 ESP32-WROVER-E 模组和串口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。PoE 子板（B 板）提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器（FT2232H 芯片）。FT2232H 芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 直接进行调试。

注解：如果采用了固件自动下载模式，则无需对 BOOT 或 EN 按键进行任何操作。

PoE 子板（B 板） PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板（A 板）提供电源。PoE 子板（B 板）的主要组件见功能概述 中的功能框图。

PoE 子板（B 板）具有以下特性：
- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板（A 板）上的 RJ45 Port 连接至 PoE 的交换机。以太网母板（A 板）检测到来自 PoE 子板（B 板）的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

RMII 时钟源选择 RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50MHz 同步时钟（即 RMII 时钟），它既可以由外部提供，也可以由内部的 ESP32 APPLL 产生（不推荐）。

注解：有关 RMII 时钟源选择的更多信息，请参见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图，第 2 页的位置 D2。
**PHY 侧提供 RMII 时钟**

ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟，该时钟信号由 PHY 外侧连接的 25 MHz 无源晶振经过倍频产生。详情请参见下图。

请注意，系统上电时 RESET_N 旁的下拉电阻会将 PHY 置于复位状态。ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY。只有这样才能保证系统的正常上电，否则 ESP32 会存在一定几率进入下载模式（当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

**ESP32 APLL 内部提供的 RMII 时钟**　另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

要实现此选项，用户需要在板子上移除或添加一些阻容元件。有关详细信息，请参见 ESP32-Ethernet-Kit V1.2 以太网母板 (A 板) 原理图，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

**GPIO 分配**

本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

**IP101GRI (PHY) 接口**　下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。
图 26: ESP32 APLL 内部提供的 RMII 时钟

**注解：**

1. 为防止 ESP32 侧 GPIO 的上电状态受 PHY 侧时钟输出的影响，PHY 侧 RESET_N 默认为低，以关闭 PHY 侧时钟输出。上电后，您可以通过 GPIO5 控制 RESET_N 以打开该时钟输出。参见 PHY 侧提供 RMI 时钟。对于无法通过 RESET_N 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。与使用 RESET_N 类似，默认情况下晶振模块应禁用，并在上电后由 ESP32 启动有关参考设计，请参见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-E 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 PSRAM 的模组，如 ESP32-WROOM-32D 或 ESP32-SOLO-1。

### 应用程序开发

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

### 初始设置

1. 首先，请将以太网母板（A 板）上的所有开关均拨至 ON 状态，使 **功能选择开关** 处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网母板（A 板）连接至 PC。
5. 将电源开关从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

### 正式开发

现在，您可以在 **快速入门** 中的 **详细安装步骤** 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。
请务必在进入下一步前，确保您已完成上述所有步骤。

**配置与加载以太网示例** 在完成开发环境设置和开发板测试后，您可以配置并烧录 `ethernet/basic` 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.2（点击放大）开发板使用的 IP101GRI。

针对 ESP32-Ethernet-Kit V1.1 的主要修改：

- 更改拨码开关紧围 GPIO 编号丝印。
- C1、C2、C42 和 C43 更新为 20 pF。详细信息见 ESP32-Ethernet-Kit V1.2 以太网母板（A 板）原理图。
- 模组 ESP32-WROVER-B 替换为 ESP32-WROVER-E。

有关本开发板的更多设计文档，请联系我们的商务部门 sales@espressif.com。

**ESP32-Ethernet-Kit V1.0 入门指南** 本指南介绍了如何使用 ESP32-Ethernet-Kit 开发板以及配置相关功能。

ESP32-Ethernet-Kit 是一款以太网 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 也同时支持以太网供电 (PoE)。

**准备工作**

- ESP32-Ethernet-Kit V1.0 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 Mac OS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

**概述** ESP32-Ethernet-Kit 是一款来自 乐鑫 的开发板，由以太网母板（A 板）和 PoE 子板（B 板）两部分组成。其中以太网母板（A 板）贴蓝牙 Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 快速以太网收发器 (PHY) IP101GRI，PoE 子板（B 板）提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。

为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器（FTDI FT2232H 芯片），进而允许开发人员直接通过 USB 接口，使用 JTAG 对 ESP32 进行调试，无需额外的 JTAG 适配器。

**功能概述** ESP32-Ethernet-Kit 开发板的主要组件和连接方式见下。
图 27: ESP32-Ethernet-Kit V1.0

**PoE 子板（B 板）**  PoE 子板通过以太网电缆传输电能 (PoE)，为以太网母板（A 板）提供电源。PoE 子板（B 板）的主要组件见功能概述 中的功能框图。
PoE 子板（B 板）具有以下特性:

- 支持 IEEE 802.3at
- 电源输出: 5 V, 1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板（A 板）上的 RJ45 端口连接至 PoE 的交换机。太网母板（A 板）检测到来自 PoE 子板（B 板）的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

### 节点管理接口

#### PHY 复位

| 信号 | GPIO5 | Reset_N |

### 注解

除了 REF_CLK 之外，RMII 接口下的所有管脚分配都是固定的，不能通过 IOMUX 或 GPIO 矩阵进行更改。

#### GPIO Header 1

本连接器包括 ESP32-Ethernet-Kit 开发板上部分不用做他用的 GPIO。
## Chapter 1. 快速入门

### GPIO Header 2

下表列出了具有特定 MII 功能的 GPIO（GPIO2 除外）。

<table>
<thead>
<tr>
<th>序号</th>
<th>ESP32 管脚</th>
<th>MII 功能</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO17</td>
<td>EMAC_CLK_180</td>
<td>见说明 1。</td>
</tr>
<tr>
<td>2</td>
<td>GPIO16</td>
<td>EMAC_CLK_OUT</td>
<td>见说明 1。</td>
</tr>
<tr>
<td>3</td>
<td>GPIO4</td>
<td>EMAC_TX_ER</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>GPIO2</td>
<td>n/a</td>
<td>见说明 2。</td>
</tr>
<tr>
<td>5</td>
<td>GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>见说明 2。</td>
</tr>
</tbody>
</table>

### 注解:

1. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROOM-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 SPI RAM 的模组，比如 ESP32-WROOM-32D 或 ESP32-SOLO-1。
2. 具体功能取决于功能选择开关 的设置。

### GPIO Header 3

本连接器中 GPIO 的功能取决于 功能选择开关 的设置。

### 注解:

1. GPIO2 用于使能 PHY 的外部振荡器。
2. GPIO0 用于为 PHY 提供 50 MHz 基准时钟源。为了防止传输线路延迟对时钟相位带来的影响，该时钟信号将首先被反相，而后提供给 PHY。
3. 为防止 PHY 端 GPIO0 的上电状态受到时钟输出的影响，PHY 的外部晶振将在 ESP32 上电后通过 GPIO2 使能。

应用程序开发 ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

初始设置
1. 首先，请将以太网母板（A 板）上的所有开关均拨至 ON 状态，即使功能选择开关处于默认状态。
2. 为了方便应用程序的下载和测试，此时请不要在开发板安装任何跳线帽，也不要为开发板接入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网母板（A 板）连接至 PC。
5. 将电源开关从 GND 拨至 5V0 一侧，此时，5V Power On LED 应点亮。

正式开发 现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

如使用较早 GNU Make 编译系统，则请参考详细安装步骤 章节。

请务必在进入下一步前，确保您已完成上述所有步骤。

配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/basic 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.0 开发板 使用的 IP101GRI。

ESP32-Ethernet-Kit V1.1 入门指南 本指南将介绍 ESP32-Ethernet-Kit 开发板的配置以及相关功能的使用。

ESP32-Ethernet-Kit 是一款以太网转 Wi-Fi 开发板，可为以太网设备赋予 Wi-Fi 连接功能。为了提供更灵活的电源选项，ESP32-Ethernet-Kit 同时也支持以太网供电 (PoE)。

准备工作
- ESP32-Ethernet-Kit V1.1 开发板
- USB 数据线（A 转 Micro-B）
- PC（Windows、Linux 或 Mac OS）

您可以跳过介绍部分，直接前往应用程序开发 章节。

概述 ESP32-Ethernet-Kit 是一款来自 乐鑫 的开发板。

它由以太网母板（A 板）和 PoE 子板（B 板）两部分组成。其中以太网母板（A 板）集成蓝牙 / Wi-Fi 双模 ESP32-WROVER-B 模组和单端口 10/100 Mbps 快速以太网收发器 (PHY) IP101GRI。PoE 子板（B 板）提供以太网供电功能。ESP32-Ethernet-Kit 的 A 板可在不连接 B 板的情况下独立工作。
图 31: ESP32-Ethernet-Kit V1.1
为了实现程序下载和监控，A 板还集成了一款先进多协议 USB 桥接器（FTDI FT2232H 芯片）。FTDI FT2232H 芯片使得开发人员无需额外的 JTAG 适配器，通过 USB 桥接器使用 JTAG 接口便可对 ESP32 进行调试。

**功能概述**

ESP32-Ethernet-Kit 开发板的主要组件和连接方式如下。

### PoE 子板（B 板）
PoE 子板转换以太网电缆传输的电能 (PoE)，为以太网母板（A 板）提供电源。PoE 子板（B 板）的主要组件见功能概述 中的功能框图。

PoE 子板（B 板）具有以下特性：
- 支持 IEEE 802.3at 标准
- 电源输出：5 V，1.4 A

如需使用 PoE 功能，请用以太网线缆将以太网母板（A 板）上的 RJ45 Port 连接至 PoE 的交换机。以太网母板（A 板）检测到来自 PoE 子板（B 板）的 5 V 供电后，将从 USB 供电自动切换至 PoE 供电。

![PoE 子板布局图](image)

</tbody>
</table>

### 设置选项
本节介绍用于 ESP32-Ethernet-Kit 开发板的硬件配置选项。

### 功能选择开关
拨码开关打开时，拨码开关将列出的 GPIO 路由到 FT2232H 以提供 JTAG 功能。拨码开关关闭时，GPIO 可用于其他目的。

<table>
<thead>
<tr>
<th>拨码开关</th>
<th>GPIO 管脚</th>

<td>GPIO13</td>
</tr>
<tr>
<td>2</td>
<td>GPIO12</td>
</tr>
<tr>
<td>3</td>
<td>GPIO15</td>
</tr>
<tr>
<td>4</td>
<td>GPIO14</td>
</tr>
</tbody>
</table>

**注解：** 拨码开关旁边开发板的丝印层上的 GPIO 管脚标记的位置是不正确的。请以表格中的顺序为准。

### RMII 时钟源选择
RMII 工作模式下的以太网 MAC 和 PHY 需要一个公共的 50MHz 同步时钟（即 RMII 时钟），它既可以由外部提供，也可以由内部的 ESP32 APLL 产生。

**注解：** 有关 RMII 时钟源选择的更多信息，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图，第 2 页的位置 D2。

### PHY 侧提供 RMII 时钟
ESP32-Ethernet-Kit 默认配置为 IP101GRI 的 50M_CLKO 信号线提供 RMII 时钟。该时钟信号由 PHY 外侧连接的 25MHz 无源晶振经过倍频产生。详情请参见下图。
图 35: PHY 侧提供 RMII 时钟
请注意，系统上电时 RESET_N 旁边的下拉电阻会将 PHY 置于复位状态。ESP32 需要通过 GPIO5 将 RESET_N 拉高才能启动 PHY，只有这样才能保证系统的正常上电。否则 ESP32 会存在一定几率进入下载模式（当 REF_CLK_50M 时钟信号在 GPIO0 上电采样阶段刚好处于高电平）。

**ESP32 APLL 内部提供的 RMII 时钟** 另一种选择是从 ESP32 APLL 内部获取 RMII 时钟，请参见下图。来自 GPIO0 的时钟信号首先被反相，以解决传输线延迟的问题，然后提供给 PHY。

![ESP32 APLL 内部提供的 RMII 时钟](image)

图 36: ESP32 APLL 内部提供的 RMII 时钟

要实现此选项，用户需要在板子上移除或添加一些阻容元器件。有关详细信息，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图，第 2 页，位置 D2。请注意，如果 APLL 已经用于其他用途（如 I2S 外设），那么只能使用外部 RMII 时钟。

**GPIO 分配** 本节介绍了 ESP32-Ethernet-Kit 开发板特定接口或功能的 GPIO 分配情况。

**IP101GRI (PHY) 接口** 下表显示了 ESP32 (MAC) 与 IP101GRI (PHY) 的管脚对应关系。ESP32-Ethernet-Kit 的实现默认设置为简化媒体独立接口。
Chapter 1.

### 注解：

1. 为防止 ESP32 的 GPIO 的上电状态受 PHY 侧时钟输出的影响，PHY 侧 reset_n 默认为低，以关闭 PHY 侧时钟输出。上电后，您可通过 GPIO5 控制 reset_n 以打开该时钟输出。参见 PHY 侧提供 RMII 时钟。对于无法通过 reset_n 关闭时钟输出的 PHY，PHY 侧建议使用可在外部禁用/使能的有源晶振。使用 reset_n 类似，默认情况下晶振模块需要禁用，并在上电后由 ESP32 开启。有关参考设计，请参见 ESP32-Ethernet-Kit V1.1 以太网母板（A 板）原理图。
2. ESP32 芯片的 GPIO16 和 GPIO17 管脚没有引出至 ESP32-WROVER-B 模组的管脚，因此无法使用。如需使用 ESP32 的 GPIO16 和 GPIO17 管脚，建议更换其他不含 SRAM 的模组，比如 ESP32-WROOM-32D 与 ESP32-SOLO-1。

### 应用程序开发

ESP32-Ethernet-Kit 上电前，请首先确认开发板完好无损。

### 初始设置

1. 首先，请将以太网母板（A 板）上的所有开关均拨至 ON 状态，使功能选择开关处于默认状态。
2. 为了方便应用程序的下载和测试，不要为开发板输入任何信号。
3. 此时可以连接 PoE 子板（B 板），但不要向 B 板连接任何外部电源。
4. 使用 USB 数据线将以太网母板（A 板）连接至 PC。
5. 将电源开关从 GND 拨至 5V0 一侧。此时，5V Power On LED 应点亮。

### 正式开始开发

现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

请务必在进入下一步前，确保您已完成上述所有步骤。
配置与加载以太网示例 在完成开发环境设置和开发板测试后，您可以配置并烧录 ethernet/basic 示例。本示例专门用于测试以太网功能，支持不同 PHY，包括 ESP32-Ethernet-Kit V1.1 开发板使用的 IP101GRI。

针对 ESP32-Ethernet-Kit V1.0 的主要修改:
- 原 GPIO10 反相后时钟提供给 PHY 方案改为由 PHY 偏外接无源晶振，提供时钟给 GPIO0。原用于控制有源晶振的 OSC_EN 的 IO2 释放，可用作其他用途。
- 为防止 ESP32 侧 GPIO0 上的电状态收到 PHY 侧时钟输出的影响，PHY 侧 reset_n 默认为低，关闭 PHY 侧时钟输出。而将可经过 GPIO5 经制 reset_n 打开该时钟输出。
- 移除 FT2232H 芯片的外部 SPI Flash U6。
- 移除流控的测试固定 J4。
- 移除 nTRST JTAG 信号，相应的 GPIO4 可用作其他用途。
- GPIO15 线的上拉电阻 R68 移至 JTAG 的 MTDO 侧。
- 为了加强 A 板和 B 板连接间的防呆设计（减少反向插入 B 板的机会），将原先 A 板上的 2 排 4 针排针改为 1 排 4 针排母和 1 排 4 针排针。相应的 4 针排针排和排母排则安装在 B 板上。

1.3.5 ESP32-DevKitS(-R)

本指南介绍了乐鑫专为 ESP32 设计的烧录底板 ESP32-DevKitS(-R)。

ESP32-DevKitS(-R) 包括两款开发板，分别是 ESP32-DevKitS 和 ESP32-DevKitS-R，S 代表弹簧（spring），R 代表 WROVER 模组。

本指南包括如下内容:
- 入门指南: 简要介绍了 ESP32-DevKitS(-R) 和硬件、软件设置指南。  
- 硬件参考: 详细介绍了 ESP32-DevKitS(-R) 的硬件。
- 相关文档: 列出了相关文档的链接。
入门指南

本节介绍了如何快速上手 ESP32-DevKitS(-R)，开头部分介绍了 ESP32-DevKitS(-R)，如何烧录开发板 小节介绍了怎样在 ESP32-DevKitS(-R) 上安装模组，配置及烧录固件。

概述 ESP32-DevKitS(-R) 是乐鑫专为 ESP32 设计的烧录底板，无需将 ESP32 模组与电源和信号线焊接便可进行烧录。ESP32-DevKitS(-R) 搭载模组后，可作为类似 ESP32-DevKitC 的小型开发板使用。

ESP32-DevKitS 和 ESP32-DevKitS-R 仅在弹簧布局上有所不同，用于适配不同的 ESP32 模组。

- **ESP32-DevKitS:**
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
  - ESP32-SOLO-1
  - ESP32-WROOM-32E
  - ESP32-WROOM-32UE

- **ESP32-DevKitS-R:**
  - ESP32-WROVER (PCB & IPEX)
  - ESP32-WROVER-B (PCB & IPEX)
  - ESP32-WROVER-E
  - ESP32-WROVER-IE

有关上述模组的详细信息，请参考 ESP32 系列模组。

![ESP32-DevKitS - 正面](image)

图 37: ESP32-DevKitS - 正面

组件介绍
主要组件 | 介绍
--- | ---
引脚弹簧 | 适配模块上的邮票孔，用于连接和固定模块。
2.54 mm 排母 | 连接板上搭载模块的引脚。关于排母的描述，请见针座 小节。
USB-to-UART 模块 | 单片 USB 转 UART 模块，可提供高达 3 Mbps 的传输速率。
LDO | 5V-to-3.3V 低压差线型稳压器 (LDO)。
Micro-USB 连接器/Micro USB 端口 | USB 接口。可用作开发板的供电电源或连接电板和开发板的通信接口。
EN 键 | 复位按键。
Boot 键 | 下载按键。按住 Boot 键的同时按一下 EN 键进入“固件下载”模式，通过串口下载固件。
电源指示 LED | 开发板通电后（USB 或供电电源），该指示灯亮起。

如何烧录开发板 | 通电前，请确保 ESP32-DevKitS(-R) 完好无损。

必备硬件
- 任选一款 ESP32 模组
- USB 2.0 数据线（标准 A 型转 Micro-B 型）
- 电脑（Windows、Linux 或 macOS）

硬件设置 | 请按照下列步骤将模块安装到 ESP32-DevKitS(-R) 烧录底板上：
- 将模块轻放到 ESP32-DevKitS(-R) 烧录底板上。确保模块上方的邮票孔与底板上的引脚弹簧对齐。
- 将模块向下压，听到“咔哒”一声即说明模块已经压入底板。
- 检查所有引脚弹簧是否均已卡进邮票孔中。如发现错位，可使用镊子将引脚弹簧拨入邮票孔中。
软件设置

首选方式 使用 ESP-IDF 开发框架是将二进制文件 (.bin) 烧录到 ESP32-DevKitS(-R) 的首选方式。请前往快速入门，详细安装步骤一节查看如何快速设置开发环境，将应用程序烧录至 ESP32-DevKitS(-R)。

备选方式 Windows 用户也可以使用 Flash 下载工具 将二进制文件。请下载该工具，解压并参照 doc 文件夹内的使用指南。

注解:
1. 烧录二进制文件时需将 ESP32 芯片设置成固件下载模式。这一步骤可由烧录工具自动执行，也可按住 Boot 按键并点按 EN 按键手动执行。
2. 烧录完成后，烧录工具默认情况下会重启模组，运行已烧录的程序。

底板尺寸

内含组件和包装

零售订单 如购买样品，每个 ESP32-DevKitS(-R) 底板将以防静电袋或零售商选择的其他方式包装。零售订单请前往 https://www.espressif.com/zh-hans/company/contact/buy-a-sample。

批量订单 如批量购买，ESP32-DevKitS(-R) 烧录底板将以大纸板箱包装。批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

硬件参考

功能框图 ESP32-DevKitS(-R) 的主要组件和连接方式如下图所示。

图 39: ESP32-DevKitS 尺寸 - 背面
图 40: ESP32-DevKitS-R 尺寸 - 背面

图 41: ESP32-DevKitS(-R)（点击放大）
电源选项 您可从以下三种供电方式中任选其一给 ESP32-DevKitS(-R) 供电：

- Micro USB 端口供电（默认）
- 5V 和 GND 管脚供电
- 3V3 和 GND 管脚供电

建议选择第一种供电方式：Micro USB 端口供电。

1.3.6 ESP32-PICO-KIT-1

概述

ESP32-PICO-KIT-1 是一款基于 ESP32 的乐鑫开发板，板上搭载 ESP32-PICO-V3（SiP，系统级封装）模组。ESP32-PICO-V3 具备完整的 Wi-Fi 和蓝牙功能，与其它 ESP32 系列模组相比，此模组已集成下述外围组件，无需额外安装：

- 40 MHz 晶振
- 4 MB flash
- 滤波电容
- 射频匹配网络等

将上述组件封装至 ESP32-PICO-V3，用户无需额外购买，大大降低了安装和测试的成本，同时也增加了产品的可用性。

ESP32-PICO-KIT-1 开发板还集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。

为方便硬件连接，ESP32-PICO-V3 上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘（18 x 0.1”）。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。

注解：ESP32-PICO-KIT-1 开发板默认采用排针。

ESP32-PICO-KIT-1 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

本指南包括以下几个章节：

- 快速入门：简要介绍 ESP32-PICO-KIT-1 开发板，以及上手这款开发板所需的软件配置；
- 内含组件和包装方式：介绍零售订单和批量订单所提供的组件及包装方式；
- 硬件参考：提供 ESP32-PICO-KIT-1 开发板硬件详细信息；
- 硬件版本：介绍硬件历史版本（如有），已知问题（如有），并提供链接至历史版本开发板的入门指南（如有）；
- 相关文档：提供相关文档的链接。

快速入门

本节介绍了如何快速上手 ESP32-PICO-KIT-1。首先对 ESP32-PICO-KIT-1 开发板进行了简要介绍，然后在应用开发小节介绍如何将固件烧录至开发板。

组件描述  ESP32-PICO-KIT-1 开发板的主要组件、接口及控制方式见下图。

从左上角开始，按顺时针顺序，开发板主要组件的描述见下表。

应用开发 上电前，请确保 ESP32-PICO-KIT-1 完好无损。

所需硬件
- 1 x ESP32-PICO-KIT-1 开发板
- 1 x USB 2.0 A 转 Micro B 数据线
- 1 x PC，运行 Windows、Linux 或 macOS 系统

软件配置 请前往快速入门，在详细安装步骤一节查看如何快速配置开发环境，将应用程序烧录至 ESP32-PICO-KIT-1 开发板。

内含组件和包装方式

零售订单 如购买样品，每个 ESP32-PICO-KIT-1 将单独包装。

零售订单，敬请前往 https://www.espressif.com/en/company/contact/buy-a-sample。
批量订单 如批量购买，ESP32-PICO-KIT-1 开发板将以纸板箱包装。
批量订单请前往 https://www.espressif.com/zh-hans/contact-us/sales-questions。

硬件参考

功能框图 ESP32-PICO-KIT-1 的主要组件和连接方式如下图所示。

图 44: ESP32-PICO-KIT-1 功能框图（点击放大）

供电选项 开发板提供以下三种供电方式，可任意选择一种：
- Micro USB 供电（默认）
- 5V/GND 管脚供电
- 3V3/GND 管脚供电

警告：上述供电方式只能选择一种方式，不能同时选择，否则可能会损坏开发板和/或电源。

管脚描述 组件描述 中所示的开发板两侧 I/O 管脚，其具体名称和功能见下表。管脚名称和编号与相关文档 中原理图保持一致。

### 1.3.7 ESP32-PICO-DevKitM-2

#### 概述

ESP32-PICO-DevKitM-2 是一款基于 ESP32 的乐鑫开发板，板上搭载 ESP32-PICO-MINI-02(02U) 模组。ESP32-PICO-MINI-02(02U) 模组具备完整的 Wi-Fi 和蓝牙功能。

ESP32-PICO-DevKitM-2 开发板同时集成了 USB-to-UART 桥接电路，方便开发人员直接通过 PC 的 USB 端口直接进行固件烧录和调试。
为方便硬件连接，ESP32-PICO-MINI-02U 上的所有 IO 信号和系统电源管脚均引出至开发板两侧焊盘（18 x 0.1”）。上述 18 个焊盘也均引出至排针，可使用杜邦线连接。

**注释：** ESP32-PICO-DevKitM-2 开发板默认采用排针。

ESP32-PICO-DevKitM-2 为用户提供了基于 ESP32 芯片应用开发的硬件，更加方便用户探索 ESP32 芯片的功能。

注解:
1. 该管脚已连接至板上 USB 桥接器芯片；
2. 32.768 kHz 晶振输入输出管脚：
   (a) 输入管脚；
   (b) 输出管脚；
3. ESP32-PICO-DevKitM-2 内置 SPI flash 的工作电压为 3.3 V。因此，Strapping 管脚 MTDI 在上电复位过程中应拉低。如果连接了该管脚，请确保该管脚在复位中不要拉高。

1.3.8 ESP32-DevKitM-1

本指南将介绍如何使用 ESP32-DevKitM-1，并提供更多关于此开发板的信息。

ESP32-DevKitM-1 是乐鑫推出的一款基于 ESP32-MINI-1(1U) 模组的人门级开发板。板上模组大部分管脚均已引出至两侧排针，用户可根据实际需求，通过跳线轻松连接多种外围设备，同时也可将开发板插在面包板上使用。
**Chapter 1. 快速入门**

<table>
<thead>
<tr>
<th>ESP32-DevKitM-1-正面</th>
<th>ESP32-DevKitM-1-侧面</th>
</tr>
</thead>
</table>

本指南包括：

- **快速入门**：提供 ESP32-DevKitM-1 的简要概述及必要的硬件和软件信息。
- **硬件参考**：提供 ESP32-DevKitM-1 的详细硬件信息。
- **相关文档**：提供相关文档的链接。

### 快速入门

本节介绍如何开始使用 ESP32-DevKitM-1，主要包括三大部分：首先，介绍一些关于 ESP32-DevKitM-1 的基本信息，然后在 应用程序开发 章节介绍如何进行硬件初始化，最后介绍如何为 ESP32-DevKitM-1 录制固件。

### 概述

ESP32-DevKitM-1 开发板是一款小巧实用的开发板，具备以下特色功能：

- 集成了 ESP32-MINI-1 或 ESP32-MINI-1U 模组
- USB 转串口编程接口同时可为开发板供电
- 没有排针
- 设有重置按钮和固件下载模式激活按钮
- 以及其他组件

### 内含组件和包装

- **零售订单** 如购买样品，每个 ESP32-DevKitM-1 开发板将防静电袋或零售商选择的其他方式包装。
  零售订单请前往 [https://www.espressif.com/zh-hans/company/contact/buy-a-sample](https://www.espressif.com/zh-hans/company/contact/buy-a-sample)。

- **批量订单** 如批量购买，ESP32-DevKitM-1 开发板将以大纸板箱包装。
  批量订单请前往 [https://www.espressif.com/zh-hans/contact-us/sales-questions](https://www.espressif.com/zh-hans/contact-us/sales-questions)。

### 组件介绍

ESP32-DevKitM-1 开发板的主要组件、接口及控制方式见下图。下文以板载 ESP32-MINI-1 的开发板为例进行说明。
主要组件 | 基本介绍
--- | ---
板载模组 | ESP32-MINI-1 模组或 ESP32-MINI-1U 模组。ESP32-MINI-1 带有板载 PCB 天线；ESP32-MINI-1U 带有外部天线连接器。两款模组内置的芯片均封装 4 MB flash，更多详情，请见《ESP32-MINI-1 & ESP32-MINI-1U 技术规格书》
5 V 转 3.3 V LDO | 电源转换器，输入 5 V，输出 3.3 V
Boot 键 | 下载按键。按下 Boot 键的同时按一下 Reset 键进入“固件下载”模式，通过串口下载固件
Reset 键 | 复位按键
Micro-USB 接口 | USB 接口，可用作开发板的供电电源或 PC 和 ESP32 芯片的通信接口
USB 至 UART 桥接器 | 单芯片 USB 至 UART 桥接器，可提供高达 3 Mbps 的传输速率
3.3 V 电源指示灯 | 开发板连接 USB 电源后，该指示灯亮起。更多信息，请见相关文档中的原理图
I/O 连接器 | 所有可用 GPIO 管脚（除 Flash 的 SPI 总线）均已引出至开发板的排针。用户可对 ESP32 芯片编程。开发多种功能

应用程序开发
ESP32-DevKitM-1 上电前，请首先确认开发板完好无损。

硬件准备
- ESP32-DevKitM-1 开发板
- USB A / micro USB B 数据线
- PC（Windows, Linux 或 Mac OS）

软件设置
现在，请前往快速入门 中的详细安装步骤 章节，查看如何设置开发环境，并尝试将示例项目烧录至您的开发板。

注意：ESP32-DevKitM-1 搭载的模组为单核 MCU 模组，烧录应用程序前，需要在 menuconfig 中使能单核模式 (CONFIG_FREERTOS_UNICORE)。
硬件参考

功能框图  ESP32-DevKitM-1 的主要组件和连接方式如下图所示。

图 51: ESP32-DevKitM-1

电源选项 开发板可从以下三种供电方式中任选其一:
- Micro USB 供电（默认）
- 5V / GND 管脚供电
- 3V3 / GND 管脚供电

警告:
- 上述供电模式 不可同时连接，否则可能会损坏开发板和/或电源。
- 建议选择第一种供电方式: Micro USB 端口供电。

管脚描述 开发板两侧 I/O 管脚，其具体名称和功能见下表。外设管脚分配请参考《ESP32 技术规格书》。

### 1.4 详细安装步骤

请根据下方详细步骤，完成安装过程。
1.4.1 设置开发环境

- 第一步：安装准备（Windows、Linux 和 macOS）
- 第二步：获取 ESP-IDF
- 第三步：设置工具
- 第四步：设置环境变量

1.4.2 创建您的第一个工程

- 第五步：开始创建工程
- 第六步：连接设备
- 第七步：配置
- 第八步：编译工程
- 第九步：烧录到设备
- 第十步：监视器

1.5 第一步：安装准备

在正式开始创建工程前，请先完成工具的安装，具体步骤见下：

1.5.1 Windows 平台工具链的标准设置

概述

ESP-IDF 需要安装一些必备工具，才能围绕 ESP32 构建固件，包括 Python、Git、交叉编译器、CMake 和 Ninja 编译工具等。

在本入门指南中，我们通过命令提示符进行有关操作。不过，您在安装 ESP-IDF 后还可以使用 Eclipse 或其他支持 CMake 的图形化工具 IDE。

注解：限定条件：- 请注意 ESP-IDF 和 ESP-IDF 工具的安装路径不能超过 90 个字符，安装路径过长可能会导致出现失败。- Python 或 ESP-IDF 的安装路径中一定不能包含空格或括号。- 除非操作系统配置为支持 Unicode UTF-8，否则 Python 或 ESP-IDF 的安装路径中也不能包含特殊字符（非 ASCII 码字符）

系统管理员可以通过如下方式将操作系统配置为支持 Unicode UTF-8：控制面板-更改日期、时间或数字格式-管理选项卡-更改系统地城-勾选选项“Beta：使用 Unicode UTF-8 支持全球语言”-点击确定-重启电脑。

ESP-IDF 工具安装器

安装 ESP-IDF 必备工具最简易的方式是从 https://dl.espressif.com/dl/esp-idf/?idf=4.4 中下载 ESP-IDF 工具安装器。

在线安装与离线安装的区别  在线安装程序非常小，可以安装 ESP-IDF 的所有版本。在安装过程中，安装程序只下载必要的依赖文件，包括 Git For Windows 安装器。在线安装程序会将下载的文件存储在缓存目录 %userprofile%\espressif 中。

离线安装程序不需要任何网络连接。安装程序中包含了所有需要的依赖文件，包括 Git For Windows 安装器。
安装内容 安装程序会安装以下组件：

- 内置的 Python
- 交叉编译器
- OpenOCD
- CMake 和 Ninja 编译工具
- ESP-IDF

安装程序允许将程序下载到现有的 ESP-IDF 目录。推荐将 ESP-IDF 下载到 %userprofile%\Desktop\esp-idf 目录下，其中%userprofile% 代表家目录。

启动 ESP-IDF 环境 安装结束时，如果勾选了 Run ESP-IDF PowerShell Environment 或 Run ESP-IDF Command Prompt (cmd.exe)，安装程序会在选定的提示符窗口启动 ESP-IDF。

Run ESP-IDF PowerShell Environment:

![ESP-IDF PowerShell Environment](image)

图 52: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

使用命令提示符

在后续步骤中，我们将使用 Windows 的命令提示符进行操作。

ESP-IDF 工具安装器可在“开始”菜单中，创建一个打开 ESP-IDF 命令提示符窗口的快捷方式。本快捷方式可以打开 Windows 命令提示符（即 cmd.exe），并运行 export.bat 脚本以设置各环境变量（比如 PATH, IDF_PATH 等）。此外，您可还以通过 Windows 命令提示符使用各种已经安装的工具。

注意，本快捷方式仅适用 ESP-IDF 工具安装器中指定的 ESP-IDF 路径。如果您的电脑上存在多个 ESP-IDF 路径（比如您需要不同版本的 ESP-IDF），您有以下两种解决方法：

Espressif Systems 93 Release v5.0-dev-489-gef98a36
Submit Document Feedback
Chapter 1. 快速入门

图 53: ESP-IDF PowerShell

图 54: 完成 ESP-IDF 工具安装向导时运行 Run ESP-IDF Command Prompt (cmd.exe)
Chapter 1.

![Image of ESP-IDF Command Prompt](image)

Using Python in C:\Users\test\AppData\Local\Programs\Python\Python37\Python 3.7.8
Using Git in C:\Users\test\Git\cmd\git version 2.30.0.windows.1
Setting IDF_PATH: C:\Users\test\esp\esp-idf

Adding ESP-IDF tools to PATH...
- C:\Users\test\espressif\tools\xtensa-esp32-elf\esp-2620r3-8.4.0\xtensa-esp32-elf\bin
- C:\Users\test\espressif\tools\xtensa-esp32s2-elf\esp-2620r3-8.4.0\xtensa-esp32s2-elf\bin
- C:\Users\test\espressif\tools\xtensa-esp32c3-elf\esp-2620r3-8.4.0\xtensa-esp32c3-elf\bin
- C:\Users\test\espressif\tools\riscv32-esp-elf\1.24.0.123_g64eb9FF-8.4.0\riscv32-esp-elf\bin
- C:\Users\test\espressif\tools\esp32ulp-elf\2.28.51-esp-20191205\esp32ulp-elf\bin
- C:\Users\test\espressif\tools\esp32s2ulp-elf\2.28.51-esp-20191205\esp32s2ulp-elf\bin
- C:\Users\test\espressif\tools\crosstool-make-3.16.4\bin
- C:\Users\test\espressif\tools\openocd-esp32\v0.10.0-esp-20200709\openocd-esp32\bin
- C:\Users\test\espressif\tools\ninja\1.10.0
- C:\Users\test\espressif\tools\idf-exe\1.0.1
- C:\Users\test\espressif\tools\ccache\3.7
- C:\Users\test\espressif\tools\dfu-util\0.9\dfu-util-0.9-win64
- C:\Users\test\espressif\tools\python_env\idf4.3_py3.7_env\Scripts
- C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

```
idf.py build
```

C:\Users\test\esp\esp-idf

**图 55: ESP-IDF 命令提示符窗口**
1. 为 ESP-IDF 工具安装器创建的快捷方式创建一个副本，并将新快捷方式的 ESP-IDF 工作路径指定为您希望使用的 ESP-IDF 路径。
2. 或者，您可以运行 cmd.exe，并切换至您希望使用的 ESP-IDF 目录，然后运行 export.bat。注意，这种方法要求 PATH 中存在 Python 和 Git。如果您在使用时遇到有关“找不到 Python 或 Git”的错误信息，请使用第一种方法。

后续步骤

当 ESP-IDF 工具安装器安装成功后，开发环境设置也到此结束。后续开发步骤，请前往第五步：开始创建工程 查看。

相关文档

想要自定义安装流程的高阶用户可参照:

在 Windows 环境下更新 ESP-IDF 工具

使用脚本安装 ESP-IDF 工具 请从 Windows “命令提示符”窗口，切换至 ESP-IDF 的安装目录。然后运行:

```bash
install.bat
```

对于 Powershell，请切换至 ESP-IDF 的安装目录。然后运行:

```bash
install.ps1
```

该命令可下载并安装 ESP-IDF 所需的工具。如您已经安装了某个版本的工具，则该命令将无效。该工具的下载安装位置由 ESP-IDF 工具安装器的设置决定，默认情况下为: C:\Users\username\espressif。

使用“导出脚本”将 ESP-IDF 工具添加至 PATH 环境变量  ESP-IDF 工具安装器将在“开始菜单”为“ESP-IDF 命令提示符”创建快捷方式。点击该快捷方式可打开 Windows 命令提示符窗口，您可在该窗口使用已安装的工具。

有些情况下，您正在使用的命令提示符窗口并不是通过快捷方式打开的，此时如果想要在该窗口使用 ESP-IDF，您可以根据下方步骤将 ESP-IDF 工具添加至 PATH 环境变量。

首先，请打开需要使用 ESP-IDF 的命令提示符窗口，切换至安装 ESP-IDF 的目录，然后执行 export.bat，具体命令如下:

```bash
cd %userprofile%\esp\esp-idf
export.bat
```

对于 Powershell 用户，请同样切换至安装 ESP-IDF 的目录，然后执行 export.ps1，具体命令如下:

```bash
cd ~/esp/esp-idf
export.ps1
```

运行完成后，您就可以通过命令提示符使用 ESP-IDF 工具了。

1.5.2  Linux 平台工具链的标准设置

安装准备

编译 ESP-IDF 需要以下软件包。请根据使用的系统，选择合适的安装命令，如下所示:

- Ubuntu 和 Debian:
### Chapter 1. 快速入门

```bash
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb
```

- CentOS7 & 8:

```bash
sudo yum -y update && sudo yum install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb
```

目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。

- Arch:

```bash
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja --ccache dfu-util libusb
```

**注解：**

- 使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装 “cmake3” 软件包（不是安装 “cmake”）。
- 如果上述列表中，并没有您使用的系统，请参考您所用系统的相关文档，查看安装软件包所用的命令。

**其他提示**

**权限问题 /dev/ttyUSB0**  使用某些 Linux 版本向 ESP32 烧录固件时，可能会出现 Failed to open port /dev/ttyUSB0 错误消息。此时可以将用户添加至 Linux Dialout 组。

**兼容的 Python 版本**

ESP-IDF 支持 Python 3.6 及以上版本，建议升级操作系统到最新版本从而更新 Python。也可选择从 sources 安装最新版 Python，或使用 Python 管理系统如 pyenv 对版本进行升级管理。

**后续步骤**

继续设置开发环境，请前往第二步：获取 ESP-IDF 章节。

#### 1.5.3 macOS 平台工具链的标准设置

**安装准备**

ESP-IDF 将使用 macOS 上默认安装的 Python 版本。

- 安装 pip:

  ```bash
  sudo easy_install pip
  ```

- 安装 CMake 和 Ninja 编译工具:
  - 若有 HomeBrew，您可以运行:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - 若有 MacPorts，您可以运行:
    ```bash
    sudo port install cmake ninja dfu-util
    ```
  - 若以上均不适用，请访问 CMake 和 Ninja 主页，查询有关 macOS 平台的下载安装问题。
Chapter 1. 快速入门

- 强烈建议同时安装 ccache 以获得更快的编译速度。如有 HomeBrew，可通过 MacPorts 上的 brew install ccache 或 sudo port install ccache 完成安装。

**注解：** 如您在上述任何步骤中遇到以下错误:
```
xcrun: error: invalid active developer path (/Library/Developer/
  ~CommandLineTools), missing xcrun at:/Library/Developer/CommandLineTools/usr/bin/
  ~xcrun```

则必须安装 XCode 命令行工具，具体可运行 xcode-select --install。

**安装 Python 3 Catalina 10.15 发布说明** 中表示不推荐使用 Python 2.7 版本，在未来的 macOS 版本中也不会默认包含 Python 2.7。执行以下命令来检查您当前使用的 Python 版本:
```
python --version
```

如果输出结果是 Python 2.7.17，则代表您的默认解析器是 Python 2.7，这时需要您运行以下命令检查电脑上是否已经安装过 Python 3:
```
python3 --version
```

如果运行上述命令出现错误，则代表电脑上没有安装 Python 3。

请根据以下步骤安装 Python 3:
- 使用 HomeBrew 进行安装的方法如下:
```
brew install python3
```
- 使用 MacPorts 进行安装的方法如下:
```
sudo port install python38
```

**后续步骤**

请前往第二步：获取 ESP-IDF 章节继续设置开发环境。

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>macOS</th>
</tr>
</thead>
</table>

**注解：** 在本文档中，Linux 和 macOS 操作系统中 ESP-IDF 的默认安装路径为 ~/esp；Windows 操作系统中的默认安装路径为 %userprofile%\esp。您也可以将 ESP-IDF 安装在任何其他路径下，但请注意在使用命令行时进行相应替换。注意，ESP-IDF 不支持带有空格的路径。
1.6 第二步：获取 ESP-IDF

在围绕 ESP32 构建应用程序之前，请先获取乐鑫提供的软件库文件 ESP-IDF 仓库。
获取 ESP-IDF 的本地副本：打开终端，切换到您要保存 ESP-IDF 的工作目录，使用 git clone 命令克隆远程仓库。针对不同操作系统的详细步骤，请见下文。

1.6.1 Linux 和 macOS 操作系统

打开终端，后运行以下命令:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 ~/esp/esp-idf。
请前往 ESP-IDF 版本简介，查看 ESP-IDF 不同版本的具体适用场景。

1.6.2 Windows 操作系统

除了安装必要工具外，第一步中介绍的 ESP-IDF 工具安装器 也能同时下载 ESP-IDF 本地副本。
除了使用 ESP-IDF 工具安装器，您也可以参考 指南 手动下载 ESP-IDF。

1.7 第三步：设置工具

除了 ESP-IDF 本身，您还需要安装 ESP-IDF 使用的各种工具，比如编译器、调试器、Python 包等。

1.7.1 Windows 操作系统

请根据第一步中对 Windows (ESP-IDF 工具安装器) 的介绍，安装所有必需工具。
除了使用 ESP-IDF 工具安装器，您也可以通过 命令提示符 窗口手动安装这些工具。具体步骤见下:

```bash
cd %userprofile%\esp\esp-idf
install.bat esp32
```

或使用 Windows PowerShell

```bash
cd ~/esp/esp-idf
./install.ps1 esp32
```

1.7.2 Linux 和 macOS 操作系统

```bash
cd ~/esp/esp-idf
./install.sh esp32
```

或使用 Fish shell

```bash
cd ~/esp/esp-idf
./install.fish esp32
```
1.7.3 下载工具配备方案

ESP-IDF 工具安装器会下载 Github 发布版本中附带的一些工具。如果访问 Github 较为缓慢，则可以设置一个环境变量，实现优先选择 Espressif 的下载服务器进行 Github 资源下载。

注解：该设置只影响从 Github 发布版本中下载的单个工具，它并不会改变访问任何 Git 仓库的 URL。

Windows 操作系统

如果希望在运行 ESP-IDF 工具安装器时优先选择 Espressif 下载服务器，请在 Select Components 窗口中的 Optimization 部分勾选 Use Espressif download mirror instead of Github 选项。

Linux 和 macOS 操作系统

要在安装工具时优先选择 Espressif 下载服务器，请在运行 install.sh 时使用以下命令：

```
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

1.7.4 自定义工具安装路径

本步骤中介绍的脚本将 ESP-IDF 所需的编译工具默认安装在用户的根目录中，即 Linux 和 macOS 系统中的 $HOME/.espressif 和 Windows 系统的 %USERPROFILE%\espressif。此外，您可以将工具安装到其他目录中，但请在运行安装脚本前，重新设置环境变量 IDFTOOLS_PATH。注意，请确保您的用户已经具备了读写该路径的权限。

如果修改了 IDFTOOLS_PATH 变量，请确保该变量在每次执行安装脚本 (install.bat、install.ps1 或 install.sh) 和导出脚本 (export.bat、export.ps1 或 export.sh) 均保持一致。

1.8 第四步：设置环境变量

此时，您刚刚安装的工具尚未添加至 PATH 环境变量，无法通过“命令窗口”使用这些工具。因此，必须设置一些环境变量，这可以通过 ESP-IDF 提供的另一个脚本完成。

1.8.1 Windows 操作系统

Windows 安装器（ESP-IDF 工具安装器）可在“开始”菜单创建一个“ESP-IDF Command Prompt”快捷方式。该快捷方式可以打开命令提示符窗口，并设置所有环境变量。您可以点击该快捷方式，然后继续下一步。

此外，如果您希望在命令提示符窗口使用 ESP-IDF，请使用下方代码：

```
%userprofile%\esp\esp-idf\export.bat
```

或使用 Windows PowerShell

Espressif Systems 100 Release v5.0-dev-489-gef98a36
Chapter 1. 快速入门

1.8.2 Linux 和 macOS 操作系统

请在需要运行 ESP-IDF 的终端窗口运行以下命令：

```
$HOME/esp/esp-idf/export.ps1
```

对于 fish shell（仅支持 fish 3.0.0 及以上版本），请运行以下命令：

```
$HOME/esp/esp-idf/export.fish
```

注意，命令开始的“.”与路径之间应有一个空格！

如果您需要经常运行 ESP-IDF，您可以为执行 export.sh 创建一个别名，具体步骤如下：

1. 复制并粘贴以下命令到 shell 配置文件中（.profile，.bashrc，.zprofile 等）

```
alias get_idf='$. $HOME/esp/esp-idf/export.sh'
```

2. 通过重启终端窗口或运行 source [path to profile]，如 source ~/.bashrc 来刷新配置文件。

现在您可以在任何终端窗口中运行 get_idf 来设置或刷新 esp-idf 环境。

这里不建议您直接将 export.sh 添加到 shell 的配置文件。因为这会导致在每个终端会话中都激活 IDF 虚拟环境（包括无需使用 IDF 的情况），从而破坏使用虚拟环境的目的，并可能影响其他软件的使用。

1.9 第五步：开始创建工程

现在，您可以开始准备开发 ESP32 应用程序了。您可以从 ESP-IDF 中 examples 目录下的 get-started/hello_world 工程开始。

将 get-started/hello_world 工程复制至您本地的 ~/esp 目录下：

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows 操作系统

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

ESP-IDF 的 examples 目录下有一系列示例工程，都可以按照上面的方法进行创建。您可以按照上述方法复制并运行其中的任何示例，也可以直接编译示例，无需进行复制。

重要：ESP-IDF 编译系统不支持带有空格的路径。
Chapter 1. 快速入门

1.10 第六步：连接设备

现在，请将您的 ESP32 开发板连接到 PC，并查看开发板使用的串口。
通常，串口在不同操作系统下显示的名称有所不同：
- Windows 操作系统： COM1 等
- Linux 操作系统： 以 /dev/tty 开始
- macOS 操作系统： 以 /dev/cu. 开始

有关如何查看串口名称的详细信息，请见与 ESP32 创建串口连接。

注解：请记住串口名，您会在下面的步骤中用到。

1.11 第七步：配置

请进入第五步：开始创建工程 中提到的 hello_world 目录，并运行工程配置工具 menuconfig。

1.11.1 Linux 和 macOS 操作系统

```bash
cd ~/esp/hello_world
idf.py set-target esp32
idf.py menuconfig
```

1.11.2 Windows 操作系统

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32
idf.py menuconfig
```

打开一个新项目后，应首先设置“目标”芯片 idf.py set-target esp32。注意，此操作将清除并初始化项目之前的编译和配置（如有）。您也可以直接将“目标”配置为环境变量（此时可跳过该步骤）。更多信息，请见选择目标芯片。

如果之前的步骤都正确，则会显示下面的菜单：

您可以通过此菜单设置项目的具体变量，包括 Wi-Fi 网络名称、密码和处理器速度等。hello_world 示例项目会以默认配置运行，因此可以跳过使用 menuconfig 进行项目配置这一步骤。

注意：如果您使用的是 ESP32-DevKitC（板载 ESP32-SOLO-1 模组）或 ESP32-DevKitM-1（板载 ESP32-MINI-1(IU) 模组），请在烧写示例程序前，前往 menuconfig 中使能单核模式 (CONFIG_FREERTOS_UNICORE)。

注解：您终端窗口中显示出的菜单颜色可能会与上图不同。您可以通过选项 --style 来改变外观。更多信息，请运行 idf.py menuconfig --help 命令。

1.12 第八步：编译工程

请使用以下命令，编译烧录工程：
idf.py build

运行以上命令可以编译应用程序和所有 ESP-IDF 组件，接着生成 bootloader、分区表和应用程序二进制文件。

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git:/usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.../.../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/buildloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

如果一切正常，编译完成后将生成.bin 文件。

## 1.13 第九步：烧录到设备

请使用以下命令，将刚刚生成的二进制文件 (bootloader.bin, partition-table.bin 和 hello_world.bin) 烧录至您的 ESP32 开发板：

```
idf.py -p PORT [-b BAUD] flash
```

请将 PORT 替换为 ESP32 开发板的串口名称，具体可见第六步：连接设备。
您还可以将 BAUD 替换为您希望的烧录波特率。默认波特率为 460800。
更多有关 idf.py 参数的详情，请见 idf.py。

注释：勾选 flash 选项将自动编译并烧录工程，因此无需再运行 idf.py build。

1.13.1 烧录过程中可能遇到的问题

如果在运行给定命令时出现如“连接失败”这样的错误，原因之一则可能是运行 esptool.py 出现错误。esptool.py 是构建系统调用的程序，用于重置芯片、与 ROM 引导加载器交互以及烧录固件的工具。解决该问题的一个简单的方法就是按照以下步骤进行手动复位。如果问题仍未解决，请参考 Troubleshooting 获取更多信息。

esptool.py 通过使 USB 转串口转接器芯片（如 FTDI 或 CP210x）的 DTR 和 RTS 控制线生效来自动复位 ESP32（请参考与 ESP32 创建串口连接 获取更多详细信息）。DTR 和 RTS 控制线又连接到 ESP32 的 GPIO0 和 CHIP_PU (EN) 管脚上，因此 DTR 和 RTS 的电压电平变化会使 ESP32 进入固件下载模式。相关示例可查看 ESP32 DevKitC 开发板的 原理图。

一般来说，使用官方的 esp-idf 开发板不会出现问题。但是，esptool.py 在以下情况下不能自动重置硬件。

- 您的硬件没有连接到 GPIO0 和 CHIP_PU 的 DTR 和 RTS 控制线。
- DTR 和 RTS 控制线的配置方式不同
- 根本没有这样的串行控制电路

根据您硬件的种类，也可以将您 ESP32 开发板手动设置成固件下载模式（复位）。

- 对于 Espressif 的开发板，您可以参考对应开发板的入门指南或用户指南。例如，可以通过按住 Boot 按钮 (GPIO0) 再按住 EN 按钮 (CHIP_PU) 来手动复位 esp-idf 开发板。
- 对于其他类型的硬件，可以尝试将 GPIO0 拉低。

1.13.2 常规操作

在烧录过程中，您会看到类似如下的输出日志：

```
... esptool.py --chip esp32 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
    --after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB_
    --0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin_
    --0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting........_
Chip is ESP32D0WDQ6 (revision 0)
Features: WiFi, BT, Dual Core, Coding Scheme None
Crystal is 40MHz
MAC: 24:0a:c4:05:b9:14
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...
Compressed 3072 bytes to 103...
Writing at 0x000008000... (100 %)
Wrote 3072 bytes (103 compressed) at 0x000008000 in 0.0 seconds (effective 5962.8_
    --kbit/s)...
Hash of data verified.
Compressed 26096 bytes to 15408...
```

(下页继续)
如果一切顺利，烧录完成后，开发板将会复位，应用程序“hello_world”开始运行。
如果您希望使用Eclipse或是VS Code IDE，而非idf.py，请参考Eclipse指南，以及VS Code指南。

1.14 第十步：监视器

您可以使用idf.py -p PORT monitor命令，监视“hello_world”工程的运行情况。注意，不要忘记将PORT替换为您的串口名称。

运行该命令后，IDF监视器应用程序将启动：

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

此时，您就可以在启动日志和诊断日志之后，看到打印的“Hello world!”了。

```
Hello world!
Restarting in 10 seconds...
This is esp32 chip with 2 CPU core(s), WiFi/BT/BLE, silicon revision 1, 2MB external flash
Minimum free heap size: 298968 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

您可使用快捷键 Ctrl+]，退出IDF监视器。

如果IDF监视器在烧录后很快发生错误，或打印信息全是乱码（如下），很有可能是因为您的开发板采用了26 MHz晶振，而ESP-IDF默认支持大多数开发板使用的40 MHz晶振。

此时，您可以：

1. 退出监视器。
2. 打开 menuconfig。
3. 进入 Component config -> ESP32-specific -> Main XTAL frequency 进行配置，将 CONFIG_ESP32_XTAL_FREQ_SEL 设置为 26 MHz。
4. 然后，请重新编译和烧录应用程序。

注解：您也可以运行以下命令，一次性执行构建、烧录和监视过程：

```
idf.py -p PORT flash monitor
```

此外，

- 请前往 IDF 监视器，了解更多信息使用 IDF 监视器的快捷键和其他详情。
- 请前往 idf.py，查看更多 idf.py 命令和选项。

恭喜，您已成功完成 ESP32 的入门学习！

现在，您可以尝试一些其他 examples，或者直接开发自己的应用程序。

重要：一些示例程序不支持 ESP32，因为 ESP32 中不包含所需的硬件。

在编译示例程序前请查看 README 文件中 Supported Targets 表格。如果表格中包含 ESP32，或者不存在这个表格，那么即表示 ESP32 支持这个示例程序。

### 1.15 更新 ESP-IDF

乐鑫会时不时推出更新版本的 ESP-IDF。修复 bug 或提供新的功能。因此，您在使用时，也应注意更新您本地的版本。最简单的方法是：直接删除您本地的 esp-idf 文件夹，并然后按照第二步：获取 ESP-IDF 中的指示，重新完成克隆。

此外，您可以仅更新变更部分。具体方式，请前往 更新 章节查看。

注意，更新完成后，请再次运行安装脚本，以防新版 ESP-IDF 所需的工具也有所更新。具体请参考第三步：设置工具。

一旦重新安装好工具，请使用导出脚本更新环境。具体请参考第四步：设置环境变量。

### 1.16 相关文档

#### 1.16.1 与 ESP32 创建串口连接

本章节主要介绍如何创建 ESP32 和 PC 之间的串口连接。

连接 ESP32 和 PC

用 USB 线将 ESP32 开发板连接到 PC。如果设备驱动程序没有自动安装，请先确认 ESP32 开发板上的 USB 转串口芯片（或外部转串口适配器）型号，然后在网上搜索驱动程序，并进行手动安装。

以下是乐鑫 ESP32 开发板驱动程序的链接：

- CP210x: CP210x USB 至 UART 桥 VCP 驱动程序
- FTDI: FTDI 虚拟 COM 端口驱动程序
以上驱动仅供参考，请参考开发板用户指南，查看开发板具体使用的 USB 转串口芯片。一般情况下，当 ESP32 开发板与 PC 连接时，对应驱动程序应该已经被打包在操作系统中，并已经自动安装。

在 Windows 上查看端口

检查 Windows 设备管理器中的 COM 端口列表。断开 ESP32 与 PC 的连接，然后重新连接，查看哪个端口从列表中消失后又再次出现。

以下为 ESP32 DevKitC 和 ESP32 WROVER KIT 串口:

![Device Manager](image)

图 57: 设备管理器中 ESP32-DevKitC 的 USB 至 UART 桥

在 Linux 和 macOS 上查看端口

查看 ESP32 开发板（或外部转串口适配器）的串口设备名称，请将以下命令运行两次。首先，断开开发板或适配器，首次运行以下命令；然后，连接开发板或适配器，再次运行以下命令。其中，第二次运行命令后出现的端口即是 ESP32 对应的串口:

**Linux:**

```bash
ls /dev/tty*
```

**macOS:**

```bash
ls /dev/cu.*
```

注解：对于 macOS 用户：若你没有看到串口，请检查你是否已按照《入门指南》安装了适用于你特定开发板的 USB/串口驱动程序。对于 macOS High Sierra (10.13) 的用户，你可能还需要手动允许驱动程序的
图 58: Windows 设备管理器中 ESP-WROVER-KIT 的两个 USB 串行端口
在 Linux 中添加用户到 dialout

当前登录用户应当可以通过 USB 对串口进行读写操作。在多数 Linux 版本中，您都可以通过以下命令，将用户添加到 dialout 组，从而获得读写权限:

`sudo usermod -a -G dialout $USER`

在 Arch Linux 中，需要通过以下命令将用户添加到 uucp 组中:

`sudo usermod -a -G uucp $USER`

请重新登录，确保串口读写权限生效。

确认串口连接

现在，请使用串口终端程序，查看重置 ESP32 后终端上是否有输出，从而验证串口连接是否可用。

Windows 和 Linux 操作系统  在本示例中，我们将使用 PuTTY SSH Client，PuTTY SSH Client 既可用于 Windows 也可用于 Linux。你也可以使用其他串口程序并设置如下的通信参数。

运行终端，配置在上述步骤中确认的串口：波特率 = 115200，数据位 = 8，停止位 = 1，奇偶校验 = N。以下列屏分别展示了如何在 Windows 和 Linux 中配置串口和上述通信参数（如 115200-8-1-N）。注意，这里一定要选择在上述步骤中确认的串口进行配置。

然后，请检查 ESP32 是否有打印日志。如有，请在终端打开串口进行查看。这里的日志内容取决于加载到 ESP32 的应用程序，请参考给出示例。

注解：请在验证完串口通信正常后，关闭串口终端。如果您让终端一直保持打开的状态，之后上传固件时将无法访问串口。

macOS 操作系统  macOS 提供了 屏幕 命令，因此您不用安装串口终端程序。

- 参考在 Linux 和 macOS 上查看端口，运行以下命令:

 ls /dev/cu.*

- 您会看到类似如下输出:

/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART7

- 根据您连接到电脑上的开发板类型和数量，输出结果会有所不同。请选择开发板的设备名称，并运行以下命令:

`screen /dev/cu.device_name 115200`

将 device_name 替换为运行 ls /dev/cu.* 后出现的设备串口号。

- 您需要的正是 屏幕 显示的日志。日志内容取决于加载到 ESP32 的应用程序，请参考给出示例。请使用 Ctrl-A + \ 键退出 屏幕 会话。

注解：请在验证完串口通信正常后，关闭 屏幕 会话。如果直接关闭终端窗口而没有关闭 屏幕，之后上传固件时将无法访问串口。
图 59: 在 Windows 操作系统中使用 PuTTY 设置串口通信参数
图 60: 在 Linux 操作系统中使用 PuTTY 设置串口通信参数
输出示例 以下是 ESP32 的一个日志示例。如果没看到任何输出，请尝试重置开发板。

```plaintext
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configisp: 0, SPIWP:0x00
clicrv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

如果打印出的日志是可读的（而不是乱码），则表示串口连接正常。此时，您可以继续进行安装，并最终将应用程序上载到 ESP32。

注解：在某些串口接线方式下，在 ESP32 启动并开始打印串口日志前，需要在终端程序中禁用串口 RTS & DTR 管脚。该问题仅存在于将 RTS & DTR 管脚直接连接到 EN & GPIO0 管脚上的情况，绝大多数开发板（包括乐鑫所有的开发板）都没有这个问题。更多信息，请参考 esptool 文档。

如您在安装 ESP32 硬件开发的软件环境时，请从第六步：连接设备 跳转到了这里，请从第七步：配置 继续阅读。

1.16.2 Eclipse IDE 创建和烧录指南

ESP-IDF V4.0 默认采用基于 CMake 的构建系统。

针对 CMake 构建系统，ESP-IDF 有一款新的 Eclipse 插件。具体操作指南，请见 ESP-IDF Eclipse 插件。

注解：ESP-IDF Eclipse 插件 中使用的是 macOS 截图，但安装指南对 Windows、Linux 和 macOS 均适用。

1.16.3 VS Code IDE 快速入门

我们支持 VS code，并且致力于为所有与 ESP-IDF 相关的操作提供完善的端到端支持，包括构建、烧录、监控、调试、追踪、core-dump、以及系统追踪查看器等操作。

快速安装指南

推荐您从 VS Code 插件市场 中下载 ESP-IDF VS Code 插件，或根据 快速安装指南 安装 ESP-IDF VS Code 插件。

支持如下功能

- 安装程序：帮助您迅速安装 ESP-IDF 及其相关工具链。
### 基本功能

- **构建**：通过一键构建和多目标构建，轻松构建并部署您的应用程序。
- **烧录**：UART 和 JTAG 均可完成烧录。
- **监控**：内置终端带有监控功能，您可以在 VS Code 中启用 IDF 监控命令，操作方法和传统终端一样。
- **调试**：提供可用的硬件调试功能，同时支持事后剖析调试如 core-dump 功能，分析 bug 更加方便。
- **GUI 菜单配置**：提供简化的用户界面，用于配置您的芯片。
- **应用程序追踪 & 堆追踪**：支持从应用程序中收集跟踪，并提供简化的用户界面分析跟踪。
- **系统视图查看器**：读取并显示 .svdat 文件到用户追踪界面，同时支持多个内核追踪视图。
- **IDF 二进制大小分析**：为分析二进制文件大小提供用户界面。
- **Rainmaker Cloud**：我们在云端的 Rainmaker Cloud 支持，您可以轻松编辑/读取连接的物联网设备的状态。
- **代码覆盖**：我们在云端的代码覆盖支持，将用颜色突出显示已经覆盖的行。我们也会在 IDE 内部直接渲染现有的 HTML 报告。

### Bugs 问题 & 功能请求

如果您在使用 VS Code 或其某些功能上遇到问题，建议您在 论坛 或是 github 上提出您的问题，我们会及时对问题进行解答。

我们也欢迎您提出新的功能需求，正是由于用户要求新功能或是建议对现有功能进行改善，才成就我们今天所具备的大多数功能。欢迎您在 github 上提出功能请求。

### 1.16.4 IDF 监视器

IDF 监视器是一个串行终端程序，用于收发目标设备串口的串行数据，IDF 监视器同时还兼具 IDF 的其他特性。

在 IDF 中调用 idf.py monitor 可以启用此监视器

### 操作快捷键

为了方便与 IDF 监视器进行交互，请使用表中给出的快捷键。

---

<table>
<thead>
<tr>
<th>命令</th>
<th>功能</th>
<th>热键</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDF</td>
<td>串行终端</td>
<td>Ctrl+Alt+D</td>
</tr>
<tr>
<td>监视器</td>
<td>双向数据传送</td>
<td>Ctrl+Alt+M</td>
</tr>
</tbody>
</table>

---
<table>
<thead>
<tr>
<th>快捷键</th>
<th>操作</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+J</td>
<td>退出监视器程序</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>菜单退出键</td>
<td>按下如下给出的任意键之一，并按指示操作。</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>将菜单字符发送至远程</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>将 exit 字符发送至远程</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>重置目标设备，进入 Bootloader，通过 RTS 线暂停应用程序</td>
<td>重置目标设备，通过 RTS 线（如已连接）进入 Bootloader，此时开发板不运行任何程序，等待其他设备启动时可以使用此操作。</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>通过 RTS 线重置目标设备</td>
<td>重置设备，并通过 RTS 线（如已连接）重新启动应用程序。</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>编译并烧录此项目</td>
<td>暂停 idf_monitor，运行 flash 目标，然后恢复 idf_monitor。任何改动的源文件都会被重新编译，然后重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。</td>
</tr>
<tr>
<td>• Ctrl+A (或 者 A)</td>
<td>仅编译及烧录应用程序</td>
<td>暂停 idf_monitor，运行 app-flash 目标，然后恢复 idf_monitor。这与 flash 类似，但只有主应用程序被编译并被重新烧录。如果 idf_monitor 是以参数 -E 启动的，则会运行目标 encrypted-flash。</td>
</tr>
<tr>
<td>Ctrl+Y</td>
<td>停止/恢复在屏幕上打印日志输出</td>
<td>激活时，会丢弃所有传入的串行数据。允许在不退出监视器的情况下快速暂停和检查日志输出。</td>
</tr>
<tr>
<td>Ctrl+L</td>
<td>停止/恢复向文件写入日志输出</td>
<td>在工程目录下创建一个文件，用于写入日志输出。可使用快捷键停止/恢复该功能（退出 IDF 监视器也会终止该功能）</td>
</tr>
<tr>
<td>Ctrl+I (或者 I)</td>
<td>停止/恢复打印时间标记</td>
<td>IDF 监视器可以在每一行的开头打印一个时间标记。时间标记的格式可以通过 --timestamp-format 命令行参数来改变。</td>
</tr>
<tr>
<td>Ctrl+H (或者 H)</td>
<td>显示所有快捷键</td>
<td></td>
</tr>
<tr>
<td>Ctrl+X (或者 X)</td>
<td>退出监视器程序</td>
<td></td>
</tr>
<tr>
<td>Ctrl+C</td>
<td>中断正在运行的应用程序</td>
<td>暂停 IDF 监视器并运行 GDB 项目调试器，从而在运行时调试应用程序。这需要启动 ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME 选项。</td>
</tr>
</tbody>
</table>

除了 Ctrl-] 和 Ctrl-T，其他快捷键信号会通过串口发送到目标设备。

### 兼具 IDF 特性

**自动解码地址** ESP-IDF 输出形式为 0x4_______ 的十六进制代码地址后，IDF 监视器将使用 addr2line 查找该地址在源代码中的位置和对应的函数名。

ESP-IDF 应用程序发生 crash 和 panic 事件时，将产生如下的寄存器转储和回溯:
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:

PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 :

IDF 监视器在后台运行以下命令，解码各地址:

xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

注解：将环境变量 ESP_MONITOR_DECODE 设置为 0 或者调用 idf_monitor.py 的特定命令行选项:
配置 GDBStub 以启用 GDB

默认情况下，如果 ESP-IDF 应用程序发生 crash 事件，panic 处理器将在串口上打印相关寄存器和堆栈转储（类似上述情况），然后重置开发板。

此外，可以配置应用程序在后台运行 GDBStub 并处理运行中的应用程序突然中断事件 (Ctrl+C)。

或者选择配置 panic 处理器以运行 GDBStub，GDBStub 工具可以与 GDB 项目调试器进行通信，允许读取内存、检查调用堆栈帧和变量等。GDBStub 虽然没有 JTAG 通用，但不需要使用特殊硬件。

如需在发生 panic 事件时启用 GDBStub，请运行 idf.py menuconfig 打开项目配置菜单，并将 CONFIG_ESP_SYSTEM_PANIC 选项设置为 GDBStub on panic，或者将 CONFIG_ESP_SYSTEM_PANIC 设置为 GDBStub on runtime。

在这种情况下，如果 panic 处理器被触发或应用程序突然中断 (Ctrl+C)，只要 IDF 监视器监控到 GDBStub 已经加载，panic 处理器就会自动暂停串行监控并使用必要的参数运行 GDB。GDB 退出后，通过 RTS 串口线复位开发板。如果未连接 RTS 串口线，请按复位键、手动复位开发板。

IDF 监控器在后台运行如下命令：

```
xtena-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
--interrupt build/PROJECT.elf :idf_target:'Hello NAME chip'
```

输出筛选

可以调用 idf.py monitor --print-filter="xyz" 启动 IDF 监视器，其中，--print-filter 是输出筛选的参数。参数默认值为空字符串，可打印任何内容。

若需对打印内容设置限制，可指定 <tag>:<log_level> 等选项。其中 <tag> 是标签字符串，<log_level> 是 (N, E, W, I, D, V, *) 集合中的一个字母，指的是日志级别。

例如，PRINT_FILTER="tag1:W" 只匹配并打印 ESP_LOGW("tag1", ...) 所写的输出，或者写在较低日志详细级别的输出，即 ESP_LOGE("tag1", ...)。请勿指定 <log_level> 或使用详细级别默认值 *。

注解：编译时，可以使用主日志在日志库中禁用不需要的输出。也可以使用 IDF 监视器筛选输出来调整筛选设置，且无需重新编译应用程序。

应用程序标签不能包含空格、星号 *、冒号 :，以便兼容输出筛选功能。

如果应用程序输出的最后—行后面没有回车，可能会影响输出筛选功能，即，监视器开始打印该行，但后来发现该行不应该被写入。这是一个已知问题，可以通过添加回车来避免此问题（特别是在没有输出紧跟其后的情况下）。

筛选规则示例

- * 可用于匹配任何类型的标签。但 PRINT_FILTER="*:I tag1:E" 打印关于 tag1 的输出时会报错，这是因为 tag1 规则比 * 规则的优先级高。
- 默认规则（空）等价于 *:V，因为在详细级别或更低级别匹配任意标签即意味匹配所有内容。
- "*:N" 不仅抑制了日志功能的输出，也抑制了 printf 的打印输出。为了避免这一问题，请使用 *:E 或更高的优先级。
- 规则 "tag1:V"、"tag1:v"、"tag1:"、"tag1:*" 和 "tag1" 等同。
- 规则 "tag1:W tag1:E" 等同于 "tag1:E"，这是因为后续出现的具有相同名称的标签会覆盖掉前一个标签。
- 规则 "tag1:I tag2:W" 仅在 Info 详细级别或更低级别打印 tag1，在 Warning 详细级别或更低级别打印 tag2。
- 规则 "tag1:I tag2:W tag3:N" 在本质上等同于上一规则，这是因为 tag3:N 指定 tag3 不打印。
• tag3:N 在规则 "tag1:I tag2:N tag3:N *:V" 中更有意义，这是因为如果没有 tag3:N，
tag3 信息就可能打印出来了；tag1 和 tag2 错误信息会打印在指定的详细度级别（或更低级别），
并默认打印所有内容。

高级筛选规则示例 如下日志是在没有设置任何筛选选项的情况下获得的:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="wifi esp_image:E light_driver:I" 筛选选项捕获的输出如下所示:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V" 选项的输出如下:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

IDF 监视器已知问题

Windows 环境下已知问题

• 由于 Windows 控制台限制，有些箭头键及其他一些特殊键无法在 GDB 中使用。
• 偶然情况下，idf.py 退出时，可能会在 IDF 监视器恢复之前暂停 30 秒。
• GDB 运行时，可能会暂停一段时间，然后才开始与 GDBStub 进行通信。

1.16.5 工具链的自定义设置

除了从乐鑫官网（请见第三步：设置工具）下载二进制工具链外，您还可以自行编译工具链。
如无特殊需求，建议直接使用我们提供的预编译二进制工具链。不过，您可以在以下情况考虑自行编译
工具链:

• 需要定制工具链编译配置
• 需要使用其他 GCC 版本（如 4.8.5）
• 需要破解 gcc、newlib 或 libstdc++
• 有相关兴趣或时间充裕
• 不信任从网站下载的 bin 文件

如需自行编译工具链，请查看以下文档:

从零开始设置 Windows 环境下的工具链

除了使用 ESP-IDF 工具安装器，用户也可以手动设置 Windows 环境下的工具链，这正是本文的主要内容。
手动安装工具可以更好地控制安装流程，同时也方便高阶用户进行自定义安装。
使用 ESP-IDF 工具安装器对工具链及其他工具进行快速标准设置，请参照 Windows 平台工具链的标准设置。

获取 ESP-IDF

注解：较早版本 ESP-IDF 使用了 MSYS2 bash 终端命令行。目前，基于 CMake 的编译系统可使用常见的 Windows 命令行，即本指南中使用的终端。

请注意，如果您使用基于 bash 的终端或 PowerShell 终端，一些命令语法将与下面描述有所不同。

打开命令提示符，运行以下命令：

```
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF 将下载至 %userprofile%\esp\esp-idf。

请前往 ESP-IDF 历史版本，查看 ESP-IDF 不同版本的具体适用场景。

注解：此命令将克隆 master 分支，该分支保存着 ESP-IDF 的最新版本，它功能齐全，每周都会更新一些新功能并修正一些错误。

注解：GitHub 中“下载 zip 文档”的功能不适用于 ESP-IDF，所以需要使用 git clone 命令。作为备份，可以在没有安装 Git 的环境中下载 Stable version 的 zip 归档文件。

注解：在克隆远程仓库时，请加上可选参数 --recursive。如果你已经克隆了 ESP-IDF 但没有加上此参数，请运行以下命令获取所有子模块

```
cd esp-idf
git submodule update --init
```

工具

CMake 工具

下载最新发布的 Windows 平台稳定版 CMake，并运行安装器。

当安装器询问“安装选项”时，选择“Add CMake to the system PATH for all users”（为所有用户的系统路径添加 CMake）或“Add CMake to the system PATH for the current user”（为当前用户的系统路径添加 CMake）。

Python 编译工具

注解：目前，Ninja 仅支持提供 64 位 Windows 版本的 bin 文件。

请从 下载页面 下载最新发布的 Windows 平台稳定版 Ninja。

适用于 Windows 平台的 Ninja 下载文件是一个.zip 文件，包含一个 ninja.exe 文件。您需要将该文件解压到目录，并 添加到 Path 环境变量（或者选择解压到 Path 变量中已有的目录）。

Python 下载并运行适用于 Windows 安装器的最新版 Python。

Python 安装器的“自定义”菜单可为您提供一系列选项，最后一项为“Add python.exe to Path”（添加 python.exe 到 Path 环境变量中），请将该选项更改为“Will be installed”（将会安装）。

Python 安装完成后，从 Windows 开始菜单中打开“命令提示符”窗口，并运行以下命令：
pip install --user pyserial

工具链设置 下载预编译的 Windows 工具链:
将压缩包文件解压到 C:\Program Files`\( 其他位置）。压缩包文件包含一个 `\xtensa-esp32-elf` 目录。
然后，请将该目录下的 bin 子目录添加到 Path 环境变量。例如，将目录 C:\Program Files\xtensa-esp32-elf\bin 添加到 Path 环境变量。

添加目录到 Path 环境变量 在 Windows 环境下，向 Path 环境变量增加任何新目录，请:
打开系统“控制面板”，找到环境变量对话框（ Windows 10 用户请前往 “高级系统设置”）。
双击 Path 变量（选择 “用户路径” 或 “系统路径” ，具体取决于您是否希望其他用户的 Path 中也存在该目录）。最后在值的末尾增加 `;<new value>`。

后续步骤 请前往第三步：设置工具 章节继续设置开发环境。

从零开始设置 Linux 环境下的工具链
除了从乐鑫官网直接下载已编译好的二进制工具链外，您还可以按照本文介绍，从头开始设置自己的工具链。如需快速使用已编译好的二进制工具链，可回到 Linux 平台工具链的标准设置 章节。

注解：设置自己的工具链可以解决 Y2K38 问题（time_t 从 32 位扩展到 64 位）。

安装准备 编译 ESP-IDF 需要以下软件包:
- CentOS 7:
  ```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf
  --python3 python3-pip cmake ninja-build ccache dfu-util libusbx
  ```
目前仍然支持 CentOS 7，但为了更好的用户体验，建议使用 CentOS 8。
- Ubuntu 和 Debian:
  ```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
  --pip python3-setuptools python3-serial python3-cryptography python3-future
  --python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev
  --libssl-dev dfu-util libusb-1.0-0
  ```
- Arch:
  ```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial
  --python-cryptography python-future python-pyparsing python-pyelftools cmake
  --ninja ccache dfu-util libusb
  ```
注解：使用 ESP-IDF 需要 CMake 3.5 或以上版本。较早的 Linux 发行版可能需要升级自身的软件源仓库，或开启 backports 套件库，或安装“cmake3”软件包（不是安装 “cmake”）。
从源代码编译工具链 安装依赖项:

- CentOS 7:
  ```bash
  sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel
  `automake bison flex texinfo help2man libtool make
  ```

- Ubuntu pre-16.04:
  ```bash
  sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev
  `automake bison flex texinfo help2man libtool make
  ```

- Ubuntu 16.04 或以上:
  ```bash
  sudo apt-get install gawk gperf grep gettext python python-dev
  `automake bison flex texinfo help2man libtool libtool-bin make
  ```

- Debian 9:
  ```bash
  sudo apt-get install gawk gperf grep gettext python python-dev
  `automake bison flex texinfo help2man libtool libtool-bin make
  ```

- Arch:
  ```bash
  sudo pacman -Sy --needed python-pip
  ```

创建工作目录，并进入该目录:

```bash
mkdir -p ~/esp
cd ~/esp
dir
```

下载并编译 crosstool-NG:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
```

```bash
./bootstrap && ./configure --enable-local && make
```

注解：在设置支持 64 位 time_t 的工具链时，您需要将 crosstool-NG/samples/xtensa-esp32-elf/crosstool.config 文件中第 33 和 43 行的可选参数 --enable-newlib-long-time_t 删除。

编译工具链:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

编译得到的工具链会被保存至 ~/esp/crosstool-NG/builds/xtensa-esp32-elf。

添加工具链到 PATH 环境变量 需要将自定义工具链复制到一个二进制目录中，并将其添加到 PATH 中。例如，您可以将编译好的工具链复制到 ~/esp/xtensa-esp32-elf/目录中。

为了正常使用工具链，您需要更新 ~/profile 文件中 PATH 环境变量。此外，您还可以在 ~/profile 文件中增加以下代码。这样，所有终端窗口均可以使用 xtensa-esp32-elf:

```bash
export PATH=~/esp/xtensa-esp32-elf/bin:$PATH
```

注解：如果您已将 /bin/bash 设置为登录 shell，且同时存在 .bash_profile 和 .profile 两个文件，则请更新 .bash_profile，在 CentOS 环境下，alias 需要添加到 .bashrc 文件中。
退出并重新登录以使 .profile 的更改生效。运行以下命令来检查 PATH 设置是否正确:

```
printenv PATH
```

此时您需要检查输出结果的开头中是否包含类似如下的工具链路径:

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
```

注意这里的 /home/user-name 应该替换成您安装的主路径。

后续步骤 请前往第二步：获取 ESP-IDF 章节继续设置开发环境。

### 从零开始设置 macOS 环境下的工具链

#### 软件包管理器
从零开始设置工具链，您需要安装 MacPorts 或 Homebrew 软件包管理器。或者，您也可以直接下载预编译的工具链。

MacPorts 需要完整的 XCode 软件，而 Homebrew 只需要安装 XCode 命令行工具即可。

请参考工具链自定义设置 章节，查看可能需要从头开始设置工具链的情况。

#### 安装准备

- 安装 pip:

  ```
sudo easy_install pip
  ```

- 安装 pyserial:

  ```
pip install --user pyserial
  ```

- 安装 CMake 和 Ninja 编译工具:
  - 若有 Homebrew，您可以运行:

    ```
brew install cmake ninja dfu-util
    ```
  - 若有 MacPorts，您可以运行:

    ```
sudo port install cmake ninja dfu-util
    ```

#### 从源代码编译工具链

安装依赖项:

- 对于 MacPorts:

  ```
sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf... --automake make
  ```

- 对于 Homebrew:

  ```
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool... --autoconf automake make
  ```

创建一个文件系统镜像（区分大小写）:

```
hdutil create ~/esp/crosschain.dmg -volname "ctng" -size 10g -fs "Case-sensitive..." -HFS+
```

挂载:
Chapter 1. 快速入门

```bash
hdiutil mount ~/esp/crosstool.dmg
```

创建指向您工作目录的符号链接:

```bash
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

前往新创建的目录:

```bash
cd ~/esp/ctng-volume
```

下载并编译 crosstool-NG:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap ./configure --enable-local --make
```

编译工具链:

```bash
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

后续步骤 请前往第二步：获取 ESP-IDF 章节继续设置开发环境。
Chapter 2

API 参考

2.1 蓝牙 API

2.1.1 Controller & VHCI

Overview

Instructions

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

• This is a BLE advertising demo with virtual HCI interface. Send Re-set/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

• components/bt/include/esp32/include/esp_bt.h

Functions

esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Return  ESP_OK - success, other - failed

Parameters

• power_type: Type of which tx power, could set Advertising/Connection/Default and etc
• power_level: Power level(index) corresponding to absolute value(dbm)

esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Return  >= 0 - Power level, < 0 - Invalid

Parameters

• power_type: Type of which tx power, could set Advertising/Connection/Default and etc

esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Return** ESP_OK - success, other - failed

**Parameters**
- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** ESP_OK - success, other - failed

**Parameters**
- `min_power_level`: The minimum power level
- `max_power_level`: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set(esp_sco_data_path_t data_path)
```

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP_OK - success, other - failed

**Parameters**
- `data_path`: SCO data path

```c
esp_err_t esp_bt_controller_init(esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** ESP_OK - success, other - failed

**Parameters**
- `cfg`: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

```c
esp_err_t esp_bt_controller_deinit(void)
```

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_enable(esp_bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- `mode`: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

```c
esp_err_t esp_bt_controller_disable(void)
```

Disable BT controller.

**Return** ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_get_status(void)
```

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

```c
bool esp_vhci_host_check_send_available(void)
```

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.
Return  true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
• data: the packet point
• len: the packet length

esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback
structure.

Return  ESP_OK - success, ESP_FAIL - failed

Parameters
• callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k
bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after
esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the
blue tooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled)
then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call
esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT
Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API
esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls
esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data
consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation
of esp_bt_mem_release() function

Return  ESP_OK - success, other - failed

Parameters
• mode: the mode want to release memory

esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the
mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Addi-
tionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the
BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth
mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled)
then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call
esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after
esp_bt_controller_deinit.
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- `mode`: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable Bluetooth modem sleep

Note that this function shall not be invoked before esp bt controller_enable()

If esp bt sleep disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp bt controller wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicatelist_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**
- ESP_OK : success
- other : failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off
Chapter 2. API Reference

**Structures**

```c
struct esp_bt_controller_config_t
```

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

- `uint16_t controller_task_stack_size`
  - Bluetooth controller task stack size
- `uint8_t controller_task_prio`
  - Bluetooth controller task priority
- `uint8_t hci_uart_no`
  - If use UART1/2 as HCI IO interface, indicate UART number
- `uint32_t hci_uart_baudrate`
  - If use UART1/2 as HCI IO interface, indicate UART baudrate
- `uint8_t scan_duplicate_mode`
  - scan duplicate mode
- `uint8_t scan_duplicate_type`
  - scan duplicate type
- `uint16_t normal_adv_size`
  - Normal adv size for scan duplicate
- `uint16_t mesh_adv_size`
  - Mesh adv size for scan duplicate
- `uint16_t send_adv_reserved_size`
  - Controller minimum memory value
- `uint32_t controller_debug_flag`
  - Controller debug log flag
- `uint8_t mode`
  - Controller mode: BR/EDR, BLE or Dual Mode
- `uint8_t ble_max_conn`
  - BLE maximum connection numbers
- `uint8_t bt_max_acl_conn`
  - BR/EDR maximum ACL connection numbers
- `uint8_t bt_scodatapath`
  - SCO data path, i.e. HCI or PCM module
- `bool auto_latency`
  - BLE auto latency, used to enhance classic BT performance
- `bool bt_legacy_auth_vs_evt`
  - BR/EDR Legacy auth complete event required to protect from BIAS attack
- `uint8_t bt_max_sync_conn`
  - BR/EDR maximum ACL connection numbers. Effective in menuconfig
- `uint8_t ble_sca`
  - BLE low power crystal accuracy index
- `uint8_t pcm_role`
  - PCM role (master & slave)
- `uint8_t pcm_polar`
  - PCM polar trig (falling clk edge & rising clk edge)
Chapter 2. API

bool hli
Using high level interrupt or not

uint32_t magic
Magic number

struct esp_vhci_host_callback

`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

Public Members

void (*`notify_host_send_available`) (void)
callback used to notify that the host can send packet to controller

int (*`notify_host_recv`) (uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t

`esp_vhci_host_callback` used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
Bluetooth mode for controller enable/disable.

Values:

ESP_BT_MODE_IDLE = 0x00
Bluetooth is not running

ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]
BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm
ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

def esp_bt_controller_status_t
paralleled controller enable/disable/initialised/de-initialised status.

Values:

ESP_BT_CONTROLLER_STATUS_IDLE = 0
ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

def esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be
set after connection completed. When connect, the correspond TX power is not effected.
ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value.
If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will
use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
For connection handle 1
ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
For connection handle 2
ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
For connection handle 3
ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
For connection handle 4
ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
For connection handle 5
ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
For connection handle 6
ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
For connection handle 7
ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers
enum esp_power_level_t

Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
    Corresponding to -12dbm
ESP_PWR_LVL_N9 = 1
    Corresponding to -9dbm
ESP_PWR_LVL_N6 = 2
    Corresponding to -6dbm
ESP_PWR_LVL_N3 = 3
    Corresponding to -3dbm
ESP_PWR_LVL_N0 = 4
    Corresponding to 0dbm
ESP_PWR_LVL_P3 = 5
    Corresponding to +3dbm
ESP_PWR_LVL_P6 = 6
    Corresponding to +6dbm
ESP_PWR_LVL_P9 = 7
    Corresponding to +9dbm
ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
    Backward compatibility! Setting to -14dbm will actually result to -12dbm
ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
    Backward compatibility! Setting to -11dbm will actually result to -9dbm
ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
    Backward compatibility! Setting to -8dbm will actually result to -6dbm
ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
    Backward compatibility! Setting to -5dbm will actually result to -3dbm
ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
    Backward compatibility! Setting to -2dbm will actually result to 0dbm
ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
    Backward compatibility! Setting to +1dbm will actually result to +3dbm
ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
    Backward compatibility! Setting to +4dbm will actually result to +6dbm
ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
    Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t

Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
    data over HCI transport
ESP_SCO_DATA_PATH_PCM = 1
    data over PCM interface

Chapter 2. API

ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128
ESP_BD_ADDR_LEN
Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
Minimum of the application id.

ESP_APP_ID_MAX
Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions

typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BT_OCTET16_LEN]
Bluetooth device address.
typedef uint8_t esp_ble_key_mask_t

Enumerations

enum esp_bt_status_t
    Status Return Value.

Values:

ESP_BT_STATUS_SUCCESS = 0
ESP_BT_STATUS_FAIL
ESP_BT_STATUS_NOT_READY
ESP_BT_STATUS_NOMEM
ESP_BT_STATUS_BUSY
ESP_BT_STATUS_DONE = 5

ESP_BT_STATUS_CONTROL_LE_DATA_LEN_UNSUPPORTED
ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
ESP_BT_STATUS_MEMORY_FULL = 20
ESP_BT_STATUS_EIR_TOO_LARGE

enum esp_bt_dev_type_t

- Bluetooth device type.

Values:

ESP_BT_DEVICE_TYPE_BREDR = 0x01
ESP_BT_DEVICE_TYPE_BLE = 0x02
ESP_BT_DEVICE_TYPE_DUMO = 0x03

enum esp_ble_addr_type_t

- BLE device address type.

Values:

BLE_ADDR_TYPE_PUBLIC = 0x00
BLE_ADDR_TYPE_RANDOM = 0x01
BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
BLE_ADDR_TYPE_RPA_RANDOM = 0x03

enum esp_ble_wl_addr_type_t

- White list address type.

Values:

BLE_WL_ADDR_TYPE_PUBLIC = 0x00
BLE_WL_ADDR_TYPE_RANDOM = 0x01

BT MAIN API

Overview Instructions

Application Example Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h
Functions

```c
esp_bluedroid_status_t esp_bluedroid_get_status(void)
```
Get bluetooth stack status.

**Return** Bluetooth stack status

```c
esp_err_t esp_bluedroid_enable(void)
```
Enable bluetooth, must after esp_bluedroid_init().

**Return**
- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_disable(void)
```
Disable bluetooth, must prior to esp_bluedroid_deinit().

**Return**
- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_init(void)
```
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

```c
esp_err_t esp_bluedroid_deinit(void)
```
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

Enumerations

```c
define esp_bluedroid_status_t
```
Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**

```c
ESP_BLUEDROID_STATUS_UNINITIALIZED = 0
```
Bluetooth not initialized

```c
ESP_BLUEDROID_STATUS_INITIALIZED
```
Bluetooth initialized but not enabled

```c
ESP_BLUEDROID_STATUS_ENABLED
```
Bluetooth initialized and enabled

BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

**Instructions**

**Application Example** Instructions

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
Functions

const uint8_t* esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after "esp_bluedroid_enable".

Return bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name (const char *name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
• ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
• ESP_FAIL : others

Parameters

• [in] name: device name to be set

2.1.3 BT LE

GAP API

Overview

Instructions

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough
• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] callback: callback function

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

Return

• ESP_OK : success
• other : failed
Parameters
  • [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

`esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t *scan_params)`
This function is called to set scan parameters.

Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

`esp_err_t esp_ble_gap_start_scanning(uint32_t duration)`
This procedure keep the device scanning the peer device which advertising on the air.

Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] duration: Keeping the scanning time, the unit is second.

`esp_err_t esp_ble_gap_stop_scanning(void)`
This function call to stop the device scanning the peer device which advertising on the air.

Return
  • ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)`
This function is called to start advertising.

Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] adv_params: pointer to User defined adv_params data structure.

`esp_err_t esp_ble_gap_stop_advertising(void)`
This function is called to stop advertising.

Return
  • ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)`
Update connection parameters, can only be used when connection is up.

Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] params: - connection update parameters

`esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)`
This function is to set maximum LE data packet size.

Return
  • ESP_OK : success
  • other : failed

`esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`
This function sets the static Random Address and Non-Resolvable Private Address for the application.
# Chapter 2. API 参考

## Return
- ESP_OK: success
- other: failed

## Parameters
- [in] rand_addr: the random address which should be setting

### esp_err_t esp_ble_gap_clear_rand_addr (void)
This function clears the random address for the application.

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)
Enable/disable privacy on the local device.

- ESP_OK: success
- other: failed

## Parameters
- [in] privacy_enable: enable/disable privacy on remote device.

### esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)
set local gap appearance icon

- ESP_OK: success
- other: failed

## Parameters

### esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)
Add or remove device from white list.

- ESP_OK: success
- other: failed

## Parameters
- [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote_bda: the remote device address add/remove from the white list.
- [in] wl_addr_type: whitelist address type

### esp_err_t esp_ble_gap_clear_whitelist (void)
Clear all white list.

- ESP_OK: success
- other: failed

### esp_err_t esp_ble_gap_get_whitelist_size (uint16_t *length)
Get the whitelist size in the controller.

- ESP_OK: success
- other: failed

## Parameters
- [out] length: the white list length.

**esp_err_t esp_ble_gap_set_prefer_conn_params:**
```
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

**esp_err_t esp_ble_gap_set_device_name:**
```
const char* name)
```

Set device name to the local device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] name: - device name.

**esp_err_t esp_ble_gap_get_local_used_addr:**
```
esp_bd_addr_t local_used_addr, uint8_t* addr_type)
```

This function is called to get local used address and address type. `uint8_t* esp_bt_dev_get_address(void)` get the public address.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] local_used_addr: - current local used ble address (six bytes)
- [in] addr_type: - ble address type

```
uint8_t* esp_ble_resolve_adv_data(uint8_t* adv_data, uint8_t type, uint8_t* length)
```

This function is called to get ADV data for a specific type.

**Return**
- pointer of ADV data

**Parameters**
- [in] adv_data: - pointer of ADV data which to be resolved
- [in] type: - finding ADV data type
- [out] length: - return the length of ADV data not including type

**esp_err_t esp_ble_gap_config_adv_data_raw:**
```
uint8_t* raw_data, uint32_t raw_data_len)
```

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] raw_data: raw advertising data
- [in] raw_data_len: raw advertising data length, less than 31 bytes

**esp_err_t esp_ble_gap_config_scan_rsp_data_raw:**
```
uint8_t* raw_data, uint32_t raw_data_len)
```

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
Chapter 2. API

- [in] raw_data:: raw scan response data
- [in] raw_data_len:: raw scan response data length, less than 31 bytes

```c
esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)
```

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_addr:: The remote connection device address.

```c
esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
             esp_duplicate_info_t device_info)
```

This function is called to add a device info into the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] type:  device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- [in] device_info:: the device information.

```c
esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
             esp_duplicate_info_t device_info)
```

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] type:  device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV , device_info is invalid.
- [in] device_info:: the device information.

```c
esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)
```

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

```c
esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value,
                    uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:
1. Set bit ESP_LE_AUTH_REQ_SC_ONLY (param_type is ESP_BLE_SM_AUTHEN_REQ_MODE), bit ESP_LE_AUTH_BOND and bit ESP_LE_AUTH_REQ_MITM is optional as required.
2. Set to ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE (param_type is ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH).

Return - ESP_OK : success
• other : failed

Parameters
• [in] param_type: : the type of the param which to be set
• [in] value: : the param value
• [in] len: : the length of the param value

esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)
Grant security request access.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr: : BD address of the peer
• [in] accept: : accept the security request or not

esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr: : the address of the peer device need to encryption
• [in] sec_act: : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr: : BD address of the peer
• [in] accept: : passkey entry successful or declined.
• [in] passkey: : passkey value, must be a 6 digit number, can be lead by 0.

esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)
Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr: : BD address of the peer device
• [in] accept: : numbers to compare are the same or different.

esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
• other : failed

Parameters
• [in] bd_addr: : BD address of the peer device

int esp_ble_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
• ESP_FAIL : failed
`esp_err_t esp_ble_get_bond_device_list(int *dev_num, esp_ble_bond_dev_t *dev_list)`

Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return - ESP_OK : success
• other : failed

Parameters
• [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
• [out] dev_list: an array(buffer) of `esp_ble_bond_dev_t` type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

`esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)`

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK: success
• other: failed

Parameters
• [in] bd_addr: BD address of the peer device.
• [in] TK: TK value, the TK value shall be a 128-bit random number
• [in] len: length of tk, should always be 128-bit

`esp_err_t esp_ble_gap_disconnect(esp_bd_addr_t remote_device)`

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Return - ESP_OK: success
• other: failed

Parameters
• [in] remote_device: BD address of the peer device

`esp_err_t esp_ble_get_current_conn_params(esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)`

This function is called to read the connection parameters information of the device.

Return - ESP_OK: success
• other: failed

Parameters
• [in] bd_addr: BD address of the peer device.
• [out] conn_params: the connection parameters information

`esp_err_t esp_gap_ble_set_channels(esp_gap_ble_channels channels)`

BLE set channels.

Return - ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• other: failed

Parameters
• [in] channels: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

`esp_err_t esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)`

This function is called to authorized a link after Authentication(MITM protection)

Return - ESP_OK: success
• other: failed

Parameters
• [in] bd_addr: BD address of the peer device.
• [out] authorize: Authorized the link or not.
Chapter 2. API 参考

```
esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)
This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

Return  - ESP_OK : success
          • other : failed

Parameters
          • [in] bd_addr : BD address of the peer device

esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask,
                                              esp_ble_gap_phy_mask_t rx_phy_mask)
This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

Return  - ESP_OK : success
          • other : failed

Parameters
          • [in] tx_phy_mask : indicates the transmitter PHYs that the Host prefers the Controller to use
          • [in] rx_phy_mask : indicates the receiver PHYs that the Host prefers the Controller to use

esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr,
                                       esp_ble_gap_all_phys_t all_phys_mask,
                                       esp_ble_gap_phy_mask_t tx_phy_mask,
                                       esp_ble_gap_phy_mask_t rx_phy_mask,
                                       esp_ble_gap_prefer_phy_options_t phy_options)
This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

Return  - ESP_OK : success
          • other : failed

Parameters
          • [in] bd_addr : remote address
          • [in] all_phys_mask : a bitfield that allows the Host to specify
          • [in] tx_phy_mask : a bitfield that indicates the transmitter PHYs that the Host prefers the Controller to use
          • [in] rx_phy_mask : a bitfield that indicates the receiver PHYs that the Host prefers the Controller to use
          • [in] phy_options : a bitfield that allows the Host to specify options for PHYs

esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)
This function is used by the Host to set the random device address specified by the Random_Address parameter.

Return  - ESP_OK : success
          • other : failed

Parameters
          • [in] instance : Used to identify an advertising set
          • [in] rand_addr : Random Device Address

esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance,
                                         const esp_ble_gap_ext_adv_params_t *params)
This function is used by the Host to set the advertising parameters.

Return  - ESP_OK : success
          • other : failed

Parameters
          • [in] instance : identifies the advertising set whose parameters are being configured.
          • [in] params : advertising parameters

esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)
This function is used to set the data used in advertising PDUs that have a data field.

Return  - ESP_OK : success
```
Chapter 2. API

**esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw**

This function is used to provide scan response data used in scanning response PDUs.

- **Return**: ESP_OK: success
  - other: failed

**Parameters**
- [in] instance: identifies the advertising set whose data are being configured
- [in] length: data length
- [in] data: data information

**esp_err_t esp_ble_gap_ext_adv_start**

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

- **Return**: ESP_OK: success
  - other: failed

**Parameters**
- [in] num_adv: Number of advertising sets to enable or disable
- [in] ext_adv: adv parameters

**esp_err_t esp_ble_gap_ext_adv_stop**

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

- **Return**: ESP_OK: success
  - other: failed

**Parameters**
- [in] num_adv: Number of advertising sets to enable or disable
- [in] ext_adv_inst: ext adv instance

**esp_err_t esp_ble_gap_ext_adv_set_remove**

This function is used to remove an advertising set from the Controller.

- **Return**: ESP_OK: success
  - other: failed

**Parameters**
- [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_ext_adv_set_clear**

This function is used to remove all existing advertising sets from the Controller.

- **Return**: ESP_OK: success
  - other: failed

**esp_err_t esp_ble_gap_periodic_adv_set_params**

This function is used by the Host to set the parameters for periodic advertising.

- **Return**: ESP_OK: success
  - other: failed

**Parameters**
- [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
- [in] params: periodic adv parameters
**esp_err_t esp_ble_gap_config_periodic_adv_data_raw** (uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
- [in] length: the length of periodic data
- [in] data: periodic data information

**esp_err_t esp_ble_gap_periodic_adv_start** (uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_periodic_adv_stop** (uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] instance: Used to identify an advertising set

**esp_err_t esp_ble_gap_set_ext_scan_params** (const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] params: scan parameters

**esp_err_t esp_ble_gap_start_ext_scan** (uint32_t duration, uint16_t period)

This function is used to enable scanning.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] duration: Scan duration
- [in] period: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

**esp_err_t esp_ble_gap_stop_ext_scan** (void)

This function is used to disable scanning.

**Return**
- ESP_OK: success
- other: failed

**esp_err_t esp_ble_gap_periodic_adv_create_sync** (const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] params: sync parameters

**esp_err_t esp_ble_gap_periodic_adv_sync_cancel** (void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Return**
- ESP_OK: success
**esp_err_t esp_ble_gap_periodic_adv_sync_terminate** (uint16_t sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] sync_handle: : identify the periodic advertiser

**esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list** (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] addr_type: : addresstype
- [in] addr: : Device Address
- [in] sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list** (esp_ble_addr_type_t addr_type, esp_bd_addr_t addr, uint8_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] addr_type: : addresstype
- [in] addr: : Device Address
- [in] sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t esp_ble_gap_periodic_adv_clear_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] addr: : device address
- [in] phy_mask: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] phy_1m_conn_params: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] phy_2m_conn_params: : Connection parameters for the LE 2M PHY are provided.
- [in] phy_coded_conn_params: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**esp_err_t esp_ble_gap_prefer_ext_connect_params_set** (esp_bd_addr_t addr, esp_ble_gap_phy_mask_t phy_mask, const esp_ble_gap_conn_params_t* phy_1m_conn_params, const esp_ble_gap_conn_params_t* phy_2m_conn_params, const esp_ble_gap_conn_params_t* phy_coded_conn_params)

This function is used to set aux connection parameters.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] addr: : device address
- [in] phy_mask: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- [in] phy_1m_conn_params: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- [in] phy_2m_conn_params: : Connection parameters for the LE 2M PHY are provided.
- [in] phy_coded_conn_params: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```

**struct ble_update_whitelist_cmpl_evt_param**

Public Members

`esp_bt_status_t status`
Indicate update duplicate scan exceptional list operation success status

```c
#include <esp_gap_ble_api.h>
ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```
Public Members

`esp_bt_status_t status`
Indicate the add or remove whitelist operation success status

`esp_ble_wl_operation_t wl_operation`
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

`struct esp_ble_adv_params_t`
Advertising parameters.

Public Members

uint16_t `adv_int_min`
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t `adv_int_max`
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`esp_ble_adv_type_t adv_type`
Advertising type

`esp_ble_addr_type_t own_addr_type`
Owner bluetooth device address type

`esp_bd_addr_t peer_addr`
Peer device bluetooth device address

`esp_ble_addr_type_t peer_addr_type`
Peer device bluetooth device address type, only support public address type and random address type

`esp_ble_adv_channel_t channel_map`
Advertising channel map

`esp_ble_adv_filter_t adv_filter_policy`
Advertising filter policy

`struct esp_ble_adv_data_t`
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

bool `set_scan_rsp`
Set this advertising data as scan response or not

bool `include_name`
Advertising data include device name or not

bool `include_txpower`
Advertising data include TX power

int `min_interval`
Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalMin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.
int max_interval
Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
External appearance of device

uint16_t manufacturer_len
Manufacturer data length

uint8_t *p_manufacturer_data
Manufacturer data point

uint16_t service_data_len
Service data length

uint8_t *p_service_data
Service data point

uint16_t service_uuid_len
Service uuid length

uint8_t *p_service_uuid
Service uuid array point

uint8_t flag
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

Public Members

esp_ble_scan_type_t scan_type
Scan type

esp_ble_addr_type_t own_addr_type
Owner address type

esp_ble_scan_filter_t scan_filter_policy
Scan filter policy

uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

esp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
connection parameters information
Public Members

uint16_t interval
  connection interval

uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
  Connection update parameters.

Public Members

esp_bd_addr_t bda
  Bluetooth device address

uint16_t min_int
  Min connection interval

uint16_t max_int
  Max connection interval

uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
  BLE pkt data length keys.

Public Members

uint16_t rx_len
  pkt rx data length value

uint16_t tx_len
  pkt tx data length value

struct esp_ble_penc_keys_t
  BLE encryption keys.

Public Members

esp_bt_octet16_t ltk
  The long term key

esp_bt_octet8_t rand
  The random number

uint16_t ediv
  The ediv value

uint8_t sec_level
  The security level of the security link

uint8_t key_size
  The key size (7~16) of the security link
struct esp_ble_pcsrk_keys_t
    BLE CSRK keys.

    Public Members

    uint32_t counter
        The counter
    esp_bt_octet16_t csrk
        The csrk key
    uint8_t sec_level
        The security level

struct esp_ble_pid_keys_t
    BLE pid keys.

    Public Members

    esp_bt_octet16_t irk
        The irk value
    esp_ble_addr_type_t addr_type
        The address type
    esp_bd_addr_t static_addr
        The static address

struct esp_ble_lenc_keys_t
    BLE Encryption reproduction keys.

    Public Members

    esp_bt_octet16_t ltk
        The long term key
    uint16_t div
        The div value
    uint8_t key_size
        The key size of the security link
    uint8_t sec_level
        The security level of the security link

struct esp_ble_lcsrk_keys
    BLE SRK keys.

    Public Members

    uint32_t counter
        The counter value
    uint16_t div
        The div value
    uint8_t sec_level
        The security level of the security link
    esp_bt_octet16_t csrk
        The csrk key value
**struct esp_ble_sec_key_notif_t**
Structure associated with ESP_KEY_NOTIF_EVT.

**Public Members**

`esp_bd_addr_t bd_addr`
peer address

`uint32_t passkey`
the numeric value for comparison. If just_works, do not show this number to UI

**struct esp_ble_sec_req_t**
Structure of the security request.

**Public Members**

`esp_bd_addr_t bd_addr`
peer address

**struct esp_ble_bond_key_info_t**
struct type of the bond key information value

**Public Members**

`esp_ble_key_mask_t key_mask`
the key mask to indicate which key is present

`esp_ble_penc_keys_t penc_key`
received peer encryption key

`esp_ble_pcsrk_keys_t pcsrk_key`
received peer device SRK

`esp_ble_pid_keys_t pid_key`
peer device ID key

**struct esp_ble_bond_dev_t**
struct type of the bond device value

**Public Members**

`esp_bd_addr_t bd_addr`
peer address

`esp_ble_bond_key_info_t bond_key`
the bond key information

**struct esp_ble_key_t**
union type of the security key value

**Public Members**

`esp_bd_addr_t bd_addr`
peer address

`esp_ble_key_type_t key_type`
key type of the security link

`esp_ble_key_value_t p_key_value`
the pointer to the key value
struct esp_ble_local_id_keys_t
  structure type of the ble local id keys value

Public Members

esp_bt_octet16_t ir
  the 16 bits of the ir value

esp_bt_octet16_t irk
  the 16 bits of the ir key value

esp_bt_octet16_t dhk
  the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
  Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t bd_addr
  BD address peer device.

bool key_present
  Valid link key value in key element

esp_link_key key
  Link key associated with peer device.

uint8_t key_type
  The type of Link Key

bool success
  TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
  The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
  Peer device address type

esp_bt_dev_type_t dev_type
  Device type

esp_ble_auth_req_t auth_mode
  authentication mode

struct esp_ble_gap_ext_adv_params_t
  ext adv parameters

Public Members

esp_ble_ext_adv_type_mask_t type
  ext adv type

uint32_t interval_min
  ext adv minimum interval

uint32_t interval_max
  ext adv maximum interval

esp_ble_adv_channel_t channel_map
  ext adv channel map
```c
esp_ble_addr_type_t own_addr_type
    ext adv own address type

esp_ble_addr_type_t peer_addr_type
    ext adv peer address type

esp_bd_addr_t peer_addr
    ext adv peer address

esp_ble_adv_filter_t filter_policy
    ext adv filter policy

int8_t tx_power
    ext adv tx power

esp_ble_gap_pri_phy_t primary_phy
    ext adv primary phy

uint8_t max_skip
    ext adv maximum skip

esp_ble_gap_phy_t secondary_phy
    ext adv secondary phy

uint8_t sid
    ext adv sid

bool scan_req_notif
    ext adv scan request event notify

struct esp_ble_ext_scan_cfg_t
    ext scan config

Public Members

esp_ble_scan_type_t scan_type
    ext scan type

uint16_t scan_interval
    ext scan interval

uint16_t scan_window
    ext scan window

struct esp_ble_ext_scan_params_t
    ext scan parameters

Public Members

esp_ble_addr_type_t own_addr_type
    ext scan own address type

esp_ble_scan_filter_t filter_policy
    ext scan filter policy

esp_ble_scan_duplicate_t scan_duplicate
    ext scan duplicate scan

esp_ble_ext_scan_cfg_mask_t cfg_mask
    ext scan config mask

esp_ble_ext_scan_cfg_t uncoded_cfg
    ext scan uncoded config parameters

dsp_ble_ext_scan_cfg_t coded_cfg
    ext scan coded config parameters
```
**struct esp_ble_gap_conn_params_t**
create extend connection parameters

**Public Members**

- `uint16_t scan_interval`
  - init scan interval
- `uint16_t scan_window`
  - init scan window
- `uint16_t interval_min`
  - minimum interval
- `uint16_t interval_max`
  - maximum interval
- `uint16_t latency`
  - ext scan type
- `uint16_t supervision_timeout`
  - connection supervision timeout
- `uint16_t min_ce_len`
  - minimum ce length
- `uint16_t max_ce_len`
  - maximum ce length

**struct esp_ble_gap_ext_adv_t**
extend adv enable parameters

**Public Members**

- `uint8_t instance`
  - advertising handle
- `int duration`
  - advertising duration
- `int max_events`
  - maximum number of extended advertising events

**struct esp_ble_gap_periodic_adv_params_t**
periodic adv parameters

**Public Members**

- `uint16_t interval_min`
  - periodic advertising minimum interval
- `uint16_t interval_max`
  - periodic advertising maximum interval
- `uint8_t properties`
  - periodic advertising properties

**struct esp_ble_gap_periodic_adv_sync_params_t**
periodic adv sync parameters

Passive scan
BLE_SCAN_TYPE_ACTIVE = 0x1
Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:
BLE_SCAN_FILTER_ALLOW_ALL = 0x0
Accept all:
1. advertisement packets except directed advertising packets not addressed to this device (default).

BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
Accept only:
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
Accept all:
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:
BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received
BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host
BLE_SCAN_DUPLICATE_MAX = 0x2
0x02~0xFF, Reserved for future use

enum esp_gap_search_evt_t
    Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.
    Values:
    
    ESP_GAP_SEARCH_INQ_RES_EVT = 0
    Inquiry result for a peer device.
    ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
    Inquiry complete.
    ESP_GAP_SEARCH_DISC_RES_EVT = 2
    Discovery result for a peer device.
    ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
    Discovery result for BLE GATT based service on a peer device.
    ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
    Discovery complete.
    ESP_GAP_SEARCH_DISC_BLE_CMPL_EVT = 5
    Discovery complete.
    ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
    Search cancelled.
    ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
    The number of pkt discarded by flow control.

enum esp_ble_evt_type_t
    Ble scan result event type, to indicate the result is scan response or advertising data or other.
    Values:
    
    ESP_BLE_EVT_CONN_ADV = 0x00
    Connectable undirected advertising (ADV_IND).
    ESP_BLE_EVT_CONN_DIR_ADV = 0x01
    Connectable directed advertising (ADV_DIRECT_IND).
    ESP_BLE_EVT_DISC_ADV = 0x02
    Scannable undirected advertising (ADV_SCAN_IND).
    ESP_BLE_EVT_NON_CONN_ADV = 0x03
    Non connectable undirected advertising (ADV_NONCONN_IND).
    ESP_BLE_EVT_SCAN_RSP = 0x04
    Scan Response (SCAN_RSP).

enum esp_ble_wl_operation_t
    Values:
    
    ESP_BLE_WHITELIST_REMOVE = 0X00
    remove mac from whitelist.
    ESP_BLE_WHITELIST_ADD = 0X01
    add address to whitelist.

enum esp_bt_duplicate_exceptional_subcode_type_t
    Values:
    
    ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
    Add device info into duplicate scan exceptional list.
    ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
    Remove device info from duplicate scan exceptional list.
**ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN**
Clean duplicate scan exceptional list

**enum esp_ble_duplicate_exceptional_info_type_t**

*Values:*

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR** = 0
  BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID**
  BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE**
  BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV**
  BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ...

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV**
  BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ...

**enum esp_duplicate_scan_exceptional_list_type_t**

*Values:*

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST** = BLE_BIT(0)
  duplicate scan exceptional addr list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST** = BLE_BIT(1)
  duplicate scan exceptional mesh link ID list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST** = BLE_BIT(2)
  duplicate scan exceptional mesh beacon type list

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST** = BLE_BIT(3)
  duplicate scan exceptional mesh adv with provisioning service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST** = BLE_BIT(4)
  duplicate scan exceptional mesh adv with provisioning service uuid

- **ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST** = 0xFFFF
  duplicate scan exceptional all list

**GATT DEFINES**

**Overview**  Instructions

**Application Example**  Instructions

**API Reference**

**Header File**
- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

union esp_gatt_rsp_t

`#include <esp_gatt_defs.h>` GATT remote read request response type.
Chapter 2. API 参考

Public Members

`esp_gatt_value_t attr_value`
Gatt attribute structure

`uint16_t handle`
Gatt attribute handle

Structures

`struct esp_gatt_id_t`
Gatt id, include uuid and instance id.

Public Members

`esp_bt_uuid_t uuid`
UUID

`uint8_t inst_id`
Instance id

`struct esp_gatt_srvc_id_t`
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

`esp_gatt_id_t id`
Gatt id, include uuid and instance

`bool is_primary`
This service is primary or not

`struct esp_attr_desc_t`
Attribute description (used to create database)

Public Members

`uint16_t uuid_length`
UUID length

`uint8_t* uuid_p`
UUID value

`uint16_t perm`
Attribute permission

`uint16_t max_length`
Maximum length of the element

`uint16_t length`
Current length of the element

`uint8_t* value`
Element value array

`struct esp_attr_control_t`
attribute auto response flag
Public Members

uint8_t auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by
replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read
operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database

Public Members

     esp_attr_control_t attr_control
     The attribute control type
     esp_attr_desc_t att_desc
     The attribute type

struct esp_attr_value_t
set the attribute value type

Public Members

uint16_t attr_max_len
attribute max value length
uint16_t attr_len
attribute current value length
uint8_t *attr_value
the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
Gatt includeservice entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included service
uint16_t end_hdl
Gatt end handle value of included service
uint16_t uuid
Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
Gatt include128 bitservice entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included 128 bit service
uint16_t end_hdl
Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
Gatt attribute value.
**Public Members**

```
uint8_t value[ESP_GATT_MAX_ATTR_LEN]
   Gatt attribute value
```

```
uint16_t handle
   Gatt attribute handle
```

```
uint16_t offset
   Gatt attribute value offset
```

```
uint16_t len
   Gatt attribute value length
```

```
uint8_t auth_req
   Gatt authentication request
```

**struct esp_gatt_conn_params_t**

Connection parameters information.

**Public Members**

```
uint16_t interval
   connection interval
```

```
uint16_t latency
   Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
```

```
uint16_t timeout
   Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
   Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

**struct esp_gattc_multi_t**

read multiple attribute

**Public Members**

```
uint8_t num_attr
   The number of the attribute
```

```
uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
   The handles list
```

**struct esp_gattc_db_elem_t**

data base attribute element

**Public Members**

```
esp_gatt_db_attr_type_t type
   The attribute type
```

```
uint16_t attribute_handle
   The attribute handle, it’s valid for all of the type
```

```
uint16_t start_handle
   The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
```

```
uint16_t end_handle
   The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
```
esp_gatt_char_prop_t properties
    The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

esp_bt_uuid_t uuid
    The attribute uuid, it’s valid for all of the type

struct esp_gattc_service_elem_t
    service element

Public Members

    bool is_primary
        The service flag, true if the service is primary service, else is secondary service

    uint16_t start_handle
        The start handle of the service

    uint16_t end_handle
        The end handle of the service

    esp_bt_uuid_t uuid
        The uuid of the service

struct esp_gattc_char_elem_t
    characteristic element

Public Members

    uint16_t char_handle
        The characteristic handle

    esp_gatt_char_prop_t properties
        The characteristic properties

    esp_bt_uuid_t uuid
        The characteristic uuid

struct esp_gattc_descr_elem_t
    descriptor element

Public Members

    uint16_t handle
        The characteristic descriptor handle

    esp_bt_uuid_t uuid
        The characteristic descriptor uuid

struct esp_gattc_incl_svc_elem_t
    include service element

Public Members

    uint16_t handle
        The include service current attribute handle

    uint16_t incl_svc_s_handle
        The start handle of the service which has been included

    uint16_t incl_svc_e_handle
        The end handle of the service which has been included
Chapter 2. API 参考

```c
esp_bt_uuid_t uuid
```

The include service uuid

**Macros**

ESP_GATT_MAX_ATTR_LEN
   GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
   If callback report gatc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
   Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
   Attribute write data type from the client.
   
   Values:
   
   ESP_GATT_PREP_WRITE_CANCEL = 0x00
      Prepare write cancel
   ESP_GATT_PREP_WRITE_EXEC = 0x01
      Prepare write execute

enum esp_gatt_status_t
   GATT success code and error codes.
   
   Values:
   
   ESP_GATT_OK = 0x0
   ESP_GATT_INVALID_HANDLE = 0x01
   ESP_GATT_READ_NOT_PERMIT = 0x02
   ESP_GATT_WRITE_NOT_PERMIT = 0x03
   ESP_GATT_INVALID_PDU = 0x04
   ESP_GATT_INSUF_AUTHENTICATION = 0x05
   ESP_GATT_REQ_NOT_SUPPORTED = 0x06

ESP_GATT_ENCRYPED_NO_MITM = 0x8d
ESP_GATT_NOT_ENCRYPTED = 0x8e
ESP_GATT_CONGESTED = 0x8f
ESP_GATT_DUP_REG = 0x90
ESP_GATT_ALREADY_OPEN = 0x91
ESP_GATT_CANCEL = 0x92
ESP_GATT_STACK_RSP = 0xe0
ESP_GATT_APP_RSP = 0xe1
ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

enum esp_gatt_conn_reason_t
    Gatt Connection reason enum.

Values:

ESP_GATT_CONN_UNKNOWN = 0
    Gatt connection unknown
ESP_GATT_CONN_L2C_FAILURE = 1
    General L2cap failure
Chapter 2. API 参考

```
ESP_GATT_CONN_TIMEOUT = 0x08
Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
No connection to cancel

enum esp_gatt_auth_req_t
    Gatt authentication request type.

    Values:

    ESP_GATT_AUTH_REQ_NONE = 0
    ESP_GATT_AUTH_REQ_NO_MITM = 1
    ESP_GATT_AUTH_REQ_MITM = 2
    ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
    ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t
    Values:

    ESP_GATT_SERVICE_FROMREMOTE_DEVICE = 0
    ESP_GATT_SERVICE_FROM_NVSF = 1
    ESP_GATT_SERVICE_FROMUNKNOWN = 2

enum esp_gatt_write_type_t
    Gatt write type.

    Values:

    ESP_GATT_WRITE_TYPE_NO_RSP = 1
    Gatt write attribute need no response

    ESP_GATT_WRITE_TYPE_RSP
    Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
    the type of attribute element

    Values:

    ESP_GATT_DB_PRIMARY_SERVICE
    Gatt primary service attribute type in the cache

    ESP_GATT_DB_SECONDARY_SERVICE
    Gatt secondary service attribute type in the cache

    ESP_GATT_DB_CHARACTERISTIC
    Gatt characteristic attribute type in the cache

    ESP_GATT_DB_DESCRIPTOR
    Gatt characteristic descriptor attribute type in the cache
```
Chapter 2. API

ESP_GATT_DB_INCLUDED_SERVICE
Gatte include service attribute type in the cache

ESP_GATT_DB_ALL
Gatte all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Overview

Instructions

Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  – bluetooth/bluedroid/ble/gatt_server_service_table
  – GATT Server Service Table Example Walkthrough
• This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  – bluetooth/bluedroid/ble/gatt_server
  – GATT Server Example Walkthrough
• This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
This function is called to register application callbacks with BTA GATTS module.

Return
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
This function is called to register application identifier.

Return
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gatts_app_unregister (esp_if_t gatts_if)
unregister with GATT Server.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] gatts_if: GATT server access interface

esp_err_t esp_ble_gatts_create_service (esp_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)
Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to...
report status and service ID to the profile. The service ID obtained in the callback function needs to be used
when adding included service and characteristics/descriptors into the service.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

`esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)`

Create a service attribute tab.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] srvc_inst_id: the instance id of the service

`esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)`

This function is called to add an included service. This function have to be called between
‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback
event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

`esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)`

This function is called to add a characteristic into a service.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: : Characteristic UUID.
- [in] perm: : Characteristic value declaration attribute permission.
- [in] property: : Characteristic Properties
- [in] char_val: : Characteristic value
- [in] control: : attribute response control byte

`esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)`

This function is called to add characteristic descriptor. When it's done, a callback event
ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

Return

- ESP_OK: success
- other: failed
Chapter 2. API

Parameters
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] char_descr_val: Characteristic descriptor value
- [in] control:: attribute response control byte

esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return
- ESP_OK: success
- other : failed

Parameters
- [in] service_handle: service_handle to be deleted.

esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)
This function is called to start a service.

Return
- ESP_OK: success
- other : failed

Parameters
- [in] service_handle: the service handle to be started.

esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)
This function is called to stop a service.

Return
- ESP_OK: success
- other : failed

Parameters
- [in] service_handle: service to be stopped.

esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
- ESP_OK: success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] conn_id: - connection id to indicate.
- [in] attr_handle: - attribute handle to indicate.
- [in] value_len: - indicate value length.
- [in] value: value to indicate.
- [in] need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
This function is called to send a response to a request.

Return
- ESP_OK: success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
Chapter 2. API

- [in] trans_id: transfer id
- [in] status: response status

`esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)`

This function is called to set the attribute value by the application.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

`esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)`

Retrieve attribute value.

**Return**
- ESP_GATT_OK: success
- other: failed

**Parameters**
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

`esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL, then it will send service change indication to all the connected devices and if not then to a specific device
union esp_ble_gatts_cb_param_t
  #include <esp_gatts_api.h> Gatt server callback parameters union.

**Public Members**

**struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg**
  Gatt server callback param of ESP_GATTS_REG_EVT

**struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read**
  Gatt server callback param of ESP_GATTS_READ_EVT

**struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write**
  Gatt server callback param of ESP_GATTS_WRITE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write**
  Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu**
  Gatt server callback param of ESP_GATTS_MBU_EVT

**struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf**
  Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

**struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create**
  Gatt server callback param of ESP_GATTS_CREATE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc**
  Gatt server callback param of ESP_GATTS_ADD_INCL SRVC_EVT

**struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char**
  Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

**struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr**
  Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

**struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del**
  Gatt server callback param of ESP_GATTS_DELETE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start**
  Gatt server callback param of ESP_GATTS_START_EVT

**struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop**
  Gatt server callback param of ESP_GATTS_STOP_EVT

**struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect**
  Gatt server callback param of ESP_GATTS_CONNECT_EVT

**struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect**
  Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

**struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open**
  Gatt server callback param of ESP_GATTS_OPEN_EVT

**struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open**
  Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

**struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close**
  Gatt server callback param of ESP_GATTS_CLOSE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest**
  Gatt server callback param of ESP_GATTS_CONGEST_EVT

**struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp**
  Gatt server callback param of ESP_GATTS_RESPONSE_EVT

**struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab**
  Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

```c
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT
```

```c
struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT
```

```
Chapter 2. API

Public Members

- `esp_gatt_status_t status`
  Operation status

- `uint16_t service_handle`
  Service attribute handle

```c
#include <esp_gatts_api.h>
ESP_GATTS_WRITE_EVT.
```

Public Members

- `uint16_t conn_id`
  Connection id

- `uint32_t trans_id`
  Transfer id

- `esp_bd_addr_t bda`
  The bluetooth device address which been written

- `uint16_t handle`
  The attribute handle

- `uint16_t offset`
  Offset of the value, if the value is too long

- `bool need_rsp`
  The write operation need to do response

- `bool is_prep`
  This write operation is prepare write

- `uint16_t len`
  The write attribute value length

- `uint8_t *value`
  The write attribute value

Macros

- `ESP_GATT_PREP_WRITE_CANCEL`
  Prepare write flag to indicate cancel prepare write

- `ESP_GATT_PREP_WRITE_EXEC`
  Prepare write flag to indicate execute prepare write

Type Definitions

```c
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

Parameters

- `event`: Event type
- `gatts_if`: GATT server access interface, normally different gatts_if correspond to different profile
- `param`: Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
  GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
  When register application id, the event comes

ESP_GATTS_READ_EVT = 1
  When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
  When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
  When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4
  When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
  When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
  When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
  When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
  When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
  When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
  When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
  When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
  When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
  When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
  When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
  When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
  When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
  When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
  When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
  When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
  When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
  When gatt send response complete, the event comes
Chapter 2. API

ESP_GATT_CREATE_ATTR_TAB_EVT = 22
When gatt create table complete, the event comes

ESP_GATT_SET_ATTR_VAL_EVT = 23
When gatt set attr value complete, the event comes

ESP_GATT_SEND_SERVICE_CHANGE_EVT = 24
When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview

Instructions

Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  – bluetooth/bluedroid/ble/gatt_client
  – GATT Client Example Walkthrough

• This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  – bluetooth/bluedroid/ble/gattc_multi_connect
  – GATT Client Multi-connection Example Walkthrough

• This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatc_api.h

Functions

esp_err_t esp_ble_gattc_register_callback(esp_gattc_cb_t callback)
This function is called to register application callbacks with GATTC module.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] callback:: pointer to the application callback function.

esp_err_t esp_ble_gattc_app_register(uint16_t app_id)
This function is called to register application callbacks with GATTC module.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] app_id:: Application Identify (UUID), for different application

esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)
This function is called to unregister an application from GATTC module.

Return
• ESP_OK: success
• other: failed
Chapter 2. API

### Parameters

- **`gattc_if`**: Gatt client access interface.

```c
def esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

**Return**

- **ESP_OK**: success
- **other**: failed

**Parameters**

- **`gattc_if`**: Gatt client access interface.
- **`remote_bda`**: remote device bluetooth device address.
- **`remote_addr_type`**: remote device bluetooth device the address type.
- **`is_direct`**: direct connection or background auto connection(by now, background auto connection is not supported).

```c
def esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```c
def esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Return**

- **ESP_OK**: success
- **other**: failed

**Parameters**

- **`gattc_if`**: Gatt client access interface.
- **`conn_id`**: connection ID to be closed.

```c
def esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Return**

- **ESP_OK**: success
- **other**: failed

**Parameters**

- **`gattc_if`**: Gatt client access interface.
- **`conn_id`**: connection ID.

```c
def esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_btuuid_t *svc_uuid, esp_gatt_service_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service.

**Note**: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.
Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] svc_uuid: the pointer to the service uuid.
• [out] result: The pointer to the service which has been found in the gattc cache.
• [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• [in] offset: Offset of the service position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_all_char(gattc_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)}
\]

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• [in] offset: Offset of the characteristic position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_all_descr(gattc_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)}
\]

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] char_handle: the given characteristic handle
• [out] result: The pointer to the descriptor in the characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• [in] offset: Offset of the descriptor position to get.

\[
\text{esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(gattc_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)}
\]

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] char_uuid: the characteristic uuid
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] char_uuid: the characteristic uuid.
• [in] descr_uuid: the descriptor uuid.
• [out] result: The pointer to the descriptor in the given characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] char_handle: the characteristic handle.
• [in] descr_uuid: the descriptor uuid.
• [out] result: The pointer to the descriptor in the given characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

Return
• ESP_OK: success
Chapter 2. API

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] incl_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] type: the attribute type.
- [in] start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

```
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] conn_id: connection ID which identify the server.
- [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] count: number of elements in database.

```
esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
• [in] handle: characteristic handle to read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [in] uuid: The UUID of attribute which will be read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] read_multi: pointer to the read multiple parameter.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: descriptor handle to read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: characteristic handle to write.
• [in] value_len: length of the value to be written.
• [in] value: the value to be written.
• [in] write_type: the type of attribute write operation.
• [in] auth_req: authentication request.
**esp_err_t** esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.

**esp_err_t** esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

**esp_err_t** esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic descriptor handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

**esp_err_t** esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
```
void is_execute::execute or cancel.
```

```
esp_err_t esp_ble_gattc_register_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```
esp_err_t esp_ble_gattc_unregister_for_notify (esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```
esp_err_t esp_ble_gattc_cache_refresh (esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.

```
esp_err_t esp_ble_gattc_cache_assoc (esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mains that device want to used the database has stored in the local cache. The source address mains that device want to share the database to the associated address device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

```
esp_err_t esp_ble_gattc_cache_get_addr_list (esp_gatt_if_t gattc_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**
- ESP_OK: success
- other: failed
Parameters
- \texttt{[in] gattc_if}: Gatt client access interface.

\texttt{esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)}
Clean the service cache of this device in the gattc stack.

Return
- ESP_OK: success
- other: failed

Parameters
- \texttt{[in] remote_bda}: remote device BD address.

Unions
\texttt{union esp_ble_gattc_cb_param_t}
#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

\texttt{struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param \textbf{reg}}
Gatt client callback param of ESP_GATTC_REG_EVT

}
```

Public Members

`esp_gatt_status_t status`
Operation status

`uint16_t handle`
The characteristic or descriptor handle

```c
typedef struct gattc_write_evt_param {
#include <esp_gattc_api.h> ESP_GATTC_WRITE_CHAR_EVT, ESP_GATTC_PREP_WRITE_EVT, ESP_GATTC_WRITE_DESCR_EVT.
}
```
uint16_t offset
    The prepare write offset, this value is valid only when prepare write

Type Definitions
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
    esp_ble_gattc_cb_param_t *param)
GATT Client callback function type.

Parameters
    • event:: Event type
    • gattc_if: GATT client access interface, normally different gattc_if correspond to different
        profile
    • param: Point to callback parameter, currently is union type

Enumerations
enum esp_gattc_cb_event_t
    GATT Client callback function events.
    Values:
    ESP_GATTC_REG_EVT = 0
        When GATT client is registered, the event comes
    ESP_GATTC_UNREG_EVT = 1
        When GATT client is unregistered, the event comes
    ESP_GATTC_OPEN_EVT = 2
        When GATT virtual connection is set up, the event comes
    ESP_GATTC_READ_CHAR_EVT = 3
        When GATT characteristic is read, the event comes
    ESP_GATTC_WRITE_CHAR_EVT = 4
        When GATT characteristic write operation completes, the event comes
    ESP_GATTC_CLOSE_EVT = 5
        When GATT virtual connection is closed, the event comes
    ESP_GATTC_SEARCH_CMPL_EVT = 6
        When GATT service discovery is completed, the event comes
    ESP_GATTC_SEARCH_RES_EVT = 7
        When GATT service discovery result is got, the event comes
    ESP_GATTC_READ_DESCR_EVT = 8
        When GATT characteristic descriptor read completes, the event comes
    ESP_GATTC_WRITE_DESCR_EVT = 9
        When GATT characteristic descriptor write completes, the event comes
    ESP_GATTC_NOTIFY_EVT = 10
        When GATT notification or indication arrives, the event comes
    ESP_GATTC_PREP_WRITE_EVT = 11
        When GATT prepare-write operation completes, the event comes
    ESP_GATTC_EXEC_EVT = 12
        When write execution completes, the event comes
    ESP_GATTC_ACL_EVT = 13
        When ACL connection is up, the event comes
    ESP_GATTC_CANCEL_OPEN_EVT = 14
        When GATT client ongoing connection is cancelled, the event comes
ESP_GATTC_SRVC_CHG_EVT = 15
When “service changed” occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
When Scan filter parameters are set, the event comes

ESP_GATTC_SCAN_FLT_STATUS_EVT = 33
When Scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REG_FOR_NOTIFY_EVT = 38
When register for notification of a service completes, the event comes

ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39
When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
When the ble physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
When the ble physical connection disconnected, the event comes
Chapter 2. API

ESP_GATTC_READ_MULTIPLE_EVT = 42
When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATTC_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45
When the ble get gattc address list in cache finish, the event comes

ESP_GATTC_DIS_SRVC_CMPL_EVT = 46
When the ble discover service complete, the event comes

BLUFI API

Overview BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

API Reference

Header File

- components/bt/common/api/include/api/esp_blufi_api.h

Functions

esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)
This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters

- [in] callbacks: callback functions

esp_err_t esp_blufi_profile_init (void)
This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t esp_blufi_profile_deinit (void)
This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)
This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters

- opmode: wifi opmode
- sta_conn_state: station is already in connection or not
• softap_conn_num: softap connection number
• extra_info: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list (uint16_t apCount, esp_blufi_ap_record_t *list)
```
This function is called to send wifi list.

**Return** ESP_OK - success, other - failed

**Parameters**
- apCount: wifi list count
- list: wifi list

```c
uint16_t esp_blufi_get_version (void)
```
Get BLUFI profile version.

**Return** Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info (esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

**Return** ESP_OK - success, other - failed

**Parameters**
- state: error state

```c
esp_err_t esp_blufi_send_custom_data (uint8_t *data, uint32_t data_len)
```
This function is called to send custom data.

**Return** ESP_OK - success, other - failed

**Parameters**
- data: custom data value
- data_len: the length of custom data

**Unions**

```c
union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.
```

**Public Members**

```c
struct esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH
```

```c
struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH
```

```c
struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH
```

```c
struct esp_blufi_cb_param_t::blufi_connect_evt_param connect
Blufi callback param of ESP_BLUFI_EVENT_CONNECT
```

```c
struct esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT
```

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID
```

```c
struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param sta_ssid
Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID
```

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param softap_ssid
Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
```
struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct esp_blufi_cb_param_t::blufi_recv_softap_channel_evt_param softap_channel
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

struct esp_blufi_cb_param_t::blufi_recv_username_evt_param username
  Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_cb_param_t::blufi_recv_ca_evt_param ca
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

struct esp_blufi_cb_param_t::blufi_recv_client_cert_evt_param client_cert
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

struct esp_blufi_cb_param_t::blufi_recv_server_cert_evt_param server_cert
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

struct esp_blufi_cb_param_t::blufi_recv_client_pkey_evt_param client_pkey
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_recv_server_pkey_evt_param server_pkey
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error
  Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

struct esp_blufi_cb_param_t::blufi_recv_custom_data_evt_param custom_data
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

struct blufi_connect_evt_param
  #include <esp_blufi.h> ESP_BLUFI_EVENT_CONNECT.

Public Members

    bool softap_authmode_set
       is authentication mode of softap interface set

    uint8_t softap_max_conn_num
       max connection number of softap interface

    bool softap_max_conn_num_set
       is max connection number of softap interface set

    uint8_t softap_channel
       channel of softap interface

    bool softap_channel_set
       is channel of softap interface set
```

```c
struct esp_blufi_ap_record_t
    Description of an WiFi AP.

    Public Members
    uint8_t ssid[33]
        SSID of AP
    int8_t rssi
        signal strength of AP

struct esp_blufi_callbacks_t
    BLUFI callback functions type.

    Public Members
    esp_blufi_event_cb_t event_cb
        BLUFI event callback
    esp_blufi_negotiate_data_handler_t negotiate_data_handler
        BLUFI negotiate data function for negotiate share key
    esp_blufi_encrypt_func_t encrypt_func
        BLUFI encrypt data function with share key generated by negotiate_data_handler
    esp_blufi_decrypt_func_t decrypt_func
        BLUFI decrypt data function with share key generated by negotiate_data_handler
    esp_blufi_checksum_func_t checksum_func
        BLUFI check sum function (FCS)

Macros

ESP_BD_ADDR_LEN
    Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
    Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)
    BLUFI event callback function type.

    Parameters
    • event:: Event type
    • param:: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)
    BLUFI negotiate data handler.

    Parameters
    • data:: data from phone
    • len:: length of data from phone
    • output_data:: data want to send to phone
    • output_len:: length of data want to send to phone
    • need_free:: output reporting if memory needs to be freed or not

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
    BLUFI encrypt the data after negotiate a share key.
```
**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**
- `iv8`: initial vector (8bit), normally, blufi core will input packet sequence number
- `crypt_data`: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- `crypt_len`: length of plain text

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**
- `iv8`: initial vector (8bit), normally, blufi core will input packet sequence number
- `crypt_data`: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- `crypt_len`: length of encrypted text

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

**Parameters**
- `iv8`: initial vector (8bit), normally, blufi core will input packet sequence number
- `data`: data need to checksum
- `len`: length of data

**Enumerations**

```c
enum esp_blufi_cb_event_t
{
    ESP_BLUFI_EVENT_INIT_FINISH = 0,
    ESP_BLUFI_EVENT_INIT_ADD_FINAL,
    ESP_BLUFI_EVENT_DEINIT_FINISH,
    ESP_BLUFI_EVENT_DEINIT_ADD_FINAL,
    ESP_BLUFI_EVENT_SET_WIFI_OPMODE,
    ESP_BLUFI_EVENT_BLE_CONNECT,
    ESP_BLUFI_EVENT_BLE_DISCONNECT,
    ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP,
    ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP,
    ESP_BLUFI_EVENT_GET_WIFI_STATUS,
    ESP_BLUFI_EVENT_DEAUTHENTICATE_STA,
    ESP_BLUFI_EVENT_RECV_STA_BSSID,
    ESP_BLUFI_EVENT_RECV_STA_SSID,
    ESP_BLUFI_EVENT_RECV_STA_PASSWD,
    ESP_BLUFI_EVENT_RECV_SOFTAP_SSID,
    ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD,
    ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM,
    ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE,
    ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL,
    ESP_BLUFI_EVENT_RECV_USERNAME,
    ESP_BLUFI_EVENT_RECV_CA_CERT,
    ESP_BLUFI_EVENT_RECV_CLIENT_CERT,
    ESP_BLUFI_EVENT_RECV_SERVER_CERT,
}

2.1.4 CLASSIC BT

CLASSIC BLUETOOTH GAP API

Overview Instructions

Application Example Instructions
API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

```c
static uint32_t esp_bt_gap_get_cod_srvc(uint32_t cod)

get major service field of COD

Return major service bits

Parameters
- [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)

get major device field of COD

Return major device bits

Parameters
- [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)

get minor service field of COD

Return minor service bits

Parameters
- [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)

get format type of COD

Return format type

Parameters
- [in] cod: Class of Device

static bool esp_bt_gap_is_valid_cod(uint32_t cod)

decide the integrity of COD

Return
- true if cod is valid
- false otherwise

Parameters
- [in] cod: Class of Device
```

```c
esp_err_t esp_bt_gap_register_callback(esp_bt_gap_cb_t callback)

register callback function. This function should be called after esp_bluedroid_enable() completes successfully

Return
- ESP_OK : Succeed
- ESP_FAIL: others
```

```c
esp_err_t esp_bt_gap_set_scan_mode(esp_bt_connection_mode_t c_mode,
                                   esp_bt_discovery_mode_t d_mode)

Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] c_mode: one of the enums of esp_bt_connection_mode_t
- [in] d_mode: one of the enums of esp_bt_discovery_mode_t
```
esp_err_t esp_bt_gap_start_discovery(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)

This function starts Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

Parameters
- [in] mode: - Inquiry mode
- [in] inq_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
  - when this time expires, Inquiry will be halted.
- [in] num_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

esp_err_t esp_bt_gap_cancel_discovery(void)

Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_gap_get_remote_services (esp_bd_addr_t remote_bda)

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_bt_gap_get_remote_service_record (esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends.

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

uint8_t *esp_bt_gap_resolve_eir_data (uint8_t *eir, esp_bt_eir_type_t type, uint8_t *length)

This function is called to get EIR data for a specific type.

Return pointer of starting position of eir data excluding eir data type, NULL if not found

Parameters
- [in] eir: - pointer of raw eir data to be resolved
- [in] type: - specific EIR data type
- [out] length: - return the length of EIR data excluding fields of length and data type
### Chapter 2. API 参考

**esp_err_t esp_bt_gap_config_eir_data (esp_bt_eir_data_t *eir_data)**

This function is called to config EIR data.

`esp_bt_gapCb_t` will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

**Return**

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**

- [in] eir_data: - pointer of EIR data content

**esp_err_t esp_bt_gap_set_cod (esp_bt_cod_t cod, esp_bt_cod_mode_t mode)**

This function is called to set class of device. The structure `esp_bt_gapCb_t` will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends. Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Return**

- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**

- [in] cod: - class of device
- [in] mode: - setting mode

**esp_err_t esp_bt_gap_get_cod (esp_bt_cod_t *cod)**

This function is called to get class of device.

**Return**

- ESP_OK : Succeed
- ESP_FAIL: others

**Parameters**

- [out] cod: - class of device

**esp_err_t esp_bt_gap_read_rssi_delta (esp_bd_addr_t remote_addr)**

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

**Return**

- ESP_OK : Succeed
- ESP_FAIL: others

**Parameters**

- [in] remote_addr: - remote device address, corresponding to a certain connection handle

**esp_err_t esp_bt_gap_remove_bond_device (esp_bd_addr_t bd_addr)**

Removes a device from the security database list of peer device.

**Return**

- ESP_OK : success
- ESP_FAIL : failed

**Parameters**

- [in] bd_addr: : BD address of the peer device

**int esp_bt_gap_get_bond_device_num (void)**

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Return**

- >= 0 : bonded devices number
- ESP_FAIL : failed

**esp_err_t esp_bt_gap_get_bond_device_list (int *dev_num, esp_bd_addr_t *dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.
Chapter 2. API

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

\[\text{esp_err_t } \text{esp_bt_gap_set_pin} (\text{esp_bt_pin_type_t } \text{pin_type}, \text{uint8_t } \text{pin_code_len}, \text{esp_bt_pin_code_t } \text{pin_code})\]

Set pin type and default pin code for legacy pairing.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

\[\text{esp_err_t } \text{esp_bt_gap_pin_reply} (\text{esp_bd_addr_t } \text{bd_addr}, \text{bool } \text{accept}, \text{uint8_t } \text{pin_code_len}, \text{esp_bt_pin_code_t } \text{pin_code})\]

Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] bd_addr: BD address of the peer
- [in] accept: Pin_code reply successful or declined.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

\[\text{esp_err_t } \text{esp_bt_gap_set_security_param} (\text{esp_bt_sp_param_t } \text{param_type}, \text{void *} \text{value}, \text{uint8_t } \text{len})\]

Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] param_type::: the type of the param which is to be set
- [in] value::: the param value
- [in] len::: the length of the param value

\[\text{esp_err_t } \text{esp_bt_gap_ssp_passkey_reply} (\text{esp_bd_addr_t } \text{bd_addr}, \text{bool } \text{accept}, \text{uint32_t } \text{passkey})\]

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] bd_addr::: BD address of the peer
- [in] accept::: passkey entry successful or declined.
- [in] passkey::: passkey value, must be a 6 digit number, can be lead by 0.

\[\text{esp_err_t } \text{esp_bt_gap_ssp_confirm_reply} (\text{esp_bd_addr_t } \text{bd_addr}, \text{bool } \text{accept})\]
Reply the confirm value to the peer device in the legacy connection stage.

**Return** - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different

```c
esp_err_t esp_bt_gap_set_afh_channels (esp_bt_gap_afh_channels channels)
```
Set the AFH channels.

**Return** - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] channels: The n th such field (in the range 0 to 78) contains the value for channel n:
  0 means channel n is bad. 1 means channel n is unknown. The most significant bit is reserved and shall be set to 0. At least 20 channels shall be marked as unknown.

```c
esp_err_t esp_bt_gap_read_remote_name (esp_bd_addr_t remote_bda)
```
Read the remote device name.

**Return** - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] remote_bda: The remote device’s address

```c
esp_err_t esp_bt_gap_set_qos (esp_bd_addr_t remote_bda, uint32_t t_poll)
```
Config Quality of service.

**Return** - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] remote_bda: The remote device’s address
- [in] t_poll: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

**Unions**

```c
union esp_bt_gap_cb_param_t
```
A2DP state callback parameters.

**Public Members**

```c
struct esp_bt_gap_cb_param_t::disc_res_param disc_res
```
discovery result parameter struct

```c
struct esp_bt_gap_cb_param_t::disc_state_changed_param disc_st_chg
```
discovery state changed parameter struct

```c
struct esp_bt_gap_cb_param_t::rmt_srvcs_param rmt_srvcs
```
services of remote device parameter struct

```c
struct esp_bt_gap_cb_param_t::rmt_svc_rec_param rmt_svc_rec
```
specific service record from remote device parameter struct

```c
struct esp_bt_gap_cb_param_t::read_rssi_delta_param read_rssi_delta
```
read rssi parameter struct

```c
struct esp_bt_gap_cb_param_t::config_eir_data_param config_eir_data
```
config EIR data
### struct esp_bt_gap_cb_param_t::auth_cmpl_param auth_cmpl

Authentication complete parameter struct

### struct esp_bt_gap_cb_param_t::pin_req_param pin_req

Pin request parameter struct

### struct esp_bt_gap_cb_param_t::cfm_req_param cfm_req

Confirm request parameter struct

### struct esp_bt_gap_cb_param_t::key_notif_param key_notif

Passkey notification parameter struct

### struct esp_bt_gap_cb_param_t::key_req_param key_req

Passkey request parameter struct

### struct esp_bt_gap_cb_param_t::set_afh_channels_param set_afh_channels

Set AFH channel parameter struct

### struct esp_bt_gap_cb_param_t::read_rmt_name_param read_rmt_name

Read Remote Name parameter struct

### struct esp_bt_gap_cb_param_t::mode_chg_param mode_chg

Mode change event parameter struct

### struct esp_bt_gap_cb_param_t::bt_remove_bond_dev_cmpl_evt_param remove_bond_dev_cmpl

Event parameter of ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT

### struct esp_bt_gap_cb_param_t::qos_cmpl_param qos_cmpl

QoS complete parameter struct

### struct auth_cmpl_param

```c
#include <esp_gap_bt_api.h>
ESP_BT_GAP_AUTH_CMPL_EVT.
```

#### Public Members

- **esp_bd_addr_t bda**
  - Remote Bluetooth device address

- **esp_bt_status_t stat**
  - Authentication complete status

- **uint8_t device_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]**
  - Device name

### struct bt_remove_bond_dev_cmpl_evt_param

```c
#include <esp_gap_bt_api.h>
ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT.
```

#### Public Members

- **esp_bd_addr_t bda**
  - Remote Bluetooth device address

- **esp_bt_status_t status**
  - Indicates the remove bond device operation success status

### struct cfm_req_param

```c
#include <esp_gap_bt_api.h>
ESP_BT_GAP_CFM_REQ_EVT.
```

#### Public Members

- **esp_bd_addr_t bda**
  - Remote Bluetooth device address
uint32_t num_val
  the numeric value for comparison.

struct config_eir_data_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_CONFIG_EIR_DATA_EVT *.

Public Members

  esp_bt_status_t stat
    config  EIR  status:  ESP_BT_STATUS_SUCCESS:  config  success
    ESP_BT_STATUS_EIR_TOO_LARGE:  the EIR data is more than 240B. The EIR may not
    contain the whole data.  others:  failed

uint8_t eir_type_num
  the number of EIR types in EIR type

  esp_bt_eir_type_t eir_type[ESP_BT_EIR_TYPE_MAX_NUM]
    EIR types in EIR type

struct disc_res_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_RES_EVT.

Public Members

  esp_bd_addr_t bda
    remote bluetooth device address

  int num_prop
    number of properties got

  esp_bt_gap_dev_prop_t *prop
    properties discovered from the new device

struct disc_state_changed_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_DISC_STATE_CHANGED_EVT.

Public Members

  esp_bt_gap_discovery_state_t state
    discovery state

struct key_notif_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_NOTIF_EVT.

Public Members

  esp_bd_addr_t bda
    remote bluetooth device address

uint32_t passkey
  the numeric value for passkey entry.

struct key_req_param
  #include <esp_gap_bt_api.h> ESP_BT_GAP_KEY_REQ_EVT.
Public Members

```c
esp_bd_addr_t bda
  remote bluetooth device address
```

```c
struct mode_chg_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_MODE_CHG_EVT.
```

Public Members

```c
esp_bd_addr_t bda
  remote bluetooth device address
```

```c
esp_bt_pm_mode_t mode
  PM mode
```

```c
struct pin_req_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_PIN_REQ_EVT.
```

Public Members

```c
esp_bd_addr_t bda
  remote bluetooth device address
```

```c
bool min_16_digit
  TRUE if the pin returned must be at least 16 digits
```

```c
struct qos_cmpl_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_QOS_CMPL_EVT.
```

Public Members

```c
esp_bt_status_t stat
  QoS status
```

```c
esp_bd_addr_t bda
  remote bluetooth device address
```

```c
uint32_t t_poll
  poll interval, the maximum time between transmissions which from the master to a particular slave
  on the ACL logical transport. unit is 0.625ms.
```

```c
struct read_rmt_name_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_REMOTE_NAME_EVT.
```

Public Members

```c
esp_bt_status_t stat
  read Remote Name status
```

```c
uint8_t rmt_name[ESP_BT_GAP_MAX_BDNAME_LEN + 1]
  Remote device name
```

```c
struct read_rssi_delta_param
#include <esp_gap_bt_api.h> ESP_BT_GAP_READ_RSSI_DELTA_EVT *.
```
Public Members

```c
esp_bd_addr_t bda
    remote bluetooth device address

esp_bt_status_t stat
    read rssi status
```

```c
int8_t rssi_delta
    rssi delta value range -128 ~ 127, The value zero indicates that the RSSI is inside the Golden Receive Power Range, the Golden Receive Power Range is from ESP_BT_GAP_RSSI_LOW_THRLD to ESP_BT_GAP_RSSI_HIGH_THRLD
```

```c

#include <esp_gap_bt_api.h> ESP_BT_GAP_RMT_SRVCS_EVT.
```

```c
Public Members

```c
esp_bd_addr_t bda
    remote bluetooth device address

esp_bt_status_t stat
    service search status
```

```c
int num_uuids
    number of UUID in uuid_list

esp_bt_uuid_t *uuid_list
    list of service UUIDs of remote device
```

```c
#include <esp_gap_bt_api.h> ESP_BT_GAP_SET_AFH_CHANNELS_EVT.
```

```c
Public Members

```c
esp_bt_status_t stat
    set AFH channel status
```

Structures

```c
struct esp_bt_cod_t
```

Class of device.

```c
Public Members

```c
uint32_t reserved_2 : 2
    undefined
```
uint32_t minor: 6
    minor class
uint32_t major: 5
    major class
uint32_t service: 11
    service class
uint32_t reserved_8: 8
    undefined

struct esp_bt_gap_dev_prop_t
    Bluetooth Device Property Descriptor.

Public Members

    esp_bt_gap_dev_prop_type_t type
        Device property type
    int len
        Device property value length
    void *val
        Device property value

struct esp_bt_eir_data_t
    EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

    bool fec_required
        FEC is required or not, true by default
    bool include_txpower
        EIR data include TX power, false by default
    bool include_uuid
        EIR data include UUID, false by default
    uint8_t flag
        EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default
    uint16_t manufacturer_len
        Manufacturer data length, 0 by default
    uint8_t *p_manufacturer_data
        Manufacturer data point
    uint16_t url_len
        URL length, 0 by default
    uint8_t *p_url
        URL point

Macros

    ESP_BT_GAP_RSSI_HIGH_THRLD
        RSSI threshold.
        High RSSI threshold
    ESP_BT_GAP_RSSI_LOW_THRLD
        Low RSSI threshold
    ESP_BT_GAP_AFH_CHANNELS_LEN
Chapter 2. API

**ESP_BT_GAP_MAX_BDNAME_LEN**
Maximum bytes of Bluetooth device name.

**ESP_BT_GAP_EIR_DATA_LEN**
Maximum size of EIR Significant part.

**ESP_BT_EIR_TYPE_FLAGS**
Extended Inquiry Response data type.
Flag with information such as BR/EDR and LE support

**ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID**
Incomplete list of 16-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_16BITS_UUID**
Complete list of 16-bit service UUIDs

**ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID**
Incomplete list of 32-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_32BITS_UUID**
Complete list of 32-bit service UUIDs

**ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID**
Incomplete list of 128-bit service UUIDs

**ESP_BT_EIR_TYPE_CMPL_128BITS_UUID**
Complete list of 128-bit service UUIDs

**ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME**
Shortened Local Name

**ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME**
Complete Local Name

**ESP_BT_EIR_TYPE_TX_POWER_LEVEL**
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

**ESP_BT_EIR_TYPE_URL**
Uniform resource identifier

**ESP_BT_EIR_TYPE_MANU_SPECIFIC**
Manufacturer specific data

**ESP_BT_EIR_TYPE_MAX_NUM**
MAX number of EIR type

**ESP_BT_EIR_FLAG_LIMIT_DISC**

**ESP_BT_EIR_FLAG_GEN_DISC**

**ESP_BT_EIR_FLAG_BREDR_NOT_SPT**

**ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT**

**ESP_BT_EIR_FLAG_DMT_HOST_SPT**

**ESP_BT_EIR_MAX_LEN**

**ESP_BT_PIN_CODE_LEN**
Max pin code length

**ESP_BT_IO_CAP_OUT**

**ESP_BT_IO_CAP_IO**

**ESP_BT_IO_CAP_IN**

**ESP_BT_IO_CAP_NONE**

**ESP_BT_PM_MD_ACTIVE**
Active mode
ESP_BT_PM_MD_HOLD
Hold mode

ESP_BT_PM_MD_SNIFF
Sniff mode

ESP_BT_PM_MD_PARK
Park state

ESP_BT_COD_SRVC_BIT_MASK
Bits of major service class field.
Major service bit mask

ESP_BT_COD_SRVC_BIT_OFFSET
Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
Bits of major device class field.
Major device bit mask

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
Bits of minor device class field.
Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
Bits of format type.
Format type bit mask

ESP_BT_COD_FORMAT_TYPE_BIT_OFFSET
Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1
Class of device format type 1.

ESP_BT_GAP_MIN_INQ_LEN
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

ESP_BT_GAP_MAX_INQ_LEN
Maximum inquiry duration, unit is 1.28s

**Type Definitions**

typedef uint8_t esp_bt_gap_afh_channels[ESP_BT_GAP_AFH_CHANNELS_LEN]
typedef uint8_t esp_bt_eir_type_t

typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
Combination of the IO Capability

typedef uint8_t esp_bt_pm_mode_t

typedef void(*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

**Parameters**

- event:: Event type
- param:: Pointer to callback parameter
Enumerations

enum esp_bt_cod_mode_t
class of device settings

Values:

ESP_BT_SET_COD_MAJOR_MINOR = 0x01
overwrite major, minor class

ESP_BT_SET_COD_SERVICE_CLASS = 0x02
set the bits in the input, the current bit will remain

ESP_BT_CLR_COD_SERVICE_CLASS = 0x04
clear the bits in the input, others will remain

ESP_BT_SET_COD_ALL = 0x08
overwrite major, minor, set the bits in service class

ESP_BT_INIT_COD = 0x0a
overwrite major, minor, and service class

enum esp_bt_connection_mode_t
Discoverability and Connectability mode.

Values:

ESP_BT_NON_CONNECTABLE
Non-connectable

ESP_BT_CONNECTABLE
Connectable

enum esp_bt_discovery_mode_t
Values:

ESP_BT_NON_DISCOVERABLE
Non-discoverable

ESP_BT_LIMITED_DISCOVERABLE
Limited Discoverable

ESP_BT_GENERAL_DISCOVERABLE
General Discoverable

enum esp_bt_gap_dev_prop_type_t
Bluetooth Device Property type.

Values:

ESP_BT_GAP_DEV_PROP_BDNAME = 1
Bluetooth device name, value type is int8_t []

ESP_BT_GAP_DEV_PROP_COD
Class of Device, value type is uint32_t

ESP_BT_GAP_DEV_PROP_RSSI
Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

ESP_BT_GAP_DEV_PROP_EIR
Extended Inquiry Response, value type is uint8_t []

enum esp_bt_cod_srvc_t
Major service class field of Class of Device, multiple bits can be set.

Values:

ESP_BT_COD_SRVC_NONE = 0
None indicates an invalid value

ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x1
Limited Discoverable Mode
ESP_BT_COD_SRVC_POSITIONING = 0x8
  Positioning (Location identification)
ESP_BT_COD_SRVC_NETWORKING = 0x10
  Networking, e.g. LAN, Ad-hoc
ESP_BT_COD_SRVC_RENDERING = 0x20
  Rendering, e.g. Printing, Speakers
ESP_BT_COD_SRVC_CAPTURING = 0x40
  Capturing, e.g. Scanner, Microphone
ESP_BT_COD_SRVC_OBJ_TRANSFER = 0x80
  Object Transfer, e.g. v-Inbox, v-Folder
ESP_BT_COD_SRVC_AUDIO = 0x100
  Audio, e.g. Speaker, Microphone, Headset service
ESP_BT_COD_SRVC_TELEPHONY = 0x200
  Telephony, e.g. Cordless telephony, Modem, Headset service
ESP_BT_COD_SRVC_INFORMATION = 0x400
  Information, e.g. WEB-server, WAP-server

enum esp_bt_pin_type_t
  Values:
  ESP_BT_PIN_TYPE_VARIABLE = 0
      Refer to BTM_PIN_TYPE_VARIABLE
  ESP_BT_PIN_TYPE_FIXED = 1
      Refer to BTM_PIN_TYPE_FIXED

enum esp_bt_sp_param_t
  Values:
  ESP_BT_SP_IOCAP_MODE = 0
      Set IO mode

enum esp_bt_cod_major_dev_t
  Major device class field of Class of Device.
  Values:
  ESP_BT_COD_MAJOR_DEV_MISC = 0
      Miscellaneous
  ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
      Computer
  ESP_BT_COD_MAJOR_DEV_PHONE = 2
      Phone(cellular, cordless, pay phone, modem
  ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
      LAN, Network Access Point
  ESP_BT_COD_MAJOR_DEV_AV = 4
      Audio/Video(headset, speaker, stereo, video display, VCR
  ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5
      Peripheral(mouse, joystick, keyboard)
  ESP_BT_COD_MAJOR_DEV_IMAGING = 6
      Imaging(printer, scanner, camera, display
  ESP_BT_COD_MAJOR_DEV_WEARABLE = 7
      Wearable
  ESP_BT_COD_MAJOR_DEV_TOY = 8
      Toy
ESP_BT_COD_MAJOR_DEV_HEALTH = 9
Health
ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
Uncategorized: device not specified

enum esp_bt_gap_discovery_state_t
Bluetooth Device Discovery state

Values:
ESP_BT_GAP_DISCOVERY_STOPPED
Device discovery stopped
ESP_BT_GAP_DISCOVERY_STARTED
Device discovery started

enum esp_bt_gap_cb_event_t
BT GAP callback events.

Values:
ESP_BT_GAP_DISC_RES_EVT = 0
Device discovery result event
ESP_BT_GAP_DISC_STATE_CHANGED_EVT
Discovery state changed event
ESP_BT_GAP_RMT_SRVCS_EVT
Get remote services event
ESP_BT_GAP_RMT_SRVC_REC_EVT
Get remote service record event
ESP_BT_GAP_AUTH_CMPI_EVT
Authentication complete event
ESP_BT_GAP_PIN_REQ_EVT
Legacy Pairing Pin code request
ESP_BT_GAP_CFM_REQ_EVT
Security Simple Pairing User Confirmation request.
ESP_BT_GAP_KEY_NOTIF_EVT
Security Simple Pairing Passkey Notification
ESP_BT_GAP_KEY_REQ_EVT
Security Simple Pairing Passkey request
ESP_BT_GAP_READ_RSSI_DELTA_EVT
Read rssi event
ESP_BT_GAP_CONFIG_EIR_DATA_EVT
Config EIR data event
ESP_BT_GAP_SET_AFH_CHANNELS_EVT
Set AFH channels event
ESP_BT_GAP_READ_REMOTE_NAME_EVT
Read Remote Name event
ESP_BT_GAP_MODE_CHG_EVT
ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
remove bond device complete event
ESP_BT_GAP_QOS_CMPL_EVT
QOS complete event
ESP_BT_GAP_EVT_MAX
enum esp_bt_inq_mode_t
    Inquiry Mode

Values:
    ESP_BT_INQ_MODE_GENERAL_INQUIRY
        General inquiry mode
    ESP_BT_INQ_MODE_LIMITED_INQUIRY
        Limited inquiry mode

Bluetooth A2DP API

Overview

Instructions

Application Example
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

• This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)
    Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.
    Return
    • ESP_OK: success
    • ESP_INVALID_STATE: if bluetooth stack is not yet enabled
    • ESP_FAIL: if callback is a NULL function pointer
    Parameters
    • [in] callback: A2DP event callback function

esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)
    Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.
    Return
    • ESP_OK: success
    • ESP_INVALID_STATE: if bluetooth stack is not yet enabled
    • ESP_FAIL: if callback is a NULL function pointer
    Parameters
    • [in] callback: A2DP sink data callback function

esp_err_t esp_a2d_sink_init (void)
    Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after esp_bluedroid_enable() completes successfully.
    Return
    • ESP_OK: if the initialization request is sent successfully
• ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
• ESP_FAIL: others

`esp_err_t esp_a2d_sink_deinit (void)`
De-initialize for A2DP sink module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

   **Return**
   • ESP_OK: if the deinitialization request is sent successfully
   • ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
   • ESP_FAIL: others

`esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`
Connect to remote Bluetooth A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

   **Return**
   • ESP_OK: connect request is sent to lower layer successfully
   • ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
   • ESP_FAIL: others

   **Parameters**
   • [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`
Disconnect from the remote A2DP source device. This API must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

   **Return**
   • ESP_OK: disconnect request is sent to lower layer successfully
   • ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
   • ESP_FAIL: others

   **Parameters**
   • [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`
Media control commands. This API can be used for both A2DP sink and source and must be called after `esp_a2d_sink_init()` and before `esp_a2d_sink_deinit()`.

   **Return**
   • ESP_OK: control command is sent to lower layer successfully
   • ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
   • ESP_FAIL: others

   **Parameters**
   • [in] ctrl: control commands for A2DP data channel

`esp_err_t esp_a2d_source_init (void)`
Initialize the Bluetooth A2DP source module. A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first. This function should be called after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

   **Return**
   • ESP_OK: if the initialization request is sent to lower layer successfully
   • ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
   • ESP_FAIL: others

`esp_err_t esp_a2d_source_deinit (void)`
De-initialize for A2DP source module. This function should be called only after `esp_bluedroid_enable()` completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

   **Return**
Chapter 2. API

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)`

Register A2DP source data input function. For now, the input should be PCM data stream. This function should be called only after `esp_bluedroid_enable()` completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- `[in]` callback: A2DP source data callback function

`esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)`

Connect to remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

**Return**
- ESP_OK: connect request is sent to lower layer successfully
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- `[in]` remote_bda: remote Bluetooth device address

`esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote A2DP sink device. This API must be called after `esp_a2d_source_init()` and before `esp_a2d_source_deinit()`.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- `[in]` remote_bda: remote Bluetooth device address

**Unions**

`union esp_a2d_cb_param_t`  
#include `<esp_a2dp_api.h>` A2DP state callback parameters.

**Public Members**

- `struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat` A2DP connection status
- `struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat` audio stream playing state
- `struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg` media codec configuration information
- `struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat` status in acknowledgement to media control commands
- `struct esp_a2d_cb_param_t::a2d_prof_stat_param a2d_prof_stat` status to indicate a2d prof init or deinit

- `struct a2d_audio_cfg_param`  
#include `<esp_a2dp_api.h>` ESP_A2D_AUDIO_CFG_EVT.
Public Members

Structures

```c
typedef struct esp_a2d_mcc_t
    A2DP media codec capabilities union
```
Chapter 2. API

Public Members

```c

typedef esp_a2d_mct_t type
    A2DP media codec type

uint8_t sbc[ESP_A2D_CIE_LEN_SBC]          // SBC codec capabilities
uint8_t m12[ESP_A2D_CIE_LEN_M12]         // MPEG-1,2 audio codec capabilities
uint8_t m24[ESP_A2D_CIE_LEN_M24]         // MPEG-2, 4 AAC audio codec capabilities
uint8_t atrac[ESP_A2D_CIE_LEN_ATRAC]     // ATRAC family codec capabilities

union esp_a2d_mcc_t:\[anonymous\] cie
    A2DP codec information element
```

Macros

```c

#define ESP_A2D_MCT_SBC                  Media codec types supported by A2DP.
#define ESP_A2D_MCT_M12                  MPEG-1, 2 Audio
#define ESP_A2D_MCT_M24                  MPEG-2, 4 AAC
#define ESP_A2D_MCT_ATRAC                ATRAC family
#define ESP_A2D_MCT_NON_A2DP             ESP_A2D_CIE_LEN_SBC
#define ESP_A2D_CIE_LEN_SBC              ESP_A2D_CIE_LEN_M12
#define ESP_A2D_CIE_LEN_M12              ESP_A2D_CIE_LEN_M24
#define ESP_A2D_CIE_LEN_M24
#define ESP_A2D_CIE_LEN_ATRAC
```

Type Definitions

```c

typedef uint8_t esp_a2d_mct_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
    A2DP profile callback function type.

Parameters
    • event:: Event type
    • param:: Pointer to callback parameter

typedef void (*esp_a2d_sink_data_cb_t)(const uint8_t* buf,uint32_t len)
    A2DP sink data callback function.

Parameters
    • [in] buf:: pointer to the data received from A2DP source device and is PCM format decoded
        from SBC decoder; buf references to a static memory block and can be overwritten by upcoming
        data
    • [in] len:: size(in bytes) in buf

typedef int32_t (*esp_a2d_source_data_cb_t)(uint8_t *buf, int32_t len)
    A2DP source data read callback function.

Return size of bytes read successfully, if the argument len is -1, this value is ignored.
```
Chapter 2. API 参考

Parameters

• [in] buf: buffer to be filled with PCM data stream from higher layer
• [in] len: size (in bytes) of data block to be copied to buf. -1 is an indication to user that data buffer shall be flushed

Enumerations

enum esp_a2d_connection_state_t
Bluetooth A2DP connection states.

Values:

ESP_A2D_CONNECTION_STATE_DISCONNECTED = 0
collection released

ESP_A2D_CONNECTION_STATE_CONNECTING
connecting remote device

ESP_A2D_CONNECTION_STATE_CONNECTED
connection established

ESP_A2D_CONNECTION_STATE_DISCONNECTING
disconnecting remote device

enum esp_a2d_disc_rsn_t
Bluetooth A2DP disconnection reason.

Values:

ESP_A2D_DISC_RSN_NORMAL = 0
Finished disconnection that is initiated by local or remote device

ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t
Bluetooth A2DP datapath states.

Values:

ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND = 0
audio stream datapath suspended by remote device

ESP_A2D_AUDIO_STATE_STOPPED
audio stream datapath stopped

ESP_A2D_AUDIO_STATE_STARTED
audio stream datapath started

enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.

Values:

ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
media control command is acknowledged with success

ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.

Values:

ESP_A2D_MEDIA_CTRL_NONE = 0
Not for application use, use inside stack only.
**Chapter 2. API 参考**

**ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY**
- check whether AVDTP is connected, only used in A2DP source

**ESP_A2D_MEDIA_CTRL_START**
- command to set up media transmission channel

**ESP_A2D_MEDIA_CTRL_STOP**
- command to stop media transmission

**ESP_A2D_MEDIA_CTRL_SUSPEND**
- command to suspend media transmission

**enum esp_a2d_init_state_t**
- Bluetooth A2DP Initiation states.
  - Values:
    - **ESP_A2D_DEINIT_SUCCESS** = 0
      - A2DP profile deinit successful event
    - **ESP_A2D_INIT_SUCCESS**
      - A2DP profile init successful event

**enum esp_a2d_cb_event_t**
- A2DP callback events.
  - Values:
    - **ESP_A2D_CONNECTION_STATE_EVT** = 0
      - connection state changed event
    - **ESP_A2D_AUDIO_STATE_EVT**
      - audio stream transmission state changed event
    - **ESP_A2D_AUDIO_CFG_EVT**
      - audio codec is configured, only used for A2DP SINK
    - **ESP_A2D_MEDIA_CTRL_ACK_EVT**
      - acknowledge event in response to media control commands
    - **ESP_A2D_PROF_STATE_EVT**
      - indicate a2dp init&deinit complete

**Functions**

```c
esp_err_t esp_avrc_ct_register_callback(esp_avrc_ct_cb_t callback)
```
- Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Return Values</th>
</tr>
</thead>
</table>
| `esp_err_t esp_avrc_ct_init(void)`           | Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP. | • ESP_OK: success  
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others |
| `esp_err_t esp_avrc_ct_deinit(void)`         | De-initialize AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP. | • ESP_OK: success  
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others |
| `esp_err_t esp_avrc_ct_send_set_player_value_cmd(uint8_t tl, uint8_t attr_id, uint8_t value_id)` | Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established. | • ESP_OK: success  
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others |
| `esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd(uint8_t tl)` | Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established. | • ESP_OK: success  
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_FAIL: others |
| `esp_err_t esp_avrc_ct_send_register_notification_cmd(uint8_t tl, uint8_t event_id, uint32_t event_parameter)` | Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established. | • ESP_OK: success  
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
• ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation  
• ESP_FAIL: others |

**Parameters**

- `[in] callback`: AVRCP controller callback function
- `[in] tl`: transaction label, 0 to 15, consecutive commands should use different values
- `[in] attr_id`: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- `[in] value_id`: attribute value defined for the specific player application setting attribute
- `[in] event_id`: supported notification event_ids
- `[in] event_parameter`: required parameter for specific event_id
• [in] `event_id`: id of events, e.g. `ESP_AVRC_RN_PLAY_STATUS_CHANGE`, `ESP_AVRC_RN_TRACK_CHANGE`, etc.
• [in] `event_parameter`: playback interval for `ESP_AVRC_RN_PLAY_POS_CHANGED`;
  For other events, value of this parameter is ignored.

```c
esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd(uint8_t tl, uint8_t volume)
```

Send set absolute volume command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Return**
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_ERR_NOT_SUPPORTED: if the `event_id` is not supported in current implementation
• ESP_FAIL: others

**Parameters**
• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values
• [in] `volume`: volume, 0 to 0x7f, means 0% to 100%

```c
esp_err_t esp_avrc_ct_send_metadata_cmd(uint8_t tl, uint8_t attr_mask)
```

Send metadata command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Return**
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**
• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
• [in] `attr_mask`: mask of attributes, e.g. `ESP_AVRC_MD_ATTR_ID_TITLE` | `ESP_AVRC_MD_ATTR_ID_ARTIST`.

```c
esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)
```

Send passthrough command to AVRCP target. This function should be called after `ESP_AVRC_CT_CONNECTION_STATE_EVT` is received and AVRCP connection is established.

**Return**
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**
• [in] `tl`: transaction label, 0 to 15, consecutive commands should use different values.
• [in] `key_code`: passthrough command code, e.g. `ESP_AVRC_PT_CMD_PLAY`, `ESP_AVRC_PT_CMD_STOP`, etc.
• [in] `key_state`: passthrough command key state, `ESP_AVRC_PT_CMD_STATE_PRESSED` or `ESP_AVRC_PT_CMD_STATE_RELEASED`

```c
esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)
```

Register application callbacks to AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully.

**Return**
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

**Parameters**
• [in] `callback`: AVRCP target callback function

```c
esp_err_t esp_avrc_tg_init(void)
```

Initialize the bluetooth AVRCP target module. This function should be called after `esp_bluedroid_enable()` completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVR should be initialized before A2DP.

**Return**
Chapter 2. API

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_tg_deinit (void)
```

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRCP cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
esp_err_t esp_avrc_tg_get_psth_cmd_filter (esp_avrc_psth_filter_t filter,
                                         esp_avrc_psth_bit_mask_t *cmd_set)
```

Get the current filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter().

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

```c
esp_err_t esp_avrc_tg_set_psth_cmd_filter (esp_avrc_psth_filter_t filter,
                                         const esp_avrc_psth_bit_mask_t *cmd_set)
```

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init().

If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set “1” as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD”.

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

```c
bool esp_avrc_psth_bit_mask_operation (esp_avrc_bit_mask_op_t op,
                                       esp_avrc_psth_bit_mask_t *psth,
                                       esp_avrc_pt_cmd_t cmd)
```

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

**Return** For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

**Parameters**
- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code

### Chapter 2. API

**esp_err_t esp_avrc_tg_get_rn_evt_cap(esp_avrc_rn_evt_cap_t cap, esp_avrc_rn_evt_cap_mask_t *evt_set)**

Get the requested event notification capabilities on local AVRRC target. The capability is returned in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

For capability type `ESP_AVRC_RN_CAP_ALLOWED_EVT`, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation.

For capability type `ESP_AVRC_RN_CAP_SUPPORTED_EVT`, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using `esp_avrc_tg_set_rn_evt_cap()`.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRRC TG is not initialized
- ESP_ERR_INVALID_ARG: if `cap` is invalid or `evt_set` is NULL
- ESP_FAIL: otherwise

**esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)**

Set the event notification capabilities on local AVRCP target. The capability is given in a bit mask representation in `evt_set` and must be a subset of allowed event IDs with current implementation. This function should be called after `esp_avrc_tg_init()`.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

**bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_rn_evt_cap_mask_t *events, esp_avrc_rn_event_ids_t event_id)**

Operate on the type `esp_avrc_rn_evt_cap_mask_t` with regard to a specific event.

For operation `ESP_AVRC_BIT_MASK_OP_TEST`, return true if the corresponding bit is set, otherwise false.

**Return** For operation `ESP_AVRC_BIT_MASK_OP_SET` or `ESP_AVRC_BIT_MASK_OP_CLEAR`, return true for a successful operation, otherwise return false.

**Parameters**

- [in] `op`: operation requested on the bit mask field
- [in] `events`: pointer to event notification capability bit mask structure
- [in] `event_id`: notification event code

**esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id, esp_avrc_rn_rsp_t rsp, esp_avrc_rn_param_t *param)**

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be set using `esp_avrc_tg_set_rn_evt_cap()`, in a bit mask representation in `evt_set`. This function should be called after `esp_avrc_tg_init()`.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRRC TG is not initialized
- ESP_ERR_INVALID_ARG: if `evt_set` is NULL

**Parameters**

- [in] `event_id`: notification event ID that remote AVRCP CT registers
- [in] `rsp`: notification response code
- [in] `param`: parameters included in the specific notification

**Unions**

```c
union esp_avrc_rn_param_t
    #include <esp_avrc_api.h> AVRCP notification parameters.
```
Public Members

uint8_t\_volume
  response data for ESP\_AVRC\_RN\_VOLUME\_CHANGE, ranges 0..127

\*esp\*\_avrc\_playback\_stat\_t*\_playback
  response data for ESP\_AVRC\_RN\_PLAY\_STATUS\_CHANGE

uint8_t\_elm_id[8]
  response data for ESP\_AVRC\_RN\_TRACK\_CHANGE

uint32_t\_play\_pos
  response data for ESP\_AVRC\_RN\_PLAY\_POS\_CHANGED, in millisecond

\*esp\*\_avrc\_batt\_stat\_t*\_batt
  response data for ESP\_AVRC\_RN\_BATTERY\_STATUS\_CHANGE

union \*esp\*\_avrc\*\_ct\*\_cb\*\_param\*\_t
  #include \*<esp\*\_avrc\*\_api\*\_h\*> AVRC controller callback parameters.

Public Members

\*struct\*\ avrc\*\_ct\*\_cb\*\_param\*\_t::avrc\*\_ct\*\_conn\*\_stat\*\_param*\_conn\*\_stat
  AVRC connection status

bool\ connected
  whether AVRC connection is set up
**Chapter 2. API Reference**

```c
esp_bd_addr_t remote_bda
remote bluetooth device address
```

**struct avrc_ct_get_rn_caps_rsp_param**

```c
#include <esp_avrc_api.h>
ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.
```

**Public Members**

```c
uint8_t cap_count
   number of items provided in event or company_id according to cap_id used
```

```c
esp_avrc_rn_evt_cap_mask_t evt_set
   supported event_ids represented in bit-mask
```

```c
#include <esp_avrc_api.h>
ESP_AVRC_CT_METADATA_RSP_EVT.
```

**Public Members**

```c
uint8_t attr_id
   id of metadata attribute
```

```c
uint8_t* attr_text
   attribute itself
```

```c
int attr_length
   attribute character length
```

```c
#include <esp_avrc_api.h>
ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
```

**Public Members**

```c
uint8_t tl
   transaction label, 0 to 15
```

```c
uint8_t key_code
   passthrough command code
```

```c
uint8_t key_state
   0 for PRESSED, 1 for RELEASED
```

**struct avrc_ct_rmt_feats_param**

```c
#include <esp_avrc_api.h>
ESP_AVRC_CT_REMOTE_FEATURES_EVT.
```

**Public Members**

```c
uint32_t feat_mask
   AVRC feature mask of remote device
```

```c
uint16_t tg_feat_flag
   feature flag of remote device as TG
```

```c
esp_bd_addr_t remote_bda
remote bluetooth device address
```

**struct avrc_ct_set_volume_rsp_param**

```c
#include <esp_avrc_api.h>
ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT.
```
Chapter 2. API

Public Members

```c
uint8_t volume
the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%
```

```c
union esp_avrc_tg_cb_param_t
#include <esp_avrc_api.h> AVRC target callback parameters.
```

Public Members

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
AVRC connection status
```

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
AVRC features discovered through SDP
```

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
pass through command
```

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
set absolute volume command targeted on audio sink
```

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
register notification
```

```c
struct esp_avrc_tg_cb_param_t::avrc_tg_set_app_value_param set_app_value
set player application value
```

```c
struct avrc_tg_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_TG_CONNECTION_STATE_EVT.
```

Public Members

```c
bool connected
whether AVRC connection is set up
```

```c
esp_bd_addr_t remote_bda
remote bluetooth device address
```

```c
struct avrc_tg_psth_cmd_param
#include <esp_avrc_api.h> ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.
```

Public Members

uint8_t key_code
passthrough command code
```

```c
uint8_t key_state
0 for PRESSED, 1 for RELEASED
```

```c
struct avrc_tg_reg_ntf_param
#include <esp_avrc_api.h> ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.
```

Public Members

```c
uint8_t event_id
event id of AVRC RegisterNotification
```

```c
uint32_t event_parameter
event notification parameter
```
```c
struct avrc_tg_rmt_feats_param
#include <esp_avrc_api.h> ESP_AVRC_TGREMOTEFEATURES_EVT.

Public Members

uint32_t feat_mask
AVRC feature mask of remote device

uint16_t ct_feat_flag
feature flag of remote device as CT

esp_bd_addr_t remote_bda
remote bluetooth device address
```

```c
struct avrc_tg_set_abs_vol_param
#include <esp_avrc_api.h> ESP_AVRC_TGSETABSOLUTE_VOLUME_CMD_EVT.

Public Members

uint8_t volume
volume ranges from 0 to 127
```

```c
struct avrc_tg_set_app_value_param
#include <esp_avrc_api.h> ESP_AVRC_TGSETPLAYER_APPVALUE_EVT.

Public Members

uint8_t num_val
attribute num

esp_avrc_set_app_value_param_t *p_vals
point to the id and value of player application attribute
```

Structures

```c
struct esp_avrc_psth_bit_mask_t
AVRC passthrough command bit mask.
```

```c
Public Members

uint16_t bits[8]
bit mask representation of PASSTHROUGH commands
```

```c
struct esp_avrc_rn_evt_cap_mask_t
AVRC target notification event capability bit mask.
```

```c
Public Members

uint16_t bits
bit mask representation of PASSTHROUGH commands
```

```c
struct esp_avrc_set_app_value_param_t
AVRCP set app value parameters.
```
Chapter 2. API

Public Members

```c
uint8_t attr_id
player application attribute id
```

```c
uint8_t attr_val
player application attribute value
```

Macros

```c
ESP_AVRC_TRANS_LABEL_MAX
max transaction label
```

Type Definitions

```c
typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
AVRCP controller callback function type.
```

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter union

```c
typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
AVRCP target callback function type.
```

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter union

Enumerations

```c
enum esp_avrc_features_t
AVRC feature bit mask.
```

**Values:**

```c
ESP_AVRC_FEAT_RCTG = 0x0001
remote control target
```

```c
ESP_AVRC_FEAT_RCCT = 0x0002
remote control controller
```

```c
ESP_AVRC_FEAT_VENDOR = 0x0008
remote control vendor dependent commands
```

```c
ESP_AVRC_FEAT_BROWSE = 0x0010
use browsing channel
```

```c
ESP_AVRC_FEAT_META_DATA = 0x0040
remote control metadata transfer command/response
```

```c
ESP_AVRC_FEAT_ADV_CTRL = 0x0200
remote control advanced control command/response
```

```c
enum esp_avrc_feature_flag_t
AVRC supported features flag retrieved in SDP record.
```

**Values:**

```c
ESP_AVRC_FEAT_FLAG_CAT1 = 0x0001
category 1
```

```c
ESP_AVRC_FEAT_FLAG_CAT2 = 0x0002
category 2
```
Chapter 2. API

class enum esp_avrc_psth_filter_t
AVRC passthrough command filter.

Values:

ESP_AVRC_PSTH_FILTER_ALLOWED_CMD = 0
all of the PASSTHRU commands that can possibly be used, immutable
ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD = 1
PASSTHRU commands selectively supported according to the current configuration
ESP_AVRC_PSTH_FILTER_SUPPORT_MAX

class enum esp_avrc_bit_mask_op_t

Values:
ESP_AVRC_BIT_MASK_OP_TEST = 0
operation code to test a specific bit

ESP_AVRC_BIT_MASK_OP_SET = 1
operation code to set a specific bit

ESP_AVRC_BIT_MASK_OP_CLEAR = 2
operation code to clear a specific bit

defined enum esp_avrc_pt_cmd_state_t
AVRC passthrough command state.
Values:
ESP_AVRC_PT_CMD_STATE_PRESSED = 0
  key pressed
ESP_AVRC_PT_CMD_STATE_RELEASED = 1
  key released

defined enum esp_avrc_ct_cb_event_t
AVRC Controller callback events.
Values:
ESP_AVRC_CT_CONNECTION_STATE_EVT = 0
  connection state changed event
ESP_AVRC_CT_PASSTHROUGH_RSP_EVT = 1
  passthrough response event
ESP_AVRC_CT_METADATA_RSP_EVT = 2
  metadata response event
ESP_AVRC_CT_PLAY_STATUS_RSP_EVT = 3
  play status response event

  connection state changed event
ESP_AVRC_TG_REMOTEFEATURES_EVT = 1
  feature of remote device indication event
ESP_AVRC_TG_PASSTHROUGH_CMD_EVT = 2
  passthrough command event
ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT = 3
  set absolute volume command from remote device
ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT = 4
  register notification event
Chapter 2. API

ESP_AVRC_TG_SET_PLAYER_APP_VALUE_EVT = 5
set application attribute value, attribute refer to esp_avrc_ps_attr_ids_t

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.
Values:
ESP_AVRC_MD_ATTR_TITLE = 0x1
title of the playing track
ESP_AVRC_MD_ATTR_ARTIST = 0x2
track artist
ESP_AVRC_MD_ATTR_ALBUM = 0x4
album name
ESP_AVRC_MD_ATTR_TRACK_NUM = 0x8
track position on the album
ESP_AVRC_MD_ATTR_NUM_TRACKS = 0x10
number of tracks on the album
ESP_AVRC_MD_ATTR_GENRE = 0x20
track genre
ESP_AVRC_MD_ATTR_PLAYING_TIME = 0x40
total album playing time in miliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.
Values:
ESP_AVRC_RN_PLAY_STATUS_CHANGE = 0x01
track status change, eg. from playing to paused
ESP_AVRC_RN_TRACK_CHANGE = 0x02
new track is loaded
ESP_AVRC_RN_TRACK_REACHED_END = 0x03
current track reached end
ESP_AVRC_RN_TRACK_REACHED_START = 0x04
current track reached start position
ESP_AVRC_RN_PLAY_POS_CHANGED = 0x05
track playing position changed
ESP_AVRC_RN_BATTERY_STATUS_CHANGE = 0x06
battery status changed
ESP_AVRC_RN_SYSTEM_STATUS_CHANGE = 0x07
system status changed
ESP_AVRC_RN_APP_SETTING_CHANGE = 0x08
application settings changed
ESP_AVRC_RN_NOW_PLAYING_CHANGE = 0x09
now playing content changed
ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
available players changed
ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
the addressed player changed
ESP_AVRC_RN_UIDS_CHANGE = 0x0c
UIDs changed

```c
#define ESP_AVRC_RN_VOLUME_CHANGE 0x0d

volume changed locally on TG

#define ESP_AVRC_RN_MAX_EVT
enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.
Values:

#define ESP_AVRC_RN_CAP_ALLOWED_EVT 0
all of the notification events that can possibly be supported, immutable

#define ESP_AVRC_RN_CAP_SUPPORTED_EVT 1
notification events selectively supported according to the current configuration

#define ESP_AVRC_RN_CAP_MAX
enum esp_avrc_rn_rsp_t
AVRC notification response type.
Values:

#define ESP_AVRC_RN_RSP_INTERIM 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

#define ESP_AVRC_RN_RSP_CHANGED 15
final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.
Values:

#define ESP_AVRC_PS_EQUALIZER 0x01
equalizer, on or off

#define ESP_AVRC_PS_REPEAT_MODE 0x02
repeat mode

#define ESP_AVRC_PS_SHUFFLE_MODE 0x03
shuffle mode

#define ESP_AVRC_PS_SCAN_MODE 0x04
scan mode on or off

#define ESP_AVRC_PS_MAX_ATTR
enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.
Values:

#define ESP_AVRC_PS_EQUALIZER_OFF 0x1
equalizer OFF

#define ESP_AVRC_PS_EQUALIZER_ON 0x2
equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.
Values:

#define ESP_AVRC_PS_REPEAT_OFF 0x1
repeat mode off

#define ESP_AVRC_PS_REPEAT_SINGLE 0x2
single track repeat
```
ESP_AVRC_PS_REPEAT_GROUP = 0x3
    group repeat

enum esp_avrc_ps_shf_value_ids_t
    AVRC shuffle modes.
Values:
    ESP_AVRC_PS_SHUFFLE_OFF = 0x1
    ESP_AVRC_PS_SHUFFLE_ALL = 0x2
    ESP_AVRC_PS_SHUFFLE_GROUP = 0x3

enum esp_avrc_ps_scn_value_ids_t
    AVRC scan modes.
Values:
    ESP_AVRC_PS_SCAN_OFF = 0x1
        scan off
    ESP_AVRC_PS_SCAN_ALL = 0x2
        all tracks scan
    ESP_AVRC_PS_SCAN_GROUP = 0x3
        group scan

enum esp_avrc_rsp_t
    AVCTP response codes.
Values:
    ESP_AVRC_RSP_NOT_IMPL = 8
        not implemented
    ESP_AVRC_RSP_ACCEPT = 9
        accept
    ESP_AVRC_RSP_REJECT = 10
        reject
    ESP_AVRC_RSP_IN_TRANS = 11
        in transition
    ESP_AVRC_RSP_IMPL_STBL = 12
        implemented/stable
    ESP_AVRC_RSP_CHANGED = 13
        changed
    ESP_AVRC_RSP_INTERIM = 15
        interim

enum esp_avrc_batt_stat_t
    AVRCP battery status.
Values:
    ESP_AVRC_BATT_NORMAL = 0
        normal state
    ESP_AVRC_BATT_WARNING = 1
        unable to operate soon
    ESP_AVRC_BATT_CRITICAL = 2
        cannot operate any more
    ESP_AVRC_BATT_EXTERNAL = 3
        plugged to external power supply
ESP_AVRC_BATT_FULL_CHARGE = 4
when completely charged from external power supply

enum esp_avrc_playback_stat_t
AVRCP current status of playback.

Values:

ESP_AVRC_PLAYBACK_STOPPED = 0
stopped
ESP_AVRC_PLAYBACK_PLAYING = 1
playing
ESP_AVRC_PLAYBACK_PAUSED = 2
paused
ESP_AVRC_PLAYBACK_FWD_SEEK = 3
forward seek
ESP_AVRC_PLAYBACK_REV_SEEK = 4
reverse seek
ESP_AVRC_PLAYBACK_ERROR = 0xFF
error

SPP API

Overview  Instructions

Application Example  Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

• This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_spp_api.h

Functions

esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)
This function is called to init callbacks with SPP module.

Return

• ESP_OK: success
• other: failed

Parameters

• [in] callback: pointer to the init callback function.

esp_err_t esp_spp_init (esp_spp_mode_t mode)
This function is called to init SPP module. When the operation is completed, the callback function will be called with ESP_SPP_INIT_EVT. This function should be called after esp_bluedroid_enable() completes successfully.

Return

• ESP_OK: success
• other: failed

Parameters
Chapter 2. API

• [in] mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.

**esp_err_t esp_spp_deinit (void)**

This function is called to uninit SPP module. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback function will be called with ESP_SPP_UNINIT_EVT. This function should be called after esp_spp_init() completes successfully.

**Return**
- ESP_OK: success
- other: failed

**esp_err_t esp_spp_start_discovery (esp_bd_addr_t bd_addr)**

This function is called to perform service discovery for the services provided by the given peer device. When the operation is completed, the callback function will be called with ESP_SPP_DISCOVERY_COMP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_connect (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)**

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] role: Master or slave.
- [in] remote_scn: Remote device bluetooth device SCN.
- [in] peer_bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_disconnect (uint32_t handle)**

This function closes an SPP connection. When the operation is completed, the callback function will be called with ESP_SPP_CLOSE_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] handle: The connection handle.

**esp_err_t esp_spp_start_srv (esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)**

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_SRV_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- ESP_OK: success
- other: failed

**Parameters**
Chapter 2. API

- **[in]** `sec_mask`: Security Setting Mask. Suggest to use ESP_SPP_SEC_NONE, ESP_SPP_SEC_AUTHORIZE or ESP_SPP_SEC_AUTHENTICATE only.
- **[in]** `role`: Master or slave.
- **[in]** `local_scn`: The specific channel you want to get. If channel is 0, means get any channel.
- **[in]** `name`: Server’s name.

### esp_err_t esp_spp_stop_srv (void)

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- **ESP_OK**: success
- **other**: failed

### esp_err_t esp_spp_stop_srv_scn (uint8_t `scn`)

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

**Return**
- **ESP_OK**: success
- **other**: failed

**Parameters**
- **[in]** `scn`: Server channel number.

### esp_err_t esp_spp_write (uint32_t `handle`, int `len`, uint8_t *`p_data`)

This function is used to write data, only for ESP_SPP_MODE_CB. When this function need to be called repeatedly, it is strongly recommended to call this function again after the previous event ESP_SPP_WRITE_EVT is received and the parameter ‘cong’ is equal to false. If the previous event ESP_SPP_WRITE_EVT with parameter ‘cong’ is equal to true, the function can only be called again when the event ESP_SPP_CONG_EVT with parameter ‘cong’ equal to false is received. This function must be called after an connection between initiator and acceptor has been established.

**Return**
- **ESP_OK**: success
- **other**: failed

**Parameters**
- **[in]** `handle`: The connection handle.
- **[in]** `len`: The length of the data written.
- **[in]** `p_data`: The data written.

### esp_err_t esp_spp_vfs_register (void)

This function is used to register VFS. For now, SPP only supports write, read and close.

**Return**
- **ESP_OK**: success
- **other**: failed

### Unions

union esp_spp_cb_param_t

```c
#include <esp_spp_api.h>
```

SPP callback parameters union.

### Public Members

```c
struct esp_spp_cb_param_t* spp_init_evt_param
init
```

SPP callback param of SPP_INIT_EVT
struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
    SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
    SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
    SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
    SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
    SPP callback param of ESP_SPP_CLOSE_EVT

struct esp_spp_cb_param_t::spp_start_evt_param start
    SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
    SPP callback param of ESP_SPP_SRV_STOP_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
    SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
    SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
    SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
    SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
    #include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

    esp_spp_status_t status
    status

    uint32_t handle
        The connection handle

    uint8_t sec_id
        security ID used by this server

    bool use_co
        TRUE to use co_rfc_data

struct spp_close_evt_param
    #include <esp_spp_api.h> ESP_SPP_CLOSE_EVT.

Public Members

    esp_spp_status_t status
    status

   #include <esp_spp_api.h> SPP_INIT_EVT.

Public Members

   esp_spp_status_t status
   struct spp_open_evt_param
      #include <esp_spp_api.h> ESP_SPP_OPEN_EVT.
Chapter 2. API 参考

Public Members

```c
esp_spp_status_t status
uint32_t handle
int fd
esp_bd_addr_t rem_bda
```

The connection handle

The file descriptor only for ESP_SPP_MODE_VFS

The peer address

### struct spp_srv_open_evt_param

```c
#include <esp_spp_api.h> ESP_SPP_SRV_OPEN_EVT.
```

Public Members

```c
esp_spp_status_t status
uint32_t handle
uint32_t new_listen_handle
int fd
esp_bd_addr_t rem_bda
```

The new listen handle

The file descriptor only for ESP_SPP_MODE_VFS

The peer address

### struct spp_srv_stop_evt_param

```c
#include <esp_spp_api.h> ESP_SPP_SRV_STOP_EVT.
```

Public Members

```c
esp_spp_status_t status
uint8_t scn
```

Server channel number

### struct spp_start_evt_param

```c
#include <esp_spp_api.h> ESP_SPP_START_EVT.
```

Public Members

```c
esp_spp_status_t status
uint32_t handle
uint8_t sec_id
uint8_t scn
```

The connection handle

security ID used by this server

Server channel number
bool use_co
    TRUE to use co_rfc_data

struct spp_uninit_evt_param
    #include <esp_spp_api.h> SPP_UNINIT_EVT.

Public Members

esp_spp_status_t status

struct spp_write_evt_param
    #include <esp_spp_api.h> ESP_SPP_WRITE_EVT.

Public Members

esp_spp_status_t status

uint32_t handle
    The connection handle

int len
    The length of the data written.

bool cong
    congestion status

Macros

ESP_SPP_SEC_NONE
    No security. relate to BTA_SEC_NONE in bta/bta_api.h

ESP_SPP_SEC_AUTHORIZE
    Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h

ESP_SPP_SEC_AUTHENTICATE
    Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h

ESP_SPP_SEC_ENCRYPT
    Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h

ESP_SPP_SEC_MODE4_LEVEL4
    Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h

ESP_SPP_SEC_MITM
    Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h

ESP_SPP_SEC_IN_16_DIGITS
    Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h

ESP_SPP_MAX_MTU
    SPP max MTU

ESP_SPP_MAX_SCN
    SPP max SCN
Type Definitions

typedef uint16_t esp_spp_sec_t

typedef void (esp_spp_cb_t) (esp_spp_cb_event_t event, esp_spp_cb_param_t *param)

SPP callback function type. When handle ESP_SPP_DATA_IND_EVT, it is strongly recommended to cache incoming data, and process them in other lower priority application task rather than in this callback directly.

Parameters

- event: Event type
- param: Point to callback parameter, currently is union type

Enumerations

define esp_spp_status_t

Values:

ESP_SPP_SUCCESS = 0
Successful operation.

ESP_SPP_FAILURE
Generic failure.

ESP_SPP_BUSY
Temporarily can not handle this request.

ESP_SPP_NO_DATA
No data

ESP_SPP_NO_RESOURCE
No more resource

ESP_SPP_NEED_INIT
SPP module shall init first

ESP_SPP_NEED_DEINIT
SPP module shall deinit first

ESP_SPP_NO_CONNECTION
Connection may have been closed

ESP_SPP_NO_SERVER
No SPP server

define esp_spp_role_t

Values:

ESP_SPP_ROLE_MASTER = 0
Role: master

ESP_SPP_ROLE_SLAVE = 1
Role: slave

define esp_spp_mode_t

Values:

ESP_SPP_MODE_CB = 0
When data is coming, a callback will come with data

ESP_SPP_MODE_VFS = 1
Use VFS to write/read data

define esp_spp_cb_event_t

SPP callback function events.

Values:

ESP_SPP_INIT_EVT = 0
When SPP is initied, the event comes

---

ESP_SPP_UNINIT_EVT = 1
When SPP is uninitied, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_WRITE_EVT = 33
When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
When SPP Server connection open, the event comes

ESP_SPP_SRV_STOP_EVT = 35
When SPP server stopped, the event comes
**Type Definitions**

typedef void (*esp_hf_connection_state_callback)(esp_hf_connection_state_t state, esp_bd_addr_t *bd_addr)
    Callback for connection state change. state will have one of the values from BtHFConnectionState

typedef void (*esp_hf_audio_state_callback)(esp_hf_audio_state_t state, esp_bd_addr_t *bd_addr)
    Callback for audio connection state change. state will have one of the values from BtHFAudioState

typedef void (*esp_hf_vr_cmd_callback)(esp_hf_vr_state_t state, esp_bd_addr_t *bd_addr)
    Callback for VR connection state change. state will have one of the values from BtHFVRState

typedef void (*esp_hf_answer_call_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for answer incoming call (ATA)

typedef void (*esp_hf_hangup_call_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP)

typedef void (*esp_hf_volume_cmd_callback)(esp_hf_volume_control_target_t type, int volume, esp_bd_addr_t *bd_addr)
    Callback for disconnect call (AT+CHUP) type will denote Speaker/Mic gain (BtHFVolumeControl).

typedef void (*esp_hf_dial_call_cmd_callback)(char* number, esp_bd_addr_t *bd_addr)
    Callback for dialing an outgoing call If number is NULL, redial

typedef void (*esp_hf_dtmf_cmd_callback)(char tone, esp_bd_addr_t *bd_addr)
    Callback for sending DTMF tones tone contains the dtmf character to be sent

typedef void (*esp_hf_nrec_cmd_callback)(esp_hf_nrec_t nrec, esp_bd_addr_t *bd_addr)
    Callback for enabling/disabling noise reduction/echo cancellation value will be 1 to enable, 0 to disable

typedef void (*esp_hf_wbs_callback)(esp_hf_wbs_config_t wbs, esp_bd_addr_t *bd_addr)
    Callback for AT+BCS and event from BAC WBS enable, WBS disable

typedef void (*esp_hf_chld_cmd_callback)(esp_hf_chld_type_t chld, esp_bd_addr_t *bd_addr)
    Callback for call hold handling (AT+CHLD) value will contain the call hold command (0, 1, 2, 3)

typedef void (*esp_hf_cnum_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for CNUM (subscriber number)

typedef void (*esp_hf_cind_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for indicators (CIND)

typedef void (*esp_hf_cops_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for operator selection (COPS)

typedef void (*esp_hf_clcc_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for call list (AT+CLCC)

typedef void (*esp_hf_unknown_at_cmd_callback)(char *at_string, esp_bd_addr_t *bd_addr)
    Callback for unknown AT command recd from AG at_string will contain the unparsed AT string

typedef void (*esp_hf_key_pressed_cmd_callback)(esp_bd_addr_t *bd_addr)
    Callback for keypressed (HSP) event.

**Enumerations**

define esp_hf_in_band_ring_state_t
    in-band ring tone state
    
    Values:
    
    ESP_HF_IN_BAND_RINGTONE_NOT_PROVIDED = 0
    ESP_HF_IN_BAND_RINGTONE_PROVIDED

Espressif Systems 275 Release v5.0-dev-489-gef98a36
enum esp_hf_vr_state_t
voice recognition state

Values:

ESP_HF_VR_STATE_DISABLED = 0
voice recognition disabled

ESP_HF_VR_STATE_ENABLED
voice recognition enabled

enum esp_hf_volume_control_target_t
Bluetooth HFP audio volume control target.

Values:

ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
speaker

ESP_HF_VOLUME_CONTROL_TARGET_MIC
microphone

enum esp_hf_audio_state_t
Bluetooth HFP audio connection status.

Values:

ESP_HF_AUDIO_STATE_DISCONNECTED = 0
audio connection released

ESP_HF_AUDIO_STATE_CONNECTING
audio connection has been initiated

ESP_HF_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

enum esp_hf_volume_type_t

Values:

ESP_HF_VOLUME_TYPE_SPK = 0

ESP_HF_VOLUME_TYPE_MIC

Values:
ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
  unknown address type
ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
  international address

enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number
Values:
ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
  unknown
ESP_HF_SUBSCRIBER_SERVICE_TYPE_VOICE
  voice service
ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
  fax service

enum esp_hf_btrh_status_t
+BTRH response and hold result code
Values:
ESP_HF_BTRH_STATUS_HELD = 0
  incoming call is put on hold in AG
ESP_HF_BTRH_STATUS_ACCEPTED
  held incoming call is accepted in AG
ESP_HF_BTRH_STATUS_REJECTED
  held incoming call is rejected in AG
enum esp_hf_btrh_cmd_t
AT+BTRH response and hold action code.

Values:

ESP_HF_BTRH_CMD_HOLD = 0
put the incoming call on hold

ESP_HF_BTRH_CMD_ACCEPT = 1
accept a held incoming call

ESP_HF_BTRH_CMD_REJECT = 2
reject a held incoming call

enum esp_hf_nrec_t
Values:

ESP_HF_NREC_STOP = 0

ESP_HF_NREC_START

enum esp_hf_call_waiting_status_t
+CCWA respose status

Values:

ESP_HF_CALL_WAITING_INACTIVE

ESP_HF_CALL_WAITING_ACTIVE

enum esp_hf_wbs_config_t
Values:

ESP_HF_WBS_NONE

ESP_HF_WBS_NO

ESP_HF_WBS_YES

enum esp_hf_connection_state_t
Bluetooth HFP RFCOMM connection and service level connection status.

Values:

ESP_HF_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released

ESP_HF_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

ESP_HF_CONNECTION_STATE_CONNECTED
RFCOMM connection established

ESP_HF_CONNECTION_STATE_SLC_CONNECTED
service level connection established

ESP_HF_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM data link

enum esp_hf_chld_type_t
AT+CHLD command values.

Values:

ESP_HF_CHLD_TYPE_REL = 0
<0>, Terminate all held or set UDUB(“busy”) to a waiting call

ESP_HF_CHLD_TYPE_REL_ACC
<1>, Terminate all active calls and accepts a waiting/held call

ESP_HF_CHLD_TYPE_HOLD_ACC
<2>, Hold all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference

ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls

ESP_HF_CHLD_TYPE_REL_X
<1x>, releases specified calls only

ESP_HF_CHLD_TYPE_PRIV_X
<2x>, request private consultation mode with specified call

enum esp_hf_at_response_code_t
Values:

ESP_HF_AT_RESPONSE_CODE_OK = 0
acknowledges execution of a command line

ESP_HF_AT_RESPONSE_CODE_ERR
command not accepted

ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
connection terminated

ESP_HF_AT_RESPONSE_CODE_BUSY
busy signal detected

ESP_HF_AT_RESPONSE_CODE_NO_ANSWER
connection completion timeout

ESP_HF_AT_RESPONSE_CODE_DELAYED
delayed

ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
blacklisted

ESP_HF_AT_RESPONSE_CODE_CME
CME error

enum esp_hf_at_response_t
Values:

ESP_HF_AT_RESPONSE_ERROR = 0

ESP_HF_AT_RESPONSE_OK

enum esp_hf_cme_err_t
Extended Audio Gateway Error Result Code Response.
Values:

ESP_HF_CME_AG_FAILURE = 0
ag failure

ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
no connection to phone

ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
operation not allowed

ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
operation not supported

ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
PH-SIM PIN Required

ESP_HF_CME_SIM_NOT_INSERTED = 10
SIM not inserted
ESP_HF_CME_SIM_PIN_REQUIRED = 11
SIM PIN required

ESP_HF_CME_SIM_PIN2_REQUIRED = 17
SIM PIN2 required

ESP_HF_CME_SIM_PUK_REQUIRED = 12
SIM PUK required

ESP_HF_CME_SIM_PUK2_REQUIRED = 18
SIM PUK2 required

ESP_HF_CME_SIM_FAILURE = 13
SIM failure

ESP_HF_CME_SIM_BUSY = 14
SIM busy

ESP_HF_CME_INCORRECT_PASSWORD = 16
incorrect password

ESP_HF_CME_INVALID_INDEX = 21
invalid index

ESP_HF_CME_MEMORY_FULL = 20
memory full

ESP_HF_CME_MEMORY_FAILURE = 23
memory failure

ESP_HF_CME_TEXT_STRING_TOO_LONG = 24
text string too long

ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING = 25
invalid characters in text string

ESP_HF_CME_DIAL_STRING_TOO_LONG = 26
dial string too long

ESP_HF_CME_INVALID_CHARACTERS_IN.Dial_STRING = 27
invalid characters in dial string

ESP_HF_CME_NO_NETWORK_SERVICE = 30
no network service

ESP_HF_CME_NETWORK_TIMEOUT = 31
network timeout

ESP_HF_CME_NETWORK_NOT_ALLOWED = 32
network not allowed emergency calls only

HFP CLIENT API

Overview
Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_hf_client_api.h
Functions

`esp_err_t esp_hf_client_register_callback (esp_hf_client_cb_t callback)`

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: HFP client event callback function

`esp_err_t esp_hf_client_init (void)`

Initialize the Bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALIDSTATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_deinit (void)`

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALIDSTATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_connect (esp_bd_addr_t remote_bda)`

Establish a Service Level Connection to remote Bluetooth HFP audio gateway (AG) device. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return

- ESP_OK: connect request is sent to lower layer
- ESP_INVALIDSTATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_hf_client_disconnect (esp_bd_addr_t remote_bda)`

Disconnect from the remote HFP audio gateway. This function must be called after esp_hf_client_init() and before esp_hf_client_deinit().

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALIDSTATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_hf_client_connect_audio (esp_bd_addr_t remote_bda)`

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALIDSTATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote Bluetooth device address

`esp_err_t esp_hf_client_disconnect_audio (esp_bd_addr_t remote_bda)`

Release the established audio connection with remote HFP AG. As a precondition to use this API, Service
Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address

esp_err_t esp_hf_client_start_voice_recognition(void)
Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_stop_voice_recognition(void)
Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)
Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker or microphone, ranges 0 to 15

esp_err_t esp_hf_client_dial(const char* number)
Place a call with a specified number, if number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] number: number string of the call. If NULL, the last number is called (aka re-dial)

esp_err_t esp_hf_client_dial_memory(int location)
Place a call with number specified by location (speed dial). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] location: location of the number in the memory

esp_err_t esp_hf_client_send_chld_cmd(esp_hf_child_type_t child, int idx)
Send call hold and multiparty commands, or enhanced call control commands (Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.
Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] chld: AT+CHLD call hold and multiparty handling AT command.
- [in] idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRIV_X

`esp_err_t esp_hf_client_send_btrh_cmd (esp_hf_btrh_cmd_t btrh)`
Send response and hold action command (Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] btrh: response and hold action to send

`esp_err_t esp_hf_client_answer_call (void)`
Answer an incoming call (send AT+A command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_reject_call (void)`
Reject an incoming call (send AT+CHUP command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_calls (void)`
Query list of current calls in AG (send AT+CLCC command). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_query_current_operator_name (void)`
Query the name of currently selected network operator in AG (use AT+COPS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_retrieve_subscriber_info (void)`
Get subscriber information number from AG (send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
Chapter 2. API

**esp_err_t esp_hf_client_send_dtmf(char code)**
Transmit DTMF codes during an ongoing call (use AT+VTS commands). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] code: dtmf code, single ascii character in the set 0-9, #, *, A-D

**esp_err_t esp_hf_client_request_last_voice_tag_number(void)**
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_send_nrec(void)**
Disable echo cancellation and noise reduction in the AG (use AT+NREC=0 command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: NREC=0 request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_register_data_callback(esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)**
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

**void esp_hf_client_outgoing_data_ready(void)**
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

As a precondition to use this API, Service Level Connection shall exist with AG.

**void esp_hf_client_pcm_resample_init(uint32_t src_sps, uint32_t bits, uint32_t channels)**
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- [in] src_sps: original samples per second (source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- [in] bits: number of bits per pcm sample (16)
- [in] channels: number of channels (i.e. mono(1), stereo(2)…)

**void esp_hf_client_pcm_resample_deinit(void)**
Deinitialize the down sampling converter.

**int32_t esp_hf_client_pcm_resample(void *src, uint32_t in_bytes, void *dst)**
Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.
Return  number of samples converted

Parameters
• [in] src: pointer to the buffer where the original sampling PCM are stored
• [in] in_bytes: length of the input PCM sample buffer in byte
• [in] dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions
union esp_hf_client_cb_param_t
#include <esp_hf_client_api.h> HFP client callback parameters.

Public Members

struct esp_hf_client_cb_param_t::hf_client_conn_stat_param conn_stat

Public Members

`esp_hf_btrh_status_t status`
call hold and response status result code

`struct hf_client_bvra_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_BVRA_EVT.

Public Members

`esp_hf_vr_state_t value`
voice recognition state

`struct hf_client_call_held_ind_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_HELD_EVT.

Public Members

`esp_hf_call_held_status_t status`
bluetooth proprietary call hold status indicator

`struct hf_client_call_ind_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_EVT.

Public Members

`esp_hf_call_status_t status`
call status indicator

`struct hf_client_call_setup_ind_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_CALL_SETUP_EVT.

Public Members

`esp_hf_call_setup_status_t status`
call setup status indicator

`struct hf_client_ccwa_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CCWA_EVT.

Public Members

`const char *number`
phone number string of waiting call

`struct hf_client_clcc_param`
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLCC_EVT.

Public Members

`int idx`
numbering (starting with 1) of the call

`esp_hf_current_call_direction_t dir`
direction of the call
Chapter 2. API

```c
esp_hf_current_call_status_t status
status of the call

esp_hf_current_call_mpty_type_t mpty
multi-party flag

char *number
phone number (optional)
```

```c
struct hf_client_clip_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CLIP_EVT.
```

**Public Members**

```c
const char *number
phone number string of call
```

```c
struct hf_client_cnum_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CNUM_EVT.
```

**Public Members**

```c
const char *number
phone number string

esp_hf_subscriber_service_type_t type
service type that the phone number relates to
```

```c
struct hf_client_conn_stat_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CONNECTION_STATE_EVT.
```

**Public Members**

```c
esp_hf_client_connection_state_t state
HF connection state

uint32_t peer_feat
AG supported features

uint32_t chld_feat
AG supported features on call hold and multiparty services

esp_bd_addr_t remote_bda
remote bluetooth device address
```

```c
struct hf_client_current_operator_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT.
```

**Public Members**

```c
const char *name
name of the network operator
```

```c
struct hf_client_network_roaming_param
#include <esp_hf_client_api.h> ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT.
```

Type Definitions

typedef void (*esp_hf_client_incoming_data_cb_t)(const uint8_t*buf, uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters
• [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: : size(in bytes) in buf

typedef uint32_t(*esp_hf_client_outgoing_data_cb_t)(uint8_t*buf, uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

Return length of data successfully read

Parameters
• [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: : size(in bytes) in buf

typedef void (*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t *param)
HFP client callback function type.

Parameters
• event:: Event type
• param:: Pointer to callback parameter

Enumerations

enum esp_hf_client_connection_state_t
Bluetooth HFP RFCOMM connection and service level connection status.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED
RFCOMM connection established

ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED
service level connection established

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM dat link

enum esp_hf_client_audio_state_t
Bluetooth HFP audio connection status.

Values:

ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0
audio connection released

ESP_HF_CLIENT_AUDIO_STATE_CONNECTING
audio connection has been initiated
Chapter 2. API 参考

```c
ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
audio connection is established

ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
mSBC audio connection is established

defined

enum esp_hf_client_in_band_ring_state_t
in-band ring tone state

Values:

ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0

ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_client_cb_event_t
HF CLIENT callback events.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_HF_CLIENT_AUDIO_STATE_EVT
audio connection state change event

ESP_HF_CLIENT_BVRA_EVT
voice recognition state change event

ESP_HF_CLIENT_CIND_CALL_EVT
call indication

ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
call setup indication

ESP_HF_CLIENT_CIND_CALL_HELD_EVT
call held indication

ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
network service availability indication

ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
signal strength indication

ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
roaming status indication

ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
battery level indication

ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
current operator information

ESP_HF_CLIENT_BTRH_EVT
call response and hold event

ESP_HF_CLIENT_CLIP_EVT
Calling Line Identification notification

ESP_HF_CLIENT_CCWA_EVT
call waiting notification

ESP_HF_CLIENT_CLCC_EVT
list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL_EVT
audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
AT command response event
```
ESP_HF_CLIENT_CNUM_EVT
subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
requested number of last voicetag from AG

ESP_HF_CLIENT_RING_IND_EVT
ring indication event

Functions

esp_err_t esp_bt_hf_register_callback (esp_hf_cb_t callback)
Register application callback function to HFP AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] callback: HFP AG event callback function

esp_err_t esp_bt_hf_init (esp_bd_addr_t remote_addr)
Initialize the bluetooth HF AG module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address

esp_err_t esp_bt_hf_deinit (esp_bd_addr_t remote_addr)
De-initialize for HF AG module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote bluetooth device address

esp_err_t esp_bt_hf_connect (esp_bd_addr_t remote_bda)
To establish a Service Level Connection to remote bluetooth HFP client device. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

Return
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
### Parameters
- **[in] remote_bda**: remote bluetooth HFP client device address

#### esp_err_t esp_bt_hf_disconnect(esp_bd_addr_t remote_bda)
Disconnect from the remote HFP client. This function must be called after esp_bt_hf_init() and before esp_bt_hf_deinit().

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] remote_bda**: remote bluetooth device address

#### esp_err_t esp_bt_hf_connect_audio(esp_bd_addr_t remote_bda)
Create audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] remote_bda**: remote bluetooth device address

#### esp_err_t esp_bt_hf_disconnect_audio(esp_bd_addr_t remote_bda)
Release the established audio connection with remote HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] remote_bda**: remote bluetooth device address

#### esp_err_t esp_bt_hf_vra(esp_bd_addr_t remote_bda, esp_hf_vr_state_t value)
Response of Volume Recognition Command(AT+VRA) from HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] remote_bda**: the device address of voice recognition initiator
- **[in] value**: 0 - voice recognition disabled, 1 - voice recognition enabled

#### esp_err_t esp_bt_hf_volume_control(esp_bd_addr_t remote_bda, esp_hf_volume_control_target_t type, int volume)
Volume synchronization with HFP client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in] remote_bda**: remote bluetooth device address
- **[in] type**: volume control target, speaker or microphone
- **[in] volume**: gain of the speaker of microphone, ranges 0 to 15

#### esp_err_t esp_hf_unat_response(esp_bd_addr_t remote_addr, char *unat)
Handle Unknown AT command from HFP Client. As a precondition to use this API, Service Level Connection
shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] unat: User AT command response to HF Client. It will respond “ERROR” by default if unat is NULL.

```c
esp_err_t esp_bt_hf_cmee_response(esp_bd_addr_t remote_bda, esp_hf_at_response_code_t response_code, esp_hf_cme_err_t error_code)
```

Unsolicited send extend AT error code to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_bda: remote Bluetooth device address
- [in] response_code: AT command response code
- [in] error_code: CME error code

```c
esp_err_t esp_bt_hf_indchange_notification(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal)
```

Unsolicited send device status notification to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5

```c
esp_err_t esp_bt_hf_cind_response(esp_bd_addr_t remote_addr, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, esp_hf_network_state_t ntk_state, int signal, esp_hf_roaming_status_t roam, int batt_lev, esp_hf_call_held_status_t call_held_status)
```

Response to device individual indicators to HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] ntk_state: network service state
- [in] signal: signal strength from 0 to 5
- [in] roam: roam state
Chapter 2. API

- [in] batt_lev: battery level from 0 to 5
- [in] call_held_status: call held status

`esp_err_t esp_bt_hf_cops_response(esp_bd_addr_t remote_addr, char *name)`

Response for AT+COPS command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] name: current operator name

`esp_err_t esp_bt_hf_clcc_response(esp_bd_addr_t remote_addr, int index, esp_hf_current_call_direction_t dir, esp_hf_current_call_status_t current_call_state, esp_hf_current_call_mode_t mode, esp_hf_current_call_mpty_type_t mpty, char *number, esp_hf_call_addr_type_t type)`

Response to AT+CLCC command from HFP Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] index: the index of current call
- [in] dir: call direction (incoming/outgoing)
- [in] current_call_state: current call state
- [in] mode: current call mode (voice/data/fax)
- [in] mpty: single or multi type
- [in] number: current call number
- [in] type: international type or unknown

`esp_err_t esp_bt_hf_cnum_response(esp_bd_addr_t remote_addr, char *number)`

Response for AT+CNUM command from HF Client. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] number: registration number
- [in] type: service type (unknown/voice/fax)

`esp_err_t esp_bt_hf_bsir(esp_bd_addr_t remote_addr, esp_hf_in_band_ring_state_t state)`

Inform HF Client that AG Provided in-band ring tone or not. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
• [in] state: in-band ring tone state

```c
esp_err_t esp_bt_hf_answer_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                                 esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                                 char *number, esp_hf_call_addr_type_t call_addr_type)
```

Answer Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp_bt_hf_reject_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                                  esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                                  char *number, esp_hf_call_addr_type_t call_addr_type)
```

Reject Incoming Call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the incoming call
- [in] call_addr_type: call address type

```c
esp_err_t esp_bt_hf_out_call (esp_bd_addr_t remote_addr, int num_active, int num_held,
                               esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state,
                               char *number, esp_hf_call_addr_type_t call_addr_type)
```

Initiate a call from AG. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the outgoing call
- [in] call_addr_type: call address type
Chapter 2. API

Esp_err_t esp_bt_hf_end_call(esp_bd_addr_t remote_addr, int num_active, int num_held, esp_hf_call_status_t call_state, esp_hf_call_setup_status_t call_setup_state, char *number, esp_hf_call_addr_type_t call_addr_type)

End an ongoing call. As a precondition to use this API, Service Level Connection shall exist with HFP client.

Return
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] remote_addr: remote Bluetooth device address
- [in] num_active: the number of active call
- [in] num_held: the number of held call
- [in] call_state: call state
- [in] call_setup_state: call setup state
- [in] number: number of the call
- [in] call_addr_type: call address type

Esp_err_t esp_bt_hf_register_data_callback (esp_hf_incoming_data_cb_t recv, esp_hf_outgoing_data_cb_t send)

Register AG data output function. The callback is only used in the case that Voice Over HCI is enabled.

Return
- ESP_OK: success
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters
- [in] recv: HFP client incoming data callback function
- [in] send: HFP client outgoing data callback function

void esp_hf_outgoing_data_ready (void)

Trigger the lower-layer to fetch and send audio data.

This function is only used in the case that Voice Over HCI is enabled. As a precondition to use this API, Service Level Connection shall exist with HFP client. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cbt to fetch data

ESP_HF_CHLD_FEAT_MERGE_DETACH
```

Type Definitions

```c
typedef void (*esp_hf_incoming_data_cb_t)(const uint8_t *buf, uint32_t len)
AG incoming data callback function, the callback is useful in case of Voice Over HCI.
```

Parameters

- **[in]** `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- **[in]** `len`: size (in bytes) in `buf`

```c
typedef uint32_t (*esp_hf_outgoing_data_cb_t)(uint8_t *buf, uint32_t len);
```

AG outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio connection is set up and the application layer has prepared data to send, the lower layer will call this function to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not enough, return value 0 is supposed.

**Return**: length of data successfully read

**Parameters**
- **[in]** `buf`: pointer to incoming data (payload of HCI synchronous data packet), the buffer is allocated inside Bluetooth protocol stack and will be released after invoke of the callback is finished.
- **[in]** `len`: size (in bytes) in `buf`

```c
typedef void (*esp_hf_cb_t)(esp_hf_cb_event_t event, esp_hf_cb_param_t *param);
```

HF AG callback function type.

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
eenum esp_hf_cb_event_t
{
    ESP_HF_CONNECTION_STATE_EVT = 0,
    ESP_HF_AUDIO_STATE_EVT,
    ESP_HF_BVRA_RESPONSE_EVT,
    ESP_HF_VOLUME_CONTROL_EVT,
    ESP_HF_UNAT_RESPONSE_EVT,
    ESP_HF_IND_UPDATE_EVT,
    ESP_HF_CIND_RESPONSE_EVT,
    ESP_HF_COPS_RESPONSE_EVT,
    ESP_HF_CLCC_RESPONSE_EVT,
    ESP_HF_CNUM_RESPONSE_EVT,
    ESP_HF_VTS_RESPONSE_EVT,
    ESP_HF_NREC_RESPONSE_EVT,
    ESP_HF_ATA_RESPONSE_EVT
};
```

HF callback events.

**Values:**
- `ESP_HF_CONNECTION_STATE_EVT`: Connection state changed event
- `ESP_HF_AUDIO_STATE_EVT`: Audio connection state change event
- `ESP_HF_BVRA_RESPONSE_EVT`: Voice recognition state change event
- `ESP_HF_VOLUME_CONTROL_EVT`: Audio volume control command from HF Client, provided by +VGM or +VGS message
- `ESP_HF_UNAT_RESPONSE_EVT`: Unknown AT cmd Response
- `ESP_HF_IND_UPDATE_EVT`: Indicator Update Event
- `ESP_HF_CIND_RESPONSE_EVT`: Call And Device Indicator Response
- `ESP_HF_COPS_RESPONSE_EVT`: Current operator information
- `ESP_HF_CLCC_RESPONSE_EVT`: List of current calls notification
- `ESP_HF_CNUM_RESPONSE_EVT`: Subscriber information response from HF Client
- `ESP_HF_VTS_RESPONSE_EVT`: Enable or not DTMF
- `ESP_HF_NREC_RESPONSE_EVT`: Enable or not NREC
- `ESP_HF_ATA_RESPONSE_EVT`: Answer an Incoming Call
Chapter 2. API

2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![ESP NimBLE Stack](image)

Typical programming sequence with NimBLE stack consists of the following steps:

1. Enable the NimBLE stack in menuconfig: choose NimBLE for the Bluetooth host.
2. Begin with the following steps:
   a. Make sure the NimBLE stack is enabled.
   b. Configure the stack settings.
   c. Initialize the NimBLE stack.
   d. Start advertising.

Programming Sequence

Submit Document Feedback
Chapter 2. API

• Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
• Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
• Initialize the host stack using `nimble_port_init`.
• Initialize the required NimBLE host configuration parameters and callbacks.
• Perform application specific tasks/initialization.
• Run the thread for host stack using `nimble_port_freertos_init`.

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

Functions

```c
esp_err_t esp_nimble_hci_init (void)
Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Return
- ESP_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error
```
```c
esp_err_t esp_nimble_hci_and_controller_init (void)
Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:
```
```c
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port__
    --stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d
    ", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```
```
nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to `nimble_port_run()`. If a separate task is not required, calling `nimble_port_run()` will run the NimBLE host in the current task.
Return
• ESP_OK if the initialization is successful
• Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

Return
• ESP_OK if the deinitialization is successful
• Appropriate error codes from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_and_controller_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.
**Note** This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with_-
        _error: %d", ret);
    }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return
• ESP_OK if the deinitialization is successful
• Appropriate error codes from esp_err_t in case of an error

**Macros**

BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO
BLE_HCI_UART_H4_EVT

## 2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.
Chapter 2. API 参考

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section ESP-BLE-MESH 快速入门. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH 架构.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH 示例 and ESP-BLE-MESH 演示视频.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

```c
#include <esp_ble_mesh_defs.h>
BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_register_comp_param prov_register_comp
Event parameter of ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_unprov_dev_name_comp_param node_set_unprov_dev_name
Event parameter of ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_enable_comp_param node_prov_enable
Event parameter of ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_prov_disable_comp_param node_prov_disable
Event parameter of ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_open_evt_param node_prov_link_open
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_link_close_evt_param node_prov_link_close
Event parameter of ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_num_evt_param node_prov_output_num
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
```

```c
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_output_str_evt_param node_prov_output_str
Event parameter of ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
```
struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_evt_param node_prov_input
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_complete_evt_param node_prov_complete
Event parameter of ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provision_reset_param node_prov_reset
Event parameter of ESP_BLE_MESH_NODE_PROV_RESET_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_set_oob_pub_key_comp_param node_prov_set_oob_pub_key_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_number_comp_param node_prov_input_num_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_input_string_comp_param node_prov_input_str_comp
Event parameter of ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_identity_enable_comp_param node_proxy_identity_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_enable_comp_param node_proxy_gatt_enable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_gatt_disable_comp_param node_proxy_gatt_disable_comp
Event parameter of ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_net_key_comp_param node_add_net_key_comp
Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_add_local_app_key_comp_param node_add_app_key_comp
Event parameter of ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_node_bind_local_mod_app_comp_param node_bind_app_key_to_model_comp
Event parameter of ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_recv_unprov_adv_pkt_param provisioner_recv_unprov_adv_pkt
Event parameter of ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_enable_comp_param provisioner_prov_enable_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_disable_comp_param provisioner_prov_disable_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_open_evt_param provisioner_prov_link_open
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_read_oob_pub_key_evt_param provisioner_prov_read_oob_pub_key
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_input_evt_param provisioner_prov_input
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_output_evt_param provisioner_prov_output
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_link_close_evt_param provisioner_prov_link_close
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_comp_param provisioner_prov_complete
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_add_unprov_dev_comp_param provisioner_add_unprov_dev_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_prov_dev_with_addr_comp_param provisioner_prov_dev_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
struct esp_ble_mesh_prov_cb_param_t

    ble_mesh_provisioner_delete_node_with_addr_comp_param
    
    Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code

    Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
    Indicate the result of setting the heartbeat filter type by the Provisioner
    Indicate the result of setting the heartbeat filter address by the Provisioner
    Indicate the result of directly erasing settings by the Provisioner
    Indicate the result of opening settings with index by the Provisioner
    Indicate the result of opening settings with user id by the Provisioner
    Indicate the result of closing settings with index by the Provisioner
    Indicate the result of closing settings with user id by the Provisioner
    Indicate the result of deleting settings with index by the Provisioner
    Indicate the result of deleting settings with user id by the Provisioner
**bool enable**
Indicate enabling or disabling receiving heartbeat messages

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

```c
uint8_t t_type
Type of the filter used for receiving heartbeat messages
```

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

```c
uint8_t t_op
Operation (add, remove, clean)
```

```c
uint16_t t hb src
Heartbeat source address
```

```c
uint16_t t hb dst
Heartbeat destination address
```

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

```c
uint8_t t init ttl
Heartbeat InitTTL
```

```c
uint8_t t rx ttl
Heartbeat RxTTL
```

```c
uint8_t t hops
Heartbeat hops (InitTTL - RxTTL + 1)
```

```c
uint16_t t feature
Bit field of currently active features of the node
```

```c
int8_t t rssi
RSSI of the heartbeat message
```

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_direct_erase_settings_comp
ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

```c
uint8_t t index
Index of Provisioner settings
```

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGST_WITH_INDEX_COMP_EVT.
```
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

```c
char t uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
Provisioner settings user id
```

```c
struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
```
Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

Public Members

int err_code
Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
Receive Friend Request from existing Low Power Node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
Receive Friend Clear from other friend node

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted
Public Members

```c
uint16_t lpn_addr
Low Power Node unicast address
```

```c
esp_ble_mesh_prov_ch_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason
```

```c
struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

    Value of the received message

struct ble_mesh_model_publish_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
    Indicate the result of publishing a message

esp_ble_mesh_model_t **model
    Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t **model
    Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
    Indicate the result of sending a message

uint32_t opcode
    Opcode of the message

esp_ble_mesh_model_t **model
    Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t **ctx
    Context of the message

struct ble_mesh_server_model_update_state_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
Chapter 2. API 参考

Public Members

```
int err_code
   Indicate the result of updating server model state

esp_ble_mesh_model_t *model
   Pointer to the server model which state value is updated

esp_ble_mesh_server_state_type_t type
   Type of the updated server state
```

Structures

```
struct esp_ble_mesh_deinit_param_t
   BLE Mesh deinit parameters

Public Members

bool erase_flash
   Indicate if erasing flash when deinit mesh stack

struct esp_ble_mesh_elem_t
   Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

uint16_t element_addr
   Element Address, assigned during provisioning.

const uint16_t location
   Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t sig_model_count
   SIG Model count

const uint8_t vnd_model_count
   Vendor Model count

esp_ble_mesh_model_t *sig_models
   SIG Models

esp_ble_mesh_model_t *vnd_models
   Vendor Models

struct esp_ble_mesh_model_pub_t
   Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

esp_ble_mesh_model_t *model
   Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
   Publish Address.

uint16_t app_idx : 12
   Publish AppKey Index.

uint16_t cred : 1
   Friendship Credentials Flag.
```
uint16_t send_rel : 1
    Force reliable sending (segment acks)

uint8_t ttl
    Publish Time to Live.

uint8_t retransmit
    Retransmit Count & Interval Steps.

uint8_t period
    Publish Period.

uint8_t period_div : 4
    Divisor for the Period.

uint8_t fast_period : 1
    Use FastPeriodDivisor

uint8_t count : 3
    Retransmissions left.

uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.
    This will get correctly created when the publication context has been defined using the
    ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
    ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
    Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct
    bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
    Message opcode

const size_t min_len
    Message minimum length

esp_ble_mesh_cb_t param_cb
    Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
    Abstraction that describes a model callback structure. This structure is associated with struct
    bt_mesh_model_cb in mesh_access.h

Public Members

esp_ble_mesh_cb_t init_cb
    Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.
uint16_t recv_dst
  Destination address of a received message. Not used for sending.

int8_t recv_rssi
  RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
  Received TTL value. Not used for sending.

uint8_t send_rel : 1
  Force sending reliably by using segment acknowledgement

uint8_t send_ttl
  TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
  Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
  Model corresponding to the message, no need to be initialized before sending message

bool srv_send
  Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
  Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
  Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid
  16-bit SIG-assigned company identifier

uint16_t pid
  16-bit vendor-assigned product identifier

uint16_t vid
  16-bit vendor-assigned product version identifier

size_t element_count
  Element count

esp_ble_mesh_elem_t *elements
  A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
  Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr
  Device address

esp_ble_mesh_addr_type_t addr_type
  Device address type

uint8_t uuid[16]
  Device UUID

uint16_t oob_info
  Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled
esp_ble_mesh_prov_bearer_t \texttt{bearer}
Provisioning Bearer

\textbf{struct esp_ble_mesh_device_delete_t}
Information of the device which is going to be deleted.

\textbf{Public Members}

\texttt{esp_ble_mesh_bd_addr_t \texttt{addr}}
Device address

\texttt{esp_ble_mesh_addr_type_t \texttt{addr_type}}
Device address type

\texttt{uint8_t \texttt{uuid}[16]}
Device UUID

\texttt{uint8_t \texttt{flag}}
BIT0: device address; BIT1: device UUID

\textbf{struct esp_ble_mesh_prov_data_info_t}
Information of the provisioner which is going to be updated.

\textbf{Public Members}

\texttt{uint16_t \texttt{net_idx}}
NetKey Index

\texttt{uint8_t \texttt{flags}}
Flags

\texttt{uint32_t \texttt{iv_index}}
IV Index

\texttt{uint8_t \texttt{flag}}
BIT0: net_idx; BIT1: flags; BIT2: iv_index

\textbf{struct esp_ble_mesh_node_t}
Information of the provisioned node

\textbf{Public Members}

\texttt{esp_ble_mesh_bd_addr_t \texttt{addr}}
Node device address

\texttt{esp_ble_mesh_addr_type_t \texttt{addr_type}}
Node device address type

\texttt{uint8_t \texttt{dev_uuid}[16]}
Device UUID

\texttt{uint16_t \texttt{oob_info}}
Node OOB information

\texttt{uint16_t \texttt{unicast_addr}}
Node unicast address

\texttt{uint8_t \texttt{element_num}}
Node element number

\texttt{uint16_t \texttt{net_idx}}
Node NetKey Index
uint8_t flags
   Node key refresh flag and iv update flag

uint32_t iv_index
   Node IV Index

uint8_t dev_key[16]
   Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
   Node name

uint16_t comp_length
   Length of Composition Data

uint8_t* comp_data
   Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
   Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
   Minimum unicast address used for fast provisioning

uint16_t unicast_max
   Maximum unicast address used for fast provisioning

uint16_t net_idx
   Netkey index used for fast provisioning

uint8_t flags
   Flags used for fast provisioning

uint32_t iv_index
   IV Index used for fast provisioning

uint8_t offset
   Offset of the UUID to be compared

uint8_t match_len
   Length of the UUID to be compared

uint8_t match_val[16]
   Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
   Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
   Heartbeat source address (unicast address)

uint16_t hb_dst
   Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
   BLE Mesh client models related definitions.
   Client model Get/Set message opcode and corresponding Status message opcode
Public Members

```c
uint32_t cli_op
The client message opcode
```

```c
uint32_t status_op
The server status opcode corresponding to the client message opcode
```

```c
struct esp_ble_mesh_client_t
Client Model user data context.
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.
```

```c
int op_pair_size
Size of the op_pair
```

```c
const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode
```

```c
uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.
```

```c
void *internal_data
Pointer to the internal data of client model
```

```c
uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages
```

```c
struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.
```

Public Members

```c
esp_ble_mesh_opcode_t opcode
Message opcode
```

```c
esp_ble_mesh_model_t *model
Pointer to the client model structure
```

```c
esp_ble_mesh_msg_ctx_t ctx
The context used to send message
```

```c
int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0
```

```c
uint8_t msg_role
Role of the device - Node/Provisioner
```

```c
struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition
```

Public Functions

```c
BLE_MESH_ATOMIC_DEFINE
Flag used to indicate if the transition timer has been started internally.
```

If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.
And users can use this flag to indicate whether the timer is started or not.

**Public Members**

```cpp
bool just_started
   Indicate if the state transition has just started
```

```cpp
uint8_t trans_time
   State transition time
```

```cpp
uint8_t remain_time
   Remaining time of state transition
```

```cpp
delay
   Delay before starting state transition
```

```cpp
uint32_t quo_tt
   Duration of each divided transition step
```

```cpp
uint32_t counter
   Number of steps which the transition duration is divided
```

```cpp
uint32_t total_duration
   State transition total duration
```

```cpp
int64_t start_timestamp
   Time when the state transition is started
```

**struct k_delayed_work timer**

```
Timer used for state transition
```

**struct esp_ble_mesh_last_msg_info_t**

```
Parameters of the server model received last same set message.
```

**Public Members**

```cpp
uint8_t tid
   Transaction number of the last message
```

```cpp
uint16_t src
   Source address of the last message
```

```cpp
uint16_t dst
   Destination address of the last message
```

```cpp
int64_t timestamp
   Time when the last message is received
```

**struct esp_ble_mesh_server_rsp_ctrl_t**

```
Parameters of the Server Model response control
```

**Public Members**

```cpp
uint8_t get_auto_rsp : 1
   BLE Mesh Server Response Option.
```

1. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, then the response of Server Status messages will be replied by the server models;

```c
uint8_t set_auto_rsp : 1
// Response control for Client Set messages
uint8_t status_auto_rsp : 1
// Response control for Server Status messages
```

**Macros**

- `ESP_BLE_MESH_SDU_MAX_LEN`<br>  
  The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.
- `ESP_BLE_MESH_MIC_SHORT`<br>  
  Length of a long Mesh MIC.
- `ESP_BLE_MESH_MIC_LONG`<br>  
  The maximum length of a BLE Mesh provisioned node name
- `ESP_BLE_MESH_NODE_NAME_MAX_LEN`<br>  
  The maximum length of a BLE Mesh unprovisioned device name
- `ESP_BLE_MESH_DEVICE_NAME_MAX_LEN`<br>  
  The maximum length of settings user id
- `ESP_BLE_MESH_SETTINGS_UID_SIZE`<br>  
  Invalid settings index
- `ESP_BLE_MESH_INVALID_SETTINGS_IDX`<br>  
  Define the BLE Mesh octet 16 bytes size
- `ESP_BLE_MESH_OCTET16_LEN`<br>  
- `ESP_BLE_MESH_OCTET8_LEN`
- `ESP_BLE_MESH_CID_NVAL`<br>  
  Special TTL value to request using configured default TTL
- `ESP_BLE_MESH_TTL_DEFAULT`<br>  
  Maximum allowed TTL value
- `ESP_BLE_MESH_TTL_MAX`
- `ESP_BLE_MESH_ADDR_UNASSIGNED`
- `ESP_BLE_MESH_ADDR_ALL_NODES`
- `ESP_BLE_MESH_ADDR_PROXIES`
- `ESP_BLE_MESH_ADDR_FRIENDS`
- `ESP_BLE_MESH_ADDR_RELAYS`
- `ESP_BLE_MESH_KEY_UNUSED`
- `ESP_BLE_MESH_KEY_DEV`
- `ESP_BLE_MESH_KEY_PRIMARY`
- `ESP_BLE_MESH_KEY_ANY`<br>  
  Primary Network Key index
- `ESP_BLE_MESH_NET_PRIMARY`<br>  
  Relay state value

ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
Supported features
ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST (addr)
ESP_BLE_MESH_ADDR_IS_GROUP (addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL (addr)
ESP_BLE_MESH_ADDR_IS_RFU (addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT (count, int_ms)
    Encode transmission count & interval steps.
    
    Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
    90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random de-
    lay).
    
    Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

    Parameters
    • count: Number of retransmissions (first transmission is excluded).
    • int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)
    Decode transmit count from a transmit value.

    Return Transmission count (actual transmissions equal to N + 1).

    Parameters
    • transmit: Encoded transmit count & interval value.
**ESP_BLE_MESH_GET_TRANSMIT_INTERVAL** (transmit)

Decode transmit interval from a transmit value.

**Return**
Transmission interval in milliseconds.

**Parameters**
- *transmit*: Encoded transmit count & interval value.

**ESP_BLE_MESH_PUBLISH_TRANSMIT** (count, int_ms)

Encode Publish Retransmit count & interval steps.

**Return**
BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

**Parameters**
- *count*: Number of retransmissions (first transmission is excluded).
- *int_ms*: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Return**
Retransmission count (actual transmissions equal to N + 1).

**Parameters**
- *transmit*: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

**Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)**

**Return**
Transmission interval in milliseconds.

**Parameters**
- *transmit*: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**

Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note**
This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- _loc: Location Descriptor.
- _mods: Array of SIG models.
- _vnd_mods: Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**

**BD_ADDR_LEN**

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC
ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.

Parameters
• _name: Variable name given to the context.
• _msg_len: Length of the publication message.
• _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.

Parameters
• _opcode: Message opcode.
• _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

Type Definitions
typedef uint8_t esp_ble_mesh_octet16_t[ESP_BLE_MESH_OCTET16_LEN]
  Define the BLE Mesh octet 8 bytes size
typedef uint8_t esp_ble_mesh_octet8_t[ESP_BLE_MESH_OCTET8_LEN]
  Invalid Company ID

typedef uint32_t esp_ble_mesh_cb_t

typedef uint8_t UINT8

typedef uint16_t UINT16

typedef uint32_t UINT32

typedef uint64_t UINT64

typedef UINT8 BT_OCTET32[BT_OCTET32_LEN]

typedef uint8_t BD_ADDR[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_addr_type_t
  BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
typedef uint8_t esp_ble_mesh_dev_add_flag_t
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint8_t esp_ble_mesh_cfg_status_t
This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state.Generics OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state.Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state.Time Message Opcode

typedef uint32_t esp_ble_mesh_light_messageOpcode_t
esp_ble_mesh_light_messageOpcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state.Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t
End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.
Enumerations

enum esp_ble_mesh_cb_type_t

Values:

enum esp_ble_mesh_prov_cb_event_t
Values:
ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
  Initialize BLE Mesh provisioning capabilities and internal data information completion event
ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
  Set the unprovisioned device name completion event
ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
  Enable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
  Disable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
  Establish a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
  Close a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
  Generate Node input OOB public key event
ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
  Generate Node Output Number event
ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
Chapter 2. API 参考

ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event
ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t
Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
• Reading of Local Data Information
• Low Power Operation (Updating)
• Send/Publish Messages, add Local AppKey, etc.
• ESP-BLE-MESH Node/Provisioner Provisioning
• ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

• components/bt/esp_bluetooth_api/interface/include/esp_bluetooth_common_api.h

Functions

\texttt{esp_err_t esp_ble_mesh_init}(\texttt{esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp})

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

\textbf{Note} After calling this API, the device needs to call \texttt{esp_ble_mesh_prov_enable()} to enable provisioning functionality again.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{[in] prov}: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
  \item \texttt{[in] comp}: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.
\end{itemize}

\texttt{esp_err_t esp_ble_mesh_deinit}(\texttt{esp_ble_mesh_deinit_param_t *param})

De-initialize BLE Mesh module.

\textbf{Note} This function shall be invoked after \texttt{esp_ble_mesh_client_model_deinit().}

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{[in] param}: Pointer to the structure of BLE Mesh deinit parameters.
\end{itemize}

Reading of Local Data Information
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

Functions

`int32_t esp_ble_mesh_get_model_publish_period(esp_mesh_model_t *model)`
Get the model publish period, the unit is ms.

**Return**  Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**

`uint16_t esp_ble_mesh_get_primary_element_address(void)`
Get the address of the primary element.

**Return**  Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

`uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)`
Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return**  Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**

- [in] `model`: Pointer to the model.
- [in] `group_addr`: Group address.

`esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)`
Find the BLE Mesh element pointer via the element address.

**Return**  Pointer to the element on success, or NULL on failure.

**Parameters**

- [in] `element_addr`: Element address.

`uint8_t esp_ble_mesh_get_element_count(void)`
Get the number of elements that have been registered.

**Return**  Number of elements.

`esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)`
Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return**  Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**

- [in] `element`: Element to which the model belongs.
- [in] `company_id`: A 16-bit company identifier assigned by the Bluetooth SIG.

`esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)`
Find the SIG model with the given element and Model id.

**Return**  Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- [in] `element`: Element to which the model belongs.
**const esp_ble_mesh_comp_t**

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

**esp_err_t**

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

**esp_err_t**

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** element_addr: Unicast address of the element to which the model belongs.
- **[in]** company_id: A 16-bit company identifier.
- **[in]** model_id: A 16-bit model identifier.
- **[in]** group_addr: The group address to be subscribed.

**esp_err_t**

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** element_addr: Unicast address of the element to which the model belongs.
- **[in]** company_id: A 16-bit company identifier.
- **[in]** model_id: A 16-bit model identifier.
- **[in]** group_addr: The subscribed group address.

**const uint8_t**

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- **[in]** net_idx: NetKey index.

**const uint8_t**

This function is called by Node to get the local AppKey.

**Return** AppKey on success, or NULL on failure.

**Parameters**

- **[in]** app_idx: AppKey index.

**esp_err_t**

This function is called by Node to add a local NetKey.

**Note** This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** net_key: NetKey to be added.
- **[in]** net_idx: NetKey Index.

**esp_err_t**

This function is called by Node to add a local AppKey.

**Note** The net_idx must be an existing one. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** app_key: AppKey to be added.
- **[in]** net_idx: NetKey Index.
Chapter 2. API

### esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `element_addr`: Node local element address
- [in] `company_id`: Node local company id
- [in] `model_id`: Node local model id
- [in] `app_idx`: Node local appkey index

## Low Power Operation (Updating)

### Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

### Functions

**esp_err_t esp_ble_mesh_lpn_enable(void)**

Enable BLE Mesh device LPN functionality.

**Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

**Return** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_lpn_disable(bool force)**

Disable BLE Mesh device LPN functionality.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] `force`: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

**esp_err_t esp_ble_mesh_lpn_poll(void)**

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

## Send/Publish Messages, add Local AppKey, etc.

### Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

### Functions
**esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)**

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)**

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** data: Pointer to the message data.
- **[in]** opcode: The message opcode.

**esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)**

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variable(d within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: BLE Mesh Client model to which the message belongs.

**esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)**

De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: Pointer of the Client model.

**esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)**

Send server model messages(such as server model status messages).

Return ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** model: BLE Mesh Server Model to which the message belongs.
- **[in]** ctx: Message context, includes keys, TTL, etc.
- **[in]** opcode: Message opcode.
- **[in]** length: Message length (exclude the message opcode).
- **[in]** data: Parameters of Access Payload (exclude the message opcode) to be sent.
**esp_err_t esp_ble_mesh_client_model_send_msg** *(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data, int32_t msg_timeout, bool need_rsp, esp_ble_mesh_dev_role_t device_role)*

Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters
- **[in]** model: BLE Mesh Client Model to which the message belongs.
- **[in]** ctx: Message context, includes keys, TTL, etc.
- **[in]** opcode: Message opcode.
- **[in]** length: Message length (exclude the message opcode).
- **[in]** data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **[in]** msg_timeout: Time to get response to the message (in milliseconds).
- **[in]** need_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **[in]** device_role: Role of the device (Node/Provisioner) that sends the message.

**esp_err_t esp_ble_mesh_model_publish** *(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)*

Send a model publication message.

Note Before calling this function, the user needs to ensure that the model publication message *(esp_ble_mesh_model_pub_t::msg)* contains a valid message to be sent. And if users want to update the publishing message, this API should be called in *ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT* with the message updated.

Return ESP_OK on success or error code otherwise.

Parameters
- **[in]** model: Mesh (client) Model publishing the message.
- **[in]** opcode: Message opcode.
- **[in]** length: Message length (exclude the message opcode).
- **[in]** data: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **[in]** device_role: Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

**esp_err_t esp_ble_mesh_server_model_update_state** *(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)*

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

Note Currently this API is used to update bound state value, not for all server model states.

Return ESP_OK on success or error code otherwise.

Parameters
- **[in]** model: Server model which is going to update the state.
- **[in]** type: Server model state type.
- **[in]** value: Server model state value.

**esp_err_t esp_ble_mesh_node_local_reset** *(void)*

Reset the provisioning procedure of the local BLE Mesh node.

Note All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

Return ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_set_node_name** *(uint16_t index, const char *name)*

This function is called to set the node (provisioned device) name.

Note index is obtained from the parameters of *ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT*.

Return ESP_OK on success or error code otherwise.

Parameters
const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)

This function is called to get the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

Parameters

• [in] index: Index of the node in the node queue.

uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)

This function is called to get the node (provisioned device) index.

Parameters

• [in] name: Name of the node (end by ‘\0’).

esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)

This function is called to store the Composition Data of the node.

Parameters

• [in] unicast_addr: Element address of the node
• [in] data: Pointer of Composition Data
• [in] length: Length of Composition Data

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])

This function is called to get the provisioned node information with the node device uuid.

Parameters

• [in] uuid: Device UUID of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)

This function is called to get the provisioned node information with the node unicast address.

Parameters

• [in] unicast_addr: Unicast address of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)

This function is called to get the provisioned node information with the node name.

Parameters

• [in] name: Name of the node (end by ‘\0’).

uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)

This function is called by Provisioner to get provisioned node count.

Parameters

Returns

Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)

This function is called by Provisioner to get the entry of the node table.

Note After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: “const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i <
CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i];
    if (node) { …… } }

Return Pointer to the start of the node table.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] uuid: Device UUID of the node

esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] unicast_addr: Unicast address of the node

esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16],
          uint16_t net_idx, uint16_t app_idx)
This function is called to add a local AppKey for Provisioner.

Note app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one.
app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will
be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] app_key: The app key to be set for the local BLE Mesh stack.
  • [in] net_idx: The network key index.
  • [in] app_idx: The app key index.

esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16],
          uint16_t net_idx, uint16_t app_idx)
This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] app_key: Value of the AppKey.
  • [in] net_idx: Corresponding NetKey Index.
  • [in] app_idx: The AppKey Index

const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters
  • [in] app_idx: Application key index.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr,
          uint16_t app_idx, uint16_t model_id,
          uint16_t company_id)
This function is called by Provisioner to bind own model with proper app key.

Note company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] element_addr: Provisioner local element address
Chapter 2. API

- [in] app_idx: Provisioner local app key index
- [in] model_id: Provisioner local model id
- [in] company_id: Provisioner local company id

```c
esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16],
                                                    uint16_t net_idx)
```

This function is called by Provisioner to add local network key.

**Note** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.

```c
esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16],
                                                        uint16_t net_idx)
```

This function is called by Provisioner to update a local network key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: Value of the NetKey.

```c
const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)
```

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

```c
esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)
```

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] enable: Enable or disable receiving heartbeat messages.

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)
```

This function is called by Provisioner to set the heartbeat filter type.

**Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleared.
   1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] type: Heartbeat filter type (acceptlist or rejectlist).

```c
esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)
```

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   1. The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
• If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
• If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
• If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] op: Add or REMOVE
  • [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

.esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.
Return ESP_OK on success or error code otherwise.

.esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.
Return ESP_OK on success or error code otherwise.

Parameters
  • [in] index: Settings index.

.esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.
Return ESP_OK on success or error code otherwise.

Parameters
  • [in] uid: Settings user id.

.esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
2. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the "erase" flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
3. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
4. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] index: Settings index.
  • [in] erase: Indicate if erasing mesh information.

.esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid (const char *uid, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.
2. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
• [in] uid: Settings user id.
• [in] erase: Indicate if erasing mesh information.

esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] index: Settings index.

const char* esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters
• [in] index: Settings index.

uint8_t esp_ble_mesh_provisioner_get_settings_index(const char* uid)

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters
• [in] uid: Settings user id.

uint8_t esp_ble_mesh_provisioner_get_free_settings_count(void)

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

const uint8_t *esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters
• [in] app_idx: Application key index.

Type Definitions
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

.esp BLE-MESH Node/Provisioner Provisioning
Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

`esp_err_t esp_ble_mesh_register_prov_callback(esp_ble_mesh_prov_cb_t callback)`
Register BLE Mesh provisioning callback.

Return: ESP_OK on success or error code otherwise.

Parameters:
- `[in]` callback: Pointer to the callback function.

`bool esp_ble_mesh_node_is_provisioned(void)`
Check if a device has been provisioned.

Return: TRUE if the device is provisioned, FALSE if the device is unprovisioned.

`esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)`
Enable specific provisioning bearers to get the device ready for provisioning.

Note: PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.
Return: ESP_OK on success or error code otherwise.

Parameters:

`esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_mesh_prov_bearer_t bearers)`
Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return: ESP_OK on success or error code otherwise.

Parameters:

`esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])`
Unprovisioned device set own oob public key & private key pair.

Note: In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Return: ESP_OK on success or error code otherwise.

Parameters:
- `[in]` pub_key_x: Unprovisioned device’s Public Key X
- `[in]` pub_key_y: Unprovisioned device’s Public Key Y
- `[in]` private_key: Unprovisioned device’s Private Key

`esp_err_t esp_ble_mesh_node_input_number(uint32_t number)`
Provide provisioning input OOB number.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Return: ESP_OK on success or error code otherwise.

Parameters:
- `[in]` number: Number input by device.

`esp_err_t esp_ble_mesh_node_input_string(const char *string)`
Provide provisioning input OOB string.

Note: This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Return: ESP_OK on success or error code otherwise.

Parameters:
- `[in]` string: String input by device.
Chapter 2. API

**esp_err_t esp_ble_mesh_set_unprovisioned_device_name (const char *name)**

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `name`: Unprovisioned device name

**esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])**

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `link_idx`: The provisioning link index
- **[in]** `pub_key_x`: Unprovisioned device’s Public Key X
- **[in]** `pub_key_y`: Unprovisioned device’s Public Key Y

**esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)**

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `string`: String input by Provisioner.
- **[in]** `link_idx`: The provisioning link index.

**esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)**

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `number`: Number input by Provisioner.
- **[in]** `link_idx`: The provisioning link index.

**esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `bearers`: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `bearers`: Bit-wise OR of provisioning bearers.

**esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_add_flag_t flags)**

Add unprovisioned device info to the unprov_dev queue.
Return  ESP_OK on success or error code otherwise.

Note 1. Currently address type only supports public address and static random address.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   • In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters
   • [in] add_dev: Pointer to a struct containing the device information
   • [in] flags: Flags indicate several operations on the device information
     – Remove device information from queue after device has been provisioned (BIT0)
     – Start provisioning immediately after device is added to queue (BIT1)
     – Device can be removed if device queue is full (BIT2)

\[
\text{esp_err_t } \text{esp_ble_mesh_provisioner_prov_device_with_addr} (\text{const uint8_t uuid[16]}, \text{esp_ble_mesh_bd_addr_t addr}, \text{esp_ble_mesh_addr_type_t addr_type}, \text{esp_ble_mesh_prov_bearer_t bearer}, \text{uint16_t oob_info}, \text{uint16_t unicast_addr})
\]

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return  Zero on success or (negative) error code otherwise.

Note 1. Currently address type only supports public address and static random address.
2. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
3. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
4. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.
Parameters
- [in] uuid: Device UUID of the unprovisioned device
- [in] addr: Device address of the unprovisioned device
- [in] addr_type: Device address type of the unprovisioned device
- [in] bearer: Provisioning bearer going to be used by Provisioner
- [in] oob_info: OOB info of the unprovisioned device
- [in] unicast_addr: Unicast address going to be allocated for the unprovisioned device

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```
Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP_OK on success or error code otherwise.

Parameters
- [in] del_dev: Pointer to a struct containing the device information.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,
                                                  uint8_t match_len,
                                                  uint8_t offset,
                                                  bool prov_after_match)
```
This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP_OK on success or error code otherwise.

Parameters
- [in] match_val: Value to be compared with the part of the device UUID.
- [in] match_len: Length of the compared match value.
- [in] offset: Offset of the device UUID to be compared (based on zero).
- [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```
This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP_OK on success or error code otherwise.

Parameters
- [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value,
                                                  uint8_t length)
```
This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP_OK on success or error code otherwise.

Parameters
- [in] value: Pointer to the static oob value.
- [in] length: Length of the static oob value.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```
This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov.t will be ignored, and Provisioner will use this address as its own...
primary element address. And if the unicast address going to assigned for the next unprovisioned de-
vice is smaller than the input address + element number of Provisioner, then the address for the next
unprovisioned device will be recalculated internally.

**Parameters**
- [in] `addr`: Unicast address of the Primary element of Provisioner.

**Return** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_set_fast_prov_info (esp_ble_mesh_fast_prov_info_t *fast_prov_info)**

This function is called to set provisioning data information before starting fast provisioning.

**Parameters**
- [in] `fast_prov_info`: Pointer to a struct containing unicast address range, net_idx, etc.

**Return** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_set_fast_prov_action (esp_ble_mesh_fast_prov_action_t action)**

This function is called to start/suspend/exit fast provisioning.

**Parameters**
- [in] `action`: fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void(*esp_ble_mesh_prov_cb_t) (esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)
```

: event, event code of provisioning events; param, parameters of provisioning events

```c
typedef void(*esp_ble_mesh_prov_adv_cb_t) (const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the
unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**
- [in] `addr`: Pointer to the unprovisioned device address.
- [in] `addr_type`: Unprovisioned device address type.
- [in] `adv_type`: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- [in] `oob_info`: OOB information of the unprovisioned device.
- [in] `bearer`: Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_proxy_identity_enable (void)
```

Enable advertising with Node Identity.

**Note** This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising
using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal
conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically
by BLE Mesh stack after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable (void)
```

Enable BLE Mesh GATT Proxy Service.
**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable(void)
```

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_client_connect(uint8_t* conn_handle, esp_ble_mesh_bd_addr_t addr,
                                          esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)
```

Proxy Client creates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `addr`: Device address of the Proxy Server.
- **[in]** `addr_type`: Device address type (public or static random).
- **[in]** `net_idx`: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

```c
esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)
```

Proxy Client terminates a connection with the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `conn_handle`: Proxy connection handle.

```c
esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle, uint16_t net_idx,
                                                      esp_ble_mesh_proxy_filter_type_t filter_type)
```

Proxy Client sets the filter type of the Proxy Server.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `filter_type`: whitelist or blacklist.

```c
esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle, uint16_t net_idx,
                                                    uint16_t *addr, uint16_t addr_num)
```

Proxy Client adds address to the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `addr`: Pointer to the filter address.
- **[in]** `addr_num`: Number of the filter address.

```c
esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx,
                                                       uint16_t *addr, uint16_t addr_num)
```

Proxy Client removes address from the Proxy Server filter list.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `conn_handle`: Proxy connection handle.
- **[in]** `net_idx`: Corresponding NetKey Index.
- **[in]** `addr`: Pointer to the filter address.
- **[in]** `addr_num`: Number of the filter address.
Chapter 2. API参考

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

注意： Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

- esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
  
  Register BLE Mesh Config Client Model callback.
  
  Return ESP_OK on success or error code otherwise.
  
  Parameters
  
  • [in] callback: Pointer to the callback function.

- esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
  
  Register BLE Mesh Config Server Model callback.
  
  Return ESP_OK on success or error code otherwise.
  
  Parameters
  
  • [in] callback: Pointer to the callback function.

- esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
  
  Get the value of Config Server Model states using the Config Client Model get messages.
  
  Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h
  
  Return ESP_OK on success or error code otherwise.
  
  Parameters
  
  • [in] params: Pointer to BLE Mesh common client parameters.
  
  • [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

- esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
  
  Set the value of the Configuration Server Model states using the Config Client Model set messages.
  
  Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h
  
  Return ESP_OK on success or error code otherwise.
  
  Parameters
  
  • [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**Public Members**

**esp_ble_mesh_cfg_server_state_change_t**

ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT

**Structures**

**struct esp_ble_meshCfg_srv**

Configuration Server Model context
Public Members

`esp_ble_mesh_model_t *model`
Pointer to Configuration Server Model

`uint8_t net_transmit`
Network Transmit state

`uint8_t relay`
Relay Mode state

`uint8_t relay_retransmit`
Relay Retransmit state

`uint8_t beacon`
Secure Network Beacon state

`uint8_t gatt_proxy`
GATT Proxy state

`uint8_t friend_state`
Friend state

`uint8_t default_ttl`
Default TTL

`struct k_delayed_work timer`
Heartbeat Publication timer

`uint16_t dst`
Destination address for Heartbeat messages

`uint16_t count`
Number of Heartbeat messages to be sent
   Number of Heartbeat messages received

`uint8_t period`
Period for sending Heartbeat messages

`uint8_t ttl`
TTL to be used when sending Heartbeat messages

`uint16_t feature`
Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`
NetKey Index used by Heartbeat Publication

`struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub`
Heartbeat Publication

`int64_t expiry`
Timestamp when Heartbeat subscription period is expired

`uint16_t src`
Source address for Heartbeat messages

`uint8_t min_hops`
Minimum hops when receiving Heartbeat messages

`uint8_t max_hops`
Maximum hops when receiving Heartbeat messages

`esp_ble_mesh_cb_t heartbeat_recv_cb`
Optional heartbeat subscription tracking function

`struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub`
Heartbeat Subscription
**struct esp_ble_mesh_cfg_composition_data_get_t**

Parameters of Config Composition Data Get.

**Public Members**

`uint8_t page`

Page number of the Composition Data.

**struct esp_ble_mesh_cfg_model_pub_get_t**

Parameters of Config Model Publication Get.

**Public Members**

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_sig_model_sub_get_t**

Parameters of Config SIG Model Subscription Get.

**Public Members**

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

**struct esp_ble_mesh_cfg_vnd_model_sub_get_t**

Parameters of Config Vendor Model Subscription Get.

**Public Members**

`uint16_t element_addr`

The element address

`uint16_t model_id`

The model id

`uint16_t company_id`

The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_app_key_get_t**

Parameters of Config AppKey Get.

**Public Members**

`uint16_t net_idx`

The network key index

**struct esp_ble_mesh_cfg_node_identity_get_t**

Parameters of Config Node Identity Get.
Public Members

```c
uint16_t net_idx
```
The network key index

**struct esp_ble_mesh_cfg_sig_model_app_get_t**
Parameters of Config SIG Model App Get.

Public Members

```c
uint16_t element_addr
```
The element address

```c
uint16_t model_id
```
The model id

**struct esp_ble_mesh_cfg_vnd_model_app_get_t**
Parameters of Config Vendor Model App Get.

Public Members

```c
uint16_t element_addr
```
The element address

```c
uint16_t model_id
```
The model id

```c
uint16_t company_id
```
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_kr_phase_get_t**
Parameters of Config Key Refresh Phase Get.

Public Members

```c
uint16_t net_idx
```
The network key index

**struct esp_ble_mesh_cfg_lpn_polltimeout_get_t**
Parameters of Config Low Power Node PollTimeout Get.

Public Members

```c
uint16_t lpn_addr
```
The unicast address of the Low Power node

**struct esp_ble_mesh_cfg_beacon_set_t**
Parameters of Config Beacon Set.

Public Members

```c
uint8_t beacon
```
New Secure Network Beacon state

**struct esp_ble_mesh_cfg_default_ttl_set_t**
Parameters of Config Default TTL Set.
Public Members

uint8_t \texttt{ttl} \\
\hspace{1em} The default TTL state value

\textbf{struct esp\_ble\_mesh\_cfg\_friend\_set\_t} \\
Parameters of Config Friend Set.

Public Members

uint8_t \texttt{friend\_state} \\
\hspace{1em} The friend state value

\textbf{struct esp\_ble\_mesh\_cfg\_gatt\_proxy\_set\_t} \\
Parameters of Config GATT Proxy Set.

Public Members

uint8_t \texttt{gatt\_proxy} \\
\hspace{1em} The GATT Proxy state value

\textbf{struct esp\_ble\_mesh\_cfg\_relay\_set\_t} \\
Parameters of Config Relay Set.

Public Members

uint8_t \texttt{relay} \\
\hspace{1em} The relay value

uint8_t \texttt{relay\_retransmit} \\
\hspace{1em} The relay retransmit value

\textbf{struct esp\_ble\_mesh\_cfg\_net\_key\_add\_t} \\
Parameters of Config NetKey Add.

Public Members

uint16_t \texttt{net\_idx} \\
\hspace{1em} The network key index

uint8_t \texttt{net\_key[16]} \\
\hspace{1em} The network key value

\textbf{struct esp\_ble\_mesh\_cfg\_app\_key\_add\_t} \\
Parameters of Config AppKey Add.

Public Members

uint16_t \texttt{net\_idx} \\
\hspace{1em} The network key index

uint16_t \texttt{app\_idx} \\
\hspace{1em} The app key index

uint8_t \texttt{app\_key[16]} \\
\hspace{1em} The app key value

\textbf{struct esp\_ble\_mesh\_cfg\_model\_app\_bind\_t} \\
Parameters of Config Model App Bind.
Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_app_idx
    Index of the app key to bind with the model
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```
*struct esp_ble_mesh_cfg_model_pub_set_t*
Parameters of Config Model Publication Set.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t publish_addr
    Value of the publish address
```

```c
uint16_t publish_app_idx
    Index of the application key
```

```c
bool cred_flag
    Value of the Friendship Credential Flag
```

```c
uint8_t publish_ttl
    Default TTL value for the publishing messages
```

```c
uint8_t publish_period
    Period for periodic status publishing
```

```c
uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```
*struct esp_ble_mesh_cfg_model_sub_add_t*
Parameters of Config Model Subscription Add.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t sub_addr
    The address to be added to the Subscription List
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```
*struct esp_ble_mesh_cfg_model_sub_delete_t*
Parameters of Config Model Subscription Delete.
```
Public Members

uint16_t element_addr  
   The element address

uint16_t sub_addr  
The address to be removed from the Subscription List

uint16_t model_id  
The model id

uint16_t company_id  
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t element_addr  
The element address

uint16_t sub_addr  
The address to be added to the Subscription List

uint16_t model_id  
The model id

uint16_t company_id  
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t element_addr  
The element address

uint8_t label_uuid[16]
   The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id  
The model id

uint16_t company_id  
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr  
The element address

uint8_t label_uuid[16]
   The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id  
The model id
uint16_t \textbf{company\_id}

The company id, if not a vendor model, shall set to 0xFFFF

\textbf{struct esp\_ble\_mesh\_cfg\_model\_sub\_va\_overwrite\_t}

Parameters of Config Model Subscription Virtual Address Overwrite.

**Public Members**

\begin{itemize}
  \item uint16_t \textbf{element\_addr}
    \hspace{2em} The element address
  \item uint8_t \textbf{label\_uuid}\[16\]
    \hspace{2em} The Label UUID of the virtual address to be added to the Subscription List
  \item uint16_t \textbf{model\_id}
    \hspace{2em} The model id
  \item uint16_t \textbf{company\_id}
    \hspace{2em} The company id, if not a vendor model, shall set to 0xFFFF
\end{itemize}

\textbf{struct esp\_ble\_mesh\_cfg\_model\_pub\_va\_set\_t}

Parameters of Config Model Publication Virtual Address Set.

**Public Members**

\begin{itemize}
  \item uint16_t \textbf{element\_addr}
    \hspace{2em} The element address
  \item uint8_t \textbf{label\_uuid}\[16\]
    \hspace{2em} Value of the Label UUID publish address
  \item uint16_t \textbf{publish\_app\_idx}
    \hspace{2em} Index of the application key
  \item bool \textbf{cred\_flag}
    \hspace{2em} Value of the Friendship Credential Flag
  \item uint8_t \textbf{publish\_ttl}
    \hspace{2em} Default TTL value for the publishing messages
  \item uint8_t \textbf{publish\_period}
    \hspace{2em} Period for periodic status publishing
  \item uint8_t \textbf{publish\_retransmit}
    \hspace{2em} Number of retransmissions and number of 50-millisecond steps between retransmissions
  \item uint16_t \textbf{model\_id}
    \hspace{2em} The model id
  \item uint16_t \textbf{company\_id}
    \hspace{2em} The company id, if not a vendor model, shall set to 0xFFFF
\end{itemize}

\textbf{struct esp\_ble\_mesh\_cfg\_model\_sub\_delete\_all\_t}

Parameters of Config Model Subscription Delete All.

**Public Members**

\begin{itemize}
  \item uint16_t \textbf{element\_addr}
    \hspace{2em} The element address
  \item uint16_t \textbf{model\_id}
    \hspace{2em} The model id
\end{itemize}
uint16_t **company_id**
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_net_key_update_t**
Parameters of Config NetKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint8_t **net_key[16]**
The network key value

**struct esp_ble_mesh_cfg_net_key_delete_t**
Parameters of Config NetKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index

**struct esp_ble_mesh_cfg_app_key_update_t**
Parameters of Config AppKey Update.

**Public Members**

uint16_t **net_idx**
The network key index

uint16_t **app_idx**
The app key index

uint8_t **app_key[16]**
The app key value

**struct esp_ble_mesh_cfg_app_key_delete_t**
Parameters of Config AppKey Delete.

**Public Members**

uint16_t **net_idx**
The network key index

uint16_t **app_idx**
The app key index

**struct esp_ble_mesh_cfg_node_identity_set_t**
Parameters of Config Node Identity Set.

**Public Members**

uint16_t **net_idx**
The network key index

uint8_t **identity**
New Node Identity state

**struct esp_ble_mesh_cfg_model_app_unbind_t**
Parameters of Config Model App Unbind.
Public Members

uint16_t `element_addr`
  The element address

uint16_t `model_app_idx`
  Index of the app key to bind with the model

uint16_t `model_id`
  The model id

uint16_t `company_id`
  The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_kr_phase_set_t`
Parameters of Config Key Refresh Phase Set.

Public Members

uint16_t `net_idx`
  The network key index

uint8_t `transition`
  New Key Refresh Phase Transition

`struct esp_ble_mesh_cfg_net_transmit_set_t`
Parameters of Config Network Transmit Set.

Public Members

uint8_t `net_transmit`
  Network Transmit State

`struct esp_ble_mesh_cfg_heartbeat_pub_set_t`
Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t `dst`
  Destination address for Heartbeat messages

uint8_t `count`
  Number of Heartbeat messages to be sent

uint8_t `period`
  Period for sending Heartbeat messages

uint8_t `ttl`
  TTL to be used when sending Heartbeat messages

uint16_t `feature`
  Bit field indicating features that trigger Heartbeat messages when changed

uint16_t `net_idx`
  NetKey Index

`struct esp_ble_mesh_cfg_heartbeat_sub_set_t`
Parameters of Config Model Heartbeat Subscription Set.
Public Members

uint16_t src
Source address for Heartbeat messages

uint16_t dst
Destination address for Heartbeat messages

uint8_t period
Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t
Parameter of Config Beacon Status

Public Members

uint8_t beacon
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t
Parameters of Config Composition Data Status

Public Members

uint8_t page
Page number of the Composition Data

struct net_buf_simple *composition_data
Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)
\textbf{struct esp_ble_mesh_cfg_model_pub_status_cb_t}

Parameters of Config Model Publication Status

**Public Members**

\begin{itemize}
  \item \texttt{uint8_t status}  
    \begin{itemize}
      \item Status Code for the request message
    \end{itemize}
  \item \texttt{uint16_t element_addr}  
    \begin{itemize}
      \item Address of the element
    \end{itemize}
  \item \texttt{uint16_t publish_addr}  
    \begin{itemize}
      \item Value of the publish address
    \end{itemize}
  \item \texttt{uint16_t app_idx}  
    \begin{itemize}
      \item Index of the application key
    \end{itemize}
  \item \texttt{bool cred_flag}  
    \begin{itemize}
      \item Value of the Friendship Credential Flag
    \end{itemize}
  \item \texttt{uint8_t ttl}  
    \begin{itemize}
      \item Default TTL value for the outgoing messages
    \end{itemize}
  \item \texttt{uint8_t period}  
    \begin{itemize}
      \item Period for periodic status publishing
    \end{itemize}
  \item \texttt{uint8_t transmit}  
    \begin{itemize}
      \item Number of retransmissions and number of 50-millisecond steps between retransmissions
    \end{itemize}
  \item \texttt{uint16_t company_id}  
    \begin{itemize}
      \item Company ID
    \end{itemize}
  \item \texttt{uint16_t model_id}  
    \begin{itemize}
      \item Model ID
    \end{itemize}
\end{itemize}

\textbf{struct esp_ble_mesh_cfg_model_sub_status_cb_t}

Parameters of Config Model Subscription Status

**Public Members**

\begin{itemize}
  \item \texttt{uint8_t status}  
    \begin{itemize}
      \item Status Code for the request message
    \end{itemize}
  \item \texttt{uint16_t element_addr}  
    \begin{itemize}
      \item Address of the element
    \end{itemize}
  \item \texttt{uint16_t sub_addr}  
    \begin{itemize}
      \item Value of the address
    \end{itemize}
  \item \texttt{uint16_t company_id}  
    \begin{itemize}
      \item Company ID
    \end{itemize}
  \item \texttt{uint16_t model_id}  
    \begin{itemize}
      \item Model ID
    \end{itemize}
\end{itemize}

\textbf{struct esp_ble_mesh_cfg_net_key_status_cb_t}

Parameters of Config NetKey Status

**Public Members**

\begin{itemize}
  \item \texttt{uint8_t status}  
    \begin{itemize}
      \item Status Code for the request message
    \end{itemize}
\end{itemize}
Chapter 2. API

Uint16_t net_idx
Index of the NetKey

**struct esp_ble_mesh_cfg_app_key_status_cb_t**
Parameters of Config AppKey Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

**struct esp_ble_mesh_cfg_mod_app_status_cb_t**
Parameters of Config Model App Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID

uint16_t model_id
Model ID

**struct esp_ble_mesh_cfg_friend_status_cb_t**
Parameter of Config Friend Status

**Public Members**

uint8_t friend_state
Friend state value

**struct esp_ble_mesh_cfg_hb_pub_status_cb_t**
Parameters of Config Heartbeat Publication Status

**Public Members**

uint8_t status
Status Code for the request message

uint16_t dst
Destination address for Heartbeat messages

uint8_t count
Number of Heartbeat messages remaining to be sent

uint8_t period
Period for sending Heartbeat messages
uint8_t _t ttl
TTL to be used when sending Heartbeat messages

uint16_t _t features
Features that trigger Heartbeat messages when changed

uint16_t _t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t _t status
Status Code for the request message

uint16_t _t src
Source address for Heartbeat messages

uint16_t _t dst
Destination address for Heartbeat messages

uint8_t _t period
Remaining Period for processing Heartbeat messages

uint8_t _t count
Number of Heartbeat messages received

uint8_t _t min_hops
Minimum hops when receiving Heartbeat messages

uint8_t _t max_hops
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
Parameters of Config Network Transmit Status

Public Members

uint8_t _t net_trans_count : 3
Number of transmissions for each Network PDU originating from the node

uint8_t _t net_trans_step : 5
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t _t status
Status Code for the request message

uint16_t _t element_addr
Address of the element

uint16_t _t company_id
Company ID

uint16_t _t model_id
Model ID
**struct net_buf_simple *sub_addr**
A block of all addresses from the Subscription List

**struct esp_ble_mesh_cfg_net_key_list_cb_t**
Parameter of Config NetKey List

**Public Members**

**struct net_buf_simple *net_idx**
A list of NetKey Indexes known to the node

**struct esp_ble_mesh_cfg_app_key_list_cb_t**
Parameters of Config AppKey List

**Public Members**

uint8_t **status**
Status Code for the request message

uint16_t **net_idx**
NetKey Index of the NetKey that the AppKeys are bound to

**struct net_buf_simple *app_idx**
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIndex

**struct esp_ble_mesh_cfg_node_id_status_cb_t**
Parameters of Config Node Identity Status

**Public Members**

uint8_t **status**
Status Code for the request message

uint16_t **net_idx**
Index of the NetKey

uint8_t **identity**
Node Identity state

**struct esp_ble_mesh_cfg_model_app_list_cb_t**
Parameters of Config SIG/Vendor Model App List

**Public Members**

uint8_t **status**
Status Code for the request message

uint16_t **element_addr**
Address of the element

uint16_t **company_id**
Company ID

uint16_t **model_id**
Model ID

**struct net_buf_simple *app_idx**
All AppKey indexes bound to the Model

**struct esp_ble_mesh_cfg_kr_phase_status_cb_t**
Parameters of Config Key Refresh Phase Status
Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t phase
Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

int32_t poll_timeout
The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index

bool cred_flag
Friendship Credential Flag

uint8_t pub_ttl
Publish TTL

uint8_t pub_period
Publish Period

uint8_t pub_retransmit
Publish Retransmit
uint16_t company_id  
  Company ID

uint16_t model_id  
  Model ID

*struct esp_ble_mesh_state_change_cfg_model_sub_add_t*
Parameters of Config Model Subscription Add

**Public Members**

uint16_t element_addr  
  Element Address

uint16_t sub_addr  
  Subscription Address

uint16_t company_id  
  Company ID

uint16_t model_id  
  Model ID

*struct esp_ble_mesh_state_change_cfg_model_sub_delete_t*
Parameters of Config Model Subscription Delete

**Public Members**

uint16_t element_addr  
  Element Address

uint16_t sub_addr  
  Subscription Address

uint16_t company_id  
  Company ID

uint16_t model_id  
  Model ID

*struct esp_ble_mesh_state_change_cfg_netkey_add_t*
Parameters of Config NetKey Add

**Public Members**

uint16_t net_idx  
  NetKey Index

uint8_t net_key[16]  
  NetKey

*struct esp_ble_mesh_state_change_cfg_netkey_update_t*
Parameters of Config NetKey Update

**Public Members**

uint16_t net_idx  
  NetKey Index

uint8_t net_key[16]  
  NetKey
struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index
uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index
uint16_t app_idx
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t element_addr
Element Address
uint16_t app_idx
AppKey Index
uint16_t company_id
Company ID
uint16_t model_id
  Model ID

struct esp_ble_mesh_state_changeCfgModelAppUnbind_t
  Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
  Element Address

uint16_t app_idx
  AppKey Index

uint16_t company_id
  Company ID

uint16_t model_id
  Model ID

struct esp_ble_mesh_state_changeCfgKPhaseSet_t
  Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
  NetKey Index

uint8_t kr_phase
  New Key Refresh Phase Transition

struct esp_ble_meshCfgServerCbParam_t
  Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
  Pointer to the server model structure

esp_ble_mesh_msg_ctx_t ctx
  Context of the received message

esp_ble_mesh_cfg_server_cb_value_t value
  Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
  Define a new Config Server Model.
  
  Note  The Config Server Model can only be included by a Primary Element.
  
  Return  New Config Server Model instance.
  
  Parameters
    • srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
  Define a new Config Client Model.
  
  Note  The Config Client Model can only be included by a Primary Element.
  
  Return  New Config Client Model instance.
  
  Parameters
    • cli_data: Pointer to a unique struct esp_ble_mesh_client_t.
Type Definitions

typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
Configuration Server Model context

typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                          esp_ble_mesh_cfg_client_cb_param_t *param)

Bluetooth Mesh Config Client and Server Model functions.
Configuration Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                          esp_ble_mesh_cfg_server_cb_param_t *param)

Configuration Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations
enum esp_ble_mesh_cfg_client_cb_event_t
This enum value is the event of Configuration Client Model

Values:
ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

enum esp_ble_mesh_cfg_server_cb_event_t
This enum value is the event of Configuration Server model

Values:
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File
• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions
esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

Return
ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)

Register BLE Mesh Health Server Model callback.
Chapter 2. API

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
```

This function is called to get the Health Server states using the Health Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
```

This function is called to set the Health Server states using the Health Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
```

This function is called by the Health Server Model to update the context of its Health Current status.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** element: The element to which the Health Server Model belongs.

**Unions**

```c
union esp_ble_mesh_health_client_get_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
```

the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

**Public Members**

```c
esp_ble_mesh_health_fault_get_t fault_get
```

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

```c
union esp_ble_mesh_health_client_set_state_t
```

the set_state parameter in the esp_ble_mesh_health_client_set_state function should not be set to NULL.

**Public Members**

```c
esp_ble_mesh_health_attention_set_t attention_set
```

For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.
Chapter 2. API Reference

```c
#include <esp_ble_mesh_health_model_api.h>
```

## Structures

**union esp_ble_mesh_health_client_common_cb_param_t**

For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

### Public Members

**esp_ble_mesh_health_current_status_cb_t current_status**

The health current status value

**esp_ble_mesh_health_fault_status_cb_t fault_status**

The health fault status value

**esp_ble_mesh_health_period_status_cb_t period_status**

The health period status value

**esp_ble_mesh_health_attention_status_cb_t attention_status**

The health attention status value

### union esp_ble_mesh_health_server_cb_param_t

For ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT or ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT.

For ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT or ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT.

For ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT or ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT.

For ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT or ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT.

For ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT or ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT.

### Structures

**struct esp_ble_mesh_health_srv_cb_t**

ESP BLE Mesh Health Server callback

### Public Members

**esp_ble_mesh_cb_t fault_clear**

Clear health registered faults. Initialized by the stack.

**esp_ble_mesh_cb_t fault_test**

Run a specific health test. Initialized by the stack.
Chapter 2. API

```
esp_ble_mesh_cb_t attention_on
    Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t attention_off
    Health attention off callback. Initialized by the stack.
```

```
struct esp_ble_mesh_health_test_t
    ESP BLE Mesh Health Server test Context
```

### Public Members

```
uint8_t id_count
    Number of Health self-test ID

const uint8_t *test_ids
    Array of Health self-test IDs

uint16_t company_id
    Company ID used to identify the Health Fault state

uint8_t prev_test_id
    Current test ID of the health fault test

uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of current faults

uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
    Array of registered faults
```

```
struct esp_ble_mesh_health_srv_t
    ESP BLE Mesh Health Server Model Context
```

### Public Members

```
esp_ble_mesh_model_t *model
    Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
    Health callback struct

struct k_delayed_work attention_timer
    Attention Timer state

bool attention_timer_start
    Attention Timer start flag

esp_ble_mesh_health_test_t health_test
    Health Server fault test
```

```
struct esp_ble_mesh_health_fault_get_t
    Parameter of Health Fault Get
```

### Public Members

```
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```
struct esp_ble_mesh_health_attention_set_t
    Parameter of Health Attention Set
```
Public Members

uint8_t attention
    Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
    Parameter of Health Period Set

Public Members

uint8_t fast_period_divisor
    Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
    Parameter of Health Fault Test

Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

uint8_t test_id
    ID of a specific test to be performed

struct esp_ble_mesh_health_fault_clear_t
    Parameter of Health Fault Clear

Public Members

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
    Parameters of Health Current Status

Public Members

uint8_t test_id
    ID of a most recently performed test

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
    Parameters of Health Fault Status

Public Members

uint8_t test_id
    ID of a most recently performed test

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values
struct esp_ble_mesh_health_period_status_cb_t
Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
Parameter of Health Attention Status

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
Health Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t status_cb
The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
Parameter of publishing Health Current Status completion event

Public Members

int error_code
The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
Pointer to the Health Server Model

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
Parameters of Health Fault Test event

Public Members
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

`uint8_t test_id`
ID of a specific test to be performed

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_attention_on_cb_t`
Parameter of Health Attention On event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

`uint8_t time`
Duration of attention timer on (in seconds)

`struct esp_ble_mesh_health_attention_off_cb_t`
Parameter of Health Attention Off event

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Health Server Model

Macros

`ESP_BLE_MESH_MODEL_HEALTH_SRV(srv, pub)`
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**
- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

`ESP_BLE_MESH_MODEL_HEALTH_CLI(cli_data)`
Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_HEALTH_PUB_DEFINE(_name, _max, _role)`
A helper to define a health publication context

**Parameters**
- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

`ESP_BLE_MESH_HEALTH_STANDARD_TEST`
SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.
ESP_BLE_MESH_NO_FAULT
Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

define esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t

This enum value is the event of Health Server Model

Values:

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)
```

Register BLE Mesh Generic Client Model callback.

- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - `[in] callback`: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                             esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

- **Note**: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h
- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - `[in] get_state`: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                             esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

- **Note**: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h
- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - `[in] set_state`: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

- **Return**: ESP_OK on success or error code otherwise.
- **Parameters**
  - `[in] callback`: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_generic_client_get_state_t

Parameters of Generic OnOff Set.
Public Members

bool op_en
  Indicate if optional parameters are included

uint8_t onoff
  Target value of Generic OnOff state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_level_set_t
  Parameters of Generic Level Set.

Public Members

bool op_en
  Indicate if optional parameters are included

int16_t level
  Target value of Generic Level state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
  Parameters of Generic Delta Set.

Public Members

bool op_en
  Indicate if optional parameters are included

int32_t level
  Delta change of Generic Level state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
  Parameters of Generic Move Set.

Public Members

bool op_en
  Indicate if optional parameters are included
int16_t delta_level  
Delta Level step to calculate Move speed for Generic Level state

uint8_t tid  
Transaction ID

tUint8_t trans_time  
Time to complete state transition (optional)

tUint8_t delay  
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t  
Parameter of Generic Default Transition Time Set.

Public Members

uint8_t trans_time  
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t  
Parameter of Generic OnPowerUp Set.

Public Members

uint8_t onpowerup  
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t  
Parameters of Generic Power Level Set.

Public Members

bool op_en  
Indicate if optional parameters are included

tUint16_t power  
Target value of Generic Power Actual state

tUint8_t tid  
Transaction ID

tUint8_t trans_time  
Time to complete state transition (optional)

tUint8_t delay  
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t  
Parameter of Generic Power Default Set.

Public Members

uint16_t power  
The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t  
Parameters of Generic Power Range Set.
Public Members

uint16_t range_min
   Value of Range Min field of Generic Power Range state

uint16_t range_max
   Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
   Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
   Global Coordinates (Latitude)

int32_t global_longitude
   Global Coordinates (Longitude)

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
   Parameters of Generic Location Local Set.

Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)

int16_t local_altitude
   Local Altitude

uint8_t floor_number
   Floor Number

uint16_t uncertainty
   Uncertainty

struct esp_ble_mesh_gen_user_property_get_t
   Parameter of Generic User Property Get.

Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct esp_ble_mesh_gen_user_property_set_t
   Parameters of Generic User Property Set.

Public Members

uint16_t property_id
   Property ID identifying a Generic User Property

struct net_buf_simple *property_value
   Raw value for the User Property
struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property

struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.
Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint8_t present_onoff
   Current value of Generic OnOff state
```

```c
uint8_t target_onoff
   Target value of Generic OnOff state (optional)
```

```c
uint8_t remain_time
   Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_gen_level_status_cb_t
   Parameters of Generic Level Status.
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
int16_t present_level
   Current value of Generic Level state
```

```c
int16_t target_level
   Target value of the Generic Level state (optional)
```

```c
uint8_t remain_time
   Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_gen_def_trans_time_status_cb_t
   Parameter of Generic Default Transition Time Status.
```

Public Members

```c
uint8_t trans_time
   The value of the Generic Default Transition Time state
```

```c
struct esp_ble_mesh_gen_onpowerup_status_cb_t
```

Public Members

```c
uint8_t onpowerup
   The value of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_gen_power_level_status_cb_t
   Parameters of Generic Power Level Status.
```

Public Members

```c
bool op_en
   Indicate if optional parameters are included
```

```c
uint16_t present_power
   Current value of Generic Power Actual state
```

```c
uint16_t target_power
   Target value of Generic Power Actual state (optional)
```
uint8_t \texttt{remain\_time}
Time to complete state transition (C.1)

\textbf{struct esp_ble_mesh_gen_power\_last\_status\_cb\_t}
Parameter of Generic Power Last Status.

\textbf{Public Members}

\textbf{uint16_t \texttt{power}}
The value of the Generic Power Last state

\textbf{struct esp_ble_mesh_gen_power\_default\_status\_cb\_t}
Parameter of Generic Power Default Status.

\textbf{Public Members}

\textbf{uint16_t \texttt{power}}
The value of the Generic Default Last state

\textbf{struct esp_ble_mesh_gen_power\_range\_status\_cb\_t}
Parameters of Generic Power Range Status.

\textbf{Public Members}

\textbf{uint8_t \texttt{status\_code}}
Status Code for the request message

\textbf{uint16_t \texttt{range\_min}}
Value of Range Min field of Generic Power Range state

\textbf{uint16_t \texttt{range\_max}}
Value of Range Max field of Generic Power Range state

\textbf{struct esp_ble_mesh_gen_battery\_status\_cb\_t}
Parameters of Generic Battery Status.

\textbf{Public Members}

\textbf{uint32_t \texttt{battery\_level} : 8}
Value of Generic Battery Level state

\textbf{uint32_t \texttt{time\_to\_discharge} : 24}
Value of Generic Battery Time to Discharge state

\textbf{uint32_t \texttt{time\_to\_charge} : 24}
Value of Generic Battery Time to Charge state

\textbf{uint32_t \texttt{flags} : 8}
Value of Generic Battery Flags state

\textbf{struct esp_ble_mesh_gen_loc\_global\_status\_cb\_t}
Parameters of Generic Location Global Status.

\textbf{Public Members}

\textbf{int32_t \texttt{global\_latitude}}
Global Coordinates (Latitude)

\textbf{int32_t \texttt{global\_longitude}}
Global Coordinates (Longitude)
**Chapter 2. API 参考**

```c
int16_t global_altitude
Global Altitude
```

**struct esp_ble_mesh_gen_loc_local_status_cb_t**
Parameters of Generic Location Local Status.

**Public Members**

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

**struct esp_ble_mesh_gen_user_properties_status_cb_t**
Parameter of Generic User Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs
```

**struct esp_ble_mesh_gen_user_property_status_cb_t**
Parameters of Generic User Property Status.

**Public Members**

```c
bool op_en
Indicate if optional parameters are included
```

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
uint8_t user_access
Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
Raw value for the User Property (C.1)
```

**struct esp_ble_mesh_gen_admin_properties_status_cb_t**
Parameter of Generic Admin Properties Status.

**Public Members**

```c
struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs
```

**struct esp_ble_mesh_gen_admin_property_status_cb_t**
Parameters of Generic Admin Property Status.
Chapter 2. API

Public Members

```c
bool op_en
  Indicate if optional parameters are included
```

```c
uint16_t property_id
  Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
  Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
  Raw value for the Admin Property (C.1)
```

```c
struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
  Parameter of Generic Manufacturer Properties Status.
```

Public Members

```c
struct net_buf_simple *property_ids
  Buffer contains a sequence of N Manufacturer Property IDs
```

```c
struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
  Parameters of Generic Manufacturer Property Status.
```

Public Members

```c
bool op_en
  Indicate if optional parameters are included
```

```c
uint16_t property_id
  Property ID identifying a Generic Manufacturer Property
```

```c
uint8_t user_access
  Enumeration indicating user access (optional)
```

```c
struct net_buf_simple *property_value
  Raw value for the Manufacturer Property (C.1)
```

```c
struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
  Parameter of Generic Manufacturer Properties Status.
```

Public Members

```c
struct net_buf_simple *property_ids
  Buffer contains a sequence of N Client Property IDs
```

```c
struct esp_ble_mesh_generic_client_cb_param_t
  Generic Client Model callback parameters
```

Public Members

```c
int error_code
  Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
  The client common parameters.
```

```c
esp_ble_mesh_gen_client_status_cb_t status_cb
  The generic status message callback values
```
struct esp_ble_mesh_gen_onoff_state_t
Parameters of Generic OnOff state

Public Members

uint8_t onoff
The present value of the Generic OnOff state

uint8_t target_onoff
The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
Parameters of Generic Level state

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_level, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model
Chapter 2. API

Public Members

`esp_ble_mesh_model_t *model`
   Pointer to the Generic Level Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_gen_level_state_t *state`
   Parameters of the Generic Level state

`esp_ble_mesh_last_msg_info_t *last`
   Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
   Parameters of state transition

`int32_t tt_delta_level`
   Delta change value of level state transition

`struct esp_ble_mesh_gen_def_trans_time_state_t`  
   Parameter of Generic Default Transition Time state

Public Members

`uint8_t trans_time`
   The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_def_trans_time_srv_t`  
   User data of Generic Default Transition Time Server Model

Public Members

`esp_ble_mesh_model_t *model`
   Pointer to the Generic Default Transition Time Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages

`esp_ble_mesh_gen_def_trans_time_state_t *state`
   Parameters of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_state_t`
   Parameter of Generic OnPowerUp state

Public Members

`uint8_t onpowerup`
   The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_onoff_srv_t`  
   User data of Generic Power OnOff Server Model

Public Members

`esp_ble_mesh_model_t *model`
   Pointer to the Generic Power OnOff Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
   Response control of the server model received messages
Chapter 2. API

### esp_ble_mesh_gen_onpowerup_state_t
Parameters of the Generic OnPowerUp state

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_gen_onpowerup_state_t *state`
  Parameters of the Generic OnPowerUp state

### struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model

### struct esp_ble_mesh_gen_power_level_state_t
Parameters of the Generic Power Level state

**Public Members**

- `uint16_t power_actual`
  The present value of the Generic Power Actual state

- `uint16_t target_power_actual`
  The target value of the Generic Power Actual state

- `uint16_t power_last`
  The value of the Generic Power Last state

- `uint16_t power_default`
  The value of the Generic Power Default state

- `uint8_t status_code`
  The status code of setting Generic Power Range state

- `uint16_t power_range_min`
  The minimum value of the Generic Power Range state

- `uint16_t power_range_max`
  The maximum value of the Generic Power Range state

### struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power Level Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_gen_power_level_state_t *state`
  Parameters of the Generic Power Level state

- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message

- `esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition
### Public Members

**int32_t tt_delta_level**
Delta change value of level state transition

**struct esp_ble_mesh_gen_power_level_setup_srv_t**
User data of Generic Power Level Setup Server Model

**Public Members**

**esp_ble_mesh_model_t *model**
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_gen_power_level_state_t *state**
Parameters of the Generic Power Level state

**struct esp_ble_mesh_gen_battery_state_t**
Parameters of Generic Battery state

**Public Members**

**uint32_t battery_level : 8**
The value of the Generic Battery Level state

**uint32_t time_to_discharge : 24**
The value of the Generic Battery Time to Discharge state

**uint32_t time_to_charge : 24**
The value of the Generic Battery Time to Charge state

**uint32_t battery_flags : 8**
The value of the Generic Battery Flags state

**struct esp_ble_mesh_gen_battery_srv_t**
User data of Generic Battery Server Model

**Public Members**

**esp_ble_mesh_model_t *model**
Pointer to the Generic Battery Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
Response control of the server model received messages

**esp_ble_mesh_gen_battery_state_t *state**
Parameters of the Generic Battery state

**struct esp_ble_mesh_gen_location_state_t**
Parameters of Generic Location state

**Public Members**

**int32_t global_latitude**
The value of the Global Latitude field

**int32_t global_longitude**
The value of the Global Longitude field

**int16_t global_altitude**
The value of the Global Altitude field
int16_t local_north
The value of the Local North field

int16_t local_east
The value of the Local East field

int16_t local_altitude
The value of the Local Altitude field

uint8_t floor_number
The value of the Floor Number field

uint16_t uncertainty
The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
User data of Generic Location Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
User data of Generic Location Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Location Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
Parameters of Generic Property states

Public Members

uint16_t id
The value of User/Admin/Manufacturer Property ID

uint8_t user_access
The value of User Access field

uint8_t admin_access
The value of Admin Access field

uint8_t manu_access
The value of Manufacturer Access field

struct net_buf_simple *val
The value of User/Admin/Manufacturer Property
struct esp_ble_mesh_gen_user_prop_srv_t
User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic User Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic User Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Admin Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
User data of Generic Manufacturer Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

uint8_t property_count
Generic Manufacturer Property count

esp_ble_mesh_generic_property_t *properties
Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Client Property Server Model.Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
Chapter 2. API

uint8_t id_count
  Generic Client Property ID count

uint16_t *property_ids
  Parameters of the Generic Client Property state

struct esp_ble_mesh_state_change_gen_onoff_set_t
  Parameter of Generic OnOff Set state change event

  Public Members

uint8_t onoff
  The value of Generic OnOff state

struct esp_ble_mesh_state_change_gen_level_set_t
  Parameter of Generic Level Set state change event

  Public Members

int16_t level
  The value of Generic Level state

struct esp_ble_mesh_state_change_gen_delta_set_t
  Parameter of Generic Delta Set state change event

  Public Members

int16_t level
  The value of Generic Level state

struct esp_ble_mesh_state_change_gen_move_set_t
  Parameter of Generic Move Set state change event

  Public Members

int16_t level
  The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
  Parameter of Generic Default Transition Time Set state change event

  Public Members

uint8_t trans_time
  The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
  Parameter of Generic OnPowerUp Set state change event

  Public Members

uint8_t onpowerup
  The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
  Parameter of Generic Power Level Set state change event

  Public Members
Public Members

uint16_t power
The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state
uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state
int32_t longitude
The Global Longitude value of Generic Location state
int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state
int16_t east
The Local East value of Generic Location state
int16_t altitude
The Local Altitude value of Generic Location state
uint8_t floor_number
The Floor Number value of Generic Location state
uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event
Public Members

```
uint16_t id
    The property id of Generic User Property state

struct net_buf_simple *value
    The property value of Generic User Property state
```

```
struct esp_ble_mesh_state_change_gen_admin_property_set_t
    Parameters of Generic Admin Property Set state change event
```

Public Members

```
uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state
```

```
struct esp_ble_mesh_state_change_gen_manu_property_set_t
    Parameters of Generic Manufacturer Property Set state change event
```

Public Members

```
uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state
```

```
struct esp_ble_mesh_server_recv_gen_user_property_get_t
    Context of the received Generic User Property Get message
```

Public Members

```
uint16_t property_id
    Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
    Context of the received Generic Admin Property Get message
```

Public Members

```
uint16_t property_id
    Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
    Context of the received Generic Manufacturer Property message
```

Public Members

```
uint16_t property_id
    Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
    Context of the received Generic Client Properties Get message
```
Public Members

`uint16_t property_id`
A starting Client Property ID present within an element

`struct esp_ble_mesh_server_recv_gen_onoff_set_t`
Context of the received Generic OnOff Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint8_t onoff`
Target value of Generic OnOff state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_level_set_t`
Context of the received Generic Level Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`int16_t level`
Target value of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_delta_set_t`
Context of the received Generic Delta Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`int32_t delta_level`
Delta change of Generic Level state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)
uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
  Context of the received Generic Move Set message

Public Members

bool op_en
  Indicate if optional parameters are included

int16_t delta_level
  Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
  Context of the received Generic Default Transition Time Set message

Public Members

uint8_t trans_time
  The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
  Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
  The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
  Context of the received Generic Power Level Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t power
  Target value of Generic Power Actual state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
  Context of the received Generic Power Default Set message
Public Members

```c
uint16_t power
```
The value of the Generic Power Default state

```c
struct esp_ble_mesh_server_recv_gen_power_range_set_t
```
Context of the received Generic Power Range Set message

Public Members

```c
uint16_t range_min
```
Value of Range Min field of Generic Power Range state

```c
uint16_t range_max
```
Value of Range Max field of Generic Power Range state

```c
struct esp_ble_mesh_server_recv_gen_loc_global_set_t
```
Context of the received Generic Location Global Set message

Public Members

```c
int32_t global_latitude
```
Global Coordinates (Latitude)

```c
int32_t global_longitude
```
Global Coordinates (Longitude)

```c
int16_t global_altitude
```
Global Altitude

```c
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
```
Context of the received Generic Location Local Set message

Public Members

```c
int16_t local_north
```
Local Coordinates (North)

```c
int16_t local_east
```
Local Coordinates (East)

```c

```
Uncertainty

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
```
Context of the received Generic User Property Set message

Public Members

```c
uint16_t property_id
```
Property ID identifying a Generic User Property

```c
struct net_buf_simple *property_value
```
Raw value for the User Property
**struct esp_ble_mesh_server_recv_gen_admin_property_set_t**

Context of the received Generic Admin Property Set message

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Admin Property
- `uint8_t user_access`
  Enumeration indicating user access
- `struct net_buf_simple *property_value`
  Raw value for the Admin Property

**struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t**

Context of the received Generic Manufacturer Property Set message

**Public Members**

- `uint16_t property_id`
  Property ID identifying a Generic Manufacturer Property
- `uint8_t user_access`
  Enumeration indicating user access

**struct esp_ble_mesh_generic_server_cb_param_t**

Generic Server Model callback parameters

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to Generic Server Models
- `esp_ble_mesh_msg_ctx_t ctx`
  Context of the received messages
- `esp_ble_mesh_generic_server_cb_value_t value`
  Value of the received Generic Messages

**Macros**

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)

Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Return** New Generic Level Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`. 
**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)
Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)
Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)
Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Property Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.

Define a new Generic OnOff Server Model.
Note 1. The Generic OnOff Server Model is a root model.
   1. This model shall support model publication and model subscription.
Return New Generic OnOff Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Level Server Model.

Note 1. The Generic Level Server Model is a root model.
   1. This model shall support model publication and model subscription.
Return New Generic Level Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.

Note 1. The Generic Default Transition Time Server Model is a root model.
   1. This model shall support model publication and model subscription.
Return New Generic Default Transition Time Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model
is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be
present.
   1. This model may be used to represent a variety of devices that do not fit any of the model descriptions
   that have been defined but support the generic properties of On/Off.
   2. This model shall support model publication and model subscription.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

Note 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and
the Generic Default Transition Time Server model.
   1. This model shall support model subscription.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the
Generic Level Server model. When this model is present on an Element, the corresponding Generic
Power Level Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
Return New Generic Power Level Server Model instance.
Parameters
   • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
   • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`. 
### Esp BLE Mesh Model Gen Power Level Setup SRV (srv_pub, srv_data)

Define a new Generic Power Level Setup Server Model.

   1. This model shall support model subscription.

**Return** New Generic Power Level Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

### Esp BLE Mesh Model Gen Battery SRV (srv_pub, srv_data)

Define a new Generic Battery Server Model.

**Note** 1. The Generic Battery Server Model is a root model.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that is powered by a battery.

**Return** New Generic Battery Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

### Esp BLE Mesh Model Gen Location SRV (srv_pub, srv_data)

Define a new Generic Location Server Model.

**Note** 1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

### Esp BLE Mesh Model Gen Location Setup SRV (srv_pub, srv_data)

Define a new Generic Location Setup Server Model.

**Note** 1. The Generic Location Setup Server model extends the Generic Location Server model.
   1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

### Esp BLE Mesh Model Gen User Prop SRV (srv_pub, srv_data)

Define a new Generic User Property Server Model.

**Note** 1. The Generic User Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

### Esp BLE Mesh Model Gen Admin Prop SRV (srv_pub, srv_data)

Define a new Generic Admin Property Server Model.

**Note** 1. The Generic Admin Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`. 
Chapter 2. API

ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)
Define a new Generic Manufacturer Property Server Model.

**Note** 1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.
**Return** New Generic Manufacturer Property Server Model instance.
**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)
Define a new Generic User Property Server Model.

**Note** 1. The Generic Client Property Server model is a root model.
   1. This model shall support model publication and model subscription.
**Return** New Generic Client Property Server Model instance.
**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.

**Type Definitions**

**typedef** void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event,
                                                      esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.
Generic Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**typedef** void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event,
                                                      esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.
Generic Server Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

**enum** esp_ble_mesh_generic_client_cb_event_t
This enum value is the event of Generic Client Model

**Values:**

- `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`

**enum** esp_ble_mesh_gen_user_prop_access_t
This enum value is the access value of Generic User Property

**Values:**

- `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
Chapter 2. API

```c
enum esp_ble_mesh_gen_admin_prop_access_t
This enum value is the access value of Generic Admin Property
Values:
ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE
```

```c
enum esp_ble_mesh_gen_manu_prop_access_t
This enum value is the access value of Generic Manufacturer Property
Values:
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ
```

```c
enum esp_ble_mesh_generic_server_cb_event_t
This enum value is the event of Generic Server Model
Values:
ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX
```

Sensor Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_sensor_client_callback(esp_ble_mesh_sensor_client_cb_t callback)
```

Register BLE Mesh Sensor Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- (in) `callback`: Pointer to the callback function.
**esp_err_t esp_ble_mesh_sensor_client_get_state** (\*params, \*get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_tinesp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- \[in\] params: Pointer to BLE Mesh common client parameters.
- \[in\] get_state: Pointer to sensor get message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_sensor_client_set_state** (\*params, \*set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_tinesp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- \[in\] params: Pointer to BLE Mesh common client parameters.
- \[in\] set_state: Pointer to sensor set message value. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_register_sensor_server_callback** (callback)

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- \[in\] callback: Pointer to the callback function.

**Unions**

union esp_ble_mesh_sensor_client_get_state_t

```c
#include <esp_ble_mesh_sensor_model_api.h> Sensor Client Model get message union.
```

Release v5.0-dev-489-gef98a36
Public Members

uint16_t property_id
   Property ID for the sensor

uint8_t fast_cadence_period_divisor : 7
   Divisor for the publish period

uint8_t status_trigger_type : 1
   The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
   Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
   Delta up value that triggers a status message

uint8_t status_min_interval
   Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
   Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
   Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
   Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
   Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
   Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
   Property ID of a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
   Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
   Property ID identifying a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
   Raw value for the setting

struct esp_ble_mesh_sensor_get_t
   Parameters of Sensor Get
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
   Parameters of Sensor Column Get

Public Members

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x
   Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
   Parameters of Sensor Series Get

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status
Public Members

```c
uint16_t sensor_property_id
    Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
    A sequence of N sensor setting property IDs (optional)
```

```c
struct esp_ble_mesh_sensor_setting_status_cb_t
    Parameters of Sensor Setting Status
```

```c
bool op_en
    Indicate if optional parameters are included

uint16_t sensor_property_id
    Property ID identifying a sensor

uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor

uint8_t sensor_setting_access
    Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
    Raw value for the setting
```

```c
struct esp_ble_mesh_sensor_status_cb_t
    Parameter of Sensor Status
```

```c
struct net_buf_simple *marshalled_sensor_data
    Value of sensor data state (optional)
```

```c
struct esp_ble_mesh_sensor_column_status_cb_t
    Parameters of Sensor Column Status
```

```c
uint16_t property_id
    Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
    Left values of sensor column status
```

```c
struct esp_ble_mesh_sensor_series_status_cb_t
    Parameters of Sensor Series Status
```

```c
uint16_t property_id
    Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
    Left values of sensor series status
```

```c
struct esp_ble_mesh_sensor_client_cb_param_t
    Sensor Client Model callback parameters
```
Chapter 2. API

Public Members

```c
int error_code
```
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

```c
esp_ble_mesh_client_common_param_t *params
```
The client common parameters.

```c
esp_ble_mesh_sensor_client_status_cb_t status_cb
```
The sensor status message callback values

```c
struct esp_ble_mesh_sensor_descriptor_t
```
Parameters of Sensor Descriptor state

Public Members

```c
uint32_t positive_tolerance : 12
```
The value of Sensor Positive Tolerance field

```c
uint32_t negative_tolerance : 12
```
The value of Sensor Negative Tolerance field

```c
uint32_t sampling_function : 8
```
The value of Sensor Sampling Function field

```c
uint8_t measure_period
```
The value of Sensor Measurement Period field

```c
uint8_t update_interval
```
The value of Sensor Update Interval field

```c
struct esp_ble_mesh_sensor_setting_t
```
Parameters of Sensor Setting state

Public Members

uint16_t property_id
```
The value of Sensor Setting Property ID field

```c
uint8_t access
```
The value of Sensor Setting Access field

```c
struct net_buf_simple *raw
```
The value of Sensor Setting Raw field

```c
struct esp_ble_mesh_sensor_cadence_t
```
Parameters of Sensor Cadence state

Public Members

```c
uint8_t period_divisor : 7
```
The value of Fast Cadence Period Divisor field

```c
uint8_t trigger_type : 1
```
The value of Status Trigger Type field

```c
struct net_buf_simple *trigger_delta_down
```
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field
struct net_buf_simple *trigger_delta_up
  The value of Status Trigger Delta Up field

uint8_t min_interval
  The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
  The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
  The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
  Parameters of Sensor Data state

Public Members

uint8_t format : 1
  Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
  Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length : 7
  The value of the Sensor Data length

struct net_buf_simple *raw_value
  The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
  Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
  The value of Sensor Raw Value X field

struct net_buf_simple *column_width
  The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
  The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
  Parameters of Sensor states

Public Members

uint16_t sensor_property_id
  The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
  Parameters of the Sensor Descriptor state

const uint8_t setting_count
  Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
  Parameters of the Sensor Setting state
**Chapter 2. API**

*esp_ble_mesh_sensor_cadence_t* \*cadence

The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

*esp_ble_mesh_sensor_data_t* \*sensor_data

Parameters of the Sensor Data state

*esp_ble_mesh_sensor_series_column_t* \*series_column

Parameters of the Sensor Series Column state

```c
struct esp_ble_mesh_sensor_srv_t
User data of Sensor Server Model
```

**Public Members**

*esp_ble_mesh_model_t* \*model

Pointer to the Sensor Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* \*rsp_ctrl

Response control of the server model received messages

```c
const uint8_t state_count
Sensor state count
```

*esp_ble_mesh_sensor_state_t* \*states

Parameters of the Sensor states

```c
struct esp_ble_mesh_sensor_setup_srv_t
User data of Sensor Setup Server Model
```

**Public Members**

*esp_ble_mesh_model_t* \*model

Pointer to the Sensor Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* \*rsp_ctrl

Response control of the server model received messages

```c
const uint8_t state_count
Sensor state count
```

*esp_ble_mesh_sensor_state_t* \*states

Parameters of the Sensor states

```c
struct esp_ble_mesh_state_change_sensor_cadence_set_t
Parameters of Sensor Cadence Set state change event
```

**Public Members**

*uint16_t* property_id

The value of Sensor Property ID state

*uint8_t* period_divisor : 7

The value of Fast Cadence Period Divisor state

*uint8_t* trigger_type : 1

The value of Status Trigger Type state

```c
struct net_buf_simple *trigger_delta_down
The value of Status Trigger Delta Down state
```
The value of Status Trigger Delta Up state

The value of Status Min Interval state

The value of Fast Cadence Low state

The value of Fast Cadence High state

Parameters of Sensor Setting Set state change event

The value of Sensor Property ID state

The value of Sensor Setting Property ID state

The value of Sensor Property Value state

Context of the received Sensor Descriptor Get message

Indicate if optional parameters are included

Property ID of a sensor (optional)

Context of the received Sensor Cadence Get message

Property ID of a sensor

Context of the received Sensor Settings Get message

Property ID of a sensor

Context of the received Sensor Setting Get message
Public Members

```c
uint16_t property_id
    Property ID of a sensor
```

```c
uint16_t setting_property_id
    Setting ID identifying a setting within a sensor
```

**struct esp_ble_mesh_server_recv_sensor_get_t**
Context of the received Sensor Get message

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property ID for the sensor (optional)
```

**struct esp_ble_mesh_server_recv_sensor_column_get_t**
Context of the received Sensor Column Get message

Public Members

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
    Raw value identifying a column
```

**struct esp_ble_mesh_server_recv_sensor_series_get_t**
Context of the received Sensor Series Get message

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value
    Raw value containing X1 and X2 (optional)
```

**struct esp_ble_mesh_server_recv_sensor_cadence_set_t**
Context of the received Sensor Cadence Set message

Public Members

```c
uint16_t property_id
    Property ID for the sensor
```

```c
struct net_buf_simple *cadence
    Value of Sensor Cadence state
```

**struct esp_ble_mesh_server_recv_sensor_setting_set_t**
Context of the received Sensor Setting Set message
Chapter 2. API Reference

Public Members

uint16_t property_id
Property ID identifying a sensor

uint16_t setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value
Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

Note: This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return: New Sensor Client Model instance.

Parameters:
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)
Sensor Server Models related context.

Define a new Sensor Server Model.

Note: 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
  1. This model shall support model publication and model subscription.

Parameters:
  • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • srv_data: Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

Note: 1. The Sensor Setup Server model extends the Sensor Server model.
  1. This model shall support model publication and model subscription.

Parameters:
  • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • srv_data: Pointer to the unique struct esp_ble_mesh_sensor_setup_srv_t.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
Length of Sensor Property ID
ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
    Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
    Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
    Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
    Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
    Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
    Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
    Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
    Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
    Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
    Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
    Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
    Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
    Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
    Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
    Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
    Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
    Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
    Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
    MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
    MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
    Zero length of Sensor Data.

    Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT(_data)
    Get format of the sensor data.
Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)
Generate a MPID value for sensor data with Format A.

Note
1. The Format field is 0b0 and indicates that Format A is used.
   1. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
   2. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
   3. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)
Generate a MPID value for sensor data with Format B.

Note
1. The Format field is 0b1 and indicates Format B is used.
   1. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
   2. The Property ID is a 16-bit bit field representing a Property ID.
   3. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
   4. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Return 3-octet MPID value for sensor data with Format B.

Parameters
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Parameters
typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Parameters
- event: Event type
- param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model

Values:

ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function

Values:

ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

default: When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.

2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

`esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)`

Register BLE Mesh Time Scene Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

`esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)`

Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** get_state: Pointer to time scene get message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state)`

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** set_state: Pointer to time scene set message value. Shall not be set to NULL.

`esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)`

Register BLE Mesh Time and Scenes Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** callback: Pointer to the callback function.

```
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

Public Members

```c
uint8_t tai_seconds[5]
```
The current TAI time in seconds

```c
uint8_t sub_second
```
The sub-second time in units of 1/256 second

```c
uint8_t uncertainty
```
The estimated uncertainty in 10-millisecond steps

```c
uint16_t time_authority = 1
0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t tai_utc_delta = 15
```
The current difference between TAI and UTC in seconds

```c
uint8_t time_zone_offset
```
The local time zone offset in 15-minute increments

```c
struct esp_ble_mesh_time_zone_set_t
```
Parameters of Time Zone Set

Public Members

```c
uint8_t time_zone_offset_new
```
Upcoming local time zone offset

```c
uint8_t tai_zone_change[5]
```
TAI Seconds time of the upcoming Time Zone Offset change

```c
struct esp_ble_mesh_tai_utc_delta_set_t
```
Parameters of TAI-UTC Delta Set
### Public Members

**uint16_t** `tai_utc_delta_new`: 15  
Upcoming difference between TAI and UTC in seconds

**uint16_t** `padding`: 1  
Always 0b0. Other values are Prohibited.

**uint8_t** `tai_delta_change[5]`  
TAI Seconds time of the upcoming TAI-UTC Delta change

```
struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set
```

### Public Members

**uint8_t** `time_role`  
The Time Role for the element

```
struct esp_ble_mesh_time_role_set_t
Parameter of Time Role Set
```

### Public Members

**uint16_t** `scene_number`  
The number of scenes to be stored

```
struct esp_ble_mesh_scene_store_t
Parameter of Scene Store
```

### Public Members

**bool** `op_en`  
Indicate if optional parameters are included

**uint16_t** `scene_number`  
The number of scenes to be recalled

**uint8_t** `tid`  
Transaction ID

**uint8_t** `trans_time`  
Time to complete state transition (optional)

**uint8_t** `delay`  
Indicate message execution delay (C.1)

```
struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete
```

### Public Members

**uint16_t** `scene_number`  
The number of scenes to be deleted

```
struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get
```
**Public Members**

```c
uint8_t index
```
Index of the Schedule Register entry to get

**struct esp_ble_mesh_scheduler_act_set_t**
Parameters of Scheduler Action Set

**Public Members**

```c
uint64_t index : 4
```
Index of the Schedule Register entry to set

```c
uint64_t year : 7
```
Scheduled year for the action

```c
uint64_t month : 12
```
Scheduled month for the action

```c
uint64_t day : 5
```
Scheduled day of the month for the action

```c
uint64_t hour : 5
```
Scheduled hour for the action

```c
uint64_t minute : 6
```
Scheduled minute for the action

```c
uint64_t second : 6
```
Scheduled second for the action

```c
uint64_t day_of_week : 7
```
Schedule days of the week for the action

```c
uint64_t action : 4
```
Action to be performed at the scheduled time

```c
uint64_t trans_time : 8
```
Transition time for this action

```c
uint16_t scene_number
```
Transition time for this action

**struct esp_ble_mesh_time_status_cb_t**
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

**Public Members**

```c
uint8_t tai_seconds[5]
```
The current TAI time in seconds

```c
uint8_t sub_second
```
The sub-second time in units of 1/256 second

```c
uint8_t uncertainty
```
The estimated uncertainty in 10-millisecond steps

```c
uint16_t time_authority : 1
```
`0 = No Time Authority, 1 = Time Authority`

```c
uint16_t tai_utc_delta : 15
```
Current difference between TAI and UTC in seconds

```c
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_zone_status_cb_t
    Parameters of Time Zone Status
```

### Public Members

```c
uint8_t time_zone_offset_curr
    Current local time zone offset
```

```c
uint8_t time_zone_offset_new
    Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]
    TAI Second time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_tai_utc_delta_status_cb_t
    Parameters of TAI-UTC Delta Status
```

### Public Members

```c
uint16_t tai_utc_delta_curr : 15
    Current difference between TAI and UTC in seconds
```

```c
uint16_t padding_1 : 1
    Always 0b0. Other values are Prohibited.
```

```c
uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t padding_2 : 1
    Always 0b0. Other values are Prohibited.
```

```c
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change
```

```c
struct esp_ble_mesh_time_role_status_cb_t
    Parameter of Time Role Status
```

### Public Members

```c
uint8_t time_role
    The Time Role for the element
```

```c
struct esp_ble_mesh_scene_status_cb_t
    Parameters of Scene Status
```

### Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint8_t status_code
    Status code of the last operation
```

```c
uint16_t current_scene
    Scene Number of the current scene
```

```c
uint16_t target_scene
    Scene Number of the target scene (optional)
```
uint8_t \texttt{remain\_time} \\
Time to complete state transition (C.1)

\textbf{struct esp\_ble\_mesh\_scene\_register\_status\_cb\_t} \\
Parameters of Scene Register Status

\textbf{Public Members} \\
\begin{itemize}
\item uint8_t \texttt{status\_code} \\
Status code for the previous operation
\item uint16_t \texttt{current\_scene} \\
Scene Number of the current scene
\item \textbf{struct} net\_buf\_simple *\texttt{scenes} \\
A list of scenes stored within an element
\end{itemize}

\textbf{struct esp\_ble\_mesh\_scheduler\_status\_cb\_t} \\
Parameter of Scheduler Status

\textbf{Public Members} \\
\begin{itemize}
\item uint16_t \texttt{schedules} \\
Bit field indicating defined Actions in the Schedule Register
\end{itemize}

\textbf{struct esp\_ble\_mesh\_scheduler\_act\_status\_cb\_t} \\
Parameters of Scheduler Action Status

\textbf{Public Members} \\
\begin{itemize}
\item uint64_t \texttt{index} : 4 \\
Enumerates (selects) a Schedule Register entry
\item uint64_t \texttt{year} : 7 \\
Scheduled year for the action
\item uint64_t \texttt{month} : 12 \\
Scheduled month for the action
\item uint64_t \texttt{day} : 5 \\
Scheduled day of the month for the action
\item uint64_t \texttt{hour} : 5 \\
Scheduled hour for the action
\item uint64_t \texttt{minute} : 6 \\
Scheduled minute for the action
\item uint64_t \texttt{second} : 6 \\
Scheduled second for the action
\item uint64_t \texttt{day\_of\_week} : 7 \\
Schedule days of the week for the action
\item uint64_t \texttt{action} : 4 \\
Action to be performed at the scheduled time
\item uint64_t \texttt{trans\_time} : 8 \\
Transition time for this action
\item uint16_t \texttt{scene\_number} \\
Transition time for this action
\end{itemize}
**struct esp_ble_mesh_time_scene_client_cb_param_t**  
Time Scene Client Model callback parameters

**Public Members**

- `int error_code`: Appropriate error code
- `esp_ble_mesh_client_common_param_t *params`: The client common parameters.
- `esp_ble_mesh_time_scene_client_status_cb_t status_cb`: The scene status message callback values

**struct esp_ble_mesh_time_state_t**  
Parameters of Time state

**Public Members**

- `uint8_t tai_seconds[5]`: The value of the TAI Seconds state
- `uint8_t subsecond`: The value of the Subsecond field
- `uint8_t uncertainty`: The value of the Uncertainty field
- `uint8_t time_zone_offset_curr`: The value of the Time Zone Offset Current field
- `uint8_t time_zone_offset_new`: The value of the Time Zone Offset New state
- `uint8_t tai_zone_change[5]`: The value of the TAI of Zone Chaneg field
- `uint16_t time_authority`: The value of the Time Authority bit
- `uint16_t tai_utc_delta_curr`: The value of the TAI-UTC Delta Current state
- `uint16_t tai_utc_delta_new`: The value of the TAI-UTC Delta New state
- `uint8_t tai_delta_change[5]`: The value of the TAI of Delta Change field

**struct esp_ble_mesh_time_state_t::[anonymous] time**  
Parameters of the Time state

- `uint8_t time_role`: The value of the Time Role state

**struct esp_ble_mesh_time_srv_t**  
User data of Time Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`: Pointer to the Time Server Model. Initialized internally.
**Chapter 2. API**

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```c
esp_ble_mesh_time_state_t *state
```

Parameters of the Time state

**struct esp_ble_mesh_time_setup_srv_t**

User data of Time Setup Server Model

**Public Members**

```c
esp_ble_mesh_model_t *model
```

Pointer to the Time Setup Server Model. Initialized internally.

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
```

Response control of the server model received messages

```c
esp_ble_mesh_time_state_t *state
```

Parameters of the Time state

**struct esp_ble_mesh_scene_register_t**

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

**Public Members**

```c
uint16_t scene_number
```

The value of the Scene Number

```c
uint8_t scene_type
```

The value of the Scene Type

```c
struct net_buf_simple *scene_value
```

Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

**struct esp_ble_mesh_scenes_state_t**

Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.
Public Members

const uint16_t scene_count
The Scenes state’s scene count

exp_ble_mesh_scene_register_t *scenes
Parameters of the Scenes state

uint16_t current_scene
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active
scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene
state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete
operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of
a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The
value of the Current Scene state

uint16_t target_scene
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is
in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register
state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a
result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The
value of the Target Scene state

uint8_t status_code
The status code of the last scene operation

bool in_progress
Indicate if the scene transition is in progress

struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state

Submit Document Feedback
Public Members

`esp_ble_mesh_model_t *model`
- Pointer to the Scene Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
- Response control of the server model received messages

`esp_ble_mesh_scenes_state_t *state`
- Parameters of the Scenes state

`struct esp_ble_mesh_schedule_register_t`
- Parameters of Scheduler Register state

Public Members

`bool in_use`
- Indicate if the registered schedule is in use

`uint64_t year : 7`
- The value of Scheduled year for the action

`uint64_t month : 12`
- The value of Scheduled month for the action

`uint64_t day : 5`
- The value of Scheduled day of the month for the action

`uint64_t hour : 5`
- The value of Scheduled hour for the action

`uint64_t minute : 6`
- The value of Scheduled minute for the action

`uint64_t second : 6`
- The value of Scheduled second for the action

`uint64_t day_of_week : 7`
- The value of Schedule days of the week for the action

`uint64_t action : 4`
- The value of Action to be performed at the scheduled time

`uint64_t trans_time : 8`
- The value of Transition time for this action

`uint16_t scene_number`
- The value of Scene Number to be used for some actions

`struct esp_ble_mesh_scheduler_state_t`
- Parameters of Scheduler state

Public Members

`const uint8_t schedule_count`
- Scheduler count

`esp_ble_mesh_schedule_register_t *schedules`
- Up to 16 scheduled entries

`struct esp_ble_mesh_scheduler_srv_t`
- User data of Scheduler Server Model
Public Members

*esp_ble_mesh_model_t* model
  Pointer to the Scheduler Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
  Response control of the server model received messages

  Response control of the server model received messages

*esp_ble_mesh_scheduler_state_t* state
  Parameters of the Scheduler state

*struct esp_ble_mesh_state_change_time_set_t*
  Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]
  The current TAI time in seconds

uint8_t subsecond
  The sub-second time in units of 1/256 second

uint8_t uncertainty
  The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
  0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
  Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
  The local time zone offset in 15-minute increments

*struct esp_ble_mesh_state_change_time_status_t*
  Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
  The current TAI time in seconds

uint8_t subsecond
  The sub-second time in units of 1/256 second

uint8_t uncertainty
  The estimated uncertainty in 10-millisecond steps
uint16_t time_authority : 1  
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15  
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr  
The local time zone offset in 15-minute increments

**struct esp_ble_mesh_state_change_time_zone_set_t**  
Parameters of Time Zone Set state change event

**Public Members**

uint8_t time_zone_offset_new  
Upcoming local time zone offset

uint8_t tai_zone_change[5]  
TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_state_change_tai_utc_delta_set_t**  
Parameters of TAI UTC Delta Set state change event

**Public Members**

uint16_t tai_utc_delta_new : 15  
Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5]  
TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_state_change_time_role_set_t**  
Parameter of Time Role Set state change event

**Public Members**

uint8_t time_role  
The Time Role for the element

**struct esp_ble_mesh_state_change_scene_store_t**  
Parameter of Scene Store state change event

**Public Members**

uint16_t scene_number  
The number of scenes to be stored

**struct esp_ble_mesh_state_change_scene_recall_t**  
Parameter of Scene Recall state change event

**Public Members**

uint16_t scene_number  
The number of scenes to be recalled

**struct esp_ble_mesh_state_change_scene_delete_t**  
Parameter of Scene Delete state change event
Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
Parameter of Scheduler Action Set state change event

Public Members

uint64_t index: 4
Index of the Schedule Register entry to set

uint64_t year: 7
Scheduled year for the action

uint64_t month: 12
Scheduled month for the action

uint64_t day: 5
Scheduled day of the month for the action

uint64_t hour: 5
Scheduled hour for the action

uint64_t minute: 6
Scheduled minute for the action

uint64_t second: 6
Scheduled second for the action

uint64_t day_of_week: 7
Schedule days of the week for the action

uint64_t action: 4
Action to be performed at the scheduled time

uint64_t trans_time: 8
Transition time for this action

uint16_t scene_number
Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
Context of the received Scheduler Action Get message

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
Context of the received Time Set message

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second
uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
   Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
   Context of the received TimeZone Set message

Public Members

uint8_t time_zone_offset_new
   Upcoming local time zone offset

uint8_t tai_zone_change[5]
   TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
   Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new : 15
   Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
   Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
   TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
   Context of the received Time Role Set message

Public Members

uint8_t time_role
   The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
   Context of the received Scene Store message

Public Members

uint16_t scene_number
   The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
   Context of the received Scene Recall message
Chapter 2. API Reference

**Public Members**

`bool op_en`
Indicate if optional parameters are included

`uint16_t scene_number`
The number of scenes to be recalled

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_scene_delete_t
Context of the received Scene Delete message
```

**Public Members**

`uint16_t scene_number`
The number of scenes to be deleted

```c
struct esp_ble_mesh_server_recv_scheduler_act_set_t
Context of the received Scheduler Action Set message
```

**Public Members**

`uint64_t index`: 4
Index of the Schedule Register entry to set

`uint64_t year`: 7
Scheduled year for the action

`uint64_t month`: 12
Scheduled month for the action

`uint64_t day`: 5
Scheduled day of the month for the action

`uint64_t hour`: 5
Scheduled hour for the action

`uint64_t minute`: 6
Scheduled minute for the action

`uint64_t second`: 6
Scheduled second for the action

`uint64_t day_of_week`: 7
Scheduled days of the week for the action

`uint64_t action`: 4
Action to be performed at the scheduled time

`uint64_t trans_time`: 8
Transition time for this action

`uint16_t scene_number`
Scene number to be used for some actions

```c
struct esp_ble_mesh_server_recv_time_status_t
Context of the received Time Status message
```
Public Members

- **uint8_t _tai_seconds[5]**
  The current TAI time in seconds
- **uint8_t _subsecond**
  The sub-second time in units of 1/256 second

  Context of the received messages
- **esp_ble_mesh_time_scene_server_cb_value_t value**
  Value of the received Time and Scenes Messages

Macros

**ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)**
Define a new Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Time Client Model.

**Return** New Time Client Model instance.

**Parameters**
- **cli_pub**: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **cli_data**: Pointer to the unique struct esp_ble_mesh_client_t.

**ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)**
Define a new Scene Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.

**Return** New Scene Client Model instance.

**Parameters**
- **cli_pub**: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **cli_data**: Pointer to the unique struct esp_ble_mesh_client_t.

**ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)**
Define a new Scheduler Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

**Return** New Scheduler Client Model instance.

**Parameters**
- **cli_pub**: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- **cli_data**: Pointer to the unique struct esp_ble_mesh_client_t.
**ESP_BLE_MESH_MODEL_TIME_SRV** (srv_pub, srv_data)

Define a new Time Server Model.

**Note**
1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
2. This model shall support model publication and model subscription.

**Return**
New Time Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_srv_t`.

---

**ESP_BLE_MESH_MODEL_TIME_SETUP_SRV** (srv_data)

Define a new Time Setup Server Model.

**Note**
1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
2. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
3. This model does not support subscribing nor publishing.

**Return**

**Parameters**
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_time_setup_srv_t`.

---

**ESP_BLE_MESH_MODEL_SCENE_SRV** (srv_pub, srv_data)

Define a new Scene Server Model.

**Note**
1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be present only on the Primary element of a node.

**Return**
New Scene Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

---

**ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV** (srv_pub, srv_data)

Define a new Scene Setup Server Model.

**Note**
1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
2. The model may be present only on the Primary element of a node.

**Return**
New Scene Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

---

**ESP_BLE_MESH_MODEL_SCHEDULER_SRV** (srv_pub, srv_data)

Define a new Scheduler Server Model.

**Note**
1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be present only on the Primary element of a node.
4. The model requires the Time Server model shall be present on the element.

**Return**
New Scheduler Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

---

---

---
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.  
2. The model may be present only on the Primary element of a node.

**Return** New Scheduler Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**Return** New Scheduler Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**
Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**
Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**
Unknown TAI of Delta Change

**ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH_TAI_SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH_INVALID_SCENE_NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC**
Every 15 seconds of the Scheduled minute
### Chapter 2. API Reference

#### ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

#### ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

#### ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

#### ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

#### ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

#### ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

#### ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

#### ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

#### ESP_BLE_MESH_TIME_NONE
Time Role - None

#### ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

#### ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

#### ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

#### ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

#### ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

#### ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

### Type Definitions

```c
typedef void(*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param);
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param);
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

**Parameters**
- `event`: Event type
**Enumerations**

```c
enum esp_ble_mesh_time_scene_client_cb_event_t

This enum value is the event of Time Scene Client Model

Values:

- ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

enum esp_ble_mesh_time_scene_server_cb_event_t

This enum value is the event of Time Scene Server Model

Values:

- ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
- ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
- ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
- ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
- ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX
```

**Lighting Client/Server Models**

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)

Register BLE Mesh Light Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

* [in] callback: pointer to the callback function.

esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_light_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)

Get the value of Light Server Model states using the Light Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
```
Return ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer of light get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)
```

Set the value of Light Server Model states using the Light Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer of light set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_lighting_server_callback(esp_ble_mesh_lighting_server_cb_t *callback)
```

Register BLE Mesh Lighting Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_light_client_get_state_t
#include <esp_ble_mesh_lighting_model_api.h> Lighting Client Model get message union.
```

Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
   Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
   Parameters of Light xyL Set

   Public Members

   bool op_en
      Indicate whether optional parameters included

   uint16_t xyl_lightness
      The target value of the Light xyL Lightness state

   uint16_t xyl_x
      The target value of the Light xyL x state

   uint16_t xyl_y
      The target value of the Light xyL y state

   uint8_t tid
      Transaction Identifier

   uint8_t trans_time
      Time to complete state transition (optional)

   uint8_t delay
      Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
   Parameters of Light xyL Default Set

   Public Members

   uint16_t lightness
      The value of the Light Lightness Default state

   uint16_t xyl_x
      The value of the Light xyL x Default state

   uint16_t xyl_y
      The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

   Public Members

   uint16_t xyl_x_range_min
      The value of the xyL x Range Min field of the Light xyL x Range state

   uint16_t xyl_x_range_max
      The value of the xyL x Range Max field of the Light xyL x Range state

   uint16_t xyl_y_range_min
      The value of the xyL y Range Min field of the Light xyL y Range state

   uint16_t xyl_y_range_max
      The value of the xyL y Range Max field of the Light xyL y Range state
struct esp_ble_mesh_light_lc_mode_set_t
   Parameter of Light LC Mode Set

   Public Members

   uint8_t mode
      The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
   Parameter of Light LC OM Set

   Public Members

   uint8_t mode
      The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
   Parameters of Light LC Light OnOff Set

   Public Members

   bool op_en
      Indicate whether optional parameters included

   uint8_t light_onoff
      The target value of the Light LC Light OnOff state

   uint8_t tid
      Transaction Identifier

   uint8_t trans_time
      Time to complete state transition (optional)

   uint8_t delay
      Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
   Parameter of Light LC Property Get

   Public Members

   uint16_t property_id
      Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
   Parameters of Light LC Property Set

   Public Members

   uint16_t property_id
      Property ID identifying a Light LC Property

struct net_buf_simple *property_value
   Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
   Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
   Parameters of Light Lightness Status
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_lightness
   Current value of light lightness actual state

uint16_t target_lightness
   Target value of light lightness actual state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
   Parameters of Light Lightness Linear Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_lightness
   Current value of light lightness linear state

uint16_t target_lightness
   Target value of light lightness linear state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
   Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
   The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
   Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
   The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
   Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
   Status Code for the request message

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state
struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
Current value of light ctl delta UV state

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
Target value of light ctl delta UV state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
Parameters of Light CTL Temperature Range Status

Public Members

uint8_t status_code
Status code for the request message

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_status_cb_t
Parameters of Light CTL Default Status
Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t temperature`
Value of light temperature default state

`int16_t delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness`
Current value of light hsl lightness state

`uint16_t hsl_hue`
Current value of light hsl hue state

`uint16_t hsl_saturation`
Current value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness_target`
Target value of light hsl lightness state

`uint16_t hsl_hue_target`
Target value of light hsl hue state

`uint16_t hsl_saturation_target`
Target value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_hue_status_cb_t`
Parameters of Light HSL Hue Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t present_hue`
Current value of light hsl hue state
uint16_t target_hue
    Target value of light hsl hue state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_saturation
    Current value of light hsl saturation state

uint16_t target_saturation
    Target value of light hsl saturation state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
Parameters of Light HSL Range Status

Public Members

uint8_t status_code
    Status code for the request message

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
Parameters of Light xyL Status
Chapter 2. API

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The present value of the Light xyL Lightness state

uint16_t xyl_x
The present value of the Light xyL x state

uint16_t xyl_y
The present value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
Parameters of Light xyL Target Status

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

Public Members

uint8_t status_code
Status Code for the requesting message

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state
uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t mode
The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t mode
The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t present_light_onoff
The present value of the Light LC Light OnOff state

uint8_t target_light_onoff
The target value of the Light LC Light OnOff state (Optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters
Public Members

int error_code
  Appropriate error code

esp_ble_mesh_client_common_param_t *params
  The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
  The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
  Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
  The present value of Light Lightness Linear state

uint16_t target_lightness_linear
  The target value of Light Lightness Linear state

uint16_t lightness_actual
  The present value of Light Lightness Actual state

uint16_t target_lightness_actual
  The target value of Light Lightness Actual state

uint16_t lightness_last
  The value of Light Lightness Last state

uint16_t lightness_default
  The value of Light Lightness Default state

uint8_t status_code
  The status code of setting Light Lightness Range state

uint16_t lightness_range_min
  The minimum value of Light Lightness Range state

uint16_t lightness_range_max
  The maximum value of Light Lightness Range state

struct esp_ble_mesh_light_lightness_srv_t
  User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
  Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t *last
  Parameters of the last received set message

esp_ble_mesh_state_transition_t *actual_transition
  Parameters of state transition

esp_ble_mesh_state_transition_t *linear_transition
  Parameters of state transition
Chapter 2. API

```c
int32_t tt_delta_lightness_actual
    Delta change value of lightness actual state transition
```

```c
int32_t tt_delta_lightness_linear
    Delta change value of lightness linear state transition
```

```c
struct esp_ble_mesh_light_lightness_setup_srv_t
    User data of Light Lightness Setup Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```

```c
esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state
```

```c
struct esp_ble_mesh_light_ctl_state_t
    Parameters of Light CTL state
```

**Public Members**

```c
uint16_t lightness
    The present value of Light CTL Lightness state
```

```c
uint16_t target_lightness
    The target value of Light CTL Lightness state
```

```c
uint16_t temperature
    The present value of Light CTL Temperature state
```

```c
uint16_t target_temperature
    The target value of Light CTL Temperature state
```

```c
int16_t delta_uv
    The present value of Light CTL Delta UV state
```

```c
int16_t target_delta_uv
    The target value of Light CTL Delta UV state
```

```c
uint8_t status_code
    The status code of setting Light CTL Temperature Range state
```

```c
uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state
```

```c
uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state
```

```c
uint16_t lightness_default
    The value of Light Lightness Default state
```

```c
uint16_t temperature_default
    The value of Light CTL Temperature Default state
```

```c
int16_t delta_uv_default
    The value of Light CTL Delta UV Default state
```

```c
struct esp_ble_mesh_light_ctl_srv_t
    User data of Light CTL Server Model
```
Public Members

```
 ESP_BLE_MESH_MODEL_T *model
 Pointer to the Lighting CTL Server Model. Initialized internally.

 ESP_BLE_MESH_SERVER_RSP_CTRL_T *rsp_ctrl
 Response control of the server model received messages

 ESP_BLE_MESH_LIGHT_CTL_STATE_T *state
 Parameters of the Light CTL state

 ESP_BLE_MESH_LAST_MSG_INFO_T *last
 Parameters of the last received set message

 ESP_BLE_MESH_STATE_TRANSITION_T *transition
 Parameters of state transition

 int32_t tt_delta_lightness
 Delta change value of lightness state transition

 int32_t tt_delta_temperature
 Delta change value of temperature state transition

 int32_t tt_delta_delta_uv
 Delta change value of delta uv state transition
```

```
 struct esp_ble_mesh_light_ctl_setup_srv_t
 User data of Light CTL Setup Server Model
```

Public Members

```
 ESP_BLE_MESH_MODEL_T *model
 Pointer to the Lighting CTL Setup Server Model. Initialized internally.

 ESP_BLE_MESH_SERVER_RSP_CTRL_T *rsp_ctrl
 Response control of the server model received messages

 ESP_BLE_MESH_LIGHT_CTL_STATE_T *state
 Parameters of the Light CTL state

 struct esp_ble_mesh_light_ctl_temp_srv_t
 User data of Light CTL Temperature Server Model
```

Public Members

```
 ESP_BLE_MESH_MODEL_T *model
 Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

 ESP_BLE_MESH_SERVER_RSP_CTRL_T *rsp_ctrl
 Response control of the server model received messages

 ESP_BLE_MESH_LIGHT_CTL_STATE_T *state
 Parameters of the Light CTL state

 ESP_BLE_MESH_LAST_MSG_INFO_T *last
 Parameters of the last received set message

 ESP_BLE_MESH_STATE_TRANSITION_T *transition
 Parameters of state transition

 int32_t tt_delta_temperature
 Delta change value of temperature state transition

 int32_t tt_delta_delta_uv
 Delta change value of delta uv state transition
```
**struct esp_ble_mesh_light_hsl_state_t**

Parameters of Light HSL state

**Public Members**

- `uint16_t lightness`
  The present value of Light HSL Lightness state

- `uint16_t target_lightness`
  The target value of Light HSL Lightness state

- `uint16_t hue`
  The present value of Light HSL Hue state

- `uint16_t target_hue`
  The target value of Light HSL Hue state

- `uint16_t saturation`
  The present value of Light HSL Saturation state

- `uint16_t target_saturation`
  The target value of Light HSL Saturation state

- `uint16_t lightness_default`
  The value of Light Lightness Default state

- `uint16_t hue_default`
  The value of Light HSL Hue Default state

- `uint16_t saturation_default`
  The value of Light HSL Saturation Default state

- `uint8_t status_code`
  The status code of setting Light HSL Hue & Saturation Range state

- `uint16_t hue_range_min`
  The minimum value of Light HSL Hue Range state

- `uint16_t hue_range_max`
  The maximum value of Light HSL Hue Range state

- `uint16_t saturation_range_min`
  The minimum value of Light HSL Saturation state

- `uint16_t saturation_range_max`
  The maximum value of Light HSL Saturation state

**struct esp_ble_mesh_light_hsl_srv_t**

User data of Light HSL Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state

- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message

- `esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition
int32_t \texttt{tt\_delta\_lightness} \\
Delta change value of lightness state transition

int32_t \texttt{tt\_delta\_hue} \\
Delta change value of hue state transition

int32_t \texttt{tt\_delta\_saturation} \\
Delta change value of saturation state transition

\textbf{struct esp\_ble\_mesh\_light\_hsl\_setup\_srv\_t} \\
User data of Light HSL Setup Server Model

\textbf{Public Members}

\texttt{esp\_ble\_mesh\_model\_t *} \texttt{model} \\
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

\texttt{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *} \texttt{rsp\_ctrl} \\
Response control of the server model received messages

Parameters of the last received set message
**esp_ble_mesh_state_transition_t**

Parameters of state transition

**int32_t tt_delta_saturation**

Delta change value of saturation state transition

**struct esp_ble_mesh_light_xyl_state_t**

Parameters of Light xyL state

**Public Members**

**uint16_t lightness**

The present value of Light xyL Lightness state

**uint16_t target_lightness**

The target value of Light xyL Lightness state

**uint16_t x**

The present value of Light xyL x state

**uint16_t target_x**

The target value of Light xyL x state

**uint16_t y**

The present value of Light xyL y state

**uint16_t target_y**

The target value of Light xyL y state

**uint16_t lightness_default**

The value of Light Lightness Default state

**uint16_t x_default**

The value of Light xyL x Default state

**uint16_t y_default**

The value of Light xyL y Default state

**uint8_t status_code**

The status code of setting Light xyL x & y Range state

**uint16_t x_range_min**

The minimum value of Light xyL x Range state

**uint16_t x_range_max**

The maximum value of Light xyL x Range state

**uint16_t y_range_min**

The minimum value of Light xyL y Range state

**uint16_t y_range_max**

The maximum value of Light xyL y Range state

**struct esp_ble_mesh_light_xyl_srv_t**

User data of Light xyL Server Model

**Public Members**

**esp_ble_mesh_model_t *model**

Pointer to the Lighting xyL Server Model. Initialized internally.

**esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**

Response control of the server model received messages

**esp_ble_mesh_light_xyl_state_t *state**

Parameters of the Light xyL state
esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_x
Delta change value of x state transition

int32_t tt_delta_y
Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states

Public Members

uint32_t mode : 1
0b0 The controller is turned off.
• The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
• The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t occupancy_mode : 1
The value of Light LC Occupancy Mode state

uint32_t light_onoff : 1
The present value of Light LC Light OnOff state

uint32_t target_light_onoff : 1
The target value of Light LC Light OnOff state

uint32_t occupancy : 1
The value of Light LC Occupancy state

uint32_t ambient_luxlevel : 24
The value of Light LC Ambient LuxLevel state

uint16_t linear_output
1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state
struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light FC Light On/Off state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state
float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine
**struct esp_ble_mesh_light_control_t**  
Parameters of Light Lightness controller

**Public Members**

- `esp_ble_mesh_light_lc_state_t state`  
Parameters of Light LC state
- `esp_ble_mesh_light_lc_property_state_t prop_state`  
Parameters of Light LC Property state
- `esp_ble_mesh_light_lc_state_machine_t state_machine`  
Parameters of Light LC state machine

**struct esp_ble_mesh_light_lc_srv_t**  
User data of Light LC Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`  
Pointer to the Lighting LC Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages
- `esp_ble_mesh_light_control_t *lc`  
Parameters of the Light controller
- `esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message
- `esp_ble_mesh_state_transition_t *transition`  
Parameters of state transition

**struct esp_ble_mesh_light_lc_setup_srv_t**  
User data of Light LC Setup Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`  
Pointer to the Lighting LC Setup Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages
- `esp_ble_mesh_light_control_t *lc`  
Parameters of the Light controller

**struct esp_ble_mesh_state_change_light_lightness_set_t**  
Parameter of Light Lightness Actual state change event

**Public Members**

- `uint16_t lightness`  
The value of Light Lightness Actual state

**struct esp_ble_mesh_state_change_light_lightness_linear_set_t**  
Parameter of Light Lightness Linear state change event
Public Members

`uint16_t lightness`
The value of Light Lightness Linear state

`struct esp_ble_mesh_state_change_light_lightness_default_set_t`
Parameter of Light Lightness Default state change event

Public Members

`uint16_t lightness`
The value of Light Lightness Default state

`struct esp_ble_mesh_state_change_light_lightness_range_set_t`
Parameters of Light Lightness Range state change event

Public Members

`uint16_t range_min`
The minimum value of Light Lightness Range state

`uint16_t range_max`
The maximum value of Light Lightness Range state

`struct esp_ble_mesh_state_change_light_ctl_set_t`
Parameters of Light CTL state change event

Public Members

`uint16_t lightness`
The value of Light CTL Lightness state

`uint16_t temperature`
The value of Light CTL Temperature state

`int16_t delta_uv`
The value of Light CTL Delta UV state

`struct esp_ble_mesh_state_change_light_ctl_temperature_set_t`
Parameters of Light CTL Temperature state change event

Public Members

`uint16_t temperature`
The value of Light CTL Temperature state

`int16_t delta_uv`
The value of Light CTL Delta UV state

`struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t`
Parameters of Light CTL Temperature Range state change event

Public Members

`uint16_t range_min`
The minimum value of Light CTL Temperature Range state

`uint16_t range_max`
The maximum value of Light CTL Temperature Range state
struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
    The value of Light CTL Lightness Default state

uint16_t temperature
    The value of Light CTL Temperature Default state

int16_t delta_uv
    The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
    The value of Light HSL Lightness state

uint16_t hue
    The value of Light HSL Hue state

uint16_t saturation
    The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
    The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event

Public Members

uint16_t saturation
    The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
    The value of Light HSL Lightness Default state

uint16_t hue
    The value of Light HSL Hue Default state

uint16_t saturation
    The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event
Chapter 2. API

**Public Members**

```c
uint16_t hue_range_min
The minimum hue value of Light HSL Range state
```

```c
uint16_t hue_range_max
The maximum hue value of Light HSL Range state
```

```c
uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state
```

```c
uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state
```

```c
struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light xyL Lightness state
```

```c
uint16_t x
The value of Light xyL x state
```

```c
uint16_t y
The value of Light xyL y state
```

```c
struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
uint16_t x
The value of Light xyL x Default state
```

```c
uint16_t y
The value of Light xyL y Default state
```

```c
struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event
```

**Public Members**

```c
uint16_t x_range_min
The minimum value of Light xyL x Range state
```

```c
uint16_t x_range_max
The maximum value of Light xyL x Range state
```

```c
uint16_t y_range_min
The minimum value of Light xyL y Range state
```

```c
uint16_t y_range_max
The maximum value of Light xyL y Range state
```

```c
struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event
```
Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message
Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
Value of range min field of light lightness range state
**uint16_t range_max**

Value of range max field of light lightness range state

**struct esp_ble_mesh_server_recv_light_ctl_set_t**

Context of the received Light CTL Set message

**Public Members**

- **bool op_en**
  Indicate if optional parameters are included
- **uint16_t lightness**
  Target value of light ctl lightness state
- **uint16_t temperature**
  Target value of light ctl temperature state
- **int16_t delta_uv**
  Target value of light ctl delta UV state
- **uint8_t tid**
  Transaction ID
- **uint8_t trans_time**
  Time to complete state transition (optional)
- **uint8_t delay**
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t**

Context of the received Light CTL Temperature Set message

**Public Members**

- **bool op_en**
  Indicate if optional parameters are included
- **uint16_t temperature**
  Target value of light ctl temperature state
- **int16_t delta_uv**
  Target value of light ctl delta UV state
- **uint8_t tid**
  Transaction ID
- **uint8_t trans_time**
  Time to complete state transition (optional)
- **uint8_t delay**
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t**

Context of the received Light CTL Temperature Range Set message

**Public Members**

- **uint16_t range_min**
  Value of temperature range min field of light ctl temperature range state
- **uint16_t range_max**
  Value of temperature range max field of light ctl temperature range state
struct esp_ble_mesh_server_recv_light_ctl_default_set_t
Context of the received Light CTL Default Set message

**Public Members**

\[
\text{uint16_t lightness} \\
\text{Value of light lightness default state}
\]
\[
\text{uint16_t temperature} \\
\text{Value of light temperature default state}
\]
\[
\text{int16_t delta_uv} \\
\text{Value of light delta UV default state}
\]

struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message

**Public Members**

\[
\text{bool op_en} \\
\text{Indicate if optional parameters are included}
\]
\[
\text{uint16_t lightness} \\
\text{Target value of light hsl lightness state}

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t hue
Value of light hue default state

uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyL Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyL Lightness state

uint16_t x
The target value of the Light xyL x state
uint16_t y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_xyl_default_set_t**
Context of the received Light xyL Default Set message

**Public Members**

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyL x Default state

uint16_t y
The value of the Light xyL y Default state

**struct esp_ble_mesh_server_recv_light_xyl_range_set_t**
Context of the received Light xyl Range Set message

**Public Members**

uint16_t x_range_min
The value of the xyl x Range Min field of the Light xyl x Range state

uint16_t x_range_max
The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t y_range_min
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t y_range_max
The value of the xyl y Range Max field of the Light xyl y Range state

**struct esp_ble_mesh_server_recv_light_lc_mode_set_t**
Context of the received Light LC Mode Set message

**Public Members**

uint8_t mode
The target value of the Light LC Mode state

**struct esp_ble_mesh_server_recv_light_lc_om_set_t**
Context of the received Light OM Set message

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state

**struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**
Context of the received Light LC Light OnOff Set message

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state
Chapter 2. API

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
Context of the received Sensor Status message

Public Members

struct net_buf_simple *data
Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
Lighting Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to Lighting Server Models

esp_ble_mesh_msg_ctx_t ctx
Context of the received messages

esp_ble_mesh_lighting_server_cb_value_t value
Value of the received Lighting Messages

Macros

ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI (cli_pub, cli_data)
Define a new Light Lightness Client Model.

Note This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

Return New Light Lightness Client Model instance.

Parameters
  • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
  • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
**ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI** (cli_pub, cli_data)

Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)

Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)

Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)

Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)

Lighting Server Models related context.

Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present. 1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model. 1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`. 
ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV (srv_pub, srv_data)
Define a new Light CTL Server Model.

**Note**
1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return**
New Light CTL Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV (srv_pub, srv_data)
Define a new Light CTL Setup Server Model.

**Note**
1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.
   1. This model shall support model subscription.

**Return**
New Light CTL Setup Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV (srv_pub, srv_data)
Define a new Light CTL Temperature Server Model.

**Note**
1. The Light CTL Temperature Server model extends the Generic Level Server model.
   1. This model shall support model publication and model subscription.

**Return**
New Light CTL Temperature Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV (srv_pub, srv_data)
Define a new Light HSL Server Model.

**Note**
1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

**Return**
New Light HSL Server Model instance.

**Parameters**
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

**Note**
1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.
   1. This model shall support model subscription.
Return New Light HSL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV** (srv_pub, srv_data)

Define a new Light HSL Hue Server Model.

**Note**
1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
2. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV** (srv_pub, srv_data)

Define a new Light HSL Saturation Server Model.

**Note**
1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.
2. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV** (srv_pub, srv_data)

Define a new Light xyL Server Model.

**Note**
1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.
2. This model shall support model publication and model subscription.

Return New Light xyL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light xyL Setup Server Model.

**Note**
1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
2. This model shall support model subscription.

Return New Light xyL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV** (srv_pub, srv_data)

Define a new Light LC Server Model.

**Note**
1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV** (srv_pub, srv_data)

Define a new Light LC Setup Server Model.
Chapter 2. API

**Note**

1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
2. This model shall support model publication and model subscription.
3. This model may be used to configure setup parameters for the Light LC Server model.

**Return**

New Light LC Setup Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Type Definitions**

```c
typedef void(*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.

Lighting Client Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

```c
typedef void(*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.

Lighting Server Model callback function type

**Parameters**

- **event**: Event type
- **param**: Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_light_client_cb_event_t
```

This enum value is the event of Lighting Client Model

**Values**:

- `ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_lc_state_t
```

This enum value is the Light LC State Machine states

**Values**:

- `ESP_BLE_MESH_LC_OFF`
- `ESP_BLE_MESH_LC_STANDBY`
- `ESP_BLE_MESH_LC_FADE_ON`
- `ESP_BLE_MESH_LC_RUN`
- `ESP_BLE_MESH_LC_FADE`
- `ESP_BLE_MESH_LC_PROLONG`
- `ESP_BLE_MESH_LC_FADE_STANDBY_AUTO`
- `ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL`
enum esp_ble_mesh_lighting_server_cb_event_t
   This enum value is the event of Lighting Server Model
   Values:

   ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
   1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
do the application layer when Lighting Get messages are received.
   2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
do the application layer when Lighting Set/Set Unack messages are received.

   ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
   When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Lighting Get messages are received.

   ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
   When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Lighting Set/Set Unack messages are received.

   ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
   When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Sensor Status message is received.

   ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP32 蓝牙架构(PDF)

Bluetooth API 的示例代码存放于 ESP-IDF bluetooth/bluedroid 示例目录下，请查看。

下面的示例给出了详细介绍:
   • GATT 客户端示例
   • GATT 服务端服务表格示例
   • GATT 服务端示例
   • GATT 客户端安全性示例
   • GATT 服务端安全性示例
   • GATT 客户端多连接示例

2.2 连网 API

2.2.1 Wi-Fi

Wi-Fi 库

概述 Wi-Fi 库支持配置及监控 ESP32 Wi-Fi 连网功能。

支持配置:
   • 基站模式（即 STA 模式或 Wi-Fi 客户端模式），此时 ESP32 连接到接入点 (AP)。
   • AP 模式（即 Soft-AP 模式或接入点模式），此时基站连接到 ESP32。
   • AP-STA 共存模式 (ESP32 既是接入点，同时又作为基站连接到另一个接入点)。
   • 上述模式的各种安全模式 (WPA, WPA2 及 WEP 等)。
   • 扫描接入点（包括手动扫描及被动扫描）。
   • 使用混杂模式监控 IEEE802.11 Wi-Fi 数据包。

应用示例 ESP-IDF 示例项目的 wifi 目录下包含以下应用程序:
   • Wi-Fi 示例代码；
   • 另外一个简单的应用程序 esp-idf-template，演示了如何将 ESP32 模组连接到 AP。
Chapter 2. API 参考

API 参考

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

**esp_err_t esp_wifi_init (const wifi_init_config_t *config)**
Init WiFi Alloc resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc, this WiFi also start WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called
**Attention** 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to init the config to default values, this can guarantee all the fields got correct value when more fields are added into wifi_init_config_t in future release. If you want to set your owner initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT, please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Return**
- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

**Parameters**
- config: pointer to WiFi init configuration structure; can point to a temporary variable.

**esp_err_t esp_wifi_deinit (void)**
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_mode (wifi_mode_t mode)**
Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code esp_err.h

**Parameters**
- mode: WiFi operating mode

**esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)**
Get current operating mode of WiFi.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] mode: store current WiFi mode

**esp_err_t esp_wifi_start (void)**
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API

- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_stop(void)`
Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_restore(void)`
Restore WiFi stack persistent settings to default values.
This function will reset settings made using the following APIs:
- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_connect(void)`
Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect(void)`
Disconnect the ESP32 WiFi station from the AP.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect(void)`
Currently this API is just an stub API.

Return
- ESP_OK: succeed
- others: fail

`esp_err_t esp_wifi_deauth_sta(uint16_t aid)`
deauthenticate all stations or associated id equals to aid
Chapter 2. API Reference

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

\[ \text{esp_err_t} \esp_wifi_scan_start( \text{const wifi_scan_config_t *} \text{config}, \text{bool} \ \text{block}) \]

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done.

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters
- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

\[ \text{esp_err_t} \esp_wifi_scan_stop( \text{void}) \]

Stop the scan in process.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

\[ \text{esp_err_t} \esp_wifi_scan_get_ap_num( \text{uint16_t *} \text{number}) \]

Get number of APs found in last scan.

Attention This API can only be called when the scan is completed, otherwise it may get wrong value.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- [inout] number: store number of APs found in last scan

\[ \text{esp_err_t} \esp_wifi_scan_get_ap_records( \text{uint16_t *} \text{number}, \text{wifi_ap_record_t *} \text{ap_records}) \]

Get AP list found in last scan.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

Parameters
- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
• **ap_records**: `wifi_ap_record_t` array to hold the found APs

```c
esp_err_t esp_wifi_sta_get_ap_info(wifi_ap_record_t *ap_info)
```

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**Parameters**

- `ap_info`: the `wifi_ap_record_t` to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1r in the `wifi_ap_record_t` struct.

  For example, phy_11b = 1 imply that ap support 802.11b mode.

```c
esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)
```

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**

- `type`: power save type

```c
esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)
```

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**

- `[out]` `type`: store current power save type

```c
esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
```

Set protocol type of specified interface. The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11N2|WIFI_PROTOCOL_11N3|WIFI_PROTOCOL_11N4).

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**

- `ifx`: interfaces
- `protocol_bitmap`: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t* protocol_bitmap)
```

Get the current protocol bitmap of the specified interface.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**

- `ifx`: interface
- `[out]` `protocol_bitmap`: store current WiFi protocol bitmap of interface ifx

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```

Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- `ifx`: interface to be configured
- `bw`: bandwidth

**esp_err_t esp_wifi_get_bandwidth** *(wifi_interface_t ifx, wifi_bandwidth_t *bw)*
Get the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `ifx`: interface to be configured
- `[out] bw`: store bandwidth of interface ifx

**esp_err_t esp_wifi_set_channel** *(uint8_t primary, wifi_second_chan_t second)*
Set primary/secondary channel of ESP32.

**Attention** 1. This API should be called after esp_wifi_start()
**Attention** 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
**Attention** 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
**Attention** 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `primary`: for HT20, primary is the channel number, for HT40, primary is the primary channel
- `second`: for HT20, second is ignored, for HT40, second is the second channel

**esp_err_t esp_wifi_get_channel** *(uint8_t *primary, wifi_second_chan_t *second)*
Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `primary`: store current primary channel
- `[out] second`: store current second channel

**esp_err_t esp_wifi_set_country** *(const wifi_country_t *country)*
configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.
**Attention** 2. The default country is CHINA { `.cc=”CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO` }
**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is { `.cc=”USA”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO` }
.nchan=11} and the country info of the AP to which the station is connected is 
{.cc=”JP”, .schan=1, .nchan=14} then the country info that will be used is 
{.cc=”JP”, .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, 
{.cc=”US”, .schan=1, .nchan=11} in the example.

Attention 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

Attention 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

Attention 6. The country configuration is stored into flash.

Attention 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: the configured country info

```c
esp_err_t esp_wifi_get_country (wifi_country_t *country)
```
get the current country info

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: country info

```c
esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])
```
Set MAC address of the ESP32 WiFi station or the soft-AP interface.

Attention 1. This API can only be called when the interface is disabled
Attention 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.
Attention 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

Parameters
- ifx: interface
- mac: the MAC address

```c
esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])
```
Get mac of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
- ifx: interface
- [out] mac: store mac of the interface ifx

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)
```
Register the RX callback function in the promiscuous mode.
Each time a packet is received, the registered callback function will be called.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- cb: callback

```c
esp_err_t esp_wifi_set_promiscuous (bool en)
```
Enable the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- en: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous (bool *en)
```
Get the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] en: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)
```
Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- filter: the packet type filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)
```
Get the promiscuous filter.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] filter: store the current status of promiscuous filter

```c
esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)
```
Enable subtype filter of the control packet in promiscuous mode.

**Note** The default filter is to filter none control packet.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- filter: the subtype of the control packet filtered in promiscuous mode.

```c
esp_err_t esp_wifi_get_promiscuous_ctrl_filter (wifi_promiscuous_filter_t *filter)
```
Get the subtype filter of the control packet in promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

• `[out]` filter: store the current status of subtype filter of the control packet in promiscuous mode

```c
esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```
Set the configuration of the ESP32 STA or AP.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail
**Attention** 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
**Attention** 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NV: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

**Parameters**
- `interface`: interface
- `conf`: station or soft-AP configuration

```c
esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)
```
Get configuration of specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- `interface`: interface
- `[out]` `conf`: station or soft-AP configuration

```c
esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)
```
Get STAs associated with soft-AP.

**Attention** SSC only API

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- `[out]` `sta`: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```
Get AID of STA connected with soft-AP.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- `[out]` `mac`: theSTA’s MAC address
- `*aid`: AID of STA connected with soft-AP

**Chapter 2. API**

- **mac**: STA’s mac address
- **[out] aid**: Store the AID corresponding to STA mac

### `esp_err_t esp_wifi_set_storage (wifi_storage_t storage)`

Set the WiFi API configuration storage type.

**Attention**
1. The default value is WIFI_STORAGE_FLASH

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **storage**: storage type

### `esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)`

Set 802.11 Vendor-Specific Information Element.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

**Parameters**
- **enable**: If true, specified IE is enabled. If false, specified IE is removed.
- **type**: Information Element type. Determines the frame type to associate with the IE.
- **idx**: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd_ie**: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

### `esp_err_t esp_wifi_set_vendor_ie_cb (esp_vendor_ie_cb_t cb, void *ctx)`

Register Vendor-Specific Information Element monitoring callback.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **cb**: Callback function
- **ctx**: Context argument, passed to callback function.

### `esp_err_t esp_wifi_set_max_tx_power (int8_t power)`

Set maximum transmitting power after WiFi start.

**Attention**
1. Maximum power before wifi startup is limited by PHY init data bin.
2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.
3. Mapping Table (Power, max_tx_power) = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

**Parameters**
- **power**: Maximum WiFi transmitting power.
**esp_err_t esp_wifi_get_max_tx_power (int8_t *power)**

Get maximum transmitting power after WiFi start.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

- **power**: Maximum WiFi transmitting power, unit is 0.25dBm.

**esp_err_t esp_wifi_set_event_mask (uint32_t mask)**

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**

- **mask**: WiFi event mask.

**esp_err_t esp_wifi_get_event_mask (uint32_t *mask)**

Get mask of WiFi events.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**

- **mask**: WiFi event mask.

**esp_err_t esp_wifi_80211_tx (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)**

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_WIFI_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

**Parameters**

- **ifx**: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer**: raw ieee80211 buffer
- **len**: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq**: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

**esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)**

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.
Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- cb: callback
- ctx: context argument, passed to callback function

`esp_err_t esp_wifi_set_csi_config(const wifi_csi_config_t *config)`
Set CSI data configuration.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- config: configuration

`esp_err_t esp_wifi_set_csi(bool en)`
Enable or disable CSI.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- en: true - enable, false - disable

`esp_err_t esp_wifi_set_ant_gpio(const wifi_ant_gpio_config_t *config)`
Set antenna GPIO configuration.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters
- config: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)`
Get current antenna GPIO configuration.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
- config: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`
Set antenna configuration.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
- config: Antenna configuration.
`esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)`
Get current antenna configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

**Parameters**
- config: Antenna configuration.

`int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)`
Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Return** 0 or the TSF time

**Parameters**
- interface: The interface whose tsf_time is to be retrieved.

`esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)`
Set the inactive time of the ESP32 STA or AP.

**Attention**  1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
3. The inactive time configuration is not stored into flash

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

**Parameters**
- ifx: interface to be configured.
- sec: Inactive time. Unit seconds.

`esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t *sec)`
Get inactive time of specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

`esp_err_t esp_wifi_statis_dump (uint32_t modules)`
Dump WiFi statistics.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- modules: statistic modules to be dumped

`esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)`
Set RSSI threshold below which APP will get an event.

**Attention** This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

**Return**
- ESP_OK: succeed
Chapter 2. API

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters
- rssi: threshold value in dbm between -100 to 0

```c
esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```
Start an FTM Initiator session by sending FTM request. If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

**Attention** Use this API only in Station mode

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- cfg: FTM Initiator session configuration

```c
esp_err_t esp_wifi_ftm_end_session(void)
```
End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Return**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)
```
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- offset_cm: T1 Offset to be added in centimeters

```c
esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)
```
Enable or disable 11b rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().
2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- disable: true means disable 11b rate while false means enable 11b rate.

```c
esp_err_t esp_wifi_config_espnow_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config ESPNOW rate of specified interface.

**Attention**
1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- ifx: Interface to be configured.
- rate: Phy rate to be configured.

```c
esp_err_t esp_wifi_set_connectionless_wake_interval(uint16_t interval)
```
Set interval for station to wake up periodically at disconnected.

**Attention**
1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
2. This configuration only work for station mode and disconnected status
### Chapter 2. API

#### Attention 3.** This configuration would influence nothing until some module configure `wake_window`**

#### Attention 4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**
- `interval`: how much microsecond would the chip wake up, from 1 to 65535.

```c
esp_err_t esp_wifi_set_country_code(const char* country, bool ieee80211d_enabled)
```

configure country

**Attention 1.** When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used.

**E.g.** if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention 2.** When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention 3.** When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention 4.** The country configuration is stored into flash.

**Attention 5.** When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention 6.** Supported country codes are **01** (world safe mode) ```AT”,” AU”,” BE”,” BG”,” BR” , “CA”,” CH”,” CN”,” CY”,” CZ”,” DE”,” DK”,” EE”,” ES”,” FI”,” FR”,” GB” ,” GR”,” HK”,” HR”,” HU”,” “IE”,” IN”,” IS”,” IT”,” JP”,” KR”,” LI”,” LT”,” LU”,” LV”,” MT”,” MX”,” NL”,” NO”,” NZ”,” PL”,” PT”,” “RO”,”” SE”,”” SI”,” SK”,” TW”,” US”```.

**Attention 7.** When country code ```01``` (world safe mode) is set, SoftAP mode won’t contain country IE.

**Attention 8.** The default country is ```CN”``` and `ieee80211d_enabled` is TRUE.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `country`: the configured country ISO code
- `ieee80211d_enabled`: 802.11d is enabled or not

```c
esp_err_t esp_wifi_get_country_code(char* country)
```

get the current country code

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `country`: country code

```c
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config 80211 tx rate of specified interface.

**Attention 1.** This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- `ifx`: Interface to be configured.
- `rate`: Phy rate to be configured.

**Structures**

```c
struct wifi_init_config_t
```

WiFi stack configuration parameters passed to `esp_wifi_init` call.
**Public Members**

```c
system_event_handler_t event_handler
    WiFi event handler

wifi_osi_funcs_t *osi_funcs
    WiFi OS functions

wpa_crypto_funcs_t wpa_crypto_funcs
    WiFi station crypto functions when connect

int static_rx_buf_num
    WiFi static RX buffer number

int dynamic_rx_buf_num
    WiFi dynamic RX buffer number

int tx_buf_type
    WiFi TX buffer type

int static_tx_buf_num
    WiFi static TX buffer number

int dynamic_tx_buf_num
    WiFi dynamic TX buffer number

int cache_tx_buf_num
    WiFi TX cache buffer number

int csi_enable
    WiFi channel state information enable flag

int ampdu_rx_enable
    WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
    WiFi AMPDU TX feature enable flag

int amsdru_tx_enable
    WiFi AMSDU TX feature enable flag

int nvs_enable
    WiFi NVS flash enable flag

int nano_enable
    Nano option for printf/scan family enable flag

int rx_ba_win
    WiFi Block Ack RX window size

int wifi_task_core_id
    WiFi Task Core ID

int beacon_max_len
    WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t feature_caps
    Enables additional WiFi features and capabilities

bool sta_disconnected_pm
    WiFi Power Management for station at disconnected status

int magic
    WiFi init magic number, it should be the last field
```
Chapter 2. API 参考

Macros

ESP_ERR_WIFI_NOT_INIT
WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
WiFi interface error

ESP_ERR_WIFI_MODE
WiFi mode error

ESP_ERR_WIFI_STATE
WiFi internal state error

ESP_ERR_WIFI_CONN
WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
WiFi internal NVS module error

ESP_ERR_WIFI_MAC
MAC address is invalid

ESP_ERR_WIFI_SSID
SSID is invalid

ESP_ERR_WIFI_PASSWORD
Password is invalid

ESP_ERR_WIFI_TIMEOUT
Timeout error

ESP_ERR_WIFI_WAKE_FAIL
WiFi is in sleep state (RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

Type Definitions

```c
typedef void(*wifi_promiscuous_cb_t)(void*buf, wifi_promiscuous_pkt_type_t type)
```

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Parameters**
- `buf`: Data received. Type of data in buffer (`wifi_promiscuous_pkt_t` or `wifi_pkt_rx_ctrl_t`) indicated by `type` parameter.
- `type`: promiscuous packet type.

```c
typedef void(*esp_vendor_ie_cb_t)(void*ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
                                 const vendor_ie_data_t*vnd_ie, int rssi)
```

Function signature for received Vendor-Specific Information Element callback.

**Parameters**
- `ctx`: context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.
- `type`: Information element type, based on frame type received.
- `sa`: Source 802.11 address.
- `vnd_ie`: Pointer to the vendor specific element data received.
- `rssi`: Received signal strength indication.

```c
typedef void(*wifi_csi_cb_t)(void*ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

**Parameters**
- `ctx`: context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.
- `data`: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- `components/esp_wifi/include/esp_wifi_types.h`
Unions
union wifi_config_t
#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

Structures

struct wifi_country_t
Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

wifi_country_policy_t policy
country policy

struct wifi_active_scan_time_t
Range of active scan times per channel.

Public Members

uint32_t min
minimum active scan time per channel, units: millisecond

uint32_t max
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t
Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t active
active scan time per channel, units: millisecond.

uint32_t passive
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.
struct wifi_scan_config_t
Parameters for an SSID scan.

**Public Members**

- uint8_t *ssid
  SSID of AP
- uint8_t *bssid
  MAC address of AP
- uint8_t channel
  channel, scan the specific channel
- bool show_hidden
  enable to scan AP whose SSID is hidden
- wifi_scan_type_t scan_type
  scan type, active or passive
- wifi_scan_time_t scan_time
  scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

**Public Members**

- uint8_t bssid[6]
  MAC address of AP
- uint8_t ssid[33]
  SSID of AP
- uint8_t primary
  channel of AP
- wifi_second_chan_t second
  secondary channel of AP
- int8_t rssi
  signal strength of AP
- wifi_auth_mode_t authmode
  authmode of AP
- wifi_cipher_type_t pairwise_cipher
  pairwise cipher of AP
- wifi_cipher_type_t group_cipher
  group cipher of AP
- wifi_ant_t ant
  antenna used to receive beacon from AP
- uint32_t phy_11b : 1
  bit: 0 flag to identify if 11b mode is enabled or not
- uint32_t phy_11g : 1
  bit: 1 flag to identify if 11g mode is enabled or not
- uint32_t phy_11n : 1
  bit: 2 flag to identify if 11n mode is enabled or not
- uint32_t phy_lr : 1
  bit: 3 flag to identify if low rate is enabled or not
uint32_t wps : 1
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder : 1
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator : 1
    bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved : 25
    bit: 7..31 reserved

`wifi_country_t` country
    country information of AP

`struct wifi_scan_threshold_t`
    Structure describing parameters for a WiFi fast scan.

**Public Members**

int8_t rssi
    The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t` authmode
    The weakest authmode to accept in the fast scan mode

`struct wifi_pmf_config_t`
    Configuration structure for Protected Management Frame

**Public Members**

bool capable
    Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if other device also advertizes PMF capability.

bool required
    Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

`struct wifi_ap_config_t`
    Soft-AP configuration settings for the ESP32.

**Public Members**

uint8_t ssid[32]
    SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t password[64]
    Password of ESP32 soft-AP.

uint8_t ssid_len
    Optional length of SSID field.

uint8_t channel
    Channel of ESP32 soft-AP

`wifi_auth_mode_t` authmode
    Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t ssid_hidden
    Broadcast SSID or not, default 0, broadcast the SSID
uint8_t max_connection
Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

wifi_cipher_type_t pairwise_cipher
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool ftm_responder
Enable FTM Responder mode

struct wifi_sta_config_t
STA configuration settings for the ESP32.

Public Members

uint8_t ssid[32]
SSID of target AP.

uint8_t password[64]
Password of target AP.

wifi_scan_method_t scan_method
do all channel scan or fast scan

bool bssid_set
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]
MAC address of target AP

uint8_t channel
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Default to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rss or security mode

wifi_scan_threshold_t threshold
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame. Will be advertized in RSN Capabilities in RSN IE.

uint32_t rm_enabled : 1
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled : 1
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled : 1
Whether MBO is enabled for the connection
uint32_t reserved: 29
Reserved for future feature set

struct wifi_sta_info_t
Description of STA associated with AP.

Public Members

uint8_t mac[6]
mac address

int8_t rssi
current average rssi of sta connected

uint32_t phy_11b: 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g: 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n: 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr: 1
bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child: 1
bit: 4 flag to identify mesh child

uint32_t reserved: 27
bit: 5..31 reserved

struct wifi_sta_list_t
List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
station list

int num
number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
Vendor identifier (OUI).

uint8_t vendor_oui_type
Vendor-specific OUI type.

uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.
struct wifi_pkt_rx_ctrl_t

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

signed rssi : 8
  Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned rate : 5
  PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__ : 1
  reserved

unsigned sig_mode : 2
  0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__ : 16
  reserved

unsigned mcs : 7
  Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)

unsigned cw : 1
  Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__ : 16
  reserved

unsigned smoothing : 1
  reserved

unsigned not_sounding : 1
  reserved

unsigned __pad3__ : 1
  reserved

unsigned aggregation : 1
  Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc : 2
  Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding : 1
  Flag is set for 11n packets which are LDPC

unsigned sgi : 1
  Short Guide Interval(SGI). 0: Long GI; 1: Short GI

signed noise_floor : 8
  Noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned ampdu_cnt : 8
  ampdu cnt

unsigned channel : 4
  primary channel on which this packet is received

unsigned secondary_channel : 4
  secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad4__ : 8
  reserved
unsigned **timestamp** : 32
  
  timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **__pad5__** : 32
  reserved

unsigned **__pad6__** : 32
  reserved

unsigned **ant** : 1
  
  antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **sig_len** : 12
  
  length of packet including Frame Check Sequence(FCS)

unsigned **__pad7__** : 12
  reserved

unsigned **rx_state** : 8
  
  state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**

Payload passed to “buf” parameter of promiscuous mode RX callback.

**Public Members**

**wifi_pkt_rx_ctrl_t** **rx_ctrl**
  
  metadata header

uint8_t **payload[0]**
  
  Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**

Mask for filtering different packet types in promiscuous mode.

**Public Members**

uint32_t **filter_mask**
  
  OR of one or more filter values WIFI_PROMIS_FILTER_*

**struct wifi_csi_config_t**

Channel state information(CSI) configuration type.

**Public Members**

bool **lltf_en**
  
  enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf_en**
  
  enable to receive HT long training field(htltf) data. Default enabled

bool **stbc_htltf2_en**
  
  enable to receive space time block code HT long training field(stbc-hltf2) data. Default enabled

bool **ltf_merge_en**
  
  enable to generate hltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool **channel_filter_en**
  
  enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled
bool manu_scale
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the
shift bits. false: automatically. true: manually. Default false

uint8_t shift
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
received packet radio metadata header of the CSI data

uint8_t mac[6]
source MAC address of the CSI data

bool first_word_invalid
first four bytes of the CSI data is invalid or not

int8_t *buf
buffer of CSI data

uint16_t len
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.

Public Members

uint8_t gpio_select : 1
Whether this GPIO is connected to external antenna switch

uint8_t gpio_num : 7
The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving

wifi_ant_mode_t rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode
is set to WIFI_ANT_MODE_AUTO
Chapter 2. API Reference

uint8_t enabled_ant0 : 4
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1 : 4
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
   Action Frame Tx Request.

**Public Members**

* wifi_interface_t ifx
  WiFi interface to send request to

* uint8_t dest_mac[6]
  Destination MAC address

* bool no_ack
  Indicates no ack required

* wifi_action_rx_cb_t rx_cb
  Rx Callback to receive any response

* uint32_t data_len
  Length of the appended Data

* uint8_t data[0]
  Appended Data payload

struct wifi_ftm_initiator_cfg_t
   FTM Initiator configuration.

**Public Members**

* uint8_t resp_mac[6]
  MAC address of the FTM Responder

* uint8_t channel
  Primary channel of the FTM Responder

* uint8_t frm_count
  No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

* uint16_t burst_period
  Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t
   Argument structure for WIFI_EVENT_SCAN_DONE event

**Public Members**

* uint32_t status
  status of scanning APs: 0 — success, 1 - failure

* uint8_t number
  number of scan results

* uint8_t scan_id
  scan sequence number, used for block scan

struct wifi_event_sta_connected_t
   Argument structure for WIFI_EVENT_STA_CONNECTED event

Espressif Systems

Submit Document Feedback
Public Members

- `uint8_t ssid[32]`  
  SSID of connected AP

- `uint8_t ssid_len`  
  SSID length of connected AP

- `uint8_t bssid[6]`  
  BSSID of connected AP

- `uint8_t channel`  
  Channel of connected AP

- `wifi_auth_mode_t authmode`  
  Authentication mode used by AP

`struct wifi_event_sta_disconnected_t`  
Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

- `uint8_t ssid[32]`  
  SSID of disconnected AP

- `uint8_t ssid_len`  
  SSID length of disconnected AP

- `uint8_t bssid[6]`  
  BSSID of disconnected AP

- `uint8_t reason`  
  Reason of disconnection

`struct wifi_event_sta_authmode_change_t`  
Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

- `wifi_auth_mode_t old_mode`  
  The old auth mode of AP

- `wifi_auth_mode_t new_mode`  
  The new auth mode of AP

`struct wifi_event_sta_wps_er_pin_t`  
Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

- `uint8_t pin_code[8]`  
  PIN code of station in enrollee mode

`struct wifi_event_sta_wps_er_success_t`  
Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

- `uint8_t ap_cred_cnt`  
  Number of AP credentials received
Chapter 2. API

```c
uint8_t ssid[MAX_SSID_LEN]
    SSID of AP
uint8_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
    All AP credentials received from WPS handshake

struct wifi_event_ap_stacconnected_t
    Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station connected to ESP32 soft-AP
uint8_t aid
    the aid that ESP32 soft-AP gives to the station connected to
bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
    Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
    MAC address of the station disconnects to ESP32 soft-AP
uint8_t aid
    the aid that ESP32 soft-AP gave to the station disconnects to
bool is_mesh_child
    flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
    Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
    Received probe request signal strength
uint8_t mac[6]
    MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
    Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
    RSSI value of bss

struct wifi_ftm_report_entry_t
    Argument structure for
```
Chapter 2. API 参考

**Public Members**

`uint8_t dlog_token`
Dialog Token of the FTM frame

`int8_t rssi`
RSSI of the FTM frame received

`uint32_t rtt`
Round Trip Time in pSec with a peer

`uint64_t t1`
Time of departure of FTM frame from FTM Responder in pSec

`uint64_t t2`
Time of arrival of FTM frame at FTM Initiator in pSec

`uint64_t t3`
Time of departure of ACK from FTM Initiator in pSec

`uint64_t t4`
Time of arrival of ACK at FTM Responder in pSec

**struct wifi_event_ftm_report_t**
Argument structure for WIFI_EVENT_FTM_REPORT event

**Public Members**

`uint8_t peer_mac[6]`
MAC address of the FTM Peer

`wifi_ftm_status_t status`
Status of the FTM operation

`uint32_t rtt_raw`
Raw average Round-Trip-Time with peer in Nano-Seconds

`uint32_t rtt_est`
Estimated Round-Trip-Time with peer in Nano-Seconds

`uint32_t dist_est`
Estimated one-way distance in Centi-Meters

`wifi_ftm_report_entry_t *ftm_report_data`
Pointer to FTM Report with multiple entries, should be freed after use

`uint8_t ftm_report_num_entries`
Number of entries in the FTM Report data

**struct wifi_event_action_tx_status_t**
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

**Public Members**

`wifi_interface_t ifx`
WiFi interface to send request to

`uint32_t context`
Context to identify the request

`uint8_t da[6]`
Destination MAC address

`uint8_t status`
Status of the operation
\textbf{struct wifi_event_roc_done_t}

Argument structure for WIFI_EVENT_ROC_DONE event

\textbf{Public Members}

\begin{verbatim}
uint32_t context
    Context to identify the request
\end{verbatim}

\textbf{Macros}

\begin{verbatim}
WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
    max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
    filter all packets
WIFI_PROMIS_FILTER_MASK_MGMT
    filter the packets with type of WIFI_PKT_MGMT
WIFI_PROMIS_FILTER_MASK_CTRL
    filter the packets with type of WIFI_PKT_CTRL
WIFI_PROMIS_FILTER_MASK_DATA
    filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
    filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
    filter the MPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
    filter the AMPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_FCSFAIL
    filter the FCS failed packets, do not open it in general
WIFI_PROMIS_CTRL_FILTER_MASK_ALL
    filter all control packets
WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
    filter the control packets with subtype of Control Wrapper
WIFI_PROMIS_CTRL_FILTER_MASK_BAR
    filter the control packets with subtype of Block Ack Request
WIFI_PROMIS_CTRLFILTER_MASK_BA
    filter the control packets with subtype of Block Ack
WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
    filter the control packets with subtype of PS-Poll
\end{verbatim}
WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
mask all WiFi events

WIFI_EVENT_MASK_NONE
mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN

MAX_PASSPHRASE_LEN

MAX_WPS_AP_CRED

WIFI_STATIS_BUFFER

WIFI_STATIS_RXTX

WIFI_STATIS_HW

WIFI_STATIS_PS

WIFI_STATIS_ALL

Type Definitions

typedef int (*wifi_action_rx_cb_t) (uint8_t *hdr, uint8_t* payload, size_t len, uint8_t channel)
The Rx callback function of Action Tx operations.

Parameters
• hdr: pointer to the IEEE 802.11 Header structure
• payload: pointer to the Payload following 802.11 Header
• len: length of the Payload
• channel: channel number the frame is received on

Enumerations
enum wifi_mode_t
    Values:
    
    WIFI_MODE_NULL = 0
null mode

    WIFI_MODE_STA
WiFi station mode

    WIFI_MODE_AP
WiFi soft-AP mode

    WIFI_MODE_APSTA
WiFi station + soft-AP mode
WIFI_MODE_MAX

enum wifi_interface_t
Values:

WIFI_IF_STA = ESP_IF_WIFI_STA
WIFI_IF_AP = ESP_IF_WIFI_AP

enum wifi_country_policy_t
Values:

WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
Values:

WIFI_AUTH_OPEN = 0
authenticate mode: open

WIFI_AUTH_WEP
authenticate mode: WEP

WIFI_AUTH_WPA_PSK
authenticate mode: WPA_PSK

WIFI_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
authenticate mode: WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode: WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode: WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode: WPA2_WPA3_PSK

WIFI_AUTH_WAPI_PSK
authenticate mode: WAPI_PSK

WIFI_AUTH_MAX

enum wifi_err_reason_t
Values:

WIFI_REASON_UNSPECIFIED = 1
WIFI_REASON_AUTH_EXPIRE = 2
WIFI_REASON_AUTH_LEAVE = 3
WIFI_REASON_ASSOC_EXPIRE = 4
WIFI_REASON_ASSOC_TOOMANY = 5

WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t
Values:
WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20
WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel
WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:
WIFI_SCAN_TYPE_ACTIVE = 0
active scan
WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:
WIFI_CIPHER_TYPE_NONE = 0
the cipher type is none
WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_SMS4
the cipher type is SMS4

WIFI_CIPHER_TYPE_GCMP
the cipher type is GCMP

WIFI_CIPHER_TYPE_GCMP256
the cipher type is GCMP-256

WIFI_CIPHER_TYPE_AES GMAC128
the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES GMAC256
the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.
Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

denum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

denum wifi_ps_type_t
Values:
WIFI_PS_NONE
No power save
WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period
WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
Values:
WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t
Values:
WIFI_STORAGE_FLASH
all configuration will store in both memory and flash
WIFI_STORAGE_RAM
all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:
WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:
WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:
WIFI_PKT_MGMT
Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.
enum wifi_ant_mode_t
WiFi antenna mode.

Values:

WIFI_ANT_MODE_ANT0
Enable WiFi antenna 0 only

WIFI_ANT_MODE_ANT1
Enable WiFi antenna 1 only

WIFI_ANT_MODE_AUTO
Enable WiFi antenna 0 and 1, automatically select an antenna

WIFI_ANT_MODE_MAX
Invalid WiFi enabled antenna

enum wifi_phy_rate_t
WiFi PHY rate encodings.

Values:

WIFI_PHY_RATE_1M_L = 0x00
1 Mbps with long preamble

WIFI_PHY_RATE_2M_L = 0x01
2 Mbps with long preamble

WIFI_PHY_RATE_5M_L = 0x02
5.5 Mbps with long preamble

WIFI_PHY_RATE_11M_L = 0x03
11 Mbps with long preamble

WIFI_PHY_RATE_2M_S = 0x05
2 Mbps with short preamble

WIFI_PHY_RATE_5M_S = 0x06
5.5 Mbps with short preamble

WIFI_PHY_RATE_11M_S = 0x07
11 Mbps with short preamble

WIFI_PHY_RATE_48M = 0x08
48 Mbps

WIFI_PHY_RATE_24M = 0x09
24 Mbps

WIFI_PHY_RATE_12M = 0x0A
12 Mbps

WIFI_PHY_RATE_6M = 0x0B
6 Mbps

WIFI_PHY_RATE_54M = 0x0C
54 Mbps

WIFI_PHY_RATE_36M = 0x0D
36 Mbps

WIFI_PHY_RATE_18M = 0x0E
18 Mbps

WIFI_PHY_RATE_9M = 0x0F
9 Mbps

WIFI_PHY_RATE_MCS0_LGI = 0x10
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz
WIFI_PHY_RATE_MCS1_LGI = 0x11
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_LGI = 0x12
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_LGI = 0x13
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_LGI = 0x14
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_LGI = 0x15
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_LGI = 0x16
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_LGI = 0x17
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS0_SGI = 0x18
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_SGI = 0x19
MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_SGI = 0x1A
MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_SGI = 0x1B
MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_SGI = 0x1C
MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_SGI = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_SGI = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_SGI = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t
WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT_SCAN_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop
WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA_AUTHMODE_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX
enum wifi_ftm_status_t
    FTM operation status types.

Values:

FTM_STATUS_SUCCESS = 0
    FTM exchange is successful

FTM_STATUS_UNSUPPORTED
    Peer does not support FTM

FTM_STATUS_CONF_REJECTED
    Peer rejected FTM configuration in FTM Request

FTM_STATUS_NO_RESPONSE
    Peer did not respond to FTM Requests

FTM_STATUS_FAIL
    Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32 devices, check API.

Application Example   Connect ESP32 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

• components/esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
    Get the version of SmartConfig.

    Return
    • SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
    Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

    Attention 1. This API can be called in station or softAP-station mode.
    Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

    Return
    • ESP_OK: succeed
    • others: fail

    Parameters
    • config: pointer to smartconfig start configure structure

esp_err_t esp_smartconfig_stop (void)
    Stop SmartConfig, free the buffer taken by esp_smartconfig_start.
Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smart-config_start.

Return
• ESP_OK: succeed
• others: fail

calls esp_esptouch_set_timeout (uint8_t time_s)
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return
• ESP_OK: succeed
• others: fail

Parameters
• time_s: range 15s~255s, offset: 45s.

calls esp_smartconfig_set_type (smartconfig_type_t type)
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return
• ESP_OK: succeed
• others: fail

Parameters
• type: Choose from the smartconfig_type_t.

calls esp_smartconfig_fast_mode (bool enable)
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
• ESP_OK: succeed
• others: fail

Parameters
• enable: false-disable(default); true-enable;

calls esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)
Get reserved data of ESPTouch v2.

Return
• ESP_OK: succeed
• others: fail

Parameters
• rvd_data: reserved data
• len: length of reserved data

Structures

struct smartconfig_event_got_ssid_pswd_t
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t ssid[32]
SSID of the AP. Null terminated string.

uint8_t password[64]
Password of the AP. Null terminated string.

bool bssid_set
whether set MAC address of target AP or not.
Chapter 2. API 参考

uint8_t bssid[6]
MAC address of target AP.

smartconfig_type_t type
Type of smartconfig (ESPTouch or AirKiss).

uint8_t token
Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
IP address of cellphone.

struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start

**Public Members**

bool enable_log
Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
ESPTouch v2 crypt key, len should be 16.

**Macros**

SMARTCONFIG_START_CONFIG_DEFAULT()

**Enumerations**

defined smartconfig_type_t

Values:

SC_TYPE_ESPTOUCH = 0
protocol: ESPTouch

SC_TYPE_AIRKISS
protocol: AirKiss

SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

SC_TYPE_ESPTOUCH_V2
protocol: ESPTouch v2

defined smartconfig_event_t

Smartconfig event declarations

Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone
Chapter 2. API 参考

ESP-NOW

概述 ESP-NOW 是一种由乐鑫公司定义的无连接 Wi-Fi 通信协议。在 ESP-NOW 中，应用程序数据被封装在各个供应商的动作帧中，然后在网络连接的情况下，从一个 Wi-Fi 设备传输到另一个 Wi-Fi 设备。CTR 与 CBC-MAC 协议 (CCMP) 可用来保护动作帧的安全。ESP-NOW 广泛应用于智能照明、远程控制、传感器等领域。

帧格式 ESP-NOW 使用各个供应商的动作帧传输数据，默认比特率为 1 Mbps。各个供应商的动作帧格式为：

<table>
<thead>
<tr>
<th>MAC 报头</th>
<th>分类代码</th>
<th>组标识符</th>
<th>随机值</th>
<th>供应商特定内容</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 字节</td>
<td>1 字节</td>
<td>3 字节</td>
<td>4 字节</td>
<td>7-255 字节</td>
<td>4 字节</td>
</tr>
</tbody>
</table>

- 分类代码：分类代码字段可用于指示各个供应商的类别（比如 127）。
- 组标识符：组标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 随机值：防止重放攻击。
- 供应商特定内容：供应商特定内容包含供应商特定字段，如下所示：

<table>
<thead>
<tr>
<th>元素 ID</th>
<th>长度</th>
<th>组标识符</th>
<th>类型</th>
<th>版本</th>
<th>正文</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 字节</td>
<td>1 字节</td>
<td>3 字节</td>
<td>1 字节</td>
<td>1 字节</td>
<td>0 - 250 字节</td>
</tr>
</tbody>
</table>

- 元素 ID：元素 ID 字段可用于指示特定于供应商的元素。
- 长度：长度是组标识符、类型、版本和正文的总长度。
- 组标识符：组标识符包含一个唯一标识符（比如 0x18fe34），为乐鑫指定的 MAC 地址的前三个字节。
- 类型：类型字段设置为 4，代表 ESP-NOW。
- 版本：版本字段设置为 ESP-NOW 的版本。
- 正文：正文包含 ESP-NOW 数据。

由于 ESP-NOW 是无连接的，因此 MAC 报头与标准帧略有不同。FrameControl 字段的 FromDS 和 ToDS 位均为 0。第一个地址字段用于配置目标地址。第二个地址字段用于配置源地址。第三个地址字段用于配置广播地址 (0xff:0xff:0xff:0xff:0xff:0xff)。

安全 ESP-NOW 采用 CCMP 方法保护供应商特定动作帧的安全，具体可参考 IEEE Std. 802.11-2012。Wi-Fi 设备维护一个初始 PMK，用于传输 ESP-NOW 数据。PMK 可使用 AES-128 算法加密 LMK。请注意，ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 esp_now_deinit() 时，配对设备的所有信息都将被删除。

初始化和反初始化 调用 esp_now_init() 初始化 ESP-NOW。调用 esp_now_deinit() 反初始化 ESP-NOW。ESP-NOW 数据必须在 Wi-Fi 启动后传输，因此建议在初始化 ESP-NOW 之前启动 Wi-Fi，并在反初始化 ESP-NOW 之后停止 Wi-Fi。当调用 esp_now_deinit() 时，配对设备的所有信息都将被删除。

Espressif Systems 559 Release v5.0-dev-489-gef98a36
Submit Document Feedback
Chapter 2. API

**Header File**
- components/esp_wifi/include/esp_now.h

**Functions**

```c
esp_err_t esp_now_init ( void )
// Initialize ESPNOW function.

esp_err_t esp_now_deinit ( void )
// De-initialize ESPNOW function.

esp_err_t esp_now_get_version ( uint32_t *version )
// Get the version of ESPNOW.

esp_err_t esp_now_register_recv_cb ( esp_now_recv_cb_t cb )
// Register callback function of receiving ESPNOW data.
```

**API 参考**

**发送 ESP-NOW 数据** 调用 `esp_now_send()` 发送 ESP-NOW 数据，调用 `esp_now_register_send_cb` 注册发送回调函数。如果 MAC 层成功接收到数据，则该函数将返回 `ESP_NOW_SEND_SUCCESS` 事件。否则，它将返回 `ESP_NOW_SEND_FAIL`。ESP-NOW 数据发送失败可能有几种原因，比如目标设备不存在、设备的信道不相同、动作在传输过程中丢失等。应用层并不一定可以总能接收到数据。如果需要，应用层可在接收 ESP-NOW 数据时发回一个应答 (ACK) 数据。如果接收 ACK 数据超时，则将重新传输 ESP-NOW 数据。可以为 ESP-NOW 数据设置序列号，从而删除重复的数据。

如果有大量 ESP-NOW 数据要发送，则调用 `esp_now_send()` 一次性发送不大于 250 字节的数据。请注意，两个 ESP-NOW 数据包的发送间隔太短可能导致回调函数被调用。“乱” 因此，建议在等到上一次回调函数返回 ACK 后再发送下一个 ESP-NOW 数据。发送回调函数从高优先级的 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据存储到队列，并交给优先级较低的任务处理。

**接收 ESP-NOW 数据** 调用 `esp_now_register_recv_cb` 注册接收回调函数。当接收 ESP-NOW 数据时，需要调用接收回调函数。接收回调函数也在 Wi-Fi 任务中运行。因此，不要在回调函数中执行冗长的操作。相反，将必要的数据存储到队列，并交给优先级较低的任务处理。

```c
Submit Document Feedback
```
Chapter 2. API

- cb: callback function of receiving ESPNOW data

```c
esp_err_t esp_now_unregister_recv_cb (void)
```
Unregister callback function of receiving ESPNOW data.

- esp_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
```
Register callback function of sending ESPNOW data.

- esp_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

- cb: callback function of sending ESPNOW data

```c
esp_err_t esp_now_unregister_send_cb (void)
```
Unregister callback function of sending ESPNOW data.

- esp_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t* peer_addr, const uint8_t* data, size_t len)
```
Send ESPNOW data.

- Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
- Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
- Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
- Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

- peer_addr: peer MAC address
- data: data to send
- len: length of data

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)
```
Add a peer to peer list.

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

- peer: peer information

```c
esp_err_t esp_now_del_peer (const uint8_t* peer_addr)
```
Delete a peer from peer list.

- ESP_OK : succeed

---

Submit Document Feedback

Espressif Systems 561 Release v5.0-dev-489-gef98a36
Chapter 2. API Reference

- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
- peer_addr: peer MAC address

`esp_err_t esp_now_mod_peer(const esp_now_peer_info_t *peer)`
Modify a peer.

Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_FULL: peer list is full

Parameters
- peer: peer information

`esp_err_t esp_now_get_peer(const uint8_t *peer_addr, esp_now_peer_info_t *peer)`
Get a peer whose MAC address matches `peer_addr` from peer list.

Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
- peer_addr: peer MAC address
- peer: peer information

`esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t *peer)`
Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
- from_head: fetch from head of list or not
- peer: peer information

`bool esp_now_is_peer_exist(const uint8_t *peer_addr)`
Peer exists or not.

Return
- true: peer exists
- false: peer not exists

Parameters
- peer_addr: peer MAC address

`esp_err_t esp_now_get_peer_num(esp_now_peer_num_t *num)`
Get the number of peers.

Return
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

Parameters
- num: number of peers

`esp_err_t esp_now_set_pmk(const uint8_t *pmk)`
Set the primary master key.
Attention 1. primary master key is used to encrypt local master key

Return
  • ESP_OK : succeed
  • ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
  • ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
  • pmk: primary master key

`esp_err_t esp_now_set_wake_window(uint16_t window)`
Set esp_now wake window for sta_disconnected power management.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
Attention 2. This configuration only work for station mode and disconnected status
Attention 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked
Attention 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time
Attention 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

Return
  • ESP_OK : succeed
  • ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

Parameters
  • window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

Structures

`struct esp_now_peer_info`
ESPNOW peer information parameters.

Public Members

- `uint8_t peer_addr[ESP_NOW_ETH_ALEN]`
  ESPNOW peer MAC address that is also the MAC address of station or softap
- `uint8_t lmk[ESP_NOW_KEY_LEN]`
  ESPNOW peer local master key that is used to encrypt data
- `uint8_t channel`
  Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.
- `wifi_interface_t ifidx`
  Wi-Fi interface that peer uses to send/receive ESPNOW data
- `bool encrypt`
  ESPNOW data that this peer sends/receives is encrypted or not
- `void *priv`
  ESPNOW peer private data

`struct esp_now_peer_num`
Number of ESPNOW peers which exist currently.

Public Members

- `int total_num`
  Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM
- `int encrypt_num`
  Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM
### Macros

**ESP_ERR_ESPNOW_BASE**
- ESPNOW error number base.

**ESP_ERR_ESPNOW_NOT_INIT**
- ESPNOW is not initialized.

**ESP_ERR_ESPNOW_ARG**
- Invalid argument

**ESP_ERR_ESPNOW_NO_MEM**
- Out of memory

**ESP_ERR_ESPNOW_FULL**
- ESPNOW peer list is full

**ESP_ERR_ESPNOW_NOT_FOUND**
- ESPNOW peer is not found

**ESP_ERR_ESPNOW_INTERNAL**
- Internal error

**ESP_ERR_ESPNOW_EXIST**
- ESPNOW peer has existed

**ESP_ERR_ESPNOW_IF**
- Interface error

**ESP_NOW_ETH_ALEN**
- Length of ESPNOW peer MAC address

**ESP_NOW_KEY_LEN**
- Length of ESPNOW peer local master key

**ESP_NOW_MAX_TOTAL_PEER_NUM**
- Maximum number of ESPNOW total peers

**ESP_NOW_MAX_ENCRYPT_PEER_NUM**
- Maximum number of ESPNOW encrypted peers

**ESP_NOW_MAX_DATA_LEN**
- Maximum length of ESPNOW data which is sent very time

### Type Definitions

```c
typedef struct esp_now_peer_info esp_now_peer_info_t
    ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
    Number of ESPNOW peers which exist currently.

typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
    Callback function of receiving ESPNOW data.

    Parameters
    • mac_addr: peer MAC address
    • data: received data
    • data_len: length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
    Callback function of sending ESPNOW data.

    Parameters
    • mac_addr: peer MAC address
    • status: status of sending ESPNOW data (succeed or fail)
```
Enumerations

```c
enum esp_now_send_status_t
{
    ESP_NOW_SEND_SUCCESS = 0,
    ESP_NOW_SEND_FAIL,
};
```

**Values:**

- `ESP_NOW_SEND_SUCCESS`: Send ESPNOW data successfully
- `ESP_NOW_SEND_FAIL`: Send ESPNOW data fail

**ESP-WIFI-MESH 編程指南**

这是 ESP-WIFI-MESH 的编程指南，包括 API 参考和编码示例。本指南分为以下部分:

1. ESP-WIFI-MESH 編程模型
2. 编写 ESP-WIFI-MESH 应用程序
3. 自组网
4. 应用实例

有关 ESP-WIFI-MESH 协议的文档，请见 ESP-WIFI-MESH API 指南。有关 ESP-WIFI-MESH 开发框架的更多内容，请见 ESP-WIFI-MESH 开发框架。

**ESP-WIFI-MESH 編程模型**

ESP-WIFI-MESH 软件栈基于 Wi-Fi 驱动程序和 FreeRTOS 构建，某些情况下（如根节点）也会使用 LwIP 软件栈。下图展示了 ESP-WIFI-MESH 软件栈。

![ESP-WIFI-MESH 软件栈](image)

图 2: ESP-WIFI-MESH 软件栈

**系统事件** 应用程序可通过 ESP-WIFI-MESH 事件与 ESP-WIFI-MESH 交互。由于 ESP-WIFI-MESH 构建在 Wi-Fi 软件栈之上，因此也可以通过 Wi-Fi 事件任务与 Wi-Fi 驱动程序进行交互。下图展示了 ESP-WIFI-MESH 应用程序中各种系统事件的接口。

`mesh_event_id_t` 定义了所有可能的 ESP-WIFI-MESH 事件，并且可以指示父节点和子节点的连接或断开等事件。应用程序如需使用 ESP-WIFI-MESH 事件，则必须通过 `esp_event_handler_register()` 将 Mesh 事件处理程序注册在默认事件任务中。注册完成后，ESP-WIFI-MESH 事件将包含与应用程序所有相关事件相关的处理程序。

Mesh 事件的典型应用场景包括：使用 `MESH_EVENT_PARENT_CONNECTED` 和 `MESH_EVENT_CHILD_CONNECTED` 事件来指示节点何时可以分别开始传输上行和下行的数据。
同样，也可以使用 IP_EVENT_STA_GOT_IP 和 IP_EVENT_STA_LOST_IP 事件来指示根节点何时可以向外部 IP 网络传输数据。

警告：在自组网模式下使用 ESP-WIFI-MESH 时，用户必须确保不得调用 Wi-Fi API。原因在于：自组网模式将内部调用 Wi-Fi API 实现连接/断开/扫描等操作。此时，如果外部应用程序调用 Wi-Fi API（包括来自回调函数和 Wi-Fi 事件处理程序的调用）都可能会干扰 ESP-WIFI-MESH 的自组网行为。因此，用户不应该在 esp_mesh_start() 和 esp_mesh_stop() 之间调用 Wi-Fi API。

LwIP & ESP-WIFI-MESH 应用程序无需通过 LwIP 层便可直接访问 ESP-WIFI-MESH 软件栈。LwIP 层仅在根节点和外部 IP 网络的数据发送与接收时会用到。但是，由于每个节点都有可能成为根节点（由于自动根节点选择机制的存在），每个节点仍必须初始化 LwIP 软件栈。

每个节点都需要通过调用 tcpip_adapter_init() 初始化 LwIP 软件栈。为了防止非根节点访问 LwIP，应用程序应该在 LwIP 初始化完成后停止以下服务：

- SoftAP 接口上的 DHCP 服务器服务。
- Station 接口上的 DHCP 客户端服务。

下方代码片段展示如何为 ESP-WIFI-MESH 应用程序进行 LwIP 初始化。

```c
/* tcpip 初始化 */
tcpip_adapter_init();
/*
* 对于 MESH
* 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
* 默认情况下，在 Station 接口上停止 DHCP 客户端
*/
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

注解：ESP-WIFI-MESH 的根节点必须与路由器连接。因此，当一个节点成为根节点时，该节点对应的处理程序必须启动 DHCP 客户端服务并立即获取 IP 地址。这样做将允许其他节点开始向/从外部 IP 网络发送/接收数据包。但是，如果使用静态 IP 设置，则不需要执行此步骤。

编写 ESP-WIFI-MESH 应用程序 ESP-WIFI-MESH 在正常启动前必须先初始化 LwIP 和 Wi-Fi 软件栈。下方代码展示了 ESP-WIFI-MESH 在开始自身初始化前必须完成的步骤。

```c
tcpip_adapter_init();
/*
* 对于 MESH
* 默认情况下，在 SoftAP 接口上停止 DHCP 服务器
*/
```
在完成 LwIP 和 Wi-Fi 的初始化后，需完成以下三个步骤以启动并运行 ESP-WIFI-MESH。

1. 初始化 Mesh
2. 配置 ESP-WIFI-MESH 网络
3. 启动 Mesh

初始化 Mesh 下方代码片段展示如何初始化 ESP-WIFI-MESH。

```c
/* Mesh 初始化 */
ESP_ERROR_CHECK(esp_mesh_init());
/* 注册 mesh 事件处理程序 */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_,
    event_handler, NULL));
```

配置 ESP-WIFI-MESH 网络 ESP-WIFI-MESH 可通过 `esp_mesh_set_config()` 进行配置，并使用 `mesh_cfg_t` 结构体传递参数。该结构体包含以下 ESP-WIFI-MESH 的配置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel (信道)</td>
<td>1 到 14 信道</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ESP-WIFI-MESH 网络的 ID，见 <code>mesh_addr_t</code>。</td>
</tr>
<tr>
<td>Router (路由器)</td>
<td>路由器配置，见 <code>mesh_router_t</code>。</td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP 配置，见 <code>mesh_ap_cfg_t</code>。</td>
</tr>
<tr>
<td>Crypto Functions (加密函数)</td>
<td>Mesh IE 的加密函数，见 <code>mesh_crypto_funcs_t</code>。</td>
</tr>
</tbody>
</table>

下方代码片段展示如何配置 ESP-WIFI-MESH。

```c
/* 默认启用 MESH IE 加密 */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* 随机值与路由器信道匹配 */
cfg.channel = CONFIG_MESH_CHANNEL;
/* 路由器 */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* Mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, 
```
启动 Mesh

启动 ESP-WIFI-MESH 后，应用程序应检查 ESP-WIFI-MESH 事件，以确定它是何时连接到网络的。连接后，应用程序可使用 esp_mesh_send() 和 esp_mesh_recv() 在 ESP-WIFI-MESH 网络中发送、接收数据包。

自组网

自组网是 ESP-WIFI-MESH 的功能之一，允许节点自动扫描/选择/连接/重新连接到其他节点和路由器。此功能允许 ESP-WIFI-MESH 网络具有很高的自主性，可适应变化的动态网络拓扑结构和环境。启用自组网功能后，ESP-WIFI-MESH 网络中的节点能够自主完成以下操作:

- 选择或选举根节点（见建立网络中的自动根节点选择）
- 选择首选的父节点（见建立网络中的父节点选择）
- 网络断开时自动重新连接（见管理网络中的中间父节点失败）

启用自组网功能后，ESP-WIFI-MESH 软件栈将内部调用 Wi-Fi API。因此，在启用自组网功能时，应用层不得调用 Wi-Fi API，否则会干扰 ESP-WIFI-MESH 的工作。

开关自组网

应用程序可以在运行时通过调用 esp_mesh_set_self_organized() 函数，启用或禁用自组网功能。该函数具有以下两个参数:

- bool enable 指定启用或禁用自组网功能。
- bool select_parent 指定在启用自组网功能时是否应选择新的父节点。根据节点类型和节点当前状态，选择新的父节点具有不同的作用。在禁用自组网功能时，此参数不使用。

禁用自组网

ESP-WIFI-MESH 将在禁用自组网时尝试维护节点的当前 Wi-Fi 状态。

- 如果节点先前已连接到其他节点，则保持连接。
- 如果节点先前已断开连接并且正在扫描父节点或路由器，则将停止扫描。
- 如果节点以前尝试重新连接到父节点或路由器，则将停止重新连接。

启用自组网

ESP-WIFI-MESH 将尝试在启用自组网时保持节点的当前 Wi-Fi 状态。但是，根据节点类型以及是否选择了新的父节点，节点的 Wi-Fi 状态可能会发生变化。下表显示了启用自组网的效果。

<table>
<thead>
<tr>
<th>是否选择父节点</th>
<th>是否为根节点</th>
<th>作用</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>N</td>
<td>已连接到父节点的节点将保持连接。之前扫描父节点的节点将停止扫描。调用 esp_mesh_connect() 重新启动。</td>
</tr>
<tr>
<td>Y</td>
<td>N</td>
<td>已连接到路由器的根节点将保持连接。从路由器断开的根节点需调用 esp_mesh_connect() 进行重连。</td>
</tr>
<tr>
<td>Y</td>
<td>Y</td>
<td>没有父节点的节点将自动选择首选父节点并连接。已连接到父节点的节点将断开连接，重新选择首选父节点并进行重连。</td>
</tr>
<tr>
<td></td>
<td>Y</td>
<td>根节点在连接至父节点前必须放弃“根节点”的角色。因此，根节点将断开与路由器和所有子节点的连接，选择首选父节点并进行连接。</td>
</tr>
</tbody>
</table>

下方代码片段展示了如何启用自组网功能。
// 启用自组网，并选择一个新的父节点
esp_mesh_set_self_organized(true, true);

...  

// 启用自组网并手动重新连接
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();

// 使用 Wi-Fi API，在有些情况下，应用程序可能希望在使用 ESP-WIFI-MESH 期间调用 Wi-Fi API。例如，
// 应用程序可能需要手动扫描邻近的接入点 (AP)。但在应用程序调用任何 Wi-Fi API 之前，必须先禁用自
// 组网。否则，ESP-WIFI-MESH 软件栈可能会同时调用 Wi-Fi API，进而影响应用程序的正常调用。
// 应用程序不应在 esp_mesh_set_self_organized() 之间调用 Wi-Fi API。下面代码片段展示了应用程序如何在 ESP-WIFI-MESH 运行期间安全地调用 esp_wifi_scan_start()。

// 禁用自组网
esp_mesh_set_self_organized(0, 0);

// 停止任何正在进行的扫描
esp_wifi_scan_stop();
// 手动启动扫描后完成时自动停止
esp_wifi_scan_start();

// 进行扫描结果
...

// 如果为连接状态，则重新启用自组网
esp_mesh_set_self_organized(1, 0);

...

// 如果为根节点且未连接，则重新启用自组网
esp_mesh_set_self_organized(1, 1);

...

// 如果为根节点且未连接，则重新启用
esp_mesh_set_self_organized(1, 0);  // 不选择新的父节点
esp_mesh_connect();  // 手动重新连接到路由器

应用实例 ESP-IDF 包含以下 ESP-WIFI-MESH 示例项目:
内部通信示例 展示了如何搭建 ESP-WIFI-MESH 网络，并让根节点向网络中的每个节点发送数据包。
手动连网示例 展示了如何禁用自组网功能的网络使用 ESP-WIFI-MESH。此示例展示了如何对节点
进行编程，以手动扫描潜在父节点的列表，并根据自定义标准选择父节点。

API 参考

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

esp_err_t esp_mesh_init (void)
Mesh initialization.
Check whether Wi-Fi is started.
Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Return**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_deinit(void)
```

Mesh de-initialization.

- Release resources and stop the mesh

**Return**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_start(void)
```

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR.Mesh.NOT_INIT
- ESP_ERR_MESH.NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

```c
esp_err_t esp_mesh_stop(void)
```

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)
```

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
**Chapter 2. API**

- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

**Parameters**

- **[in]** to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **[in]** data: pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **[in]** flag: bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root ( “to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **[in]** opt: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **[in]** opt_count: option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**esp_err_t esp_mesh_send_block_time (uint32_t time_ms)**

Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK

**Parameters**

- **[in]** time_ms: blocking time of esp_mesh_send(), unit:ms

**esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)**

Receive a packet targeted to self over the mesh network.

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.
• Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD

Parameters
• **[out]** from: the address of the original source of the packet
• **[out]** data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• **[in]** timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• **[out]** flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

---

Use esp_mesh_recv_toDS() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters
• **[out]** from: the address of the original source of the packet
• **[out]** to: the address contains remote IP address and port (IPv4:PORT)
• **[out]** data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• **[in]** timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• **[out]** flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
Parameters
- \([\text{out}]\) \text{opt}\): options desired to receive
- \([\text{in}]\) \text{opt\_count}\): option count desired to receive

\text{esp\_err\_t} \text{esp\_mesh\_set\_config} (\text{const mesh\_cfg\_t *} \text{config})

Set mesh stack configuration.

- Use \text{MESH\_INIT\_CONFIG\_DEFAULT()} to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

\textbf{Attention} This API shall be called before mesh is started after mesh is initialized.

Return
- \text{ESP\_OK}
- \text{ESP\_ERR\_MESH\_ARGUMENT}
- \text{ESP\_ERR\_MESH\_NOT\_ALLOWED}

Parameters
- \([\text{in}]\) \text{config}\): pointer to mesh stack configuration

\text{esp\_err\_t} \text{esp\_mesh\_get\_config} (\text{mesh\_cfg\_t *} \text{config})

Get mesh stack configuration.

Return
- \text{ESP\_OK}
- \text{ESP\_ERR\_MESH\_ARGUMENT}

Parameters
- \([\text{out}]\) \text{config}\): pointer to mesh stack configuration

\text{esp\_err\_t} \text{esp\_mesh\_set\_router} (\text{const mesh\_router\_t *} \text{router})

Get router configuration.

\textbf{Attention} This API is used to dynamically modify the router configuration after mesh is configured.

Return
- \text{ESP\_OK}
- \text{ESP\_ERR\_MESH\_ARGUMENT}

Parameters
- \([\text{in}]\) \text{router}\): pointer to router configuration

\text{esp\_err\_t} \text{esp\_mesh\_get\_router} (\text{mesh\_router\_t *} \text{router})

Get router configuration.

Return
- \text{ESP\_OK}
- \text{ESP\_ERR\_MESH\_ARGUMENT}

Parameters
- \([\text{out}]\) \text{router}\): pointer to router configuration

\text{esp\_err\_t} \text{esp\_mesh\_set\_id} (\text{const mesh\_addr\_t *} \text{id})

Set mesh network ID.

\textbf{Attention} This API is used to dynamically modify the mesh network ID.
Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT: invalid argument

Parameters
• [in] id: pointer to mesh network ID

\texttt{esp_err_t esp_mesh_get_id(mesh_addr_t *id)}
Get mesh network ID.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] id: pointer to mesh network ID

\texttt{esp_err_t esp_mesh_set_type(mesh_type_t type)}
Designate device type over the mesh network.

• MESH_IDLE: designates a device as a self-organized node for a mesh network
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
• MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] type: device type

\texttt{mesh_type_t esp_mesh_get_type(void)}
Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return mesh type

\texttt{esp_err_t esp_mesh_set_max_layer(int max_layer)}
Set network max layer value.

• for tree topology, the max is 25.
• for chain topology, the max is 1000.
• Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] max_layer: max layer value

\texttt{int esp_mesh_get_max_layer(void)}
Get max layer value.

Return max layer value

\texttt{esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)}
Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
Chapter 2. API 参考

- [in] pwd: pointer to the password
- [in] len: password length

**esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)**
Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] authmode: authentication mode

**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**
Get mesh softAP authentication mode.

**Return** authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] connections: the number of max connections

**int esp_mesh_get_ap_connections (void)**
Get mesh max connection configuration.

**Return** the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**
Get non-mesh max connection configuration.

**Return** the number of non-mesh max connections

**int esp_mesh_get_layer (void)**
Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**
Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [out] bssid: pointer to parent BSSID

**bool esp_mesh_is_root (void)**
Return whether the device is the root node of the network.

**Return** true/false

**esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)**
Enable/disable self-organized networking.
Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.

Self-organized networking is enabled by default.

If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] enable: enable or disable self-organized networking
- [in] select_parent: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

A device is elected root primarily based on RSSI from the external router.

If external router conditions change, users can call this API to perform a root switch.

In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.

If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.

After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

Parameters
- [in] vote: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)

During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage (void)
Get vote percentage threshold for approval of being a root.
Chapter 2. API

Return percentage threshold

**esp_err_t esp_mesh_set_ap_assoc_expire** (int seconds)
Set mesh softAP associate expired time (default: 10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] seconds: the expired time

**int esp_mesh_get_ap_assoc_expire** (void)
Get mesh softAP associate expired time.

Return seconds

**int esp_mesh_get_total_node_num** (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Return total number of devices (including the root)

**int esp_mesh_get_routing_table_size** (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

**esp_err_t esp_mesh_get_routing_table** (mesh_addr_t *mac, int len, int *size)
Get routing table of this device’s sub-network (including itself)

Return
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

Parameters
- [out] mac: pointer to routing table
- [in] len: routing table size (in bytes)
- [out] size: pointer to the number of devices in routing table (including itself)

**esp_err_t esp_mesh_post_toDS_state** (bool reachable)
Post the toDS state to the mesh stack.

Attention This API is only for the root.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] reachable: this state represents whether the root is able to access external IP network

**esp_err_t esp_mesh_get_tx_pending** (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [out] pending: pointer to the TX pending

**esp_err_t esp_mesh_get_rx_pending** (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
- ESP_OK
- ESP_FAIL
Parameters
• [out] pending: pointer to the RX pending

int esp_mesh_available_txupQ_num(const mesh_addr_t *addr, uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.
Parameters
• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize(int qsize)
Set the number of queue.
Attention This API shall be called before mesh is started.
Return
• ESP_OK
• ESP_FAIL
Parameters
• [in] qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize(void)
Get queue size.
Return the number of queue

esp_err_t esp_mesh_allow_root_conflicts(bool allowed)
Set whether allow more than one root existing in one network.
Return
• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START
Parameters
• [in] allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed(void)
Check whether allow more than one root to exist in one network.
Return true/false

esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
Set group ID addresses.
Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT
Parameters
• [in] addr: pointer to new group ID addresses
• [in] num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
Delete group ID addresses.
Parameters
• [in] addr: pointer to deleted group ID address
• [in] num: the number of group ID addresses

int esp_mesh_get_group_num(void)
Get the number of group ID addresses.
Return the number of group ID addresses
**esp_err_t esp_mesh_get_group_list** *(mesh_addr_t *addr, int num)*
Get group ID addresses.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [out] addr: pointer to group ID addresses
- [in] num: the number of group ID addresses

**bool esp_mesh_is_my_group** *(const mesh_addr_t *addr)*
Check whether the specified group address is my group.

**Return** true/false

**esp_err_t esp_mesh_set_capacity_num** *(int num)*
Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [in] num: mesh network capacity

**int esp_mesh_get_capacity_num** *(void)*
Get mesh network capacity.

**Return** mesh network capacity

**esp_err_t esp_mesh_set_ie_crypto_funcs** *(const mesh_crypto_funcs_t *crypto_funcs)*
Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return** ESP_OK

**Parameters**
- [in] crypto_funcs: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

**esp_err_t esp_mesh_set_ie_crypto_key** *(const char *key, int len)*
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [in] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

**esp_err_t esp_mesh_get_ie_crypto_key** *(char *key, int len)*
Get mesh IE crypto key.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [out] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

**esp_err_t esp_mesh_set_root_healing_delay** *(int delay_ms)*
Set delay time before starting root healing.

**Return**
Chapter 2. API

**Parameters**

- **ESP_OK**

**Parameters**

- **[in]** `delay_ms`: delay time in milliseconds

```c
int esp_mesh_get_root_healing_delay(void)
```

Get delay time before network starts root healing.

**Return**

delay time in milliseconds

```c
esp_err_t esp_mesh_fix_root(bool enable)
```

Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Return**

- **ESP_OK**

**Parameters**

- **[in]** `enable`: enable or not

```c
bool esp_mesh_is_root_fixed(void)
```

Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API `esp_mesh_fix_root()`.
- Network Fixed Root Setting also changes with the "flag" value in parent networking IE.

**Return**

true/false

```c
esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
```

Set a specified parent for the device.

**Attention**

This API can be called at any time after mesh is configured.

**Return**

- **ESP_OK**
- **ESP_ERR_ARGUMENT**
- **ESP_ERR_MESH_NOT_CONFIG**

**Parameters**

- **[in]** `parent`: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- **[in]** `parent_mesh_id`: parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- **[in]** `my_type`: mesh type
  - `MESH_STA` is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then `my_type` shall set `MESH_ROOT` and `my_layer` shall set `MESH_ROOT_LAYER`.
- **[in]** `my_layer`: mesh layer
  - `my_layer` of the device may change after joining the network.
  - If `my_type` is set `MESH_NODE`, `my_layer` shall be greater than `MESH_ROOT_LAYER`.
  - If `my_type` is set `MESH_LEAF`, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

```c
esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)
```

Get mesh networking IE length of one AP.

**Return**

- **ESP_OK**
- **ESP_ERR_WIFI_NOT_INIT**
- **ESP_ERR_WIFI_ARG**
- **ESP_ERR_WIFI_FAIL**

**Parameters**

- **[out]** `len`: mesh networking IE length
**esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)**

Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP

**esp_err_t esp_mesh_flush_upstream_packets (void)**

Flush upstream packets pending into _parent queue and to_parent_p2p queue.

**Return**
- ESP_OK

**esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)**

Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)**

Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

**esp_err_t esp_mesh_disconnect (void)**

Disconnect from current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_connect (void)**

Connect to current parent.

**Return**
- ESP_OK

**esp_err_t esp_mesh_flush_scan_result (void)**

Flush scan result.

**Return**
- ESP_OK

**esp_err_t esp_mesh_switch_channel (const uint8_t *new_bssid, int csa_newchan, int csa_count)**

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
Chapter 2. API 参考

- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**
- ESP_OK

**Parameters**
- `[in]` new_bssid: the new router BSSID if the router changes
- `[in]` csa_newchan: the new channel number to which the whole network is moving
- `[in]` csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

```
esp_err_t esp_mesh_get_router_bssid(uint8_t *router_bssid)
```
Get the router BSSID.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

**Parameters**
- `[out]` router_bssid: pointer to the router BSSID

```
int64_t esp_mesh_get_tsf_time(void)
```
Get the TSF time.

**Return** the TSF time

```
esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)
```
Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- `[in]` topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

```
esp_mesh_topology_t esp_mesh_get_topology(void)
```
Get mesh topology.

**Return** MESH_TOPO_TREE or MESH_TOPO_CHAIN

```
esp_err_t esp_mesh_enable_ps(void)
```
Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```
esp_err_t esp_mesh_disable_ps(void)
```
Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

```
bool esp_mesh_is_ps_enabled(void)
```
Check whether the mesh Power Save function is enabled.
Return true/false

bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)
Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)
Get device duty cycle and type.

Return
- ESP_OK

Parameters
- [out] dev_duty: device duty cycle
- [out] dev_duty_type: device PS duty cycle type

esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)
Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.
- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears,
the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.

- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] nwk_duty: network duty cycle
- [in] duration_mins: duration (unit: minutes)
- [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**Return**
- ESP_OK

**Parameters**
- [out] nwk_duty: current network duty cycle
- [out] duration_mins: the duration of current nwk_duty
- [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
int esp_mesh_get_running_active_duty_cycle(void)
```

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Return**
the running active duty cycle

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

**Return**
- ESP_OK

**Parameters**
- [in] fwd_times: the times of forwarding duty signaling packets

---

**Unions**

```c
union mesh_addr_t
#include <esp_mesh.h> Mesh address.
```

**Public Members**

```c
uint8_t addr[6]
mac address
```
mip_t mip
mip address
union mesh_event_info_t
#include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t channel_switch
channel switch

mesh_event_child_connected_t child_connected
child connected

mesh_event_child_disconnected_t child_disconnected
child disconnected

mesh_event_routing_table_change_t routing_table
routing table change

mesh_event_connected_t connected
parent connected

mesh_event_disconnected_t disconnected
parent disconnected

mesh_event_no_parent_found_t no_parent
no parent found

mesh_event_layer_change_t layer_change
layer change

mesh_event_toDS_state_t toDS_state
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
vote started

mesh_event_root_address_t root_addr
root address

mesh_event_root_switch_req_t switch_req
root switch request

mesh_event_root_conflict_t root_conflict
other powerful root

mesh_event_root_fixed_t root_fixed
fixed root

mesh_event_scan_done_t scan_done
scan done

mesh_event_network_state_t network_state
network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
network found that can join

mesh_event_router_switch_t router_switch
new router information

mesh_event_ps_duty_t ps_duty
PS duty information
union mesh_rc_config_t
   
   #include <esp_mesh.h> Vote address configuration.

**Public Members**

int attempts
   max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
   a new root address specified by users for API esp_mesh_waive_root()

**Structures**

**struct mip_t**
   IP address and port.

**Public Members**

ip4_addr_t ip4
   IP address

uint16_t port
   port

**struct mesh_event_channel_switch_t**
   Channel switch information.

**Public Members**

uint8_t channel
   new channel

**struct mesh_event_connected_t**
   Parent connected information.

**Public Members**

wifi_event_sta_connected_t connected
   parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer
   layer

uint8_t duty
   parent duty

**struct mesh_event_no_parent_found_t**
   No parent found information.

**Public Members**

int scan_times
   scan times being through

**struct mesh_event_layer_change_t**
   Layer change information.
Public Members

uint16_t new_layer
new layer

struct mesh_event_vote_started_t
vote started information

Public Members

int reason
vote reason, vote could be initiated by children or by the root itself

int attempts
max vote attempts before stopped

mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
find a mesh network that this device can join

Public Members

uint8_t channel
channel number of the new found network

uint8_t router_bssid[6]
router BSSID

struct mesh_event_root_switch_req_t
Root switch request information.

Public Members

int reason
root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
the address of root switch requester

struct mesh_event_root_conflict_t
Other powerful root address.

Public Members

int8_t rssi
rssi with router

uint16_t capacity
the number of devices in current network

uint8_t addr[6]
other powerful root address

struct mesh_event_routing_table_change_t
Routing table change.
Public Members

- `uint16_t rt_size_new`
  the new value
- `uint16_t rt_size_change`
  the changed value

**struct mesh_event_root_fixed_t**
Root fixed.

Public Members

- `bool is_fixed`
  status

**struct mesh_event_scan_done_t**
Scan done event information.

Public Members

- `uint8_t number`
  the number of APs scanned

**struct mesh_event_network_state_t**
Network state information.

Public Members

- `bool is_rootless`
  whether current mesh network has a root

**struct mesh_event_ps_duty_t**
PS duty information.

Public Members

- `uint8_t duty`
  parent or child duty

**mesh_event_child_connected_t**
child info

**struct mesh_opt_t**
Mesh option.

Public Members

- `uint8_t type`
  option type
- `uint16_t len`
  option length
- `uint8_t *val`
  option value

**struct mesh_data_t**
Mesh data for esp_mesh_send() and esp_mesh_recv()
Chapter 2. API 参考

**Public Members**

```c
uint8_t *data
    data
uint16_t size
    data size
mesh_proto_t proto
    data protocol
mesh_tos_t tos
    data type of service
```

**struct mesh_router_t**
Router configuration.

**Public Members**

```c
uint8_t ssid[32]
    SSID
uint8_t ssid_len
    length of SSID
uint8_t bssid[6]
    BSSID, if this value is specified, users should also specify “allow_router_switch”.
uint8_t password[64]
    password
bool allow_router_switch
    if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.
```

**struct mesh_ap_cfg_t**
Mesh softAP configuration.

**Public Members**

```c
uint8_t password[64]
    mesh softAP password
uint8_t max_connection
    max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections
uint8_t nonmesh_max_connection
    max non-mesh connections
```

**struct mesh_cfg_t**
Mesh initialization configuration.

**Public Members**

```c
uint8_t channel
    channel, the mesh network on
```
bool allow_channel_switch
  if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel
  scan for a network that could join. The default value is false.

mesh_addr_t mesh_id
  mesh network identification

mesh_router_t router
  router configuration

mesh_ap_cfg_t mesh_ap
  mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
  crypto functions

struct mesh_vote_t
  Vote.

Public Members

float percentage
  vote percentage threshold for approval of being a root

bool is_rc_specified
  if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
  network start root election.

mesh_rc_config_t config
  vote address configuration

struct mesh_tx_pending_t
  The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
  to parent queue

int to_parent_p2p
  to parent (P2P) queue

int to_child
  to child queue

int to_child_p2p
  to child (P2P) queue

int mgmt
  management queue

int broadcast
  broadcast and multicast queue

struct mesh_rx_pending_t
  The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
  to external DS
int toSelf
    to self

**Macros**

- **MESH_ROOT_LAYER**
  - root layer value

- **MESH_MTU**
  - max transmit unit (in bytes)

- **MESH_MPS**
  - max payload size (in bytes)

- **ESP_ERR_MESH_WIFI_NOT_START**
  - Mesh error code definition.
  - Wi-Fi isn’t started

- **ESP_ERR_MESH_NOT_INIT**
  - mesh isn’t initialized

- **ESP_ERR_MESH_NOT_CONFIG**
  - mesh isn’t configured

- **ESP_ERR_MESH_NOT_START**
  - mesh isn’t started

- **ESP_ERR_MESH_NOT_SUPPORT**
  - not supported yet

- **ESP_ERR_MESH_NOT_ALLOWED**
  - operation is not allowed

- **ESP_ERR_MESH_NO_MEMORY**
  - out of memory

- **ESP_ERR_MESH_ARGUMENT**
  - illegal argument

- **ESP_ERR_MESH_EXCEED_MTU**
  - packet size exceeds MTU

- **ESP_ERR_MESH_TIMEOUT**
  - timeout

- **ESP_ERR_MESH_DISCONNECTED**
  - disconnected with parent on station interface

- **ESP_ERR_MESH_QUEUE_FAIL**
  - queue fail

- **ESP_ERR_MESH_QUEUE_FULL**
  - queue full

- **ESP_ERR_MESH_NO_PARENT_FOUND**
  - no parent found to join the mesh network

- **ESP_ERR_MESH_NO_ROUTE_FOUND**
  - no route found to forward the packet

- **ESP_ERR_MESH_OPTION_NULL**
  - no option found

- **ESP_ERR_MESH_OPTION_UNKNOWN**
  - unknown option

- **ESP_ERR_MESH_XON_NO_WINDOW**
  - no window for software flow control on upstream
ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT

ESP_ERR_MESH_QUEUE_READ
error in reading queue

ESP_ERR_MESH_PS
mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
release esp_mesh_recv_toDS

MESH_DATA_ENC
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P
point-to-point delivery over the mesh network

MESH_DATA_FROMDS
receive from external IP network

MESH_DATA_TODS
identify this packet is target to external IP network

MESH_DATA_NONBLOCK
esp_mesh_send() non-block

MESH_DATA_DROP
in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
identify this packet is target to a group address

MESH_OPT_SEND_GROUP
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
Flag of mesh networking IE.
vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
fixed root
Chapter 2. API

**MESH_PS_DEVICE_DUTY_REQUEST**
Mesh PS (Power Save) duty cycle type. requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

**MESH_PS_DEVICE_DUTY_DEMAND**
requests to join a network PS and specifies a demanded device duty cycle

**MESH_PS_NETWORK_DUTY_MASTER**
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

**MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE**
Mesh PS (Power Save) duty cycle applied rule.

**MESH_PS_NETWORK_DUTY_APPLIED_UPLINK**

Type Definitions

```c
typedef mesh_addr_t mesh_event_root_address_t
// Root address.

typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
// Parent disconnected information.

typedef wifi_event_ap_sta_connected_t mesh_event_child_connected_t
// Child connected information.

typedef wifi_event_ap_sta_disconnected_t mesh_event_child_disconnected_t
// Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
// New router information.
```

Enumerations

```c
enum mesh_event_id_t
// Enumerated list of mesh event id.

Values:

MESH_EVENT_STARTED
// mesh is started

MESH_EVENT_STOPPED
// mesh is stopped

MESH_EVENT_CHANNEL_SWITCH
// channel switch

MESH_EVENT_CHILD_CONNECTED
// a child is connected on softAP interface

MESH_EVENT_CHILD_DISCONNECTED
// a child is disconnected on softAP interface

MESH_EVENT_ROUTING_TABLE_ADD
// routing table is changed by adding newly joined children

MESH_EVENT_ROUTING_TABLE_REMOVE
// routing table is changed by removing leave children

MESH_EVENT_PARENT_CONNECTED
// parent is connected on station interface

MESH_EVENT_PARENT_DISCONNECTED
// parent is disconnected on station interface
```
MESH_EVENT_NO_PARENT_FOUND
  no parent found

MESH_EVENT_LAYER_CHANGE
  layer changes over the mesh network

MESH_EVENT_TODS_STATE
  state represents whether the root is able to access external IP network

MESH_EVENT_VOTE_STARTED
  the process of voting a new root is started either by children or by the root

MESH_EVENT_VOTE_STOPPED
  the process of voting a new root is stopped

MESH_EVENT_ROOT_ADDRESS
  the root address is obtained. It is posted by mesh stack automatically.

MESH_EVENT_ROOT_SWITCH_REQ
  root switch request sent from a new voted root candidate

MESH_EVENT_ROOT_SWITCH_ACK
  root switch acknowledgment responds the above request sent from current root

MESH_EVENT_ROOTAsked_YIELD
  the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

MESH_EVENT_ROOT_FIXED
  when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

MESH_EVENT_SCAN_DONE
  if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

MESH_EVENT_NETWORK_STATE
  network state, such as whether current mesh network has a root.

MESH_EVENT_STOP_RECONNECTION
  the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

MESH_EVENT_FIND_NETWORK
  when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH
  if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_PS_PARENT_DUTY
  parent duty

MESH_EVENT_PS_CHILD_DUTY
  child duty

MESH_EVENT_PS_DEVICE_DUTY
  device duty

MESH_EVENT_MAX

enum mesh_type_t
  Device type.

Values:
MESH_IDLE
hasn’t joined the mesh network yet

MESH_ROOT
the only sink of the mesh network. Has the ability to access external IP network

MESH_NODE
intermediate device. Has the ability to forward packets over the mesh network

MESH_LEAF
has no forwarding ability

MESH_STA
connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum mesh_proto_t
Protocol of transmitted application data.

Values:

MESH_PROTO_BIN
binary

MESH_PROTO_HTTP
HTTP protocol

MESH_PROTO_JSON
JSON format

MESH_PROTO_MQTT
MQTT protocol

MESH_PROTO_AP
IP network mesh communication of node’s AP interface

MESH_PROTO_STA
IP network mesh communication of node’s STA interface

enum mesh_tos_t
For reliable transmission, mesh stack provides three type of services.

Values:

MESH_TOS_P2P
provide P2P (point-to-point) retransmission on mesh stack by default

MESH_TOS_E2E
provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

MESH_TOS_DEF
no retransmission on mesh stack

enum mesh_vote_reason_t
Vote reason.

Values:

MESH_VOTE_REASON_ROOT_INITIATED = 1
vote is initiated by the root

MESH_VOTE_REASON_CHILD_INITIATED
vote is initiated by children

enum mesh_disconnect_reason_t
Mesh disconnect reason code.

Values:

MESH_REASON_CYCLIC = 100
cyclic is detected
MESH_REASON_PARENT_IDLE
parent is idle

MESH_REASON_LEAF
the connected device is changed to a leaf

MESH_REASON_DIFF_ID
in different mesh ID

MESH_REASON_ROOTS
root conflict is detected

MESH_REASON_PARENT_STOPPED
parent has stopped the mesh

MESH_REASON_SCAN_FAIL
scan fail

MESH_REASON_IE_UNKNOWN
unknown IE

MESH_REASON_WAIVE_ROOT
waive root

MESH_REASON_PARENT_WORSE
parent with very poor RSSI

MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent

MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router

enum esp_mesh_topology_t
Mesh topology.
Values:

MESH_TOPO_TREE
treetopology

MESH_TOPO_CHAIN
chaintopology

enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)
Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

MESH_TODS_REACHABLE
the root is able to access external IP network

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
Chapter 2. API

- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

```c
esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)
 Initialize DPP Supplicant.
 Starts DPP Supplicant and initializes related Data Structures.
 return
 • ESP_OK: Success
 • ESP_FAIL: Failure

Parameters
 • evt_cb: Callback function to receive DPP related events

void esp_supp_dpp_deinit (void)
 De-initialize DPP Supplicant.
 Frees memory from DPP Supplicant Data Structures.

esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
 Generates Bootstrap Information as an Enrollee.
 Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Return
 • ESP_OK: Success
 • ESP_FAIL: Failure

Parameters
 • chan_list: List of channels device will be available on for listening
 • type: Bootstrap method type, only QR Code method is supported for now.
 • key: (Optional) Private Key used to generate a Bootstrapping Public Key
 • info: (Optional) Ancillary Device Information like Serial Number

esp_err_t esp_supp_dpp_start_listen (void)
 Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.
 Listens on every Channel from Channel List for a pre-defined wait time.

Return
 • ESP_OK: Success
```
Chapter 2. API

- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.
```

**Macros**

- **ESP_ERR_DPP_FAILURE**
  Generic failure during DPP Operation
- **ESP_ERR_DPP_TX_FAILURE**
  DPP Frame Tx failed OR not Acked
- **ESP_ERR_DPP_INVALID_ATTR**
  Encountered invalid DPP Attribute

**Type Definitions**

- **typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t**
  Types of Bootstrap Methods for DPP.
- **typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t *evt, void *data)**
  Callback function for receiving DPP Events from Supplicant.

  Callback function will be called with DPP related information.

  **Parameters**
  - *evt*: DPP event ID
  - *data*: Event data payload

**Enumerations**

- **enum dpp_bootstrap_type**
  Types of Bootstrap Methods for DPP.
  **Values:**
  - **DPP_BOOTSTRAP_QR_CODE**
    QR Code Method
  - **DPP_BOOTSTRAP_PKEX**
    Proof of Knowledge Method
  - **DPP_BOOTSTRAP_NFC_URI**
    NFC URI record Method

- **enum esp_supp_dpp_event_t**
  Types of Callback Events received from DPP Supplicant.
  **Values:**
  - **ESP_SUPP_DPP_URI_READY**
    URI is ready through Bootstrapping
  - **ESP_SUPP_DPP_CFG_RECVD**
    Config received via DPP Authentication
  - **ESP_SUPP_DPP_FAIL**
    DPP Authentication failure
2.2.2 以太网

应用示例
- 以太网基本示例：ethernet/basic.
- 以太网 iPerf 示例：ethernet/iPerf.

以太网驱动程序模型
- esp_eth/include/esp_eth.h

以太网通用接口
- esp_eth/include/esp_eth_com.h

以太网 MAC 接口
- esp_eth/include/esp_eth_mac.h

以太网 PHY 接口
- esp_eth/include/esp_eth_phy.h

以太网 PHY 公共寄存器
- esp_eth/include/eth_phy_regs_struct.h

API 参考 - 驱动程序模型

Header File
- components/esp_eth/include/esp_eth.h

Functions

```c
esp_err_t esp_eth_driver_install(const esp_eth_config_t *config,
                                 esp_eth_handle_t *out_hdl)
```

Install Ethernet driver.

Return
- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

Parameters
- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)
```

Uninstall Ethernet driver.

Note 由于 history of the code, it’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

Return
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
• ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
• ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver

esp_err_t esp_eth_start (esp_eth_handle_t hdl)

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

Note This API will start driver state machine and internal software timer (for checking link status).

Return
• ESP_OK: start esp_eth driver successfully
• ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
• ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
• ESP_FAIL: start esp_eth driver failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver

esp_err_t esp_eth_stop (esp_eth_handle_t hdl)

Stop Ethernet driver.

Note This function does the opposite operation of esp_eth_start.

Return
• ESP_OK: stop esp_eth driver successfully
• ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
• ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
• ESP_FAIL: stop esp_eth driver failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver

esp_err_t esp_eth_update_input_path (esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e. specify where to pass the input buffer)

Note After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Return
• ESP_OK: update input path successfully
• ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
• ESP_FAIL: update input path failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver
• [in] stack_input: function pointer, which does the actual process on incoming packets
• [in] priv: private resource, which gets passed to stack_input callback without any modification

esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, void *buf, size_t length)

General Transmit.

Return
• ESP_OK: transmit frame buffer successfully
• ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
• ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver
• [in] buf: buffer of the packet to transfer
• [in] length: length of the buffer to transfer

esp_err_t esp_eth_receive (esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.
Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Note This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with esp_eth_update_input_path.

Return
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. In this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters
- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

```
int esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)
```

Misc IO function of Ethernet driver.

The following IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR**: sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR**: gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR**: sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR**: gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO**: enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO**: gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED**: sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED**: gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS**: sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL**: sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE**: sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_DUPLEX_MODE**: gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK**: sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

Return
- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

Parameters
- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
Chapter 2. API

- [inout] data: address of data for set command or address where to store the data when used with get command

```c
esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)
```
Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Return**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)
```
Decrease Ethernet driver reference.

**Return**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**
- [in] hdl: handle of Ethernet driver

**Structures**

```c
struct esp_eth_config_t
```
Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```
Ethernet MAC object.

```c
esp_eth_phy_t *phy
```
Ethernet PHY object.

```c
uint32_t check_link_period_ms
```
Period time of checking Ethernet link status.

```c
bool auto_nego_en
```
Configuration status of PHY autonegotiation feature.

```c
esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)
```
Input frame buffer to user’s stack.

**Return**
- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

**Parameters**
- [in] eth_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

```c
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

**Return**
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**
Chapter 2. API

- [in] eth_handle: handle of Ethernet driver

```c
esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
```

Callback function invoked when low-level deinitialization is finished.

**Return**
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**
- [in] eth_handle: handle of Ethernet driver

```c
esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**Parameters**
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```c
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Note** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Parameters**
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

**Macros**

```c
ETH_DEFAULT_CONFIG (emac, ephy)
```

Default configuration for Ethernet driver.

**Type Definitions**

```c
typedef void *esp_eth_handle_t
```

Handle of Ethernet driver.

**Enumerations**

```c
enum esp_eth_io_cmd_t
```

Command list for ioctl API.

**Values:**
Chapter 2. API

ETH_CMD_G_MAC_ADDR
Get MAC address

ETH_CMD_S_MAC_ADDR
Set MAC address

ETH_CMD_G_PHY_ADDR
Get PHY address

ETH_CMD_S_PHY_ADDR
Set PHY address

ETH_CMD_G_AUTONEGO
Get PHY Auto Negotiation

ETH_CMD_S_AUTONEGO
Set PHY Auto Negotiation

ETH_CMD_G_SPEED
Get Speed

ETH_CMD_S_SPEED
Set Speed

ETH_CMD_S_PROMISCUOUS
Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
Set flow control

ETH_CMD_G_DUPLEX_MODE
Get Duplex mode

ETH_CMD_S_DUPLEX_MODE
Set Duplex mode

ETH_CMD_S_PHY_LOOPBACK
Set PHY loopback

API 参考 - 通用接口

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)
Detect PHY address.

Return
- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

Parameters
- [in] eth: mediator of Ethernet driver
- [out] detected_addr: a valid address after detection

Structures

struct esp_eth_mediator_s
Ethernet mediator.
Public Members

\texttt{esp_err_t(*phy\_reg\_read)(esp\_eth\_mediator\_t \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t *reg\_value)}

Read PHY register.

\textbf{Return}
- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

\textbf{Parameters}
- \texttt{[in] eth: mediator of Ethernet driver}
- \texttt{[in] phy\_addr: PHY Chip address (0-31)}
- \texttt{[in] phy\_reg: PHY register index code}
- \texttt{[out] reg\_value: PHY register value}

\texttt{esp_err_t(*phy\_reg\_write)(esp\_eth\_mediator\_t \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)}

Write PHY register.

\textbf{Return}
- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

\textbf{Parameters}
- \texttt{[in] eth: mediator of Ethernet driver}
- \texttt{[in] phy\_addr: PHY Chip address (0-31)}
- \texttt{[in] phy\_reg: PHY register index code}
- \texttt{[in] reg\_value: PHY register value}

\texttt{esp_err_t(*stack\_input)(esp\_eth\_mediator\_t \*eth, uint8\_t *buffer, uint32\_t length)}

Deliver packet to upper stack.

\textbf{Return}
- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

\textbf{Parameters}
- \texttt{[in] eth: mediator of Ethernet driver}
- \texttt{[in] buffer: packet buffer}
- \texttt{[in] length: length of the packet}

\texttt{esp_err_t(*on\_state\_changed)(esp\_eth\_mediator\_t \*eth, esp\_eth\_state\_t state, void *args)}

Callback on Ethernet state changed.

\textbf{Return}
- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

\textbf{Parameters}
- \texttt{[in] eth: mediator of Ethernet driver}
- \texttt{[in] state: new state}
- \texttt{[in] args: optional argument for the new state}

Type Definitions

\texttt{typedef struct esp\_eth\_mediator\_s esp\_eth\_mediator\_t}

Ethernet mediator.

Enumerations

\texttt{enum esp\_eth\_state\_t}

Ethernet driver state.

\textbf{Values}

\texttt{ETH\_STATE\_LLINIT}
Lowlevel init done
### API Reference

#### MAC

**Header File**
- components/esp_eth/include/esp_eth_mac.h

**Functions**

```c
esp_eth_mac_t *esp_eth_mac_new_esp32 (const eth_mac_config_t *config);
```
Create ESP32 Ethernet MAC instance.

**Return**
- instance: create MAC instance successfully
- NULL: create MAC instance failed because some error occurred

**Parameters**
- `config`: Ethernet MAC configuration

**Unions**

```c
union eth_mac_clock_config_t
```

**Public Members**

```c
struct eth_mac_clock_config_t:[anonymous] mii
```
EMAC MII Clock Configuration

```c
dmac_rmii_clock_mode_t clock_mode
```
RMII Clock Mode Configuration

```c
dmac_rmii_clock_gpio_t clock_gpio
```
RMII Clock GPIO Configuration

---

**ETH_STATE_DEINIT**
- Deinit done

**ETH_STATE_LINK**
- Link status changed

**ETH_STATE_SPEED**
- Speed updated

**ETH_STATE_DUPLEX**
- Duplex updated

**ETH_STATE_PAUSE**
- Pause ability updated

**enum eth_event_t**
Ethernet event declarations.

**Values:**

- **ETHERNET_EVENT_START**
  - Ethernet driver start

- **ETHERNET_EVENT_STOP**
  - Ethernet driver stop

- **ETHERNET_EVENT_CONNECTED**
  - Ethernet got a valid link

- **ETHERNET_EVENT_DISCONNECTED**
  - Ethernet lost a valid link
struct eth_mac_clock_config_t {[anonymous] rmii}  
EMAC RMII Clock Configuration

**Structures**

**struct esp_eth_mac_s**  
Ethernet MAC.

**Public Members**

```
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)  
Set mediator for Ethernet MAC.
```

**Return**

- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

```
esp_err_t (*init)(esp_eth_mac_t *mac)  
Initialize Ethernet MAC.
```

**Return**

- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

```
esp_err_t (*deinit)(esp_eth_mac_t *mac)  
Deinitialize Ethernet MAC.
```

**Return**

- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

```
esp_err_t (*start)(esp_eth_mac_t *mac)  
Start Ethernet MAC.
```

**Return**

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

```
esp_err_t (*stop)(esp_eth_mac_t *mac)  
Stop Ethernet MAC.
```

**Return**

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

```
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)  
Transmit packet from Ethernet MAC.
```

**Return**

- ESP_OK: transmit packet successfully
Chapter 2. API

• ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
• ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
• ESP_FAIL: transmit packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] buf: packet buffer to transmit
• [in] length: length of packet

```
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer.
After the function returned, the value of “length” means the real length of received data.

Return
• ESP_OK: receive packet successfully
• ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
• ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
• ESP_FAIL: receive packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] buf: packet buffer which will preserve the received frame
• [in] length: length of the received packet

```
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [out] reg_value: PHY register value

```
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [in] reg_value: PHY register value

```
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

Return
• ESP_OK: set MAC address successfully
• ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
• ESP_FAIL: set MAC address failed because some other error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[in]** `addr`: MAC address

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```
Get MAC address.

**Return**

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[out]** `addr`: MAC address

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```
Set speed of MAC.

**Return**

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[in]** `speed`: MAC speed

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```
Set duplex mode of MAC.

**Return**

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[in]** `duplex`: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

**Return**

- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[in]** `link`: Link status

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

**Return**

- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

**Parameters**

- **[in]** `mac`: Ethernet MAC instance
- **[in]** `enable`: set true to enable promiscuous mode; set false to disable promiscuous mode

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```
Enable flow control on MAC layer or not.

**Return**

- ESP_OK: set flow control successfully
### ESP_FAIL: set flow control failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control

```c
esp_err_t (*set_flowcontrol)(esp_eth_mac_t *mac, uint32_t enable)
```

Set the PAUSE ability of peer node.

**Return**

- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance
- [in] ability: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```

Free memory of Ethernet MAC.

**Return**

- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**

- [in] mac: Ethernet MAC instance

```c
struct eth_mac_config_t
```

Configuration of Ethernet MAC object.

**Public Members**

- `uint32_t sw_reset_timeout_ms`
  
  Software reset timeout value (Unit: ms)

- `uint32_t rx_task_stack_size`
  
  Stack size of the receive task

- `uint32_t rx_task_prio`
  
  Priority of the receive task

- `int smi_mdc_gpio_num`
  
  SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

- `int smi_mdio_gpio_num`
  
  SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

- `uint32_t flags`
  
  Flags that specify extra capability for mac driver

- `eth_data_interface_t interface`
  
  EMAC Data interface to PHY (MII/RMII)

- `eth_mac_clock_config_t clock_config`
  
  EMAC Interface clock configuration

**Macros**

- `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`
  
  MAC driver can work when cache is disabled

- `ETH_MAC_FLAG_PIN_TO_CORE`
  
  Pin MAC task to the CPU core where driver installation happened

- `ETH_MAC_DEFAULT_CONFIG()`
  
  Default configuration for Ethernet MAC object.
Type Definitions

typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.

Enumerations

ever_int emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    Values:
    EMAC_CLK_DEFAULT
        Default values configured using Kconfig are going to be used when “Default” selected.
    EMAC_CLK_EXT_IN
        Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.
        Note MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
    EMAC_CLK_OUT
        Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

ever_int emac_rmii_clock_gpio_t
    RMII Clock GPIO number Options.
    Values:
    EMAC_CLK_IN_GPIO = 0
        MAC will get RMII clock from outside at this GPIO.
        Note ESP32 only supports GPIO0 to input the RMII clock.
    EMAC_APPL_CLK_OUT_GPIO = 0
        Output RMII Clock from internal APLL Clock available at GPIO0.
        Note GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have a directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.
    EMAC_CLK_OUT_GPIO = 16
        Output RMII Clock from internal APLL Clock available at GPIO16.
    EMAC_CLK_OUT_180_GPIO = 17
        Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

API 参考 PHY 接口

Header File

- components/esp_eth/include/esp_ethphy.h

Functions

esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)
    Create a PHY instance of IP101.

    Return
    - instance: create PHY instance successfully
    - NULL: create PHY instance failed because some error occurred
Chapter 2. API

Parameters

• [in] config: configuration of PHY

```
esp_eth_phy_t *esp_ethphy_new_rtl8201(const eth_phy_config_t *config)
```

Create a PHY instance of RTL8201.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
esp_eth_phy_t *esp_ethphy_new_lan87xx(const eth_phy_config_t *config)
```

Create a PHY instance of LAN87xx.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
static esp_eth_phy_t *esp_ethphy_new_lan8720(const eth_phy_config_t *config)
```

Create a PHY instance of LAN8720.

Note For ESP-IDF backwards compatibility reasons. In all other cases, use esp_ethphy_new_lan87xx instead.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
esp_eth_phy_t *esp_ethphy_new_dp83848(const eth_phy_config_t *config)
```

Create a PHY instance of DP83848.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
esp_eth_phy_t *esp_ethphy_new_ksz8041(const eth_phy_config_t *config)
```

Create a PHY instance of KSZ8041.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
esp_eth_phy_t *esp_ethphy_new_ksz8081(const eth_phy_config_t *config)
```

Create a PHY instance of KSZ8081.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters

• [in] config: configuration of PHY

```
static esp_eth_phy_t *esp_ethphy_new_ksz8091(const eth_phy_config_t *config)
```

Create a PHY instance of KSZ8091.

Return

• instance: create PHY instance successfully
• NULL: create PHY instance failed because some error occurred

Parameters
• [in] config: configuration of PHY

**Structures**

```c
struct esp_eth_phy_s

Ethernet PHY.
```

**Public Members**

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)

Set mediator for PHY.
```

Return

- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters

- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)

Software Reset Ethernet PHY.
```

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)

Hardware Reset Ethernet PHY.
```

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return

- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

```c
esp_err_t (*init)(esp_eth_phy_t *phy)

Initialize Ethernet PHY.
```

Return

- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)

Deinitialize Ethernet PHY.
```

Return

- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters

- [in] phy: Ethernet PHY instance

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)

Configure auto negotiation.
```

Return

- ESP_OK: restart auto negotiation successfully
• ESP_FAIL: restart auto negotiation failed because some error occurred
• ESP_ERR_INVALID_ARG: invalid command

Parameters
• [in] phy: Ethernet PHY instance
• [in] cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
• [out] autonego_en_stat: Address where to store current status of auto negotiation configuration

```
esp_err_t (*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.
```

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

```
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.
```

Return
• ESP_OK: control Ethernet PHY power successfully
• ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

```
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
Set PHY chip address.
```

Return
• ESP_OK: set Ethernet PHY address successfully
• ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] addr: PHY chip address

```
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
Get PHY chip address.
```

Return
• ESP_OK: get Ethernet PHY address successfully
• ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance
• [out] addr: PHY chip address

```
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
Advertise pause function supported by MAC layer.
```

Return
• ESP_OK: Advertise pause ability successfully
• ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance

```
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
Sets the PHY to loopback mode.
```

Return
• ESP_OK: PHY instance loopback mode has been configured successfully
• ESP_FAIL: PHY instance loopback configuration failed because some error occurred
Parameters

• [in] phy: Ethernet PHY instance
• [in] enable: enables or disables PHY loopback

\textbf{esp_err_t (\texttt{\_set\_speed}) (esp\_eth\_phy\_t *phy, eth\_speed\_t speed)}

Sets PHY speed mode.

\textbf{Note} Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**

• ESP_OK: PHY instance speed mode has been configured successfully
• ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

**Parameters**

• [in] phy: Ethernet PHY instance
• [in] speed: Speed mode to be set

\textbf{esp_err_t (\texttt{\_set\_duplex}) (esp\_eth\_phy\_t *phy, eth\_duplex\_t duplex)}

Sets PHY duplex mode.

\textbf{Note} Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**

• ESP_OK: PHY instance duplex mode has been configured successfully
• ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

**Parameters**

• [in] phy: Ethernet PHY instance
• [in] duplex: Duplex mode to be set

\textbf{esp_err_t (\texttt{\_del}) (esp\_eth\_phy\_t *phy)}

Free memory of Ethernet PHY instance.

**Return**

• ESP_OK: free PHY instance successfully
• ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**

• [in] phy: Ethernet PHY instance

\textbf{struct eth\_phy\_config\_t}

Ethernet PHY configuration.

**Public Members**

int32\_t phy\_addr

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t reset\_timeout\_ms

Reset timeout value (Unit: ms)

uint32\_t autonego\_timeout\_ms

Auto-negotiation timeout value (Unit: ms)

int reset\_gpio\_num

Reset GPIO number, -1 means no hardware reset

**Macros**

\textbf{ESP_ETH_PHY_ADDR\_AUTO}

\textbf{ETH_PHY\_DEFAULT\_CONFIG()} ()

Default configuration for Ethernet PHY object.

**Type Definitions**

typedef struct esp\_eth\_phy\_t

Ethernet PHY.
Enumerations
enum eth_phy_autoneg_cmd_t
Auto-negotiation control commands.
Values:
- ESP_ETH_PHY_AUTONEGO_RESTART
- ESP_ETH_PHY_AUTONEGO_EN
- ESP_ETH_PHY_AUTONEGO_DIS
- ESP_ETH_PHY_AUTONEGO_G_STAT

API Reference

Header File
- components/esp_eth/include/esp_eth_netif_glue.h

Functions

esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
Create a netif glue for Ethernet driver.

Note: netif glue is used to attach io driver to TCP/IP netif
Return: glue object, which inherits esp_netif_driver_base_t
Parameters
- eth_hdl: Ethernet driver handle

esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
Delete netif glue of Ethernet driver.

Return: -ESP_OK: delete netif glue successfully
Parameters
- eth_netif_glue: netif glue

esp_err_t esp_eth_set_default_handlers(void *esp_netif)
Register default IP layer handlers for Ethernet.

Note: Ethernet handle might not yet properly initialized when setting up these default handlers
Warning: This function is deprecated and is kept here only for compatibility reasons. Registration of default
IP layer handlers for Ethernet is now handled automatically. Do not call this function if you want to use
multiple Ethernet instances at a time.

Return
- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: set default IP layer handlers successfully
- others: other failure occurred during register esp_event handler
Parameters
- [in] esp_netif: esp network interface handle created for Ethernet driver

esp_err_t esp_eth_clear_default_handlers(void *esp_netif)
Unregister default IP layer handlers for Ethernet.

Warning: This function is deprecated and is kept here only for compatibility reasons. Unregistration
of default IP layer handlers for Ethernet is now handled automatically if not registered by calling
esp_eth_set_default_handlers.

Return
- ESP_ERR_INVALID_ARG: invalid parameter (esp_netif is NULL)
- ESP_OK: clear default IP layer handlers successfully
- others: other failure occurred during unregister esp_event handler
Parameters
- [in] esp_netif: esp network interface handle created for Ethernet driver
Type Definitions

typedef struct esp_eth_netif_glue *esp_eth_netif_glue_handle_t

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

2.2.3 Thread

Thread

Introduction  Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

Application Examples  The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell openthread/ot_cli.
- The Thread border router openthread/ot_br.
- The Thread radio co-processor openthread/ot_rcp.

API Reference  For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

- components/openthread/include/esp_openthread.h

Functions

esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)

Initializes the full OpenThread stack.

Note  The OpenThread instance will also be initialized in this function.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

Parameters

- [in] init_config: The initialization configuration.

esp_err_t esp_openthread_launch_mainloop(void)

Launches the OpenThread main loop.

Note  This function will not return unless error happens when running the OpenThread stack.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

esp_err_t esp_openthread_deinit(void)

This function performs OpenThread stack and platform driver deinitialization.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_ERR_INVALID_ARG if not initialized

otInstance *esp_openthread_get_instance(void)

This function acquires the underlying OpenThread instance.
Note  This function can be called on other tasks without lock.

Return  The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

struct esp_openthread_mainloop_context_t

This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t

The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

int rx_pin
UART RX pin

int tx_pin
UART TX pin

struct esp_openthread_radio_config_t

The OpenThread radio configuration.

Public Members

esp_openthread_radio_mode_t radio_mode
The radio mode

esp_openthread_uart_config_t radio_uart_config
The uart configuration to RCP

struct esp_openthread_host_connection_config_t

The OpenThread host connection configuration.
Public Members

```c
esp_openthread_host_connection_mode_t host_connection_mode
    The host connection mode
```n
```c
esp_openthread_uart_config_t host_uart_config
    The UART configuration to host
```n
```c
struct esp_openthread_port_config_t
    The OpenThread port specific configuration.
```n
Public Members

```c
const char *storage_partition_name
    The partition for storing OpenThread dataset
```n
```c
uint8_t netif_queue_size
    The packet queue size for the network interface
```n
```c
uint8_t task_queue_size
    The task queue size
```n
```c
struct esp_openthread_platform_config_t
    The OpenThread platform configuration.
```n
Public Members

```c
esp_openthread_radio_config_t radio_config
    The radio configuration
```n
```c
esp_openthread_host_connection_config_t host_config
    The host connection configuration
```n
```c
esp_openthread_port_config_t port_config
    The port configuration
```n
Enumerations

```c
enum esp_openthread_event_t
    OpenThread event declarations.
```n
Values:

```c
OPENTHREAD_EVENT_START
    OpenThread stack start
```n
```c
OPENTHREAD_EVENT_STOP
    OpenThread stack stop
```n
```c
OPENTHREAD_EVENT_IF_UP
    OpenThread network interface up
```n
```c
OPENTHREAD_EVENT_IF_DOWN
    OpenThread network interface down
```n
```c
OPENTHREAD_EVENT_GOT_IP6
    OpenThread stack added IPv6 address
```n
```c
OPENTHREAD_EVENT_LOST_IP6
    OpenThread stack removed IPv6 address
```n
```c
OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN
    OpenThread stack joined IPv6 multicast group
```n
**OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**
OpenThread stack left IPv6 multicast group

**OPENTHREAD_EVENT_TREL_ADD_IP6**
OpenThread stack added TREL IPv6 address

**OPENTHREAD_EVENT_TREL_REMOVE_IP6**
OpenThread stack removed TREL IPv6 address

**OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**
OpenThread stack joined TREL IPv6 multicast group

### enum esp_openthread_radio_mode_t

The radio mode of OpenThread.

*Values:*

- **RADIO_MODE_NATIVE** = 0x0
  Use the native 15.4 radio

- **RADIO_MODE_UART_RCP** = 0x1
  UART connection to a 15.4 capable radio co-processor (RCP)

- **RADIO_MODE_SPI_RCP** = 0x2
  SPI connection to a 15.4 capable radio co-processor (RCP)

### enum esp_openthread_host_connection_mode_t

How OpenThread connects to the host.

*Values:*

- **HOST_CONNECTION_MODE_NONE** = 0x0
  Disable host connection

- **HOST_CONNECTION_MODE_CLI_UART** = 0x1
  CLI UART connection to the host

- **HOST_CONNECTION_MODE_RCP_UART** = 0x2
  RCP UART connection to the host

### Header File

- components/openthread/include/esp_openthread_lock.h

### Functions

**esp_err_t esp_openthread_lock_init (void)**
This function initializes the OpenThread API lock.

*Return*

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void esp_openthread_lock_deinit (void)**
This function deinitializes the OpenThread API lock.

**bool esp_openthread_lock_acquire (TickType_t block_ticks)**
This function acquires the OpenThread API lock.

*Note*
Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

*Return*

- True on lock acquired
- False on failing to acquire the lock with the timeout.

*Parameters*

- [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.
void esp_openthread_lock_release (void)
    This function releases the OpenThread API lock.

Header File
    • components/openthread/include/esp_openthread_netif_glue.h

Functions
void *esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)
    This function initializes the OpenThread network interface glue.
    Return
        • glue pointer on success
        • NULL on failure
    Parameters
        • [in] config: The platform configuration.
void esp_openthread_netif_glue_deinit (void)
    This function deinitializes the OpenThread network interface glue.

esp_netif_t *esp_openthread_get_netif (void)
    This function acquires the OpenThread netif.
    Return The OpenThread netif or NULL if not initialized.

Header File
    • components/openthread/include/esp_openthread_border_router.h

Functions
void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)
    Sets the backbone interface used for border routing.
    Note This function must be called before esp_openthread_init
    Parameters
        • [in] backbone_netif: The backbone network interface (WiFi or ethernet)
esp_err_t esp_openthread_border_router_init (void)
    Initializes the border router features of OpenThread.
    Note Calling this function will make the device behave as an OpenThread border router. Kconfig option
        CONFIG_OPENTHREAD_BORDER_ROUTER is required.
    Return
        • ESP_OK on success
        • ESP_ERR_NOT_SUPPORTED if feature not supported
        • ESP_ERR_INVALID_STATE if already initialized
        • ESP_FIAL on other failures

esp_err_t esp_openthread_border_router_deinit (void)
    Deinitializes the border router features of OpenThread.
    Return
        • ESP_OK on success
        • ESP_ERR_INVALID_STATE if not initialized
        • ESP_FIAL on other failures

esp_netif_t *esp_openthread_get_backbone_netif (void)
    Gets the backbone interface of OpenThread border router.
    Return The backbone interface or NULL if border router not initialized.

本部分的 Thread API 示例代码存放在 ESP-IDF 示例项目的 openthread 目录下。
2.2.4 IP 网络层协议

ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP 配置迁移指南 section in case existing applications to be ported to use the esp-netif API instead.

ESP-NETIF architecture
Data and event flow in the diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code
- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API
- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver

Communication driver plays these two important roles in relation with ESP-NETIF:
- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
  - Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter

ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
Chapter 2. API

- DHCP server and client API
- DNS API

6) Driver conversion utilities

D) Network stack  
Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface  
The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to 虚拟文件系统组件 to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization  
To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

`open()`  
Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

`ioctl()`  
The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`’ s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2
logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

| Note: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application. |

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- EBAADF - not a valid file descriptor.
- EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptor.
- ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.
- ENOSPC - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.
- ENOSYS - unsupported operation, passed configuration option does not exists.

### read()

Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

- EBAADF - not a valid file descriptor.
- EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

### write()

A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+----------------------------
| Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/  
data) ... |
+-------------------+-------------------+-------------+----------------------------
```

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network Interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On
Chapter 2. API 参考

error, -1 is returned, and errno is set to indicate the error.

EBADF - not a valid file descriptor.
EBADMSG - Ethernet type of the frame is different then file descriptor configured filter.
EIO - Network interface not available or busy.

close() Opened ESP-NETIF L2 TAP file descriptor can be closed by the close() to free its allocated resources. The ESP-NETIF L2 TAP implementation of close() may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, close() returns zero. On error, -1 is returned, and errno is set to indicate the error.
EBADF - not a valid file descriptor.

select() Select is used in a standard way, just CONFIG_VFS_SUPPORT_SELECT needs to be enabled to be the select() function available.

ESP-NETIF programmer’s manual Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c

For more specific cases please consult this guide: ESP-NETIF Custom I/O Driver.

WiFi default initialization The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- esp_netif_create_default_wifi_ap()
- esp_netif_create_default_wifi_sta()

Please note that these functions return the esp_netif handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using esp_netif_destroy_default_wifi().
- These default interfaces must not be created multiple times, unless the created handle is deleted using esp_netif_destroy().
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- components/esp_netif/include/esp_netif.h

Functions

esp_err_t esp_netif_init (void)
Initialize the underlying TCP/IP stack.

Return
- ESP_OK on success
- ESP_FAIL if initializing failed

Note This function should be called exactly once from application code, when the application starts up.
**esp_err_t esp_netif_deinit (void)**

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Return**
- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

**esp_netif_t **esp_netif_new (const esp_netif_config_t **esp_netif_config)**

Creates an instance of new esp-netif object based on provided config.

**Return**
- pointer to esp-netif object on success
- NULL otherwise

**Parameters**
- [in] esp_netif_config: pointer esp-netif configuration

**void esp_netif_destroy (esp_netif_t **esp_netif)**

Destroys the esp_netif object.

**Parameters**
- [in] esp_netif: pointer to the object to be deleted

**esp_err_t esp_netif_set_driver_config (esp_netif_t **esp_netif, const esp_netif_driver_ifconfig_t **driver_config)**

Configures driver related options of esp_netif object.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**
- [inout] esp_netif: pointer to the object to be configured
- [in] driver_config: pointer esp-netif io driver related configuration

**esp_err_t esp_netif_attach (esp_netif_t **esp_netif, esp_netif_iodriver_handle driver_handle)**

Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**
- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

**esp_err_t esp_netif_receive (esp_netif_t **esp_netif, void **buffer, size_t len, void **eb)**

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

**esp_err_t esp_netif_transmit_hook_attach (esp_netif_t **esp_netif, void **hook_fn)**

Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.
Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to transmit hook call-back function

esp_err_t esp_netif_post_transmit_hook_attach (esp_netif_t *esp_netif, void *hook_fn)
Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

Note Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to post transmit hook call-back function

esp_err_t esp_netif_recv_hook_attach (esp_netif_t *esp_netif, void *hook_fn)
Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to receive hook callback function

esp_err_t esp_netif_transmit_hook_detach (esp_netif_t *esp_netif)
Removes reference to previously attached transmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_post_transmit_hook_detach (esp_netif_t *esp_netif)
Removes reference to previously attached post transmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_recv_hook_detach (esp_netif_t *esp_netif)
Removes reference to previously attached receive hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

void esp_netif_action_start (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

Note This API can be directly used as event handler

Parameters
void esp_netif_action_stop (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver stop event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_connected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver connected event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver disconnected event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon network got IP event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group join.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IPv6 multicast group leave.

Note This API can be directly used as event handler

Parameters
void esp_netif_action_add_ip6_address (void *netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void esp_netif_action_remove_ip6_address (void *netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

Note This API can be directly used as event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
esp_err_t esp_netif_set_mac (esp_netif_t *netif, uint8_t mac[])  
```

Set the mac address for the interface instance.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] mac: Desired mac address for the related network interface

```c
esp_err_t esp_netif_get_mac (esp_netif_t *netif, uint8_t mac[])  
```

Get the mac address for the interface instance.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] mac: Resultant mac address for the related network interface

```c
esp_err_t esp_netif_set_hostname (esp_netif_t *netif, const char *hostname)  
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
- [in] esp_netif: Handle to esp-netif instance
**esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)**

Get interface hostname.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**bool esp_netif_is_netif_up (esp_netif_t *esp_netif)**

Test if supplied interface is up or down.

**Return**
- true - Interface is up
- false - Interface is down

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)**

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

**esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)**

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

**esp_err_t esp_netif_set_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running
Chapter 2. API

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

`esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: Store the old IP information for the specified interface

`int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)`

Get net interface index from network stack implementation.

Note This index could be used in `setsockopt()` to bind socket with multicast interface

Return implementation specific index of interface represented with supplied `esp_netif`

Parameters
- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)`

Get net interface name from network stack implementation.

Note This name could be used in `setsockopt()` to bind socket with appropriate interface

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

`esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)`

Set or Get DHCP server option.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.
\texttt{esp_err_t esp_netif_dhcpc_option}\,(\texttt{esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len})

Set or Get DHCP client option.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**

- [in] \texttt{esp_netif}: Handle to esp-netif instance
- [in] \texttt{opt_op}: \texttt{ESP_NETIF_OP_SET} to set an option, \texttt{ESP_NETIF_OP_GET} to get an option.
- [in] \texttt{opt_id}: Option index to get or set, must be one of the supported enum values.
- [inout] \texttt{opt_val}: Pointer to the option parameter.
- [in] \texttt{opt_len}: Length of the option parameter.

\texttt{esp_err_t esp_netif_dhcpc_start}\,(\texttt{esp_netif_t* esp_netif})

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the \texttt{SYSTEM_EVENT_STA_CONNECTED} and \texttt{SYSTEM_EVENT_ETH_CONNECTED} events call this function.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCPC_START_FAILED

**Parameters**

- [in] \texttt{esp_netif}: Handle to esp-netif instance

\texttt{esp_err_t esp_netif_dhcpc_stop}\,(\texttt{esp_netif_t* esp_netif})

Stop DHCP client (only if enabled in interface object)

**Note** Calling \texttt{action_netif_stop()} will also stop the DHCP Client if it is running.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**

- [in] \texttt{esp_netif}: Handle to esp-netif instance

\texttt{esp_err_t esp_netif_dhcpc_get_status}\,(\texttt{esp_netif_t* esp_netif, esp_netif_dhcp_status_t* status})

Get DHCP client status.

**Return**

- ESP_OK

**Parameters**

- [in] \texttt{esp_netif}: Handle to esp-netif instance
- [out] \texttt{status}: If successful, the status of DHCP client will be returned in this argument.

\texttt{esp_err_t esp_netif_dhcps_get_status}\,(\texttt{esp_netif_t* esp_netif, esp_netif_dhcp_status_t* status})

Get DHCP Server status.

**Return**

- ESP_OK

**Parameters**

- [in] \texttt{esp_netif}: Handle to esp-netif instance
- [out] \texttt{status}: If successful, the status of the DHCP server will be returned in this argument.

\texttt{esp_err_t esp_netif_dhcps_start}\,(\texttt{esp_netif_t* esp_netif})

Start DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)**

Stop DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)**

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled.

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the Wi-Fi AP interface.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [in] dns: DNS Server address to set

**esp_err_t esp_netif_get_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)**

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [out] dns: DNS Server result is written here on success

**esp_err_t esp_netif_create_ip6_linklocal (esp_netif_t *esp_netif)**

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.
This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
int esp_netif_get_all_ip6(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6[])]
```
Get all IPv6 addresses of the specified interface.

**Return** number of returned IPv6 addresses

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: Array of IPv6 addresses will be copied to the argument

```c
void esp_netif_set_ip4_addr(esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
```
Sets IPv4 address to the specified octets.

**Parameters**
- [out] addr: IP address to be set
- a: the first octet (127 for IP 127.0.0.1)
- b:
- c:
- d:

```c
char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)
```
Converts numeric IP address into decimal dotted ASCII representation.

**Return** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

**Parameters**
- addr: ip address in network order to convert
- buf: target buffer where the string is stored
- buflen: length of buf
uint32_t esp_ip4addr_aton(const char *addr)

Ascii internet address interpretation routine. The value returned is in network order.

Return  ip address in network order

Parameters
  • addr: IP address in ascii representation (e.g. “127.0.0.1”)

esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)

Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return  
  • ESP_OK on success
  • ESP_FAIL if conversion failed
  • ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
  • [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
  • [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)

Converts Ascii internet IPv6 address into esp_ip6_addr_t. Zeros in the IP address can be stripped or completely omitted: “2001:db8:85a3:0:0:0:0:2:1” or “2001:db8::2:1”

Return  
  • ESP_OK on success
  • ESP_FAIL if conversion failed
  • ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
  • [in] src: IPv6 address in ascii representation (e.g. “2001:db8:85a3:0:0:0:0:0:0:2:1”)
  • [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address

esp_netif_iodriver_handle esp_netif_get_io_driver(esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

Return  opaque pointer of related IO driver

Parameters
  • [in] esp_netif: Handle to esp-netif instance

esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

Return  Handle to esp-netif instance

Parameters
  • if_key: Textual description of network interface

esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)

Returns configured flags for this interface.

Return  Configuration flags

Parameters
  • [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_ifkey(esp_netif_t *esp_netif)

Returns configured interface key for this esp-netif instance.

Return  Textual description of related interface

Parameters
  • [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_desc(esp_netif_t *esp_netif)

Returns configured interface type for this esp-netif instance.

Return  Enumerated type of this interface, such as station, AP, ethernet

Parameters
  • [in] esp_netif: Handle to esp-netif instance
int esp_netif_get_route_prio (esp_netif_t *esp_netif)
Returns configured routing priority number.

Return Integer representing the instance’s route-prio, or -1 if invalid parameters

Parameters
• [in] esp_netif: Handle to esp-netif instance

int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
Returns configured event for this esp-netif instance and supplied event type.

Return Specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

Parameters
• [in] esp_netif: Handle to esp-netif instance
• event_type: (either get or lost IP)

esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise

Parameters
• [in] esp_netif: Handle to esp-netif instance

size_t esp_netif_get_nr_of_ifs (void)
Returns number of registered esp_netif objects.

Return Number of esp_netifs

void esp_netif_netstack_buf_ref (void *netstack_buf)
Increase the reference counter of net stack buffer

Parameters
• [in] netstack_buf: the net stack buffer

void esp_netif_netstack_buf_free (void *netstack_buf)
Free the netstack buffer

Parameters
• [in] netstack_buf: the net stack buffer

Macros
_ESP_NETIF_SUPPRESS_LEGACY_WARNING_

WiFi default API reference

Header File
• components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.

Return
• ESP_OK on success
• ESP_FAIL if attach failed

Parameters
• esp_netif: instance to attach the wifi station to

esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.

Return
### Chapter 2. API 参考

- ESP_OK on success
- ESP_FAIL if attach failed

#### Parameters
- esp_netif: instance to attach the wifi AP to

**esp_err_t esp_wifi_set_default_wifi_sta_handlers (void)**
Sets default wifi event handlers for STA interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)**
Sets default wifi event handlers for AP interface.

**Return**
- ESP_OK on success, error returned from esp_event_handler_register if failed

**esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void*)**
Clears default wifi event handlers for supplied network interface.

**Parameters**
- esp_netif: instance of corresponding if object

**esp_netif_t *esp_netif_create_default_wifi_ap (void)**
Creates default WiFi AP. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

**Return** pointer to esp-netif instance

**esp_netif_t *esp_netif_create_default_wifi_sta (void)**
Creates default WiFi STA. In case of any init error this API aborts.

**Note** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**Return** pointer to esp-netif instance

**void esp_netif_destroy_default_wifi (void*)**
Destroys default WiFi netif created with esp_netif_create_default_wifi() API.

**Note** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**
- [in] esp_netif: object to detach from WiFi and destroy

**esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)**
Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return** pointer to esp-netif instance

**Parameters**
- [in] wifi_if: type of wifi interface
- [in] esp_netif_config: inherent esp-netif configuration pointer

**esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)**
Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.
## TCP/IP 适配器迁移指南

TCP/IP 适配器在 ESP-NETIF 之前版本中用于简化网络接口抽象组件。本文档概述了从 tcpip_adapter 移出至其后继者 ESP-NETIF 的过程。

### 更新网络连接代码

**网络软件栈初始化** 只需将 tcpip_adapter_init() 替换为 esp_netif_init()。请注意，ESP-NETIF 初始化 API 可返回标准错误代码，还可以使用 esp_netif_deinit() 进行去初始化。

此外，还需将 #include "tcpip_adapter.h" 替换为 #include "esp_netif.h"。

### 创建网络接口

TCP/IP 适配器静态定义了三个接口:

- Wi-Fi Station
- Wi-Fi AP
- 以太网

网络接口的设计应严格参考 ESP-NETIF，以使其能够连接到 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用 esp_netif_create_default_wifi_sta()；或 esp_netif_create_default_wifi_ap()。请参阅这三个接口的初始化代码示例:

- Wi-Fi Station: wifi/getting_started/station/main/station_example_main.c
- Wi-Fi AP: wifi/getting_started/softAP/main/softap_example_main.c
- 以太网: ethernet/basic/main/ethernet_example_main.c

### 更改其他 tcpip_adapter API

所有 tcpip_adapter 函数都有对应的 esp_netif。具体请见 esp_netif 的内容:

- Setters/Getters
- DHCP
- DNS
- IP address

### 默认事件处理程序

事件处理程序已经从 tcpip_adapter 移动到相应的驱动程序代码。从应用程序的角度来看，这不会带来任何影响，所有事件仍以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用程序代码通常以 esp-netif 结构体的形式接收 IP 地址（不是 LwIP 结构，但兼容二进制格式）。这是打印地址的首选方式:

```c
ESP_LOGI(TAG, "got ip: IPSTR \n", IP2STR(&event->ip_info.ip));
```

而不是

```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

由于 ip4addr_ntoa() 为 LwIP API，因此 esp-netif 还提供了替代函数 esp_ip4addr_ntoa()，但整体而言仍推荐上述方法。

### IP 地址

推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。

* esp-netif IP address definitions
Chapter 2. API

본보기 为了移植应用程序使其可以使用ESP-NETIF 还需完成的步骤包括：在组件配置中禁用 tcpip_adapter 兼容层。方法为：ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface，并检查工程是否编译成功。TCP/IP 适配器涉及大量依赖项，这一步可能有助于将应用程序与特定 TCP/IP 软件栈的 API 分离开来。

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- esp_netif_transmit()
- esp_netif_free_rx_buffer()
- esp_netif_receive()

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls esp_netif_receive() on a new data received event.

Post attach callback  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t *driver_handle);
```

It is assumed that the esp_netif_iodriver_handle is a pointer to driver’s object, a struct derived from struct esp_netif_driver_base_s, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;       //!< base structure reserved as...
    esp_netif_iodriver_impl_t *h;      //!< handle of driver...
} my_netif_driver_t;
```

with actual values of my_netif_driver_t::base.post_attach and the actual drivers handle my_netif_driver_t::h. So when the esp_netif_attach() gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
    };
    //...
}
```

（下页继续）
Default handlers
I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example \textit{driver start} $\rightarrow$ \textit{network start}, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVT_STOP, esp_netif);
    return ESP_OK;
}
```

Network stack connection
The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.

Header File
- components/esp_netif/include/esp_netif_net_stack.h

Functions

- \texttt{esp_netif_t* esp_netif_get_handle_from_netif_impl (void *dev)}
  Returns esp-netif handle.
  \textbf{Return} handle to related esp-netif instance
  \textbf{Parameters}
  \begin{itemize}
    \item [in] dev: opaque ptr to network interface of specific TCP/IP stack
  \end{itemize}

- \texttt{esp_netif_t* esp_netif_get_netif_impl (esp_netif_t* esp_netif)}
  Returns network stack specific implementation handle (if supported)
  Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode
  \textbf{Return} handle to related network stack netif handle
  \textbf{Parameters}
  \begin{itemize}
    \item [in] esp_netif: Handle to esp-netif instance
  \end{itemize}

- \texttt{esp_err_t esp_netif_transmit (esp_netif_t* esp_netif, void *data, size_t len)}
  Outputs packets from the TCP/IP stack to the media to be transmitted.
  This function gets called from network stack to output packets to IO driver.
  \textbf{Return} ESP_OK on success, an error passed from the I/O driver otherwise
  \textbf{Parameters}
  \begin{itemize}
    \item [in] esp_netif: Handle to esp-netif instance
    \item [in] data: Data to be transmitted
    \item [in] len: Length of the data frame
  \end{itemize}
esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] data: Data to be transmitted
• [in] len: Length of the data frame
• [in] netstack_buf: net stack buffer

void esp_netif_free_rx_buffer(void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] buffer: Rx buffer pointer

TCP/IP 套接字 API 的示例代码存放在 ESP-IDF 示例项目的 protocols/sockets 目录下。

2.2.5 应用层协议

应用层网络协议（IP 网络层协议之上）的相关文档存放在 应用层协议。

2.3 外设 API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 18 measurement channels (analog enabled pins).

These channels are supported:

ADC1:
• 8 channels: GPIO32 - GPIO39

ADC2:
• 10 channels: GPIO0, GPIO2, GPIO4, GPIO12 - GPIO15, GPIO25 - GPIO27

ADC Attenuation

Vref is the reference voltage used internally by ESP32 ADCs for measuring the input voltage. The ESP32 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>100 mV ~ 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>100 mV ~ 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>150 mV ~ 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>150 mV ~ 2450 mV</td>
</tr>
</tbody>
</table>
ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = \frac{D_{out} \times V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(V_{out})</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>(D_{out})</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>(V_{max})</td>
<td>Maximum measurable input analog voltage, see ADC Attenuation.</td>
</tr>
<tr>
<td>(D_{max})</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 4095 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See ADC Calibration.

ADC Limitations

- Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
  - ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
  - ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.
  - Since the ADC2 module is also used by the Wi-Fi, only one of them could get the preemption when using together, which means the `adc2_get_raw()` may get blocked until Wi-Fi stops, and vice versa.

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

ADC Single Read mode

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.
Chapter 2. API Reference

Single Read mode ADC example can be found in peripherals/adc/single_read directory of ESP-IDF examples. It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section ADC Calibration.

### Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

![ADC Noise Comparison](image)

**图 4: Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

### ADC Calibration

The `esp_adc_cal/include/esp_adc_cal.h` API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \) and is used to convert ADC readings to

---

**Notes**: See ADC Limitations for the limitation of using ADC single read mode.
voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values**

Calibration values are used to generate characteristic curves that account for the variation of ADC reference voltage of a particular ESP32 chip. There are currently 3 source(s) of calibration values on ESP32. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150 mV and 850 mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse BLOCK3.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse BLOCK0 during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, Default Vref will be used.

Individual measurement and burning of the eFuse Vref has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/after than 012018 (see Line 4 on figure below).

If you would like to purchase chips or modules with calibration, double check with distributor or Espressif (sales@espressif.com) directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if eFuse Vref is present by running the espefuse.py tool with adc_info parameter

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace /dev/ttyUSB0 with ESP32 board’s port name.

A chip that has specific eFuse Vref value programmed (in this case 1093 mV) will be reported as follows:

```
ADC VRef calibration: 1093 mV
```

In another example below the eFuse Vref is not programmed:
Chapter 2. API 参考

图 6: ESP32 Chip Surface Marking

ADC VRef calibration: None (1100 mV nominal)

For a chip with two point calibration the message will look similar to:

ADC VRef calibration: 1149 mV
ADC readings stored in efuse BLK3:
ADC1 Low reading (150 mV): 306
ADC1 High reading (850 mV): 3153
ADC2 Low reading (150 mV): 389
ADC2 High reading (850 mV): 3206

Application Extensions

For a full example see esp-idf: peripherals/adc/single_read

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

//Characterize ADC at particular attenu
essp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
essp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
//Check type of calibration value used to characterize ADC
if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
    printf("eFuse Vref");
} else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
    printf("Two Point");
} else {
    printf("Default");
}
```

Reading an ADC then converting the reading to a voltage:
#include "driver/adc.h"
#include "esp_adc_cal.h"
...
  uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
  uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

#include "driver/adc.h"
...
  esp_err_t status = adc_vref_to_gpio(ADC_UNIT_1, GPIO_NUM_25);
  if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
  } else {
    printf("failed to route v_ref\n");
  }

**GPIO Lookup Macros**

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. **ADC1_CHANNEL_0_GPIO_NUM** is the GPIO number of ADC1 channel 0.
2. **ADC1_GPIOn_CHANNEL** is the ADC1 channel number of GPIO n.

**API Reference**

This reference covers three components:

- **ADC driver**
- **ADC Calibration**
- **GPIO Lookup Macros**

**ADC driver**

**Header File**

- components/driver/esp32/include/driver/adc.h

**Functions**

```c
esp_err_t adc_set_i2s_data_source(adc_i2s_source_t src)
```
Set I2S data source.

- **Return**
  - ESP_OK success

- **Parameters**
  - src: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

```c
esp_err_t adc_i2s_mode_init(adc_unit_t adc_unit, adc_channel_t channel)
```
Initialize 12S ADC mode.

- **Return**
  - ESP_OK success

- **ESP_ERR_INVALID_ARG** Parameter error

- **Parameters**
  - adc_unit: ADC unit index
• channel: ADC channel index

```c
int hall_sensor_read (void)
    Read Hall Sensor.
```

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

**Return** The hall sensor reading.

**Header File**

- components/hal/include/hal/adc_types.h

**Structures**

```c
struct adc_digi_pattern_table_t
    ADC digital controller (DMA mode) conversion rules setting.
```

**Public Members**

```c
uint8_t atten : 2
    ADC sampling voltage attenuation configuration. Modification of attenuation affects the range of measurements. 0: measurement range 0 - 800mV, 1: measurement range 0 - 1100mV, 2: measurement range 0 - 1350mV, 3: measurement range 0 - 2600mV.
```

```c
uint8_t bit_width : 2
    ADC resolution.
    • 0: 9 bit;
    • 1: 10 bit;
    • 2: 11 bit;
    • 3: 12 bit.
```

```c
int8_t channel : 4
    ADC channel index.
```

```c
uint8_t val
    Raw data value
```

```c
struct adc_digi_output_data_t
    ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.
```

**Note** ESP32-S2: Member channel can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

**Public Members**

```c
uint16_t data : 12
    ADC real output data info. Resolution: 12 bit.
```

```c
uint16_t data : 11
    ADC real output data info. Resolution: 11 bit.
```

```c
uint16_t channel : 4
    ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.
```
struct adc_digi_output_data_t::[anonymous]::[anonymous] type1

When the configured output format is 12bit. ADC_DIGI_FORMAT_12BIT

uint16_t unit: 1
ADC unit index info. 0: ADC1; 1: ADC2.

struct adc_digi_output_data_t::[anonymous]::[anonymous] type2

When the configured output format is 11bit. ADC_DIGI_FORMAT_11BIT

uint16_t val
Raw data value

struct adc_digi_config_t
CONFIG_IDF_TARGET_ESP32.

ADC digital controller (DMA mode) configuration parameters.

Example setting: When using ADC1 channel0 to measure voltage, the sampling rate is required to be 1 kHz:

```
+---------------------+--------+--------+--------+
| sample rate | 1 kHz | 1 kHz | 1 kHz |
| conv_mode | single | both | alter |
| adc1_pattern_len | 1 | 1 | 1 |
| dig_clk.use_apll | 0 | 0 | 0 |
| dig_clk.div_num | 99 | 99 | 99 |
| dig_clk.div_b | 0 | 0 | 0 |
| dig_clk.div_a | 0 | 0 | 0 |
| interval | 400 | 400 | 200 |
+---------------------+--------+--------+--------+
| `trigger_meas_freq` | 1 kHz | 1 kHz | 2 kHz |
+---------------------+--------+--------+--------+
```

Explanation of the relationship between conv_limit_num, dma_eof_num and the number of DMA outputs:

```
+---------------------+--------+--------+--------+
| conv_mode | single | both | alter |
| trigger meas times | 1 | 1 | 1 |
+---------------------+--------+--------+--------+
| conv_limit_num | +1 | +1 | +1 |
| dma_eof_num | +1 | +2 | +1 |
| dma output (byte) | +2 | +4 | +2 |
+---------------------+--------+--------+--------+
```

**Public Members**

bool conv_limit_en
Enable the function of limiting ADC conversion times. If the number of ADC conversion trigger count is equal to the limit_num, the conversion is stopped.

uint32_t conv_limit_num
Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t adc1_pattern_len
Pattern table length for digital controller. Range: 0 ~ 16 (0: Don’t change the pattern table setting). The pattern table that defines the conversion rules for each SAR ADC. Each table has 16 items, in which channel selection, resolution and attenuation are stored. When the conversion is started, the controller reads conversion rules from the pattern table one by one. For each controller the scan sequence has at most 16 different rules before repeating itself.

uint32_t adc2_pattern_len
Refer to adc1_pattern_len
adc_digi_pattern_table_t *adc1_pattern
   Pointer to pattern table for digital controller. The table size defined by adc1_pattern_len.

adc_digi_pattern_table_t *adc2_pattern
   Refer to adc1_pattern

adc_digi_convert_mode_t conv_mode
   ADC conversion mode for digital controller. See adc_digi_convert_mode_t.

adc_digi_output_format_t format
   ADC output data format for digital controller. See adc_digi_output_format_t.

Enumerations
enum adc_unit_t
   ADC unit enumeration.

   Note For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

   Values:
   
   ADC_UNIT_1 = 1
      SAR ADC 1.
   ADC_UNIT_2 = 2
      SAR ADC 2.
   ADC_UNIT_BOTH = 3
      SAR ADC 1 and 2.
   ADC_UNIT_ALTER = 7
      SAR ADC 1 and 2 alternative mode.
   ADC_UNIT_MAX

enum adc_channel_t
   ADC channels handle. See adc1_channel_t, adc2_channel_t.

   Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

   Values:
   
   ADC_CHANNEL_0 = 0
      ADC channel
   ADC_CHANNEL_1
      ADC channel
   ADC_CHANNEL_2
      ADC channel
   ADC_CHANNEL_3
      ADC channel
   ADC_CHANNEL_4
      ADC channel
   ADC_CHANNEL_5
      ADC channel
   ADC_CHANNEL_6
      ADC channel
   ADC_CHANNEL_7
      ADC channel
   ADC_CHANNEL_8
      ADC channel
ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55x)

ADC_ATTEN_MAX

enum adc_i2s_source_t
ESP32 ADC DMA source selection.

Values:

ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX

enum adc_bits_width_t
ADC resolution setting option.

Values:

ADC_WIDTH_BIT_9 = 0
ADC capture width is 9Bit.

ADC_WIDTH_BIT_10 = 1
ADC capture width is 10Bit.

ADC_WIDTH_BIT_11 = 2
ADC capture width is 11Bit.

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Note The conversion mode affects the sampling frequency: SINGLE_UNIT_1: When the measurement is triggered, only ADC1 is sampled once. SINGLE_UNIT_2: When the measurement is triggered, only ADC2 is sampled once. BOTH_UNIT: When the measurement is triggered, ADC1 and ADC2 are sampled at the same time. ALTER_UNIT: When the measurement is triggered, ADC1 or ADC2 samples alternately.

Values:
ADC_CONV_SINGLE_UNIT_1 = 1
SAR ADC 1.

ADC_CONV_SINGLE_UNIT_2 = 2
SAR ADC 2.

ADC_CONV_BOTH_UNIT = 3
SAR ADC 1 and 2.

ADC_CONV_ALTER_UNIT = 7
SAR ADC 1 and 2 alternative mode.

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

Header File
- components/driver/include/driver/adc_common.h

Functions
void adc_power_on (void)
Enable ADC power.

void adc_power_off (void)
Power off SAR ADC.

void adc_power_acquire (void)
Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
Call adc_power_release when done using the ADC.

void adc_power_release (void)
Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
Call this function when done using the ADC.

esp_err_t adc_gpio_init (adc_unit_t adc_unit, adc_channel_t channel)
Initialize ADC pad.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- channel: ADC channel index

esp_err_t adcl_pad_get_io_num (adc1_channel_t channel, gpio_num_t *gpio_num)
Get the GPIO number of a specific ADC1 channel.

Return
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters
- channel: Channel to get the GPIO number
Chapter 2. API

- `gpio_num`: output buffer to hold the GPIO number

`esp_err_t adcl_config_channel_atten (adc1_channel_t channel, adc_atten_t atten)`

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td>ESP32</td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td>ESP32-S2</td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>0 ~ 1050</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>0 ~ 1300</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

`esp_err_t adcl_config_width (adc_bits_width_t width_bit)`

Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `width_bit`: Bit capture width for ADC1

`int adcl_get_raw (adc1_channel_t channel)`

Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call
adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will re-
move the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this
function is called. Configuring a new channel does not prevent a previously configured channel from
being read.

**Return**
-1: Parameter error
Other: ADC1 channel reading.

**Parameters**
- `channel`: ADC1 channel to read

```c
esp_err_t adc_set_data_inv (adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit index
- `inv_en`: whether enable data invert

```c
esp_err_t adc_set_clk_div (uint8_t clk_div)
```
Set ADC source clock.

**Return**
- ESP_OK success

**Parameters**
- `clk_div`: ADC clock divider, ADC clock is divided from APB clock

```c
esp_err_t adc_set_data_width (adc_unit_t adc_unit, adc_bits_width_t width_bit)
```
Configure ADC capture width.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit index
- `width_bit`: Bit capture width for ADC unit.

```c
void adc1_ulp_enable (void)
```
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using
`adc1_get_raw()` function.

Note that `adc1_config_channel_atten, adc1_config_width()` functions need to be called to configure
ADC1 channels, before ADC1 is used by the ULP.

```c
esp_err_t adc2_pad_get_io_num (adc2_channel_t channel, gpio_num_t *gpio_num)
```
Get the GPIO number of a specific ADC2 channel.

**Return**
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**
- `channel`: Channel to get the GPIO number
- `gpio_num`: output buffer to hold the GPIO number

```c
esp_err_t adc2_config_channel_atten (adc2_channel_t channel, adc_atten_t atten)
```
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it
is possible to read higher voltages.
Due to ADC characteristics, most accurate results are obtained within the "suggested range" shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation</th>
<th>suggested range</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(dB)</td>
<td>(mV)</td>
</tr>
<tr>
<td>0</td>
<td>100 ~ 950</td>
<td></td>
</tr>
<tr>
<td>2.5</td>
<td>100 ~ 1250</td>
<td></td>
</tr>
<tr>
<td>ESP32</td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
<tr>
<td>2.5</td>
<td>0 ~ 1050</td>
<td></td>
</tr>
<tr>
<td>ESP32-S2</td>
<td>6</td>
<td>0 ~ 1300</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 support hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.
**esp_err_t adc_vref_to_gpio (adc_unit_t adc_unit, gpio_num_t gpio)**

Output ADC1 or ADC2’s reference voltage to adc2_channe_t’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- [in] adc_unit: ADC unit index
- [in] gpio: GPIO number (Only ADC2’s channels IO are supported)

**esp_err_t adc2_vref_to_gpio (gpio_num_t gpio)**

Output ADC2 reference voltage to adc2_channe_t’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- [in] gpio: GPIO number (ADC2’s channels are supported)

**esp_err_t adc_digi_init (void)**

ADC digital controller initialization.

**Return**
- ESP_OK Success

**esp_err_t adc_digi_deinit (void)**

ADC digital controller deinitialization.

**Return**
- ESP_OK Success

**esp_err_t adc_digi_controller_config (const adc_digi_config_t *config)**

Setting the digital controller.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

**Parameters**
- config: Pointer to digital controller paramter. Refer to adc_digi_config_t.

**Macros**

**ADC_ATTEN_0db**
ADC rtc controller attenuation option.

**Note** This definitions are only for being back-compatible

**ADC_ATTEN_2_5db**

**ADC_ATTEN_6db**

**ADC_ATTEN_11db**

**ADC_WIDTH_BIT_DEFAULT**
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by SOC_ADC_MAX_BITWIDTH defined in soc_caps.h.

**ADC_WIDTH_9Bit**

**ADC_WIDTH_10Bit**
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit

Enumerations

enum adc1_channel_t

Values:
ADC1_CHANNEL_0 = 0
ADC1 channel 0 is GPIO36
ADC1_CHANNEL_1
ADC1 channel 1 is GPIO37
ADC1_CHANNEL_2
ADC1 channel 2 is GPIO38
ADC1_CHANNEL_3
ADC1 channel 3 is GPIO39
ADC1_CHANNEL_4
ADC1 channel 4 is GPIO32
ADC1_CHANNEL_5
ADC1 channel 5 is GPIO33
ADC1_CHANNEL_6
ADC1 channel 6 is GPIO34
ADC1_CHANNEL_7
ADC1 channel 7 is GPIO35
ADC1_CHANNEL_MAX

enum adc2_channel_t

Values:
ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)
ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)
ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)
ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)
ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)
ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)
ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)
ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)
ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)
ADC2_CHANNEL_MAX
### enum adc_i2s_encode_t

ADC digital controller encode option.

Values:

- **ADC_ENCODE_12BIT**: ADC to DMA data format, [15:12]-channel [11:0]-12 bits ADC data
- **ADC_ENCODE_11BIT**: ADC to DMA data format, [15]-unit, [14:11]-channel [10:0]-11 bits ADC data
- **ADC_ENCODE_MAX**

### ADC Calibration

**Header File**

- components/esp_adc_cal/include/esp_adc_cal.h

**Functions**

- **esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)**

  Checks if ADC calibration values are burned into eFuse.

  This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

  **Note**: in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

  **Return**
  - ESP_OK: The calibration mode is supported in eFuse
  - ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
  - ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

- **esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)**

  Characterize an ADC at a particular attenuation.

  This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[y = \text{coeff}_a \times x + \text{coeff}_b\]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

  **Note**: For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

  **Return**
  - ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
  - ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
  - ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

  **Parameters**
  - \[\text{in}\] adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
  - \[\text{in}\] atten: Attenuation to characterize
  - \[\text{in}\] bit_width: Bit width configuration of ADC
  - \[\text{in}\] default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
  - \[\text{out}\] chars: Pointer to empty structure used to store ADC characteristics
uint32_t esp_adc_cal_raw_to_voltage (uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

**Note** Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return** Voltage in mV

**Parameters**
- [in] adc_reading: ADC reading
- [in] chars: Pointer to initialized structure containing ADC characteristics

esp_err_t esp_adc_cal_get_voltage (adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

**Note** The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

**Return**
- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

**Parameters**
- [in] channel: ADC Channel to read
- [in] chars: Pointer to initialized ADC characteristics structure
- [out] voltage: Pointer to store converted voltage

**Structures**

**struct esp_adc_cal_characteristics_t**

Structure storing characteristics of an ADC.

**Note** Call esp_adc_cal_characterize() to initialize the structure

**Public Members**

**adc_unit_t**

ADC number

**adc_atten_t**

ADC attenuation

**adc_bits_width_t**

ADC bit width

**uint32_t**

Gradient of ADC-Voltage curve

**uint32_t**

Offset of ADC-Voltage curve

**uint32_t**

Vref used by lookup table

**const uint32_t**

Pointer to low Vref curve of lookup table (NULL if unused)

**const uint32_t**

Pointer to high Vref curve of lookup table (NULL if unused)
uint8_t version
    ADC Calibration

Enumerations

enum esp_adc_cal_value_t
    Type of calibration value used in characterization.
    Values:
    ESP_ADC_CAL_VAL_EFUSE_VREF = 0
        Characterization based on reference voltage stored in eFuse
    ESP_ADC_CAL_VAL_EFUSE_TP = 1
        Characterization based on Two Point values stored in eFuse
    ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
        Characterization based on default reference voltage
    ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
        Characterization based on Two Point values and fitting curve coefficients stored in eFuse
    ESP_ADC_CAL_VAL_MAX
    ESP_ADC_CAL_VAL_NOT_SUPPORTED

2.3.2 Digital To Analog Converter (DAC)

Overview

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data by the digital controller, via the I2S driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

Application Example

Setting DAC channel 1 (GPIO25) voltage to approx 0.78 of VDD_A voltage (VDD_A * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>
...
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```
Chapter 2. API

API Reference

Header File

- components/driver/esp32/include/driver/dac.h

Functions

*esp_err_t dac_i2s_enable (void)*
Enable DAC output data from I2S.

Return
- ESP_OK success

*esp_err_t dac_i2s_disable (void)*
Disable DAC output data from I2S.

Return
- ESP_OK success

Header File

- components/driver/include/driver/dac_common.h

Functions

*esp_err_t dac_pad_get_io_num (dac_channel_t channel, gpio_num_t *gpio_num)*
Get the GPIO number of a specific DAC channel.

Return
- ESP_OK if success

Parameters
- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

*esp_err_t dac_output_voltage (dac_channel_t channel, uint8_t dac_value)*
Set DAC output voltage. DAC output is 8-bit. Maximum (255) corresponds to VDD3P3_RTC.

Note Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return
- ESP_OK success

Parameters
- channel: DAC channel
- dac_value: DAC output value

*esp_err_t dac_output_enable (dac_channel_t channel)*
DAC pad output enable.

Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

Parameters
- channel: DAC channel

*esp_err_t dac_output_disable (dac_channel_t channel)*
DAC pad output disable.

Note DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

Return
- ESP_OK success

Parameters
- channel: DAC channel

*esp_err_t dac_cw_generator_enable (void)*
Enable cosine wave generator output.
Chapter 2. API

Return
• ESP_OK success

\texttt{esp_err_t dac_cw_generator_disable (void)}
Disable cosine wave generator output.

Return
• ESP_OK success

\texttt{esp_err_t dac_cw_generator_config (dac_config_t *cw)}
Config the cosine wave generator function in DAC module.

Parameters
• \texttt{cw}: Configuration.

\textbf{GPIO Lookup Macros} Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.
1. \texttt{DAC_CHANNEL_1_GPIO_NUM} is the GPIO number of channel 1 (GPIO25);
2. \texttt{DAC_GPIO26_CHANNEL} is the channel number of GPIO 26 (channel 2).

\textbf{Header File}
• components/soc/esp32/include/soc/dac_channel.h

\textbf{Macros}
\texttt{DAC_GPIO25_CHANNEL}
\texttt{DAC_CHANNEL_1_GPIO_NUM}
\texttt{DAC_GPIO26_CHANNEL}
\texttt{DAC_CHANNEL_2_GPIO_NUM}

\textbf{Header File}
• components/hal/include/hal/dac_types.h

\textbf{Structures}
\texttt{struct dac_cw_config_t}
Config the cosine wave generator function in DAC module.

\textbf{Public Members}
\texttt{dac_channel_t en_ch}
Enable the cosine wave generator of DAC channel.

\texttt{dac_cw_scale_t scale}
Set the amplitude of the cosine wave generator output.

\texttt{dac_cw_phase_t phase}
Set the phase of the cosine wave generator output.

\texttt{uint32_t freq}
Set frequency of cosine wave generator output. Range: 130(130Hz) \~ 55000(100KHz).
int8_t offset
Set the voltage value of the DC component of the cosine wave generator output. Note: Unreasonable settings can cause waveform to be oversaturated. Range: -128 ~ 127.

Enumerations
enum dac_channel_t
Values:
DAC_CHANNEL_1 = 0
DAC channel 1 is GPIO25(ESP32) / GPIO17(ESP32S2)
DAC_CHANNEL_2 = 1
DAC channel 2 is GPIO26(ESP32) / GPIO18(ESP32S2)
DAC_CHANNEL_MAX
enum dac_cw_scale_t
The multiple of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.
Values:
DAC_CW_SCALE_1 = 0x0
1/1. Default.
DAC_CW_SCALE_2 = 0x1
1/2.
DAC_CW_SCALE_4 = 0x2
1/4.
DAC_CWSCALE_8 = 0x3
1/8.
enum dac_cw_phase_t
Set the phase of the cosine wave generator output.
Values:
DAC_CW_PHASE_0 = 0x2
Phase shift +0°
DAC_CW_PHASE_180 = 0x3
Phase shift +180°

2.3.3 通用定时间器
简介
ESP32 芯片提供两组硬件定时器。每组包含 2 个通用硬件定时器。这些 64 位通用定时器均基于 16 位预分频器和 64 位可自动重新加载向上/向下计数器。

功能概述
下文介绍了配置和操作定时器的常规步骤：
• 定时器初始化 - 启动定时器前应设置的参数，以及每个设置提供的具体功能。
• 定时器控制 - 如何读取定时器的值。如何暂停/启动定时器以及如何改变定时器的操作方式。
• 警报 - 如何设置和使用警报。
• 处理中断事务 - 如何使用中断提供的回调函数。
定时器初始化

两个 ESP32 定时器组中，每组都有 2 个定时器，总共共有 4 个定时器供使用。可使用 `timer_group_t` 查看 ESP32 定时器组的类型，使用 `timer_idx_t` 查看每组中的具体定时器类型。

首先调用 `timer_init()` 函数，并将 `timer_config_t` 结构体传递给此函数，用于定义定时器的工作方式。实现定时器初始化。特别注意设置各个定时器参数：

- **分频器**：设置定时器中计数器计数的速度，`divider` 的设置将用作输入时钟源的除数。默认的时钟源是 APB_CLK（一般是 80 MHz）。更多有关 APB_CLK 时钟频率信息，请查看 ESP32 技术参考手册 > 复位和时钟 [PDF] 章节。
- **模式**：设置计数器的递增或递减。可通过从 `timer_count_dir_t` 中选取一个值，然后使用 `counter_dir` 来选择模式。
- **计数器使能**：如果计数器已使能，在调用 `timer_init()` 后计数器将立即开始递增/递减。您可通过从 `timer_start_t` 中选取一个值，然后使用 `counter_en` 改变此行为。
- **报警使能**：可使用 `alarm_en` 设置。
- **自动重载**：设置计数器是否应该在定时器警报上使用 `auto_reload` 自动重载首个计数值，还是继续递增或递减。

要获取定时器设置的当前值，请使用函数 `timer_get_config()`。

定时器控制

定时器使能后会开始计数。要使能定时器，可首先设置 `counter_en` 为 `true`，然后调用函数 `timer_init()`，或者直接调用函数 `timer_start()`。您可通过调用函数 `timer_set_counter_value()` 来指定定时器的首个计数值。要检查定时器的当前值，调用函数 `timer_get_counter_value()` 或 `timer_get_counter_time_sec()`。

可通过调用函数 `timer_pause()` 随时暂停定时器。若要再次启动它，可调用函数 `timer_start()`。

要重新配置定时器，可调用函数 `timer_init()`，该函数详细介绍见定时器初始化。

除此之外，还可通过使用专有函数更改个别设置来重新配置定时器：

<table>
<thead>
<tr>
<th>设置</th>
<th>专有函数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>分频器</td>
<td>timer_set_divider()</td>
<td>更改分频器，为避免发生不可预测情况，更改分频器时应暂停定时器。如果定时器正在运行，则使用 <code>timer_set_divider()</code> 将其暂停并更改设置，然后重新启动定时器。</td>
</tr>
<tr>
<td>模式</td>
<td>timer_set_count_dir()</td>
<td>设置计数器为递增还是递减</td>
</tr>
<tr>
<td>自动重载</td>
<td>timer_set_auto_reload()</td>
<td>设置是否在定时器警报上重载首个计数值</td>
</tr>
</tbody>
</table>

警告

要设置警报，先调用函数 `timer_set_alarm_value()`，然后使用 `timer_set_alarm()` 使能警报。当调用函数 `timer_init()` 时，也可以在定时器初始化阶段使能警报。

警报已使能且定时器达到警报值后，根据配置，可能会出现以下两种行为：

- 如果先前已配置，此时将触发中断。有关如何配置中断，请参见处理中断事务。
- 如 `auto_reload` 已使能，定时器的计数器将重新加载，从先前配置好的值开始再次计数。应使用函数 `timer_set_counter_value()` 预先设置该值。

注解：

- 如果已设置警报值且定时器已超过该值，则将立即触发警报。
- 一旦触发后，警报将自动关闭，需要重新使能才能再次触发。

要检查某特定的警报值，调用函数 `timer_get_alarm_value()`。

---

**Chapter 2. API 参考**

| ESP32 Systems | 665 | Release v5.0-dev-489-gef98a36 | Submit Document Feedback |

- timer_init()
- timer_get_counter_value()
- timer_set_alarm_value()
- timer_set_counter_value()
- timer_start()
- timer_get_config()
- timer_set_divider()
**处理中断事务** 通过调用 `timer_isr_callback_add()` 函数并向该函数传递组 ID、定时器 ID、回调处理程序以及用户数据，可以给某个定时器注册一个中断回调函数。回调处理程序会在 ISR 上下文中调用，因此用户不能在回调函数中放置任何会阻塞 CPU 的 API。

相较于从头编写中断处理程序，使用中断回调函数的好处是，用户无需检测和处理中断的状态位，这些操作会由驱动中默认的中断处理程序替我们完成。

有关如何使用中断回调函数，请参考如下应用示例。

**应用示例**

64 位通用硬件定时器示例：`peripherals/timer_group`。

**API 参考**

**Header File**

- components/driver/include/driver/timer.h

**Functions**

* `esp_err_t timer_get_counter_value (timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- timer_val: Pointer to accept timer counter value.

* `esp_err_t timer_get_counter_time_sec (timer_group_t group_num, timer_idx_t timer_num, double *time)`

Read the counter value of hardware timer, in unit of a given scale.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- time: Pointer, type of double*, to accept timer counter value, in seconds.

* `esp_err_t timer_set_counter_value (timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)`

Set counter value to hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- load_val: Counter value to write to the hardware timer.

* `esp_err_t timer_start (timer_group_t group_num, timer_idx_t timer_num)`

Start the counter of hardware timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_pause(timer_group_t group_num, timer_idx_t timer_num)`

Pause the counter of hardware timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

`esp_err_t timer_set_counter_mode(timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)`

Set counting mode for hardware timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- counter_dir: Counting direction of timer, count-up or count-down

`esp_err_t timer_set_auto_reload(timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)`

Enable or disable counter reload function when alarm event occurs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- reload: Counter reload mode

`esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)`

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- divider: Timer clock divider value. The divider’s range is from from 2 to 65536.

`esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)`

Set timer alarm value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- alarm_value: A 64-bit value to set the alarm value.

`esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)`

Get timer alarm value.
## Chapter 2. API

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value**: Pointer of A 64-bit value to accept the alarm value.

```c
esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)
```

Enable or disable generation of timer alarm events.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters
- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_en**: To enable or disable timer alarm function.

```c
esp_err_t timer_isr_callback_add(timer_group_t group_num, timer_idx_t timer_num, timer_isr_t isr_handler, void* arg, int intr_alloc_flags)
```

Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

**Note** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call `timer_isr_register(...)` to register ISR.

### Parameters
- **group_num**: Timer group number
- **timer_num**: Timer index of timer group
- **isr_handler**: Interrupt handler function, it is a callback function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

If the `intr_alloc_flags` value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_isr_callback_remove(timer_group_t group_num, timer_idx_t timer_num)
```

Remove ISR handle callback for the corresponding timer.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_isr_register(timer_group_t group_num, timer_idx_t timer_num, void (*fn)(void*) void * arg, int intr_alloc_flags, timer_isr_handle_t *handle)
```

Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the `intr_alloc_flags` value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

**Note** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call `timer_spinlock_take(..)` before your handling, and call `timer_spinlock_give(…)` after your handling.
### Parameters
- **group_num**: Timer group number
- **timer_num**: Timer index of timer group
- **fn**: Interrupt handler function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t timer_init (timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)
```
Initializes and configures the timer.

### Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **config**: Pointer to timer initialization parameters.

```c
esp_err_t timer_deinit (timer_group_t group_num, timer_idx_t timer_num)
```
Deinitializes the timer.

### Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_get_config (timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)
```
Get timer configure value.

### Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **config**: Pointer of struct to accept timer parameters.

```c
esp_err_t timer_group_intr_enable (timer_group_t group_num, timer_intr_t intr_mask)
```
Enable timer group interrupt, by enable mask.

### Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask**: Timer interrupt enable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

```c
esp_err_t timer_group_intr_disable (timer_group_t group_num, timer_intr_t intr_mask)
```
Disable timer group interrupt, by disable mask.

### Return
- ESP_OK Success
Chapter 2. API

• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• intr_mask: Timer interrupt disable mask.
  – TIMER_INTR_T0: t0 interrupt
  – TIMER_INTR_T1: t1 interrupt
  – TIMER_INTR_WDT: watchdog interrupt

`esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)`
Enable timer interrupt.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)`
Disable timer interrupt.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Clear timer interrupt status, just used in ISR.

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`void timer_group_clr_intr_status_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Clear timer interrupt status, just used in ISR.

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`void timer_group_enable_alarm_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Enable alarm interrupt, just used in ISR.

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`uint64_t timer_group_get_counter_value_in_isr(timer_group_t group_num, timer_idx_t timer_num)`
Get the current counter value, just used in ISR.

Return
• Counter value

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
• timer_num: Timer index.

`void timer_group_set_alarm_value_in_isr(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_val)`
Set the alarm threshold for the timer, just used in ISR.

Parameters
• group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
**void timer_group_set_counter_enable_in_isr**

Enable/disable a counter, just used in ISR.

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index.
- **counter_en**: Enable/disable.

**timer_intr_t**

**timer_group_intr_get_in_isr**

Get the masked interrupt status, just used in ISR.

**Return**
- Interrupt status

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

**uint32_t**

**timer_group_get_intr_status_in_isr**

Get interrupt status, just used in ISR.

**Return**
- Interrupt status

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

**void timer_group_clr_intr_sta_in_isr**

Clear the masked interrupt status, just used in ISR.

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask**: Masked interrupt.

**bool timer_group_get_auto_reload_in_isr**

Get auto reload enable status, just used in ISR.

**Return**
- True Auto reload enabled
- False Auto reload disabled

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index

**esp_err_t**

**timer_spinlock_take**

Take timer spinlock to enter critical protect.

**Note** Deprecated, the recommended way is to use ISR callbacks instead, see timer_group_example_main

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

**esp_err_t**

**timer_spinlock_give**

Give timer spinlock to exit critical protect.

**Note** Deprecated, the recommended way is to use ISR callbacks instead, see timer_group_example_main

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
Chapter 2. API 参考

**Structures**

```c
struct timer_config_t {
    // Data structure with timer’s configuration settings.
}
```

**Public Members**

- `timer_alarm_t alarm_en`
  - Timer alarm enable
- `timer_start_t counter_en`
  - Counter enable
- `timer_intr_mode_t intr_type`
  - Interrupt mode
- `timer_count_dir_t counter_dir`
  - Counter direction
- `timer_autoreload_t auto_reload`
  - Timer auto-reload
- `timer_src_clk_t clk_src`
  - Selects source clock.
- `uint32_t divider`
  - Counter clock divider

**Macros**

```c
#define TIMER_BASE_CLK
```

- Frequency of the clock on the input of the timer groups.

  **Note** This macro is not correct for Timer Groups with multiple clock sources (e.g. APB, XTAL) So please don’t use it in your application, we keep it here only for backward compatible

**Type Definitions**

```c
typedef bool (*timer_isr_t)(void *)
```

- Interrupt handle callback function. User need to retrun a bool value in callback.

  **Return**
  - True Do task yield at the end of ISR
  - False Not do task yield at the end of ISR

  **Note** If you called FreeRTOS functions in callback, you need to return true or false based on the retrun value of argument pxHigherPriorityTaskWoken. For example, xQueueSendFromISR is called in callback, if the return value pxHigherPriorityTaskWoken of any FreeRTOS calls is pdTRUE, return true; otherwise return false.

**Enumerations**

```c
enum timer_group_t {
    TIMER_GROUP_0 = 0,
    TIMER_GROUP_1 = 1
}
```

- Selects a Timer-Group out of 2 available groups.

  **Values:**
  - `TIMER_GROUP_0 = 0`
    - Hw timer group 0
  - `TIMER_GROUP_1 = 1`
    - Hw timer group 1
Chapter 2. API

TIMER_GROUP_MAX
Maximum number of Hw timer groups

enum timer_idx_t
Select a hardware timer from timer groups.
Values:

TIMER_0 = 0
Select timer0 of GROUPx

TIMER_1 = 1
Select timer1 of GROUPx

TIMER_MAX

enum timer_intr_t
Interrupt types of the timer.
Values:

TIMER_INTR_T0 = 1 << 0
interrupt of timer 0

TIMER_INTR_T1 = 1 << 1
interrupt of timer 1

TIMER_INTR_WDT = 1 << 2
interrupt of watchdog

TIMER_INTR_NONE = 0

enum timer_count_dir_t
Decides the direction of counter.
Values:

TIMER_COUNT_DOWN = GPTIMER_COUNT_DOWN
Descending Count from cnt.high\|cnt.low

TIMER_COUNT_UP = GPTIMER_COUNT_UP
Ascending Count from Zero

TIMER_COUNT_MAX
Maximum number of timer count directions

enum timer_start_t
Decides whether timer is on or paused.
Values:

TIMER_PAUSE
Pause timer counter

TIMER_START
Start timer counter

enum timer_alarm_t
Decides whether to enable alarm mode.
Values:

TIMER_ALARM_DIS = 0
Disable timer alarm

TIMER_ALARM_EN = 1
Enable timer alarm

TIMER_ALARM_MAX
enum timer_intr_mode_t
Select interrupt type if running in alarm mode.

Values:

TIMER_INTR_LEVEL = 0
Interrupt mode: level mode

TIMER_INTR_MAX

enum timer_autoreload_t
Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

TIMER_AUTORELOAD_DIS = 0
Disable auto-reload: hardware will not load counter value after an alarm event

TIMER_AUTORELOAD_EN = 1
Enable auto-reload: hardware will load counter value after an alarm event

TIMER_AUTORELOAD_MAX

enum timer_src_clk_t
Select timer source clock.

Values:

TIMER_SRC_CLK_APB = GPTIMER_CLK_SRC_APB
Select APB as the source clock

Header File
• components/hal/include/hal/timer_types.h

Enumerations
enum gptimer_clock_source_t
GPTimer clock source.

Note The clock source listed here is not supported on all targets

<table>
<thead>
<tr>
<th>GPTimer clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPTIMER_CLK_SRC_APB</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>GPTIMER_CLK_SRC_XTAL</td>
<td>Medium resolution, high accuracy</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

Values:

GPTIMER_CLK_SRC_APB
Select APB as the source clock

GPTIMER_CLK_SRC_XTAL
Select XTAL as the source clock

enum gptimer_count_direction_t
GPTimer count direction.

Values:

GPTIMER_COUNT_DOWN
Decrease count value

GPTIMER_COUNT_UP
Increase count value
enum gptimer_alarm_action_t
GPTimer actions on alarm event.

Values:

GPTIMER_ALARM_ACTION_CONTINUE
Counter will pass through the alarm point and continue counting

GPTIMER_ALARM_ACTION_STOP
Counter will stop on alarm event

GPTIMER_ALARM_ACTION_RELOAD
Counter will do reload on alarm event

2.3.4 GPIO & RTC GPIO

Overview

The ESP32 chip features 34 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see ESP32 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal. The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

<table>

</tr>
</tbody>
</table>

**Notes:**

- Strapping pin: GPIO0, GPIO2, GPIO5, GPIO12 (MTDI), and GPIO15 (MTDO) are strapping pins. For more information, please refer to ESP32 datasheet.
- SPI0/1: GPIO6-11 and GPIO16-17 are usually connected to the SPI flash and PSRAM integrated on the module and therefore should not be used for other purposes.
- JTAG: GPIO12-15 are usually used for inline debug.
- GPI: GPIO34-39 can only be set as input mode and do not have software-enabled pullup or pulldown functions.
- TXD & RXD are usually used for flashing and debugging.
- ADC2: ADC2 pins cannot be used when Wi-Fi is used. So, if you’re using Wi-Fi and you’re having trouble getting the value from an ADC2 GPIO, you may consider using an ADC1 GPIO instead, that should solve your problem. For more details, please refer to ADC limitations.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use.

### Application Example

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

### API Reference - Normal GPIO

#### Header File

- components/driver/include/driver/gpio.h

#### Functions

```c
esp_err_t gpio_config (const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

Configure GPIO’s Mode, pull-up, pull-down, IntrType

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin (gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP_OK.

**Parameters**

- gpio_num: GPIO number.
**esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Set interrupt trigger type.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to set the trigger type of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **intr_type**: Interrupt type, select from gpio_int_type_t

**esp_err_t gpio_intr_enable(gpio_num_t gpio_num)**

Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

**esp_err_t gpio_intr_disable(gpio_num_t gpio_num)**

Disable GPIO module interrupt signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

**esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)**

Set output level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
- **gpio_num**: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **level**: Output level. 0: low; 1: high

**int gpio_get_level(gpio_num_t gpio_num)**

Get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- **gpio_num**: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

**esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)**

Set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Return**
**Parameters**

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16`(16);
- `mode`: GPIO direction

`esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)`

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16`(16);
- `pull`: GPIO pull up/down mode.

`esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)`

Enable GPIO wake-up function.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

`esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)`

Disable GPIO wake-up function.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**

- `gpio_num`: GPIO number

`esp_err_t gpio_isr_register(void (*fn)(void *)) void * , void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)`

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**

- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : GPIO error
- ESP_ERR_NOT_FOUND : No free interrupt found with the specified flags

`esp_err_t gpio_pullup_en(gpio_num_t gpio_num)`

Enable pull-up on GPIO.
Chapter 2. API 参考

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)
Disable pull-up on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)
Enable pull-down on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)
Disable pull-down on GPIO.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

esp_err_t gpio_install_isr_service(int intr_alloc_flags)
Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM No memory to install this service
• ESP_ERR_INVALID_STATE ISR service already installed.
• ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
• ESP_ERR_INVALID_ARG GPIO error

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void gpio_uninstall_isr_service(void)
Uninstall the driver’s GPIO ISR service, freeing related resources.

esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number
• isr_handler: ISR handler function for the corresponding GPIO number.
• args: parameter for ISR handler.

esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)
Remove ISR handler for the corresponding GPIO pin.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
• strength: Drive capability of the pad

esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
• strength: Pointer to accept drive capability of the pad

esp_err_t gpio_hold_en (gpio_num_t gpio_num)
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, gpio_deep_sleep_hold_en should also be called.

Power down or call gpio_hold_dis will disable this function.

Return
• ESP_OK Success
• ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
• gpio_num: GPIO number, only support output-capable GPIOs

esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and gpio_hold_dis is called, gpio18 will output low level (because gpio18 is input mode by
default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling gpio_hold_dis.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- gpio_num: GPIO number, only support output-capable GPIOs

void gpio_deep_sleep_hold_en (void)
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call gpio_hold_dis will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

void gpio_deep_sleep_hold_dis (void)
Disable all digital gpio pad hold function during Deep-sleep.

void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
Set pad input to a peripheral signal through the IOMUX.

Parameters
- gpio_num: GPIO number of the pad.
- signal_idx: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
Set peripheral output to an GPIO pad through the IOMUX.

Parameters
- gpio_num: gpio_num GPIO number of the pad.
- func: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- oen_inv: True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
Enable SLP_SEL to change GPIO status automatically in lightsleep.

Return
- ESP_OK Success

Parameters
- gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
Disable SLP_SEL to change GPIO status automatically in lightsleep.

Return
- ESP_OK Success

Parameters
- gpio_num: GPIO number of the pad.

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
GPIO set direction at sleep.

Configure GPIO direction, such as output_only,input_only,output_and_input

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

Parameters
**Chapter 2. API**

- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `mode`: GPIO direction

```c
esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
```
Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `pull`: GPIO pull up/down mode.

**Macros**

- `GPIO_PIN_COUNT`
- `GPIO_IS_VALID_GPIO (gpio_num)`
  Check whether it is a valid GPIO number.
- `GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)`
  Check whether it can be a valid GPIO number of output mode.

**Type Definitions**

```c
typedef intr_handle_t gpio_isr_handle_t
```

**Header File**

- components/hal/include/hal/gpio_types.h

**Structures**

```c
struct gpio_config_t
Configuration parameters of GPIO pad for gpio_config function.
```

**Public Members**

- `uint64_t pin_bit_mask`
  GPIO pin: set with bit mask, each bit maps to a GPIO

GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File

• components/driver/include/driver/rtc_io.h

Functions

static bool rtc_gpio_is_valid_gpio(gpio_num_t gpio_num)
    Determine if the specified GPIO is a valid RTC GPIO.
    Return true if GPIO is valid for RTC GPIO use. false otherwise.
    Parameters
    • gpio_num: GPIO number

static int rtc_io_number_get(gpio_num_t gpio_num)
    Get RTC IO index number by gpio number.
    Return >=0: Index of rtcio. -1: The gpio is not rtcio.
    Parameters
    • gpio_num: GPIO number

esp_err_t rtc_gpio_init(gpio_num_t gpio_num)
    Init a GPIO as RTC GPIO.
    This function must be called when initializing a pad for an analog function.
    Return
    • ESP_OK success
    • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
    Parameters
    • gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_deinit(gpio_num_t gpio_num)
    Init a GPIO as digital GPIO.
    Return
    • ESP_OK success
    • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
    Parameters
    • gpio_num: GPIO number (e.g. GPIO_NUM_12)

uint32_t rtc_gpio_get_level(gpio_num_t gpio_num)
    Get the RTC IO input level.
    Return
    • 1 High level
    • 0 Low level
    • ESP_ERR_INVALID_ARG GPIO is not an RTC IO
Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_set_level(gpio_num_t gpio_num, uint32_t level)
```
Set the RTC IO output level.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- level: output level

```c
esp_err_t rtc_gpio_set_direction(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```
RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

```c
esp_err_t rtc_gpio_set_direction_in_sleep(gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```
RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
- mode: GPIO direction

```c
esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)
```
RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)
```
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)
```
RTC GPIO pullup disable.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)`
RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)`
Set RTC GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

`esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)`
Get RTC GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

`esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)`
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)`
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)
**esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)**

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**Parameters**

- gpio_num: GPIO number (e.g. GPIO_NUM_12).

**esp_err_t rtc_gpio_force_hold_all(void)**

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all(void)**

Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable wakeup from sleep mode using specific GPIO.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**

- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)**

Disable wakeup from sleep mode using specific GPIO.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Parameters**

- gpio_num: GPIO number

**Macros**

RTC_GPIO_IS_VALID_GPIO(gpio_num)

**Header File**

- components/hal/include/hal/rtc_io_types.h

**Enumerations**

enum rtc_gpio_mode_t

RTCIO output/input mode type.

**Values:**

- RTC_GPIO_MODE_INPUT_ONLY
  - Pad input
- RTC_GPIO_MODE_OUTPUT_ONLY
  - Pad output
**RTC_GPIO_MODE_INPUT_OUTPUT**
Pad input + output

**RTC_GPIO_MODE_DISABLED**
Pad (output + input) disable

**RTC_GPIO_MODE_OUTPUT_OD**
Pad open-drain output

**RTC_GPIO_MODE_INPUT_OUTPUT_OD**
Pad input + open-drain output

### 2.3.5 I2C

#### 概述

I2C 是一种串行同步半双工通信协议，总线上可以同时挂载多个主机和从机。I2C 总线由串行数据线（SDA）和串行时钟线（SCL）线构成。这些线都需要上拉电阻。

I2C 具有简单且制造成本低廉等优点，主要用于低速外围设备的短距离通信（一英尺以内）。

ESP32 有两个 I2C 控制器（也称为端口），负责处理在 I2C 两根总线上的通信。每个控制器都可以设置为主机或从机。例如，可以同时让一个控制器用作主机，另一个用作从机。

#### 驱动程序的功能

I2C 驱动程序管理在 I2C 总线上设备的通信，该驱动程序具备以下功能：

- 在主机模式下读写字节
- 支持从机模式
- 读取并写入寄存器，然后由主机读取/写入

#### 使用驱动程序

以下部分将指导您完成 I2C 驱动程序配置和工作的基本步骤：

1. 配置驱动程序 - 设置初始化参数（如主机模式或从机模式，SDA 和 SCL 使用的 GPIO 管脚，时钟速度等）
2. 安装驱动程序 - 激活一个 I2C 控制器的驱动，该控制器可为主机也可为从机
3. 根据是为机还是从机配置驱动程序，选择合适的项目
   a. 主机模式下通信 - 发起通信（主机模式）
   b. 从机模式下通信 - 响应主机消息（从机模式）
4. 中断处理 - 配置 I2C 中断服务
5. 用户自定义配置 - 调整默认的 I2C 通信参数（如时序、位序等）
6. 错误处理 - 如何识别和处理驱动程序配置和通信错误
7. 删除驱动程序 - 在通信结束时释放 I2C 驱动程序所使用的资源

#### 配置驱动程序

建立 I2C 通信第一步是配置驱动程序，这需要设置 I2C 配置结构中的几个参数：

- 设置 I2C 工作模式 - 从 i2c_mode_t 中选择主机模式或从机模式
- 设置通信管脚
  - 指定 SDA 和 SCL 信号使用的 GPIO 管脚
  - 是否启用 ESP32 的内部上拉电阻
- (仅限主机模式) 设置 I2C 时钟速度
- (仅限从机模式) 设置以下内容：
  - 是否应启用 10 位寻址模式
  - 定义 从机地址
然而，初始化给定I2C端口的配置，请使用端口号和i2c_config_t作为函数调用参数来调用i2c_param_config() 函数。

配置示例（主）：

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,  // select GPIO specific to your...
    .scl_io_num = I2C_MASTER_SCL_IO,  // select GPIO specific to your...
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your...
    .clk_flags = 0,  // < Optional, you can use I2C_SCLK_SRC_FLAG_*
                      // .clk_flags = 0, /*!< Optional, you can use I2C_SCLK_SRC_FLAG_*
                      // flags to choose i2c source clock here. */
};
```

配置示例（从）：

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your...
    .scl_io_num = I2C_SLAVE_SCL_IO,  // select GPIO specific to your...
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.slave_addr = ESP_SLAVE_ADDR,  // address of your project
};
```

在此阶段，i2c_param_config() 还将其他I2C配置参数设置为I2C总线协议规范中定义的默认值。有关默认值及修改默认值的详细信息，请参考用户自定义配置。

### 时钟源配置

增加了时钟源分配器，用于支持不同的时钟源。时钟分配器将选择一个满足所有频率和能力要求的时钟源（如i2c_config_t::clk_flags中的要求）。

当i2c_config_t::clk_flags为0时，时钟分配器将仅根据所需频率进行选择。如果不需要诸如APB之类的特殊功能，则可以将时钟分配器配置为仅根据所需频率选择源时钟。为此，请将i2c_config_t::clk_flags设置为0。有关时钟特性，请参见下表。

#### 注解：
如果时钟不满足请求的功能，则该时钟不是有效的选项，即，请求的功能中的任何位（clk_flags）在时钟的功能中均为0。

<table>
<thead>
<tr>
<th>时钟名称</th>
<th>时钟频率</th>
<th>SCL 的最大频率</th>
<th>时钟功能</th>
</tr>

<td>4 MHz</td>
<td>/</td>
</tr>
</tbody>
</table>

表2: ESP32时钟源特性

对i2c_config_t::clk_flags的解释如下：

Espressif Systems

Submit Document Feedback
Chapter 2. API 参考

1. **I2C_SCLK_SRC_FLAG_AWARE_DFS**: 当 APB 时钟改变时，时钟的波特率不会改变。
2. **I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**: 支持轻度睡眠模式，APB 时钟则不支持。
3. **ESP32** 可能不支持某些标志，请在使用前阅读技术参考手册。

注解：在主机模式下，SCL 的时钟频率不应大于上表中提到的 SCL 的最大频率。

安装驱动程序 配置好 I2C 驱动程序后，使用以下参数调用函数 `i2c_driver_install()` 安装驱动程序：

- 端口号，从 `i2c_port_t` 中二选一
- 主机或从机模式，从 `i2c_mode_t` 中选择
- (仅限从机模式) 分配用于在从机模式下发送和接收数据的缓存区大小。

I2C 是一个以主机为中心的总线，数据只能根据主机的要求从从机传输到主机。因此，从机通常有一个发送缓存区，供从应用程序写入数据使用。数据保留在发送缓存区中，由主机自行读取。

用于分配中断的标志（请参考 `esp_hw_support/include/esp_intr_alloc.h` 中 ESP_INTR_FLAG_* 值）

主机模式下通信 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

ESP32 的 I2C 控制器在主机模式下负责与 I2C 从机设备建立通信，并发送命令让从机响应，如进行测量并将结果发回给主机。

为优化通信流程，驱动程序提供一个名为“命令链接”的容器。该容器应填充一系列命令，然后传递给 I2C 控制器执行。

主机写入数据 下面的示例展示如何为 I2C 主机构建命令链，从而向从机发送 n 个字节。

![I2C command link - master write example](image)

图 7: I2C command link - master write example

下面介绍如何为“主机写入数据”设置命令链，并其内部内容：

1. 使用 `i2c_cmd_link_create()` 创建一个命令链接。
   然后，将一系列待发送给从机的数据填充命令链：
   a) 启动位 - `i2c_master_start()`
   b) 从机地址 - `i2c_master_write_byte()`，提供单字节地址作为调用此函数的实参。
   c) 数据 - 一个或多个字节的数据作为 `i2c_master_write()` 的实参。
   d) 停止位 - `i2c_master_stop()`

   函数 `i2c_master_write_byte()` 和 `i2c_master_write()` 都有额外的实参，规定主机是否应确认其有无接受到 ACK 位。
2. 通过调用 `i2c_master_cmd_begin()` 来触发 I2C 控制器执行命令链接。一旦开始执行，就不能再修改命令链接。
3. 命令发送后，通过调用 `i2c_cmd_link_delete()` 释放命令链接使用的资源。

**主机读取数据** 下面的示例展示如何为 I2C 主机构建命令链接，以便从从机读取 n 个字节。

![I2C command link - master read example](image)

在读取数据时，在上述步骤 4 中，不是用 `i2c_master_write...`，而是用 `i2c_master_read_byte()` 和或 `i2c_master_read()` 填充命令链接。同样，在步骤 5 中配置最后一次的读取，以便主机不提供 ACK 位。

**指示写入或读取数据** 发送从机地址后（请参考上图中第 3 步），主机可以写入或从从机读取数据。

主机实际执行的操作信息存储在从机地址的最低有效位中。

因此，为了将数据写入从机，主机发送的命令链接应包含地址 `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE`，如下所示:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

同理，指示从从机读取数据的命令链接如下所示:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**从机模式下通信** 安装 I2C 驱动程序后，ESP32 即可与其他 I2C 设备通信。

API 为从机提供以下功能:

* `i2c_slave_read_buffer()`
  当从机将数据写入从机时，从机将自动将其存储在接收缓存区中。从机应用程序可自行调用函数 `i2c_slave_read_buffer()`。如果接收缓存区中没有数据，此函数还具有一个参数用于指定阻塞时间。这将允许从机应用程序在指定的超时设定内等待数据到达缓存区。

* `i2c_slave_write_buffer()`
  发送缓存区是用于存储从机要以 FIFO 顺序发送给主机的所有数据。在主机请求接收前，这些数据一直存储在发送缓存区。函数 `i2c_slave_write_buffer()` 有一个参数，用于指定发送缓冲区已满时的块时间。这将允许从机应用程序在指定的超时设定内等待发送缓存区中足够的可用空间。

在 `peripherals/i2c` 中可找到介绍如何使用这些功能的代码示例。
中断处理  安装驱动程序时，默认情况下会安装中断处理程序。但是，您可以通过调用函数 `i2c_isr_register()` 来注册自己的而不是默认的中断处理程序。在运行自己的中断处理程序时，可以参考 ESP32 技术参考手册 > I2C 控制器 (I2C) > 中断 [PDF]，以获取有关 I2C 控制器触发的中断描述。

调用函数 `i2c_isr_free()` 删除中断处理程序。

用户自定义配置  如本节末尾所述，配置驱动程序，函数 `i2c_param_config()` 在初始化 I2C 端口的驱动程序配置时，也会将几个 I2C 通信参数设置为 I2C 总线协议规范 规定的默认值。其他一些相关参数已在 I2C 控制器的寄存器中预先配置。

通过调用下表中提供的专用函数，可以将所有这些参数更改为用户自定义值。请注意，时序值是在 APB 时钟周期中定义。APB 的频率在 `I2C_APB_CLK_FREQ` 中指定。

### 表3: 其他可配置的 I2C 通信参数

<table>
<thead>
<tr>
<th>要更改的参数</th>
<th>函数</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCL 时钟周期的高电平和低电平</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>在产生自动信号期间使用的 SCL 和 SDA 信号时序</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>在产生停止信号期间使用的 SCL 和 SDA 信号时序</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>从机采样以及主机切换时，SCL 和 SDA 信号之间的时序关系</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C 超时</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>优选发送/接收最高有效位 (LSB) 或最低有效位 (MSB)，可在 <code>i2c_trans_mode()</code> 定义的模式中选择</td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

上述每个函数都有一个 `_get_` 对应项来检查当前设置的值。例如，调用 `i2c_get_timeout()` 来检查 I2C 超时值。

要检查在驱动程序配置过程中设置的参数默认值，请参考文件 `driver/i2c.c` 并查找带有后缀 `_DEFAULT` 的定义。

通过函数 `i2c_set_pin()` 可以为 SDA 和 SCL 信号选择不同的管脚并改变上拉配置。如果要修改已经输入的值，请使用函数 `i2c_param_config()`。

**注解:** ESP32 的内部上拉电阻范围为几万欧姆，因此在大多数情况下，它们本身不足以用作 I2C 上拉电阻。建议用户使用阻值在 I2C 总线协议规范 规定范围内的上拉电阻。

错误处理  大多数 I2C 驱动程序的函数在成功完成时会返回 ESP_OK，或在失败时会返回特定的错误代码。实时检查返回的值并进行错误处理是一种好习惯。驱动程序也会打印日志消息，其中包含错误说明，例如检查输入配置的正确性。有关详细信息，请参考文件 `driver/i2c.c` 并用后缀 `_ERR_STR` 查找定义。

使用专用中断来捕获通信故障。例如，如果从机将数据发送回主机耗时太长时间，会触发 `I2C_TIME_OUT_INT` 中断。详细信息请参考 中断处理。

如果出现通信失败，可以分别为发送和接收缓存区调用 `i2c_reset_tx_fifo()` 和 `i2c_reset_rx_fifo()` 来重置内部硬件缓存区。

删除驱动程序 当使用 `i2c_driver_install()` 建立 I2C 通信，一段时间后不再需要 I2C 通信时，可以通过调用 `i2c_driver_delete()` 来移除驱动程序以释放分配的资源。

由于函数 `i2c_driver_delete()` 无法移除驱动程序前务必确保所有的线程都已停止使用驱动程序。

应用示例

I2C 主机和从机示例: `peripherals/i2c`。

---

**Espressif Systems**

**Release v5.0-dev-489-gef98a36**

Submit Document Feedback
Chapter 2. API 参考

Header File

- components/driver/include/driver/i2c.h

Functions

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

Install an I2C driver.

**Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in `i2c` read and write function, because we cannot access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver installation error

**Parameters**

- `i2c_num`: I2C port number
- `mode`: I2C mode (either master or slave)
- `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

`esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`

Delete I2C driver.

**Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port to delete

`esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

Configure an I2C bus with the given configuration.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port to configure
- `i2c_conf`: Pointer to the I2C configuration

`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`

reset I2C tx hardware fifo

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `i2c_num`: I2C port number

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`

reset I2C rx fifo

**Return**
Chapter 2. API

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number

```c
esp_err_t i2c_isr_register(i2c_port_t i2c_num, void (*fn) (void *arg), intr_alloc_flags *handle)
```

Register an I2C ISR handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number to attach handler to
- `fn`: ISR handler function
- `arg`: Parameter for the ISR handler
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.
- `handle`: Handle return from esp_intr_alloc.

```c
esp_err_t i2c_isr_free(intr_handle_t handle)
```

Delete and free I2C ISR handle.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `handle`: Handle of isr to delete.

```c
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
```

Configure GPIO pins for I2C SCK and SDA signals.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number
- `sda_io_num`: GPIO number for I2C SDA signal
- `scl_io_num`: GPIO number for I2C SCL signal
- `sda_pullup_en`: Enable the internal pullup for SDA pin
- `scl_pullup_en`: Enable the internal pullup for SCL pin
- `mode`: I2C mode

```c
esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
```

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc … It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.
**Chapter 2. API**

### esp_err_t i2c_master_read_from_device

```c
i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address,
                              uint8_t *read_buffer, size_t read_size, TickType_t
ticks_to_wait)
```

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**

- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

### esp_err_t i2c_master_write_read_device

```c
i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address,
                              const uint8_t *write_buffer, size_t write_size,
                              uint8_t *read_buffer, size_t read_size, TickType_t
ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**

- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

### i2c_cmd_handle_t i2c_cmd_link_create_static

```c
i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)
```

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

**Note** It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

**Return** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

**Parameters**

- `buffer`: Buffer to use for commands allocations
- `size`: Size in bytes of the buffer

### i2c_cmd_handle_t i2c_cmd_link_create

```c
i2c_cmd_link_create(void)
```

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is
required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

Return Handle to the I2C command link

```c
void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)
```

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

Parameters
- `cmd_handle`: I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)

Free the I2C commands list.

Parameters
- `cmd_handle`: I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

```c
esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)
```

Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters
- `cmd_handle`: I2C commands list

```c
esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)
```

Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters
- `cmd_handle`: I2C commands list
- `data`: Byte to send on the port
- `ack_en`: Enable ACK signal

```c
esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)
```

Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_NO_MEM` The static buffer used to create `cmd_handler` is too small
- `ESP_FAIL` No more memory left on the heap

Parameters
- `cmd_handle`: I2C commands list
- `data`: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- `data_len`: Length, in bytes, of the data buffer
- `ack_en`: Enable ACK signal
Chapter 2. API

esp_err_t i2c_master_read_byte (i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
• ack: ACK signal

esp_err_t i2c_master_read (i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
• data_len: Size, in bytes, of the data buffer
• ack: ACK signal

esp_err_t i2c_master_stop (i2c_cmd_handle_t cmd_handle)

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list

esp_err_t i2c_master_cmd_begin (i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number
• cmd_handle: I2C commands list
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.
int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL (-1) Parameter error
• Other (>=0) The number of data bytes pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Bytes to write into internal buffer
• size: Size, in bytes, of data buffer
• ticks_to_wait: Maximum ticks to wait.

int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL(-1) Parameter error
• Others(>=0) The number of data bytes read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Buffer to fill with ringbuffer’s bytes
• max_size: Maximum bytes to read
• ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)
Set I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
• low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)
Get I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow down the SCL clock.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
Chapter 2. API

- **i2c_num**: I2C port number to filter
- **cyc_num**: the APB cycles need to be filtered (0<=cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

**esp_err_t i2c_filter_disable(i2c_port_t i2c_num)**

Disable filter on I2C bus.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

**esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)**

set I2C master start signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

**esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)**

get I2C master start signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- setup_time: pointer to get setup time
- hold_time: pointer to get hold time

**esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)**

set I2C master stop signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- setup_time: clock num between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- hold_time: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

**esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)**

get I2C master stop signal timing

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- setup_time: pointer to get setup time.
- hold_time: pointer to get hold time.

**esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)**

set I2C data signal timing

**Return**
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```

get I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sample_time: pointer to get sample time
- hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

set I2C timeout value

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```

get I2C timeout value

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: I2C sending data mode
- rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- tx_trans_mode: pointer to get I2C sending data mode
- rx_trans_mode: pointer to get I2C receiving data mode
Structures

struct i2c_config_t
I2C initialization parameters.

Public Members

i2c_mode_t mode
I2C mode

int sda_io_num
GPIO number for I2C sda signal

int scl_io_num
GPIO number for I2C scl signal

bool sda_pullup_en
Internal GPIO pull mode for I2C sda signal

bool scl_pullup_en
Internal GPIO pull mode for I2C scl signal

uint32_t clk_speed
I2C clock frequency for master mode, (no higher than 1MHz for now)

struct i2c_config_t::[anonymous]:[anonymous] master
I2C master config

uint8_t addr_10bit_en
I2C 10bit address mode enable for slave mode

uint16_t slave_addr
I2C address for slave mode

uint32_t maximum_speed
I2C expected clock speed from SCL.

struct i2c_config_t::[anonymous]:[anonymous] slave
I2C slave config

uint32_t clk_flags
Bitwise of I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

Macros

I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz

I2C_NUM_MAX
I2C port max

I2C_NUM_0
I2C port 0

I2C_NUM_1
I2C port 1

I2C_SCLK_SRC_FLAG_FOR_NOMAL
Any one clock source that is available for the specified frequency may be choosen

I2C_SCLK_SRC_FLAG_AWARE_DFS
For REF tick clock, it won’t change with APB.

I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
For light sleep mode.

I2C_INTERNAL_STRUCT_SIZE
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.
The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

Type Definitions

```c
typedef void *i2c_cmd_handle_t

I2C command handle
```

Header File

```c
components/hal/include/hal/i2c_types.h
```

Macros

```c
I2C_CLK_FREQ_MAX

Use the highest speed that is available for the clock source picked by clk_flags.
```

Type Definitions

```c
typedef int i2c_port_t

I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```

Enumerations

```c
enum i2c_mode_t

Values:

I2C_MODE_SLAVE = 0
I2C slave mode

I2C_MODE_MASTER
I2C master mode

I2C_MODE_MAX

```

```c
enum i2c_rw_t

Values:

I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data

```

```c
enum i2c_trans_mode_t

Values:

I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first

I2C_DATA_MODE_MAX

```

```c
enum i2c_addr_mode_t

Values:
```
Chapter 2. API

I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode

I2C_ADDR_BIT_10 = 0
I2C 10bit address for slave mode

I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:

I2C_MASTER_ACK = 0x0
I2C ack for each byte read

I2C_MASTER_NACK = 0x1
I2C nack for each byte read

I2C_MASTER_LAST_NACK = 0x2
I2C nack for the last byte

I2C_MASTER_ACK_MAX

enum i2c_sclk_t
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.
Values:

I2C_SCLK_DEFAULT = 0
I2C source clock not selected

I2C_SCLK_APB
I2C source clock from APB, 80M

I2C_SCLK_MAX

enum i2c_opmode_t
Values:

I2C_CMD_RESTART = 0
I2C restart command

I2C_CMD_WRITE
I2C write command

I2C_CMD_READ
I2C read command

I2C_CMD_STOP
I2C stop command

I2C_CMD_END
I2C end command

2.3.6 Inter-IC Sound (I2S)

Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
• Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

• Operation as system master or slave
• Capable of acting as transmitter or receiver
• DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

I2S0 output can be routed directly to the digital-to-analog converter’s (DAC) output channels (GPIO 25 & GPIO 26) to produce direct analog output without involving any external I2S codecs. I2S0 can also be used for transmitting PDM (Pulse-density modulation) signals.

The I2S peripherals also support LCD mode for communicating data over a parallel bus, as used by some LCD displays and camera modules. LCD mode has the following operational modes:

• LCD master transmitting mode
• Camera slave receiving mode
• ADC/DAC mode

For more information, see ESP32 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

注解：For high accuracy clock applications, use the APLL_CLK clock source, which has the frequency range of 16 ~ 128 MHz. You can enable the APLL_CLK clock source by setting `i2s_config_t::use_apll` to `TRUE`.

If `i2s_config_t::use_apll` = `TRUE` and `i2s_config_t::fixed_mclk > 0`, then the master clock output frequency for I2S will be equal to the value of `i2s_config_t::fixed_mclk`, which means that the mclk frequency is provided by the user, instead of being calculated by the driver.

The clock rate of the word select line, which is called audio left-right clock rate (LRCK) here, is always the divisor of the master clock output frequency and for which the following is always true: 0 < MCLK/LRCK/channels/bits_per_sample < 64.

### Functional Overview

#### Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

• Port number
• The structure `i2s_config_t` with defined communication parameters
• Event queue size and handle

Once `i2s_driver_install` returns `ESP_OK`, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // I2S port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};
```

(代码翻译)
**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

```c
static const i2s_pin_config_t pin_config = {
  .mck_io_num = 0,
  .bck_io_num = 4,
  .ws_io_num = 5,
  .data_out_num = 18,
  .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```c
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, i2s_bytes_read, 100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

**Application Example**

A code example for the I2S driver can be found in the directory `peripherals/i2s`. In addition, there are two short configuration examples for the I2S driver. In addition, there is a short configuration examples for the I2S driver.
**I2S configuration**  Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = ESP_INTR_FLAG_LEVEL1 // Interrupt level 1, default 0
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NOCHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

/* You can reset parameters by calling 'i2s_set_clk'
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

**Configuring I2S to use internal DAC for analog output**

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .mode = I2S_MODE_MASTER | I2S_MODE_DAC_BUILT_IN,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false,
    .intr_alloc_flags = 0 /* default interrupt priority */
};
...
```

(下页继续)
i2s_driver_install(i2s_num, &i2s_config, 0, NULL);  //install and start i2s

i2s_set_pin(i2s_num, NULL);  //for internal DAC, this will enable both of the
//internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050);  //set sample rates

i2s_driver_uninstall(i2s_num);  //stop & destroy i2s driver

---

**API Reference**

**Header File**

- components/driver/include/driver/i2s.h

**Functions**

**esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)**

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note**  The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**

- i2s_num: I2S port number
- pin: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note**  if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call i2s_set_dac_mode instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

**esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t downsamplerate)**

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsampling process in hardware. In the first downsampling process, the sampling number can be 16 or 8. In the second downsampling process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be (fpcm * 64) or (fpcm * 128) accordingly.

**Note**  After calling this function, it would call i2s_set_clk inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**

- i2s_num: I2S port number
- downsamplerate: I2S RX down sample rate for PDM mode.

**esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)**

Set TX PDM mode up-sample rate.
Note If you have set PDM mode while calling ‘i2s_driver_install’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- upsample_cfg: Set I2S PDM up-sample rate configuration

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters
- i2s_num: I2S port number
- i2s_config: I2S configurations - see i2s_config_t struct
- queue_size: I2S event queue size/depth.
- i2s_queue: I2S event queue handle, if set NULL, driver will not use an event queue.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.

Parameters
- i2s_num: I2S port number

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM. Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).
### Chapter 2. API 参考

#### Parameters
- `i2s_num`: I2S port number
- `src`: Source address to write from
- `size`: Size of data in bytes
- `src_bits`: Source audio bit
- `aim_bits`: Bit wanted, no more than 32, and must be greater than `src_bits`
- `[out] bytes_written`: Number of bytes written, if timeout, the result will be less than the size passed in.
- `ticks_to_wait`: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read (i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call `i2s_adc_enable` and `i2s_adc_disable` around the whole reading process, to prevent the data getting corrupted.

#### Parameters
- `i2s_num`: I2S port number
- `dest`: Destination address to read into
- `size`: Size of data in bytes
- `[out] bytes_read`: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- `ticks_to_wait`: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass `portMAX_DELAY` for no timeout.

```c
esp_err_t i2s_set_sample_rates (i2s_port_t i2s_num, uint32_t rate)
```

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and `i2s_config_t` configuration parameters (number of channels, `bits_per_sample`).

\[
\text{bit\_clock} = \text{rate} \times (\text{number\ of\ channels}) \times \text{bits\_per\ sample}
\]

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

#### Parameters
- `i2s_num`: I2S port number
- `rate`: I2S sample rate (ex: 8000, 44100…)

```c
esp_err_t i2s_stop (i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

#### Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

#### Parameters
Chapter 2. API

**• i2s_num**: I2S port number

```c
esp_err_t i2s_start (i2s_port_t i2s_num)
```

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
```

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- `i2s_num`: I2S port number
- `rate`: I2S sample rate (ex: 8000, 44100…)
- `bits_cfg`: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see `i2s_bits_per_sample_t`) the high 16 bits is for total bits in one channel (see `i2s_bits_per_chan_t`) high 16bits =0 means same as the bits per sample.
- `ch`: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

```c
float i2s_get_clk (i2s_port_t i2s_num)
```

get clock set on particular port number.

**Return**
- actual clock set by i2s driver

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_set_adc_mode (adc_unit_t adc_unit, adc1_channel_t adc1_channel, adc2_channel)
```

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

**Note** In this mode, the ADC maximum sampling rate is 150KHz. Set the sampling rate through `i2s_config_t`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit
- `adc1_channel`: ADC1 channel
- `adc2_channel`: ADC2 channel

---

Espressif Systems 715 Release v5.0-dev-489-gef98a36
• adc_unit: SAR ADC unit index
• adc_channel: ADC channel index

`esp_err_t i2s_adc_enable(i2s_port_t i2s_num)`
Start to use I2S built-in ADC mode.

**Note** This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral being used to do fully continuous ADC sampling.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

**Parameters**
- `i2s_num`: i2s port index

`esp_err_t i2s_adc_disable(i2s_port_t i2s_num)`
Stop to use I2S built-in ADC mode.

**Note** This function would release the lock of ADC so that other tasks can use ADC.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

**Parameters**
- `i2s_num`: i2s port index

`esp_err_t i2s_set_dac_mode(i2s_dac_mode_t dac_mode)`
Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one cannot be used as RTC DAC function at the same time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `dac_mode`: DAC mode configurations - see i2s_dac_mode_t

**Structures**

```c
struct i2s_pdm_tx_upsample_cfg_t
I2S PDM up-sample rate configuration.

**Note** TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.
```

**Public Members**

```c
int sample_rate
I2S PDM sample rate

int fp
I2S PDM TX upsampling parameter. Normally it should be set to 960

int fs
I2S PDM TX upsampling parameter. When it is set to 480, the pdm clock frequency Fpdm = 128 * sample_rate, when it is set to sample_rate / 100, Fpdm will be fixed to 128*48000
```

`struct i2s_pin_config_t`
I2S pin number for i2s_set_pin.
Public Members

```c
int mck_io_num
    MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only
```

```c
int bck_io_num
    BCK in out pin
```

```c
int ws_io_num
    WS in out pin
```

```c
int data_out_num
    DATA out pin
```

```c
int data_in_num
    DATA in pin
```

```c
struct i2s_driver_config_t
```
I2S driver configuration parameters.

Public Members

```c
i2s_mode_t mode
    I2S work mode
```

```c
uint32_t sample_rate
    I2S sample rate
```

```c
i2s_bits_per_sample_t bits_per_sample
    I2S sample bits in one channel
```

```c
i2s_channel_fmt_t channel_format
    I2S channel format.
```

```c
i2s_comm_format_t communication_format
    I2S communication format
```

```c
int intr_alloc_flags
    Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info
```

```c
int dma_buf_count
    I2S DMA Buffer Count
```

```c
int dma_buf_len
    I2S DMA Buffer Length
```

```c
bool use_apll
    I2S using APLL as main I2S clock, enable it to get accurate clock
```

```c
bool tx_desc_auto_clear
    I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)
```

```c
int fixed_mclk
    I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect
```

```c
i2s_mclk_multiple_t/mclk_multiple
    The multiple of I2S master clock(MCLK) to sample rate
```

```c
i2s_bits_per_chan_t/bits_per_chan
    I2S total bits in one channel, only take effect when larger than ‘bits_per_sample’, default ‘0’ means equal to ‘bits_per_sample’
```
struct i2s_event_t
   Event structure used in I2S event queue.

Public Members

\texttt{i2s\_event\_type\_t \texttt{type}}
   I2S event type

\texttt{size\_t \texttt{size}}
   I2S data size for I2S\_DATA event

Macros

\texttt{I2S\_PIN\_NO\_CHANGE}
   Use in \texttt{i2s\_pin\_config\_t} for pins which should not be changed

\texttt{I2S\_PDM\_DEFAULT\_UPSAMPLE\_CONFIG(rate)}
   Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

\texttt{typedef \texttt{i2s\_driver\_config\_t} \texttt{i2s\_config\_t}}

\texttt{typedef \texttt{intr\_handle\_t} \texttt{i2s\_isr\_handle\_t}}

Enumerations

\texttt{enum i2s\_port\_t}
   I2S port number, the max port number is (I2S\_NUM\_MAX -1).
   
   \texttt{Values:}
   \begin{itemize}
   \item \texttt{I2S\_NUM\_0 = 0}  
      I2S port 0
   \item \texttt{I2S\_NUM\_1 = 1}  
      I2S port 1
   \item \texttt{I2S\_NUM\_MAX}  
      I2S port max
   \end{itemize}

\texttt{enum i2s\_event\_type\_t}
   I2S event queue types.
   
   \texttt{Values:}
   \begin{itemize}
   \item \texttt{I2S\_EVENT\_DMA\_ERROR}
   \item \texttt{I2S\_EVENT\_TX\_DONE}
      I2S DMA finish sent 1 buffer
   \item \texttt{I2S\_EVENT\_RX\_DONE}
      I2S DMA finish received 1 buffer
   \item \texttt{I2S\_EVENT\_TX\_Q\_OVF}
      I2S DMA sent queue overflow
   \item \texttt{I2S\_EVENT\_RX\_Q\_OVF}
      I2S DMA receive queue overflow
   \item \texttt{I2S\_EVENT\_MAX}
      I2S event max index
   \end{itemize}

Header File

- components/hal/include/hal/i2s_types.h
Enumerations

enum i2s_bits_per_sample_t
I2S bit width per sample.

Values:

I2S_BITS_PER_SAMPLE_8BIT = 8
data bit-width: 8

I2S_BITS_PER_SAMPLE_16BIT = 16
data bit-width: 16

I2S_BITS_PER_SAMPLE_24BIT = 24
data bit-width: 24

I2S_BITS_PER_SAMPLE_32BIT = 32
data bit-width: 32

enum i2s_bits_per_chan_t
I2S bit width per chan.

Values:

I2S_BITS_PER_CHAN_DEFAULT = (0)
channel bit-width equals to data bit-width

I2S_BITS_PER_CHAN_8BIT = (8)
channel bit-width: 8

I2S_BITS_PER_CHAN_16BIT = (16)
channel bit-width: 16

I2S_BITS_PER_CHAN_24BIT = (24)
channel bit-width: 24

I2S_BITS_PER_CHAN_32BIT = (32)
channel bit-width: 32

enum i2s_channel_t
I2S channel.

Values:

I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels

I2S_CHANNEL_STEREO = 0x03
I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.

enum i2s_comm_format_t
I2S communication standard format.

Values:

I2S_COMM_FORMAT_STAND_I2S = 0X01
I2S communication I2S Philips standard, data launch at second BCK

I2S_COMM_FORMAT_STAND_MSB = 0X02
I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.
Chapter 2. API

I2S_COMM_FORMAT_STAND_MAX

standard max

I2S_COMM_FORMAT_I2S = 0x01

I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01

I2S format MSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02

I2S format LSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04

I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04

PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08

PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t

I2S channel format type.

Values:

I2S_CHANNEL_FMT_RIGHT_LEFT

Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT

Load right channel data in both two channels

I2S_CHANNEL_FMT_ALL_LEFT

Load left channel data in both two channels

I2S_CHANNEL_FMT_ONLY_RIGHT

Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT

Only load data in left channel (mono mode)

enum i2s_mode_t

I2S Mode.

Values:

I2S_MODE_MASTER = (0x1 « 0)

Master mode

I2S_MODE_SLAVE = (0x1 « 1)

Slave mode

I2S_MODE_TX = (0x1 « 2)

TX mode

I2S_MODE_RX = (0x1 « 3)

RX mode

I2S_MODE_DAC_BUILT_IN = (0x1 « 4)

Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB

I2S_MODE_ADC_BUILT_IN = (0x1 « 5)

Input I2S data from built-in ADC, each data can be 12-bit width at most
**Chapter 2. API**

**I2S_MODE_PDM** = (0x1 « 6)
I2S PDM mode

**enum i2s_clock_src_t**
I2S source clock.

*Values:*

- **I2S_CLK_D2CLK** = 0
  Clock from PLL_D2_CLK(160M)

- **I2S_CLK_APLL**
  Clock from APLL

**enum i2s_mclk_multiple_t**
The multiple of mclk to sample rate.

*Values:*

- **I2S_MCLK_MULTIPLE_DEFAULT** = 0
  Default value. mclk = sample_rate * 256

- **I2S_MCLK_MULTIPLE_128** = 128
  mclk = sample_rate * 128

- **I2S_MCLK_MULTIPLE_256** = 256
  mclk = sample_rate * 256

- **I2S_MCLK_MULTIPLE_384** = 384
  mclk = sample_rate * 384

**enum i2s_dac_mode_t**
I2S DAC mode for i2s_set_dac_mode.

*Note* Built-in DAC functions are only supported on I2S0 for current ESP32 chip.

*Values:*

- **I2S_DAC_CHANNEL_DISABLE** = 0
  Disable I2S built-in DAC signals

- **I2S_DAC_CHANNEL_RIGHT_EN** = 1
  Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

- **I2S_DAC_CHANNEL_LEFT_EN** = 2
  Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

- **I2S_DAC_CHANNEL_BOTH_EN** = 0x3
  Enable both of the I2S built-in DAC channels.

- **I2S_DAC_CHANNEL_MAX** = 0x4
  I2S built-in DAC mode max index

**enum i2s_pdm_dsr_t**
I2S PDM RX downsample mode.

*Values:*

- **I2S_PDM_DSR_8S** = 0
  downsampling number is 8 for PDM RX mode

- **I2S_PDM_DSR_16S**
  downsampling number is 16 for PDM RX mode

- **I2S_PDM_DSR_MAX**

**enum i2s_pdm_sig_scale_t**

*Values:*

- **I2S_PDM_SIG_SCALING_DIV_2** = 0
  I2S TX PDM sigmadelta signal scaling: /2
Chapter 2. API 参考

I2S_PDM_SIG_SCALING_MUL_1 = 1
I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2
I2S TX PDM sigmadelta signal scaling: x2

I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4

2.3.7 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I2C LCD, RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

• RGB LCD panel - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
• Controller based LCD panel involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

• Jpeg decoding and LCD display - peripherals/lcd/tjgpd
• LVGL porting and animation UI - peripherals/lcd/lvgl

API Reference

Header File

• components/hal/include/hal/lcd_types.h

Enumerations

enum lcd_clock_source_t
LCD clock source.

Note User should select the clock source based on the real requirement:

Values:

LCD_CLK_SRC_PLL160M
Select PLL160M as the source clock

LCD_CLK_SRC_APLL
Select APLL as the source clock

LCD_CLK_SRC_XTAL
Select XTAL as the source clock
Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t* esp_lcd_panel_io_handle_t
Type of LCD panel IO handle

typedef struct esp_lcd_panel_t* esp_lcd_panel_handle_t
Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t
LCD color space type definition.

Values:

ESP_LCD_COLOR_SPACE_RGB
Color space: RGB

ESP_LCD_COLOR_SPACE_BGR
Color space: BGR

ESP_LCD_COLOR_SPACE_MONOCHROME
Color space: monochrome

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
Transmit LCD command and corresponding parameters.

Note Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- [in] lcd_cmd: The specific LCD command
- [in] param: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- [in] param_size: Size of param in memory, in bytes, set to zero if no parameter is needed for the command

esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
Transmit LCD RGB data.

Note This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
Parameters
- [in] io: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- [in] lcd_cmd: The specific LCD command
- [in] color: Buffer that holds the RGB color data
- [in] color_size: Size of color in memory, in bytes

`esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)`
Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- [in] io: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

`esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`
Create LCD panel IO handle, for SPI interface.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- [in] bus: SPI bus handle
- [in] io_config: IO configuration, for SPI interface
- [out] ret_io: Returned IO handle

`esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`
Create LCD panel IO handle, for I2C interface.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
- [in] bus: I2C bus handle
- [in] io_config: IO configuration, for I2C interface
- [out] ret_io: Returned IO handle

`esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)`
Create Intel 8080 bus handle.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

Parameters
- [in] bus_config: Bus configuration
- [out] ret_bus: Returned bus handle

`esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)`
Destroy Intel 8080 bus handle.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

`esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`

Create LCD panel IO, for Intel 8080 interface.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
• [in] io_config: IO configuration, for i80 interface
• [out] ret_io: Returned panel IO handle

Structures

`struct esp_lcd_panel_io_event_data_t`  
Type of LCD panel IO event data.

`struct esp_lcd_panel_io_spi_config_t`  
Panel IO configuration structure, for SPI interface.

Public Members

int cs_gpio_num  
GPIO used for CS line

int dc_gpio_num  
GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

int spi_mode  
Traditional SPI mode (0~3)

unsigned int pclk_hz  
Frequency of pixel clock

size_t trans_queue_depth  
Size of internal transaction queue

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`  
Callback invoked when color data transfer has finished

void *user_ctx  
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits  
Bit-width of LCD command

int lcd_param_bits  
Bit-width of LCD parameter

unsigned int dc_as_cmd_phase : 1  
D/C line value is encoded into SPI transaction command phase

unsigned int dc_low_on_data : 1  
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
Chapter 2. API

unsigned int octal_mode : 1
    transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

struct esp_lcd_panel_io_i2c_config_t

Public Members

uint32_t dev_addr
    I2C device address

estp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
    Callback invoked when color data transfer has finished

void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

size_t control_phase_bytes
    I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int dc_bit_offset
    Offset of the D/C selection bit in control phase

int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_low_on_data : 1
    If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

struct esp_lcd_i80_bus_config_t
    LCD Intel 8080 bus configuration structure.

Public Members

int dc_gpio_num
    GPIO used for D/C line

int wr_gpio_num
    GPIO used for WR line

clock_source_t clk_src
    Clock source for the 80 LCD peripheral

int data_gpio_nums[(24)]
    GPIOs used for data lines

size_t bus_width
    Number of data lines, 8 or 16

size_t max_transfer_bytes
    Maximum transfer size, this determines the length of internal DMA link

struct esp_lcd_panel_io_i80_config_t
    Panel IO configuration structure, for intel 8080 interface.

Public Members

int cs_gpio_num
    GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
    Frequency of pixel clock
size_t\ trans\_queue\_depth
Transaction\ queue\ size,\ larger\ queue,\ higher\ throughput

\texttt{esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t} \ on\_color\_trans\_done
Callback\ invoked\ when\ color\ data\ was\ transferred\ done

\textbf{void \*user\_ctx}
User\ private\ data,\ passed\ directly\ to\ on\_color\_trans\_done’\ s\ user\_ctx

\textbf{int \ lcdn\_cmd\_bits}
Bit-width\ of\ LCD\ command

\textbf{int \ lcdn\_param\_bits}
Bit-width\ of\ LCD\ parameter

\textbf{unsigned\ int \ dc\_idle\_level}: 1
Level\ of\ DC\ line\ in\ IDLE\ phase

\textbf{unsigned\ int \ dc\_cmd\_level}: 1
Level\ of\ DC\ line\ in\ CMD\ phase

\textbf{unsigned\ int \ dc\_dummy\_level}: 1
Level\ of\ DC\ line\ in\ DUMMY\ phase

\textbf{unsigned\ int \ dc\_data\_level}: 1
Level\ of\ DC\ line\ in\ DATA\ phase

\textbf{struct \ esp\_lcd\_panel\_io\_i80\_config\_t:\[anonymous\]dc\_levels}
Each\ i80\ device\ might\ have\ its\ own\ D/C\ control\ logic

\textbf{unsigned\ int \ cs\_active\_high}: 1
If\ set,\ a\ high\ level\ of\ CS\ line\ will\ select\ the\ device,\ otherwise,\ CS\ line\ is\ low\ level\ active

\textbf{unsigned\ int \ reverse\_color\_bits}: 1
Reverse\ the\ data\ bits,\ D[N:0] \&gt; D[0:N]

\textbf{unsigned\ int \ swap\_color\_bytes}: 1
Swap\ adjacent\ two\ color\ bytes

\textbf{unsigned\ int \ pclk\_active\_neg}: 1
The\ display\ will\ write\ data\ lines\ when\ there’s\ a\ falling\ edge\ on\ WR\ signal\ (a.k.a\ the\ PCLK)

\textbf{unsigned\ int \ pclk\_idle\_low}: 1
The\ WR\ signal\ (a.k.a\ the\ PCLK)\ stays\ at\ low\ level\ in\ IDLE\ phase

\textbf{Type\ Definitions}

\textbf{typedef} \ void \*\texttt{esp\_lcd\_spi\_bus\_handle\_t}
Type\ of\ LCD\ SPI\ bus\ handle

\textbf{typedef} \ void \*\texttt{esp\_lcd\_i2c\_bus\_handle\_t}
Type\ of\ LCD\ I2C\ bus\ handle

\textbf{typedef} \ struct \ esp\_lcd\_i80\_bus\_t \*\texttt{esp\_lcd\_i80\_bus\_handle\_t}
Type\ of\ LCD\ intel\ 8080\ bus\ handle

\textbf{typedef} \ bool (*\texttt{esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t})(\texttt{esp\_lcd\_panel\_io\_handle\_t}\ panel\_io,\ 
\texttt{esp\_lcd\_panel\_io\_event\_data\_t}\ *edata,\ \texttt{void} \*\texttt{user\_ctx})

Declare\ the\ prototype\ of\ the\ function\ that\ will\ be\ invoked\ when\ panel\ IO\ finishes\ transferring\ color\ data.

\textbf{Return} Whether\ a\ high\ priority\ task\ has\ been\ waken\ up\ by\ this\ function

\textbf{Parameters}

\begin{itemize}
  \item \textbf{[in]} \texttt{panel\_io}: LCD\ panel\ IO\ handle,\ which\ is\ created\ by\ factory\ API\ like\ 
  \texttt{esp\_lcd\_new\_panel\_io\_spi()}
  \item \textbf{[in]} \texttt{edata}: Panel\ IO\ event\ data,\ fed\ by\ driver
  \item \textbf{[in]} \texttt{user\_ctx}: User\ data,\ passed\ from\ \texttt{esp\_lcd\_panel\_io\_xxx\_config\_t}
\end{itemize}
Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

**esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)**

Reset LCD panel.

**Note** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)**

Initialize LCD panel.

**Note** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)**

Deinitialize the LCD panel.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)**

Draw bitmap on LCD panel.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] x_start: Start index on x-axis (x_start included)
- [in] y_start: Start index on y-axis (y_start included)
- [in] x_end: End index on x-axis (x_end not included)
- [in] y_end: End index on y-axis (y_end not included)
- [in] color_data: RGB color data that will be dumped to the specific window range

**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**

Mirror the LCD panel on specific axis.

**Note** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- [in] mirror_x: Whether the panel will be mirrored about the x axis
- [in] mirror_y: Whether the panel will be mirrored about the y axis
**esp_err_t esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)**

Swap/Exchange x and y axis.

**Note** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- **[in]** panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **[in]** swap_axes: Whether to swap the x and y axis

**esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)**

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Return**
- ESP_OK on success

**Parameters**
- **[in]** panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **[in]** x_gap: Extra gap on x axis, in pixels
- **[in]** y_gap: Extra gap on y axis, in pixels

**esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)**

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- **[in]** panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **[in]** invert_color_data: Whether to invert the color data

**esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)**

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- **[in]** panel: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **[in]** off: Whether to turn off the screen

### Header File

### Functions

**esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)**

Create LCD panel for model ST7789.
Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

Structures

```c
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

Public Members

```c
int reset_gpio_num
```

GPIO used to reset the LCD panel, set to -1 if it’s not used

```c
esp_lcd_color_space_t color_space
```

Set the color space used by the LCD panel

```c
unsigned int bits_per_pixel
```

Color depth, in bpp

```c
unsigned int reset_active_high: 1
```

Setting this if the panel reset is high level active

2.3.8 LED PWM 控制器
概述

LED 控制器 (LEDC) 主要用于控制 LED，也可产生 PWM 信号用于其他设备的控制。该控制器有 16 路通道，可以产生独立的波形来驱动 RGB LED 等设备。

LEDC 通道共有两组，分别为 8 路高速通道和 8 路低速通道。高速通道模式在硬件中实现，可以自动且无干扰地改变 PWM 占空比。低速通道模式下，PWM 占空比需要由软件中的驱动器来变化。每组通道都可以使用不同的时钟源。

LED PWM 控制器可在无需 CPU 干预的情况下自动改变占空比，实现亮度和颜色渐变。

功能概要

设置 LEDC 通道在高速模式或低速模式下运行，需要进行如下配置：

1. 定时器配置 指定 PWM 信号的频率和占空比分辨率。
2. 通道配置 绑定定时器和输出 PWM 信号的 GPIO。
3. 改变 PWM 信号 输出 PWM 信号来驱动 LED。可通过软件控制或使用硬件逐变功能来改变 LED 的亮度。

另一个可选步骤是可以在渐变终端设置一个中断。

图 9: LED PWM 控制器 API 的关键配置

定时器配置 要设置定时器，可调用函数 ledc_timer_config()，并将包括如下配置参数的数据结构 ledc_timer_config_t 传递给该函数：

- 速度模式 ledc_mode_t
- 定时器索引 ledc_timer_t
- PWM 信号频率
- PWM 占空比分辨率

频率和占空比分辨率相互关联。PWM 频率越高，占空比分辨率越低，反之亦然。如果 API 不是用来改变 LED 亮度，而是用于其它目的，这种相互关系可能会很重要。更多信息详见频率和占空比分辨率支持范围 一节。

通道配置 定时器设置好后，请配置所需的通道 (ledc_channel_t 之一)。配置通道需调用函数 ledc_channel_config()。
通道的配置与定时器设置类似，需向通道配置函数传递包括通道配置参数的结构体`ledc_channel_config_t`。

此时，通道会按照`ledc_channel_config_t`的配置开始运作，并在选定的GPIO上生成由定时器设置指定的频率和占空比的PWM信号。在通道运作过程中，可以随时通过调用函数`ledc_stop()`将其暂停。

### 改变PWM信号
通道开始运行，生成具有恒定占空比和频率的PWM信号之后，有几种方式可以改变该信号。驱动LED时，主要通过改变占空比来变化光线亮度。

以下两节介绍了如何使用软件和硬件改变占空比。如有需要，PWM信号的频率也可更改，详见改变PWM频率一节。

#### 使用软件改变PWM占空比
调用函数`ledc_set_duty()`可以设置新的占空比。之后，调用函数`ledc_update_duty()`使新配置生效。要查看当前设置的占空比，可使用`_get_`函数`ledc_get_duty()`。

另外一种设置占空比和其他通道参数的方式是调用通道配置一节提到的函数`ledc_channel_config()`。

传递给函数的占空比数值范围取决于选定的`duty_resolution`，应为0至`(2 ** duty_resolution) - 1`。例如，如选定的占空比分辨率为10，则占空比的数值范围为0至1023，此时分辨率为~0.1%。

#### 使用硬件改变PWM占空比
LED PWM控制器硬件可逐渐改变占空比的数值。要使用此功能，需用函数`ledc_fade_func_install()`使能渐变，之后用下列可用渐变函数之一配置：

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

最后用`ledc_fade_start()`开启渐变。

如不需要渐变和渐变中断，可用函数`ledc_fade_func_uninstall()`关闭。

### 改变PWM频率
LED PWM控制器API有多种方式即时改变PWM频率：

- 通过调用函数`ledc_set_freq()`设置频率。可用函数`ledc_get_freq()`查看当前频率。
- 通过调用函数`ledc_bind_channel_timer()`将其他定时器绑定到该通道来改变频率和占空比分辨率。
- 通过调用函数`ledc_channel_config()`改变通道的定时器。

### 控制PWM的更多方式
有一些较底层的定时器特定函数可用于更改PWM设置：

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

前两个功能可通过函数`ledc_channel_config()`在后台运行，在定时器配置后启动。

### 使用中断配置
LED PWM控制器通道时，可在`ledc_channel_config_t`中选取参数`ledc_intr_type_t`，在渐变完成时触发中断。

要注册处理程序来处理中断，可调用函数`ledc_isr_register()`。
LED PWM 控制器高速和低速模式

高速模式的优点是可平稳地改变定时器。也就是说，高速模式下如定时器设置改变，此变更会自动应用于定时器的下一次溢出中断。而更新低速定时器时，设置变更应由软件显示触发。LED PWM 驱动的设置将在硬件层面被修改，比如在调用函数 ledc_timer_config() 或 ledc_timer_set() 时。

更多关于速度模式的详细信息请参阅 ESP32 技术参考手册 > LED PWM 控制器 (LEDC) [PDF]。注意，该手册中提到的支持 SLOW_CLOCK 限适用于 LED PWM 驱动。

频率和占空比分辨率支持范围

LED PWM 控制器主要用于驱动 LED。该控制器 PWM 占空比设置的分辨率范围较广。比如，PWM 频率为 5 kHz 时，占空比分辨率最大可为 13 位。这意味着占空比为 0 至 100% 之间的任意值，分辨率约为 0.012% (2 ** 13 = 8192 LED 亮度的离散电平)。然而，这些参数取决于为 LED PWM 控制器定时器计时的时钟信号。LED PWM 控制器为通道提供时钟（具体可参考定时器配置和 ESP32 技术参考手册 > LED PWM 计时器 (LEDC) [PDF])。

LED PWM 控制器可用于生成频率较高的信号，足以为数码相机模组等其他设备提供时钟。此时，最大频率可为 40 MHz，占空比分辨率可为 1 位。也就是说，占空比固定为 50%，无法调整。

LED PWM 控制器 API 会在设定的频率和占空比分辨率超过 LED PWM 控制器硬件范围时报错。例如，试图将频率设置为 20 MHz，占空比分辨率设置为 3 位时，串行端口监视器会报告如下错误：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try__
    ~reducing freq_hz or duty_resolution. div_param=128
```

此时，占空比分辨率或频率必须降低。比如，将占空比分辨率设置为 2 会解决这一问题，让占空比设置为 25% 的倍数，即 25%、50% 或 75%。

如设置的频率和占空比分辨率低于所支持的最低值，LED PWM 驱动器也会反映并报告，如：

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try__
    ~increasing freq_hz or duty_resolution. div_param=12800000
```

占空比分辨率通常用 ledc_timer_bit_t 设置，范围是 10 至 15 位。如需较低的占空比分辨率（上至 10，下至 1），可直接输入相应数值。

应用实例

使用 LEDC 改变占空比和渐变控制的实例请参考 peripherals/ledc/ledc.fade。

使用 LEDC 基本实例请参照 peripherals/ledc/ledc_basic。

API 参考

Header File

- components/driver/include/driver/ledc.h

Functions

```
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LEDCC channel configuration Configure LEDC channel with the given channel/output
gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- ledc_conf: Pointer of LEDC channel configure struct
**esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)**

LED timer configuration. Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- timer_conf: Pointer of LEDC timer configure struct

**esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)**

LED update channel parameters.

**Note**
Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings.

**Note**
ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)**

Set LEDC output gpio.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: The LEDC output gpio
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- ledc_channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)**

LED stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- idle_level: Set output idle level after LEDC stops.

**esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)**

LED set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t
• freq_hz: Set the LEDC frequency

```c
uint32_t ledc_get_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num)
```

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDC set duty and hpoint value. Only after calling ledc_update_duty will the duty update.

**Note**
- ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.
- If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is \([0, (2^{*duty\_resolution}) - 1]\)
- hpoint: Set the LEDC hpoint value (max: 0xfffff)

```c
int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty. This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note**
- ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.
- If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is \([0, (2^{*duty\_resolution}) - 1]\)

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDC get duty.
Chapter 2. API

Return
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)
```
LEDCC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- fade_direction: Set the direction of the gradient
- step_num: Set the number of the gradient
- duty_cycle_num: Set how many LEDC tick each time the gradient lasts
- duty_scale: Set gradient change amplitude

```c
esp_err_t ledc_isr_register(void (*fn) void *)
```
void *arg, int intr_alloc_flags, ledc_isr_handle_t *handleRegister LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

Parameters
- fn: Interrupt handler function.
- arg: User-supplied argument passed to the handler function.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set(ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
uint32_t duty_resolution, ledc_clk_src_t clk_src)
```
Configure LEDC settings.

Return
- (-1) Parameter error
- Other Current LEDC duty

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: Timer index (0-3), there are 4 timers in LEDC module
- clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
- duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
- clk_src: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst(ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```
Reset LEDC timer.
Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_timer_pause(ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Pause LEDC timer counter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_timer_resume(ledc_mode_t speed_mode, ledc_timer_t timer_sel)`
Resume LEDC timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)`
Bind LEDC channel with the selected timer.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)`
Set LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• target_duty: Target duty of fading [0, (2*duty_resolution) - 1]
• scale: Controls the increase or decrease step scale.
• cycle_num: increase or decrease the duty every cycle_num cycles

call esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)

Set LEDC fade function, with a limited time.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_FAIL Fade function init error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• target_duty: Target duty of fading [0, (2*duty_resolution) - 1]
• max_fade_time_ms: The maximum time of the fading (ms).

call esp_err_t ledc_fade_func_install(int intr_alloc_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function already installed.

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void ledc_fade_func_uninstall(void)

Uninstall LEDC fade function.

call esp_err_t ledc_fade_start(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)

Start LEDC fading.

Note Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_ERR_INVALID_ARG Parameter error.

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel number
• fade_mode: Whether to block until fading done.

call esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.
Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is \[0, (2^{*duty\_resolution}) - 1\]
- **hpoint**: Set the LEDC hpoint value(max: 0xfffff)

```c
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call `ledc_fade_func_install()` once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \[0, (2^{*duty\_resolution}) - 1\]
- **max_fade_time_ms**: The maximum time of the fading (ms).
- **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \[0, (2^{*duty\_resolution}) - 1\]
- **scale**: Controls the increase or decrease step scale.
- **cycle_num**: increase or decrease the duty every cycle_num cycles
- **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Return**

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
* ESP_FAIL Fade function init error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- cbs: Group of LEDC callback functions
- user_arg: user registered data for the callback function

**Structures**

```c
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for ledc_channel_config function.

**Public Members**

```c
int gpio_num
```

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

```c
ledc_mode_t speed_mode
```

LEDC speed speed_mode, high-speed mode or low-speed mode

```c
ledc_channel_t channel
```

LEDC channel (0 - 7)

```c
ledc_intr_type_t intr_type
```

configure interrupt, Fade interrupt enable or Fade interrupt disable

```c
ledc_timer_t timer_sel
```

Select the timer source of channel (0 - 3)

```c
uint32_t duty
```

LEDC channel duty, the range of duty setting is [0, \((2^{**duty_resolution})\)]

```c
int hpoint
```

LEDC channel hpoint value, the max value is 0xffffff

```c
unsigned int output_invert : 1
```

Enable (1) or disable (0) gpio output invert

```c
struct ledc_channel_config_t::[anonymous] flags
```

LEDC flags

```c
struct ledc_timer_config_t
```

Configuration parameters of LEDC Timer timer for ledc_timer_config function.

**Public Members**

```c
ledc_mode_t speed_mode
```

LEDC speed speed_mode, high-speed mode or low-speed mode

```c
ledc_timer_bit_t duty_resolution
```

LEDC channel duty resolution

```c
ledc_timer_bit_t bit_num
```

Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

```c
ledc_timer_t timer_num
```

The timer source of channel (0 - 3)

```c
uint32_t freq_hz
```

LEDC timer frequency (Hz)
**Chapter 2. API Reference**

**ledc_clk_cfg_t** `clk_cfg`

Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`.

**struct ledc_cb_param_t**

LEDC callback parameter.

**Public Members**

**ledc_cb_event_t** `event`

Event name

**uint32_t** `speed_mode`

Speed mode of the LEDC channel group

**uint32_t** `channel`

LEDC channel (0 - `LEDC_CHANNEL_MAX-1`)

**uint32_t** `duty`

LEDC current duty of the channel, the range of duty is `[0, (2**duty_resolution) - 1]`

**struct ledc_cbs_t**

Group of supported LEDC callbacks.

**Note** The callbacks are all running under ISR environment.

**Public Members**

**ledc_cb_t** `fade_cb`

LEDC fade end callback function

**Macros**

`LEDC_APB_CLK_HZ`

`LEDC_REF_CLK_HZ`

`LEDC_ERR_DUTY`

`LEDC_ERR_VAL`

**Type Definitions**

```c
typedef intr_handle_t ledc_isr_handle_t
typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
```

Type of LEDC event callback.

**Parameters**

- `param`: LEDC callback parameter
- `user_arg`: User registered data

**Enumerations**

**enum ledc_cb_event_t**

LEDC callback event type.

**Values:**

`LEDC_FADE_END_EVT`

LEDC fade end event
Chapter 2. API 参考

Header File

- components/hal/include/hal/ledc_types.h

Enumerations

enum ledc_mode_t

Values:

LEDC_HIGH_SPEED_MODE = 0
LEDC high speed speed_mode

LEDC_LOW_SPEED_MODE
LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX
LEDC speed limit

enum ledc_intr_type_t

Values:

LEDC_INTR_DISABLE = 0
Disable LEDC interrupt

LEDC_INTR_FADE_END
Enable LEDC interrupt

LEDC_INTR_MAX

enum ledc_duty_direction_t

Values:

LEDC_DUTY_DIR_DECREASE = 0
LEDC duty decrease direction

LEDC_DUTY_DIR_INCREASE = 1
LEDC duty increase direction

LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t

Values:

LEDC_SLOW_CLK_RTC8M = 0
LEDC low speed timer clock source is 8MHz RTC clock

LEDC_SLOW_CLK_APB
LEDC low speed timer clock source is 80MHz APB clock

enum ledc_clk_cfg_t

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

LEDC_AUTO_CLK = 0
The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_APB_CLK
LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK
LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

LEDC_USE_REF_TICK
LEDC timer select REF_TICK clock as source clock
enum ledc_clk_src_t
Values:

LEDC_REF_TICK = LEDC_USE_REF_TICK
    LEDC timer clock divided from reference tick (1Mhz)

LEDC_APB_CLK = LEDC_USE_APB_CLK
    LEDC timer clock divided from APB clock (80Mhz)

LEDC_SCLK = LEDC_USE_APB_CLK
    Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0
    LEDC timer 0

LEDC_TIMER_1
    LEDC timer 1

LEDC_TIMER_2
    LEDC timer 2

LEDC_TIMER_3
    LEDC timer 3

LEDC_TIMER_MAX

enum ledc_channel_t
Values:

LEDC_CHANNEL_0 = 0
    LEDC channel 0

LEDC_CHANNEL_1
    LEDC channel 1

LEDC_CHANNEL_2
    LEDC channel 2

LEDC_CHANNEL_3
    LEDC channel 3

LEDC_CHANNEL_4
    LEDC channel 4

LEDC_CHANNEL_5
    LEDC channel 5

LEDC_CHANNEL_6
    LEDC channel 6

LEDC_CHANNEL_7
    LEDC channel 7

LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
Values:

LEDC_TIMER_1_BIT = 1
    LEDC PWM duty resolution of 1 bits

LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits

LEDC_TIMER_3_BIT
    LEDC PWM duty resolution of 3 bits
Chapter 2. API

**LEDC_TIMER_4_BIT**
LED PWM duty resolution of 4 bits

**LEDC_TIMER_5_BIT**
LED PWM duty resolution of 5 bits

**LEDC_TIMER_6_BIT**
LED PWM duty resolution of 6 bits

**LEDC_TIMER_7_BIT**
LED PWM duty resolution of 7 bits

**LEDC_TIMER_8_BIT**
LED PWM duty resolution of 8 bits

**LEDC_TIMER_9_BIT**
LED PWM duty resolution of 9 bits

**LEDC_TIMER_10_BIT**
LED PWM duty resolution of 10 bits

**LEDC_TIMER_11_BIT**
LED PWM duty resolution of 11 bits

**LEDC_TIMER_12_BIT**
LED PWM duty resolution of 12 bits

**LEDC_TIMER_13_BIT**
LED PWM duty resolution of 13 bits

**LEDC_TIMER_14_BIT**
LED PWM duty resolution of 14 bits

**LEDC_TIMER_15_BIT**
LED PWM duty resolution of 15 bits

**LEDC_TIMER_16_BIT**
LED PWM duty resolution of 16 bits

**LEDC_TIMER_17_BIT**
LED PWM duty resolution of 17 bits

**LEDC_TIMER_18_BIT**
LED PWM duty resolution of 18 bits

**LEDC_TIMER_19_BIT**
LED PWM duty resolution of 19 bits

**LEDC_TIMER_20_BIT**
LED PWM duty resolution of 20 bits

**LEDC_TIMER_BIT_MAX**

**enum ledc_fade_mode_t**

*Values:*

**LEDC_FADE_NO_WAIT** = 0
LED fade function will return immediately

**LEDC_FADE_WAIT_DONE**
LED fade function will block until fading to the target duty

**LEDC_FADE_MAX**

### 2.3.9 Motor Control Pulse Width Modulator (MCPWM)

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.
Further in documentation the outputs of a single unit are labeled PWMxA/PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture and Carrier.

**Contents**

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Synchronize** sync timers to work together
- **Capture** external signals to provide additional control over the outputs
- **Use** Fault Handler to detect and manage faults
- **Add** a higher frequency Carrier, if output signals are passed through an isolation transformer
- **Extra** configuration of Resolution.

**Configure**

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`. 
Chapter 2. API 参考

图 11: MCPWM Block Diagram

图 12: Example of Brushed DC Motor Control with MCPWM
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

### Operate

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

| 注解： | Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle. |

### Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

| 注解： | Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO |
as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].

**Synchronize**

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%-99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

**Capture**

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`
Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

### Fault Handler

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.
The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

**Carrier**

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the carrier with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see ESP32 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

**Interrupts**

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

**Resolution**

The default resolution for MCPWM group and MCPWM timer are configured to 10MHz and 1MHz in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.
Chapter 2. API 参考

Application Example

MCPWM example are located under: peripherals/mcpwm:

• Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_bldc_hall_control
• Brushed DC motor control - peripherals/mcpwm/mcpwm_brushed_dc_control
• Servo motor control - peripherals/mcpwm/mcpwm_servo_control
• HC-SR04 sensor with capture - peripherals/mcpwm/mcpwm_capture_hc_sr04

Enumerations

enum mcpwm_timer_direction_t
Values:

MCPWM_TIMER_DIRECTION_UP
Counting direction: Increase

MCPWM_TIMER_DIRECTION_DOWN
Counting direction: Decrease

enum mcpwm_timer_event_t
Values:

MCPWM_TIMER_EVENT_ZERO
MCPWM timer counts to zero

MCPWM_TIMER_EVENT_PEAK
MCPWM timer counts to peak

enum mcpwm_timer_count_mode_t
Values:

MCPWM_TIMER_COUNT_MODE_PAUSE
MCPWM timer paused

MCPWM_TIMER_COUNT_MODE_UP
MCPWM timer counting up

MCPWM_TIMER_COUNT_MODE_DOWN
MCPWM timer counting down

MCPWM_TIMER_COUNT_MODE_UP_DOWN
MCPWM timer counting up and down

enum mcpwm_timer_execute_cmd_t
Values:

MCPWM_TIMER_STOP_AT_ZERO
MCPWM timer stops when counting to zero

MCPWM_TIMER_STOP_AT_PEAK
MCPWM timer stops when counting to peak

MCPWM_TIMER_START_NO_STOP
MCPWM timer starts counting

MCPWM_TIMER_START_STOP_AT_ZERO
MCPWM timer starts counting and stops when counting to zero
**Chapter 2. API 参考**

**MCPWM_TIMER_START_STOP_AT_PEAK**
MCPWM timer starts counting and stops when counting to peak

**enum mcpwm_generator_action_t**
**Values:**

**MCPWM_GEN_ACTION_KEEP**
Generator action: Keep the same level

**MCPWM_GEN_ACTION_LOW**
Generator action: Force to low level

**MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

**MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

**enum mcpwm_trip_type_t**
**Values:**

**MCPWM_TRIP_TYPE_CBC**
CBC trip type, shut down the operator cycle by cycle

**MCPWM_TRIP_TYPE_OST**
OST trip type, shut down the operator in one shot

**Header File**

**Functions**

**esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)**
This function initializes each gpio signal for MCPWM.

**Note** This function initializes one gpio at a time.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- mcpwm_num: set MCPWM unit(0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

**esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)**
Initialize MCPWM gpio structure.

**Note** This function initialize a group of MCPWM GPIOs at a time.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- mcpwm_num: set MCPWM unit(0-1)
- mcpwm_pin: MCPWM pin structure

**esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)**
Initialize MCPWM parameters.

**Note** The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.

**Return**
Chapter 2. API

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers.
- `mcpwm_conf`: configure structure `mcpwm_config_t`

#### esp_err_t mcpwm_group_set_resolution(`mcpwm_unit_t mcpwm_num, unsigned long int resolution`) Set resolution of the MCPWM group.

**Note** This will override default resolution of group (=10,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters

- `mcpwm_num`: set MCPWM unit (0-1)
- `resolution`: set expected frequency resolution

#### esp_err_t mcpwm_timer_set_resolution(`mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution`) Set resolution of each timer.

**Note** This WILL override default resolution of timer (=1,000,000). This WILL NOT automatically update frequency and duty. Call `mcpwm_set_frequency()` and `mcpwm_set_duty()` manually to set them back.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `resolution`: set expected frequency resolution

#### esp_err_t mcpwm_set_frequency(`mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency`) Set frequency (in Hz) of MCPWM timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `frequency`: set the frequency in Hz of each timer

#### esp_err_t mcpwm_set_duty(`mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty`) Set duty cycle of each operator (MCPWMXA/MCPWMXB)

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

### Parameters

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the generator (MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- `duty`: set duty cycle in % (i.e. for 62.3% duty cycle, duty = 62.3) of each operator

#### esp_err_t mcpwm_set_duty_in_us(`mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us`) Set duty cycle of each operator (MCPWMXA/MCPWMXB) in us.

**Return**

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
• duty_in_us: set duty value in microseconds of each operator

esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)

Set duty either active high or active low(out of phase/inverted)

Note Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
• duty_type: set active low or active high duty type

uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Get frequency of timer.

Return
• frequency of timer

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

float mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)

Get duty cycle of each operator.

Return
• duty cycle in % of each operator(56.7 means duty is 56.7%)

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

uint32_t mcpwm_get_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)

Get duty cycle of each operator in us.

Return
• duty cycle in us of each operator

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)

Use this function to set MCPWM signal high.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected
**esp_err_t mcpwm_set_signal_low** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMX8), ‘x’ is timer number selected

**esp_err_t mcpwm_start** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_stop** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_carrier_init** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)

Initialize carrier configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_conf: configure structure mcpwm_carrier_config_t

**esp_err_t mcpwm_carrier_enable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Enable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_carrier_disable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
API Reference

`esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)`

Set period of carrier.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM
- `carrier_period`: set the carrier period of each timer, carrier period = (carrier_period + 1)∗800ns (carrier_period <= 15)

`esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)`

Set duty_cycle of carrier.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM
- `carrier_duty`: set duty_cycle of carrier, carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

`esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)`

Enable and set width of first pulse in carrier oneshot mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM
- `pulse_width`: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width +1) (pulse_width <= 15)

`esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Disable oneshot mode, width of first pulse = carrier period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM

`esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)`

Enable or disable carrier output inversion.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM
- `carrier_ivt_mode`: enable or disable carrier output inversion

`esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)`
Enable and initialize deadtime for each MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = red*100ns
- `fed`: set rising edge delay = fed*100ns

```c
esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable deadtime on MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)
```

Initialize fault submodule, currently low level triggering is not supported.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_sig`: set the fault pin, which needs to be enabled

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.  

**Note** currently low level triggering is not supported

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_sig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.  

**Note** currently low level triggering is not supported

**Return**
Chapter 2. API

Esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)

Disable fault signal.

Parameters
- mcpwm_num: set MCPWM unit (0-1)
- fault_sig: fault pin, which needs to be disabled

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig,
                                 mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)

Initialize capture submodule.

Note: Enabling capture feature would also enable the capture interrupt event. Users have to register an interrupt
handler by mcpwm_isr_register, and in there, query the capture data.

Parameters
- mcpwm_num: set MCPWM unit (0-1)
- cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- cap_sig: capture pin, which needs to be enabled
- num_of_pulse: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

Esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)

Disable capture signal.

Parameters
- mcpwm_num: set MCPWM unit (0-1)
- cap_sig: capture pin, which needs to be disabled

Esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel, const
                                        mcpwm_capture_config_t *cap_conf)

Enable capture channel.

Parameters
- mcpwm_num: set MCPWM unit (0-1)
- cap_channel: capture channel, which needs to be enabled
- cap_conf: capture channel configuration

Esp_err_t mcpwm_capture_disable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel)

Parameters
- mcpwm_num: set MCPWM unit (0-1)
- cap_channel: capture channel, which needs to be enabled
**Disable capture channel.**

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be disabled

```c
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Get capture value.

**Return** Captured value

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel on which value is to be measured

```c
uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Get edge of capture signal.

**Return** Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel of whose edge is to be determined

```c
esp_err_t mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)
```

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Note** Count direction is undefined within this API

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization input signal
- `phase_val`: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

```c
esp_err_t mcpwm_sync_configure(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_sync_config_t *sync_conf)
```

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_conf`: sync configuration on this timer

```c
esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable sync submodule on given timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
### Chapter 2. API

#### esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)

Sets sync output on given timer. Configures what event triggers MCPWM timer to output a sync signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM. Each MCPWM unit has 3 timers
- trigger: set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM_SWSYNC_SOURCE_DISABLED will disable the timer from generating sync signal.

#### esp_err_t mcpwm_timer_trigger_soft_sync(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Trigger a software sync event and sends it to a specific timer.

**Note** This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if MCPWM_SWSYNC_SOURCE_SYNCIN is selected via mcpwm_set_timer_sync_output().
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM. Each MCPWM unit has 3 timers

#### esp_err_t mcpwm_sync_invert_gpio_synchro(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)

Set external GPIO sync input inverter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- sync_sig: set sync signal of MCPWM, only supports GPIO sync signal
- invert: whether GPIO sync source input is inverted (to get negative edge trigger)

#### esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void (*fn)(void *, void *, int *intr_alloc_flags), intr_handle_t *handle)

Register MCPWM interrupt handler, the handler is an ISR. the handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- fn: interrupt handler function.
- arg: user-supplied argument passed to the handler function.
- intr_alloc_flags: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. see esp_intr_alloc.h for more info.
- handle: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

### Structures

#### struct mcpwm_pin_config_t

- pin number for MCPWM
Public Members

```c
int mcpwm0a_out_num
MCPWM0A out pin
int mcpwm0b_out_num
MCPWM0A out pin
int mcpwm1a_out_num
MCPWM0A out pin
int mcpwm1b_out_num
MCPWM0A out pin
int mcpwm2a_out_num
MCPWM0A out pin
int mcpwm2b_out_num
MCPWM0A out pin
int mcpwm_sync0_in_num
SYNC0 in pin
int mcpwm_sync1_in_num
SYNC1 in pin
int mcpwm_sync2_in_num
SYNC2 in pin
int mcpwm_fault0_in_num
FAULT0 in pin
int mcpwm_fault1_in_num
FAULT1 in pin
int mcpwm_fault2_in_num
FAULT2 in pin
int mcpwm_cap0_in_num
CAP0 in pin
int mcpwm_cap1_in_num
CAP1 in pin
int mcpwm_cap2_in_num
CAP2 in pin
struct cap_event_data_t
event data that will be passed into ISR callback
```

Public Members

```c
mcpwm_capture_on_edge_t cap_edge
Which signal edge is detected
```

```c
uint32_t cap_value
Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)
```

```c
struct mcpwm_config_t
MCPWM config structure.
```

Public Members

```c
uint32_t frequency
Set frequency of MCPWM in Hz
```
float cmpr_a
Set % duty cycle for operator a (MCPWMXA), i.e. for 62.3% duty cycle, duty_a = 62.3

float cmpr_b
Set % duty cycle for operator b (MCPWMXB), i.e. for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t duty_mode
Set type of duty cycle

mcpwm_counter_type_t counter_mode
Set type of MCPWM counter

struct mcpwm_carrier_config_t
MCPWM carrier configuration structure.

Public Members

uint8_t carrier_period
Set carrier period = (carrier_period + 1) * 800ns, carrier_period should be < 16

uint8_t carrier_duty
Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t pulse_width_in_os
Set pulse width of first pulse in one shot mode = (carrier period) * (pulse_width_in_os + 1), should be less then 16

mcpwm_carrier_os_t carrier_os_mode
Enable or disable carrier oneshot mode

mcpwm_carrier_out_ivt_t carrier_ivt_mode
Invert output of carrier

struct mcpwm_capture_config_t
MCPWM config capture structure.

Public Members

mcpwm_capture_on_edge_t cap_edge
Set capture edge

uint32_t cap_prescale
Prescale of capture signal, ranging from 1 to 256

cap_isr_cb_t capture_cb
User defined capture event callback, running under interrupt context

void* user_data
User defined ISR callback function args

struct mcpwm_sync_config_t
MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t sync_sig
Set sync input signal that will cause timer to sync

uint32_t timer_val
Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak

mcpwm_timer_direction_t count_direction
Counting direction to be set after sync
Chapter 2. API

Macros
MCPWM_OPR_A
MCPWM_OPR_B
MCPWM_OPR_MAX
MCPWM_SELCT_SYNC0
MCPWM_SELCT_SYNC1
MCPWM_SELCT_SYNC2
MCPWM_NO_CHANGE_IN_MCPWMXA
MCPWM_FORCE_MCPWMXA_LOW
MCPWM_FORCE_MCPWMXA_HIGH
MCPWM_TOG_MCPWMXA
MCPWM_NO_CHANGE_IN_MCPWMXB
MCPWM_FORCE_MCPWMXB_LOW

Type Definitions
typedef mcpwm_generator_t mcpwm_operator_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t
typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t
       MCPWM capture channel ID alias.
typedef bool (*cap_isr_cb_t) (mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel,
       const cap_event_data_t *edata, void *user_data)

Type of capture event callback.

Note  Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used
      within ISR (usually has ‘_ISR’ postfix)

Return  Whether a task switch is needed after the callback function returns, this is usually due to the callback
         wakes up some high priority task.

Parameters
• mcpwm: MCPWM unit (0-1)
• cap_channel: capture channel ID
• edata: Capture event data, contains capture edge and capture value, fed by the driver
• user_data: User registered data, passed from mcpwm_capture_config_t

Enumerations
enum mcpwm_io_signals_t
   IO signals for the MCPWM.
   • 6 MCPWM output pins that generate PWM signals
   • 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
   • 3 MCPWM sync input pins to synchronize MCPWM outputs signals
   • 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:
MCPWM0A = 0
   PWM0A output pin
MCPWM0B
   PWM0B output pin
MCPWM1A
PWM1A output pin

MCPWM1B
PWM1B output pin

MCPWM2A
PWM2A output pin

MCPWM2B
PWM2B output pin

MCPWM_SYNC_0
SYNC0 input pin

MCPWM_SYNC_1
SYNC1 input pin

MCPWM_SYNC_2
SYNC2 input pin

MCPWM_FAULT_0
FAULT0 input pin

MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

```c
enum mcpwm_unit_t
Select MCPWM unit.
```

Values:

```c
MCPWM_UNIT_0
MCPWM unit0 selected

MCPWM_UNIT_1
MCPWM unit1 selected

MCPWM_UNIT_MAX
Max number of MCPWM units
```

```c
enum mcpwm_timer_t
Select MCPWM timer.
```

Values:

```c
MCPWM_TIMER_0
Select MCPWM timer0

MCPWM_TIMER_1
Select MCPWM timer1

MCPWM_TIMER_2
Select MCPWM timer2

MCPWM_TIMER_MAX
Max number of timers in a unit
```
enum mcpwm_generator_t
    Select MCPWM operator.

Values:

MCPWM_GEN_A
    Select MCPWMXA, where ‘X’ is operator number

MCPWM_GEN_B
    Select MCPWMXB, where ‘X’ is operator number

MCPWM_GEN_MAX
    Num of generators to each operator of MCPWM

enum mcpwm_carrier_os_t
    MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

Values:

MCPWM_ONESHOT_MODE_DIS
    Enable oneshot mode

MCPWM_ONESHOT_MODE_EN
    Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
    MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

MCPWM_CARRIER_OUT_IVT_DIS
    Enable carrier output inversion

MCPWM_CARRIER_OUT_IVT_EN
    Disable carrier output inversion

enum mcpwm_fault_signal_t
    MCPWM select fault signal input.

Values:

MCPWM_SELECT_F0
    Select F0 as input

MCPWM_SELECT_F1
    Select F1 as input

MCPWM_SELECT_F2
    Select F2 as input

enum mcpwm_sync_signal_t
    MCPWM select sync signal input.

Values:

MCPWM_SELECT_NO_INPUT
    No sync input selected

MCPWM_SELECT_TIMER0_SYNC
    Select software sync signal from timer0 as input

MCPWM_SELECT_TIMER1_SYNC
    Select software sync signal from timer1 as input

MCPWM_SELECT_TIMER2_SYNC
    Select software sync signal from timer2 as input

MCPWM_SELECT_GPIO_SYNC0
    Select GPIO SYNC0 as input
MCPWM_SELECT_GPIO_SYNC1
Select GPIO SYNC1 as input

MCPWM_SELECT_GPIO_SYNC2
Select GPIO SYNC2 as input

enum mcpwm_timer_sync_trigger_t
MCPWM timer sync event trigger.

Values:

MCPWM_SWSYNC_SOURCE_SYNCIN
the input sync signal will be routed to its sync output path

MCPWM_SWSYNC_SOURCE_TEZ
sync signal generated when timer counts to zero

MCPWM_SWSYNC_SOURCE_TEP
sync signal generated when timer counts to peak

MCPWM_SWSYNC_SOURCE_DISABLED
timer does not generate sync signals

enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.

Values:

MCPWM_LOW_LEVEL_TGR
Fault condition occurs when fault input signal goes from high to low

MCPWM_HIGH_LEVEL_TGR
Fault condition occurs when fault input signal goes low to high

enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.

Values:

MCPWM_NEG_EDGE = BIT(0)
Capture the negative edge

MCPWM_POS_EDGE = BIT(1)
Capture the positive edge

MCPWM_BOTH_EDGE = BIT(1) | BIT(0)
Capture both edges

enum mcpwm_intr_t
Interrupt masks for MCPWM capture.

Values:

MCPWM_LL_INTR_CAP0 = BIT(27)
Capture 0 happened.

MCPWM_LL_INTR_CAP1 = BIT(28)
Capture 1 happened.

MCPWM_LL_INTR_CAP2 = BIT(29)
Capture 2 happened.

enum mcpwm_counter_type_t
Select type of MCPWM counter.

Values:

MCPWM_FREEZE_COUNTER
Counter freeze
**MCPWM_UP_COUNTER**
For asymmetric MCPWM

**MCPWM_DOWN_COUNTER**
For asymmetric MCPWM

**MCPWM_UP_DOWN_COUNTER**
For symmetric MCPWM, frequency is half of MCPWM frequency set

**MCPWM_COUNTER_MAX**
Maximum counter mode

```c
enum mcpwm_duty_type_t
```
Select type of MCPWM duty cycle mode.

*Values:*

**MCPWM_DUTY_MODE_0 = 0**
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

**MCPWM_DUTY_MODE_1**
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM

**MCPWM_HAL_GENERATOR_MODE_FORCE_LOW**

**MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH**

**MCPWM_DUTY_MODE_MAX**
Num of duty cycle modes

```c
enum mcpwm_deadtime_type_t
```
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.

*Values:*

**MCPWM_DEADTIME_BYPASS = 0**
Bypass the deadtime

**MCPWM_BYPASS_RED**
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

**MCPWM_BYPASS_FED**
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

**MCPWM_ACTIVE_HIGH_MODE**
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

**MCPWM_ACTIVE_LOW_MODE**
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXB In with compliment of falling edge delay

**MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE**
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

**MCPWM_ACTIVE_LOW_COMPLIMENT_MODE**
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXB In with falling edge delay

**MCPWM_ACTIVE_RED_FED_FROM_PWMXA**
MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay
MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX
Maximum number of supported dead time modes

enum mcpwm_output_action_t
MCPWM select action to be taken on the output when event happens.

Values:

MCPWM_ACTION_NO_CHANGE = 0
No change in the output

MCPWM_ACTION_FORCE_LOW
Make output low

MCPWM_ACTION_FORCE_HIGH
Make output high

MCPWM_ACTION_TOGGLE
Make output toggle

enum mcpwm_capture_signal_t
MCPWM select capture signal input.

Values:

MCPWM_SELECT_CAP0
Select CAP0 as input

MCPWM_SELECT_CAP1
Select CAP1 as input

MCPWM_SELECT_CAP2
Select CAP2 as input

2.3.10 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- Configuration - describes counter’s configuration parameters and how to setup the counter.
- Operating the Counter - provides information on control functions to pause, measure and clear the counter.
- Filtering Pulses - describes options to filtering pulses and the counter control signals.
- Using Interrupts - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting units numbered from 0 to 7. In the API they are referred to using pcnt_unit_t. Each unit has two independent channels numbered as 0 and 1 and specified with pcnt_channel_t.
Chapter 2. API 参考

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

### Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

---

注解：For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

### Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

### Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in Configuration
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.
In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`.
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`.

**API Reference**

**Header File**

- `components/driver/include/driver/pcnt.h`

**Functions**

### `esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)`

Configure Pulse Counter unit.

**Note**
This function will disable three events: `PCNT_EVT_L_LIM`, `PCNT_EVT_H_LIM`, `PCNT_EVT ZERO`.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver already initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**
- `pcnt_config`: Pointer of Pulse Counter unit configure parameter

### `esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)`

Get pulse counter value.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**
- `pcnt_unit`: Pulse Counter unit number
- `count`: Pointer to accept counter value

### `esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)`

Pause PCNT counter of PCNT unit.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

### `esp_err_t pcnt_counter_resume(pcnt_unit_t pcnt_unit)`

Resume counting for PCNT counter.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number

### `esp_err_t pcnt_counter_clear(pcnt_unit_t pcnt_unit)`

Clear and reset PCNT counter value to zero.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` pcnt driver has not been initialized
- `ESP_ERR_INVALID_ARG` Parameter error

**Parameters**
- `pcnt_unit`: PCNT unit number, select from `pcnt_unit_t`
Chapter 2. API 參考

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

```c
esp_err_t pcnt_intr_enable (pcnt_unit_t pcnt_unit)
```
Enable PCNT interrupt for PCNT unit.

**Note** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with pcnt_event_enable() and pcnt_event_disable()

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number

```c
esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)
```
Disable PCNT interrupt for PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number

```c
esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Enable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

```c
esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Disable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

```c
esp_err_t pcnt_set_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)
```
Set PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
Chapter 2. API

- **value**: Counter value for PCNT event

```c
esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)
```

Get PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **unit**: PCNT unit number
- **evt_type**: Watchpoint event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- **value**: Pointer to accept counter value for PCNT event

```c
esp_err_t pcnt_get_event_status (pcnt_unit_t unit, uint32_t *status)
```

Get PCNT event status of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **unit**: PCNT unit number
- **status**: Pointer to accept event status word

```c
esp_err_t pcnt_isr_unregister (pcnt_isr_handle_t handle)
```

Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- **handle**: handle to unregister the ISR service.

```c
esp_err_t pcnt_isr_register (void (*fn) (void *), void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)
```

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- **fn**: Interrupt handler function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `pcnt_isr_unregister` to unregister this ISR service if needed, but only if the handle is not NULL.

```c
esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)
```

Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
**Chapter 2. API**

- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- channel: PCNT channel number
- pulse_io: Pulse signal input GPIO
- ctrl_io: Control signal input GPIO

```c
esp_err_t pcnt_filter_enable (pcnt_unit_t unit)
```
Enable PCNT input filter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number

```c
esp_err_t pcnt_filter_disable (pcnt_unit_t unit)
```
Disable PCNT input filter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number

```c
esp_err_t pcnt_set_filter_value (pcnt_unit_t unit, uint16_t filter_val)
```
Set PCNT filter value.

**Note**
filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value (pcnt_unit_t unit, uint16_t *filter_val)
```
Get PCNT filter value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- filter_val: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode (pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```
Set PCNT counter mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- channel: PCNT channel number
• pos_mode: Counter mode when detecting positive edge
• neg_mode: Counter mode when detecting negative edge
• hctrl_mode: Counter mode when control signal is high level
• lctrl_mode: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add (pcnt_unit_t unit, void (*isr_handler)(void), void *args)
```
Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- isr_handler: Interrupt handler function.
- args: Parameter for handler function

```c
esp_err_t pcnt_isr_service_install (int intr_alloc_flags)
```
Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

**Parameters**
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void pcnt_isr_service_uninstall (void)
```
Uninstall PCNT ISR service, freeing related resources.

```c
esp_err_t pcnt_isr_handler_remove (pcnt_unit_t unit)
```
Delete ISR handler for specified unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number

**Structures**

```c
struct pcnt_config_t
```
Pulse Counter configuration for a single channel.

**Public Members**

```c
int pulse_gpio_num
```
Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will
be ignored

```c
int ctrl_gpio_num
    Control signal input GPIO number, a negative value will be ignored
```

```c
pcnt_ctrl_mode_t lctrl_mode
    PCNT low control mode
```

```c
pcnt_ctrl_mode_t hctrl_mode
    PCNT high control mode
```

```c
pcnt_count_mode_t pos_mode
    PCNT positive edge count mode
```

```c
pcnt_count_mode_t neg_mode
    PCNT negative edge count mode
```

```c
int16_t counter_h_lim
    Maximum counter value
```

```c
int16_t counter_l_lim
    Minimum counter value
```

```c
pcnt_unit_t unit
    PCNT unit number
```

```c
pcnt_channel_t channel
    the PCNT channel
```

**Macros**

```c
PCNT_PIN_NOT_USED
    When selected for a pin, this pin will not be used
```

```c
PCNT_MODE_KEEP
    Control mode: won’t change counter mode
```

```c
PCNT_MODE_REVERSE
    Control mode: invert counter mode(increase -> decrease, decrease -> increase)
```

```c
PCNT_MODE_DISABLE
    Control mode: Inhibit counter(counter value will not change in this condition)
```

```c
PCNT_MODE_MAX
```

```c
PCNT_COUNT_DIS
    Counter mode: Inhibit counter(counter value will not change in this condition)
```

```c
PCNT_COUNT_INC
    Counter mode: Increase counter value
```

```c
PCNT_COUNT_DEC
    Counter mode: Decrease counter value
```

```c
PCNT_COUNT_MAX
```

**Type Definitions**

```c
typedef intr_handle_t pcnt_isr_handle_t
```

```c
typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t
    Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.
```

**Note** Configuration covers two actions, one for high, and one for low level on the control input

```c
typedef pcnt_channel_edge_action_t pcnt_count_mode_t
    Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.
```

**Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input
Enumerations

enum pcnt_port_t
PCNT port number; the max port number is (PCNT_PORT_MAX - 1).

Values:

\texttt{PCNT\_PORT\_0}
PCNT port 0

\texttt{PCNT\_PORT\_MAX}
PCNT port max

enum pcnt_unit_t
Selection of all available PCNT units.

Values:

\texttt{PCNT\_UNIT\_0}
PCNT unit 0

\texttt{PCNT\_UNIT\_1}
PCNT unit 1

\texttt{PCNT\_UNIT\_2}
PCNT unit 2

\texttt{PCNT\_UNIT\_3}
PCNT unit 3

\texttt{PCNT\_UNIT\_4}
PCNT unit 4

\texttt{PCNT\_UNIT\_5}
PCNT unit 5

\texttt{PCNT\_UNIT\_6}
PCNT unit 6

\texttt{PCNT\_UNIT\_7}
PCNT unit 7

\texttt{PCNT\_UNIT\_MAX}

enum pcnt_channel_t
Selection of channels available for a single PCNT unit.

Values:

\texttt{PCNT\_CHANNEL\_0}
PCNT channel 0

\texttt{PCNT\_CHANNEL\_1}
PCNT channel 1

\texttt{PCNT\_CHANNEL\_MAX}

enum pcnt_evt_type_t
Selection of counter’s events the may trigger an interrupt.

Values:

\texttt{PCNT\__EVT\_THRES\_1} = 1 \ll 2
PCNT watch point event: threshold1 value event

\texttt{PCNT\__EVT\_THRES\_0} = 1 \ll 3
PCNT watch point event: threshold0 value event

\texttt{PCNT\__EVT\_L\_LIM} = 1 \ll 4
PCNT watch point event: Minimum counter value
PCNT_EVT_H_LIM = 1 \times 5
PCNT watch point event: Maximum counter value

PCNT_EVT_ZERO = 1 \times 6
PCNT watch point event: counter value zero event

PCNT_EVT_MAX

Header File
- components/hal/include/hal/pcnt_types.h

Enumerations
enum pcnt_channel_level_action_t
PCNT channel action on control level.
Values:
- PCNT_CHANNEL_LEVEL_ACTION_KEEP
  Keep current count mode
- PCNT_CHANNEL_LEVEL_ACTION_INVERSE
  Invert current count mode (increase -> decrease, decrease -> increase)
- PCNT_CHANNEL_LEVEL_ACTION_HOLD
  Hold current count value

enum pcnt_channel_edge_action_t
PCNT channel action on signal edge.
Values:
- PCNT_CHANNEL_EDGE_ACTION_HOLD
  Hold current count value
- PCNT_CHANNEL_EDGE_ACTION_INCREASE
  Increase count value
- PCNT_CHANNEL_EDGE_ACTION_DECREASE
  Decrease count value

enum pcnt_unit_count_sign_t
PCNT unit counter value’s sign.
Values:
- PCNT_UNIT_COUNT_SIGN_ZERO_POS
  positive value to zero
- PCNT_UNIT_COUNT_SIGN_ZERO_NEG
  negative value to zero
- PCNT_UNIT_COUNT_SIGN_NEG
  counter value negative
- PCNT_UNIT_COUNT_SIGN_POS
  counter value positive

2.3.11 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.
There reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. Use Interrupts

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

**Configure Driver**

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

**Common Parameters**

- The channel to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT operation mode - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` members to one of the values from `rmt_mode_t`.
- What is the pin number to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many memory blocks will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the `flags`.
When **RMT_CHANNEL_FLAGS_AWARE_DFS** is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See *power_management* for more information.

When **RMT_CHANNEL_FLAGS_INVERT_SIG** is set, the driver will invert the RMT signal sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.

- A **clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting **clk_div** to a value within [1..255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when **RMT_CHANNEL_FLAGS_AWARE_DFS** is set in **flags**, RMT source clock is changed to REF_TICK or XTAL.

There are also couple of specific parameters that should be set up depending if selected channel is configured in **Transmit Mode** or **Receive Mode**.

**Transmit Mode**  When configuring channel in transmit mode, set **tx_config** and the following members of **rmt_tx_config_t**:

- Transmit the currently configured data items in a loop - **loop_en**
- Enable the RMT carrier signal - **carrier_en**
- Frequency of the carrier in Hz - **carrier_freq_hz**
- Duty cycle of the carrier signal in percent (%) - **carrier_duty_percent**
- Level of the RMT output, when the carrier is applied - **carrier_level**
- Enable the RMT output if idle - **idle_output_en**
- Set the signal level on the RMT output if idle - **idle_level**

**Receive Mode**  In receive mode, set **rx_config** and the following members of **rmt_rx_config_t**:

- Enable a filter on the input of the RMT receiver - **filter_en**
- A threshold of the filter, set in the number of ticks - **filter_ticks_thresh**. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - **idle_threshold**. The receiver will ignore pulses longer than this setting.

**Finalize Configuration**  Once the **rmt_config_t** structure is populated with parameters, it should be then invoked with **rmt_config()** to make the configuration effective.

The last configuration step is installation of the driver in memory by calling **rmt_driver_install()**. If **rx_buf_size** parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in *Use Interrupts*.

Now, depending on how the channel is configured, we are ready to either **Transmit Data** or **Receive Data**. This is described in next two sections.

**Transmit Data**

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure **rmt_item32_t**. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

For a simple example how to define a block of items see *peripherals/rmt/morse_code*. 
Chapter 2. API

16: Structure of RMT items (L - signal level)

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to send is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

<table>
<thead>
<tr>
<th>警告：RMT RX channel can’t receive packet whose items are larger than its memory block size. If you set the memory block number to 1, then this RX channel can’t receive packet with more than 64 items. This is a hardware limitation.</th>
</tr>
</thead>
</table>

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in peripherals/rmt/ir_protocols.

To stop the receiver, call `rmt_rx_stop()`.

Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an
alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have _get_ counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

**Receive Mode Parameters**

- The filtersetting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`

**Use Interrupts**

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

---

**注解:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

---

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value - `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the event_name is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

---

**警告:** It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.
Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

- Using RMT to send morse code: `peripherals/rmt/morse_code`
- Using RMT to drive RGB LED strip: `peripherals/rmt/led_strip`
- NEC remote control TX and RX example: `peripherals/rmt/ir_protocols`
- Musical buzzer example: `peripherals/rmt/musical_buzzer`

API Reference

Header File

- `components/driver/include/driver/rmt.h`

Functions

`esp_err_t rmt_set_clk_div(rmt_channel_t channel, uint8_t div_cnt)`

Set RMT clock divider, channel clock is divided from source clock.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `div_cnt`: RMT counter clock divider

`esp_err_t rmt_get_clk_div(rmt_channel_t channel, uint8_t* div_cnt)`

Get RMT clock divider, channel clock is divided from source clock.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `div_cnt`: pointer to accept RMT counter divider

`esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)`

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- `channel`: RMT channel
- `thresh`: RMT RX idle threshold

`esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t* thresh)`

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Chapter 2. API Reference

Parameters

- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

```c
esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)
```

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 * 4

Note If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

```c
esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t* rmt_mem_num)
```

Get RMT memory block number.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

```c
esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)
```

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier
- low_level: Low level duration of carrier.
- carrier_level: Configure the way carrier wave is modulated for channel.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)
```

Set RMT memory in low power mode.

Reduce power consumed by memory. 1: memory is in low power state.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: RMT memory low power enable.

```c
esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)
```
Get RMT memory low power mode.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• pd_en: Pointer to accept RMT memory low power mode.

```c
esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)
```
Set RMT start sending data from memory.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

```c
esp_err_t rmt_tx_stop(rmt_channel_t channel)
```
Set RMT stop sending.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel

```c
esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)
```
Set RMT start receiving data.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

```c
esp_err_t rmt_rx_stop(rmt_channel_t channel)
```
Set RMT stop receiving data.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel

```c
esp_err_t rmt_tx_memory_reset(rmt_channel_t channel)
```
Reset RMT TX memory.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel

```c
esp_err_t rmt_rx_memory_reset(rmt_channel_t channel)
```
Reset RMT RX memory.
Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`esp_err_t rmt_set_memory_owner(rmt_channel_t channel, rmt_mem_owner_t owner)`
Set RMT memory owner.

Note Setting memory is only valid for RX channel.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- owner: To set when the transmitter or receiver can process the memory of channel.

`esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)`
Get RMT memory owner.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- owner: Pointer to get memory owner.

`esp_err_t rmt_set_tx_loop_mode(rmt_channel_t channel, bool loop_en)`
Set RMT tx loop mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

`esp_err_t rmt_get_tx_loop_mode(rmt_channel_t channel, bool *loop_en)`
Get RMT tx loop mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- loop_en: Pointer to accept RMT transmitter loop sending mode.

`esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)`
Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- rx_filter_en: To enable RMT receiver filter.
- thresh: Threshold of pulse width for receiver.

`esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)`
Set RMT source clock.
RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- base_clk: To choose source clock for RMT module.

```c
esp_err_t rmt_get_source_clk (rmt_channel_t channel, rmt_source_clk_t *src_clk)
```
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- src_clk: Pointer to accept source clock for RMT module.

```c
esp_err_t rmt_set_idle_level (rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
```
Set RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- idle_out_en: To enable idle level output.
- level: To set the output signal’s level for channel in idle state.

```c
esp_err_t rmt_get_idle_level (rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
```
Get RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- idle_out_en: Pointer to accept value of enable idle.
- level: Pointer to accept value of output signal’s level in idle state for specified channel.

```c
esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
```
Get RMT status.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0-7) in rmt_reg.h for more details of each field.

```c
esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
```
Set RMT RX interrupt enable.

Return
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API

ESP_OK Success

Parameters
- channel: RMT channel
- en: enable or disable RX interrupt.

```c
esp_err_t rmt_set_err_intr_en(rmt_channel_t channel, bool en)
```
Set RMT RX error interrupt enable.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- en: enable or disable RX err interrupt.

```c
esp_err_t rmt_set_tx_intr_en(rmt_channel_t channel, bool en)
```
Set RMT TX interrupt enable.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- en: enable or disable TX interrupt.

```c
esp_err_t rmt_set_tx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)
```
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

```c
esp_err_t rmt_set_gpio(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)
```
Configure the GPIO used by RMT channel.

Return
- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

Parameters
- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

```c
esp_err_t rmt_config(const rmt_config_t *rmt_param)
```
Configure RMT parameters.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- rmt_param: RMT parameter struct

```c
esp_err_t rmt_isr_register(void (*fn)(void *), void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
```
Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.
Note: If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

Parameters:
- fn: Interrupt handler function.
- arg: Parameter for the handler function.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)
Deregister previously registered RMT interrupt handler.

Return:
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

Parameters:
- handle: Handle obtained from rmt_isr_register

esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)
Fill memory data of channel with given RMT items.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.

esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)
Initialize RMT driver.

Return:
- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

esp_err_t rmt_driver_uninstall(rmt_channel_t channel)
Uninstall RMT driver.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel

esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)
Get the current status of eight channels.
Note  Do not call this function if it is possible that \texttt{rmt\_driver\_uninstall} will be called at the same time.

Return
- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

Parameters
- \[\text{out}\] channel\_status: store the current status of each channel

\textit{esp\_err\_t rmt\_get\_counter\_clock} (\texttt{rmt\_channel\_t channel}, uint32\_t \*clock\_hz)

Get speed of channel’s internal counter clock.

Return
- ESP\_ERR\_INVALID\_ARG Parameter is NULL
- ESP\_OK Success

Parameters
- \text{channel}: RMT channel
- \[\text{out}\] clock\_hz: counter clock speed, in hz

\textit{esp\_err\_t rmt\_write\_items} (\texttt{rmt\_channel\_t channel}, const rmt\_item32\_t \*rmt\_item, int item\_num, bool wait\_tx\_done)

RMT send waveform from rmt\_item array.

This API allows user to send waveform with any length.

Note  This function will not copy data, instead, it will point to the original items, and send the waveform items.

If \texttt{wait\_tx\_done} is set to true, this function will block and will not return until all items have been sent out. If \texttt{wait\_tx\_done} is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

Return
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

Parameters
- \text{channel}: RMT channel
- \text{rmt\_item}: head point of RMT items array. If ESP\_INTR\_FLAG\_IRAM is used, please do not use the memory allocated from psram when calling rmt\_write\_items.
- \text{item\_num}: RMT data item number.
- \text{wait\_tx\_done}:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

\textit{esp\_err\_t rmt\_wait\_tx\_done} (\texttt{rmt\_channel\_t channel}, TickType\_t wait\_time)

Wait RMT TX finished.

Return
- ESP\_OK RMT Tx done successfully
- ESP\_ERR\_TIMEOUT Exceeded the ‘wait\_time’ given
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

Parameters
- \text{channel}: RMT channel
- \text{wait\_time}: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP\_ERR\_TIMEOUT if TX is busy (polling).

\textit{esp\_err\_t rmt\_get\_ringbuf\_handle} (\texttt{rmt\_channel\_t channel}, RingbufHandle\_t \*buf\_handle)

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

Parameters
Chapter 2. API 参考

```c

• channel: RMT channel
• buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

esp_err_t rmt_translator_init (rmt_channel_t channel, sample_to_rmt_t fn)
Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return
• ESP_FAIL Init fail.
• ESP_OK Init success.

Parameters
• channel: RMT channel.
• fn: Point to the data conversion function.

esp_err_t rmt_translator_set_context (rmt_channel_t channel, void *context)
Set user context for the translator of specific channel.

Return
• ESP_FAIL Set context fail
• ESP_OK Set context success

Parameters
• channel: RMT channel number
• context: User context

esp_err_t rmt_translator_get_context (const size_t *item_num, void **context)
Get the user context set by ‘rmt_translator_set_context’. 

Note  This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

Return
• ESP_FAIL Get context fail
• ESP_OK Get context success

Parameters
• item_num: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
• context: Returned User context

esp_err_t rmt_write_sample (rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)
Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

Return
• ESP_FAIL Send fail
• ESP_OK Send success

Parameters
• channel: RMT channel.
• src: Pointer to the raw data.
• src_size: The size of the raw data.
• wait_tx_done: Set true to wait all data send done.

rmt_tx_end_callback_t rmt_register_tx_end_callback (rmt_tx_end_fn_t function, void *arg)
Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

Note  Requires rmt_driver_install to install the default ISR handler.

Return the previous callback settings (members will be set to NULL if there was none)

Parameters
• function: Function to be called from the default interrupt handler or NULL.
• arg: Argument which will be provided to the callback when it is called.

esp_err_t rmt_memory_rw_rst (rmt_channel_t channel)
Reset RMT TX/RX memory index.
```

Espressif Systems  790  Release v5.0-dev-489-gef98a36
Submit Document Feedback
Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`void rmt_set_intr_enable_mask(uint32_t mask)`
Set mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to set to the register

`void rmt_clr_intr_enable_mask(uint32_t mask)`
Clear mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to clear the register

`esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`
Set RMT pin.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- mode: TX or RX mode for RMT
- gpio_num: GPIO number to transmit or receive the signal.

Structures
`struct rmt_tx_config_t`
Data struct of RMT TX configure parameters.

Public Members

uint32_t `carrier_freq_hz`
RMT carrier frequency

`rmt_carrier_level_t carrier_level`
Level of the RMT output, when the carrier is applied

`rmt_idle_level_t idle_level`
RMT idle level

uint8_t `carrier_duty_percent`
RMT carrier duty (%)

bool `carrier_en`
RMT carrier enable

bool `loop_en`
Enable sending RMT items in a loop

bool `idle_output_en`
RMT idle level output enable

`struct rmt_rx_config_t`
Data struct of RMT RX configure parameters.

Public Members

uint16_t `idle_threshold`
RMT RX idle threshold
# Chapter 2. API

```c
uint8_t filter_ticks_thresh
    RMT filter tick number

bool filter_en
    RMT receiver filter enable

struct rmt_config_t
    Data struct of RMT configure parameters.
```

## Public Members

- `rmt_mode_t rmt_mode`
  - RMT mode: transmitter or receiver
- `rmt_channel_t channel`
  - RMT channel
- `gpio_num_t gpio_num`
  - RMT GPIO number
- `uint8_t clk_div`
  - RMT channel counter divider
- `uint8_t mem_block_num`
  - RMT memory block number
- `uint32_t flags`
  - RMT channel extra configurations, OR’d with RMT_CHANNEL_FLAGS_[*]

- `rmt_tx_config_t tx_config`
  - RMT TX parameter
- `rmt_rx_config_t rx_config`
  - RMT RX parameter

## struct rmt_tx_end_callback_t

Structure encapsulating a RMT TX end callback.

## Public Members

- `rmt_tx_end_fn_t function`
  - Function which is called on RMT TX end
- `void *arg`
  - Optional argument passed to function

## Macros

- `RMT_CHANNEL_FLAGS_AWARE_DFS`
  - Channel can work during APB clock scaling
- `RMT_CHANNEL_FLAGS_INVERT_SIG`
  - Invert RMT signal
- `RMT_MEM_ITEM_NUM`
  - Define memory space of each RMT channel (in words = 4 bytes)

- `RMT_DEFAULT_CONFIG_TX (gpio, channel_id)`
  - Default configuration for Tx channel.
- `RMT_DEFAULT_CONFIG_RX (gpio, channel_id)`
  - Default configuration for RX channel.
Type Definitions

```c
typedef intr_handler_t rmt_isr_handler_t
RMT interrupt handle.
```

```c
typedef void (*rmt_tx_end_fn_t)(rmt_channel_t channel, void*arg)
Type of RMT Tx End callback function.
```

```c
typedef void(*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t
wanted_num, size_t *translated_size, size_t *item_num)
User callback function to convert uint8_t type data to rmt format(rmt_item32_t).
```

This function may be called from an ISR, so, the code should be short and efficient.

**Note** In fact, item_num should be a multiple of translated_size, e.g. When we convert each byte of uint8_t
 type data to rmt format data, the relation between item_num and translated_size should be:

\[
\text{item\_num} = \text{translated\_size} \times 8.
\]

**Parameters**
- `src`: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- `[out] dest`: Pointer to the buffer storing the rmt format data.
- `src_size`: The raw data size.
- `wanted_num`: The number of rmt format data that wanted to get.
- `[out] translated_size`: The size of the raw data that has been converted to rmt format, it
  should return 0 if no data is converted in user callback.
- `[out] item_num`: The number of the rmt format data that actually converted to, it can be less
  than wanted_num if there is not enough raw data, but cannot exceed wanted_num. It should return
  0 if no data was converted.

Header File

- components/hal/include/hal/rmt_types.h

Structures

```c
struct rmt_channel_status_result_t
Data struct of RMT channel status.
```

**Public Members**

```c
rmt_channel_status_t status[RMT_CHANNEL_MAX]
Store the current status of each channel
```

Enumerations

```c
typedef enum rmt_channel_t
RMT channel ID.
```

**Values**

- `RMT_CHANNEL_0`: RMT channel number 0
- `RMT_CHANNEL_1`: RMT channel number 1
- `RMT_CHANNEL_2`: RMT channel number 2
- `RMT_CHANNEL_3`: RMT channel number 3
- `RMT_CHANNEL_4`: RMT channel number 4
RMT_CHANNEL_5
RMT channel number 5

RMT_CHANNEL_6
RMT channel number 6

RMT_CHANNEL_7
RMT channel number 7

RMT_CHANNEL_MAX
Number of RMT channels

enum rmt_mem_owner_t
RMT Internal Memory Owner.

Values:

RMT_MEM_OWNER_TX
RMT RX mode, RMT transmitter owns the memory block

RMT_MEM_OWNER_RX
RMT RX mode, RMT receiver owns the memory block

RMT_MEM_OWNER_MAX

enum rmt_source_clk_t
Clock Source of RMT Channel.

Values:

RMT_BASECLK_REF = 0
RMT source clock is REF_TICK, 1MHz by default

RMT_BASECLK_APB = 1
RMT source clock is APB CLK, 80Mhz by default

RMT_BASECLK_MAX

enum rmt_data_mode_t
RMT Data Mode.

Note We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.

Values:

RMT_DATA_MODE_FIFO
RMT_DATA_MODE_MEM
RMT_DATA_MODE_MAX

enum rmt_mode_t
RMT Channel Working Mode (TX or RX)

Values:

RMT_MODE_TX
RMT TX mode

RMT_MODE_RX
RMT RX mode

RMT_MODE_MAX

enum rmt_idle_level_t
RMT Idle Level.

Values:

RMT_IDLE_LEVEL_LOW
RMT TX idle level: low Level
RMT_IDLE_LEVEL_HIGH
RMT TX idle level: high Level

RMT_IDLE_LEVEL_MAX

**enum rmt_carrier_level_t**
RMT Carrier Level.

*Values:*

RMT_CARRIER_LEVEL_LOW
RMT carrier wave is modulated for low Level output

RMT_CARRIER_LEVEL_HIGH
RMT carrier wave is modulated for high Level output

RMT_CARRIER_LEVEL_MAX

**enum rmt_channel_status_t**
RMT Channel Status.

*Values:*

RMT_CHANNEL_UNINIT
RMT channel uninitialized

RMT_CHANNEL_IDLE
RMT channel status idle

RMT_CHANNEL_BUSY
RMT channel status busy

### 2.3.12 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see *MTDI Strapping Pin* below.

This document has the following structure:

- *Overview of compatibility* between the default pull states on pins of Espressif’s products and the states required by the SD bus
- *Solutions* - ideas on how to resolve compatibility issues
- *Related information* - other relevant information

**Overview of Compatibility**

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.
Systems on a Chip (SoCs)

• ESP32 (except for D2WD versions, see ESP32 datasheet):
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip

• ESP32-D2WD:
  – No Pull-ups
  – No Pull-up on GPIO12

Systems in Packages (SIP)

• ESP32-PICO-D4:
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2

Modules

  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2

• ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  – No Pull-ups

• ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

• ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)

• ESP32-DevKitC, including ESP32-DevKitC v4 and v2
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)

• ESP-WROVER-KIT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  – Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  – Download Mode Not Working (minor issue) (v2, v1)

You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
  – ESP32-WROVER-B on v4.1
  – ESP32-WROVER on v3
  – ESP32-WROOM-32 on v1 and v2

• ESP32-LyraTD-MSC
  – Required pull-ups are provided
  – Conflicts Between Bootstrap and SDIO on DAT2

• ESP32-LyraT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13

Non-Espressif Hosts

Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.
Solutions

No Pull-ups  If you use a development board without pull-ups, you can do the following:

• If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
• Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13  If DAT3 of your device is not properly pulled up, you have the following options:

• Use 1-bit SD mode and tie the device’s DAT3 to VDD
• Use SPI mode
• Perform one of the following actions on the GPIO13 pin:
  – Remove the pull-down resistors
  – Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  – Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2  There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:

1. (Recommended) Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

   警告： Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on http://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

   If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

   ```
   components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
   ```

   This command will burn the XPD_SDIO_TIEH, XPD_SDIO_FORCE, and XPD_SDIO_REG eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

   ![espefuse.py v2.6](image)

   To check the status of the eFuses, run:

   ```
   "components/esptool_py/esptool/espefuse.py summary"
   ```

   If running from an automated flashing script, espefuse.py has an option --do-not-confirm. For more details, see ESP32 Technical Reference Manual [PDF].

   2. If using 1-bit SD mode or SPI mode, disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:

   • Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   • For a slave device, build a firmware with the option SDIO_SLAVE_FLAG_DAT2_DISABLED and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode
will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

- For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
- For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
  - **LEDs** would not affect operation in most cases.
  - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see *Overview of Compatibility*.

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC
### 2.3.13 SDMMC Host Driver

#### Overview

ESP32’s SDMMC host peripheral has two slots:

- Slot 0 (**SDMMC_HOST_SLOT_0**) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (**SDMMC_HOST_SLOT_1**) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.

<table>
<thead>
<tr>
<th>Signal</th>
<th>Slot 0</th>
<th>Slot 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMD</td>
<td>GPIO11</td>
<td>GPIO15</td>
</tr>
<tr>

<tr>
<td>WP</td>
<td>any input via GPIO matrix</td>
<td></td>
</tr>
</tbody>
</table>

The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (HS1_*-) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

#### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards
Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

See also

See `SD/SDIO/MMC Driver` for the higher level driver which implements the protocol layer.

See `SD SPI Host Driver` for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See `SD Pull-up Requirements` for pullup support and compatibilities of modules and development kits.

API Reference

Header File

- `components/driver/include/driver/sdmmc_host.h`

Functions

```c
esp_err_t sdmmc_host_init (void)
```

Initialize SDMMC host peripheral.

**Note** This function is not thread safe

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdmmc_host_init` was already called
- `ESP_ERR_NO_MEM` if memory cannot be allocated

```c
esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)
```

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:
Chapter 2. API

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config`: additional configuration for the slot

```c
esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)
```

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `width`: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

```c
size_t sdmmc_host_get_slot_width (int slot)
```

Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

```c
esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)
```

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `freq_khz`: card clock frequency, in kHz

```c
esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)
```

Enable or disable DDR mode of SD interface.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

**Parameters**
- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `ddr_enabled`: enable or disable DDR mode

```c
esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)
```

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.
Attention  Data buffer passed in cmdinfo->data must be in DMA capable memory

Return
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
• ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
• ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• cmdinfo: pointer to structure describing command and data to transfer

```
esp_err_t sdmmc_host_io_int_enable (int slot)
```
Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

Return  returns ESP_OK, other errors possible in the future

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

```
esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)
```
Block until an SDIO interrupt is received, or timeout occurs.

Return
• ESP_OK on success (interrupt received)
• ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

Parameters
• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• timeout_ticks: number of RTOS ticks to wait for the interrupt

```
esp_err_t sdmmc_host_deinit (void)
```
Disable SDMMC host and release allocated resources.

Note  This function is not thread safe

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

```
esp_err_t sdmmc_host_pullup_en (int slot, int width)
```
Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC SLOT FLAG INTERNAL_PULLUP flag in sdmmc_slot_config_t:flags instead.

Note  You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

Return
• ESP_OK: if success
• ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

Parameters
• slot: Slot to use, normally set it to 1.
• width: Bit width of your configuration, 1 or 4.

Structures
```
struct sdmmc_slot_config_t
```
Extra configuration for SDMMC peripheral slot
Public Members

```c
uint8_t width
    Bus width used by the slot (might be less than the max width supported)

uint32_t flags
    Features used by this slot.
```

Macros

- `SDMMC_HOST_SLOT_0` SDMMC slot 0.
- `SDMMC_HOST_SLOT_1` SDMMC slot 1.
- `SDMMC_HOST_DEFAULT()` Default `sdmmc_host_t` structure initializer for SDMMC peripheral.
  - Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
- `SDMMC_SLOT_FLAG_INTERNAL_PULLUP` Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.
- `SDMMC_SLOT_NO_CD` indicates that card detect line is not used
- `SDMMC_SLOT_NO_WP` indicates that write protect line is not used
- `SDMMC_SLOT_WIDTH_DEFAULT` use the maximum possible width for the slot
- `SDMMC_SLOT_CONFIG_DEFAULT()` Macro defining default configuration of SDMMC host slot

### 2.3.14 SD SPI Host Driver

**Overview**

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

This driver’s naming pattern was adopted from the SDMMC Host driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See SDMMC Host) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.
With the help of SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

**How to Use**

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

**Other Details**

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

注解：SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**API Reference**

**Header File**

- `components/driver/include/driver/sdspi_host.h`

**Functions**

`esp_err_t sdspi_host_init (void)`

Initialize SD SPI driver.

**Note** This function is not thread safe

**Return**

- ESP_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note** This function is not thread safe

**Note** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**

- ESP_OK on success
• ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
• ESP_ERR_NO_MEM if memory can not be allocated
• other errors from the underlying spi_master and gpio drivers

Parameters
• dev_config: pointer to device configuration structure
• out_handle: Output of the handle to the sdspi device.

\textbf{esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)}

Remove an SD SPI device.

\textbf{Return} Always ESP_OK

\textbf{Parameters}
• handle: Handle of the SD SPI device

\textbf{esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t \*cmdinfo)}

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

\textbf{Note} This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

\textbf{Return}
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

\textbf{Parameters}
• handle: Handle of the sdspi device
• cmdinfo: pointer to structure describing command and data to transfer

\textbf{esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)}

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

\textbf{Note} This function is not thread safe

\textbf{Return}
• ESP_OK on success
• other error codes may be returned in the future

\textbf{Parameters}
• host: Handle of the sdspi device
• freq_khz: card clock frequency, in kHz

\textbf{esp_err_t sdspi_host_deinit (void)}

Release resources allocated using sdspi_host_init.

\textbf{Note} This function is not thread safe

\textbf{Return}
• ESP_OK on success
• ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

\textbf{esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)}

Enable SDIO interrupt.

\textbf{Return}
• ESP_OK on success

\textbf{Parameters}
• handle: Handle of the sdspi device

\textbf{esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)}

Wait for SDIO interrupt until timeout.

\textbf{Return}
• ESP_OK on success

**Parameters**
- `handle`: Handle of the sdspi device
- `timeout_ticks`: Ticks to wait before timeout.

```c
desp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)
```
Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe
**Note** The SDIO overs dspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**
- `slot`: SPI controller to use (SPI2_HOST or SPI3_HOST)
- `slot_config`: pointer to slot configuration structure

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

```c
struct sdspi_device_config_t
Extra configuration for SD SPI device.
```

**Public Members**

```c
tspt_host_device_t host_id
SPI host to use, SPIx_HOST (see spi_types.h).
```

```c
gpio_num_t gpio_cs
GPIO number of CS signal.
```

```c
gpio_num_t gpio_cd
GPIO number of card detect signal.
```

```c
gpio_num_t gpio_wp
GPIO number of write protect signal.
```

```c
gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.
```

```c
struct sdspi_slot_config_t
Extra configuration for SPI host.
```

**Public Members**

```c
gpio_num_t gpio_cs
GPIO number of CS signal.
```

```c
gpio_num_t gpio_cd
GPIO number of card detect signal.
```

```c
gpio_num_t gpio_wp
GPIO number of write protect signal.
```

```c
gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.
```

```c
gpio_num_t gpio_miso
GPIO number of MISO signal.
```
**Chapter 2. API**

```c
gpio_num_t gpio_mosi
GPIO number of MOSI signal.
```

```c
gpio_num_t gpio_sck
GPIO number of SCK signal.
```

```c
int dma_channel
DMA channel to be used by SPI driver (1 or 2).
```

**Macros**

```c
SDSPI_DEFAULT_HOST
```

Default `sdmmc_host_t` structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

‘slot’ should be set to an `sdspi_device` initialized by `sdspi_host_init_device()`.

```c
SDSPI_SLOT_NO_CD
```

indicates that card detect line is not used

```c
SDSPI_SLOT_NO_WP
```

indicates that write protect line is not used

```c
SDSPI_SLOT_NO_INT
```

indicates that interrupt line is not used

```c
SDSPI_DEVICE_CONFIG_DEFAULT()
```

Macro defining default configuration of SD SPI device.

```c
SDSPI_SLOT_CONFIG_DEFAULT()
```

Macro defining default configuration of SPI host

**Type Definitions**

```c
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

### 2.3.15 SDIO Card Slave Driver

**Overview**

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

**Connections**

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>Corresponding pins in SPI mode</th>

</tbody>
</table>

- **1-bit SD mode**: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
Chapter 2. API

- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

**Overview of Compatibility**

Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check **Overview of Compatibility** to see whether your development boards have such pullups.

- **Most official modules have conflicts on strapping pins with the SDIO slave function.** If you are using an ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See **Overview of Compatibility** to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

- **Modules:** ESP32-PICO-D4, ESP32-WROOM-32 series (including ESP32-SOLO-1), ESP32-WROVER-B and ESP32-WROVER-IB
- **Kits:** ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to **SD Pull-up Requirements** for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology**

The SDIO slave driver uses the following terms:

- **Transfer:** a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending:** slave to host transfers.
- **Receiving:** host to slave transfers.

**Register names in ESP32 Technical Reference Manual > SDIO Slave Controller [PDF]** are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO:** specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \( \text{requested length} = 0x1F800\text{-address} \)
- **Ownership:** When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length:** The length requested in one transfer determined by the FIFO address.
- **Transfer length:** The length requested in one transfer determined by the CMD53 byte/block count field.
**Chapter 2. API Reference**

**Note:** Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the `recv_buffer_size` member of `sdio_slave_config_t`.
- Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in **Interrupts**.
- Registers: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave** The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of **SDIO Simplified Specification**), which is described briefly in **ESP SDIO Slave Initialization**.

Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to **ESP SDIO Slave Protocol**. There is also a component **ESP Serial Slave Link** for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.

**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Get the received data by calling sdio_slave_recv or sdio_slave_recv_packet. If non-blocking call is needed, set wait=0.
   The difference between two APIs is that, sdio_slave_recv_packet gives more information about packet, which can consist of several buffers. When ESP_ERR_NOT_FINISHED is returned by this API, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host. Call sdio_slave_recv_get_buf to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.
   If the host never sends data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version sdio_slave_recv instead.
4. Pass the handle of processed buffer back to the driver by sdio_recv_load_buf again.

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- Stream Mode: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- Packet Mode: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**注解:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

The sending mode can be set in the sending_mode member of sdio_slave_config_t, and the buffer numbers can be set in the send_queue_size. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call sdio_slave_transmit to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an arg indicating the buffer) to sdio_slave_send_queue. If non-blocking call is needed, set wait=0. If the wait is not portMAX_DELAY (wait until success), application has to check the result to know whether the data is put in to the queue or discard.
2. Call sdio_slave_send_get_finished to get and deal with a finished transfer. A buffer should be keep unmodified until returned from sdio_slave_send_get_finished. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the arg in the queue parameter:

1. Directly point arg to a dynamic-allocated buffer, and use the arg to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point arg to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t * buffer;
    size_t  size;
    int     id;
} sdio_transfer_t;

// and send as:
```

(下頁繼續)
Chapter 2. API

```c
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3,  // the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t* arg = NULL;
ESP_LOGI("tag", "(#d) successfully send %d bytes of %p", arg->id, arg->size,
    arg->buffer);
some_post_callback(arg);  // do more things
```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256] = {1,2,3,4,5,6,7,8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see peripherals/sdio.

### Application Example

Slave/master communication: peripherals/sdio.

### API Reference

#### Header File

- components/hal/include/hal/sdio_slave_types.h

#### Enumerations

**enum sdio_slave_hostint_t**

Mask of interrupts sending to the host.

**Values:**

- `SDIO_SLAVE_HOSTINT_BIT0` = BIT(0)
  
  General purpose interrupt bit 0.

- `SDIO_SLAVE_HOSTINT_BIT1` = BIT(1)

- `SDIO_SLAVE_HOSTINT_BIT2` = BIT(2)

- `SDIO_SLAVE_HOSTINT_BIT3` = BIT(3)

- `SDIO_SLAVE_HOSTINT_BIT4` = BIT(4)

- `SDIO_SLAVE_HOSTINT_BIT5` = BIT(5)

- `SDIO_SLAVE_HOSTINT_BIT6` = BIT(6)
```c
SDIO_SLAVE_HOSTINT_BIT7 = BIT(7)
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = BIT(23)
    New packet available.

enum sdio_slave_timing_t
    Timing of SDIO slave.
    Values:
    SDIO_SLAVE_TIMING_PSEND_PSAMPLE = 0
        Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.
    SDIO_SLAVE_TIMING_NSEND_PSAMPLE
        Send at negedge, and sample at posedge. Default value for DS mode and below.
    SDIO_SLAVE_TIMING_PSEND_NSAMPLE
        Send at posedge, and sample at negedge.
    SDIO_SLAVE_TIMING_NSEND_NSAMPLE
        Send at negedge, and sample at negedge.

enum sdio_slave_sending_mode_t
    Configuration of SDIO slave mode.
    Values:
    SDIO_SLAVE_SEND_STREAM = 0
        Stream mode, all packets to send will be combined as one if possible.
    SDIO_SLAVE_SEND_PACKET = 1
        Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

Header File
    • components/driver/include/driver/sdio_slave.h

Functions
    esp_err_t sdio_slave_initialize (sdio_slave_config_t *config)
        Initialize the sdio slave driver
        Return
            • ESP_ERR_NOT_FOUND if no free interrupt found.
            • ESP_ERR_INVALID_STATE if already initialized.
            • ESP_ERR_NO_MEM if fail due to memory allocation failed.
            • ESP_OK if success
        Parameters
            • config: Configuration of the sdio slave driver.
    void sdio_slave_deinit (void)
        De-initialize the sdio slave driver to release the resources.
    esp_err_t sdio_slave_start (void)
        Start hardware for sending and receiving, as well as set the IOREADY1 to 1.
        Note: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.
        Return
            • ESP_ERR_INVALID_STATE if already started.
            • ESP_OK otherwise.
    void sdio_slave_stop (void)
        Stop hardware from sending and receiving, also set IOREADY1 to 0.
        Note: this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call sdio_slave_reset to do that.
```
**Chapter 2. API**

**esp_err_t sdio_slave_reset** (void)

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Return** always return ESP_OK.

**sdio_buf_handle_t sdio_slave_recv_register_buf** (uint8_t *start)

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return** The buffer handle if success, otherwise NULL.

**Parameters**
- **start**: The start address of the buffer.

**esp_err_t sdio_slave_recv_unregister_buf** (sdio_buf_handle_t handle)

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return** ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

**Parameters**
- **handle**: Handle to the buffer to release.

**esp_err_t sdio_slave_recv_load_buf** (sdio_buf_handle_t handle)

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Return**
- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP_OK if success

**Parameters**
- **handle**: Handle to the buffer ready to receive data.

**esp_err_t sdio_slave_recv_packet** (sdio_buf_handle_t *handle_ret, TickType_t wait)

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**
- ESP_ERR_INVALID_ARG if `handle_ret` is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

**Parameters**
- **handle_ret**: Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait**: Time to wait before data received.

**esp_err_t sdio_slave_recv** (sdio_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Return**
- ESP_ERR_INVALID_ARG if `handle_ret` is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

**Parameters**
- **handle_ret**: Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait**: Time to wait before data received.
sdio_slave_get_buffer.

Return
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

Parameters
- handle_ret: Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
- [out] out_addr: Output of the start address, set to NULL if not needed.
- [out] out_len: Actual length of the data in the buffer, set to NULL if not needed.
- wait: Time to wait before data received.

uint8_t* sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t* len_o)
Retrieve the buffer corresponding to a handle.

Return buffer address if success, otherwise NULL.

Parameters
- handle: Handle to get the buffer.
- len_o: Output of buffer length

esp_err_t sdio_slave_send_queue(uint8_t* addr, size_t len, void* arg, TickType_t wait)
Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

Return
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

Parameters
- addr: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- len: Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- arg: Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- wait: Time to wait if the buffer is full.

esp_err_t sdio_slave_send_get_finished(void** out_arg, TickType_t wait)
Return the ownership of a finished transaction.

Return ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

Parameters
- out_arg: Argument of the finished transaction. Set to NULL if unused.
- wait: Time to wait if there’s no finished sending transaction.

esp_err_t sdio_slave_transmit(uint8_t* addr, size_t len)
Start a new sending transfer, and wait for it (blocked) to be finished.

Return
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

Parameters
- addr: Start address of the buffer to send
- len: Length of buffer to send.

uint8_t sdio_slave_read_reg(int pos)
Read the spi slave register shared with host.

Note register 28 to 31 are reserved for interrupt vector.

Return value of the register.

Parameters
- pos: register address, 0-27 or 32-63.
**esp_err_t** `sdio_slave_write_reg(int pos, uint8_t reg)`
Write the SPI slave register shared with host.

**Note** register 29 and 31 are used for interrupt vector.
**Return** ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.
**Parameters**
- **pos**: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
- **reg**: the value to write.

`sdio_slave_hostint_t` `sdio_slave_get_host_intena(void)`
Get the interrupt enable for host.

**Return** the interrupt mask.

void `sdio_slave_set_host_intena(sdio_slave_hostint_t mask)`
Set the interrupt enable for host.

**Parameters**
- **mask**: Enable mask for host interrupt.

`esp_err_t` `sdio_slave_send_host_int(uint8_t pos)`
Interrupt the host by general purpose interrupt.

**Return**
- ESP_ERR_INVALID_ARG if interrupt num error
- ESP_OK otherwise

**Parameters**
- **pos**: Interrupt num, 0-7.

void `sdio_slave_clear_host_int(sdio_slave_hostint_t mask)`
Clear general purpose interrupt to host.

**Parameters**
- **mask**: Interrupt bits to clear, by bit mask.

`esp_err_t` `sdio_slave_wait_int(int pos, TickType_t wait)`
Wait for general purpose interrupt from host.

**Note** this clears the interrupt at the same time.
**Return** ESP_OK if success, ESP_ERR_TIMEOUT if timeout.
**Parameters**
- **pos**: Interrupt source number to wait for. is set.
- **wait**: Time to wait before interrupt triggered.

**Structures**

`struct sdio_slave_config_t`
Configuration of SDIO slave.

**Public Members**

`sdio_slave_timing_t` `timing`
timing of `sdio_slave`. see `sdio_slave_timing_t`.

`sdio_slave_sending_mode_t` `sending_mode`
mode of `sdio_slave`. `SDIO_SLAVE_MODE_STREAM` if the data needs to be sent as much as possible; `SDIO_SLAVE_MODE_PACKET` if the data should be sent in packets.

`int` `send_queue_size`
max buffers that can be queued before sending.

`size_t` `recv_buffer_size`
If buffer size is too small, it costs more CPU time to handle larger number of buffers. If buffer size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully
fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.

**`sdio_event_cb_t event_cb`**
- when the host interrupts slave, this callback will be called with interrupt number (0-7).

**`uint32_t flags`**
- Features to be enabled for the slave, combinations of `SDIO_SLAVE_FLAG_`.*

### Macros

#### `SDIO_SLAVE_RECV_MAX_BUFFER`
- It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

#### `SDIO_SLAVE_FLAG_HOST_INTR_DISABLED`
- The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

#### `SDIO_SLAVE_FLAG_INTERNAL_PULLUP`
- Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

### Type Definitions

**`typedef void (*sdio_event_cb_t)(uint8_t event)`**

**`typedef void *sdio_slave_buf_handle_t`**
- Handle of a receive buffer, register a handle by calling `sdio_slave_recv_register_buf`. Use the handle to load the buffer to the driver, or call `sdio_slave_recv_unregister_buf` if it is no longer used.

### 2.3.16 Sigma-delta Modulation

#### Introduction

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

#### Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`
The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Sallen-Key Low Pass Filter](image)

**图 17: Sallen-Key Low Pass Filter**

Application Example

Sigma-delta Modulation example: `peripherals/sigmadelta`.

API Reference

**Header File**

- `components/driver/include/driver/sigmadelta.h`

**Functions**

```c
esp_err_t sigmadelta_config(const sigmadelta_config_t *config)
```

Configure Sigma-delta channel.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error
Parameters

- **config**: Pointer of Sigma-delta channel configuration struct

```c
esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)
```

Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{VDDIO}{256} \times \text{duty} + \frac{VDDIO}{2} \), where VDDIO is the power supply voltage.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **channel**: Sigma-delta channel number
- **duty**: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

```c
esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)
```

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **channel**: Sigma-delta channel number
- **prescale**: The divider of source clock, ranges from 0 to 255

```c
esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)
```

Set Sigma-delta signal output pin.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **channel**: Sigma-delta channel number
- **gpio_num**: GPIO number of output pin.

**Header File**

- `components/hal/include/hal/sigmadelta_types.h`

**Structures**

```c
struct sigmadelta_config_t
```

Sigma-delta configure struct.

**Public Members**

```c
ten8_t sigmadelta_duty
```

Sigma-delta duty, duty ranges from -128 to 127.

```c
uint8_t sigmadelta_prescale
```

Sigma-delta prescale, prescale ranges from 0 to 255.
Chapter 2. API

uint8_t sigmaDelta_gpio
Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

enum sigmaDelta_port_t
SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

Values:

SIGMADELTA_PORT_0
SIGMADELTA port 0
SIGMADELTA_PORT_MAX
SIGMADELTA port max

enum sigmaDelta_channel_t
Sigma-delta channel list.

Values:

SIGMADELTA_CHANNEL_0
Sigma-delta channel 0
SIGMADELTA_CHANNEL_1
Sigma-delta channel 1
SIGMADELTA_CHANNEL_2
Sigma-delta channel 2
SIGMADELTA_CHANNEL_3
Sigma-delta channel 3
SIGMADELTA_CHANNEL_4
Sigma-delta channel 4
SIGMADELTA_CHANNEL_5
Sigma-delta channel 5
SIGMADELTA_CHANNEL_6
Sigma-delta channel 6
SIGMADELTA_CHANNEL_7
Sigma-delta channel 7
SIGMADELTA_CHANNEL_MAX
Sigma-delta channel max

2.3.17 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

Overview of ESP32’s SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.
Chapter 2. API

Terminology

The terms used in relation to the SPI master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>Deassertion</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

!!! warning: The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using xSemaphoreCreateMutex.
SPI Features

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
  There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Com-</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>mand</td>
<td>Address</td>
</tr>
<tr>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
<td></td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.
Chapter 2. API

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If \texttt{rx\_buffer} is \texttt{NULL} and \texttt{SPI\_TRANS\_USE\_RXDATA} is not set, the read phase is skipped. If \texttt{tx\_buffer} is \texttt{NULL} and \texttt{SPI\_TRANS\_USE\_TXDATA} is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see \textit{Notes on Sending Mixed Transactions to the Same Device}.

\textbf{Interrupt Transactions} Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

\textbf{Polling Transactions} Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The \texttt{spi\_device\_polling\_end()} routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions \texttt{spi\_device\_acquire\_bus()} and \texttt{spi\_device\_release\_bus()} to avoid the overhead. For more information, see \textit{Bus Acquiring}.

\textbf{Transaction Line Mode} Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member \texttt{flags} in the struct \texttt{spi\_transaction\_t} as shown in the \textit{Transaction Flag} column. If you want to check if corresponding IO pins are set or not, set the member \texttt{flags} in the \texttt{spi\_bus\_config\_t} as shown in the \textit{Bus IO setting Flag} column.

<table>
<thead>
<tr>

<td>SPICOM_MON_BUSFLAG_QUAD</td>
</tr>
</tbody>
</table>

\textbf{Command and Address Phases} During the command and address phases, the members \texttt{cmd} and \texttt{addr} in the struct \texttt{spi\_transaction\_t} are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in \texttt{spi\_device\_interface\_config\_t} by calling \texttt{spi\_bus\_add\_device()}. If the flags \texttt{SPI\_TRANS\_VARIABLE\_CMD} and \texttt{SPI\_TRANS\_VARIABLE\_ADDR} in the member \texttt{spi\_transaction\_t::flags} are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct \texttt{spi\_transaction\_ext\_t}, set the flags \texttt{SPI\_TRANS\_VARIABLE\_CMD} and/or \texttt{SPI\_TRANS\_VARIABLE\_ADDR} in the member \texttt{spi\_transaction\_ext\_t::base} and configure the

Submit Document Feedback
rest of base as usual. Then the length of each phase will be equal to \texttt{command_bits} and \texttt{address_bits} set in the struct \texttt{spi_transaction_ext_t}.

If the command and address phase need to be as the same number of lines as data phase, you need to set \texttt{SPI_TRANS_MULTILINE_CMD} and/or \texttt{SPI_TRANS_MULTILINE_ADDR} to the \texttt{flags} member in the struct \texttt{spi_transaction_t}. Also see \textit{Transaction Line Mode}.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members \texttt{rx_buffer} and \texttt{tx_buffer} of the structure \texttt{spi_transaction_t}. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If \textit{external PSRAM is enabled}, this means using \texttt{pvPortMallocCaps(size, MALLOC_CAP_DMA)}.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set \texttt{SPI_DEVICE_HALFDUPLEX} flag for the member \texttt{flags} in the struct \texttt{spi_device_interface_config_t}. And the member \texttt{flags} in the struct \texttt{spi_transaction_t} should be set as described in \textit{Transaction Line Mode}.

---

Nota: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see \textit{Known Issues}.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions \texttt{spi_device_acquire_bus()} and \texttt{spi_device_release_bus()}.  

**Driver Usage**

- Initialize an SPI bus by calling the function \texttt{spi_bus_initialize()}. Make sure to set the correct I/O pins in the struct \texttt{spi_bus_config_t}. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function \texttt{spi_bus_add_device()}. Make sure to configure any timing requirements the device might need with the parameter \texttt{dev_config}. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more \texttt{spi_transaction_t} structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function \texttt{spi_device_queue_trans()} and, at a later time, query the result using the function \texttt{spi_device_get_trans_result()}, or handle all requests synchronously by feeding them into \texttt{spi_device_transmit()}.
  - **Polling** Call the function \texttt{spi_device_polling_transmit()} to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using \texttt{spi_device_polling_start()} and \texttt{spi_device_polling_end()}.
- (Optional) To perform back-to-back transactions with a Device, call the function \texttt{spi_device_acquire_bus()} before sending transactions and \texttt{spi_device_release_bus()} after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call \texttt{spi_bus_remove_device()} with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call \texttt{spi_bus_free()}.  

The example code for the SPI master driver can be found in the \texttt{peripherals/spi_master} directory of ESP-IDF examples.
Transactions with Data Not Exceeding 32 Bits  When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the tx_buffer or rx_buffer members, because they use the same memory locations as tx_data and rx_data.

Transactions with Integers Other Than uint8_t  An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device  To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus  Though the SPI Bus Lock feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between spi_device_acquire_bus() and spi_device_release_bus().
   - Implicit bus acquiring between spi_device_polling_start() and spi_device_polling_end() (or inside spi_device_polling_transmit()).
During the time above, all other tasks and most ISRs will be disabled (see IRAM 安全中断处理程序). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a Cache disabled but cached memory region accessed exception. For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

To place functions into the IRAM, you can either:
1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:
   ```c
   IRAM_ATTR void foo(void) {}
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.
2. Use the `noflash` placement in the `linker.lf`. See more in 链接器脚本生成机制. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:
1. Add `DRAM_ATTR` (include `esp_attr.h`) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;
   ```
2. Use the `noflash` placement in the `linker.lf`. See more in 链接器脚本生成机制.

Please also see the example peripherals/spi_master/hd_eeprom.

### GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>

<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

• Only the first Device attached to the bus can use the CS0 pin.

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.
**Transaction Duration**  Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

**SPI Clock Frequency**  Transferring each byte takes eight times the clock period 8/fspi.

If the clock frequency is too high, the use of some functions might be limited. See Timing Considerations.

**Cache Miss**  The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is 20+8n/fspi[MHz] [us] for n bytes transferred in one transaction. Hence, the transferring speed is: n/(20+8n/fspi). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (Kbps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see IRAM.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.
The maximum allowed frequency is dependent on:

- `input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33-77% in comparison to the existing input delay. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the Host only writes data, the dummy bit workaround and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

The SPI master driver still works even if the `input_delay_ns` in the structure `spi_device_interface_config_t::flags` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.
Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit (MHz)} = \frac{80}{\left\lfloor \frac{\text{MISO delay (ns)}}{12.5} \right\rfloor + 1}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX (0ns)</td>
<td>0</td>
<td>0</td>
<td>80</td>
</tr>
<tr>
<td></td>
<td>50</td>
<td>50</td>
<td>16</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td>GPIO (25ns)</td>
<td>0</td>
<td>25</td>
<td>26.67</td>
</tr>
<tr>

<td>50</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used.
If such transactions are required, you have to use one of the alternative solutions:
1. Use full-duplex transactions instead.
2. Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:
   ```c
   ret = spi_bus_initialize(VSPI_HOST, &buscfg, 0);
   ```
   This can prohibit you from transmitting and receiving data longer than 64 bytes. 3. Try using the command and address fields to replace the write phase.
2. Full-duplex transactions are not compatible with the dummy bit workaround, hence the frequency is limited. See dummy bit speed-up workaround.
3. dummy_bits in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**
- `components/hal/include/hal/spi_types.h`

**Structures**

`struct spi_line_mode_t`

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

**Public Members**

- `uint8_t cmd_lines`
  The line width of command phase, e.g. 2-line-cmd-phase.
- `uint8_t addr_lines`
  The line width of address phase, e.g. 1-line-addr-phase.
- `uint8_t data_lines`
  The line width of data phase, e.g. 4-line-data-phase.

**Enumerations**

`enum spi_host_device_t`

Enum with the three SPI peripherals that are software-accessible in it.

**Values:**

- `SPI1_HOST = 0`
  SPI1.
- `SPI2_HOST = 1`
  SPI2.
- `SPI3_HOST = 2`
  SPI3.
- `SPI_HOST_MAX`
  invalid host value

`enum spi_event_t`

SPI Events.

**Values:**
**Chapter 2. API 参考**

**SPI_EV_BUF_TX** = BIT(0)
The buffer has sent data to master.

**SPI_EV_BUF_RX** = BIT(1)
The buffer has received data from master.

**SPI_EV_SEND_DMA_READY** = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

**SPI_EV_SEND** = BIT(3)
Master has received certain number of the data, the number is determined by Master.

**SPI_EV_RECV_DMA_READY** = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

**SPI_EV_RECV** = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

**SPI_EV_CMD9** = BIT(6)
Received CMD9 from master.

**SPI_EV_CMDA** = BIT(7)
Received CMDA from master.

**SPI_EV_TRANS** = BIT(8)
A transaction has done.

**Header File**
- components/driver/include/driver/spi_common.h

**Functions**

```c
esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config,
                             spi_dma_chan_t dma_chan)
```
Initialize a SPI bus.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**
- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- *host_id*: SPI peripheral that controls this bus
- *bus_config*: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- *dma_chan*: Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_bus_free(spi_host_device_t host_id)
```
Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
• ESP_OK on success

**Parameters**

- **host_id**: SPI peripheral to free

**Structures**

```c
define spi_bus_config_t

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referencing to these lines will be ignored and can thus safely be left uninitialized.

**Public Members**

- **int mosi_io_num**: GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.
- **int data0_io_num**: GPIO pin for spi data0 signal in quad/octet mode, or -1 if not used.
- **int miso_io_num**: GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.
- **int data1_io_num**: GPIO pin for spi data1 signal in quad/octet mode, or -1 if not used.
- **int sclk_io_num**: GPIO pin for SPI Clock signal, or -1 if not used.
- **int quadwp_io_num**: GPIO pin for WP (Write Protect) signal, or -1 if not used.
- **int data2_io_num**: GPIO pin for spi data2 signal in quad/octet mode, or -1 if not used.
- **int quadhd_io_num**: GPIO pin for HD (Hold) signal, or -1 if not used.
- **int data3_io_num**: GPIO pin for spi data3 signal in quad/octet mode, or -1 if not used.
- **int data4_io_num**: GPIO pin for spi data4 signal in octal mode, or -1 if not used.
- **int data5_io_num**: GPIO pin for spi data5 signal in octal mode, or -1 if not used.
- **int data6_io_num**: GPIO pin for spi data6 signal in octal mode, or -1 if not used.
- **int data7_io_num**: GPIO pin for spi data7 signal in octal mode, or -1 if not used.
- **int max_transfer_sz**: Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.
- **uint32_t flags**: Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.
int intr_flags
Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros
SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX (DATA, LEN)
Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters
- DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
- LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.
E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)tx_data, 15);
```

Parameters
- DATA: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- LEN: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_GPIO_PINS
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates MOSI line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_IO4_IO7
Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.
**SPICOMMON_BUSFLAG_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPII04/SPII05/SPII06/SPII07 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**

```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```c
enum spi_common_dma_t
{
    SPI_DMA_DISABLED = 0,
    SPI_DMA_CH1 = 1,
    SPI_DMA_CH2 = 2,
    SPI_DMA_CH_AUTO = 3
};
```

**Values:**

- **SPI_DMA_DISABLED** = 0
  - Do not enable DMA for SPI.
- **SPI_DMA_CH1** = 1
  - Enable DMA, select DMA Channel 1.
- **SPI_DMA_CH2** = 2
  - Enable DMA, select DMA Channel 2.
- **SPI_DMA_CH_AUTO** = 3
  - Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master**

**Header File**

- components/driver/include/driver/spi_master.h

**Functions**

```c
esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- `host_id`: SPI peripheral to allocate device on
- `dev_config`: SPI interface protocol config for the device
- `handle`: Pointer to variable to hold the device handle

```c
esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
```

Remove a device from the SPI bus.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success
Parameters

- **handle**: Device handle to free

```c
esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if **SPI_DEVICE_CS_KEEP_LOW** flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never timeout.

```c
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`. This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

**Parameters**

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never timeout.

```c
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute

```c
esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.
Note Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_DEVICE_CS_KEEP_LOW flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; currently only port-MAX_DELAY is supported.

esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute

esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)

 Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

Note The function will wait until all the existing transactions have been sent.

Return
- ESP_ERR_INVALID_ARG : wait is not set to portMAX_DELAY.
- ESP_OK : Success.

Parameters
- device: The device to occupy the bus.
- wait: Time to wait before the the bus is occupied by the device. Currently MUST set to port-MAX_DELAY.

void spi_device_release_bus(spi_device_handle_t dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.
### Chapter 2. API

**Parameters**

- dev: The device to release the bus.

```c
int spi_cal_clock (int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```

Calculate the working frequency that is most close to desired frequency, and also the register value.

**Parameters**

- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock
- reg_o: Output of value to be set in clock register, or NULL if not needed.

**Return**
Actual working frequency that most fit.

```c
int spi_get_actual_clock (int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Return**
Actual working frequency that most fit.

**Parameters**

- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock

```c
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note**
If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**

- gpio_is_used: True if using GPIO matrix, or False if iomux pins are used.
- input_delay_ns: Input delay from SCLK launched edge to MISO data valid.
- eff_clk: Effective clock frequency (in Hz) from spi_cal_clock.
- dummy_o: Address of dummy bits used output. Set to NULL if not needed.
- cycles_remain_o: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return**
Frequency limit of current configurations.

**Parameters**

- gpio_is_used: True if using GPIO matrix, or False if native pins are used.
- input_delay_ns: Input delay from SCLK launch edge to MISO data valid.

### Structures

**struct spi_device_interface_config_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

#### Public Members

**uint8_t command_bits**

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.

**uint8_t address_bits**

Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

---

Espressif Systems 836

Submit Document Feedback

Release v5.0-dev-489-gef98a36
uint8_t **dummy_bits**
Amount of dummy bits to insert between address and data phase.

uint8_t **mode**
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t **duty_cycle_pos**
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t **cs_ena_pretrans**
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t **cs_ena_posttrans**
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock_speed_hz**
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int **input_delay_ns**
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int **spics_io_num**
CS GPIO pin for this device, or -1 if not used.

uint32_t **flags**
Bitwise OR of SPI_DEVICE_* flags.

int **queue_size**
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

**transaction_cb_t pre_cb**
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**transaction_cb_t post_cb**
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**struct spi_transaction_t**
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

uint32_t **flags**
Bitwise OR of SPI_TRANS_* flags.

uint16_t **cmd**
Command data, of which the length is set in the command_bits of spi_device_interface_config_t.
Chapter 2. API

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_.12).

```c
uint64_t addr
Address data, of which the length is set in the address_bits of spi_device_interface_config_t.
```

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

```c
size_t length
Total data length, in bits.
```

```c
size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).
```

```c
void *user
User-defined variable. Can be used to store eg transaction ID.
```

```c
const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.
```

```c
uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.
```

```c
void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.
```

```c
uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.
```

```c
struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.
```

Public Members

```c
struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.
```

```c
uint8_t command_bits
The command length in this transaction, in bits.
```

```c
uint8_t address_bits
The address length in this transaction, in bits.
```

```c
uint8_t dummy_bits
The dummy length in this transaction, in bits.
```

Macros

```c
SPI_MASTER_FREQ_8M
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).
```

```c
8MHz
```

```c
SPI_MASTER_FREQ_9M
8.89MHz
```

```c
SPI_MASTER_FREQ_10M
10MHz
```
SPI_MASTER_FREQ_11M
11.43MHz

SPI_MASTER_FREQ_13M
13.33MHz

SPI_MASTER_FREQ_16M
16MHz

SPI_MASTER_FREQ_20M
20MHz

SPI_MASTER_FREQ_26M
26.67MHz

SPI_MASTER_FREQ_40M
40MHz

SPI_MASTER_FREQ_80M
80MHz

SPI_DEVICE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_DEVICE_BIT_LSBFIRST
Transmit and receive LSB first.

SPI_DEVICE_3WIRE
Use MOSI (=spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS
Make CS positive during a transaction instead of negative.

SPIDEVICE_HALFDUPLEX
Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS
Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_TRANS_MODE_DIO
Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO
Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.
SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_CS_KEEP_ACTIVE
Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions
typedef struct spi_transaction_t spi_transaction_t
typedef void(*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.3.18 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

• SPI2, sometimes referred to as HSPI
• SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
### Term | Definition
--- | ---
**Host** | The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.

**Device** | SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.

**Bus** | A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.

- **MISO** | Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.

- **MOSI** | Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.

- **SCLK** | Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.

- **CS** | Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.

- **QUADWP** | Write Protect signal. Only used for 4-bit (qio/qout) transactions.

- **QUADHD** | Hold signal. Only used for 4-bit (qio/qout) transactions.

- **Assertion** | The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.

**Transaction** | One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.

**Launch edge** | Edge of the clock at which the source register launches the signal onto the line.

**Latch edge** | Edge of the clock at which the destination register latches in the signal.

### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

<table>
<thead>
<tr>
<th>注解：A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.</th>
</tr>
</thead>
</table>

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the structure `bus_config`. Set the unused signals to -1.

  If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

  - Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

  - (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO_MUX**

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.
The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO Number</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th></th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency is equal to the limitation, it can lead to random errors. 2. The clock uncertainty between Host and Device (12.5ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.
Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:

If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

API Reference

Header File

- components/driver/include/driver/spi_slave.h

Functions

```c
esp_err_t spi_slave_initialize (spi_host_device_t host, const spi_bus_config_t *bus_config,
                                 const spi_slave_interface_config_t *slave_config,
                                 spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to use as a slave interface
- **bus_config**: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **slave_config**: Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
• dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  – Selecting SPI_DMA_DISABLED limits the size of transactions.
  – Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  – Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

\[
\text{esp_err_t spi_slave_free} (\text{spi_host_device_t host})
\]
Free a SPI bus claimed as a SPI slave interface.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• host: SPI peripheral to free

\[
\text{esp_err_t spi_slave_queue_trans} (\text{spi_host_device_t host, const spi_slave_transaction_t *} \text{trans_desc}, \text{TickType_t ticks_to_wait})
\]
Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• host: SPI peripheral that is acting as a slave
• trans_desc: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
• ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

\[
\text{esp_err_t spi_slave_get_trans_result} (\text{spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait})
\]
Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

Return

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters

• host: SPI peripheral to that is acting as a slave
• [out] trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

\[
\text{esp_err_t spi_slave_transmit} (\text{spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait})
\]
Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.
Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- host: SPI peripheral to that is acting as a slave
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Structures

struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

int spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0,0)
- 1: (0,1)
- 2: (1,0)
- 3: (1,1)

slave_transaction_cb / post_setup_cb
Callback called after the SPI registers are loaded with new data.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb / post_trans_cb
Callback called after a transaction is done.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.
`void rx_buffer`  
Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer % 4 == 0`), and has length of a multiple of 4 bytes.

`void user`  
User-defined variable. Can be used to store eg transaction ID.

**Macros**

SPI_SLAVE_TXBIT_LSBFIRST  
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST  
Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST  
Transmit and receive LSB first.

**Type Definitions**

```c
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void(*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

### 2.3.19 ESP32-WROOM-32SE (Secure Element)

**Overview**

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A.

**Application Example**

Secure Element ECDSA Sign/Verify example: `peripherals/secure_element/atecc608_ecdsa`.

**How to configure and provision ESP32-WROOM-32SE for TLS**

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit `esp_cryptoauth_utility`.

**How to use ATECC608A of ESP32-WROOM-32SE for TLS**

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer `ATECC608A with ESP-TLS in ESP-TLS documentation`.

### 2.3.20 触摸传感器

**概述**

触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成。保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

ESP32 最多可支持 10 个电容式触摸传感器通道/GPIO。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触摸区域及更多触感点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。
如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32 技术参考手册》PDF 中“片上传感器与模拟信号处理”章节。

请参考触摸传感器应用方案简介，查看触摸传感器设计详情和固件开发指南。

如果想评估触摸传感器的多种应用场景，请查看 ESP32 触摸功能开发套件。

功能介绍

下面将 API 分解成几个函数组进行介绍，帮助用户快速了解以下功能:

- 初始化触摸传感器驱动程序
- 配置触摸传感器 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 滤波采样
- 触控监测方式
- 设置中断信号触发触碰动作
- 中断触发，唤醒睡眠模式

请前往 API 参考 章节，查看某一函数的具体描述。应用示例 章节则介绍了此 API 的具体实现。

初始化触摸传感器驱动程序 使用触摸传感器之前，需要先调用 touch_pad_init() 函数初始化触摸传感器驱动程序。此函数设置了 API 参考 下的 Macros 中列出的几项 .DEFAULT 驱动程序参数，同时删除之前设置过的触摸传感器信息 (如有)，并禁用中断。

如果不再需要该驱动程序，可以调用 touch_pad_deinit() 释放已初始化的驱动程序。

配置触摸传感器 GPIO 管脚 调用 touch_pad_config() 使能某一 GPIO 的触感功能。

使用 touch_pad_set_fsm_mode() 选择触控传感器测量 (由 FSM 操作) 是由硬件定时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 touch_pad_sw_start() 启动 FSM。

触摸状态测量 借助以下两个函数从传感器读取原始数据和滤波后的数据:

- touch_pad_read_raw_data()
- touch_pad_read_filtered()

这两个函数也可以用于检查触碰和释放触摸传感器时传感器读数变化范围，然后根据这些信息设定触摸传感器的触碰阈值。

注解：使用 touch_pad_read_filtered() 之前，需要先调用滤波采样 中特定的滤波器函数来初始化并配置该滤波器。

请参考应用示例 peripherals/touch_sensor/touch_sensor_v1/touch_pad_read，查看如何使用读取触摸传感器数据。

优化测量 触控传感器设有数个可配置参数，以适应触摸传感器设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触控传感器充放电的参考电压范围。用户可以使用 touch_pad_set_voltage() 函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用程序功耗，但可能会增加测量噪声干扰。如果得到的动态范围结果比较理想，则可以调用 touch_pad_set_meas_time() 函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的‘set’函数总结如下：

- 触摸传感器充放电参数:
  - 电压门限: touch_pad_set_voltage()
- 速率（斜率）
  - touch_pad_set_cnt_mode()
- 测量时间
  - touch_pad_set_meas_time()

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示:

图 18: 触摸传感器 - 测量参数之间的关系

上图中的 Output 代表触摸传感器读值，即一个测量周期内测得的脉冲计数值。
所有函数均成对出现，用于设定某一特定参数，并获取当前参数值，例如: touch_pad_set_voltage() 和 touch_pad_get_voltage()。

滤波采样
如果测量中存在噪声，可以使用提供的 API 函数对采样进行滤波。使用滤波器之前，请先调用 touch_pad_filter_start() 启动该滤波器。
滤波器类型为 IIR（无限脉冲响应滤波器），用户可以调用 touch_pad_set_filter_period() 配置此类滤波器的采样周期。
 如需停止滤波器，请调用 touch_pad_filter_stop() 函数。如果不再使用该滤波器，请调用 touch_pad_filter_delete() 删除此滤波器。

触摸监测
触摸监测基于用户配置的阈值和 FSM 执行的原始测量，并由 ESP32 硬件实现。用户可以调用 touch_pad_get_status() 查看被触碰的触摸传感器，或调用 touch_pad_clear_status() 清除触摸状态信息。
用户也可以将硬件触摸监测连接至中断，详细介绍见下一章节。
如果测量中存在噪声，且电容变化幅度较小，硬件触摸监测结果可能就不太理想。如需解决这一问题，不建议使用硬件监测或中断信号，建议用户在自己的应用程序中进行采样滤波，并执行触摸监测。请参考 peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt，查看以上两种触摸监测的实现方式。

中断触发
在对触摸监测启用中断之前，请先设置一个触摸监测阈值。然后使用触摸状态测量 中所述的函数读取并显示触摸和释放触摸传感器时测得的结果。如果测量中存在噪声且相对电容变化较小，请使用滤波器。用户也可以根据应用程序和环境条件，测试温度和电源电压变化对测量值的影响。
确定监测阈值后就可以在初始化时调用 touch_pad_config() 设置此阈值，或在运行时调用 touch_pad_set_thresh() 设置此阈值。
下一步就是设置如何触发中断。用户可以设置在阈值以下或以上触发中断，具体触发模式由函数 touch_pad_set_trigger_mode() 设置。
最后用户可以使用以下函数配置和管理中断调用:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

中断配置完成后，用户可以调用`touch_pad_get_status()`查看中断信号来自哪个触摸传感器，也可以调用`touch_pad_clear_status()`清除触摸传感器状态信息。

**注解：**触摸监测中的中断信号基于原始/未经滤波的采样（对比用户设置的阈值），并在硬件中实现。启用软件滤波API（请参考滤波采样）并不会影响这一过程。

### 从睡眠模式唤醒
如果使用触摸传感器中断将芯片从睡眠模式唤醒，用户可以选择配置一些触摸传感器，例如SET1或SET1和SET2。触摸这些触动传感器将触发中断并唤醒芯片，请调用`touch_pad_set_trigger_source()`实现上述操作。

用户可以使用以下函数管理‘SET’中触摸传感器所需的位模式配置:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

### 应用示例

- 触摸传感器读值示例：`peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`
- 触摸传感器中断示例：`peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`

### API 参考

**Header File**

- `components/driver/esp32/include/driver/touch_sensor.h`

**Functions**

```c
esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)
```

Configure touch pad interrupt threshold.

**Note** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

**Parameters**

- `touch_num`: touch pad index
- `threshold`: interrupt threshold.

```c
esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t *touch_value)
```

Get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized
Parameters
- `touch_num`: touch pad index
- `touch_value`: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_filtered(touch_pad_t touch_num, uint16_t *touch_value)
```

get filtered touch sensor counter value by IIR filter.

**Note**
touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

Parameters
- `touch_num`: touch pad index
- `touch_value`: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t *touch_value)
```

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note**
touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

Parameters
- `touch_num`: touch pad index
- `touch_value`: pointer to accept touch sensor value

```c
esp_err_t touch_pad_set_filter_read_cb(filter_cb_t read_cb)
```

Register the callback function that is called after each IIR filter calculation.

**Note**
The `read_cb` callback is called in timer task in each filtering cycle.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Set error

Parameters
- `read_cb`: Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

```c
esp_err_t touch_pad_isr_register(intr_handler_t fn, void *arg)
```

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

Parameters
- `fn`: Pointer to ISR handler
- `arg`: Parameter for ISR

```c
esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_cycle)
```

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note**
The greater the duty cycle of the measurement time, the more system power is consumed.

**Return**
- ESP_OK on success
Parameters

- **sleep_cycle**: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. \( t_{\text{sleep}} = \text{sleep\_cycle} / (\text{RTC\_SLOW\_CLK} \text{ frequency}) \). The approximate frequency value of RTC\_SLOW\_CLK can be obtained using rtc\_clk\_slow\_freq\_get\_hz function.
- **meas_cycle**: The duration of the touch sensor measurement. \( t_{\text{meas}} = \text{meas\_cycle} / 8\text{M} \), the maximum measure time is \( 0\text{xffff} / 8\text{M} = 8.19 \text{ ms} \)

```c
esp_err_t touch_pad_get_meas_time(uint16_t *sleep_cycle, uint16_t *meas_cycle)
```
Get touch sensor measurement and sleep time.

**Return**

- ESP_OK on success

**Parameters**

- **sleep_cycle**: Pointer to accept sleep cycle number
- **meas_cycle**: Pointer to accept measurement cycle count.

```c
esp_err_t touch_pad_sw_start(void)
```
Trigger a touch sensor measurement, only support in SW mode of FSM.

**Return**

- ESP_OK on success

```c
esp_err_t touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)
```
Set touch sensor interrupt threshold.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**

- **touch_num**: touch pad index
- **threshold**: threshold of touchpad count, refer to touch_pad_set_trigger_mode to see how to set trigger mode.

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint16_t *threshold)
```
Get touch sensor interrupt threshold.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**

- **touch_num**: touch pad index
- **threshold**: pointer to accept threshold

```c
esp_err_t touch_pad_set_trigger_mode(touch_trigger_mode_t mode)
```
Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**

- **mode**: touch sensor interrupt trigger mode

```c
esp_err_t touch_pad_get_trigger_mode(touch_trigger_mode_t *mode)
```
Get touch sensor interrupt trigger mode.

**Return**

- ESP_OK on success

**Parameters**

- **mode**: pointer to accept touch sensor interrupt trigger mode

```c
esp_err_t touch_pad_set_trigger_source(touch_trigger_src_t src)
```
Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to
several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `src`: touch sensor interrupt trigger source

```c
esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t *src)
```
Get touch sensor interrupt trigger source.

**Return**
- ESP_OK on success

**Parameters**
- `src`: pointer to accept touch sensor interrupt trigger source

```c
esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
```
Set touch sensor group mask. Touchpad module has two sets of signals. ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `set1_mask`: bitmask of touch sensor signal group1, it’s a 10-bit value
- `set2_mask`: bitmask of touch sensor signal group2, it’s a 10-bit value
- `en_mask`: bitmask of touch sensor work enable, it’s a 10-bit value

```c
esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)
```
Get touch sensor group mask.

**Return**
- ESP_OK on success

**Parameters**
- `set1_mask`: pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
- `set2_mask`: pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
- `en_mask`: pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

```c
esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
```
Clear touch sensor group mask. Touch pad module has two sets of signals. Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `set1_mask`: bitmask touch sensor signal group1, it’s a 10-bit value
- `set2_mask`: bitmask touch sensor signal group2, it’s a 10-bit value
- `en_mask`: bitmask of touch sensor work enable, it’s a 10-bit value

```c
esp_err_t touch_pad_intr_enable (void)
```
To enable touch pad interrupt.

**Return**
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable (void)
```
To disable touch pad interrupt.

**Return**
- ESP_OK on success
**Chapter 2. API**

- ESP_OK on success

```c
esp_err_t touch_pad_intr_clear (void)
```
- To clear touch pad interrupt.

**Return**
- ESP_OK on success

```c
esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)
```
- set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- `new_period_ms`: filter period, in ms

```c
esp_err_t touch_pad_get_filter_period (uint32_t* p_period_ms)
```
- get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- `p_period_ms`: pointer to accept period

```c
esp_err_t touch_pad_filter_start (uint32_t filter_period_ms)
```
- start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

**Note** This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

**Parameters**
- `filter_period_ms`: filter calibration period, in ms

```c
esp_err_t touch_pad_filter_stop (void)
```
- stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

```c
esp_err_t touch_pad_filter_delete (void)
```
- delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**Type Definitions**

```c
typedef void (*filter_cb_t) (uint16_t *raw_value, uint16_t *filtered_value)
```
- Callback function that is called after each IIR filter calculation.

**Note** This callback is called in timer task in each filtering cycle.

**Note** This callback should not be blocked.
Parameters

- **raw_value**: The latest raw data (touch sensor counter value) that points to all channels (raw_value[0..TOUCH_PAD_MAX-1]).
- **filtered_value**: The latest IIR filtered data (calculated from raw data) that points to all channels (filtered_value[0..TOUCH_PAD_MAX-1]).

Header File

- components/driver/include/driver/touch_sensor_common.h

Functions

```c
esp_err_t touch_pad_init (void)
Initializes touch module.
```

**Note** If default parameter don’t match the usage scenario, it can be changed after this function.
**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

```c
esp_err_t touch_pad_deinit (void)
Uninstall touch pad driver.
```

**Note** After this function is called, other touch functions are prohibited from being called.
**Return**

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

```c
esp_err_t touch_pad_io_init (touch_pad_t touch_num)
Initializes touch pad GPIO.
```

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**

- **touch_num**: touch pad index

```c
esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)
Set touch sensor high voltage threshold of charge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.
```

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**

- **refh**: the value of DREFH
- **refl**: the value of DREFL
- **atten**: the attenuation on DREFH

```c
esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)
Get touch sensor reference voltage.
```

**Return**

- ESP_OK on success

**Parameters**

- **refh**: pointer to accept DREFH value
- **refl**: pointer to accept DREFL value
- **atten**: pointer to accept the attenuation on DREFH
`esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)`

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `touch_num`: touch pad index
- `slope`: touch pad charge/discharge speed
- `opt`: the initial voltage

`esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)`

Get touch sensor charge/discharge speed for each pad.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `touch_num`: touch pad index
- `slope`: pointer to accept touch pad charge/discharge slope
- `opt`: pointer to accept the initial voltage

`esp_err_t touch_pad_isr_deregister(void (*fn))(void *arg)`

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both `fn` and `arg` isn’t registered

**Parameters**
- `fn`: handler function to call (as passed to `touch_pad_isr_handler_register`)
- `arg`: argument of the handler (as passed to `touch_pad_isr_handler_register`)

`esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)`

Get the touch pad which caused wakeup from deep sleep.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- `pad_num`: pointer to touch pad which caused wakeup

`esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)`

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `mode`: FSM mode

`esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)`

Get touch sensor FSM mode.

**Parameters**
- `mode`: pointer to accept FSM mode
**esp_err_t touch_pad_clear_status (void)**

To clear the touch sensor channel active status.

**Note** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

**Return**
- ESP_OK on success

**uint32_t touch_pad_get_status (void)**

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Return**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

**bool touch_pad_meas_is_done (void)**

Check touch sensor measurement status.

**Return**
- True measurement is under way
- False measurement done

- TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
- TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
- TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT
- TOUCH_PAD_THRESHOLD_MAX
  If set touch threshold max value, The touch sensor can’t be in touched status
- TOUCH_PAD_SLEEP_CYCLE_DEFAULT
  The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff
- TOUCH_PAD_MEASURE_CYCLE_DEFAULT
  The timer frequency is 8Mhz, the max value is 0x7fff
- TOUCH_FSM_MODE_DEFAULT
  The touch FSM my be started by the software or timer
- TOUCH_TRIGGER_MODE_DEFAULT
  Interrupts can be triggered if sensor value gets below or above threshold
- TOUCH_TRIGGER_SOURCE_DEFAULT
  The wakeup trigger source can be SET1 or both SET1 and SET2

Enumerations

enum touch_pad_t
  Touch pad channel

Values:

- TOUCH_PAD_NUM0 = 0
  Touch pad channel 0 is GPIO4(ESP32)
- TOUCH_PAD_NUM1
  Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
- TOUCH_PAD_NUM2
  Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)
- TOUCH_PAD_NUM3
  Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)
- TOUCH_PAD_NUM4
  Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)
- TOUCH_PAD_NUM5
  Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)
- TOUCH_PAD_NUM6
  Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)
Chapter 2. API

TOUCH_PAD_NUM7
Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

TOUCH_PAD_NUM8
Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

TOUCH_PAD_NUM9
Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

TOUCH_PAD_MAX

enum touch_high_volt_t
Touch sensor high reference voltage

Values:

TOUCH_HVOLT_KEEP = -1
Touch sensor high reference voltage, no change

TOUCH_HVOLT_2V4 = 0
Touch sensor high reference voltage, 2.4V

TOUCH_HVOLT_2V5
Touch sensor high reference voltage, 2.5V

TOUCH_HVOLT_2V6
Touch sensor high reference voltage, 2.6V

TOUCH_HVOLT_2V7
Touch sensor high reference voltage, 2.7V

TOUCH_HVOLT_MAX

enum touch_low_volt_t
Touch sensor low reference voltage

Values:

TOUCH_LVOLT_KEEP = -1
Touch sensor low reference voltage, no change

TOUCH_LVOLT_0V5 = 0
Touch sensor low reference voltage, 0.5V

TOUCH_LVOLT_0V6
Touch sensor low reference voltage, 0.6V

TOUCH_LVOLT_0V7
Touch sensor low reference voltage, 0.7V

TOUCH_LVOLT_0V8
Touch sensor low reference voltage, 0.8V

TOUCH_LVOLT_MAX

enum touch_volt_atten_t
Touch sensor high reference voltage attenuation

Values:

TOUCH_HVOLT_ATTEN_KEEP = -1
Touch sensor high reference voltage attenuation, no change

TOUCH_HVOLT_ATTEN_1V5 = 0
Touch sensor high reference voltage attenuation, 1.5V attenuation

TOUCH_HVOLT_ATTEN_1V
Touch sensor high reference voltage attenuation, 1.0V attenuation

TOUCH_HVOLT_ATTEN_0V5
Touch sensor high reference voltage attenuation, 0.5V attenuation
**TOUCH_HVOLT_ATTEN_0V**

Touch sensor high reference voltage attenuation, 0V attenuation

**TOUCH_HVOLT_ATTEN_MAX**

**enum touch_cnt_slope_t**

Touch sensor charge/discharge speed

*Values:*

- **TOUCH_PAD_SLOPE_0 = 0**
  Touch sensor charge / discharge speed, always zero

- **TOUCH_PAD_SLOPE_1 = 1**
  Touch sensor charge / discharge speed, slowest

- **TOUCH_PAD_SLOPE_2 = 2**
  Touch sensor charge / discharge speed

- **TOUCH_PAD_SLOPE_3 = 3**
  Touch sensor charge / discharge speed

- **TOUCH_PAD_SLOPE_4 = 4**
  Touch sensor charge / discharge speed

- **TOUCH_PAD_SLOPE_5 = 5**
  Touch sensor charge / discharge speed

- **TOUCH_PAD_SLOPE_6 = 6**
  Touch sensor charge / discharge speed

- **TOUCH_PAD_SLOPE_7 = 7**
  Touch sensor charge / discharge speed, fast

**TOUCH_PAD_SLOPE_MAX**

**enum touch_tie_opt_t**

Touch sensor initial charge level

*Values:*

- **TOUCH_PAD_TIE_OPT_LOW = 0**
  Initial level of charging voltage, low level

- **TOUCH_PAD_TIE_OPT_HIGH = 1**
  Initial level of charging voltage, high level

**TOUCH_PAD_TIE_OPT_MAX**

**enum touch_fsm_mode_t**

Touch sensor FSM mode

*Values:*

- **TOUCH_fsm_mode_Timer = 0**
  To start touch FSM by timer

- **TOUCH_fsm_mode_SW**
  To start touch FSM by software trigger

**TOUCH_fsm_mode_MAX**

**enum touch_trigger_mode_t**

*Values:*

- **TOUCH_TRIGGER_BELOW = 0**
  Touch interrupt will happen if counter value is less than threshold.

- **TOUCH_TRIGGER_ABOVE = 1**
  Touch interrupt will happen if counter value is larger than threshold.
**Chapter 2. API**

**TOUCH_TRIGGER_MAX**

```c
enum touch_trigger_src_t
{
    TOUCH_TRIGGER_SOURCE_BOTH = 0,
    wakeup interrupt is generated if both SET1 and SET2 are “touched”
    TOUCH_TRIGGER_SOURCE_SET1 = 1,
    wakeup interrupt is generated if SET1 is “touched”
    TOUCH_TRIGGER_SOURCE_MAX
}
```

### 2.3.21 Two-Wire Automotive Interface (TWAI)

**Overview**

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. **TWAI Protocol Summary**
2. **Signals Lines and Transceiver**
3. **Driver Configuration**
4. **Driver Operation**
5. **Examples**

**TWAI Protocol Summary**

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended**
Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

**Error Active**: A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

**Error Passive**: A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off**: A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

![Diagram of TWAI Controller Signals Lines](image)

图 19: Signal lines of the TWAI controller
**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes**  The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts**  The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**注解:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors.
before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Bit Timing**  The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple **time quanta**, and the period of a **time quantum** is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. **The Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the **brp** can be any even number from 2 to 128. If the ESP32 is a revision 2 or later chip, the **brp** will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

![Bit Timing Configuration](image)

**图 20:** Bit timing configuration for 500kbit/s given BRP = 8

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. **sjw** can range from 1 to 4.

**注解:** Multiple combinations of **brp**, **tseg_1**, **tseg_2**, and **sjw** can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay**, **node information processing time**, and **phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS()`
- `TWAI_TIMING_CONFIG_800KBITS()`
- `TWAI_TIMING_CONFIG_500KBITS()`
- `TWAI_TIMING_CONFIG_250KBITS()`
- `TWAI_TIMING_CONFIG_125KBITS()`
Revision 2 or later of the ESP32 also supports the following bit rates:

- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()

Acceptance Filter  The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it.** Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode.** Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Bit layout of single filter mode (Right side MSBit)](image1)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Bit layout of dual filter mode (Right side MSBit)](image2)

Disabling TX Queue  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI
driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the CONFIG_TWAI_ISR_IN_IRAM option using idf.py menuconfig.
- When calling twai_driver_install(), the intr_flags member of twai_general_config_t should set the ESP_INTR_FLAG_IRAM set.

**注解:** When the CONFIG_TWAI_ISR_IN_IRAM option is enabled, the TWAI driver will no longer log any alerts (i.e., the TWAI_ALERT_AND_LOG flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](diagram)

**Label** | **Transition** | **Action/Condition**
---|---|---
A | Uninstalled -> Stopped | twai_driver_install()
B | Stopped -> Uninstalled | twai_driver_uninstall()
C | Stopped -> Running | twai_start()
D | Running -> Stopped | twai_stop()
E | Running -> Bus-Off | Transmit Error Counter >= 256
F | Bus-Off -> Uninstalled | twai_driver_uninstall()
G | Bus-Off -> Recovering | twai_initiate_recovery()
H | Recovering -> Stopped | 128 occurrences of 11 consecutive recessive bits.

**Driver States**

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.
Bus-Off: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

Recovering: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags: The TWAI driver distinguishes different types of messages by using the various bit field members of the twai_message_t structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the flags member of twai_message_t and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

Examples

Configuration & Installation: The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the twai_driver_install() function, and the twai_start() function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
    }
}
```
The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission**  The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}
//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception**  The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```c
#include "driver/twai.h"
...
//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}
//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```
Reconfiguring and Reading Alerts   The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```
**Application Examples**

**Network Example:** The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

---

**API Reference**

**Header File**

- components/hal/include/hal/twai_types.h

**Structures**

```c
struct twai_message_t
    Structure to store a TWAI message.

    **Note** The flags member is deprecated
```

**Public Members**

```c
uint32_t extd : 1
    Extended Frame Format (29bit ID)

uint32_t rtr : 1
    Message is a Remote Frame

uint32_t ss : 1
    Transmit as a Single Shot Transmission. Unused for received.

uint32_t self : 1
    Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp : 1
    Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved : 27
    Reserved bits

uint32_t flags
    Deprecated: Alternate way to set bits using message flags

uint32_t identifier
    11 or 29 bit identifier

uint8_t data_length_code
    Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)
```

**Structure**

```c
struct twai_timing_config_t
    Structure for bit timing configuration of the TWAI driver.

    **Note** Macro initializers are available for this structure
```
Public Members

`uint32_t brp`
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

`uint8_t tseg_1`
Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`
Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`
Enables triple sampling when the TWAI controller samples a bit

```c
struct twai_filter_config_t
```
Structure for acceptance filter configuration of the TWAI driver (see documentation)

**Note** Macro initializers are available for this structure

Public Members

`uint32_t acceptance_code`
32-bit acceptance code

`uint32_t acceptance_mask`
32-bit acceptance mask

`bool single_filter`
Use Single Filter Mode (see documentation)

Macros

`TWAI_EXTD_ID_MASK`
TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

`TWAI_STD_ID_MASK`
Bit mask for 11 bit Standard Frame Format ID

`TWAI_FRAME_MAX_DLC`
Max data bytes allowed in TWAI

`TWAI_FRAME_EXTD_ID_LEN_BYTES`
EFF ID requires 4 bytes (29bit)

`TWAI_FRAME_STD_ID_LEN_BYTES`
SFF ID requires 2 bytes (11bit)

`TWAI_ERR_PASS_THRESH`
Error counter threshold for error passive

Enumerations

```c
enum twai_mode_t
```
TWAI Controller operating modes.

**Values:**

`TWAI_MODE_NORMAL`
Normal operating mode where TWAI controller can send/receive/acknowledge messages
TWAI_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

TWAI_MODE_LISTEN_ONLY
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File
• components/driver/include/driver/twai.h

Functions

esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
Install TWAI driver.
This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)
Note To reinstall the TWAI driver, call twai_driver_uninstall() first

Return
• ESP_OK: Successfully installed TWAI driver
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_NO_MEM: Insufficient memory
• ESP_ERR_INVALID_STATE: Driver is already installed

Parameters
• [in] g_config: General configuration structure
• [in] t_config: Timing configuration structure
• [in] f_config: Filter configuration structure

esp_err_t twai_driver_uninstall(void)
Uninstall the TWAI driver.
This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Return
• ESP_OK: Successfully uninstalled TWAI driver
• ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start(void)
Start the TWAI driver.
This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Return
• ESP_OK: TWAI driver is now running
• ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop(void)
Stop the TWAI driver.
This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.
Warning  A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Return  
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

```c
twai_transmit(const twai_message_t *message, TickType_t ticks_to_wait)
```
Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note  This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note  The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Return  
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters  
- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

```c
twai_receive(twai_message_t *message, TickType_t ticks_to_wait)
```
Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning  The flags field of the received message should be checked to determine if the received message contains any data bytes.

Return  
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters  
- [out] message: Received message
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

```c
twai_read_alerts(uint32_t *alerts, TickType_t ticks_to_wait)
```
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

Note  Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Return  
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters  
- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks_to_wait: Number of FreeRTOS ticks to block for alert
### Chapter 2. API 参考

**Esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t* current_alerts)**

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**

- [in] alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
- [out] current_alerts: Bit field of currently raised alerts. Set to NULL if unused

**Esp_err_t twai_initiate_recovery (void)**

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

**Esp_err_t twai_get_status_info (twai_status_info_t* status_info)**

Get current status information of the TWAI driver.

**Return**

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**

- [out] status_info: Status information

**Esp_err_t twai_clear_transmit_queue (void)**

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**Return**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

**Esp_err_t twai_clear_receive_queue (void)**

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when twai_start() is called.

**Return**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

**struct twai_general_config_t**

Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure
Chapter 2. API

**Public Members**

`twai_mode_t mode`
Mode of TWAI controller

`gpio_num_t tx_io`
Transmit GPIO number

`gpio_num_t rx_io`
Receive GPIO number

`gpio_num_t clkout_io`
CLKOUT GPIO number (optional, set to -1 if unused)

`gpio_num_t bus_off_io`
Bus off indicator GPIO number (optional, set to -1 if unused)

`uint32_t tx_queue_len`
Number of messages TX queue can hold (set to 0 to disable TX Queue)

`uint32_t rx_queue_len`
Number of messages RX queue can hold

`uint32_t alerts_enabled`
Bit field of alerts to enable (see documentation)

`uint32_t clkout_divider`
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

`int intr_flags`
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

**struct twai_status_info_t**
Structure to store status information of TWAI driver.

**Public Members**

`twai_state_t state`
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`
Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`
Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`
Current value of Transmit Error Counter

`uint32_t rx_error_counter`
Current value of Receive Error Counter

`uint32_t tx_failed_count`
Number of messages that failed transmissions

`uint32_t rx_missed_count`
Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

`uint32_t rx_overrun_count`
Number of messages that were lost due to a RX FIFO overrun

`uint32_t arb_lost_count`
Number of instances arbitration was lost

`uint32_t bus_error_count`
Number of instances a bus error has occurred
Macros

\texttt{TWAI\_IO\_UNUSED}
Marks GPIO as unused in TWAI configuration

Enumerations

\textbf{enum twai\_state\_t}

\begin{verbatim}
    TWAI\_STATE\_STOPPED
    Stopped state. The TWAI controller will not participate in any TWAI bus activities

    TWAI\_STATE\_RUNNING
    Running state. The TWAI controller can transmit and receive messages

    TWAI\_STATE\_BUS\_OFF
    Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

    TWAI\_STATE\_RECOVERING
    Recovering state. The TWAI controller is undergoing bus recovery
\end{verbatim}

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e.,
timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as
RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex
data exchange among different devices.

The ESP32 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of
registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering,
number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various
manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using
the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken
down into the sections provided below:

1. Setting Communication Parameters - Setting baud rate, data bits, stop bits, etc.
2. Setting Communication Pins - Assigning pins for connection to a device.
3. Driver Installation - Allocating ESP32’s resources for the UART driver.
4. Running UART Communication - Sending / receiving data
5. Using Interrupts - Triggering interrupts on specific communication events
6. Deleting a Driver - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.
The UART driver’s functions identify each of the UART controllers using \texttt{uart\_port\_t}. This identification is
needed for all the following function calls.

\textbf{Setting Communication Parameters}

UART communication parameters can be configured all in a single step or individually in multiple steps.
**Chapter 2. API 参考**

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
  .baud_rate = 115200,
  .data_bits = UART_DATA_8_BITS,
  .parity = UART_PARITY_DISABLE,
  .stop_bits = UART_STOP_BITS_1,
  .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
  .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baudrate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size,
                      uart_buffer_size, 10, &uart_queue, 0));
```
Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

**Receiving** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```
If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()

**Software Flow Control**  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection**  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts**  There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:  
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`  
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`  
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:  
  - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`  
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros**  The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver**  If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.
Overview of RS485 specific communication options

The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- **UART_RS485_CONF_REG.UART_RS485_EN**: setting this bit enables RS485 communication mode support.
- **UART_RS485_CONF_REG.UART_RS485TX_RX_EN**: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- **UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN**: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the -RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

- **The schematics below do not necessarily contain all required elements.**
- **The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.**

**Circuit A: Collision Detection Circuit**

```
VCC --------------+           
                   |           
                   +------------x----------+
RXD <--------| R |           
|           | |           
|           |B|----------<> B
TXD -------->| D | ADM483 |
```

(下页継続)
This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.
Application Examples

API Reference

Header File

- components/driver/include/driver/uart.h

Functions

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- rx_buffer_size: UART RX ring buffer size.
- tx_buffer_size: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- queue_size: UART event queue size/depth.
- uart_queue: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

```c
esp_err_t uart_driver_delete(uart_port_t uart_num)
```

Uninstall UART driver.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
bool uart_is_driver_installed(uart_port_t uart_num)
```

Checks whether the driver is installed or not.
Return
- true driver is installed
- false driver is not installed

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`
Set UART data bits.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- data_bit: UART data bits

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`
Get the UART data bit configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- data_bit: Pointer to accept value of UART data bits.

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`
Set UART stop bits.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- stop_bits: UART stop bits

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- stop_bits: Pointer to accept value of UART stop bits.

`esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)`
Set UART parity mode.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- parity_mode: the enum of uart parity configuration

`esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)`
Get the UART parity mode configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• parity_mode: Pointer to accept value of UART parity mode.

```c
esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
```
Set UART baud rate.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate`: UART baud rate.

```c
esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t* baudrate)
```
Get the UART baud rate configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate`: Pointer to accept value of UART baud rate

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```
Set UART line inverse mode.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `inverse_mask`: Choose the wires that need to be inverted. Using the ORred mask of
  ```c
  uart_signal_inv_t
  ```

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```
Set hardware flow control.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl`: Hardware flow control mode
- `rx_thresh`: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when
  UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

```c
esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)
```
Set software flow control.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `enable`: switch on or off
- `rx_thresh_xon`: low water mark
- `rx_thresh_xoff`: high water mark

```c
esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t* flow_ctrl)
```
Get the UART hardware flow control configuration.

**Return**
- ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• flow_ctrl: Option for different flow control mode.

`esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)`
Clear UART interrupt status.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• clr_mask: Bit mask of the interrupt status to be cleared.

`esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)`
Set UART interrupt enable.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• enable_mask: Bitmask of the enable bits.

`esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)`
Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
• disable_mask: Bit mask of the disable bits.

`esp_err_t uart_enable_rx_intr(uart_port_t uart_num)`
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_disable_rx_intr(uart_port_t uart_num)`
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

`esp_err_t uart_disable_tx_intr(uart_port_t uart_num)`
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number

`esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)`
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)
Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- enable: 1: enable; 0: disable
- thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

`esp_err_t uart_isr_register (uart_port_t uart_num, void (*fn) void *, void *arg, int intr_alloc_flags, uart_isr_handle_t *handle)`
Register UART interrupt handler (ISR).

Note UART ISR handler will be attached to the same CPU core that this function is running on.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- fn: Interrupt handler function.
- arg: parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

`esp_err_t uart_isr_free (uart_port_t uart_num)`
Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

`esp_err_t uart_set_pin (uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)`
Assign signals of a UART peripheral to GPIO pins.

Note If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- tx_io_num: UART TX pin GPIO number.
- rx_io_num: UART RX pin GPIO number.
- rts_io_num: UART RTS pin GPIO number.
- cts_io_num: UART CTS pin GPIO number.

`esp_err_t uart_set_rts (uart_port_t uart_num, int level)`
Manually set the UART RTS pin level.

Note UART must be configured with hardware flow control disabled.

Return
- ESP_OK Success
- ESP_FAIL Parameter error
Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- level: 1: RTS output low (active); 0: RTS output high (block)

`esp_err_t uart_set_dtr (uart_port_t uart_num, int level)`
Manually set the UART DTR pin level.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- level: 1: DTR output low; 0: DTR output high

`esp_err_t uart_set_tx_idle_num (uart_port_t uart_num, uint16_t idle_num)`
Set UART idle interval after tx FIFO is empty.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- idle_num: idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

`esp_err_t uart_param_config (uart_port_t uart_num, const uart_config_t *uart_config)`
Set UART configuration parameters.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- uart_config: UART parameter settings

`esp_err_t uart_intr_config (uart_port_t uart_num, const uart_intr_config_t *intr_conf)`
Configure UART interrupts.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- intr_conf: UART interrupt settings

`esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)`
Wait until UART TX FIFO is empty.

Return
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- ticks_to_wait: Timeout, count in RTOS ticks

`int uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)`
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.

Return
- (-1) Parameter error
Chapter 2. API

• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• buffer: data buffer address
• len: data length to send

int uart_write_bytes (uart_port_t uart_num, const *src, size_t size)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• src: data buffer address
• size: data length to send

int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Return
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• src: data buffer address
• size: data length to send
• brk_len: break signal duration(unit: the time it takes to send one bit at current baudrate)

int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Return
• (-1) Error
• OTHERS (>=0) The number of bytes read from UART FIFO

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• buf: pointer to the buffer.
• length: data length
• ticks_to_wait: sTimeout, count in RTOS ticks

esp_err_t uart_flush (uart_port_t uart_num)

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_flush_input(uart_port_t uart_num)
```
Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```
UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- size: Pointer of size_t to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)
```
UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_enable_pattern_det_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```
UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Note** This function only works for esp32. And this function is deprecated, please use uart_enable_pattern_det_baud_intr instead.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- uart_num: UART port number.
- pattern_chr: character of the pattern.
- chr_num: number of the character, 8bit value.
- chr_tout: timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char.
- post_idle: idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- pre_idle: idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```
UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
Chapter 2. API

• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number.
• pattern_chr: character of the pattern.
• chr_num: number of the character, 8bit value.
• chr_tout: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
• post_idle: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
• pre_idle: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

int uart_pattern_pop_pos (uart_port_t uart_num)
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

int uart_pattern_get_pos (uart_port_t uart_num)
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return
• ESP_ERR_NO_MEM No enough memory
• ESP_ERR_INVALID_STATE Driver not installed
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• queue_length: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.
** Chapter 2. API **

** `esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)` **

UART set communication mode.

** Note **
This function must be executed after `uart_driver_install()`, when the driver object is initialized.

** Return **
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

** Parameters **
- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode`: UART UART mode to set

** `esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)` **

Set uart threshold value for RX fifo full.

** Note **
If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwitten then this threshold can be reduced

** Return **
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

** Parameters **
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value above which RX fifo full interrupt is generated

** `esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)` **

Set uart threshold values for TX fifo empty.

** Return **
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

** Parameters **
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

** `esp_err_t uart_set_rx_timeout (uart_port_t uart_num, const uint8_t tout_thresh)` **

UART set threshold timeout for TOUT feature.

** Return **
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

** Parameters **
- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. `tou_thresh = 1`, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If `tout_thresh == 0`, the TOUT feature is disabled.

** `esp_err_t uart_get_collision_flag (uart_port_t uart_num, bool *collision_flag)` **

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. `*collision_flag = true`, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after `uart_write_bytes()`).

** Return **
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

** Parameters **
- `uart_num`: Uart number to configure the max port number is (UART_NUM_MAX -1).
- `collision_flag`: Pointer to variable of type bool to return collision flag.

** `esp_err_t uart_set_wakeup_threshold (uart_port_t uart_num, int wakeup_threshold)` **

Set the number of RX pin signal edges for light sleep wakeup.

---

** Espressif Systems **

Release v5.0-dev-489-gef98a36
UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in `uart_config_t` to true.

Note in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

Parameters
- `uart_num`: UART number, the max port number is (UART_NUM_MAX - 1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

`esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)`
Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL.

Parameters
- `uart_num`: UART number, the max port number is (UART_NUM_MAX - 1).
- [out] `out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

`esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)`
Wait until UART tx memory empty and the last char send ok (polling mode).

- Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters
- `uart_num`: UART number

`esp_err_t uart_set_loop_back (uart_port_t uart_num, bool loop_back_en)`
Configure TX signal loop back to RX module, just for the test usage.

- Return
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

Parameters
- `uart_num`: UART number
- `loop_back_en`: Set true to enable the loop back function, else set it false.

void `uart_set_always_rx_timeout (uart_port_t uart_num, bool always_rx_timeout_en)`
Configure behavior of UART RX timeout interrupt.
When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- `uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

```c
struct uart_intr_config_t
UART interrupt configuration parameters for uart_intr_config function.
```

**Public Members**

- `intr_enable_mask`: UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator
- `rx_timeout_thresh`: UART timeout interrupt threshold (unit: time of sending one byte)
- `txfifo_empty_intr_thresh`: UART TX empty interrupt threshold.
- `rxfifo_full_thresh`: UART RX full interrupt threshold.

```c
struct uart_event_t
Event structure used in UART event queue.
```

**Public Members**

- `type`: UART event type
- `size`: UART data size for UART_DATA event
- `timeout_flag`: UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

**Macros**

- `UART_NUM_0`: UART port 0
- `UART_NUM_1`: UART port 1
- `UART_NUM_2`: UART port 2
- `UART_NUM_MAX`: UART port max
- `UART_PIN_NO_CHANGE`: Length of the UART HW FIFO.
UART_BITRATE_MAX
Maximum configurable bitrate.

Type Definitions
typedef intr_handle_t uart_isr_handle_t

Enumerations
enum uart_event_type_t
UART event types used in the ring buffer.
Values:

UART_DATA
UART data event

UART_BREAK
UART break event

UART_BUFFER_FULL
UART RX buffer full event

UART_FIFO_OVF
UART FIFO overflow event

UART_FRAME_ERR
UART RX frame error event

UART_PARITY_ERR
UART RX parity event

UART_DATA_BREAK
UART TX data and break event

UART_PATTERN_DET
UART pattern detected

UART_EVENT_MAX
UART event max index

Header File
- components/hal/include/hal/uart_types.h

Structures
struct uart_at_cmd_t
UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char
UART AT cmd char

uint8_t char_num
AT cmd char repeat number

uint32_t gap_tout
gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
the idle time(in baud-rate) between the non AT char and first AT char
Chapter 2. API

- **Post_idle**: The idle time (in baud-rate) between the last AT char and the none AT char

- **struct uart_sw_flowctrl_t**: UART software flow control configuration parameters.
  
  **Public Members**
  
  - `uint8_t xon_char`: Xon flow control char
  - `uint8_t xoff_char`: Xoff flow control char
  - `uint8_t xon_thrd`: If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent
  - `uint8_t xoff_thrd`: If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

- **struct uart_config_t**: UART configuration parameters for uart_param_config function.
  
  **Public Members**
  
  - `int baud_rate`: UART baud rate
  - `uart_word_length_t data_bits`: UART byte size
  - `uart_parity_t parity`: UART parity mode
  - `uart_stop_bits_t stop_bits`: UART stop bits
  - `uart_hw_flowcontrol_t flow_ctrl`: UART HW flow control mode (cts/rts)
  - `uint8_t rx_flow_ctrl_thresh`: UART HW RTS threshold
  - `uart_sclk_t source_clk`: UART source clock selection
  - `bool use_ref_tick`: Deprecated method to select ref tick clock source, set source_clk field instead

- **Type Definitions**
  
  - `typedef int uart_port_t`: UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

- **Enumerations**
  
  - `enum uart_mode_t`: UART mode selection.
    
    **Values**:
    
    - `UART_MODE_UART = 0x00`: mode: regular UART mode

```c
UART_MODE_RS485_HALF_DUPLEX = 0x01
mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
mode: IRDA UART mode

UART_MODE_RS485_COLLISION_DETECT = 0x03
mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
mode: application control RS485 UART mode (used for test purposes)
```

### enum uart_word_length_t

UART word length constants.

**Values:**

- **UART_DATA_5_BITS = 0x0**
  - word length: 5bits
- **UART_DATA_6_BITS = 0x1**
  - word length: 6bits
- **UART_DATA_7_BITS = 0x2**
  - word length: 7bits
- **UART_DATA_8_BITS = 0x3**
  - word length: 8bits
- **UART_DATA_BITS_MAX = 0x4**

### enum uart_stop_bits_t

UART stop bits number.

**Values:**

- **UART_STOP_BITS_1 = 0x1**
  - stop bit: 1bit
- **UART_STOP_BITS_1_5 = 0x2**
  - stop bit: 1.5bits
- **UART_STOP_BITS_2 = 0x3**
  - stop bit: 2bits
- **UART_STOP_BITS_MAX = 0x4**

### enum uart_parity_t

UART parity constants.

**Values:**

- **UART_PARITY_DISABLE = 0x0**
  - Disable UART parity
- **UART_PARITY_EVEN = 0x2**
  - Enable UART even parity
- **UART_PARITY_ODD = 0x3**
  - Enable UART odd parity

### enum uart_hw_flowcontrol_t

UART hardware flow control modes.

**Values:**

- **UART_HW_FLOWCTRL_DISABLE = 0x0**
  - disable hardware flow control
- **UART_HW_FLOWCTRL_RTS = 0x1**
  - enable RX hardware flow control (rts)
UART_HW_FLOWCTRL_CTS = 0x2
enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
enable hardware flow control

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
UART signal bit map.

Values:

UART_SIGNAL_INV_DISABLE = 0
Disable UART signal inverse

UART_SIGNAL_IRDA_TX_INV = (0x1 « 0)
inverse the UART irda_tx signal

UART_SIGNAL_IRDA_RX_INV = (0x1 « 1)
inverse the UART irda_rx signal

UART_SIGNAL_RXD_INV = (0x1 « 2)
inverse the UART rxd signal

UART_SIGNAL_CTS_INV = (0x1 « 3)
inverse the UART cts signal

UART_SIGNAL_DSR_INV = (0x1 « 4)
inverse the UART dsr signal

UART_SIGNAL_TXD_INV = (0x1 « 5)
inverse the UART txd signal

UART_SIGNAL_RTS_INV = (0x1 « 6)
inverse the UART rts signal

UART_SIGNAL_DTR_INV = (0x1 « 7)
inverse the UART dtr signal

enum uart_sclk_t
UART source clock.

Values:

UART_SCLK_APB = 0x0
UART source clock from APB

UART_SCLK_REF_TICK = 0x3
UART source clock from REF_TICK

GPIO Lookup Macros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

注解：These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXDDIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. **UART_CTS_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- components/soc/esp32/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO22_DIRECT_CHANNEL
- UART_NUM_0_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO1_DIRECT_CHANNEL
- UART_RXD_GPIO3_DIRECT_CHANNEL
- UART_CTS_GPIO19_DIRECT_CHANNEL
- UART_RTS_GPIO22_DIRECT_CHANNEL
- UART_GPIO10_DIRECT_CHANNEL
- UART_NUM_1_TXD_DIRECT_GPIO_NUM
- UART_GPIO9_DIRECT_CHANNEL
- UART_NUM_1_RXD_DIRECT_GPIO_NUM
- UART_GPIO6_DIRECT_CHANNEL
- UART_NUM_1_CTS_DIRECT_GPIO_NUM
- UART_GPIO11_DIRECT_CHANNEL
- UART_NUM_1_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO10_DIRECT_CHANNEL
- UART_RXD_GPIO9_DIRECT_CHANNEL
- UART_CTS_GPIO6_DIRECT_CHANNEL
- UART_RTS_GPIO11_DIRECT_CHANNEL
- UART_GPIO17_DIRECT_CHANNEL
- UART_NUM_2_TXD_DIRECT_GPIO_NUM
- UART_GPIO16_DIRECT_CHANNEL
- UART_NUM_2_RXD_DIRECT_GPIO_NUM
- UART_GPIO8_DIRECT_CHANNEL
- UART_NUM_2_CTS_DIRECT_GPIO_NUM
- UART_GPIO7_DIRECT_CHANNEL
- UART_NUM_2_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 peripherals 目录下。

2.4 应用层协议

2.4.1 mDNS 服务

概述

mDNS 是一种组播 UDP 服务，用来提供本地网络服务和主机发现。
绝大多数的操作系统默认都会安装 mDNS 服务，或者提供单独的安装包。Mac OS 默认会安装名为Bonjour 的服务（该服务基于 mDNS），此外 Apple 还发布了适用于 Windows 系统的安装程序，可以在官方支持找到。在 Linux 上，mDNS 服务由 avahi 提供，通常也会被默认安装。

mDNS 属性

- hostname: 设备会去响应的主机名，如果没有设置，会根据设备的网络接口名定义 hostname。例如，my-esp32 会被解析为 my-esp32.local。
- default_instance: 默认实例名 (即易记的服务名)，例如 Jhon's ESP32 Thing。如果没有设置，将会使用 hostname。

以下为 STA 接口启动 mDNS 服务并设置 hostname 和 default_instance 的示例方法：

```c
void start_mdns_service()
{
    // 初始化 mDNS 服务
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    // 设置 hostname
    mdns_hostname_set("my-esp32");
    // 设置默认实例
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

mDNS 服务 mDNS 可以广播设备能够提供的网络服务的相关信息，每个服务会由以下属性构成。

- instance_name: 实例名 (即易记的服务名)，例如 Jhon's ESP32 Web Server。如果没有定义，会使用 default_instance。
- service_type: (必需) 服务类型，以下划线为前缀，这里列出了常见的类型。
- proto: (必需) 服务运行所依赖的协议，以下划线为前缀，例如 _tcp 或者 _udp。
- port: (必需) 服务运行所用的端口号。
- txt: 形如 {var, val} 的字符串数组，用于定义服务的属性。

添加一些服务和不同属性的示例方法：

```c
void add_mdns_services()
{
    // 添加服务
    mdns_service_add(NULL, ".http", ".tcp", 80, NULL, 0);
    // (下页继续)
}
```
mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

// 注意：必须先添加服务，然后才能设置其属性
// web 服务器使用自定义的实例名
mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

mdns_txt_item_t serviceTxtData[3] = {
    {"board", "esp32"},
    {"u", "user"},
    {"p", "password"}
};
// 设置服务的文本数据（会释放并替换当前数据）
mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

void resolve_mdns_host(const char *host_name)
{
    printf("Query A: %s.local", host_name);
    struct ip4_addr addr;
    addr.addr = 0;
    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if (err) {
        if (err == ESP_ERR_NOT_FOUND) {
            printf("Host was not found!");
        }
        printf("Query Failed");
    }
    printf(IPSTR, IP2STR(&addr));
}

void mdns_print_results(mdns_result_t *results)
{
    mdns_result_t *r = results;
    mdns_ip_addr_t *a = NULL;
    int i = -1, t;
    while (r) {
        printf("%d: Interface: %s, Type: %s\n", i++, ip_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if (r->instance_name) {
            printf(" %s: %s", r->instance_name);
        }
    }
}

mDNS 查询：mDNS 提供查询服务和解析主机 IP/IPv6 地址的方法。
服务查询的结果会作为 mdns_result_t 类型对象的链表返回。
解析主机 IP 地址的示例方法：

解析本地服务的示例方法：
if (r->hostname){
    printf(" SRV : %s.local:%u", r->hostname, r->port);
}
if (r->txt_count){
    printf(" TXT : [%u]", r->txt_count);
    for (t=0; t<r->txt_count; t++){
        printf("%s=%s;", r->txt[t].key, r->txt[t].value);
    }
    printf("\n");
}

for (t=0; t<r->addr_list; t++){
    if (r->addr.type == IPADDR_TYPE_V6){
        printf(" AAAA: " IPV6STR "\n", IPV62STR(r->addr.u_addr.ip6));
    } else {
        printf(" A : " IPSTR "\n", IP2STR(&r->addr.u_addr.ip4));
    }
    a = r->next;
}

r = r->next;

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local\n", service_name, proto);
    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if (err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if (!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }
    mdns_print_results(results);
    mdns_query_results_free(results);
}

使用上述方法的示例:

void my_app_some_method(){
    // 搜索 esp32-mdns.local
    resolve_mdns_host("esp32-mdns");

    // 搜索 HTTP 服务器
    find_mdns_service("_http", "_tcp");
    // 或者搜索文件服务器
    find_mdns_service("_smb", "_tcp"); // Windows 系统的共享服务
    find_mdns_service("_afpovertcp", "_tcp"); // Apple AFP 文件共享服务
    find_mdns_service("_nfs", "_tcp"); // NFS 服务器
    find_mdns_service("_ftp", "_tcp"); // FTP 服务器
    // 或者网络打印机
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}
Chapter 2. API 参考

应用示例

有关 mDNS 服务器和查询器的应用示例请参考 protocols/mdns。

API 参考

Header File

- components/mdns/include/mdns.h

Functions

`esp_err_t mdns_init (void)`
Initialize mDNS on given interface.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mdns task

void `mdns_free (void)`
Stop and free mDNS server.

`esp_err_t mdns_hostname_set (const char *hostname)`
Set the hostname for mDNS server required if you want to advertise services.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**
- `hostname`: Hostname to set

`esp_err_t mdns_delegate_hostname_add (const char *hostname, const mdns_ip_addr_t *address_list)`
Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**
- `hostname`: Hostname to add
- `address_list`: The IP address list of the host

`esp_err_t mdns_delegate_hostname_remove (const char *hostname)`
Remove a delegated hostname All the services added to this host will also be removed.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**
- `hostname`: Hostname to remove

`bool mdns_hostname_exists (const char *hostname)`
Query whether a hostname has been added.

**Return**
- true The hostname has been added.
false The hostname has not been added.

**Parameters**
- `hostname`: Hostname to query

**esp_err_t mdns_instance_name_set(const char *instance_name)**

Set the default instance name for mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

**Parameters**
- `instance_name`: Instance name to set

**esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)**

Add service to mDNS server.

**Note**
The value length of `txt` items will be automatically decided by `strlen`

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

**Parameters**
- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used.
- Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `port`: service port
- `txt`: string array of TXT data (eg. {{“var”,” val”},{ “other”,” 2”}})
- `num_items`: number of items in TXT data

**esp_err_t mdns_service_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, mdns_txt_item_t txt[], size_t num_items)**

Add service to mDNS server with a delegated hostname.

**Note**
The value length of `txt` items will be automatically decided by `strlen`

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

**Parameters**
- `instance_name`: instance name to set. If NULL, global instance name or hostname will be used.
- Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `port`: service port
- `txt`: string array of TXT data (eg. {{“var”,” val”},{ “other”,” 2”}})
- `num_items`: number of items in TXT data

**bool mdns_service_exists(const char *service_type, const char *proto, const char *hostname)**

Check whether a service has been added.

**Return**
- true Corresponding service has been added.
- false Service not found.
Chapter 2. API

Parameters
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, checks for the local hostname.

```c
bool mdns_service_exists_with_instance(const char *instance, const char *service_type,
                                       const char *proto, const char *hostname)
```

Check whether a service has been added.

Return
- true Corresponding service has been added.
- false Service not found.

Parameters
- `instance`: instance name
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, checks for the local hostname.

```c
esp_err_t mdns_service_remove(const char *service_type, const char *proto)
```

Remove service from mDNS server.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)

```c
esp_err_t mdns_service_remove_for_host(const char *service_type, const char *proto,
                                       const char *hostname)
```

Remove service from mDNS server with hostname.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.

```c
esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto,
                                         const char *instance_name)
```

Set instance name for service.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `instance_name`: instance name to set

```c
esp_err_t mdns_service_instance_name_set_for_host(const char *service_type, const char *proto,
                                                  const char *hostname, const char *instance_name)
```

Set instance name for service with hostname.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, local hostname will be used.
• instance_name: instance name to set

```c
esp_err_t mdns_service_port_set (const char *service_type, const char *proto, uint16_t port)
```

Set service port.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• port: service port

```c
esp_err_t mdns_service_port_set_for_host (const char *service_type, const char *proto,
                                          const char *hostname, uint16_t port)
```

Set service port with hostname.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, local hostname will be used.
• port: service port

```c
esp_err_t mdns_service_txt_set (const char *service_type, const char *proto,
                                 mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

Note The value length of txt items will be automatically decided by strlen

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• txt: array of TXT data (eg. [ { "var", "val" }, { "other", "2" } ])
• num_items: number of items in TXT data

```c
esp_err_t mdns_service_txt_set_for_host (const char *service_type, const char *proto,
                                         const char *hostname, mdns_txt_item_t txt[],
                                         uint8_t num_items)
```

Replace all TXT items for service with hostname.

Note The value length of txt items will be automatically decided by strlen

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, local hostname will be used.
• txt: array of TXT data (eg. {{ "var", "val" }, { "other", "2" }})
• num_items: number of items in TXT data

`esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)`

Set/Add TXT item for service TXT record.

Note The value length will be automatically decided by strlen

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to add/update
• value: the new value of the key

`esp_err_t mdns_service_txt_item_set_with_explicit_value_len(const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)`

Set/Add TXT item for service TXT record.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• key: the key that you want to add/update
• value: the new value of the key
• value_len: the length of the value

`esp_err_t mdns_service_txt_item_set_for_host(const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)`

Set/Add TXT item for service TXT record with hostname.

Note The value length will be automatically decided by strlen

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

Parameters
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, local hostname will be used.
• key: the key that you want to add/update
• value: the new value of the key
```c
esp_err_t mdns_service_txt_item_set_for_host_with_explicit_value_len(const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, uint8_t value_len)
```

Set/Add TXT item for service TXT record with hostname and txt value length.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to add/update
- `value`: the new value of the key
- `value_len`: the length of the value

```c
esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)
```

Remove TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `key`: the key that you want to remove

```c
esp_err_t mdns_service_txt_item_remove_for_host(const char *service_type, const char *proto, const char *hostname, const char *key)
```

Remove TXT item for service TXT record with hostname.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to remove
Add subtype for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- instance_name: instance name. If NULL, will find the first service with the same service type and protocol.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- subtype: The subtype to add.

Remove and free all services from mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Deletes the finished query. Call this only after the search has ended!

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via mdns_query_async_delete once the query has finished. The results although have to be freed manually.

**Return** True if search has finished before or at timeout False if search timeout is over

**Parameters**
- search: pointer to search object
- timeout: time in milliseconds to wait for answers
- results: pointer to the results of the query

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

**Return** mdns_search_once_s pointer to new search object if query initiated successfully. NULL otherwise.

**Parameters**
- name: service instance or host name (NULL for PTR queries)
- service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- type: type of query (MDNS_TYPE_*)
- timeout: time in milliseconds during which mDNS query is active
- max_results: maximum results to be collected
- notifier: Notification function to be called when the result is ready, can be NULL

Get result of search query.

**Return**
- esp_err_t esp_err_t: OK success

**Parameters**
- name: service instance or host name (NULL for PTR queries)
- service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- type: type of query (MDNS_TYPE_*)
- timeout: time in milliseconds during which mDNS query is active
- max_results: maximum results to be collected
- notifier: Notification function to be called when the result is ready, can be NULL
Chapter 2. API

Query mDNS for host or service

All following query methods are derived from this one.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG timeout was not given

Parameters

• name: service instance or host name (NULL for PTR queries)
• service_type: service type (http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds to wait for answers.
• max_results: maximum results to be collected
• results: pointer to the results of the query results must be freed using mdns_query_results_free below

```c
void mdns_query_results_free (mdns_result_t *results)
```

Free query results.

Parameters

• results: linked list of results to be freed

```c
esp_err_t mdns_query_ptr (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Query mDNS for service.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters

• service_type: service type (http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• max_results: maximum results to be collected
• results: pointer to the results of the query

```c
disp_err_t mdns_query_srv (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```

Query mDNS for SRV record.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters

• instance_name: service instance name
• service_type: service type (http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• result: pointer to the result of the query

```c
disp_err_t mdns_query_txt (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```

Query mDNS for TXT record.

Return

• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
- instance_name: service instance name
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

```c
esp_err_t mdns_query_a (const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)
```
Query mDNS for A record.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer.
- addr: pointer to the resulting IP4 address

```c
esp_err_t mdns_query_aaaa (const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)
```
Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

Parameters
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
- addr: pointer to the resulting IP6 address

```c
esp_err_t mdns_handle_system_event (void *ctx, system_event_t *event)
```
System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Parameters
- ctx: The system event context
- event: The system event

Structures
```c
struct mdns_txt_item_t
```
mDNS basic text item structure Used in mdns_service_add()

Public Members
```c
const char *key
```
item key name
```c
const char *value
```
item value string
```c
struct mdns_ip_addr_s
```
mDNS query linked list IP item
Public Members

```c
esp_ip_addr_t addr
   IP address
```

```c
struct mdns_ip_addr_s *next
   next IP, or NULL for the last IP in the list
```

```c
struct mdns_result_s
   mDNS query result structure
```

Public Members

```c
struct mdns_result_s *next
   next result, or NULL for the last result in the list
```

```c
mdns_if_t tcpip_if
   interface index
```

```c
uint32_t ttl
   time to live
```

```c
mdns_ip_protocol_t ip_protocol
   ip_protocol type of the interface (v4/v6)
```

```c
char *instance_name
   instance name
```

```c
char *service_type
   service type
```

```c
char *proto
   service protocol
```

```c
char *hostname
   hostname
```

```c
uint16_t port
   service port
```

```c
mdns_txt_item_t *txt
   txt record
```

```c
uint8_t *txt_value_len
   array of txt value len of each record
```

```c
size_t txt_count
   number of txt items
```

```c
mdns_ip_addr_t *addr
   linked list of IP addresses found
```

Macros

```c
#define MDNS_TYPE_A
#define MDNS_TYPE_PTR
#define MDNS_TYPE_TXT
#define MDNS_TYPE_AAAA
#define MDNS_TYPE_SRV
#define MDNS_TYPE_OPT
#define MDNS_TYPE_NSEC
#define MDNS_TYPE_ANY
```
Type Definitions

typedef struct mdns_search_once_s mdns_search_once_t
    Asynchronous query handle.
typedef struct mdns_ip_addr_s mdns_ip_addr_t
    mDNS query linked list IP item

typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
    mDNS query result structure

typedef void (*mdns_query_notify_t)(mdns_search_once_t *search)

Enumerations
enum mdns_ip_protocol_t
    mDNS enum to specify the ip_protocol type
    Values:
    MDNS_IP_PROTOCOL_V4
    MDNS_IP_PROTOCOL_V6
    MDNS_IP_PROTOCOL_MAX

enum mdns_if_internal
    Values:
    MDNS_IF_STA = 0
    MDNS_IF_AP = 1
    MDNS_IF_ETH = 2
    MDNS_IF_MAX

2.4.2 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

- esp_tls_conn_new(): for opening a new TLS connection.
- esp_tls_conn_read(): for reading from the connection.
- esp_tls_conn_write(): for writing into the connection.
- esp_tls_conn_delete(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component
Chapter 2. API

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the esp_tls_cfg_t structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the esp_tls_cfg_t structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in esp_tls_cfg_t structure must be set.
  - cacert_buf - pointer to the buffer which contains the CA cert.
  - cacert_bytes - size of the CA certificate in bytes.

- **use_global_ca_store**: The global_ca_store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set use_global_ca_store = true in their respective esp_tls_cfg_t structure. See API Reference section below on information regarding different API used for initializing and setting up the global_ca_store.

- **crt_bundle_attach**: The ESPx509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at ESP x509 Certificate Bundle.

- **psk_hint_key**: To use pre-shared keys for server verification, CONFIG_ESP_TLS_PSK_VERIFICATION should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the esp_tls_cfg_t structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling CONFIG_ESP_TLS_INSECURE and CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the esp_tls_cfg_t structure. WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**Note**: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.
How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:

```
(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.
   • Download wolfssl with:
     ```
git clone https://github.com/espressif/esp-wolfssl.git
     ```
   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and version of respective libraries.

ATECC608A (Secure Element) with ESP-TLS

ESP-TLS provides support for using ATECC608A cryptoauth chip with ESP32-WROOM-32SE. Use of ATECC608A is supported only when ESP-TLS is used with mbedTLS as its underlying SSL/TLS stack. ESP-TLS uses mbedtls as its underlying TLS/SSL stack by default unless changed manually.

Note: ATECC608A chip on ESP32-WROOM-32SE must be already configured and provisioned, for details refer esp_cryptoauth_utility

To enable the secure element support, and use it in your project for TLS connection, you will have to follow below steps

1) Add esp-cryptoauthlib in your project, for details please refer esp-cryptoauthlib with ESP_IDF
2) Enable following menuconfig option:

```
menuconfig->Component config->ESP-TLS->Use Secure Element (ATECC608A) with ESP-TLS
```
3) Select type of ATECC608A chip with following option:

```
menuconfig->Component config->esp-cryptoauthlib->Choose Type of ATECC608A chip
```

to know more about different types of ATECC608A chips and how to obtain type of ATECC608A connected to
your ESP module please visit ATECC608A chip type

4) Enable use of ATECC608A in ESP-TLS by providing following config option in `esp_tls_cfg_t`

```
esp_tls_cfg_t cfg = {
    /* other configurations options */
    .use_secure_element = true,
};
```

API Reference

Header File

- components/esp-tls/esp_tls.h

Functions

```c
esp_tls_t *esp_tls_init (void)
Create TLS connection.
This function allocates and initializes esp-tls structure handle.
```

Return
tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

```c
esp_tls_t *esp_tls_conn_new(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.
Note: This API is present for backward compatibility reasons. Alternative function with the same functionality
is `esp_tls_conn_new_sync` (and its asynchronous version `esp_tls_conn_new_async`)
```

Return pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this
NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should
be zero-initialized.

```c
int esp_tls_conn_new_sync(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg,
                          esp_tls_t *tls)
Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.
```

Return

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this
NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should
be zero-initialized.
- [in] tls: Pointer to esp_tls as esp-tls handle.
**esp_tls_t** *esp_tls_conn_http_new(const *url, const esp_tls_cfg_t *cfg)*

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**  
pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

**int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t **tls)**

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- [in] tls: pointer to esp-tls as esp-tls handle.

**int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t **tls)**

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

**static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)**

Write from buffer ‘data’ into specified tls connection.

**Return**

- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

**Parameters**

- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

**static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)**

Read from specified tls connection into the buffer ‘data’.
Return
• >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
• 0 if read operation was not successful. The underlying connection was closed.
• <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.
• [in] data: Buffer to hold read data.
• [in] datalen: Length of data buffer.

void esp_tls_conn_delete (esp_tls_t *tls)
Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

Note This API will be removed in IDFv5.0

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy (esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.
This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Return
- 0 on success
• -1 if socket error or an invalid argument

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail (esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.
This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Return
• -1 in case of invalid arg
• bytes available in the application data record read buffer

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd (esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.

Return
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
• ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
• [in] tls: handle to esp_tls context
• [out] sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store (void)
Create a global CA store, initially empty.
This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return
• ESP_OK if creating global CA store was successful.
• ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls resources.

esp_err_t esp_tls_set_global_ca_store (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
Set the global CA store with the buffer provided in pem format.
This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls
esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Return
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Parameters
- [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

void esp_tls_free_global_ca_store(void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

Parameters
- [in] h: esp-tls error handle.
- [out] esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- [out] esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
Returns the last error captured in esp_tls of a specific type The error information is cleared internally upon return.

Return
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

Parameters
- [in] h: esp-tls error handle.
- [in] err_type: specific error type
- [out] error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

mbedtls_x509_crt *esp_tls_get_global_ca_store(void)
Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

Note  Modifying the pointer might cause a failure in verifying the certificates.

Return
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

esp_err_t esp_tls_plain_tcp_connect(const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return  ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

Parameters
• [in] host: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
• [out] error_handle: ESP-TLS error handle holding potential errors occurred during connection
• [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.

Note
Note about format of certificates:
• This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
• Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
• Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
should be negotiated. The format is length followed by protocol name. For the most common cases the
following is ok: const char **alpn_protos = { “h2”, NULL };

- where ‘h2’ is the protocol name

```c
const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support
This buffer should be NULL terminated in case of PEM
```

```c
const unsigned char *cacert_pem_buf
CA certificate buffer legacy name
```

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

```c
const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer
should be NULL terminated in case of PEM
```

```c
const unsigned char *clientcert_pem_buf
Client certificate legacy name
```

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

```c
const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be
NULL terminated in case of PEM
```

```c
const unsigned char *clientkey_pem_buf
Client key legacy name
```

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

```c
const unsigned char *clientkey_password
Client key decryption password string
```

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking
mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

```c
const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match
hostname.
```
bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach) (void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

struct esp_tls
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
TLS/SSL context

mbedtls_entropy_context entropy
mbedtls entropy context structure

mbedtls_ctr_drbg_context ctr_drbg
mbedtls ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config conf
TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context server_fd
mbedtls wrapper type for sockets

mbedtls_x509_crt cacert
Container for the X.509 CA certificate

mbedtls_x509_crt *cacert_ptr
Pointer to the cacert being used.

mbedtls_x509_crt clientcert
Container for the X.509 client certificate

mbedtls_pk_context clientkey
Container for the private key of the client certificate

int sockfd
Underlying socket file descriptor.

ssize_t (*read) (struct esp_tls *tls, char *data, size_t datalen)
Callback function for reading data from TLS/SSL connection.

ssize_t (*write) (struct esp_tls *tls, const char *data, size_t datalen)
Callback function for writing data to TLS/SSL connection.
**Type Definitions**

```c
typedef enum esp_tls_conn_state esp_tls_conn_state_t ESP-TLS Connection State.
typedef enum esp_tls_role esp_tls_role_t ESP-TLS role.
typedef struct psk_key_hint psk_hint_key_t ESP-TLS preshared key and hint structure.
typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t esp-tls client session ticket ctx.
typedef struct esp_tls_cfg esp_tls_cfg_t ESP-TLS configuration parameters.
```

**Note**
- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

```c
typedef struct esp_tls esp_tls_t ESP-TLS Connection Handle.
```

**Enumerations**

```c
enum esp_tls_conn_state

ESP-TLS Connection State.

Values:

ESP_TLS_INIT = 0
ESP_TLS_CONNECTING
ESP_TLS_HANDSHAKE
ESP_TLS_FAIL
ESP_TLS_DONE
```
Chapter 2. API

```c
enum esp_tls_role
{
    ESP_TLS_CLIENT = 0,
    ESP_TLS_SERVER
};
```

2.4.3 OpenSSL-APIs

注解：The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in openssl directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedtls to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter 1. SSL Context Method Create

1.1 `const SSL_METHOD* SSLv3_client_method(void)`

Arguments:

| none |

Return:

| SSLV3.0 version SSL context client method point |

Description:

| create the target SSL context method |

Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 `const SSL_METHOD* TLSv1_client_method(void)`

Arguments:

| none |

Return:
Chapter 2. API 参考

### 1.3 const SSL_METHOD* TLSv1_1_client_method (void)

**Arguments:**

none

**Return:**

TLSV1.1 version SSL context client method point

**Description:**

create the target SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ...
}
```

### 1.4 const SSL_METHOD* TLSv1_2_client_method (void)

**Arguments:**

none

**Return:**

TLSV1.2 version SSL context client method point

**Description:**

create the target SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

### 1.5 const SSL_METHOD* TLS_client_method (void)

TLSV1.0 version SSL context client method point

**Description:**

create the target SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```
### 2. API

**TLSv1.2 version SSL context client method point**

**Description:**
create the default SSL context method, it's always to be TLSV1.2

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

### 1.6 const SSL_METHOD* SSLv3_server_method (void)

**Arguments:**
none

**Return:**
SSLV3.0 version SSL context server method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

### 1.7 const SSL_METHOD* TLSv1_server_method (void)

**Arguments:**
none

**Return:**
TLSV1.0 version SSL context server method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```
1.8 const SSL_METHOD* TLSv1_1_server_method (void)

Arguments:

none

Return:

TLSV1.1 version SSL context server method point

Description:

create the target SSL context method

Example:

void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}

1.9 const SSL_METHOD* TLSv1_2_server_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context server method point

Description:

create the target SSL context method

Example:

void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:

none

Return:

TLSV1.2 version SSL context server method point

Description:
create the default SSL context method, it's always to be TLSV1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

Chapter 2. SSL Context Function

2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)

Arguments:

- method - the SSL context method point

Return:

- context point

Description:

- create a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)

Arguments:

- ctx - the SSL context point

Return:

- none

Description:

- free a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    ...
    SSL_CTX_free(ctx);
}
```
2.3 int SSL_CTX_set_ssl_version (SSL_CTX *ctx, const SSL_METHOD *meth)

Arguments:

<table>
<thead>
<tr>
<th>ctx</th>
<th>SSL context point</th>
</tr>
</thead>
<tbody>
<tr>
<td>meth</td>
<td>SSL method point</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>1</th>
<th>OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

set the SSL context version

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
    ...
    SSL_CTX_set_ssl_version(ctx, meth);
}
```

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX *ctx)

Arguments:

| ctx | SSL context point |

Return:

SSL context method

Description:

get the SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;
    ...
    method = SSL_CTX_get_ssl_method(ctx);
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX *ctx)

Arguments:

| ctx | SSL context point |

Return:
SSL method

Description:
create a SSL

Example:
```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ssl = SSL_new(ctx);
}
```

3.2 void SSL_free (SSL * ssl)

Arguments:
ssl - SSL point

Return:
none

Description:
free SSL

Example:
```c
void example(void)
{
    SSL *ssl;
    ...
    SSL_free(ssl);
}
```

3.3 int SSL_do_handshake (SSL * ssl)

Arguments:
ssl - SSL point

Return:
1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:
perform the SSL handshake

Example:
void example(void)
{
    SSL *ssl;
    int ret;

    ... ...

    ret = SSL_do_handshake(ssl);
}

3.4 int SSL_connect (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

connect to the remote SSL server

Example:

void example(void)
{
    SSL *ssl;
    int ret;

    ... ...

    ret = SSL_connect(ssl);
}

3.5 int SSL_accept (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

accept the remote connection

Example:

void example(void)
{
    SSL *ssl;
    int ret;

    ... ...

    (下页继续)
3.6 int SSL_shutdown (SSL * ssl)

Arguments:
ssl - SSL point

Return:
1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:
shutdown the connection

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_shutdown(ssl);
}

3.7 int SSL_clear (SSL * ssl)

Arguments:
ssl - SSL point

Return:
1 : OK
0 : failed

Description:
shutdown the connection

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_clear(ssl);
}

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:
Chapter 2. API 参考

### 2.1 SSL_read

**Arguments:**

- `ssl` - point
- `buffer` - data buffer point
- `len` - data length

**Return:**

- `> 0` : OK, and return received data bytes
- `= 0` : no data received or connection is closed
- `< 0` : an error catch

**Description:**

read data from remote

**Example:**

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ...

    ret = SSL_read(ssl, buf, len);
}
```

### 3.9 int SSL_write (SSL * ssl, const void * buffer, int len)

**Arguments:**

- `ssl` - SSL point
- `buffer` - data buffer point
- `len` - data length

**Return:**

- `> 0` : OK, and return received data bytes
- `= 0` : no data sent or connection is closed
- `< 0` : an error catch

**Description:**

send the data to remote

**Example:**

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;

    ... ...

    ret = SSL_write(ssl, buf, len);
}
```

### 3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)

**Arguments:**
Chapter 2. API

### 2.1 SSL

**ssl - SSL point**

**Return:**

SSL context

**Description:**

get SSL context of the SSL

**Example:**

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ... ...
    ctx = SSL_get_SSL_CTX(ssl);
}
```

### 3.11 int SSL_get_shutdown (const SSL * ssl)

**Arguments:**

ssl - SSL point

**Return:**

shutdown mode

**Description:**

get SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int mode;
    ... ...
    mode = SSL_get_SSL_CTX(ssl);
}
```

### 3.12 void SSL_set_shutdown (SSL * ssl, int mode)

**Arguments:**

ssl - SSL point

**Return:**

shutdown mode

**Description:**

set SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ... ...
    ctx = SSL_get_SSL_CTX(ssl);
}
```
3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:

ssl - SSL point

Return:

SSL method

Description:

set SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
    method = SSL_get_ssl_method(ssl);
}
```

3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)

Arguments:

ssl - SSL point
meth - SSL method point

Return:

1 : OK
0 : failed

Description:

set the SSL method

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
    (下页继续)
```
Chapter 2. API 参考

```
ret = SSL_set_ssl_method(ssl, method);
```

3.15 int SSL_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

data bytes

Description:

get received data bytes

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : Yes
0 : No

Description:

check if data is received

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:
Chapter 2. API

3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the read only socket of the SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_rfd(ssl);
}

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the write only socket of the SSL

Example:
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_wfd(ssl);
}

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:
ssl - SSL point
fd - socket id

Return:
1 : OK
0 : failed

Description:
set socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_fd(ssl, socket);
}

3.21 int SSL_set_rfd (SSL * ssl, int fd)

Arguments:
ssl - SSL point
fd - socket id

Return:
1 : OK
0 : failed

Description:
set read only socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
}
Chapter 2. API 参考

3.22 int SSL_set_wfd (SSL * ssl, int fd)

Arguments:

ssl - SSL point
fd - socket id

Return:

1 : OK
0 : failed

Description:
set write only socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}

3.23 int SSL_version (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

SSL version

Description:
get SSL version

Example:

void example(void)
{
    int version;
    SSL *ssl;
    ...
    version = SSL_version(ssl);
}

3.24 const char* SSL_get_version (const SSL * ssl)
2. API

### SSL_get_version

**Arguments:**
ssl - SSL point

**Return:**
SSL version string

**Description:**
get the SSL current version string

**Example:**
```c
void example(void)
{
    char *version;
    SSL *ssl;
    ...
    version = SSL_get_version(ssl);
}
```

### SSL_get_state

**Arguments:**
ssl - SSL point

**Return:**
SSL state

**Description:**
get the SSL state

**Example:**
```c
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;
    ...
    state = SSL_get_state(ssl);
}
```

### SSL_alert_desc_string

**Arguments:**
value - SSL description

**Return:**
alert value string

**Description:**
get alert description string

Example:
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string(val);
}

3.27 const char* SSL_alert_desc_string_long (int value)

Arguments:
value - SSL description

Return:
alert value long string

Description:
get alert description long string

Example:
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string_long(val);
}

3.28 const char* SSL_alert_type_string (int value)

Arguments:
value - SSL type description

Return:
alert type string

Description:
get alert type string

Example:
void example(void)
{
    int val;
    char *str;
    ...
}
3.29 `const char* SSL_alert_type_string_long(int value)`

**Arguments:**

value - SSL type description

**Return:**

alert type long string

**Description:**

get alert type long string

**Example:**

```c
void example(void)
{
    int val;
    char *str;
    ... ...
    str = SSL_alert_type_string_long(val);
}
```

3.30 `const char* SSL_rstate_string(SSL *ssl)`

**Arguments:**

ssl - SSL point

**Return:**

state string

**Description:**

get the state string where SSL is reading

**Example:**

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ... ...
    str = SSL_rstate_string(ssl);
}
```

3.31 `const char* SSL_rstate_string_long(SSL *ssl)`

**Arguments:**

ssl - SSL point

**Return:**
state long string

Description:
get the state long string where SSL is reading

Example:
```c
void example(void)
{
    SSL *ssl;
    char *str;
    .... ....
    str = SSL_rstate_string_long(ssl);
}
```

3.32 `const char* SSL_state_string (const SSL * ssl)`

Arguments:
ssl - SSL point

Return:
state string

Description:
get the state string

Example:
```c
void example(void)
{
    SSL *ssl;
    const char *str;
    .... ....
    str = SSL_state_string(ssl);
}
```

3.33 `char* SSL_state_string_long (const SSL * ssl)`

Arguments:
ssl - SSL point

Return:
state long string

Description:
get the state long string

Example:
null
3.36 int SSL_want_nothing (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true

Description:
check if SSL want nothing

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_nothing(ssl);
}

3.37 int SSL_want_read (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true

Description:
check if SSL want to read

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_read(ssl);
}

3.38 int SSL_want_write (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true
Chapter 2. API

Description:
check if SSL want to write

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_want_write(ssl);
}
```

Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:
cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes

Return:
X509 certification object point

Description:
load a character certification context into system context. If '*cert' is
...pointed to the
certification, then load certification into it. Or create a new X509_.
...certification object

Example:

```c
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ...
    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:
ssl - SSL point
x - CA certification point

Return:
1 : OK
0 : failed
Chapter 2. API

Description:

add CA client certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;
    ...
    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)

Arguments:

ctx - SSL context point
x  - CA certification point

Return:

1 : OK
0 : failed

Description:

add CA client certification into the SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;
    ...
    ret = SSL_CTX_add_client_CA(ctx, new);
}
```

4.4 X509* SSL_get_certificate (const SSL * sss)

Arguments:

ssl - SSL point

Return:

SSL certification point

Description:

get the SSL certification point

Example:
void example(void)
{
    SSL *ssl;
    X509 *cert;
    ...
    cert = SSL_get_certificate(ssl);
}

4.5 long SSL_get_verify_result (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

the result of verifying

Description:

get the verifying result of the SSL certification

Example:

void example(void)
{
    SSL *ssl;
    long ret;
    ...
    ret = SSL_get_verify_result(ssl);
}

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)

Arguments:

ctx - the SSL context point
pkey - certification object point

Return:

1 : OK
0 : failed

Description:

load the certification into the SSL_CTX or SSL object

Example:

void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;
    ...
    }
4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)

Arguments:

- ctx - SSL context point
- len - certification length
- d - data point

Return:

- 1 : OK
- 0 : failed

Description:

load the ASN1 certification into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;
    ...
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}
```

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX * ctx, EVP_PKEY * pkey)

Arguments:

- ctx - SSL context point
- pkey - private key object point

Return:

- 1 : OK
- 0 : failed

Description:

load the private key into the context object

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;
    ...
    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}
```
4.9 int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX *ctx, const unsigned char *d, long len)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>SSL context point</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
<tr>
<td>len</td>
<td>private key length</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load the ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    int pk;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;
    ...
    ...
    ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX *ctx, const unsigned char *d, long len)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>SSL context point</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
<tr>
<td>len</td>
<td>private key length</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load the RSA ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;
    ...
    ...
    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL *ssl, int len, const unsigned char *d)
Arguments:

ssl - SSL point
len - data bytes
d - data point

Return:

1 : OK
0 : failed

Description:

load certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;
    ... ...
    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}
```

4.12 X509* SSL_get_peer_certificate (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

peer certification

Description:

get peer certification

Example:

```c
void example(void)
{
    SSL *ssl;
    X509 *peer;
    ... ...
    peer = SSL_get_peer_certificate(ssl);
}
```

### 2.4.4 ESP HTTP Client

**Overview**

esp_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:
• **esp_http_client_init()**: To use the HTTP client, the first thing we must do is create an esp_http_client bypass into this function with the esp_http_client_config_t configurations. Which configuration values we do not define, the library will use default.

• **esp_http_client_perform()**: The esp_http_client argument created from the init function is needed. This function performs all operations of the esp_http_client, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event_handle (defined by esp_http_client_config_t). This function performs its job and blocks the current task until it’s done.

• **esp_http_client_cleanup()**: After completing our esp_http_client’s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client.

### Application Example

```c
esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
        case HTTP_EVENT_ERROR:
            ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
            break;
        case HTTP_EVENT_ON_CONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
            break;
        case HTTP_EVENT_HEADER_SENT:
            ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
            break;
        case HTTP_EVENT_ON_HEADER:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
            printf("%.s", evt->data_len, (char*)evt->data);
            break;
        case HTTP_EVENT_ON_DATA:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
            if (!esp_http_client_is_chunked_response(evt->client)) {
                printf("%.s", evt->data_len, (char*)evt->data);
            }
            break;
        case HTTP_EVENT_ON_FINISH:
            ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
            break;
        case HTTP_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
            break;
    }
    return ESP_OK;
}

esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
             esp_http_client_get_status_code(client),
             esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);
```
Persistent Connections

Persistent connections mean that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the `Connection: close` header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example

```c
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);
esp_http_client_cleanup(client);
```

HTTPS

The HTTP client supports SSL connections using mbedtls, with the `url` configuration starting with `https` scheme (or `transport_type = HTTP_TRANSPORT_OVER_SSL`). HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

注解： By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to `cert.pem` in `esp_http_client_config_t`.

HTTPS example

```c
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```
HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. The HTTP client supports some functions to make this easier. Of course, once you use these functions, you should not use the `esp_http_client_perform()` function with that handle, and `esp_http_client_init()` always called first to get the handle. Perform these functions in the order below:

- `esp_http_client_init()`: to create and handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: to modify the http connection information (optional)
- `esp_http_client_open()`: Open the http connection with `write_len` parameter, `write_len=0` if we only need read
- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the content-length from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should close the connection after finish
- `esp_http_client_cleanup()`: And release the resources

**Perform HTTP request as Stream reader** Check the example function `http_perform_as_stream_reader` at [protocols/esp_http_client](https://espressif.github.io/esp-http-client/)

HTTP Authentication

The HTTP client supports both Basic and Digest Authentication. By providing usernames and passwords in `url` or in the `username`, `password` of config entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

**Config authentication example with URI**

```c
esp_http_client_config_t config = {
  .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

**Config authentication example with username, password entry**

```c
esp_http_client_config_t config = {
  .url = "http://httpbin.org/basic-auth/user/passwd",
  .username = "user",
  .password = "passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: [protocols/esp_http_client](https://espressif.github.io/esp-http-client/).

API Reference

**Header File**

- `components/esp_http_client/include/esp_http_client.h`
## Functions

**esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)**

Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Return**
- `esp_http_client_handle_t`
- `NULL` if any errors

**Parameters**
- `[in] config`: The configurations, see `http_client_config_t`

**esp_err_t esp_http_client_perform(esp_http_client_handle_t client)**

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invoke to set options for the following `esp_http_client_perform`.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

**Return**
- `ESP_OK` on successful
- `ESP_FAIL` on error

**Parameters**
- `client`: The `esp_http_client` handle

**esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)**

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**
- `ESP_OK`
- `ESP_FAIL`

**Parameters**
- `[in] client`: The `esp_http_client` handle
- `[in] url`: The url

**esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)**

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**
- `ESP_OK`
- `ESP_FAIL`

**Parameters**
- `[in] client`: The `esp_http_client` handle
- `[in] data`: post data pointer
- `[in] len`: post length

**int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)**
Get current post field information.

**Return** Size of post data

**Parameters**
- **[in]** client: The client
- **[out]** data: Point to post data pointer

```c
esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)
```

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- **[in]** client: The `esp_http_client` handle
- **[in]** key: The header key
- **[in]** value: The header value

```c
esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
```

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- **[in]** client: The `esp_http_client` handle
- **[in]** key: The header key
- **[out]** value: The header value

```c
esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
```

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- **[in]** client: The `esp_http_client` handle
- **[out]** value: The username value

```c
esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
```

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- **[in]** client: The `esp_http_client` handle
- **[in]** username: The username value

```c
esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
```

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
• [in] client: The esp_http_client handle
• [out] value: The password value

```
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] password: The password value

```
esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client,
                                         esp_http_client_auth_type_t auth_type)
```

Set http request auth_type.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] auth_type: The esp_http_client auth type

```
int esp_http_client_get_errno(esp_http_client_handle_t client)
```

Get HTTP client session errno.

Return
• (-1) if invalid argument
• errno

Parameters
• [in] client: The esp_http_client handle

```
esp_err_t esp_http_client_set_method(esp_http_client_handle_t client,
                                         esp_http_client_method_t method)
```

Set http request method.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] method: The method

```
esp_err_t esp_http_client_set_timeout_ms(esp_http_client_handle_t client, int timeout_ms)
```

Set http request timeout.

Return
• ESP_OK
• ESP_ERR_INVALID_ARG

Parameters
• [in] client: The esp_http_client handle
• [in] timeout_ms: The timeout value

```
esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)
```

Delete http request header.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [in] key: The key
**esp_err_t esp_http_client_open** *(esp_http_client_handle_t client, int write_len)*

This function will be open the connection, write all header strings and return.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- **[in]** client: The esp_http_client handle
- **[in]** write_len: HTTP Content length need to write to the server

**int esp_http_client_write** *(esp_http_client_handle_t client, const char* buffer, int len)*

This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Return**
- (-1) if any errors
- Length of data written

**Parameters**
- **[in]** client: The esp_http_client handle
- buffer: The buffer
- **[in]** len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

**int64_t esp_http_client_fetch_headers** *(esp_http_client_handle_t client)*

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Return**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

**Parameters**
- **[in]** client: The esp_http_client handle

**bool esp_http_client_is_chunked_response** *(esp_http_client_handle_t client)*

Check response data is chunked.

**Return** true or false

**Parameters**
- **[in]** client: The esp_http_client handle

**int esp_http_client_read** *(esp_http_client_handle_t client, char* buffer, int len)*

Read data from http stream.

**Return**
- (-1) if any errors
- Length of data was read

**Parameters**
- **[in]** client: The esp_http_client handle
- buffer: The buffer
- **[in]** len: The length

**int esp_http_client_get_status_code** *(esp_http_client_handle_t client)*

Get http response status code, the valid value if this function invoke after esp_http_client_perform

**Return** Status code

**Parameters**
- **[in]** client: The esp_http_client handle

**int64_t esp_http_client_get_content_length** *(esp_http_client_handle_t client)*

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

**Return**
- (-1) Chunked transfer
- Content-Length value as bytes
Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_close (esp_http_client_handle_t client)
Close http connection, still kept all http request resources.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)
This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)
Get transport type.

Return
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)
Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

void esp_http_client_add_auth (esp_http_client_handle_t client)
On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters
• [in] client: The esp_http_client handle

bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)
Checks if entire data in the response has been read without any error.

Return
• true
• false

Parameters
• [in] client: The esp_http_client handle

int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)
Helper API to read larger data chunks This is a helper API which internally calls esp_http_client_read
multiple times till the end of data is reached or till the buffer gets full.

**Return**
- Length of data was read

**Parameters**
- `[in]` `client`: The esp_http_client handle
- `buffer`: The buffer
- `[in]` `len`: The buffer length

```c
esp_err_t esp_http_client_flush_response(esp_http_client_handle_t client, int *len)
```
Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Return**
- ESP_OK If successful, `len` will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

**Parameters**
- `[in]` `client`: The esp_http_client handle
- `len`: Length of data discarded

```c
esp_err_t esp_http_client_get_url(esp_http_client_handle_t client, char *url, const int len)
```
Get URL from client.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- `[in]` `client`: The esp_http_client handle
- `[inout]` `url`: The buffer to store URL
- `[in]` `len`: The buffer length

```c
esp_err_t esp_http_client_get_chunk_length(esp_http_client_handle_t client, int *len)
```
Get Chunk-Length from client.

**Return**
- ESP_OK If successful, `len` will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or `len` are NULL

**Parameters**
- `[in]` `client`: The esp_http_client handle
- `[out]` `len`: Variable to store length

**Structures**

```c
def struct esp_http_client_event:
    HTTPClient events data.
```

**Public Members**

```c
def event_id event_id
    event_id, to know the cause of the event
```

```c
def esp_http_client_handle_t client
    esp_http_client_handle_t context
```

```c
void *data
data of the event
```

```c
int data_len
data length of data
```
void *user_data
    user_data context, from esp_http_client_config_t user_data

char *header_key
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct esp_http_client_config_t
    HTTP configuration.

Public Members

const char *url
    HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
    Using for Http authentication

const char *password
    Using for Http authentication

esp_http_client_auth_type_t auth_type
    Http authentication type, see esp_http_client_auth_type_t

const char *path
    HTTP Path, if not set, default is /

const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
    Client key decryption password string

size_t client_key_password_len
    String length of the password pointed to by client_key_password

const char *user_agent
    The User Agent string to send with HTTP requests

esp_http_client_method_t method
    HTTP Method
int timeout_ms
   Network timeout in milliseconds

bool disable_auto_redirect
   Disable HTTP automatic redirects

int max_redirection_count
   Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
   Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables
   authorization retry if -1

http_event_handle_cb event_handler
   HTTP Event Handle

esp_http_client_transport_t transport_type
   HTTP transport type, see esp_http_client_transport_t

int buffer_size
   HTTP receive buffer size

int buffer_size_tx
   HTTP transmit buffer size

void *user_data
   HTTP user_data context

bool is_async
   Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field

esp_err_t (crt_bundle_attach) (void *conf)
   Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification,
   must be enabled in menuconfig

bool keep_alive_enable
   Enable keep-alive timeout

int keep_alive_idle
   Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
   Keep-alive interval time. Default is 5 (second)

int keep_alive_count
   Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
   The name of interface for data to go through. Use the default interface without setting

Macros

DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection
Chapter 2. API

ESP_ERR_HTTP_WRITE_DATA
Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
Read FIN from peer and the connection closed

Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

#endif _ESP_IDF_HTTP_CLIENT_EVENTS_H_

#endif _ESP_IDF_HTTP_CLIENT_H_

#endif _ESP_IDF_HTTP_PARSER_H_

#endif _ESP_IDF_HTTP_TRANSPORT_H_

#ifndef _ESP_IDF_HTTP_STREAM_H_

#endif _ESP_IDF_HTTP_PARSER_EVENTS_H_

enum esp_http_client_event_id_t
HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatability and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

eenum esp_http_client_transport_t
HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp
HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.
Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

HTTP_METHOD_COPY
HTTP COPY Method

HTTP_METHOD_MOVE
HTTP MOVE Method

HTTP_METHOD_LOCK
HTTP LOCK Method

HTTP_METHOD_UNLOCK
HTTP UNLOCK Method

HTTP_METHOD_PROPFIND
HTTP PROPFIND Method

HTTP_METHOD_PROPPATCH
HTTP PROPPATCH Method

HTTP_METHOD_MKCOL
HTTP MKCOL Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
HTTP Authentication type.
Values:

HTTP_AUTH_TYPE_NONE = 0
No authention
HTTP_AUTH_TYPE_BASIC
HTTP Basic authentication

HTTP_AUTH_TYPE_DIGEST
HTTP Digest authentication

enum HttpStatus_Code
Enum for the HTTP status codes.

Values:
HttpStatus_Ok = 200
HttpStatus_MultipleChoices = 300
HttpStatus MovedPermanently = 301
HttpStatus_Found = 302
HttpStatus_TemporaryRedirect = 307
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

2.4.5 ESP WebSocket Client

Overview
The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32

Features

• Supports WebSocket over TCP, TLS with mbedtls
• Easy to setup with URI
• Multiple instances (Multiple clients in one application)

Configuration

URI

• Supports ws, wss schemes
• WebSocket samples:
  – ws://echo.websocket.org: WebSocket over TCP, default port 80
  – wss://echo.websocket.org: WebSocket over SSL, default port 443

Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```
If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

**TLS Configuration:**

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

注解：If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

PEM certificate for this example could be extracted from an openssl `s_client` command connecting to websocket.org. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used).

```
` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem`
```

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol**  The subprotocol field in the config struct can be used to request a subprotocol

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

注解：The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Events**

- `WEBSOCKET_EVENT_CONNECTED`: The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- `WEBSOCKET_EVENT_DISCONNECTED`: The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- `WEBSOCKET_EVENT_DATA`: The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- `WEBSOCKET_EVENT_ERROR`: Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:
esp_websocket_client_init(client, config);  

Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses esp_websocket_client to establish a websocket connection and send/receive data with the websocket.org server can be found here: protocols/websocket.

Sending Text Data

The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

esp_websocket_client_send_text(client, data, len, portMAX_DELAY);

API Reference

Header File

- components/esp_websocket_client/include/esp_websocket_client.h

Functions

- esp_websocket_client_init(config)
  - Start a Websocket session. This function must be the first function to call, and it returns a esp_websocket_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_websocket_client_destroy when the operation is complete.
    
    **Return**
    - esp_websocket_client_handle_t
    - NULL if any errors

    **Parameters**
    - [in] config: The configuration

- esp_websocket_client_set_uri(client, uri)
  - Set URL for client, when performing this behavior, the options in the URL will replace the old ones. Must stop the WebSocket client before set URI if the client has been connected.
    
    **Return**
    - esp_err_t

    **Parameters**
    - [in] client: The client
    - [in] uri: The uri

- esp_websocket_client_start(client)
  - Open the WebSocket connection.
    
    **Return**
    - esp_err_t

    **Parameters**
    - [in] client: The client

- esp_websocket_client_stop(client)
  - Stops the WebSocket connection without websocket closing handshake.
    
    This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using esp_websocket_client_close().

Submit Document Feedback
Notes:

- Cannot be called from the websocket event handler

**Return** esp_err_t

**Parameters**

- [in] client: The client

```c
esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)
```

Destroy the WebSocket connection and free all resources. This function must be the last function to call for a session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

**Return** esp_err_t

**Parameters**

- [in] client: The client

```c
int esp_websocket_client_send(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
```

Generic write data to the WebSocket connection; defaults to binary send.

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

```c
int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
```

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

```c
int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
```

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**

- Number of data was sent
- (-1) if any errors

**Parameters**

- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout in RTOS ticks

```c
esp_err_t esp_websocket_client_close(esp_websocket_client_handle_t client, TickType_t timeout)
```

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:
• Client sends CLOSE frame
• Client waits until server echos the CLOSE frame
• Client waits until server closes the connection
• Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:
  – Cannot be called from the websocket event handler

Return: `esp_err_t`
Parameters:
  • `[in] client`: The client
  • `[in] timeout`: Timeout in RTOS ticks for waiting

```c
esp_err_t esp_websocket_client_close_with_code(esp_websocket_client_handle_t client, int code, const char *data, int len, TickType_t timeout)
```

Close the WebSocket connection in a clean way with custom code/data. Closing sequence is the same as for `esp_websocket_client_close()`

Notes:
  • Cannot be called from the websocket event handler

Return: `esp_err_t`
Parameters:
  • `[in] client`: The client
  • `[in] code`: Close status code as defined in RFC6455 section-7.4
  • `[in] data`: Additional data to closing message
  • `[in] len`: The length of the additional data
  • `[in] timeout`: Timeout in RTOS ticks for waiting

```c
bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
```

Check the WebSocket client connection state.

Return:
  • `true`
  • `false`

Parameters:
  • `[in] client`: The client handle

```c
esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client, esp_websocket_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register the Websocket Events.

Return: `esp_err_t`
Parameters:
  • `client`: The client handle
  • `event`: The event id
  • `event_handler`: The callback function
  • `event_handler_arg`: User context

### Structures

```c
struct esp_websocket_event_data_t
Websocket event data.
```

### Public Members

```c
custom char *data_ptr
Data pointer
```

```c
int data_len
Data length
```
uint8_t op_code
    Received opcode

esp_websocket_client_handle_t client
    esp_websocket_client_handle_t context

void *user_context
    user_data context, from esp_websocket_client_config_t user_data

int payload_len
    Total payload length, payloads exceeding buffer will be posted through multiple events

int payload_offset
    Actual offset for the data associated with this event

struct esp_websocket_client_config_t
    Websocket client setup configuration.

Public Members

const char *uri
    Websocket URI, the information on the URI can be overrides the other fields below, if any

const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char *username
    Using for Http authentication - Not supported for now

const char *password
    Using for Http authentication - Not supported for now

const char *path
    HTTP Path, if not set, default is /

bool disable_auto_reconnect
    Disable the automatic reconnect function when disconnected

void *user_context
    HTTP user data context

int task_prio
    Websocket task priority

int task_stack
    Websocket task stack

int buffer_size
    Websocket buffer size

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.
size_t client_cert_len
Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char *client_key
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_websocket_transport_t transport
Websocket transport type, see 'esp_websocket_transport_t

const char *subprotocol
Websocket subprotocol

const char *user_agent
Websocket user-agent

const char *headers
Websocket additional headers

int pingpong_timeout_sec
Period before connection is aborted due to no PONGs received

bool disable_pingpong_discon
Disable auto-disconnect due to no PONG received within pingpong_timeout_sec

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
Keep-alive interval time. Default is 5 (second)

int keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

size_t ping_interval_sec
Websocket ping interval, defaults to 10 seconds if not set

struct ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

Type Definitions
typedef struct esp_websocket_client *esp_websocket_client_handle_t

Enumerations
enum esp_websocket_event_id_t
WebSocket Client events id.

Values:
WEB_SOCKET_EVENT_ANY = -1
WEBSOCKET_EVENT_ERROR = 0
This event occurs when there are any errors during execution

WEBSOCKET_EVENT_CONNECTED
Once the WebSocket has been connected to the server, no data exchange has been performed

WEBSOCKET_EVENT_DISCONNECTED
The connection has been disconnected

WEBSOCKET_EVENT_DATA
When receiving data from the server, possibly multiple portions of the packet

WEBSOCKET_EVENT_CLOSED
The connection has been closed cleanly

WEBSOCKET_EVENT_MAX

enum esp_websocket_transport_t
Websocket Client transport.

Values:

WEBSOCKET_TRANSPORT_UNKNOWN = 0x0
Transport unknown
WEBSOCKET_TRANSPORT_OVER_TCP
Transport over tcp
WEBSOCKET_TRANSPORT_OVER_SSL
Transport over ssl

2.4.6 HTTP 服务器

概述
HTTP Server 组件提供了在 ESP32 上运行轻量级 Web 服务器的功能，下面介绍使用 HTTP Server 组件 API 的详细步骤:

• httpd_start(): 创建 HTTP 服务器的实例，根据具体的配置为其分配内存和资源，并返回该服务器实例的句柄。服务器使用了两个套接字，一个用来监听 HTTP 流量 (TCP 类型)，另一个用来处理控制信号 (UDP 类型)，它们在服务器的任务循环中轮流使用。通过向 httpd_start() 传递 httpd_config_t 结构体，可以在创建服务器实例时配置任务的优先级和堆栈的大小。TCP 流量被解析为 HTTP 请求，根据请求的 URI 来调用用户注册的处理程序，在处理程序中需要发送回 HTTP 响应数据包。

• httpd_stop(): 根据传入的句柄停止服务器，并释放相关联的内存和资源。这是一个阻塞函数，首先给服务器任务发送停止信号，然后等待其终止。期间服务器任务会关闭所有已打开的连接，删除已注册的 URI 处理程序，并将所有会话的上下文数据重置为空。

• httpd_register_uri_handler(): 通过传入httpd_uri_t 结构体类型的对象来注册 URI 处理程序。该结构体包含如下成员: uri 名字, method 类型（比如 HTTPD_GET/HTTPD_POST/HTTPD_PUT 等等), esp_err_t * handler (httpd_req_t *req) 类型的函数指针，指向用户上下文数据的 user_ctx 指针。

应用示例

```c
/* URI 处理函数，在客户端发起 GET /uri 请求时被调用 */
esp_err_t get_handler (httpd_req_t *req)
{
    /* 发送回简单的响应数据包 */
    const char[] resp = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}
```
/* URI 处理函数，在客户端发起 POST /uri 请求时被调用 */

esp_err_t post_handler(httpd_req_t *req)
{
    /* 定义 HTTP POST 请求数据的目标缓存区 */
    /* httpd_req_recv() 只接收 char* 数据，但也可以是任意二进制数据（需要类型转换）
     * 对于字符串数据，null 终止符会被省略，content_len 会给出字符串的长度 */
    char content[100];

    /* 如果内容长度大于缓冲区则截断 */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 返回 0 表示连接已关闭 */
        /* 检查是否超时 */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* 如果是超时，可以调用 httpd_req_recv() 重试 */
            /* 简单起见，这里我们直接响应 HTTP 408（请求超时）错误给客户端 */
            httpd_resp_send_408(req);
        }

        /* 如果发生了错误，返回 ESP_FAIL 可以确保低层套接字被关闭 */
        return ESP_FAIL;
    }

    /* 发送简单的响应数据包 */
    const char[] resp = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* GET /uri 的 URI 处理结构 */

httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* POST /uri 的 URI 处理结构 */

httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* 启动 Web 服务器的函数 */

httpd_handle_t start_webserver(void)
{
    /* 生成默认的配置参数 */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* 设置 esp_http_server 的实例句柄 */
    httpd_handle_t server = NULL;

    /* 启动 httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* 注册 URI 处理程序 */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
}
API 参考

HTTP 长连接

HTTP 服务器具有长连接的功能，允许重复使用同一个连接（会话）进行多次传输，同时保持会话的上下文数据。上下文数据可由处理程序动态分配，在这种情况下需要提前指定好自定义的回调函数，以便在连接/会话被关闭时释放这部分内存资源。

长连接示例

```c
/* 定义函数，用来释放上下文数据 */
void free_ctx_func(void *ctx)
{
    /* 也可以是 free 以外的代码逻辑 */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* 如果会话上下文不存在则新建一个 */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* 指向上文数据 */
        req->free_ctx_func = free_ctx_func; /* 释放上下文数据的函数 */
    }

    /* 访问上下文数据 */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* 响应 */
    /* ................. */
    /* ................. */
    return ESP_OK;
}
```

详情请参考位于 protocols/http_server/persistent_sockets 的示例代码。

Header File

- components/esp_http_server/include/esp_http_server.h
**Functions**

`esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my.Uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

**Note** URI handlers can be registered in real time as long as the server handle is valid.

**Return**

- ESP_OK : On successfully registering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

**Parameters**

- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

`esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)`

Unregister a URI handler.

**Return**

- ESP_OK : On successfully deregistering the handler
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

**Parameters**

- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

`esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)`

Unregister all URI handlers with the specified uri string.
Return
• ESP_OK: On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_NOT_FOUND: No handler registered with specified uri string

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri: uri string specifying all handlers that need to be deregistered

esp_err_t httpd_sess_set_recv_override (httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)
Overwrite web server’s receive function (by session FD)
This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments

Parameters
• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] recv_func: The receive function to be set for this session

esp_err_t httpd_sess_set_send_override (httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
Overwrite web server’s send function (by session FD)
This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments

Parameters
• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] send_func: The send function to be set for this session

esp_err_t httpd_sess_set_pending_override (httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
Overwrite web server’s pending function (by session FD)
This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG: Null arguments

Parameters
• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] pending_func: The receive function to be set for this session

int httpd_req_to_sockfd (httpd_req_t *r)
Get the Socket Descriptor from the HTTP request.
This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, e.g.: `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note** This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

**Return**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NUL request pointer

**Parameters**
- `[in]` `r`: The request whose socket descriptor should be found

```c
int httpd_req_recv(httpd_req_t *r, char* buf, size_t buf_len)
```

This API will read HTTP content data from the HTTP request into provided buffer. Use `content_len` provided in `httpd_req_t` structure to know the length of data to be fetched. If `content_len` is too large for the buffer then user may have to make multiple calls to this function, each time fetching `buf_len` number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes: Number of bytes read into the buffer successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv() 
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- `[in]` `r`: The request being responded to
- `[in]` `buf`: Pointer to a buffer that the data will be read into
- `[in]` `buf_len`: Length of the buffer

```c
size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char* field)
```

Search for a field in request headers and return the string length of it’s value.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

**Parameters**
- `[in]` `r`: The request being responded to
- `[in]` `field`: The header field to be searched in the request

```c
esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char* field, char *val, size_t val_size)
```

Get the value string of a field from the request headers.

**Note**
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once `httpd_resp_send()` API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Chapter 2. API

• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.

Use `httpd_req_get_hdr_value_len()` to know the right buffer length

Return

• ESP_OK : Field found in the request header and value string copied
• ESP_ERR_NOT_FOUND : Key not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

Parameters

• [in] r: The request being responded to
• [in] field: The field to be searched in the header
• [out] val: Pointer to the buffer into which the value will be copied if the field is found
• [in] val_size: Size of the user buffer “val”

size_t `httpd_req_get_url_query_len(httpd_req_t *r)`

Get Query string length from the request URL.

Note

This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

Return

• Length : Query is found in the request URL
• Zero : Query not found / Null arguments / Invalid request

Parameters

• [in] r: The request being responded to

Esp_err_t `httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)`

Get Query string from the request URL.

Note

• Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
• This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
• Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return

• ESP_OK : Query is found in the request URL and copied to buffer
• ESP_ERR_NOT_FOUND : Query not found
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
• ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated

Parameters

• [in] r: The request being responded to
• [out] buf: Pointer to the buffer into which the query string will be copied (if found)
• [in] buf_len: Length of output buffer

Esp_err_t `httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)`

Helper function to get a URL query tag from a query string of the type `param1=val1&param2=val2`.

Note

• The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
• If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
Return

- ESP_OK: Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

Parameters

- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val_size: Size of the user buffer “val”

`esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)`

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return

- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

Parameters

- [in] req: Pointer to the HTTP request
- [in] cookie_name: The cookie name to be searched in the request
- [out] val: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- [inout] val_size: Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length incase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

`bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)`

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/* matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /foo/
- /foo/* or /foo/*? (sans the backslash) matches /foo/*, /foo/bar, and also /foo, but not /foo or /foo/

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return true if a match was found

Parameters

- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

`esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)`

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header.
Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• [in] r : The request being responded to
• [in] buf : Buffer from where the content is to be fetched
• [in] buf_len : Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• When you are finished sending all your chunks, you must call this function with buf_len as 0.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet chunk
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• [in] r : The request being responded to
• [in] buf : Pointer to a buffer that stores the data
• [in] buf_len : Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

static esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls httpd_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
• [in] r : The request being responded to
• [in] str : String to be sent as response body
Chapter 2. API

**static esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)**

API to send a string as an HTTP response chunk.

This API simply calls httpd_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)

**esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)**

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] status: The HTTP status code of this response

**esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)**

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] type: The Content Type of the response

**esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)**

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
Chapter 2. API

The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
Make sure that the lifetime of the field value strings are valid till send function is called.

Return
- ESP_OK: On successfully appending new header
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_HDR: Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to
- [in] field: The field name of the HTTP header
- [in] value: The value of this HTTP header

```c
esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)
```
For sending out error code in response to HTTP request.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

```c
static esp_err_t httpd_resp_send_404(httpd_req_t *r)
```
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to

```c
static esp_err_t httpd_resp_send_408(httpd_req_t *r)
```
Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
• [in] r: The request being responded to

static esp_err_t httpd_resp_send_500(httpd_req_t *r)
Helper function for HTTP 500.
Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK: On successfully sending the response packet
• ESP_ERR_INVALID_ARG: Null arguments
• ESP_ERR_HTTPD_RESP_SEND: Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
• [in] r: The request being responded to

int httpd_send(httpd_req_t *r, const char *buf, size_t buf_len)
Raw HTTP send.
Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.
If the send override function is set, this API will end up calling that function eventually to send data out.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of: httpd_resp_send(), httpd_resp_send_chunk()

Return
• Bytes: Number of bytes that were sent successfully
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
• [in] r: The request being responded to
• [in] buf: Buffer from where the fully constructed packet is to be read
• [in] buf_len: Length of the buffer

int httpd_socket_send(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
A low level API to send data on a given socket
This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

Note This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

Return
Chapter 2. API

- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

int httpd_socket_recv(httpd_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)

A low level API to receive data from a given socket

Note This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

Return
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

Parameters
- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
```
httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}

Return
• ESP_OK: Instance created successfully
• ESP_ERR_INVALID_ARG: Null argument(s)
• ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK: Failed to launch server task

Parameters
• [in] config: Configuration for new instance of the server
• [out] handle: Handle to newly created instance of the server. NULL on error

esp_err_t httpd_stop(httpd_handle_t handle)

Stop the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

    // Function for stopping the webserver
    void stop_webserver(httpd_handle_t server) {
        // Ensure handle is non NULL
        if (server != NULL) {
            // Stop the httpd server
            httpd_stop(server);
        }
    }

Return
• ESP_OK: Server stopped successfully
• ESP_ERR_INVALID_ARG: Handle argument is Null

Parameters
• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return
• ESP_OK: On successfully queueing the work
• ESP_FAIL: Failure in ctrl socket
• ESP_ERR_INVALID_ARG: Null arguments

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] work: Pointer to the function to be executed in the HTTPD’s context
• [in] arg: Pointer to the arguments that should be passed to this function
void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure.
But, there are cases where the web server’s send/receive functions may require the context (for example,
for accessing keying information etc). Since the send/receive function only have the socket descriptor at their
disposal, this API provides them with a way to retrieve the session context.

Return
• void*: Pointer to the context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void* ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Context object to assign to the session
• [in] free_fn: Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See httpd_sess_get_ctx()

Return
• void*: Pointer to the transport context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void* ctx, httpd_free_ctx_fn_t free_fn)
Set session ‘transport’ context by socket descriptor.

See httpd_sess_set_ctx()

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Transport context object to assign to the session
• [in] free_fn: Function that should be called to free the transport context

void *httpd_get_global_user_ctx(httpd_handle_t handle)
Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters
• [in] handle: Handle to server returned by httpd_start

void *httpd_get_global_transport_ctx(httpd_handle_t handle)
Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters
• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
Trigger an http session close externally.
**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**
- ESP_OK : On successfully initiating closure
- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **[in]** handle: Handle to server returned by httpd_start
- **[in]** sockfd: The socket descriptor of the session to be closed

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **[in]** handle: Handle to server returned by httpd_start
- **[in]** sockfd: The socket descriptor of the session for which LRU counter is to be updated

```c
esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t* fds, int* client_fds)
```

Returns list of current socket descriptors of active sessions.

**Note** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Return**
- ESP_OK : Successfully retrieved session list
- ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

**Parameters**
- **[in]** handle: Handle to server returned by httpd_start
- **[inout]** fds: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **[out]** client_fds: Array of client fds

**Structures**

**struct httpd_config**

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

**unsigned task_priority**
Priority of FreeRTOS task which runs the server

**size_t stack_size**
The maximum stack size allowed for the server task
The core the HTTP server task will run on

**core_id**

TCP Port number for receiving and transmitting HTTP traffic

**server_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

**ctrl_port**

Max number of sockets/clients connected at any time

**max_open_sockets**

Maximum allowed uri handlers

**max_uri_handlers**

Maximum allowed additional headers in HTTP response

**max_resp_headers**

Number of backlog connections

**backlog_conn**

Purge “Least Recently Used” connection

**lru_purge_enable**

Timeout for recv function (in seconds)

**recv_wait_timeout**

Timeout for send function (in seconds)

**send_wait_timeout**

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

**global_user_ctx**

Free function for global user context

**httpd_free_ctx_fn_t**

Global user context

**global_user_ctx_free_fn**

Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

**httpd_free_ctx_fn_t**

Free function for global transport context

**global_transport_ctx_free_fn**

Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

**httpd_close_func_t**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket.

This is a place for custom de-init code common to all sockets.
Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

### `httpd_uri_match_func_t uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

#### `struct httpd_req`

HTTP Request Data Structure.

**Public Members**

#### `httpd_handle_t handle`
Handle to server instance

#### `int method`
The type of HTTP request, `-1` if unsupported method

#### `const char uri[HTTPD_MAX_URI_LEN + 1]`
The URI of this request (1 byte extra for null termination)

#### `size_t content_len`
Length of the request body

#### `void *aux`
Internally used members

#### `void *user_ctx`
User context pointer passed during URI registration.

#### `void *sess_ctx`
Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

#### `httpd_free_ctx_fn_t free_ctx`
Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

#### `bool ignore_sess_ctx_changes`
Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform
any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the
socket gets closed.

**struct httpd_uri**
Structure for URI handler.

**Public Members**

```
const char *uri
   The URI to handle

httpd_method_t method
   Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
   Handler to call for supported request method. This must return ESP_OK, or else the underlying socket
   will be closed.

void *user_ctx
   Pointer to user context data which will be available to handler
```

**Macros**

```
HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT
HTTPD_200
   HTTP Response 200
HTTPD_204
   HTTP Response 204
HTTPD_207
   HTTP Response 207
HTTPD_400
   HTTP Response 400
HTTPD_404
   HTTP Response 404
HTTPD_408
   HTTP Response 408
HTTPD_500
   HTTP Response 500
HTTPD_TYPE_JSON
   HTTP Content type JSON
HTTPD_TYPE_TEXT
   HTTP Content type text/HTML
HTTPD_TYPE_OCTET
   HTTP Content type octet-stream
HTTPD_DEFAULT_CONFIG
ESP_ERR_HTTPD_BASE
   Starting number of HTTPD error codes
```
Chapter 2. API

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions
typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPD low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of errno,
and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value
of httpd_send() function

Return
• Bytes: The number of bytes sent successfully
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
• [in] hd: server instance
• [in] sockfd: session socket file descriptor
• [in] buf: buffer with bytes to send
• [in] buf_len: data size
• [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPD low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno,
and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value
of httpd_req_recv() function

Return
• Bytes: The number of bytes received successfully
• 0: Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()
Chapter 2. API

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPD's low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Return
- ESP_OK: error handled successful
- ESP_FAIL: failure indicates that the underlying socket needs to be closed

Parameters
- [in] req: HTTP request for which the error needs to be handled
- [in] error: Error type

typedef void *httpd_handle_t
HTTP Server Instance Handle.
Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)

Parameters
- [in] ctx: object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

Return
Chapter 2. API

• ESP_OK : On success
  • Any value other than ESP_OK will signal the server to close the socket immediately

Parameters
  • [in] hd: server instance
  • [in] sockfd: session socket file descriptor

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.

  Note It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated
  sessions. Ensure proper handling of return codes.

Parameters
  • [in] hd: server instance
  • [in] sockfd: session socket file descriptor

typedef bool(*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.

  Return true on match

Parameters
  • [in] reference_uri: URI/template with respect to which the other URI is matched
  • [in] uri_to_match: URI/template being matched to the reference URI/template
  • [in] match_upto: For specifying the actual length of uri_to_match up to which the
    matching algorithm is to be applied (The maximum value is strlen(uri_to_match), inde-
    pendent of the length of reference_uri)

typedef struct httpd_config httpd_config_t
HTTP Server Configuration Structure.

  Note Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify
  only those fields that are specifically determined by the use case.

typedef void(*httpd_work_fn_t)(void *arg)
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

Parameters
  • [in] arg: The arguments for this work function

Enumerations
enum httpd_err_code_t
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

 Values:
HTTPD_500_INTERNAL_SERVER_ERROR = 0
HTTPD_501_METHOD_NOT_IMPLEMENTED
HTTPD_505_VERSION_NOT_SUPPORTED
HTTPD_400_BAD_REQUEST
HTTPD_401_UNAUTHORIZED
HTTPD_403_FORBIDDEN
HTTPD_404_NOT_FOUND
HTTPD_405_METHOD_NOT_ALLOWED
HTTPD_408_REQ_TIMEOUT
HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
2.4.7 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config_t.global_transport_ctx
  - httpd_config_t.global_transport_ctx_free_fn
  - httpd_config_t.open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - httpd_ssl_config.transport_mode. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- components/esp_https_server/include/esp_https_server.h
Chapter 2. API

Functions

esp_err_t httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)

Create a SSL capable HTTP server (secure mode may be disabled in config)

Return success

Parameters

• [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
• [out] handle: - storage for the server handle, must be a valid pointer

void httpd_ssl_stop (httpd_handle_t handle)

Stop the server. Blocks until the server is shut down.

Parameters

• [in] handle:

Structures

struct esp_https_server_user_cb_arg

Callback data struct, contains the ESP-TLS connection handle.

struct httpd_ssl_config

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

httpd_config_t httpd

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

const uint8_t *cacert_pem

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client_verify_cert_pem var) 2)There should be another variable servercert which should hold servers own certificate (should inherit current role of cacert var)

size_t cacert_len

CA certificate byte length

const uint8_t *client_verify_cert_pem

Client verify authority certificate (CA used to sign clients, or client cert itself

size_t client_verify_cert_len

Client verify authority cert len

const uint8_t *prvtkey_pem

Private key

size_t prvtkey_len

Private key byte length

httpd_ssl_transport_mode_t transport_mode

Transport Mode (default secure)

uint16_t port_secure

Port used when transport mode is secure (default 443)

uint16_t port_insecure

Port used when transport mode is insecure (default 80)

bool session_tickets

Enable tls session tickets
Chapter 2. API

```c
esp_https_server_user_cb *user_cb

User callback for esp_https_server
```

**Macros**

`HTTPD_SSL_CONFIG_DEFAULT()`

Default config struct init

(http_server default config had to be copied for customization)

**Notes:**

- port is set when starting the server, according to ‘transport_mode’
- one socket uses ~40k BRAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

**Type Definitions**

```c
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t

Callback data struct, contains the ESP-TLS connection handle.
```

```c
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)

Callback function prototype. Can be used to get connection or client information (SSL context). E.g. Client certificate, Socket FD, Connection state, etc.
```

**Parameters**

- `user_cb`: Callback data struct

```c
typedef struct httpd_ssl_config httpd_ssl_config_t
```

**Enumerations**

```c
enum httpd_ssl_transport_mode_t

Values:

HTTPD_SSL_TRANSPORT_SECURE
HTTPD_SSL_TRANSPORT_INSECURE
```

### 2.4.8 ICMP Echo

**Overview**

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session**

To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}
static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}
static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}
void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);
    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it
}
Start and Stop ping session  You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session  If a ping session won’t be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e. you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics  As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- components/lwip/include/apps/ping/ping_sock.h

Functions

esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)

Create a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP_ERR_NO_MEM: out of memory
- ESP_FAIL: other internal error (e.g. socket error)
- ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

Parameters

- config: ping configuration
- cbs: a bunch of callback functions invoked by internal ping task
- hdl_out: handle of ping session

esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)

Delete a ping session.

Return

- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: delete ping session successfully
Parameters
- hdl: handle of ping session

\texttt{esp_err_t esp\_ping\_start (esp\_ping\_handle\_t hdl)}
Start the ping session.

Return
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

Parameters
- hdl: handle of ping session

\texttt{esp_err_t esp\_ping\_stop (esp\_ping\_handle\_t hdl)}
Stop the ping session.

Return
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

Parameters
- hdl: handle of ping session

\texttt{esp_err_t esp\_ping\_get\_profile (esp\_ping\_handle\_t hdl, esp\_ping\_profile\_t profile, void *data, uint32\_t size)}
Get runtime profile of ping session.

Return
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

Parameters
- hdl: handle of ping session
- profile: type of profile
- data: profile data
- size: profile data size

Structures
\texttt{struct esp\_ping\_callbacks\_t}
Type of “ping” callback functions.

Public Members

void *cb\_args
arguments for callback functions

void (*on\_ping\_success) (esp\_ping\_handle\_t hdl, void *args)
Invoked by internal ping thread when received ICMP echo reply packet.

void (*on\_ping\_timeout) (esp\_ping\_handle\_t hdl, void *args)
Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on\_ping\_end) (esp\_ping\_handle\_t hdl, void *args)
Invoked by internal ping thread when a ping session is finished.

\texttt{struct esp\_ping\_config\_t}
Type of “ping” configuration.

Public Members

uint32\_t count
A “ping” session contains count procedures
uint32_t interval_ms
    Milliseconds between each ping procedure
uint32_t timeout_ms
    Timeout value (in milliseconds) of each ping procedure
uint32_t data_size
    Size of the data next to ICMP packet header
uint8_t tos
    Type of Service, a field specified in the IP header
ip_addr_t target_addr
    Target IP address, either IPv4 or IPv6
uint32_t task_stack_size
    Stack size of internal ping task
uint32_t task_prio
    Priority of internal ping task
uint32_t interface
    Netif index, interface=0 means NETIF_NO_INDEX

Macros
ESP_PING_DEFAULT_CONFIG()
    Default ping configuration.
ESP_PING_COUNT_INFINITE
    Set ping count to zero will ping target infinitely

Type Definitions
typedef void *esp_ping_handle_t
    Type of “ping” session handle.

Enumerations
enum esp_ping_profile_t
    Profile of ping session.
    Values:
    ESP_PING_PROF_SEQNO
        Sequence number of a ping procedure
    ESP_PING_PROF_TTL
        Time to live of a ping procedure
    ESP_PING_PROF_REQUEST
        Number of request packets sent out
    ESP_PING_PROF_REPLY
        Number of reply packets received
    ESP_PING_PROF_IPADDR
        IP address of replied target
    ESP_PING_PROF_SIZE
        Size of received packet
    ESP_PING_PROF_TIMEGAP
        Elapsed time between request and reply packet
    ESP_PING_PROF_DURATION
        Elapsed time of the whole ping session
2.4.9 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.

**Supported features**  ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:

- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include

- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio protocols/asio:

- protocols/asio/udp_echo_server
- protocols/asio/tcp_echo_server
- protocols/asio/asio_chat
- protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

2.4.10 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

**Features**

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).
Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
  - mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883;
  - mqtt://mqtt.eclipseprojects.io:1884: MQTT over TCP, port 1884;
  - mqtt://username:password@mqtt.eclipseprojects.io:1884: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - mqtts://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
  - mqtts://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - ws://mqtt.eclipseprojects.io:80/mqtt
- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipseprojects.io:443/mqtt

  Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .uri = "mqtt://mqtt.eclipseprojects.io",
  // .user_context = (void *)your_context
};
```

```c
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ...
  client);
esp_mqtt_client_start(client);
```

  Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: mqtt.eclipseprojects.io openssl s_client
  -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null
  openssl x509 -outform PEM >mqtt_eclipse_org.pem
- Check the sample application: examples/mqtt_ssl
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .uri = "mqtts://mqtt.eclipseprojects.io:8883",
  .event_handle = mqtt_event_handler,
  .cert_pem = (const char *)mqtt_eclipse_org.pem_start,
};
```

If the certificate is not null-terminated then cert_len should also be set. Other SSL related configuration parameters are:

- use_global_ca_store: use the global certificate store to verify server certificate, see esp-tls.h for more information
- client_cert_pem: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
Chapter 2. API

- **client_cert_len**: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- **client_key_pem**: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- **client_key_len**: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- **psk_hint_key**: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- **alpn_protos**: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament**  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t-struct.

- **lwt_topic**: pointer to the LWT message topic
- **lwt_msg**: pointer to the LWT message
- **lwt_msg_len**: length of the LWT message, required if lwt_msg is not null-terminated
- **lwt_qos**: quality of service for the LWT message
- **lwt_retain**: specifies the retain flag of the LWT message

**Other Configuration Parameters**

- **disable_clean_session**: determines the clean session flag for the connect message, defaults to a clean session
- **keepalive**: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- **disable_auto_reconnect**: enable to stop the client from reconnecting to server after errors or disconnects
- **user_context**: custom context that will be passed to the event handler
- **task_prio**: MQTT task priority, defaults to 5
- **task_stack**: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- **buffer_size**: size of MQTT send/receive buffer, default is 1024 bytes
- **username**: pointer to the username used for connecting to the broker
- **password**: pointer to the password used for connecting to the broker
- **client_id**: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
- **host**: MQTT broker domain (ipv4 as string), setting the uri will override this
- **port**: MQTT broker port, specifying the port in the uri will override this
- **transport**: sets the transport protocol, setting the uri will override this
- **refresh_connection_after_ms**: refresh connection after this value (in milliseconds)
- **event_handle**: handle for MQTT events as a callback in legacy mode
- **event_loop_handle**: handle for MQTT event loop library

For more options on esp_mqtt_client_config, please refer to API reference below

**Change settings in Project Configuration Menu**  The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

- **CONFIG_MQTT_PROTOCOL_311**: Enables 3.1.1 version of MQTT protocol
- **CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET**: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- **CONFIG_MQTT_CUSTOM_OUTBOX**: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:
• **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
• **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
• **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
• **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
• **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
• **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
• **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple **MQTT_EVENT_DATA** will be posted and **current_data_offset** and **total_data_len** from event data updated to keep track of the fragmented message.
• **MQTT_EVENT_ERROR**: The client has encountered an error. **esp_mqtt_error_type_t** from **error_handle** in the event data can be used to further determine the type of the error. The type of error will determine which parts of the **error_handle** struct is filled.

**API Reference**

**Header File**

- components/mqtt/esp-mqtt/include/mqtt_client.h

**Functions**

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates mqtt client handle based on the configuration.

**Return**
.

**Parameters**

- **config**: mqtt configuration structure

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

**Return**

ESP_FAIL if URI parse error, ESP_OK on success

**Parameters**

- **client**: mqtt client handle
- **uri**:

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```

Starts mqtt client with already created client handle.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**Parameters**

- **client**: mqtt client handle

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**Parameters**

- **client**: mqtt client handle

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
• client: mqtt client handle

    `esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)`
    Stops mqtt client tasks.
    * Notes:
      * Cannot be called from the mqtt event handler
    * Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state
    * Parameters
      * client: mqtt client handle

int `esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char* topic, int qos)`
  Subscribe the client to defined topic with defined qos.
  * Notes:
    * Client must be connected to send subscribe message
    * This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
  * Return message_id of the subscribe message on success -1 on failure
  * Parameters
    * client: mqtt client handle
    * topic:
    * qos:

int `esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char* topic)`
  Unsubscribe the client from defined topic.
  * Notes:
    * Client must be connected to send unsubscribe message
    * It is thread safe, please refer to esp_mqtt_client_subscribe for details
  * Return message_id of the subscribe message on success -1 on failure
  * Parameters
    * client: mqtt client handle
    * topic:

int `esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char* topic, const char* data, int len, int qos, int retain)`
  Client to send a publish message to the broker.
  * Notes:
    * This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
    * Client doesn’t have to be connected for this API to work, enqueuing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
    * It is thread safe, please refer to esp_mqtt_client_subscribe for details
  * Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure
  * Parameters
    * client: mqtt client handle
    * topic: topic string
    * data: payload string (set to NULL, sending empty payload message)
    * len: data length, if set to 0, length is calculated from payload string
    * qos: qos of publish message
    * retain: retain flag
int esp_mqtt_client_enqueue(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters
• client: mqtt client handle
• topic: topic string
• data: payload string (set to NULL, sending empty payload message)
• len: data length, if set to 0, length is calculated from payload string
• qos: qos of publish message
• retain: retain flag
• store: if true, all messages are enqueued; otherwise only qos1 and qos2 are enqueued

esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)

Destroys the client handle.

Notes:
• Cannot be called from the mqtt event handler

Return ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

Parameters
• client: mqtt client handle

esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

Parameters
• client: mqtt client handle
• config: mqtt configuration structure

esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client,
                                      esp_mqtt_event_id_t event,
                                      esp_event_handler_t event_handler,
                                      void *event_handler_arg)

 Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization
ESP_OK on success

Parameters
• client: mqtt client handle
• event: event type
• event_handler: handler callback
• event_handler_arg: handlers context

int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)

Get outbox size.

Return outbox size 0 on wrong initialization

Parameters
• client: mqtt client handle

Structures
struct esp_mqtt_error_codes

MQTT error code structure to be passed as a contextual information into ERROR event.
Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

**Public Members**

`esp_err_t esp_tls_last_esp_err`
- last esp_err code reported from esp-tls component

`int esp_tls_stack_err`
- tls specific error code reported from underlying tls stack

`int esp_tls_cert_verify_flags`
- tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t error_type`
- error type referring to the source of the error

`esp_mqtt_connect_return_code_t connect_return_code`
- connection refused error code reported from MQTT broker on connection

`int esp_transport_sock_errno`
- errno from the underlying socket

`struct esp_mqtt_event_t`
- MQTT event configuration structure

**Public Members**

`esp_mqtt_event_id_t event_id`
- MQTT event type

`esp_mqtt_client_handle_t client`
- MQTT client handle for this event

`void *user_context`
- User context passed from MQTT client config

`char *data`
- Data associated with this event

`int data_len`
- Length of the data for this event

`int total_data_len`
- Total length of the data (longer data are supplied with multiple events)

`int current_data_offset`
- Actual offset for the data associated with this event

`char *topic`
- Topic associated with this event

`int topic_len`
- Length of the topic for this event associated with this event

`int msg_id`
- MQTT message id of message
Chapter 2. API

int session_present
MQTT session_present flag for connection event

esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool retain
Retained flag of the message associated with this event

struct esp_mqtt_client_config_t
MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

const char *client_id
default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true

int keepalive
mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context
**Chapter 2. API**

**task_prio**
- MQTT task priority, default is 5, can be changed in `make menuconfig`

**task_stack**
- MQTT task stack size, default is 6144 bytes, can be changed in `make menuconfig`

**buffer_size**
- size of MQTT send/receive buffer, default is 1024 (only receive buffer size if `out_buffer_size` defined)

**cert_pem**
- Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

**client_cert_len**
- Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

**client_key_pem**
- Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert_pem` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`.

**client_key_len**
- Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

**transport**
- Overrides URI transport

**refresh_connection_after_ms**
- Refresh connection after this value (in milliseconds)

**psk_hint_key**
- Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

**use_global_ca_store**
- Use a global ca store for all the connections in which this bool is set.

**crt_bundle_attach**
- Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

**reconnect_timeout_ms**
- Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

**alpn_protos**
- NULL-terminated list of supported application protocols to be used for ALPN

**clientkey_password**
- Client key decryption password string

**clientkey_password_len**
- String length of the password pointed to by `clientkey_password`

**protocol_ver**
- MQTT protocol version used for connection, defaults to value from menuconfig
Chapter 2. API

```c
int out_buffer_size
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
enable secure element for enabling SSL connection

void *ds_data
carrier of handle for digital signature parameters

int network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
Path in the URI

int message_retransmit_timeout
timeout for retransmit of failed packet
```

**Macros**

MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility.

**Type Definitions**

typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

**Enumerations**

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- user_context - user data from esp_mqtt_client_config_t
- client - mqtt client handle
• various other data depending on event type

Values:

MQTT_EVENT_ANY = -1

MQTT_EVENT_ERROR = 0
  on error event, additional context: connection return code, error handle from esp_tls (if supported)

MQTT_EVENT_CONNECTED
  connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
  disconnected event

MQTT_EVENT_SUBSCRIBED
  subscribed event, additional context: msg_id

MQTT_EVENT_UNSUBSCRIBED
  unsubscribed event

MQTT_EVENT_PUBLISHED
  published event, additional context: msg_id

MQTT_EVENT_DATA
  data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received
  • retain retain flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
  The event occurs before connecting

MQTT_EVENT_DELETED
  Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  • Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_CONNECTION_ACCEPTED = 0
  Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
  MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
  MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
  MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME
  MQTT connection refused reason: Wrong user
MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event
Values:
MQTT_ERROR_TYPE_NONE = 0
MQTT_ERROR_TYPE_TCP_TRANSPORT
MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
Values:
MQTT_TRANSPORT_UNKNOWN = 0x0
MQTT_TRANSPORT_OVER_TCP
MQTT over TCP, using scheme: mqtt
MQTT_TRANSPORT_OVER_SSL
MQTT over SSL, using scheme: mqtts
MQTT_TRANSPORT_OVER_WS
MQTT over Websocket, using scheme:: ws
MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection
Values:
MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1

2.4.11 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- Modbus RTU — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
- Modbus ASCII — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":" ) and trailing newline (CR/LF).
- Modbus TCP/IP or Modbus TCP — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.
The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’s with protocol specifications for specifics.

**Messaging Model And Data Mapping**

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

![Modbus segment diagram](image)

**图 24: Modbus segment diagram**

**Note:** It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’s data to the four types of registers.
Modbus Port Initialization

The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER, MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER, MB_PORT_TCP_SLAVE` are reserved for internal usage.

```c
void* master_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

This example code to initialize slave port:

```c
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
}
```
Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Master Data Access** - Configure data descriptors to access slave parameters.
3. **Master Communication Options** - Allows to setup communication options for selected port.
4. **Master Communication** - Start stack and sending / receiving data.
5. **Modbus Master Teardown** - Destroy Modbus controller and its resources.

**Configuring Master Data Access** The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:
### Table 1: Modbus master Data Dictionary description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cid</td>
<td>Characteristic ID (must be unique).</td>
</tr>
<tr>
<td>param_key</td>
<td>String description of the characteristic.</td>
</tr>
<tr>
<td>param_units</td>
<td>Physical Units of the characteristic.</td>
</tr>
<tr>
<td>mb_slave_addr</td>
<td>The short address of the device with correspond parameter UID.</td>
</tr>
<tr>
<td>mb_param_type</td>
<td>Type of Modbus register area. MB_PARAM_INPUT, MB_PARAM_HOLDING, MB_PARAM_COIL, MB_PARAM_DISCRETE - represents Input, Holding, Coil and Discrete input register area accordingly;</td>
</tr>
<tr>
<td>mb_reg_start</td>
<td>Relative register address of the characteristic in the register area.</td>
</tr>
<tr>
<td>mb_size</td>
<td>Length of characteristic in registers.</td>
</tr>
<tr>
<td>param_offset</td>
<td>Offset to instance of the characteristic in bytes. It is used to calculate the absolute address to the characteristic in the storage structure. It is optional field and can be set to zero if the parameter is not used in the application.</td>
</tr>
<tr>
<td>param_type</td>
<td>Specifies type of the characteristic. PARAM_TYPE_U8, PARAM_TYPE_U16, PARAM_TYPE_U32 - Unsigned integer 8/16/32 bit type; PARAM_TYPE_FLOAT - IEEE754 floating point format; PARAM_TYPE_ASCII - ASCII string or binary data;</td>
</tr>
<tr>
<td>param_size</td>
<td>The storage size of the characteristic (bytes).</td>
</tr>
<tr>
<td>param_opts</td>
<td>Limits, options of characteristic used during processing of alarm in user application (optional)</td>
</tr>
<tr>
<td>access</td>
<td>Can be used in user application to define the behavior of the characteristic during processing of data in user application; PAR_PERMS_READ_WRITE_TRIGGER, PAR_PERMS_READ, PAR_PERMS_READ_WRITE_TRIGGER;</td>
</tr>
</tbody>
</table>

**Note:** The cid and param_key have to be unique. Please use the prefix to the parameter key if you have several similar parameters in your register map table.

### Table 2: Example Register mapping table of Modbus slave

<table>
<thead>
<tr>
<th>CID</th>
<th>Register Range</th>
<th>Type</th>
<th>Units</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>30000-30003</td>
<td>MAX_UINT32</td>
<td>Not defined</td>
<td>Serial number of device (4 bytes) read-only</td>
</tr>
<tr>
<td>1</td>
<td>30002-30003</td>
<td>MAX_UINT16</td>
<td>Not defined</td>
<td>Software version (4 bytes) read-only</td>
</tr>
<tr>
<td>2</td>
<td>40000-40003</td>
<td>FLOAT</td>
<td>DegC</td>
<td>Room temperature in DegC. Writing a temperature value to this register for single point calibration.</td>
</tr>
</tbody>
</table>

```c
// Enumeration of modbus slave addresses accessed by master device
typedef enum {
    MB_DEVICE_ADDR1 = 1,
    MB_DEVICE_ADDR2,
    MB_SLAVE_COUNT
};
```

(下頁繼續)
Chapter 2. API

Enumeration of all supported CIDs for device

```c
enum {
    CID_SER_NUM1 = 0,
    CID_SW_VER1,
    CID_TEMP_DATA_1,
    CID_SER_NUM2,
    CID_SW_VER2,
    CID_TEMP_DATA_2
};
```

Example Data Dictionary for Modbus parameters in 2 slaves in the segment

```c
mb_parameter_descriptor_t device_parameters[] = {
    // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus Reg read length,
    // Instance offset (NA), Instance type, Instance length (bytes), Options (NA), Permissions
    { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS(0,0,0), PAR_PERMS_READ_WRITE_TRIGGER },
    { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS(0,0,0), PAR_PERMS_READ_WRITE_TRIGGER },
    { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MB_DEVICE_ADDR1, MB_PARAM_HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS(16,30,1), PAR_PERMS_READ_WRITE_TRIGGER },
    { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS(0,0,0), PAR_PERMS_READ_WRITE_TRIGGER },
    { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS(0,0,0), PAR_PERMS_READ_WRITE_TRIGGER },
    { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS(20,30,1), PAR_PERMS_READ_WRITE_TRIGGER },
};
```

```
// Calculate number of parameters in the table
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_parameters[0]));
```

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as the parameter of the function below.

`mbc_master_set_descriptor()`: Initialization of master descriptor.

```c
ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_parameters));
```

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initialization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included in descriptor table using its CID.

**Master Communication Options** Calling the setup function allows for specific communication options to be defined for port.
mbc_master_setup()

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```c
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM,  // Serial port number
    .mode = MB_MODE_RTU,   // Modbus mode of communication (MB_MODE_RTU or MB_MODE_ASCII)
    .baudrate = 9600,      // Modbus communication baud rate
    .parity = MB_PARITY_NONE // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

```c
#define MB_SLAVE_COUNT 2 // Number of slaves in the segment being accessed (as defined in Data Dictionary)
char* slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2",  // Address corresponds to UID1 and set to predefined value by user
    "192.168.1.3",  // corresponds to UID2 in the segment
    NULL // end of table
};
mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,  // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4,  // version of IP protocol
    .ip_mode = MB_MODE_TCP,  // Port communication mode
    .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

注解：Refer to esp_netif component for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to protocols/modbus/tcp/mb_tcp_master for more information.

注解：RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to Running UART Communication section of UART documentation.

Master Communication The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```c
mbc_master_start()
```

```c
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
```
The list of functions below are used by the Modbus master stack from a user’s application:

`mbc_master_send_request()`: This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure `mb_param_request_t`) and then blocks until a response from corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

`mbc_master_get_cid_info()`: The function gets information about each characteristic supported in the data dictionary and returns the characteristic’s description in the form of the `mb_parameter_descriptor_t` structure. Each characteristic is accessed using its CID.

`mbc_master_get_parameter()`: The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```c
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #\%d %s (%s) value = (0x%08x) read successful.
        ",
                   param_descriptor->cid,
                   (char*)param_descriptor->param_key,
                   (char*)param_descriptor->param_units,
                   "(uint32_t)" temp_data);
    } else {  
        ESP_LOGE(TAG, "Characteristic #\%d %s (%s) read fail, err = 0x%x (%s).", 
                   param_descriptor->cid,
                   (char*)param_descriptor->param_key,
                   (int)err,
                   (char*)esp_err_to_name(err));
    }
} else {  
    ESP_LOGE(TAG, "Could not get information for characteristic #\%d.", cid);
}
```

`mbc_master_set_parameter()`

The function writes characteristic’s value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

```c
uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {  
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s) ", (int)err, (char*)esp_err_to_name(err));
}
```
Modbus Master Teardown This function stops Modbus communication stack and destroys controller interface and free all used active objects.

```c
mbc_master_destroy()
ESP_ERROR_CHECK(mbc_master_destroy());
```

Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Slave Data Access** - Configure data descriptors to access slave parameters.
3. **Slave Communication Options** - Allows to setup communication options for selected port.
4. **Slave Communication** - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. **Modbus Slave Teardown** - Destroy Modbus controller and its resources.

**Configuring Slave Data Access** The following functions must be called when the Modbus controller slave port is already initialized. Refer to **Modbus Port Initialization**.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

**Register area** is defined by using the `mb_register_area_descriptor_t` structure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_offset</td>
<td>Zero based register relative offset for defined register area. Example: register address = 40001 (4x register area - Function 3 - holding register), start_offset = 2</td>
</tr>
<tr>
<td>type</td>
<td>Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.</td>
</tr>
<tr>
<td>address</td>
<td>A pointer to the memory area which is used to store the register data for this area descriptor.</td>
</tr>
<tr>
<td>size</td>
<td>The size of the memory area in bytes which is used to store register data.</td>
</tr>
</tbody>
</table>

```c
mbc_slave_set_descriptor()
```

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```c
#define MB_REG_INPUT_START_AREA0 (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT (100)
#define MB_REG_INPUT_CNT (100)
mb_register_area_descriptor_t reg_area; // Modbus register area descriptor_
  ->structure
unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding_
  ->registers
unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input_
  ->registers
```

(下页继续)
At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

```c
portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);
```

Slave Communication Options  The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

`mbc_slave_setup()`

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```c
esp_netif_init();
...
mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,  // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4,  // version of IP protocol
    .ip_mode = MB_MODE_TCP,  // Port communication mode
    .ip_addr = NULL,  // This field keeps the client IP
    .address_to_bind, NULL - bind to any client
    .ip_netif_ptr = esp_netif_ptr  // esp_netif_ptr = pointer to the
    .corresponding network interface
};
// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_set_descriptor((void*)&comm_info));
```

Example initialization of Modbus serial communication:

```c
#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...
// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
```
Slave Communication

The function below is used to start Modbus controller interface and allows communication.

```c
mbc_slave_start();
```

```c
mbc_slave_check_event();
```

The blocking call to function waits for an event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event `mb_event_group_t` which describes the type of register access being done.

```c
mbc_slave_get_param_info();
```

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE` key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The `mb_param_info_t` structure contains information about accessed parameter.

### Table 4 Description of the register info structure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_stamp</td>
<td>the time stamp of the event when defined parameter is accessed</td>
</tr>
<tr>
<td>mb_offset</td>
<td>start Modbus register accessed by master</td>
</tr>
<tr>
<td>type</td>
<td>type of the Modbus register area being accessed (See the <code>mb_event_group_t</code> for more information)</td>
</tr>
<tr>
<td>address</td>
<td>memory address that corresponds to accessed register in defined area descriptor</td>
</tr>
<tr>
<td>size</td>
<td>number of registers being accessed by master</td>
</tr>
</tbody>
</table>

Example to get event when holding or input registers accessed in the slave:

```c
#define MB_READ_MASK ((MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD))
#define MB_WRITE_MASK (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_RATE_MS)
....

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG REGARD | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
            rw_str,
            // (下页继续)
```
Modbus Slave Teardown  This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

```c
mbc_slave_destroy()
```

ESP_ERROR_CHECK(mbc_slave_destroy());

Possible Communication Issues And Solutions

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master_get_<parameter> failure error=(0x107) (ESP_ERR_TIMEOUT).
```
### Table 5: Modbus error codes and troubleshooting

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>Possible Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x106</td>
<td>ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.</td>
<td>Refer to slave register map. Check the master data dictionary for correctness.</td>
</tr>
<tr>
<td>0x107</td>
<td>ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.</td>
<td>Measure and increase the maximum slave response timeout idf.py menu-config, option CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND. Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than CONFIG_FMB_PORT_TASK_PRIO it is recommended to place Modbus tasks on the other core using an option CONFIG_FMB_PORT_TASK_AFFINITY. Configure the Modbus task’s priority CONFIG_FMB_PORT_TASK_PRIO to ensure that the task gets sufficient processing time to handle Modbus stack events.</td>
</tr>
<tr>
<td>0x108</td>
<td>ESP_ERRINVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.</td>
<td>Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.</td>
</tr>
<tr>
<td>0x103</td>
<td>ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.</td>
<td>Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.</td>
</tr>
</tbody>
</table>

### Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support …” for appropriate communication mode and related configuration keys.

- `protocols/modbus/serial/mb_slave`
- `protocols/modbus/serial/mb_master`
- `protocols/modbus/tcp/mb_tcp_slave`
- `protocols/modbus/tcp/mb_tcp_master`

Please refer to the specific example README.md for details.

**Unions**
union mb_communication_info_t
#include <esp_modbus_common.h> Device communication structure to setup Modbus controller.

Public Members

mb_mode_type_t mode
Modbus communication mode

uint8_t slave_addr
Modbus slave address field (dummy for master)

uart_port_t port
Modbus communication port (UART) number

uint32_t baudrate
Modbus baudrate

uart_parity_t parity
Modbus UART parity settings

uint16_t dummy_port
Dummy field, unused

struct mb_communication_info_t::[anonymous] [anonymous]

mb_mode_type_t ip_mode
Modbus communication mode

uint16_t ip_port
Modbus port

mb_tcp_addr_type_t ip_addr_type
Modbus address type

void *ip_addr
Modbus address table for connection

void *ip_netif_ptr
Modbus network interface

struct mb_communication_info_t::[anonymous] [anonymous]

Macros

_XFER_2_WR (dst, src)
Type Definitions

```c
typedef esp_err_t (*iface_init)(void **)
common interface method types
```

```c
typedef esp_err_t (*iface_destroy)(void)
Interface method destroy
```

```c
typedef esp_err_t (*iface_setup)(void *)
Interface method setup
```

```c
typedef esp_err_t (*iface_start)(void)
Interface method start
```

Enumerations

```c
enum mb_port_type_t
Types of actual Modbus implementation.

Values:

MB_PORT_SERIAL_MASTER = 0x00
Modbus port type serial master.

MB_PORT_SERIAL_SLAVE
Modbus port type serial slave.

MB_PORT_TCP_MASTER
Modbus port type TCP master.

MB_PORT_TCP_SLAVE
Modbus port type TCP slave.

MB_PORT_COUNT
Modbus port count.

MB_PORT_INACTIVE = 0xFF
```

```c
enum mb_event_group_t
Event group for parameters notification.

Values:

MB_EVENT_NO_EVENTS = 0x00

MB_EVENT_HOLDING_REG_WR = BIT0
Modbus Event Write Holding registers.

MB_EVENT_HOLDING_REG_RD = BIT1
Modbus Event Read Holding registers.

MB_EVENT_INPUT_REG_RD = BIT3
Modbus Event Read Input registers.

MB_EVENT_COILS_WR = BIT4
Modbus Event Write Coils.

MB_EVENT_COILS_RD = BIT5
Modbus Event Read Coils.

MB_EVENT_DISCRETE_RD = BIT6
Modbus Event Read Discrete bits.

MB_EVENT_STACK_STARTED = BIT7
Modbus Event Stack started
```

```c
enum mb_param_type_t
Type of Modbus parameter.

Values:
```
**MB_PARAM_HOLDING** = 0x00
Modbus Holding register.

**MB_PARAM_INPUT**
Modbus Input register.

**MB_PARAM_COIL**
Modbus Coils.

**MB_PARAM_DISCRETE**
Modbus Discrete bits.

**MB_PARAM_COUNT**

**MB_PARAM_UNKNOWN** = 0xFF

```c
enum mb_mode_type_t
    Modbus serial transmission modes (RTU/ASCII).

Values:

**MB_MODE_RTU**
    RTU transmission mode.

**MB_MODE_ASCII**
    ASCII transmission mode.

**MB_MODE_TCP**
    TCP communication mode.

**MB_MODE_UDP**
    UDP communication mode.
```

```c
enum mb_tcp_addr_type_t
    Modbus TCP type of address.

Values:

**MB_IPV4** = 0
    TCP IPV4 addressing

**MB_IPV6** = 1
    TCP IPV6 addressing
```

---

**Functions**

`esp_err mbc_master_init_tcp(void **handler)`

Initialize Modbus controller and stack for TCP port.

**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

**Parameters**

- [out] handler: handler(pointer) to master data structure

`esp_err mbc_master_init(mb_port_type_t port_type, void **handler)`

Initialize Modbus Master controller and stack for Serial port.

**Return**

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
Chapter 2. API

• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: type of stack

void mbc_master_init_iface (void *handler)
Initialize Modbus Master controller interface handle.

Parameters
• [in] handler: pointer to master data structure

esp_err_t mbc_master_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_master_start (void)
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t mbc_master_setup (void *comm_info)
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

esp_err_t mbc_master_set_descriptor (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
Assign parameter description table for Modbus controller interface.

Return
• esp_err_t ESP_OK - set descriptor successfully
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

Parameters
• [in] descriptor: pointer to parameter description table
• num_elements: number of elements in the table

esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

Return
• esp_err_t ESP_OK - request was successful
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] request: pointer to request structure of type mb_param_request_t
• [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

esp_err_t mbc_master_get_cid_info (uint16_t cid, const mb_parameter_descriptor_t **param_info)
Get information about supported characteristic defined as cid. Uses parameter description table to get this
information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return
- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters
- [in] cid: characteristic id
- param_info: pointer to pointer of characteristic data.

\texttt{esp_err_t \textit{mbc_master_get_parameter} (uint16_t \textit{cid}, char *\textit{name}, uint8_t *\textit{value}, uint8_t *\textit{type})}

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

Return
- esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

\texttt{esp_err_t \textit{mbc_master_set_parameter} (uint16_t \textit{cid}, char *\textit{name}, uint8_t *\textit{value}, uint8_t *\textit{type})}

Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return
- esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of parameter
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

Unions

\texttt{union \textit{mb_parameter_opt_t}}

\texttt{\#include <esp_modbus_master.h> Modbus parameter options for description table.}
Public Members

int opt1
  Parameter option1
int opt2
  Parameter option2
int opt3
  Parameter option3

struct mb_parameter_opt_t::[anonymous] [anonymous]
int min
  Parameter minimum value
int max
  Parameter maximum value
int step
  Step of parameter change tracking

struct mb_parameter_opt_t::[anonymous] [anonymous]

Structures

struct mb_parameter_descriptor_t
  Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

Public Members

uint16_t cid
  Characteristic cid
const char *param_key
  The key (name) of the parameter
const char *param_units
  The physical units of the parameter
uint8_t mb_slave_addr
  Slave address of device in the Modbus segment
mb_param_type_t mb_param_type
  Type of modbus parameter
uint16_t mb_reg_start
  This is the Modbus register address. This is the 0 based value.
uint16_t mb_size
  Size of mb parameter in registers
uint16_t param_offset
  Parameter name (OFFSET in the parameter structure)
mb_descr_type_t param_type
  Float, U8, U16, U32, ASCII, etc.
mb_descr_size_t param_size
  Number of bytes in the parameter.
mb_parameter_opt_t param_opts
  Parameter options used to check limits and etc.
mb_param_perms_t access
  Access permissions based on mode
**struct mb_param_request_t**

Modbus register request type structure.

**Public Members**

- `uint8_t slave_addr`
  Modbus slave address
- `uint8_t command`
  Modbus command to send
- `uint16_t reg_start`
  Modbus start register
- `uint16_t reg_size`
  Modbus number of registers

**Enumerations**

**enum mb_descr_type_t**

Modbus descriptor table parameter type defines.

*Values:*

- `PARAM_TYPE_U8 = 0x00`
  Unsigned 8
- `PARAM_TYPE_U16 = 0x01`
  Unsigned 16
- `PARAM_TYPE_U32 = 0x02`
  Unsigned 32
- `PARAM_TYPE_FLOAT = 0x03`
  Float type
- `PARAM_TYPE_ASCII = 0x04`
  ASCII type

**enum mb_descr_size_t**

Modbus descriptor table parameter size in bytes.

*Values:*

- `PARAM_SIZE_U8 = 0x01`
  Unsigned 8
- `PARAM_SIZE_U16 = 0x02`
  Unsigned 16
- `PARAM_SIZE_U32 = 0x04`
  Unsigned 32
- `PARAM_SIZE_FLOAT = 0x04`
  Float size
- `PARAM_SIZE_ASCII = 0x08`
  ASCII size
- `PARAM_SIZE_ASCII24 = 0x18`
  ASCII24 size
- `PARAM_MAX_SIZE`

**enum mb_param_perms_t**

Permissions for the characteristics.

*Values:*

PAR_PERMS_READ = 1 « BIT0
the characteristic of the device are readable

PAR_PERMS_WRITE = 1 « BIT1
the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 « BIT2
the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = PAR_PERMS_READ | PAR_PERMS_WRITE
the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = PAR_PERMS_READ | PAR_PERMS_TRIGGER
the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = PAR_PERMS_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = PAR_PERMS_READ_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are readable & writable & triggerable

Header File

- components/freemodbus/common/include/esp_modbus_slave.h

Functions

esp_err_t mbc_slave_init_tcp(void **handler)
Initialize Modbus Slave controller and stack for TCP port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure

esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
Initialize Modbus Slave controller and stack for Serial port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure
- [in] port_type: the type of port

void mbc_slave_init_iface (void *handler)
Initialize Modbus Slave controller interface handle.

Parameters
- [in] handler: - pointer to slave interface data structure

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_slave_start (void)
Start Modbus communication stack.
Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

`esp_err_t mbc_slave_setup(void *comm_info)`
Set Modbus communication parameters for the controller.

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters

• comm_info: Communication parameters structure.

`mb_event_group_t mbc_slave_check_event(mb_event_group_t group)`
Wait for specific event on parameter change.

Return

• mb_event_group_t event bit triggered

Parameters

• group: Group event bit mask to wait for change

`esp_err_t mbc_slave_get_param_info(mb_param_info_t *reg_info, uint32_t timeout)`
Get parameter information.

Return

• ESP_OK Success
• ESP_ERR_TIMEOUT Can not get data from parameter queue or queue overflow

Parameters

• [out] reg_info: parameter info structure
• timeout: Timeout in milliseconds to read information from parameter queue

`esp_err_t mbc_slave_set_descriptor(mb_register_area_descriptor_t descr_data)`
Set Modbus area descriptor.

Return

• ESP_OK: The appropriate descriptor is set
• ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters

• descr_data: Modbus registers area descriptor structure

Structures

`struct mb_param_info_t`
Parameter access event information type.

Public Members

`uint32_t time_stamp`
Timestamp of Modbus Event (uS)

`uint16_t mb_offset`
Modbus register offset

`mb_event_group_t type`
Modbus event type

`uint8_t *address`
Modbus data storage address

`size_t size`
Modbus event register size (number of registers)

`struct mb_register_area_descriptor_t`
Parameter storage area descriptor.
Public Members

- **uint16_t** `start_offset`  
  Modbus start address for area descriptor

- **mb_param_type_t** `type`  
  Type of storage area descriptor

- **void**`*address`  
  Instance address for storage area descriptor

- **size_t** `size`  
  Instance size for area descriptor (bytes)

### 2.4.12 ESP Local Control

**Overview**

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------*/
                /* ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            },
            ...
        },
        .proto_sec = {
            .version = PROTOCOL_SEC0,
            .custom_handle = NULL,
            .pop = NULL,
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
}
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();
```
You may set security for transport in ESP local control using following options:

1. `PROTOCOM_SEC1`: specifies that end to end encryption is used.
2. `PROTOCOM_SEC0`: specifies that data will be exchanged as a plain text.
3. `PROTOCOM_SEC_CUSTOM`: you can define your own security requirement. Please note that you will also have to provide `custom_handle` of type `protocomm_security_t *` in this context.

**Creating a property**

Now that we know how to start the `esp_local_ctrl` service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g. enum), `flags` (bit fields) and `size.`

The `size` is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the `size` field to the right value, helps `esp_local_ctrl` to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines
Chapter 2. API

`TYPE_TIMESTAMP` and `READONLY`, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};
/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a `ctx` field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx) {
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_values, void *usr_ctx) {
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```
For complete example see protocols/esp_local_ctrl

**Client Side Implementation**

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. `get_prop_count`: This should simply return the total number of properties supported by the service
2. `get_prop_values`: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. `set_prop_values`: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

**API Reference**

**Header File**

- components/esp_local_ctrl/include/esp_local_ctrl.h

**Functions**

`const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)`  
Function for obtaining BLE transport mode.

`const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)`  
Function for obtaining HTTPD transport mode.

`esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)`  
Start local control service.
Chapter 2. API

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**
- [in] config: Pointer to configuration structure

```c
esp_err_t esp_local_ctrl_stop(void)
```
Stop local control service.

```c
esp_err_t esp_local_ctrl_add_property(const esp_local_ctrl_prop_t *prop)
```
Add a new property.

- This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties

**Return**
- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**
- [in] prop: Property description structure

```c
esp_err_t esp_local_ctrl_remove_property(const char *name)
```
Remove a property.

- This finds a property by name, and releases the internal resources which are associated with it.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Failure

**Parameters**
- [in] name: Name of the property to remove

```c
const esp_local_ctrl_prop_t *esp_local_ctrl_get_property(const char *name)
```
Get property description structure by name.

- This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known

**Return**
- Pointer to property
- NULL if not found

**Parameters**
- [in] name: Name of the property to find

```c
esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_reg_handler_t handler, void *user_ctx)
```
Register protocomm handler for a custom endpoint.

- This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().

**Return**
- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

**Unions**

```c
union esp_local_ctrl_transport_config_t
```

- #include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.
Chapter 2. API

Public Members

`esp_local_ctrl_transport_config_ble_t *ble`
This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

`esp_local_ctrl_transport_config_httpd_t *httpd`
This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

Structures

`struct esp_local_ctrl_prop`
Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

Public Members

`char *name`
Unique name of property

`uint32_t type`
Type of property. This may be set to application defined enums

`size_t size`
Size of the property value, which:

• if zero, the property can have values of variable size
• if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

`uint32_t flags`
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

`void *ctx`
Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

`void (*ctx_free_fn)(void *ctx)`
Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

`struct esp_local_ctrl_prop_val`
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

Public Members

`void *data`
Pointer to memory holding property value

`size_t size`
Size of property value

`void (*free_fn)(void *data)`
This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl`
struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

desp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for retrieving current values of properties.

Note If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set.

Return Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

Parameters
- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the current values for which have been requested by the client
- [out] prop_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

desp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for changing values of properties.

Note If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

Return Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

Parameters
- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the values for which the client requests to change
- [in] prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- [in] usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

void *usr_ctx
Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

void (*usr_ctx_free_fn)(void *usr_ctx)
 Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

struct esp_local_ctrl_proto_sec_cfg
Protocol security configs
Chapter 2. API

**Public Members**

```c
const esp_local_ctrl_transport_t *transport
```
Transport layer over which service will be provided

```c
esp_local_ctrl_transport_config_t transport_config
```
Transport layer over which service will be provided

```c
esp_local_ctrl_proto_sec_cfg_t proto_sec
```
Security version and POP

```c
esp_local_ctrl_handlers_t handlers
```
Register handlers for responding to get/set requests on properties

```c
size_t max_properties
```
This limits the number of properties that are available at a time

**Macros**

<table>
<thead>
<tr>
<th>ESP_LOCAL_CTRL_TRANSPORT_BLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_LOCAL_CTRL_TRANSPORT_HTTPD</td>
</tr>
</tbody>
</table>

**Type Definitions**

```c
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
```
Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```c
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
```
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

```c
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
```
Handlers for receiving and responding to local control commands for getting and setting properties.

```c
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
```
Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`

```c
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
```
Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include `protocomm_ble.h`.
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
Configuration for transport mode HTTPD.

This is a forward declaration for httpd_ssl_config_t. To use this, application must set CON-
FIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
Security types for esp_local_control.

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
Configuration structure to pass to esp_local_ctrl_start()

Enumerations
enum esp_local_ctrl_proto_sec
Security types for esp_local_control.

Values:

PROTOCOM_SEC0 = 0
PROTOCOM_SEC1
PROTOCOM_SEC_CUSTOM

2.4.13 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have
their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master
to communicate with ESP slave devices through those protocols over the bus drivers.

After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP
slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

Communication with ESP SDIO Slave This document describes the process of initialization of an ESP SDIO
Slave device and then provides details on the ESP SDIO Slave protocol - a non-standard protocol that allows an SDIO
Host to communicate with an ESP SDIO slave.

The ESP SDIO Slave protocol was created to implement the communication between SDIO host and slave, because
the SDIO specification only shows how to access the custom region of a card (by sending CMD52 and CMD53 to
Functions 1-7) without any details regarding the underlying hardware implementation.

SDIO Slave Capabilities of Espressif chips The services provided by the SDIO Slave peripheral of the ESP32
chip are listed in the table below:
## ESP SDIO Slave Initialization

The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Section 3.1.2 of *SDIO Simplified Specification*). In this specification as well as below, the SDIO slave is called an (SD)IO card. Here is a brief example of an ESP SDIO Slave initialization process:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000
   - **Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0XXFFFFF00. Keep sending CMD5 with arg=0x00FF0000 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)
   - **Example:** Arg of R6 after CMD3 is 0x0001xxxx.
    - Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x010~0x011)
    - CMD52/53 (Write 0x10=0x00)
    - CMD52/53 (Write 0x11=0x02)
    - CMD52/53 (Read 0x10~0x11, read to check the final value)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)
    - CMD52/53 (Write 0x110=0x00)
    - CMD52/53 (Write 0x111=0x02)
    - CMD52/53 (Read 0x110~0x111, read to check the final value)

## ESP SDIO Slave Protocol

The ESP SDIO Slave protocol is based on the SDIO Specification’s I/O Read/Write commands, i.e., CMD52 and CMD53. The protocol offers the following services:

- Sending FIFO and receiving FIFO
- 52 8-bit R/W registers shared by host and slave (For details, see *ESP32 Technical Reference Manual > SDIO Slave Controller > Register Summary > SDIO SLC Host registers* [PDF])
- 16 general purpose interrupt sources, 8 from host to slave and 8 from slave to host

To begin communication, the host needs to enable the I/O Function 1 in the slave and access its registers as described below.

Check the code example peripherals/sdio.

The *ESP Serial Slave Link* component implements the logic of this protocol for ESP32 SDIO Host when communicating with an ESP32 SDIO slave.

### Slave register table

#### 32-bit

- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the number of the receiving buffer.
Chapter 2. API

- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated data length (in bytes) already read by host plus the data copied to the buffer but yet to be read.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

8-bit Shared general purpose registers:
- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

FIFO (sending and receiving)  0x090 - 0x1F7FF are reserved for FIFOs.
The address of CMD53 is related to the length requested to read from or write to the slave in a single transfer, as demonstrated by the equation below:

\[ \text{requested length} = 0x1F800 - \text{address} \]

The slave will respond with data that has a length equal to the length field of CMD53. In cases where the data is longer than the requested length, the data will be zero filled (when sending) or discarded (when receiving). This includes both the block and the byte mode of CMD53.

Interrupts  SDIO interrupts are "level sensitive". For host interrupts, the slave sends an interrupt by pulling the DAT1 line down at a proper time. The host detects when the interrupt line is pulled down and reads the INT_ST register to determine the source of the interrupt. After that, the host can clear the interrupt bits by writing the INT_CLR register and process the interrupt. The host can also mask unneeded sources by clearing the bits in the INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

On ESP32, the corresponding host_int bits are: bit 0 to bit 7.

For slave interrupts, the host sends a transfer to write the SLAVE_INT register. Once a bit is set to 1, the slave hardware and the driver will detect it and inform the application.

Receiving FIFO  To write to the slave’s receiving FIFO, the host should complete the following steps:

1. Read the TOKEN1 field (bits 27-16) of the register TOKEN_RDATA (0x044). The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (buffer_size x buffer_num is greater than the data to write, buffer_size is pre-defined between the host and the slave before the communication starts). Otherwise, keep returning to Step 1 until the buffer size is sufficient.
3. Write to the FIFO address with CMD53. Note that the requested length should not exceed the length calculated at Step 2, and the FIFO address is related to requested length.
4. Calculate used buffers. Note that a partially used buffer at the tail is counted as used.
Sending FIFO  To read the slave’s sending FIFO, the host should complete the following steps:

1. **Wait for the interrupt line to become active** (optional, low by default).
2. **Read (poll) the interrupt bits in the INT_ST register** to monitor if new packets exist.
3. **If new packets are ready, read the PKT_LEN register.** Before reading the packets, determine the length of data to be read. As the host keeps the length of data already read from the slave, subtract this value from PKT_LEN, the result will be the maximum length of data available for reading. If no data has been added to the sending FIFO yet, wait and poll until the slave is ready and update PKT_LEN.
4. **Read from the FIFO using CMD53.** Note that the requested length should not be greater than calculated at Step 3, and the FIFO address is related to requested length.
5. **Update the read length.**

Esp: The driver for ESP32 hasn’t been developed yet.

ESP SPI Slave HD (Half Duplex) Mode Protocol

**Introduction**  In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
  
  This phase determines the rest phases of the transactions. See *Supported Commands*.

- **Address:** 8-bit, master to slave, optional
  
  For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.

- **Dummy:** 8-bit, floating, optional
  
  This phase is the turn around time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to master.

- **Data:** variable length, the direction is also determined by the command.
  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The direction means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

**Data IO Modes**  In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here’s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.
Chapter 2. API

<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See **Supported Commands**), except from the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit form the QPI mode, master can send EXQPI command.

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

**Segment Transaction Mode**  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- **ESSL**: Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master**: The device running the esp_serial_slave_link component.
- **ESSL device**: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle**: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc. The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave**: the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus**: The bus over which the master and the slave communicate with each other.
- **Slave protocol**: The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num**: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size**: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.

The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.

5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See SDIO Slave Capabilities of Expressif chips and SPI Slave Capabilities of Expressif chips for more details.

**Initialization of ESP Serial Slave Link**

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see :doc:`Document of SDMMC driver </api-reference/storage/sdmmc>` structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave** 注解: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the SDIO interface instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.
RX FIFO

1. Call `essi_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essi_get_packet()` to receive data from the slave.

Reset counters (Optional)  Call `essi_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

API Reference

Header File

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

`esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)`

Initialize the slave.

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)`

Wait for interrupt of an ESSL slave device.

Return

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

`esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

Return

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of a ESSL device.
- out_tx_num: Output of buffer num that host can send data to ESSL slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.
**esp_err_t** essl_get_rx_data_size (essl_handle_t handle, uint32_t* out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters
- handle: Handle of an ESSL device.
- out_rx_size: Output of data size to read from slave, in bytes
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t** essl_reset_cnt (essl_handle_t handle)

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

Parameters
- handle: Handle of an ESSL device.

**esp_err_t** essl_send_packet (essl_handle_t handle, const void* start, size_t length, uint32_t wait_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

Return
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t** essl_get_packet (essl_handle_t handle, void* out_data, size_t size, size_t* out_length, uint32_t wait_ms)

Get a packet from ESSL slave.

Return
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
- [out] out_data: Data output address
- size: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- [out] out_length: Output of length the data actually received from slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t** essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.
Note: 
sdio 28-31 are reserved, the lower API helps to skip.

Return

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_read_reg (essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)
```

Read general purpose R/W registers (8-bit) of ESSL slave.

Return

- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

Parameters

- handle: Handle of an ESSL device.
- add: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return
  interrupt bits on read). For SPI, see `essl_spi.h`
- value_o: Output value read from the register.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

Return

- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

Parameters

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the
same.

Return

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.

Parameters

- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to clear.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

Return

- ESP_OK: Success
- ESP_INVALID_ARG: If both intr_raw and intr_st are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.

Parameters

- handle: Handle of an ESSL device.
- intr_raw: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- intr_st: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.
Chapter 2. API

**esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)**

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)**

Get interrupt enable bits of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)**

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Type Definitions**

```c
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

**esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)**

Initialize the ESSL SDIO device and get its handle.

**Return**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**Parameters**
- `out_handle`: Output of the handle.
- `config`: Configuration for the ESSL_SDIO device.

**esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)**

Deinitialize and free the space used by the ESSL SDIO device.

**Return**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed
Parameters

• handle: Handle of the ESSL SDIO device to deinit.

Structures

`struct essl_sdio_config_t`

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t *card

The initialized sdmmc card pointer of the slave.

int recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

`esp_err_t essl_spi_init_dev(essl_handle_t*out_handle, const essl_spi_config_t *init_config)`

Initialize the ESSL SPI device function list and get its handle.

Return

• ESP_OK: On success
• ESP_ERR_NO_MEM: Memory exhausted
• ESP_ERR_INVALID_STATE: SPI driver is not initialized
• ESP_ERR_INVALID_ARG: Wrong register ID

Parameters

• [out] out_handle: Output of the handle
• init_config: Configuration for the ESSL SPI device

`esp_err_t essl_spi_deinit_dev(essl_handle_t handle)`

Deinitialize the ESSL SPI device and free the memory used by the device.

Return

• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters

• handle: Handle of the ESSL SPI device

`esp_err_t essl_spi_read_reg(void *arg, uint8_t addr, uint8_t*out_value, uint32_t wait_ms)`

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note1.
• or other return value from :cpp:func:spi_device_transmit.

Parameters

• arg: Context of the component. (Member arg from essl_handle_t)
• addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
• [out] out_value: Read buffer for the shared registers.
• wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t essl_spi_get_packet(void *arg, void *out_data, size_t size, uint32_t wait_ms)`

Get a packet from Slave.
Return

- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

Parameters

- arg: Context of the component. (Member arg from essl_handle_t)
- [out] out_data: Output data address
- size: The size of the output data.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

void *essl_spi_write_reg (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)

Write to the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see tx_sync_reg in essl_spi_config_t)

Note Feature of checking the actual written value (out_value) is not supported.

Return

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set out_value to NULL. See note 2.
- or other return value from :cpp:func:spi_device_transmit.

Parameters

- arg: Context of the component. (Member arg from essl_handle_t)
- addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, reg-
- isters for M/S sync are reserved, see note1)
- value: Buffer for data to send, should be align to 4.
- [out] out_value: Not supported, should be set to NULL.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

void *essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)

Send a packet to Slave.

Return

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

Parameters

- arg: Context of the component. (Member arg from essl_handle_t)
- data: Address of the data to send
- size: Size of the data to send.
- wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

void essl_spi_reset_cnt (void *arg)

Reset the counter in Master context.

Note Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters

- arg: Context of the component. (Member arg from essl_handle_t)
DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from `cpp:func:spl_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rdbuf_polling(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```

Read the shared buffer from the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from `cpp:func:spl_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from `cpp:func:spl_device_polling_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from `cpp:func:spl_device_polling_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.
**esp_err_t** `essel_spi_rddma` *(spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)*

Receive long buffer in segments from the slave through its DMA.

**Note** This function combines several :cpp:func:`essel_spi_rddma_seg` and one :cpp:func:`essel_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len: Total length of data to receive.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** `essel_spi_rddma_seg` *(spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)*

Read one data segment from the slave through its DMA.

**Note** To read long buffer, call :cpp:func:`essel_spi_rddma` instead.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- seg_len: Length of this segment
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** `essel_spi_rddma_done` *(spi_device_handle_t spi, uint32_t flags)*

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note** This is required only when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t** `essel_spi_wrdma` *(spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)*

Send long buffer in segments to the slave through its DMA.

**Note** This function combines several :cpp:func:`essel_spi_wrdma_seg` and one :cpp:func:`essel_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- len: Total length of data to send.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one
segment (the wrdma_done will still be sent.)
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)
```

Send one data segment to the slave through its DMA.

Note To send long buffer, call :cpp:func:essl_spi_wrdma instead.

Return
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

Parameters
• spi: SPI device handle representing the slave
• data: Buffer for data to send, strongly suggested to be in the DRAM
• seg_len: Length of this segment
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note This is required only when the slave is working in segment mode.

Return
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

Parameters
• spi: SPI device handle representing the slave
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

### Structures

```c
struct essl_spi_config_t
```

Configuration of ESSL SPI device.

### Public Members

```c
spi_device_handle_t *spi
```

Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```

The pre-negotiated Master TX buffer size used by both the host and the slave.

```c
uint8_t tx_sync_reg
```

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```c
uint8_t rx_sync_reg
```

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

### 2.4.14 ESP x509 Certificate Bundle

#### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.
The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

注解：Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script mk-ca-bundle.pl that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.
Chapter 2. API

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in *Updating the Certificate Bundle*.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https_x509_bundle](protocols/https_x509_bundle).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https_request](protocols/https_request).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https_mbedtls](protocols/https_mbedtls).

### API Reference

#### Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

#### Functions

- **esp_err_t esp_crt_bundle_attach(void *conf)**
  
  Attach and enable use of a bundle for certificate verification.

  Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

  **Return**

  - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

- **void esp_crt_bundle_detach(mbedtls_ssl_config *conf)**
  
  Disable and dealloc the certification bundle.

  Removes the certificate verification callback and deallocates used resources.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

- **void esp_crt_bundle_set(const uint8_t *x509_bundle)**
  
  Set the default certificate bundle used for verification.

  Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

  **Parameters**

  - [in] x509_bundle: A pointer to the certificate bundle.

此 API 部分的示例代码在 ESP-IDF 示例工程的 protocols 目录下提供。

### 2.4.15 IP 网络层协议

IP 网络层协议（应用层协议之下）的文档位于连网 API。
Chapter 2. API

2.5 配网 API

2.5.1 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol:** The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. **Transport Flexibility:** The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. **Security Scheme Flexibility:** It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. **Compact Data Representation:** The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

**Deciding on Transport**

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.

4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

**Deciding on Security**

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device.
Chapter 2. API

Typical Provisioning Process

1. Transport specific discovery and connection

   Some form of beaoning

   Client connects

2. Session Establishment

   Get Version Request

   Get Version Response

   Session Setup Request

   Session Setup Response

   One or multiple steps as per protocol

3. Configuration

   App specific Set Config (optional)

   Set Config Response (optional)

   Wi-Fi SetConfig (SSID, Passphrase...)

   Wi-Fi SetConfig response

   Wi-Fi ApplyConfig cmd

   Wi-Fi ApplyConfig resp

   Wi-Fi GetStatus cmd (repeated)

   Wi-Fi GetStatus resp (repeated)

4. Close connection

   Close Connection
it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

![Unified Provisioning Architecture](image)

It relies on the base layer called Protocol Communication (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.
Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

### Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

- **Authorized** - Proof of Possession (PoP) string used to authorize session and derive shared key
- **No Auth** (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

### Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

### Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.
- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.
- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.2 Protocol Communication

#### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

**Following features are available for provisioning:**

- **Communication security at application level -**
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- **Proof-of-possession** (support with protocomm_security1 only)
ProtoComm internally uses Protobuf (Protocol Buffers) for secure session establishment. Though users can implement their own security (even without using Protobuf). One can even use ProtoComm without any security layer.

ProtoComm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for ProtoComm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

**Transport Example (SoftAP + HTTP) with Security 1**

For complete example see provisioning/legacy/softap_prov

```c
/* Endpoint handler to be registered with ProtoComm. */

type_t echo_req_handler (uint32_t session_id,
 const uint8_t *inbuf, ssize_t inlen,
 uint8_t **outbuf, ssize_t *outlen,
 void *priv_data)
{
  /* Session ID may be used for persistence */
  printf("Session ID : %d", session_id);

  /* Echo back the received data */
  *outlen = inlen; /* Output data length updated */
  *outbuf = malloc(inlen); /* This will be deallocated outside */
  memcpy(*outbuf, inbuf, inlen);

  /* Private data that was passed at the time of endpoint creation */
  uint32_t *priv = (uint32_t *)priv_data;
  if (priv) {
    printf("Private data : %d", *priv);
  }

  return ESP_OK;
}

/* Example function for launching a ProtoComm instance over HTTP */
protoComm_t *start_pc(const char *pop_string)
{
  protoComm_t *pc = protoComm_new();

  /* Config for protoCommHttpd_start() */
  protoCommHttpd_config_t pc_config = {
    .data = {
      .config = PROTOCOL_HTTPD_DEFAULT_CONFIG()
    }
  }

  /* Start protoComm server on top of HTTP */
  protoCommHttpd_start(pc, &pc_config);

  /* Create Proof of Possession object from pop_string. It must be valid */
  /* throughout the scope of protoComm endpoint. This need not be */
  /* static, */
  /* ie. could be dynamically allocated and freed at the time of */
  /* removal */
  const static protoComm_security_pop_t pop_obj = {
    .data = (const uint8_t *)strdup(pop_string),
    .len = strlen(pop_string)
  }
```

(下页继续)
Chapter 2. API 参考

Transport Example (BLE) with Security 0

For complete example see provisioning/legacy/ble_prov

```c
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
       {"security_endpoint", 0xFF51},
       {"echo_req_endpoint", 0xFF52}
    };
```

(续下页)
/* Config for protocomm_ble_start() */
protocomm_ble_config_t config = {
    .service_uuid = {
        /* LSB <---------------------------------------
         * ---------------------------------------> MSB */
        0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x80, 0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
    },
    .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
    .nu_lookup = nu_lookup_table
};

/* Start protocomm layer on top of BLE */
protocomm_ble_start(pc, &config);

/* For protocomm_security0, Proof of Possession is not used, and can be kept NULL */
protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
return pc;

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");
    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);
    protocomm_delete(pc);
}

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new (void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Return

- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters
**Chapter 2. API 参考**

- [in] `pc`: Pointer to the protocomm instance to be deleted

```c
esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, proto-
comm_reg_handler_t h, void *priv_data)
```

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered add_endpoint() function of the selected transport which is a member of the protocomm_t instance structure.

**Return**
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

**Parameters**
- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string
- [in] `h`: Endpoint handler function
- [in] `priv_data`: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**
- This function internally calls the registered remove_endpoint() function which is a member of the protocomm_t instance structure.

**Return**
- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**
- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```

Allocates internal resources for new transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**
- [in] `pc`: Pointer to the protocomm instance
- [in] `session_id`: Unique ID for a communication session

```c
esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)
```

Frees internal resources used by a transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**
### Chapter 2. API

- **[in]** pc: Pointer to the protocomm instance
- **[in]** session_id: Unique ID for a communication session

```c
esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**
- ESP_OK: Request handled successfully
- ESP_FAIL: Internal error in execution of registered handler
- ESP_ERR_NO_MEM: Error allocating internal resource
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**
- **[in]** pc: Pointer to the protocomm instance
- **[in]** ep_name: Endpoint identifier(name) string
- **[in]** session_id: Unique ID for a communication session
- **[in]** inbuf: Input buffer contains input request data which is to be processed by the registered handler
- **[in]** inlen: Length of the input buffer
- **[out]** outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **[out]** outlen: Buffer length of the allocated output buffer

```c
esp_err_t protocomm_set_security (protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Security endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

**Parameters**
- **[in]** pc: Pointer to the protocomm instance
- **[in]** ep_name: Endpoint identifier(name) string
- **[in]** sec: Pointer to endpoint security instance
- **[in]** pop: Pointer to proof of possession for authenticating a client

```c
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Return**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**
Chapter 2. API

**protocomm_set_version**

```c
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using **protocomm_new()**.

**Parameters**

- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string
- [in] `version`: Version identifier(name) string

**Return**

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

**protocomm_unset_version**

```c
esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name)
```

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Return**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

**Parameters**

- [in] `pc`: Pointer to the protocomm instance
- [in] `ep_name`: Endpoint identifier(name) string

**Type Definitions**

```c
typedef esp_err_t (protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```c
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API **protocomm_new()** is called. The remaining Protocomm APIs require this object as the first parameter.

**Note** Structure of the protocomm object is kept private

**Header File**

- components/protocomm/include/security/protocomm_security.h

**Structures**

```c
struct protocomm_security_pop
```

Proof Of Possession for authenticating a secure session.

**Public Members**

```c
const uint8_t *data
```

Pointer to buffer containing the proof of possession data
**Chapter 2. API 参考**

```c
uint16_t len
```

Length (in bytes) of the proof of possession data

```c
struct protocomm_security
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy

### Public Members

```c
int ver
```

Unique version number of security implementation

```c
esp_err_t (*init)(protocomm_security_handle_t *handle)
```

Function for initializing/allocating security infrastructure

```c
esp_err_t (*cleanup)(protocomm_security_handle_t handle)
```

Function for deallocating security infrastructure

```c
esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
```

Starts new secure transport session with specified ID

```c
esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
```

Closes a secure transport session with specified ID

```c
esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Handler function for authenticating connection request and establishing secure session

```c
esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
```

Function which implements the encryption algorithm

```c
esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
```

Function which implements the decryption algorithm

### Type Definitions

```c
typedef struct protocomm_security_pop protocomm_security_pop_t
```

Proof Of Possession for authenticating a secure session.

```c
typedef void *protocomm_security_handle_t
```

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entrancy
