**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If `external PSRAM is enabled`, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLex` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in `Transaction Line Mode`.

备注: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see Known Issues.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the
spi_transaction_t::tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use spi_transaction_t::rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the spi_transaction_t::tx_buffer or spi_transaction_t::rx_buffer members, because they use the same memory locations as spi_transaction_t::tx_data and spi_transaction_t::rx_data.

Transactions with Integers Other Than uint8_t  An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device  To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus  Though the SPIMaster feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between spi_device_acquire_bus() and spi_device_release_bus()
   - Implicit bus acquiring between spi_device_polling_start() and spi_device_polling_end() (or inside spi_device_polling_transmit())
During the time above, all other tasks and most ISRs will be disabled (see IRAM 安全中断处理程序). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a Cache disabled but cached memory region accessed exception. For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

To place functions into the IRAM, you can either:
1. Add `IRAM_ATTR` (include esp_attr.h) to the function like:
   ```c
   IRAM_ATTR void foo(void) {}
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.
2. Use the `noflash` placement in the linker.lf. See more in 链接器脚本生成机制. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:
1. Add `DRAM_ATTR` (include esp_attr.h) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3;
   ```
2. Use the `noflash` placement in the linker.lf. See more in 链接器脚本生成机制.

Please also see the example peripherals/spi_master/hd_eeprom.

**GPIO Matrix and IO_MUX** Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:

- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**备注：** For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.
Transaction Duration  
Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

SPI Clock Frequency  
The driver support setting an SPI peripheral to different clock frequencies. Actual clock frequency may not be exactly equal to the number you set, it will be re-calculated by the driver to the nearest hardware compatible number, you can call `spi_device_get_actual_freq()` to get the actual frequency computed by driver.

Theoretical maximum transfers speed of Write or Read phase can be calculated according to the table below:

<table>
<thead>
<tr>
<th>Line Width of Write/Read phase</th>
<th>Speed (Bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-Line</td>
<td>SPI Frequency / 8</td>
</tr>
<tr>
<td>2-Line</td>
<td>SPI Frequency / 4</td>
</tr>
<tr>
<td>4-Line</td>
<td>SPI Frequency / 2</td>
</tr>
</tbody>
</table>

The transfer speed calculation of other phases (command, address, dummy) are similar.

If the clock frequency is too high, the use of some functions might be limited. See Timing Considerations.

Cache Miss  
The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is \(20+8n/F_{spi}[MHz]\) [us] for n bytes transferred in one transaction. Hence, the transferring speed is: \(n/(20+8n/F_{spi})\). An example of transferring speed at 8 MHz clock speed is given in the following table:

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member
spi_bus_config_t::intr_flags. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see IRAM 安全中断处理程序.

Timing Considerations

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed. When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.

![Timing Diagram](image)

The maximum allowed frequency is dependent on:

- spi_device_interface_config_t::input_delay_ns - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing input delay. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function spi_get_freq_limit().

**Dummy bit workaround:** Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>-</td>
<td>Yes</td>
</tr>
</tbody>
</table>

If the Host only writes data, the dummy bit workaround and the frequency check can be disabled by setting the bit SPI_DEVICE_NO_DUMMY in the member spi_device_interface_config_t::flags. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.
spi_device_interface_config_t::flags

The SPI master driver still works even if the `spi_device_interface_config_t::input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.

Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
Freq \ limit \ [MHz] = \frac{80}{floor(MISO \ delay[ns]/12.5) + 1}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.
<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX (0ns)</td>
<td>0</td>
<td>0</td>
<td>80</td>
</tr>
<tr>
<td></td>
<td>50</td>
<td>50</td>
<td>16</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td>GPIO (25ns)</td>
<td>0</td>
<td>25</td>
<td>26.67</td>
</tr>
<tr>
<td></td>

<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. **Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:**
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      This can prohibit you from transmitting and receiving data longer than 64 bytes.
   3. Try using the command and address fields to replace the write phase.

2. Full-duplex transactions are not compatible with the *dummy bit workaround*, hence the frequency is limited. See [dummy bit speed-up workaround](#).

3. *dummy_bits* in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- `components/hal/include/hal/spi_types.h`

**Structures**

struct `spi_line_mode_t`

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

**Public Members**

- `uint8_t cmd_lines`
  The line width of command phase, e.g. 2-line-cmd-phase.

- `uint8_t addr_lines`
  The line width of address phase, e.g. 1-line-addr-phase.

- `uint8_t data_lines`
  The line width of data phase, e.g. 4-line-data-phase.
Chapter 2. API

Enumerations

enum spi_host_device_t
Enum with the three SPI peripherals that are software-accessible in it.

Values:

enumerator SPI1_HOST
SPI1.

enumerator SPI2_HOST
SPI2.

enumerator SPI3_HOST
SPI3.

enumerator SPI_HOST_MAX
invalid host value

enum spi_clock_source_t
Values:

enumerator SPI_CLK_APB
Select APB as the source clock.

enumerator SPI_CLK_XTAL
Select XTAL as the source clock.

enum spi_event_t
SPI Events.

Values:

enumerator SPI_EV_BUF_TX
The buffer has sent data to master.

enumerator SPI_EV_BUF_RX
The buffer has received data from master.

enumerator SPI_EV_SEND_DMA_READY
Slave has loaded its TX data buffer to the hardware (DMA).

enumerator SPI EV_SEND
Master has received certain number of the data, the number is determined by Master.

enumerator SPI_EV_RECV_DMA_READY
Slave has loaded its RX data buffer to the hardware (DMA).

enumerator SPI EV_RECV
Slave has received certain number of data from master, the number is determined by Master.
Chapter 2. API 参考

enumerator SPI_EV_CMD9
   Received CMD9 from master.

enumerator SPI_EV_CMDA
   Received CMDA from master.

enumerator SPI_EV_TRANS
   A transaction has done.

enum spi_command_t
   SPI command.
   Values:
   enumerator SPI_CMD_HD_WRBUF
   enumerator SPI_CMD_HD_RDBUF
   enumerator SPI_CMD_HD_WRDMA
   enumerator SPI_CMD_HD_RDDMA
   enumerator SPI_CMD_HD_SEG_END
   enumerator SPI_CMD_HD_EN_QPI
   enumerator SPI_CMD_HD_WR_END
   enumerator SPI_CMD_HD_INT0
   enumerator SPI_CMD_HD_INT1
   enumerator SPI_CMD_HD_INT2

Header File
   • components/driver/include/driver/spi_common.h

Functions
esp_err_t spi_bus_initialize (spi_host_device_t host_id, const spi_bus_config_t *bus_config,
   spi_dma_chan_t dma_chan)
   Initialize a SPI bus.

警告： SPI0/1 is not supported

警告： If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host_id` – SPI peripheral that controls this bus
- `bus_config` – Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma_chan` – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Return**

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

```c
esp_err_t spi_bus_free(spi_host_device_t host_id)
```

Free a SPI bus.

In order for this to succeed, all devices have to be removed first.

**Parameters**

- `host_id` – SPI peripheral to free

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn’t been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

**Structures**

```c
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**备注**：Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` refering to these lines will be ignored and can thus safely be left uninitialized.

**Public Members**

```c
int mosi_io_num
```

GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

```c
int data0_io_num
```

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.
int miso_io_num
GPIO pin for Master In Slave Out (spi_q) signal, or -1 if not used.

int data1_io_num
GPIO pin for spi data1 signal in quad/octet mode, or -1 if not used.

int sclk_io_num
GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
GPIO pin for spi data2 signal in quad/octet mode, or -1 if not used.

int quadhd_io_num
GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
GPIO pin for spi data3 signal in quad/octet mode, or -1 if not used.

int data4_io_num
GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to
SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

int intr_flags
Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

 Macros

SPI_MAX_DMA_LEN
**SPI_SWAP_DATA_TX** (DATA, LEN)
Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

- **DATA** - Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** - Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI_SWAP_DATA_RX** (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

- **DATA** - Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** - Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**
Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**
Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.
**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**

typedef *spi_common_dma_t* spi_dma_chan_t

**Enumerations**
enum *spi_common_dma_t*
SPI DMA channels.

*Values:*

enumerator *SPI_DMA_DISABLED*
   Do not enable DMA for SPI.

enumerator *SPI_DMA_CH1*
   Enable DMA, select DMA Channel 1.

enumerator *SPI_DMA_CH2*
   Enable DMA, select DMA Channel 2.

enumerator *SPI_DMA_CH_AUTO*
   Enable DMA, channel is automatically selected by driver.

**API Reference - SPI Master**

**Header File**
- components/driver/include/driver/spi_master.h

**Functions**

`esp_err_t spi_bus_add_device (spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)`
Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.
Chapter 2. API

While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

### Parameters
- **host_id** - SPI peripheral to allocate device on
- **dev_config** - SPI interface protocol config for the device
- **handle** - Pointer to variable to hold the device handle

### Returns
- **ESP_ERR_INVALID_ARG** if parameter is invalid or configuration combination is not supported (e.g. dev_config->post_cb isn’t set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- **ESP_ERR_NOT_FOUND** if host doesn’t have any free CS slots
- **ESP_ERR_NO_MEM** if out of memory
- **ESP_OK** on success

```c
esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
```

Remove a device from the SPI bus.

- **handle** - Device handle to free

### Returns
- **ESP_ERR_INVALID_ARG** if parameter is invalid
- **ESP_ERR_INVALID_STATE** if device already is freed
- **ESP_OK** on success

```c
esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

### Returns
- **ESP_ERR_INVALID_ARG** if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- **ESP_ERR_TIMEOUT** if there was no room in the queue before ticks_to_wait expired
- **ESP_ERR_NO_MEM** if allocating DMA-capable temporary buffer failed
- **ESP_ERR_INVALID_STATE** if previous transactions are not finished
- **ESP_OK** on success

```c
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

### Parameters
- **handle** - Device handle obtained using `spi_host_add_dev`
• **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
• **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

回复
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
• ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
• ESP_OK on success

```c
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that has’nt been finalized.

备注: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

参数
• **handle** - Device handle obtained using `spi_host_add_dev`
• **trans_desc** - Description of transaction to execute

返回
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

```c
esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

备注: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

参数
• **handle** - Device handle obtained using `spi_host_add_dev`
• **trans_desc** - Description of transaction to execute
• **ticks_to_wait** - Ticks to wait until there’s room in the queue; currently only `portMAX_DELAY` is supported.

返回
• ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
• ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
• ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

```c
esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.
### Chapter 2. API 参考

#### 参数
- **handle** - Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

#### 返回
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP_OK on success

```c
esp_err_t spi_device_polling_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**备注:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

#### 参数
- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Description of transaction to execute

#### 返回
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_device_acquire_bus (spi_device_handle_t device, TickType_t wait)
```

Occupies the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**备注:** The function will wait until all the existing transactions have been sent.

#### 参数
- **device** - The device to occupy the bus.
- **wait** - Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

#### 返回
- ESP_ERR_INVALID_ARG: `wait` is not set to `portMAX_DELAY`.
- ESP_OK: Success.

```c
void spi_device_release_bus (spi_device_handle_t dev)
```

Releases the SPI bus occupied by the device. All other devices can start sending transactions.

**参数** dev – The device to release the bus.

```c
esp_err_t spi_device_get_actual_freq (spi_device_handle_t handle, int *freq_khz)
```

Calculates working frequency for specific device.

**参数**
- **handle** - SPI device handle
- **freq_khz** - [out] output parameter to hold calculated frequency in kHz

#### 返回
- ESP_ERR_INVALID_ARG: `handle` or `freq_khz` parameter is NULL
- ESP_OK: Success

```c
int spi_get_actual_clock (int fapb, int hz, int duty_cycle)
```

Calculates the working frequency that is most close to desired frequency.
The frequency of the APB clock should be `APB_CLK_FREQ`.

Desired working frequency

Duty cycle of the SPI clock

Actual working frequency that most fit.

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**备注:** If `*dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

```c
int spi_get_freq_limit(bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

```c
uint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
Chapter 2. API

- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
CS GPIO pin for this device, or -1 if not used.

uint32_t flags
Bitwise OR of SPI_DEVICE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.
Public Members

uint32_t flags
    Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
    Command data, of which the length is set in the command_bits of spi_device_interface_config_t.
    NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.
    Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr
    Address data, of which the length is set in the address_bits of spi_device_interface_config_t.
    NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.
    Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
    Total data length, in bits.

size_t rxlength
    Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
    User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
    If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
    If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
    This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members
struct spi_transaction_t

Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits

The command length in this transaction, in bits.

uint8_t address_bits

The address length in this transaction, in bits.

uint8_t dummy_bits

The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M

SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

8MHz

SPI_MASTER_FREQ_9M

8.89MHz

SPI_MASTER_FREQ_10M

10MHz

SPI_MASTER_FREQ_11M

11.43MHz

SPI_MASTER_FREQ_13M

13.33MHz

SPI_MASTER_FREQ_16M

16MHz

SPI_MASTER_FREQ_20M

20MHz

SPI_MASTER_FREQ_26M

26.67MHz

SPI_MASTER_FREQ_40M

40MHz

SPI_MASTER_FREQ_80M

80MHz

SPI_DEVICE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.
**Chapter 2. API 参考**

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALF Duplex**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_DEVICE_NO_RETURN_RESULT**
Don’t return the descriptor to the host on completion (use post_cb to notify instead)

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.
Chapter 2. API

**SPI_TRANS_VARIABLE_CMD**

Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_ADDR**

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_DUMMY**

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_CS_KEEP_ACTIVE**

Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase).

**SPI_TRANS_MODE_OCT**

Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase).

**Type Definitions**

typedef struct `spi_transaction_t` spi_transaction_t

typedef void (*`transaction_cb_t`)(`spi_transaction_t` *trans)

typedef struct `spi_device_t` *`spi_device_handle_t`

Handle for a device on a SPI bus.

2.6.21 SPI 从机驱动程序

SPI 从机驱动程序控制在 ESP32 中作为从机的 SPI 外设。

**ESP32 中 SPI 外设概述**

ESP32 集成了 2 个通用的 SPI 控制器，可用作片外 SPI 主机驱动的从机节点。

- SPI2，有时也称为 HSPI
- SPI3，有时也称为 VSPI

SPI2 和 SPI3 各自具有一个与之同名的独立总线信号。
术语
下表为 SPI 主机驱动的相关术语。

<table>
<thead>
<tr>
<th>术语</th>
<th>定义</th>
</tr>
</thead>
<tbody>
<tr>
<td>主机 (Host)</td>
<td>ESP32 外部的 SPI 控制器外设。用作 SPI 主机，在总线上发起 SPI 传输。</td>
</tr>
<tr>
<td>从机设备 (Device)</td>
<td>SPI 从机设备 (通用 SPI 控制器)。每个从机设备共享 MOSI、MISO 和 SCLK 信号。但是只有当主机向从机设备的专属 CS 线发送信号时，从机设备才在总线上处于激活状态。</td>
</tr>
<tr>
<td>总线 (Bus)</td>
<td>信号总线，由连接到同一主机的所有从机设备共用。一般来说，一条总线包括以下线路：MISO、MOSI、SCLK、一条或多条 CS 线，以及可选的 QUADWP 和 QUADHD。每个从机设备都有单独的 CS 线，除此之外，所有从机设备都连接在同一根总线上。如果以菊花链的方式连接，几个从机设备也可以共享一条 CS 线。</td>
</tr>
<tr>
<td>MISO</td>
<td>主机输入，从机输出。数据从从机设备发送至主机。</td>
</tr>
<tr>
<td>MOSI</td>
<td>主机输出，从机输入。数据从主机发送至从机设备。</td>
</tr>
<tr>
<td>SCLK</td>
<td>串行时钟。由主机产生的振荡信号，使数据位的传输保持同步。</td>
</tr>
<tr>
<td>CS</td>
<td>片选。允许主机选择连接到总线上的单个从机设备，以便发送或接收数据。</td>
</tr>
<tr>
<td>QUADWP</td>
<td>写保护信号。只用于 4 位 (qio/qout) 传输。</td>
</tr>
<tr>
<td>QUADHD</td>
<td>保持信号。只用于 4 位 (qio/qout) 传输。</td>
</tr>
<tr>
<td>断言 (Assertion)</td>
<td>指激活一条线的操作。反之，将线路恢复到非活动状态 (回到空闲状态) 的操作称为去断言。</td>
</tr>
<tr>
<td>传输事务 (Transaction)</td>
<td>即主机断言从机设备的 CS 线，向从机设备传输数据，接着去断言 CS 线的过程。传输事务为原子操作，不可打断。</td>
</tr>
<tr>
<td>发射沿 (Launch Edge)</td>
<td>源寄存器将信号发射到线路上的时钟边沿。</td>
</tr>
<tr>
<td>锁存沿 (Latch Edge)</td>
<td>目的寄存器锁存信号的时钟边沿。</td>
</tr>
</tbody>
</table>

驱动程序的功能
SPI 从机驱动程序允许将 SPI 外设作为全双工设备使用。驱动程序可以发送/接收长度不超过 64 字节的传输事务，或者利用 DMA 来发送/接收更长的传输事务。然而，存在一些与 DMA 有关的已知问题。

SPI 传输事务
主机断言 CS 线并在 SCLK 线上发出时钟脉冲时，一次全双工 SPI 传输事务就此开始。每个时钟脉冲都意味着通过 MOSI 线从主机转移一个数据位到从机设备上，并同时通过 MISO 线返回一个数据位。传输事务结束后，主机去断言 CS 线。

传输事务的属性由作为从机设备的 SPI 外设的配置结构体 spi_slave_interface_config_t 和传输事务配置结构体 spi_slave_transaction_t 决定。

由于并非每次传输事务都需要写入和读取数据，您可以选择配置 spi_transaction_t 为仅 TX，仅 RX 或同时 TX 和 RX 传输事务。如果将 spi_slave_transaction_t::rx_buffer 设置为 NULL，读取阶段将被跳过。如果将 spi_slave_transaction_t::tx_buffer 设置为 NULL，则写入阶段将被跳过。

备注：主机应在从机设备准备好接收数据之后再进行传输事务。建议使用另外一个 GPIO 管脚作为握手信号来同步设备。更多细节，请参阅传输事务间例。
使用驱动程序

- 调用函数 `cpp:func:sipSlaveInitialize`，将 SPI 外设初始化为从机设备。请确保在 `bus_config` 中设置正确的 I/O 管脚，并将未使用的信号设置为 -1。

如果传输事务的数据大于 32 字节，需要将参数 `dma_chan` 分别设置为 1 或 2 以使能 DMA 通道 1 或通道 2。若数据小于 32 字节，则应将 `dma_chan` 设为 0。

- 传输事务开始前，需设置要求的事务参数填充一个或多个 `spi_slave_transaction_t` 结构体。可以调用`spi_slave_queue_trans()` 将所有传输事务推入队列，并在后续使用函数 `spi_slave_get_trans_result()` 查询结果。也可以将所有请求输入 `spi_slave_transmit()` 中单独处理。主机上的传输事务完成前，两个函数将被阻塞，以便发送并接收队列中的数据。

- (可选) 如需卸载 SPI 从机驱动程序，请调用 `spi_slave_free()`。

传输事务数据和主从机长度不匹配

通常，通过从机设备进行传输的数据会被读取或写入到由 `spi_slave_transaction_t::rx_buffer` 和`spi_slave_transaction_t::tx_buffer` 指示的大块内存中。可以配置 SPI 驱动程序，使用 DMA 进行传输。在这种情况下，则必须使用 `pvPortMallocCaps(size, MALLOC_CAP_DMA)` 将缓存区分配到具备 DMA 功能的内存中。

驱动程序可以读取或写入缓存区的数据量取决于 `spi_slave_transaction_t::length`，但其并不会定义一次 SPI 传输的实际长度。传输事务的长度由主机的时钟线和 CS 线决定。且只有在传输事务完成后，才能从 `spi_slave_transaction_t::trans_len` 中读取实际长度。

如果传输长度超过缓存区长度，则只有在 `spi_slave_transaction_t::length` 中指定的初始比特数会被发送和接收。此时，`spi_slave_transaction_t::trans_len` 被设置为实际传输事务长度。若需满足实际传输事务长度的要求，请将 `spi_slave_transaction_t::length` 设置为大于 `spi_slave_transaction_t::trans_len` 预期最大值的值。如果传输长度短于缓存区长度，则只传输与缓存区长度相等的数据。

GPIO 交换矩阵和 IO_MUX

ESP32 的大多数外设信号都直接连接到其专用的 IO_MUX 管脚。不过，也可以使用 GPIO 交换矩阵，将信号路由到任何可用的其他管脚。

如果通过 GPIO 交换矩阵路由了至少一个信号，则所有信号都将通过 GPIO 交换矩阵路由。GPIO 交换矩阵以 80 MHz 的频率对所有信号进行采样，并在 GPIO 和外设之间进行传输。

如果已经配置过驱动程序，所有的 SPI 信号都已路由到专用的 IO_MUX 管脚，或者根本没有连接到任何管脚，那么 GPIO 交换矩阵将被绕过。

GPIO 交换矩阵提高了信号传输的灵活性，但也增大了 MISO 信号的输入延迟，导致违反 MISO 设置时间的可能性更高。如需 SPI 高速运行，请使用专用的 IO_MUX 管脚。

备注：更多有关 MISO 输入延迟对最大时钟频率影响的细节，请参阅 `Timing Considerations`。

下表列出了 SPI 总线的 IO_MUX 管脚。

<table>
<thead>
<tr>

Submit Document Feedback
速度与时钟

传输事务间隔 ESP32 的 SPI 从机外设是由 CPU 控制的通用从机设备。与专用的从机相比，在内嵌 CPU 的 SPI 从机设备中，预定义寄存器的数量有限，所有的传输事务都必须由 CPU 处理。也就是说，传输和响应并不是实时的，且可能存在明显的延迟。

解决方案为，首先使用函数 `spi_slave_queue_trans()`，然后使用 `spi_slave_get_trans_result()`，来代替 `spi_slave_trans()`，由此一来，可使从设备的响应速度提高一倍。

您也可以配置一个 GPIO 管脚，当从设备开始新一次传输事务前，它将通过该管脚向主机发出信号。示例代码存放在 peripherals/spi_slave 目录下。

时钟频率要求 SPI 从机的工作频率最高可达 10 MHz。如果时钟频率过快或占空比不足 50%，数据就无法被正确识别或接收。

除此之外，在数据方面还有一些额外要求，以满足时间限制：

- 读取 (MOSI): 只有当数据在主机的发射沿准备好时，从机设备才能正确读取数据。此为大多数主机的默认情况。
- 写入 (MISO): MISO 信号的输出延迟应短于半个时钟周期，以确保 MISO 线在下一个锁存沿之前保持稳定。基于时钟同步，不同情况下的输出延迟和频率限制如下。

<table>
<thead>
<tr>
<th></th>
<th>MISO 输出延迟 (ns)</th>
<th>频率限制 (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO 交换阵</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

注：1. 如果频率达到上限，会导致随机误差。2. 主机和设备之间的时钟不确定性 (12.5 ns) 已被考虑在内。3. 表中的输出延迟为理想情况 (无负载) 下的数据。如果 MISO 管脚负载较重，则输出延迟更长，且最大允许频率更低。

例外情况：如果主机支持更多相关 MISO 设置时的选项，例如，可以在下一个边沿锁存数据，或可以配置锁存时间，则频率限制的上限会更高。

条件和已知问题

1. 若启用了 DMA，则 RX 缓冲区应该以字对齐（从 32 位边界开始，字节长度为 4 的倍数）。否则，DMA 可能无法正确写入或无法实现边界对齐。若此项条件不满足，驱动程序将会报错。

2. 此外，使用 DMA 时需启用 SPI 模式 1 和模式 3。在 SPI 模式 0 和模式 2 下，为满足时序要求，MISO 信号必须提前半个时钟周期启动。新的时序如下：

如果启用了 DMA，从机设备的发送沿会比正常时间提前半个 SPI 时钟周期，变为主机的实际锁存沿。在这种情况下，如果 GPIO 交换矩阵被绕过，数据采样的保持时间将是 68.75 ns，而非半个 SPI 时钟周期。如果使用了 GPIO 交换矩阵，保持时间将增加到 93.75 ns。主机应在锁存沿立即采样数据，或在 SPI 模式 1 或模式 3 中进行通信。如果您的主机无法满足上述时间要求，请在没有 DMA 的情况下初始化从机设备。

应用示例

从机设备/主机通信的示例代码存放在 ESP-IDF 示例项目的 peripherals/spi_slave 目录下。
API 参考

Header File

- components/driver/include/driver/spi_slave.h

Functions

**esp_err_t spi_slave_initialize (spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)**

Initialize a SPI bus as a slave interface.

警告：SPI0/1 is not supported

警告：If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

警告：The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

参数

- **host** - SPI peripheral to use as a SPI slave interface
- **bus_config** - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **slave_config** - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

返回

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t spi_slave_free (spi_host_device_t host)**

Free a SPI bus claimed as a SPI slave interface.

参数 **host** - SPI peripheral to free

返回

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**esp_err_t spi_slave_queue_trans (spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Queue a SPI transaction for execution.

Queue a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.
This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

### Parameters
- **host** - SPI peripheral that is acting as a slave
- **trans_desc** - Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use port MAX_DELAY to never time out.

### Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t spi_slave_get_trans_result (spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)**

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

### Parameters
- **host** - SPI peripheral that is acting as a slave
- **trans_desc** [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use port MAX_DELAY to never time out.

### Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t spi_slave_transmit (spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

### Parameters
- **host** - SPI peripheral that is acting as a slave
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use port MAX_DELAY to never time out.

### Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Structures**

**struct spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**
int spics_io_num
   CS GPIO pin for this device.

uint32_t flags
   Bitwise OR of SPI_SLAVE_* flags.

int queue_size
   Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
   SPI mode, representing a pair of (CPOL, CPHA) configuration:
   • 0: (0, 0)
   • 1: (0, 1)
   • 2: (1, 0)
   • 3: (1, 1)

slave_transaction_cb_t post_setup_cb
   Callback called after the SPI registers are loaded with new data.
   This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb
   Callback called after a transaction is done.
   This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
   This structure describes one SPI transaction

**Public Members**

size_t length
   Total data length, in bits.

size_t trans_len
   Transaction data length, in bits.

const void *tx_buffer
   Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user
   User-defined variable. Can be used to store eg transaction ID.
Chapter 2. API Reference

**Macros**

**SPI_SLAVE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_SLAVE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_SLAVE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_SLAVE_NO_RETURN_RESULT**
Don’t return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

**Type Definitions**

typedef struct spi_slave_transaction_t spi_slave_transaction_t

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

### 2.6.22 ESP32-WROOM-32SE (Secure Element)

**Overview**

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

**Application Example**

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

**How to configure and provision ESP32-WROOM-32SE for TLS**

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility

**How to use ATECC608A of ESP32-WROOM-32SE for TLS**

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer ATECC608A with ESP-TLS in ESP-TLS documentation.

### 2.6.23 触摸传感器
概述
触摸传感器系统由保护覆盖层、触摸电极、绝缘基板和走线组成，保护覆盖层位于最上层，绝缘基板上设有电极及走线。用户触摸覆盖层将产生电容变化，根据电容变化判断此次触摸是否为有效触摸行为。

触摸传感器可以以矩阵或滑条等方式组合使用，从而覆盖更大触感区域及更多触感点。触摸传感由软件或专用硬件计时器发起，由有限状态机 (FSM) 硬件控制。

如需了解触摸传感器设计、操作及其控制寄存器等相关信息，请参考《ESP32 技术参考手册》(PDF) 中“片上传感器与模拟信号处理”章节。

请参考 触摸传感器应用方案简介，查看触摸传感器设计详情和固件开发指南。

如果想评估触摸传感器的多种应用场景，请查看 ESP32 触摸功能开发套件。

功能介绍
下面将 API 分解成几个函数组进行介绍，帮助用户快速了解以下功能：

- 初始化触摸传感器驱动程序
- 配置触摸传感器 GPIO 管脚
- 触摸状态测量
- 调整测量参数（优化测量）
- 滤波采样
- 触摸检测方式
- 设置中断信号检测模式动作
- 中断触发，唤醒睡眠模式

请前往API 参考 章节，查看某一函数的具体描述。应用示例 章节则介绍了此 API 的具体实现。

初始化触摸传感器驱动程序 使用触摸传感器之前，需要先调用 touch_pad_init() 函数初始化触摸传感器驱动程序。此函数设置了API 参考 项下的 Macros 中列出的几项 .__DEFAULT 驱动程序参数，同时删除之前设置过的触摸传感器信息 (如有)，并启用中断。

如果不再需要该驱动程序，可以调用 touch_pad_deinit() 释放已初始化的驱动程序。

配置触摸传感器 GPIO 管脚 可调用 touch_pad_config() 使能某一 GPIO 的触感功能。ESP32 最多可支持 10 个电容式触摸传感器通道。

<table>

使用 touch_pad_set_fsm_mode() 选择触摸传感器测量（由 FSM 操作）是由硬件定时器自动启动，还是由软件自动启动。如果选择软件模式，请使用 touch_pad_sw_start() 启动 FSM。

触摸状态测量 借助以下两个函数从传感器读取原始数据和滤波后的数据：

- touch_pad_read_raw_data()
- touch_pad_read_filtered()
这两个函数也可以用于检查触碰和释放触摸传感器时传感器读数变化范围，然后根据这些信息设定触摸传感器的触摸阈值。

备注：使用`touch_pad_read_filtered()`之前，需要先调用`filter_data()`中特定的滤波器函数来初始化并配置该滤波器。

请参考应用示例`peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`，查看如何使用读取触摸传感器数据。

测量方式：触摸传感器会统计固定时间内的充电次数，其计数结果即为原始数据。可由`touch_pad_read_raw_data()`读出。上述固定时间可通过`touch_pad_set_measurement_clock_cycles()`设置。完成一次测量后，触摸传感器会在下次测量开始前保持睡眠状态。两次测量之间的间隔时间可由`touch_pad_set_measurement_interval()`进行设置。

备注：若设置的计数时间太短（即测量持续的时钟周期数太小），则可能导致结果不准确；但是过大的计数时间也会造成功耗上升。另外，若睡眠时间加测量时间的总时间过长，则会造成触摸传感器响应变慢。

优化测量：触摸传感器设有数个可配置参数，以适应触摸传感器设计特点。例如，如果需要感知较细微的电容变化，则可以缩小触摸传感器充电放电的参考电压范围。用户可以使用`touch_pad_set_voltage()`函数设置电压参考低值和参考高值。

优化测量除了可以识别细微的电容变化之外，还可以降低应用功耗，但可能会增加测量噪声干扰。如果得到的动态读数范围结果比较理想，则可以调用`touch_pad_set_measurement_clock_cycles()`函数来减少测量时间，从而进一步降低功耗。

可用的测量参数及相应的‘set’函数总结如下：

- 触摸传感器充电放电参数：
  - 电压门限：`touch_pad_set_voltage()`
  - 速率（斜率）：`touch_pad_set_cnt_mode()`

- 单次测量所用的时钟周期：`touch_pad_set_measurement_clock_cycles()`

电压门限（参考低值/参考高值）、速率（斜率）与测量时间的关系如下图所示：

![图20：触摸传感器 - 测量参数之间的关系](image-url)

Espressif Systems 1266 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
Chapter 2. API 参考

上图中的 Output 代表触碰传感器读值，即一个测量周期内测得的脉冲计数值。
所有函数均成对出现，用于设定某一特定参数，并获取当前参数值。例如：`touch_pad_set_voltage()` 和 `touch_pad_get_voltage()`。

### 波动采样
如果测量中存在噪声，可以使用提供的 API 函数对采样进行滤波。使用滤波器之前，请先调用 `touch_pad_filter_start()` 启动该滤波器。
滤波器类型为 IIR（无限脉冲响应滤波器），用户可以调用 `touch_pad_set_filter_period()` 配置此类滤波器的采样周期。
如需停止滤波器，请调用 `touch_pad_filter_stop()` 函数。如果不再使用该滤波器，请调用 `touch_pad_filter_delete()` 删除此滤波器。

### 触摸监测
触摸监测基于用户配置的阈值和 FSM 执行的原始测量，并由 ESP32 硬件实现。用户可以调用 `touch_pad_get_status()` 查看被触碰的触摸传感器，或调用 `touch_pad_clear_status()` 清除触摸状态信息。
用户也可以将硬件触摸监测连接至中断，详细介绍见下一章节。
如果测量中存在噪声，且电容变化幅度较小，硬件触摸监测结果可能就不太理想。如需解决这一问题，不建议使用硬件监测或中断信号，建议用户在自己的应用程序中进行采样滤波，并执行触摸监测。参考 [peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt]。(查看以上两种触摸监测的实现方式)

### 中断触发
在对触摸监测启用中断之前，请先设置一个触摸检测阈值。然后使用 [触摸状态测量] 中所述的函数读取并显示触摸和释放触摸传感器时测得的结果。如果测量中存在噪声且相对电容变化较小，请使用滤波器。用户也可以根据应用程序和环境条件，测试温度和电源电压变化对测量值的影响。
确定监测阈值后就可以在初始化时调用 `touch_pad_config()` 设置此阈值，或在运行时调用 `touch_pad_set_thresh()` 设置此阈值。
下一步就是设置如何触发中断。用户可以设置在阈值以下或以上触发中断，具体触发模式由函数 `touch_pad_set_trigger_mode()` 设置。
最后用户可以使用以下函数配置和管理中断调用：
- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`
中断配置完成后，用户可以调用 `touch_pad_get_status()`，查看中断信号来自哪个触摸传感器，也可以调用 `touch_pad_clear_status()` 清除触摸传感器状态信息。备注：触摸监测中的中断信号基于原始/未经滤波的采样（对比用户设置的阈值），并在硬件中实现。启用软件滤波 API(请参考 波动采样) 并不会影响这一过程。

### 从睡眠模式唤醒
如果使用触摸传感器中断将芯片从睡眠模式唤醒，用户可以选择配置一些触摸传感器，例如 SET1 或 SET2 和 SET2。触摸这些触摸传感器将触发中断并唤醒芯片，请调用 `touch_pad_set_trigger_source()` 实现上述操作。
用户可以使用以下函数管理 ‘SET’ 中触摸传感器所需的位模式配置：
- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

### 应用示例
- 触摸传感器读值示例： `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`
- 触摸传感器中断示例： `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`
Chapter 2. API 参考

API 参考

Header File

- components/driver/esp32/include/driver/touch_sensor.h

Functions

`esp_err_t touch_pad_config (touch_pad_t touch_num, uint16_t threshold)`

Configure touch pad interrupt threshold.

备注： If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

参数

- `touch_num` – touch pad index
- `threshold` – interrupt threshold

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

`esp_err_t touch_pad_read (touch_pad_t touch_num, uint16_t *touch_value)`

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

备注： This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

参数

- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

`esp_err_t touch_pad_read_filtered (touch_pad_t touch_num, uint16_t *touch_value)`

get filtered touch sensor counter value by IIR filter.

备注： touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

参数

- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
## Chapter 2. API

- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t *touch_value)
```

Get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**备注:** touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR.

### 参数
- `touch_num` – touch pad index
- `touch_value` – pointer to accept touch sensor value

### 返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

```c
esp_err_t touch_pad_set_filter_read_cb(filter_cb_t read_cb)
```

Register the callback function that is called after each IIR filter calculation.

**备注:** The ‘read_cb’ callback is called in timer task in each filtering cycle.

### 参数 `read_cb` – Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

### 返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG set error

```c
esp_err_t touch_pad_isr_register(intr_handler_t fn, void *arg)
```

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

### 参数
- `fn` – Pointer to ISR handler
- `arg` – Parameter for ISR

### 返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

```c
esp_err_t touch_pad_set_measurement_clock_cycles(uint16_t clock_cycle)
```

Set the clock cycles of each measurement.

**备注:** This function will specify the clock cycles of each measurement and the clock is sourced from SOC_MOD_CLK_RTC_FAST, its default frequency is SOC_CLK_RC_FAST_FREQ_APPROX The touch sensor will record the charge and discharge times during these clock cycles as the final result (raw value).

**备注:** If clock cycles is too small, it may lead to inaccurate results.

### 参数 `clock_cycle` – The clock cycles of each measurement measure_time = clock_cycle / SOC_CLK_RC_FAST_FREQ_APPROX, the maximum measure time is 0xffff / SOC_CLK_RC_FAST_FREQ_APPROX
Chapter 2. API

**API Reference**

### ESP_OK

Set the clock cycle success

**esp_err_t touch_pad_get_measurement_clock_cycles (uint16_t *clock_cycle)**

Get the clock cycles of each measurement.

**参数**
- `clock_cycle` - The clock cycles of each measurement

**返回**
- ESP_OK Get the clock cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

**esp_err_t touch_pad_set_measurement_interval (uint16_t interval_cycle)**

Set the interval between two measurements.

**备注：** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPROX.

**参数**
- `interval_cycle` - The interval between two measurements

**返回**
- ESP_OK Set interval cycle success

**esp_err_t touch_pad_get_measurement_interval (uint16_t *interval_cycle)**

Get the interval between two measurements.

**参数**
- `interval_cycle` - The interval between two measurements

**返回**
- ESP_OK Get interval cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

**esp_err_t touch_pad_set_meas_time (uint16_t sleep_cycle, uint16_t meas_cycle)**

Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**备注：** The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified as the second parameter). That means the number of cycles (raw value) will decrease as the capacity of the touch pad is increasing.

**备注：** The greater the duty cycle of the measurement time, the more system power is consumed.

**参数**
- `sleep_cycle` - The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX`. The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
- `meas_cycle` - The duration of the touch sensor measurement. `t_meas = meas_cycle / SOC_CLK_RC_FAST_FREQ_APPROX`. The maximum measure time is 0xffff / SOC_CLK_RC_FAST_FREQ_APPROX

**返回**
- ESP_OK on success
Get touch sensor measurement and sleep time.

- `sleep_cycle` -- Pointer to accept sleep cycle number
- `meas_cycle` -- Pointer to accept measurement cycle count.

*ESP_OK* on success
*ESP_ERR_INVALID_ARG* if the input parameter is NULL

Trigger a touch sensor measurement, only support in SW mode of FSM.

*ESP_OK* on success

Set touch sensor interrupt threshold.

- `touch_num` -- Touch pad index
- `threshold` -- Threshold of touchpad count, refer to `touch_pad_set_trigger_mode` to see how to set trigger mode.

*ESP_OK* on success
*ESP_ERR_INVALID_ARG* if argument is wrong

Get touch sensor interrupt threshold.

- `touch_num` -- Touch pad index
- `threshold` -- Pointer to accept threshold

*ESP_OK* on success
*ESP_ERR_INVALID_ARG* if argument is wrong

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

- `mode` -- Touch sensor interrupt trigger mode

*ESP_OK* on success
*ESP_ERR_INVALID_ARG* if argument is wrong

Get touch sensor interrupt trigger mode.

- `mode` -- Pointer to accept touch sensor interrupt trigger mode

*ESP_OK* on success

Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is 'touched'. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

- `src` -- Touch sensor interrupt trigger source

*ESP_OK* on success
*ESP_ERR_INVALID_ARG* if argument is wrong
esp_err_t touch_pad_get_trigger_source (touch_trigger_src_t *src)
Get touch sensor interrupt trigger source.
参数 src – pointer to accept touch sensor interrupt trigger source
返回 • ESP_OK on success

esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.
参数
• set1_mask – bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask – bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask – bitmask of touch sensor work enable, it’s a 10-bit value
返回 • ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)
Get touch sensor group mask.
参数
• set1_mask – pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask – pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask – pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value
返回 • ESP_OK on success

esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.
参数
• set1_mask – bitmask touch sensor signal group1, it’s a 10-bit value
• set2_mask – bitmask touch sensor signal group2, it’s a 10-bit value
• en_mask – bitmask of touch sensor work enable, it’s a 10-bit value
返回 • ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_intr_enable (void)
To enable touch pad interrupt.
返回 • ESP_OK on success

esp_err_t touch_pad_intr_disable (void)
To disable touch pad interrupt.
返回 • ESP_OK on success

esp_err_t touch_pad_intr_clear (void)
To clear touch pad interrupt.
返回 • ESP_OK on success

esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)
set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs
**Chapter 2. API 参考**

**函数** `touch_pad_get_filter_period` (uint32_t *p_period_ms)

get touch pad filter calibration period, in ms Need to call `touch_pad_get_filter_period` before all touch filter APIs

参数 `p_period_ms` - pointer to accept period

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**函数** `touch_pad_filter_start` (uint32_t filter_period_ms)

start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call `touch_pad_filter_start` before all touch filter APIs

参数 `filter_period_ms` - filter calibration period, in ms

返回

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

**函数** `touch_pad_filter_stop` (void)

stop touch pad filter function Need to call `touch_pad_filter_start` before all touch filter APIs

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**函数** `touch_pad_filter_delete` (void)

delete touch pad filter driver and release the memory Need to call `touch_pad_filter_start` before all touch filter APIs

返回

- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**Type Definitions**

typedef void (*filter_cb_t)(uint16_t*raw_value, uint16_t*filtered_value)

Callback function that is called after each IIR filter calculation.

**备注:** This callback is called in timer task in each filtering cycle.

**备注:** This callback should not be blocked.
Param **raw_value**  The latest raw data (touch sensor counter value) that points to all channels ([raw_value[0..TOUCH_PAD_MAX-1]]).

Param **filtered_value**  The latest IIR filtered data (calculated from raw data) that points to all channels ([filtered_value[0..TOUCH_PAD_MAX-1]]).

**Header File**

- components/driver/include/driver/touch_sensor_common.h

**Functions**

```c
esp_err_t touch_pad_init (void)
```

Initialize touch module.

**备注:** If default parameter don’t match the usage scenario, it can be changed after this function.

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

```c
esp_err_t touch_pad_deinit (void)
```

Un-install touch pad driver.

**备注:** After this function is called, other touch functions are prohibited from being called.

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

```c
esp_err_t touch_pad_io_init (touch_pad_t touch_num)
```

Initialize touch pad GPIO.

**参数**  `touch_num` – touch pad index

**备注**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)
```

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**参数**
- `refh` – the value of DREFH
- `refl` – the value of DREFL
- `atten` – the attenuation on DREFH

**备注**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)
```

Get touch sensor reference voltage.

**参数**
- `refh` – pointer to accept DREFH value
- `refl` – pointer to accept DREFL value
Chapter 2. API

- `atten` – pointer to accept the attenuation on DREFH
  ESP_OK on success

`esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)`

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

备注：The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

参数
- `touch_num` – touch pad index
- `slope` – touch pad charge/discharge speed
- `opt` – the initial voltage

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)`

Get touch sensor charge/discharge speed for each pad.

参数
- `touch_num` – touch pad index
- `slope` – pointer to accept touch pad charge/discharge slope
- `opt` – pointer to accept the initial voltage

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_isr_deregister(void (*fn)(void*), void* arg)`

Deregister the handler previously registered using touch_pad_isr_handler_register.

参数
- `fn` – handler function to call (as passed to touch_pad_isr_handler_register)
- `arg` – argument of the handler (as passed to touch_pad_isr_handler_register)

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

`esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)`

Get the touch pad which caused wakeup from deep sleep.

参数 `pad_num` – pointer to touch pad which caused wakeup

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

`esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)`

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

参数 `mode` – FSM mode

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong
**API Reference**

**Function:**

```c
esp_err_t touch_pad_get_fsm_mode (touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

- **Parameters:**
  - `mode`: pointer to accept FSM mode

- **Return:**
  - ESP_OK on success

**Function:**

```c
esp_err_t touch_pad_clear_status (void)
```

To clear the touch sensor channel active status.

---

**备注:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

---

**Function:**

```c
uint32_t touch_pad_get_status (void)
```

Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

- **Return:**
  - The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

**Function:**

```c
bool touch_pad_meas_is_done (void)
```

Check touch sensor measurement status.

- **Return:**
  - True measurement is under way
  - False measurement done

**GPIO 宏查找表**

用户可以使用宏定义某一触摸传感器通道的 GPIO，或定义某一 GPIO 的通道。例如:

1. `TOUCH_PAD_NUM5_GPIO_NUM` 定义了通道 5 的 GPIO（即 GPIO 12）;
2. `TOUCH_PAD_GPIO4_CHANNEL` 定义了 GPIO 4 的通道（即通道 0）。

**Header File**

- `components/soc/esp32/include/soc/touch_sensor_channel.h`

**Macros**

Chapter 2. API

### TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT

### TOUCH_PAD_THRESHOLD_MAX
If set touch threshold max value, The touch sensor can’t be in touched status

### TOUCH_PAD_SLEEP_CYCLE_DEFAULT
The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff

### TOUCH_PAD_MEASURE_CYCLE_DEFAULT
The timer frequency is 8Mhz, the max value is 0x7fff

### TOUCH_FSM_MODE_DEFAULT
The touch FSM may be started by the software or timer

### TOUCH_TRIGGER_MODE_DEFAULT
Interrupts can be triggered if sensor value gets below or above threshold

### TOUCH_TRIGGER_SOURCE_DEFAULT
The wakeup trigger source can be SET1 or both SET1 and SET2

#### Enumerations

```c
enum touch_pad_t
{
    Touch pad channel

    Values:

    enumerator TOUCH_PAD_NUM0
        Touch pad channel 0 is GPIO4(ESP32)

    enumerator TOUCH_PAD_NUM1
        Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

    enumerator TOUCH_PAD_NUM2
        Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

    enumerator TOUCH_PAD_NUM3
        Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

    enumerator TOUCH_PAD_NUM4
        Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

    enumerator TOUCH_PAD_NUM5
        Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

    enumerator TOUCH_PAD_NUM6
        Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)
}
```
enumerator TOUCH_PAD_NUM7

Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator TOUCH_PAD_NUM8

Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator TOUCH_PAD_NUM9

Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator TOUCH_PAD_MAX

def touch_high_volt_t

Touch sensor high reference voltage

Values:

enumerator TOUCH_HVOLT_KEEP

Touch sensor high reference voltage, no change

enumerator TOUCH_HVOLT_2V4

Touch sensor high reference voltage, 2.4V

enumerator TOUCH_HVOLT_2V5

Touch sensor high reference voltage, 2.5V

enumerator TOUCH_HVOLT_2V6

Touch sensor high reference voltage, 2.6V

enumerator TOUCH_HVOLT_2V7

Touch sensor high reference voltage, 2.7V

enumerator TOUCH_HVOLT_MAX

def touch_low_volt_t

Touch sensor low reference voltage

Values:

enumerator TOUCH_LVOLT_KEEP

Touch sensor low reference voltage, no change

enumerator TOUCH_LVOLT_0V5

Touch sensor low reference voltage, 0.5V

enumerator TOUCH_LVOLT_0V6

Touch sensor low reference voltage, 0.6V

enumerator TOUCH_LVOLT_0V7

Touch sensor low reference voltage, 0.7V
enumerator TOUCH_LVOLT_0V8
Touch sensor low reference voltage, 0.8V

enumerator TOUCH_LVOLT_MAX

enum touch_volt_atten_t
Touch sensor high reference voltage attenuation

Values:

enumerator TOUCH_HVOLT_ATTEN_KEEP
Touch sensor high reference voltage attenuation, no change

enumerator TOUCH_HVOLT_ATTEN_1V5
Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_1V
Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V5
Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V
Touch sensor high reference voltage attenuation, 0V attenuation

enumerator TOUCH_HVOLT_ATTEN_MAX

enum touch_cnt_slope_t
Touch sensor charge/discharge speed

Values:

enumerator TOUCH_PAD_SLOPE_0
Touch sensor charge / discharge speed, always zero

enumerator TOUCH_PAD_SLOPE_1
Touch sensor charge / discharge speed, slowest

enumerator TOUCH_PAD_SLOPE_2
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_3
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_4
Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_5
Touch sensor charge / discharge speed
enumerator TOUCH_PAD_SLOPE_6
    Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_7
    Touch sensor charge / discharge speed, fast

enumerator TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
    Touch sensor initial charge level
    Values:

    enumerator TOUCH_PAD_TIE_OPT_LOW
        Initial level of charging voltage, low level

    enumerator TOUCH_PAD_TIE_OPT_HIGH
        Initial level of charging voltage, high level

    enumerator TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t
    Touch sensor FSM mode
    Values:

    enumerator TOUCH_FSM_MODE_TIMER
        To start touch FSM by timer

    enumerator TOUCH_FSM_MODE_SW
        To start touch FSM by software trigger

    enumerator TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t
    Values:

    enumerator TOUCH_TRIGGER_BELOW
        Touch interrupt will happen if counter value is less than threshold.

    enumerator TOUCH_TRIGGER_ABOVE
        Touch interrupt will happen if counter value is larger than threshold.

    enumerator TOUCH_TRIGGER_MAX

enum touch_trigger_src_t
    Values:

    enumerator TOUCH_TRIGGER_SOURCE_BOTH
        wakeup interrupt is generated if both SET1 and SET2 are “touched”
enumerator TOUCH_TRIGGER_SOURCE_SET1
wakeup interrupt is generated if SET1 is “touched”

enumerator TOUCH_TRIGGER_SOURCE_MAX

### 2.6.24 Two-Wire Automotive Interface (TWAI)

**Overview**

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

| Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors. |

This programming guide is split into the following sections:

**Sections**

- [Two-Wire Automotive Interface (TWAI)]
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
  - Examples
  - API Reference

#### TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signalling:** Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.
**TWAI Messages**  
TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters**  
The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

**Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

**Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock.

---

**Driver Configuration**

This section covers how to configure the TWAI driver.
Chapter 2. API 参考

## Operating Modes

The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts**

The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

![Signal lines of the TWAI controller](image)
### TWAIDriverAlerts

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters has exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**备注**: The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to **96**. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below **96**.

**备注**: When enabling alerts, the **TWAI_ALERT_AND_LOG** flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and **TWAI_ALERT_AND_LOG** if the **CONFIG_TWAI_ISR_IN_IRAM** option is enabled (see **Placing ISR into IRAM**).

**备注**: The **TWAI_ALERT_ALL** and **TWAI_ALERT_NONE** macros can also be used to enable/disable all alerts during configuration/reconfiguration.

### Bit Timing

The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The **Baudrate Prescaler** is used to determine the period of each time quantum by dividing the TWAI controller’s source clock. On the ESP32, the `brp` can be any even number from **2** to **128**. Alternatively, you can decide the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It’s useful when you set different clock sources but want the bitrate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

If the ESP32 is a revision 2 or later chip, the **brp** will also support any multiple of **4** from **132** to **256**, and can be enabled by setting the **CONFIG_ESP32_REV_MIN** to revision 2 or higher.
Chapter 2. API

Bittimingconfigurationfor500kbit/sgivenBRP=8,clocksourcefrequencyis80MHz

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling Triple Sampling will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The Synchronization Jump Width is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- TWAI_TIMING_CONFIG_1MBITS
- TWAI_TIMING_CONFIG_800KBITS
- TWAI_TIMING_CONFIG_500KBITS
- TWAI_TIMING_CONFIG_250KBITS
- TWAI_TIMING_CONFIG_125KBITS
- TWAI_TIMING_CONFIG_100KBITS
- TWAI_TIMING_CONFIG_50KBITS
- TWAI_TIMING_CONFIG_25KBITS

Revision 2 or later of the ESP32 also supports the following bit rates:

- TWAI_TIMING_CONFIG_20KBITS
- TWAI_TIMING_CONFIG_16KBITS
- TWAI_TIMING_CONFIG_12_5KBITS

Acceptance Filter The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within twai_filter_config_t known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under Single or Dual Filter Mode. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram
Disabling TX Queue  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

备注:  When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

ESP32 Errata Workarounds  The ESP32’s TWAI controller contains multiple hardware errata (more details about the errata can be found in the ESP32’s ECO document). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:

- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
• If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Driver States**

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped**: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off**: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.
**Message Fields and Flags**  The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation**  The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.
**Message Transmission**  The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}
//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception**  The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```c
#include "driver/twai.h"
...
//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}
//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

**Reconfiguring and Reading Alerts**  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai_reconfigure_alerts.h"
...
//Reconfigure alerts to detect Error Passive and Bus-Off error states
```
Chapter 2. API

```c
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

**Stop and Uninstall** The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
//Acceptance Mask
MASK = 11'b000 0000 1101
```

**Application Examples**

**Network Example:** The TWAI Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`. 
Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

</table>
struct twai_timing_config_t

Structure for bit timing configuration of the TWAI driver.

备注: Macro initializers are available for this structure

**Public Members**

*twai_clock_source_t* `clk_src`

Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source

*uint32_t* `quanta_resolution_hz`

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it’s non-zero, otherwise, `brp` needs to be set manually.

*uint32_t* `brp`

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported.

*uint8_t* `tseg_1`

Timing segment 1 (Number of time quanta, between 1 to 16)

*uint8_t* `tseg_2`

Timing segment 2 (Number of time quanta, 1 to 8)

*uint8_t* `sjw`

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

*bool* `triple_sampling`

Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t

Structure for acceptance filter configuration of the TWAI driver (see documentation)

备注: Macro initializers are available for this structure

**Public Members**

*uint32_t* `acceptance_code`

32-bit acceptance code

*uint32_t* `acceptance_mask`

32-bit acceptance mask

*bool* `single_filter`

Use Single Filter Mode (see documentation)
Macros

**TWAI_EXTD_ID_MASK**
- TWAI Constants.
  - Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**
- Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**
- Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**
- EFF ID requires 4 bytes (29bit)

**TWAI_FRAME_STD_ID_LEN_BYTES**
- SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**
- Error counter threshold for error passive

Type Definitions

typedef `soc_periph_twai_clk_src_t twai_clock_source_t`
- RMT group clock source.

备注：User should select the clock source based on the power and resolution requirement

Enumerations

enum `twai_mode_t`
- TWAI Controller operating modes.
  - Values:

  enumerator **TWAI_MODE_NORMAL**
  - Normal operating mode where TWAI controller can send/receive/acknowledge messages

  enumerator **TWAI_MODE_NO_ACK**
  - Transmission does not require acknowledgment. Use this mode for self testing

  enumerator **TWAI_MODE_LISTEN_ONLY**
  - The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- `components/driver/include/driver/twai.h`
**Functions**

\[ \texttt{esp_err_t twai_driver_install} \left( \text{const twai_general_config_t* } \text{g_config, const twai_timing_config_t* } \text{t_config, const twai_filter_config_t* } \text{f_config} \right) \]

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**备注:** Macro initializers are available for the configuration structures (see documentation)

**备注:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

<table>
<thead>
<tr>
<th>参数</th>
<th>返回</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>g_config</code> [in] General configuration structure</td>
<td>ESP_OK: Successfully installed TWAI driver</td>

</tr>
<tr>
<td><code>f_config</code> [in] Filter configuration structure</td>
<td>ESP_ERR_NO_MEM: Insufficient memory</td>
</tr>
<tr>
<td></td>
<td>ESP_ERR_INVALID_STATE: Driver is already installed</td>
</tr>
</tbody>
</table>

\[ \texttt{esp_err_t twai_driver_uninstall} \left( \text{void} \right) \]

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**警告:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

<table>
<thead>
<tr>
<th>返回</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OK: Successfully uninstalled TWAI driver</td>
<td>ESP_OK: TWAI driver is now running</td>
</tr>
<tr>
<td>ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed</td>
<td>ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed</td>
</tr>
</tbody>
</table>

\[ \texttt{esp_err_t twai_start} \left( \text{void} \right) \]

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

<table>
<thead>
<tr>
<th>返回</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OK: TWAI driver is now running</td>
<td>ESP_OK: TWAI driver is now running</td>
</tr>
<tr>
<td>ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed</td>
<td>ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed</td>
</tr>
</tbody>
</table>

\[ \texttt{esp_err_t twai_stop} \left( \text{void} \right) \]

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.
A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

ESP_OK: TWAI driver is now Stopped
ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

```c
esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)
```

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

ESP_OK: Transmission successfully queued/initiated
ESP_ERR_INVALID_ARG: Arguments are invalid
ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
ESP_FAIL: TX queue is disabled and another message is currently transmitting
ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

```c
esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)
```

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

ESP_OK: Message successfully received from RX queue
ESP_ERR_TIMEOUT: Timed out waiting for message
ESP_ERR_INVALID_ARG: Arguments are invalid
ESP_ERR_INVALID_STATE: TWAI driver is not installed

The flags field of the received message should be checked to determine if the received message contains any data bytes.

```
```

Parameters:

- *message* - [in] Message to transmit
- *ticks_to_wait* - [in] Number of FreeRTOS ticks to block on the TX queue

Returns:

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters:

- *message* - [out] Received message
- *ticks_to_wait* - [in] Number of FreeRTOS ticks to block on RX queue

Returns:

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed
esp_err_t twai_read_alerts(uint32_t*alerts, TickType_t ticks_to_wait)
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

备注：Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

参数
- alerts [out] Bit field of raised alerts (see documentation for alert flags)
- ticks_to_wait [in] Number of FreeRTOS ticks to block for alert

返回
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t*current_alerts)
Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

参数
- alerts_enabled [in] Bit field of alerts to enable (see documentation for alert flags)
- current_alerts [out] Bit field of currently raised alerts. Set to NULL if unused

返回
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_initiate_recovery(void)
Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

备注：The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

返回
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

esp_err_t twai_get_status_info(twai_status_info_t*status_info)
Get current status information of the TWAI driver.

参数 status_info [out] Status information
返回
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed
### Chapter 2. API 参考

#### esp_err_t twai_clear_transmit_queue (void)
Clear the transmit queue.
This function will clear the transmit queue of all messages.

**备注：** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**返回**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

#### esp_err_t twai_clear_receive_queue (void)
Clear the receive queue.
This function will clear the receive queue of all messages.

**备注：** The receive queue is automatically cleared when twai_start() is called.

**返回**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

### Structures

**struct twai_general_config_t**
Structure for general configuration of the TWAI driver.

**备注：** Macro initializers are available for this structure

### Public Members

**twai_mode_t mode**
Mode of TWAI controller

**gpio_num_t tx_io**
Transmit GPIO number

**gpio_num_t rx_io**
Receive GPIO number

**gpio_num_t clkout_io**
CLKOUT GPIO number (optional, set to -1 if unused)

**gpio_num_t bus_off_io**
Bus off indicator GPIO number (optional, set to -1 if unused)

**uint32_t tx_queue_len**
Number of messages TX queue can hold (set to 0 to disable TX Queue)
uint32_t rx_queue_len
    Number of messages RX queue can hold

uint32_t alerts_enabled
    Bit field of alerts to enable (see documentation)

uint32_t clkout_divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t
    Structure to store status information of TWAI driver.

**Public Members**

twai_state_t state
    Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
    Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred
Chapter 2. API 参考

Macros

**TWAI_IO_UNUSED**

Marks GPIO as unused in TWAI configuration

Enumerations

```c
enum twai_state_t
```

TWAIdriver states.

**Values:**

- **enumerator TWAI_STATE_STOPPED**
  - Stopped state. The TWAI controller will not participate in any TWAI bus activities

- **enumerator TWAI_STATE_RUNNING**
  - Running state. The TWAI controller can transmit and receive messages

- **enumerator TWAI_STATE_BUS_OFF**
  - Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

- **enumerator TWAI_STATE_RECOVERING**
  - Recovering state. The TWAI controller is undergoing bus recovery

2.6.25 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional. The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.
Setting Communication Parameters  UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step**  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

**Multiple Steps**  Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>

</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Setting Communication Pins  After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

Driver Installation  Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.
**Chapter 2. API 参考**

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size,
        uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

### Running UART Communication

Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

### Transmitting

After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_waitTxDone()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

### Receiving

Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num,(size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

### Software Flow Control
If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

### Communication Mode Selection
The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));

### Using Interrupts
There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.
  - **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
    - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
    - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
    - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
    - Configure and enable this interrupt using `uart_enable_pattern_det_intr()`
    - Disable the interrupt using `uart_disable_pattern_det_intr()`

### Macros
The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

### Deleting a Driver
If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.
Overview of RS485 specific communication options

The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485_TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485_RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the -RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options  This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

备注:  The schematics below do not necessarily contain all required elements.

- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

Circuit A: Collision Detection Circuit

![Circuit A schematic diagram]

(下页续)
This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.
Application Examples

The table below describes the code examples available in the directory `peripherals/uart/`.

API Reference

Header File

- components/driver/include/driver/uart.h

Functions

```c
esp_err_t uart_driver_install (uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**备注:** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

参数

- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** – UART RX ring buffer size.
- **tx_buffer_size** – UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** – UART event queue size/depth.
- **uart_queue** – UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

返回

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_driver_delete (uart_port_t uart_num)
```

Uninstall UART driver.

参数 **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

返回
Chapter 2. API 参考

- ESP_OK Success
- ESP_FAIL Parameter error

`bool uart_is_driver_installed(uart_port_t uart_num)`
Checks whether the driver is installed or not.

参数 `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).

返回
- true driver is installed
- false driver is not installed

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`
Set UART data bits.

参数
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).
- `data_bit` – UART data bits

返回
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`
Get the UART data bit configuration.

参数
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).
- `data_bit` – Pointer to accept value of UART data bits.

返回
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`
Set UART stop bits.

参数
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).
- `stop_bits` – UART stop bits

返回
- ESP_OK Success
- ESP_FAIL Fail

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

参数
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).
- `stop_bits` – Pointer to accept value of UART stop bits.

返回
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bits)

`esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)`
Set UART parity mode.

参数
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX - 1).
- `parity_mode` – the enum of uart parity configuration

返回
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)`
Get the UART parity mode configuration.
Chapter 2. API 参考

参数
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode - Pointer to accept value of UART parity mode.

返回
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

```c
esp_err_t uart_get_sclk_freq(uart_sclk_t sclk, uint32_t*out_freq_hz)
```

Get the frequency of a clock source for the UART.

参数
- sclk - Clock source
- out_freq_hz - [out] Output of frequency, in Hz

返回
- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

```c
esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
```

Set UART baud rate.

参数
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate - UART baud rate.

返回
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t*baudrate)
```

Get the UART baud rate configuration.

参数
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate - Pointer to accept value of UART baud rate

返回
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

```c
esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
```

Set UART line inverse mode.

参数
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- inverse_mask - Choose the wires that need to be inverted. Using the ORred mask of uart_signal_inv_t

返回
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
```

Set hardware flow control.

参数
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- flow_ctrl - Hardware flow control mode
- rx_thresh - Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

返回
- ESP_OK Success
- ESP_FAIL Parameter error
**esp_err_t uart_set_sw_flow_ctrl** (*uart_port_t* *uart_num*, bool *enable*, uint8_t *rx_thresh_xon*, uint8_t *rx_thresh_xoff*)

Set software flow control.

- **uart_num** - UART NUM_0, UART NUM_1 or UART NUM_2
- **enable** - switch on or off
- **rx_thresh_xon** - low water mark
- **rx_thresh_xoff** - high water mark

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_hw_flow_ctrl** (*uart_port_t* *uart_num*, *uart_hw_flowcontrol_t* *flow_ctrl*)

Get the UART hardware flow control configuration.

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** - Option for different flow control mode.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl*

**esp_err_t uart_clear_intr_status** (*uart_port_t* *uart_num*, uint32_t *clr_mask*)

Clear UART interrupt status.

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** - Bit mask of the interrupt status to be cleared.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_intr_mask** (*uart_port_t* *uart_num*, uint32_t *enable_mask*)

Set UART interrupt enable.

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** - Bit mask of the enable bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_disable_intr_mask** (*uart_port_t* *uart_num*, uint32_t *disable_mask*)

Clear UART interrupt enable bits.

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** - Bit mask of the disable bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_rx_intr** (*uart_port_t* *uart_num*)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error
**esp_err_t uart_disable_rx_intr (uart_port_t uart_num)**
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT_INTERRUPT)

**参数**
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_disable_tx_intr (uart_port_t uart_num)**
Disable UART TX interrupt (TX_FULL & TX_TIMEOUT_INTERRUPT)

**参数**
- uart_num - UART port number

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_tx_intr (uart_port_t uart_num, int enable, int thresh)**
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT_INTERRUPT)

**参数**
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- enable - 1: enable; 0: disable
- thresh - Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_set_pin (uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)**
Assign signals of a UART peripheral to GPIO pins.

**备注:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**备注:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**参数**
- uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
- tx_io_num - UART TX pin GPIO number.
- rx_io_num - UART RX pin GPIO number.
- rts_io_num - UART RTS pin GPIO number.
- cts_io_num - UART CTS pin GPIO number.

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_set_rts (uart_port_t uart_num, int level)**
Manually set the UART RTS pin level.

**备注:** UART must be configured with hardware flow control disabled.
## Chapter 2. API 参考

### 参数
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` - 1: RTS output low (active); 0: RTS output high (block)

### 返回
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t esp_set_dtr (uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**参数**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` - 1: DTR output low; 0: DTR output high

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t esp_set_tx_idle_num (uart_port_t uart_num, uint16_t idle_num)
```
Set UART idle interval after tx FIFO is empty.

**参数**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num` - idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t esp_param_config (uart_port_t uart_num, const uart_config_t *uart_config)
```
Set UART configuration parameters.

**参数**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `uart_config` - UART parameter settings

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t esp_intr_config (uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```
Configure UART interrupts.

**参数**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `intr_conf` - UART interrupt settings

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t esp_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)
```
Wait until UART TX FIFO is empty.

**参数**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `ticks_to_wait` - Timeout, count in RTOS ticks

**返回**
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

```c
int uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)
```
Send data to the UART port from a given buffer and length.
This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

备注: This function should only be used when UART TX buffer is not enabled.

### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buffer` - data buffer address
- `len` - data length to send

### Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send

### Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `src` - data buffer address
- `size` - data length to send
- `brk_len` - break signal duration(unit: the time it takes to send one bit at current baudrate)

### Return
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buf` - pointer to the buffer.
- `length` - data length
- `ticks_to_wait` - s Timeout, count in RTOS ticks

### Return
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer
**esp_err_t uart_flush (uart_port_t uart_num)**

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**备注:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**参数:** `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**返回:**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_flush_input (uart_port_t uart_num)**

Clear input buffer, discard all the data is in the ring-buffer.

**备注:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**参数:** `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**返回:**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)**

UART get RX ring buffer cached data length.

**参数:**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `size` - Pointer of size_t to accept cached data length

**返回:**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_tx_buffer_free_size (uart_port_t uart_num, size_t *size)**

UART get TX ring buffer free space size.

**参数:**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `size` - Pointer of size_t to accept the free space size

**返回:**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)**

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**参数:** `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).

**返回:**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)**

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**参数:** `uart_num` - UART port number.
Chapter 2. API

- **pattern_chr** – character of the pattern.
- **chr_num** – number of the character, 8-bit value.
- **chr_tout** – timeout of the interval between each pattern characters, 16-bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** – idle time after the last pattern character, 16-bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- **pre_idle** – idle time before the first pattern character, 16-bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

返回

- ESP_OK Success
- ESP_FAIL Parameter error

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注：If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

```c
int uart_pattern_get_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

备注：If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

```c
esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)
```

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

参数

- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

返回

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.
Chapter 2. API 参考

- **queue_length** - Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

返回
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)
```
UART set communication mode.

备注：This function must be executed after uart_driver_install(), when the driver object is initialized.

参数
- **uart_num** - Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **mode** - UART UART mode to set

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t uart_set_rx_full_threshold(uart_port_t uart_num, int threshold)
```
Set uart threshold value for RX fifo full.

备注：If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

参数
- **uart_num** - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** - Threshold value above which RX fifo full interrupt is generated

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)
```
Set uart threshold values for TX fifo empty.

参数
- **uart_num** - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold** - Threshold value below which TX fifo empty interrupt is generated

返回
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```
UART set threshold timeout for TOUT feature.

参数
- **uart_num** - Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** - This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is
expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)**

Returns collision detection flag for RS485 mode. Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

- **uart_num** - Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** - Pointer to variable of type bool to return collision flag.

**esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)**

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select UART_SCLK_REF_TICK or UART_SCLK_XTAL as UART clock source in `uart_config_t::source_clk`.

**备注：** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

- **uart_num** - UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** - number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

**esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)**

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

- **uart_num** - UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)**

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select UART_SCLK_REF_TICK or UART_SCLK_XTAL as UART clock source in `uart_config_t::source_clk`.

**备注：** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

- **uart_num** - UART number, the max port number is (UART_NUM_MAX -1).
- **wakeup_threshold** - number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

**esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)**

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

- **uart_num** - UART number, the max port number is (UART_NUM_MAX -1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

**返回**
- ESP_OK on success
**Chapter 2. API 参考**

- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

```c
esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**参数**
- `uart_num` - UART number

```c
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**参数**
- `uart_num` - UART number
- `loop_back_en` - Set true to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**参数**
- `uart_num` - UART number
- `always_rx_timeout_en` - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

```c
struct uart_intr_config_t
```

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

```c
uint32_t intr_enable_mask
```

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

```c
uint8_t rx_timeout_thresh
```

UART timeout interrupt threshold (unit: time of sending one byte)
Chapter 2. API

```c
uint8_t txfifo_empty_intr_thresh
UART TX empty interrupt threshold.

uint8_t rxfifo_full_thresh
UART RX full interrupt threshold.
```

```c
struct uart_event_t
Event structure used in UART event queue.
```

**Public Members**

```c
uart_event_type_t type
UART event type
```

```c
size_t size
UART data size for UART_DATA event
```

```c
bool timeout_flag
UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
```

**Macros**

```c
UART_NUM_0
UART port 0
```

```c
UART_NUM_1
UART port 1
```

```c
UART_NUM_2
UART port 2
```

```c
UART_NUM_MAX
UART port max
```

```c
UART_PIN_NO_CHANGE
```

**Type Definitions**

```c
typedef intr_handle_t uart_isr_handle_t
```

Submit Document Feedback
Enumerations

enum uart_event_type_t

UART event types used in the ring buffer.

Values:

enumerator UART_DATA

UART data event

enumerator UART_BREAK

UART break event

enumerator UART_BUFFER_FULL

UART RX buffer full event

enumerator UART_FIFO_OVF

UART FIFO overflow event

enumerator UART_FRAME_ERR

UART RX frame error event

enumerator UART_PARITY_ERR

UART RX parity event

enumerator UART_DATA_BREAK

UART TX data and break event

enumerator UART_PATTERN_DET

UART pattern detected

enumerator UART_EVENT_MAX

UART event max index

Header File

- components/hal/include/hal/uart_types.h

Structures

struct uart_at_cmd_t

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char

UART AT cmd char
uint8_t char_num  
AT cmd char repeat number

uint32_t gap_tout  
gap time (in baud-rate) between AT cmd char

uint32_t pre_idle  
the idle time (in baud-rate) between the non AT char and first AT char

uint32_t post_idle  
the idle time (in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t  
UART software flow control configuration parameters.

**Public Members**

uint8_t xon_char  
Xon flow control char

uint8_t xoff_char  
Xoff flow control char

uint8_t xon_thrd  
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd  
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t  
UART configuration parameters for uart_param_config function.

**Public Members**

int baud_rate  
UART baud rate

_uart_word_length_t data_bits  
UART byte size

_uart_parity_t parity  
UART parity mode

_uart_stop_bits_t stop_bits  
UART stop bits
**Chapter 2. API**

```c
uart_hw_flowcontrol_t flow_ctrl
    UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
    UART HW RTS threshold

uart_sclk_t source_clk
    UART source clock selection
```

### Type Definitions

typedef int **uart_port_t**
    UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

typedef **soc_periph_uart_clk_src_legacy_t** uart_sclk_t
    UART source clock.

### Enumerations

enum **uart_mode_t**
    UART mode selection.
    **Values:**

    enumerator **UART_MODE_UART**
        mode: regular UART mode

    enumerator **UART_MODE_RS485_HALF_DUPLEX**
        mode: half duplex RS485 UART mode control by RTS pin

    enumerator **UART_MODE_IRDA**
        mode: IRDA UART mode

    enumerator **UART_MODE_RS485_COLLISION_DETECT**
        mode: RS485 collision detection UART mode (used for test purposes)

    enumerator **UART_MODE_RS485_APP_CTRL**
        mode: application control RS485 UART mode (used for test purposes)

enum **uart_word_length_t**
    UART word length constants.
    **Values:**

    enumerator **UART_DATA_5_BITS**
        word length: 5bits

    enumerator **UART_DATA_6_BITS**
        word length: 6bits
enumerator UART_DATA_7_BITS
    word length: 7bits

enumerator UART_DATA_8_BITS
    word length: 8bits

enumerator UART_DATA_BITS_MAX

enum uart_stop_bits_t
    UART stop bits number.
    Values:
    
enumerator UART_STOP_BITS_1
    stop bit: 1bit

enumerator UART_STOP_BITS_1_5
    stop bit: 1.5bits

enumerator UART_STOP_BITS_2
    stop bit: 2bits

enumerator UART_STOP_BITS_MAX

enum uart_parity_t
    UART parity constants.
    Values:
    
enumerator UART_PARITY_DISABLE
    Disable UART parity

enumerator UART_PARITY_EVEN
    Enable UART even parity

enumerator UART_PARITY_ODD
    Enable UART odd parity

enum uart_hw_flowcontrol_t
    UART hardware flow control modes.
    Values:
    
enumerator UART_HW_FLOWCTRL_DISABLE
    disable hardware flow control

enumerator UART_HW_FLOWCTRL_RTS
    enable RX hardware flow control (rts)

enumerator UART_HW_FLOWCTRL_CTS
    enable TX hardware flow control (cts)
enumerator UART_HW_FLOWCTRL_CTS_RTS
    enable hardware flow control

enumerator UART_HW_FLOWCTRL_MAX

definitions

enum uart_signal_inv_t
    UART signal bit map.
    Values:

enumerator UART_SIGNAL_INV_DISABLE
    Disable UART signal inverse

enumerator UART_SIGNAL_IRDA_TX_INV
    inverse the UART irda_tx signal

enumerator UART_SIGNAL_IRDA_RX_INV
    inverse the UART irda_rx signal

enumerator UART_SIGNAL_RXD_INV
    inverse the UART rxd signal

enumerator UART_SIGNAL_CTS_INV
    inverse the UART cts signal

enumerator UART_SIGNAL_DSR_INV
    inverse the UART dsr signal

enumerator UART_SIGNAL_TXD_INV
    inverse the UART txd signal

enumerator UART_SIGNAL_RTS_INV
    inverse the UART rts signal

enumerator UART_SIGNAL_DTR_INV
    inverse the UART dtr signal

GPIOLookupMacros The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIOLookupMacros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

备注：These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. **UART_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0).

3. **UART_CTS_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses the esp-idf-kconfig package based on kconfiglib which is a Python-based extension to the Kconfig system. Kconfig provides a compile-time project configuration mechanism and is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extentions.
2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sdkconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

2.7.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for `git`). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see 自定义 `sdkconfig` 的默认值.

2.7.4 Kconfig Formatting Rules

The following attributes of `Kconfig` files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the help of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

Format checker

`tools/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.7.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `kconfiggen` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig` would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `kconfgen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target specific rename file: `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.

3. `kconfgen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.

4. **Deprecated options and their replacements** are automatically generated by `kconfgen`.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

**Build type**

Contains:

- `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`
- `CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS`
- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```bash
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```bash
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```
Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

```cpp
CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=y
CONFIG_ESP_ERR_TO_NAME_LOOKUP=y
```

Available options:
- Default (binary application + 2nd stage bootloader) (APP_BUILD_TYPE_APP_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL) (APP_BUILD_TYPE_ELF_RAM)

**CONFIG_APP_REPRODUCIBLE_BUILD**

Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

*Default value:*
- No (disabled)

**CONFIG_APP_NO_BLOBS**

No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

*Default value:*
- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERs**

App compatible with bootloader before ESP-IDF v2.1

*Found in: Build type*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

- If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.
- If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

*Default value:*
- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERs**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Build type*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.
Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**
- No (disabled)

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDSDIO_BOOST`

**CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION**

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc `O` argument) for the bootloader.

- The default “Size” setting will add the `-Os` flag to CFLAGS.
- The “Debug” setting will add the `-Og` flag to CFLAGS.
- The “Performance” setting will add the `-O2` flag to CFLAGS.
- The “None” setting will add the `-O0` flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**

- Size (-Os) (BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

**Available options:**

- No output (BOOTLOADER_LOG_LEVEL_NONE)
• Error (BOOTLOADER_LOG_LEVEL_ERROR)
• Warning (BOOTLOADER_LOG_LEVEL_WARN)
• Info (BOOTLOADER_LOG_LEVEL_INFO)
• Debug (BOOTLOADER_LOG_LEVEL_DEBUG)
• Verbose (BOOTLOADER_LOG_LEVEL_VERBOSE)

**CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN**

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in: Bootloader config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

*Default value:*

• No (disabled) if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

*Range:*

• from 0 to 33 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

*Default value:*

• 7 if ESPTOOLPY_FLASHMODE_QIO || ESPTOOLPY_FLASHMODE_QOUT

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MT-DI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*

• 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
• 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)
**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**Default value:**
- 4 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER_OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if `CONFIG_BOOTLOADER_FACTORY_RESET`
**CONFIG_BOOTLOADER_APP_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**
- 18 if `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL**

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE**

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**
- Yes (enabled)
**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

*Default value:*
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

*Default value:*
- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

*Range:*
- from 0 to 120000

*Default value:*
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

*Default value:*
- No (disabled)
**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see `BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should have a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the eFuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the eFuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 32 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

*Found in: Bootloader config > CONFIG BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP

Skip image validation when exiting deep sleep

Found in: Bootloader config

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep() entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

Default value:
- No (disabled) if (CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT

CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON

Skip image validation from power on reset (READ HELP FIRST)

Found in: Bootloader config

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option BOOTLOADER_WDT_ENABLE enabled and consider also enabling BOOTLOADER_WDT_DISABLE_IN_USER_CODE - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

Default value:
- No (disabled)

CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS

Skip image validation always (READ HELP FIRST)

Found in: Bootloader config

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

Default value:
- No (disabled)
**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Default value:**
- 0 if CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**Default value:**
- Yes (enabled)

**Security features**

Contains:

- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_SIGNED_APPS_SCHEME
- CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT
- CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP
- CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE
- CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_MODE
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_UART_ROM_DL_MODE
- CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT
CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.

2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

*Available options:*

- **ECDSA (SECURE_SIGNED_APPS_ECDSA_SCHEME)**
  - Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.

- **RSA (SECURE_SIGNED_APPS_RSA_SCHEME)**
  - Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

- **ECDSA (V2) (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)**
  - For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to brute force.

*Available options:*

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

*Found in: Security features*
If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**
- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `SECURE_SIGNED_APPS_ECDSA_SCHEME`

### CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

### CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
- No (disabled)

### CONFIG_SECURE_BOOT_VERSION

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

**Available options:**

Chapter 2. API

- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**

- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named as “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

- “secure_boot_signing_key.pem” if CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader.

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

*Default value:*

- No (disabled) if `CONFIG_SECURE_BOOT && SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY`

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espfuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

*Available options:*

- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

*Default value:*
Chapter 2. API

• No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read [*Flash Encryption*](https://github.com/espressif/esp-idf) before enabling.

**Default value:**

• No (disabled)

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**

Size of generated AES-XTS key

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated AES-XTS key.

• AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
• AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
• AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**

• AES-128 key derived from 128 bits (SHA256(128 bits)) (SE-CURE_FLASH_ENCRYPTION_AES128_DERIVED)
• AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
• AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**

• Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
• Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options**

Contains:

• `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
• `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
• `CONFIG_SECURE_BOOT_ALLOW_JTAG`
• `CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC`
Chapter 2. API Reference

- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
- CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
- CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

### CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

*Default value:*
- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

### CONFIG_SECURE_BOOT.Allow_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

*Default value:*
- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

### CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

### CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*
If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a BLOCK is read-protected, the application will read all zeros from that block

NOTE: If UART ROM download mode (Permanently disabled (recommended)) or UART ROM download mode (Permanently switch to Secure mode (recommended)) is set, then it is _NOT_ possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application

**CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` && `SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`
**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**
- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

**Default value:**
- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

**Available options:**
- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)

If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
• UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)

If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.

Secure Download mode limits the use of Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

Secure Download mode is not compatible with the esptool.py flasher stub feature, espefuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.

Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.

It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

• UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

• CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
• CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
• CONFIG_APP_PROJECT_VER_FROM_CONFIG
• CONFIG_APP_RETRIEVE_LEN_ELF_SHA
• CONFIG_APP_COMPILE_TIME_DATE

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

*Default value:*

• Yes (enabled)

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*

• No (disabled)
**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**

Exclude `PROJECT_NAME` from firmware image

*Found in: Application manager*

The `PROJECT_NAME` variable from the build system will not affect the firmware image. This value will not be contained in the `esp_app_desc` structure.

*Default value:*
- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item `APP_PROJECT_VER` will be used for the variable `PROJECT_VER`. Other ways to set `PROJECT_VER` will be ignored.

*Default value:*
- No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

*Default value:*
- 1 if `CONFIG_APP_PROJECT_VER_FROM_CONFIG`

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

*Range:*
- from 8 to 64

*Default value:*
- 16

**Serial flasher config**

Contains:

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
Chapter 2. API 参考

**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

*Default value:*

- No (disabled)

**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

*Available options:*

- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)
- OPI (ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

*Available options:*

- STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

*Available options:*

- 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
- 15 MHz (ESPTOOLPY_FLASHFREQ_15M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

*Available options:*

- 1347
Chapter 2. API

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

**Default value:**
- No (disabled)

**CONFIG_ESPTOOLPY_BEFORE**

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

**Partition Table**

Contains:

- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`
CONFIG_PARTITION_TABLE_TYPE

Partition Table

Found in: Partition Table

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:
• Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
• Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
• Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
• Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
• Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
• Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
• Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv
Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**
- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**
- Yes (enabled) if `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
• The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER_COMPILER_OPTIMIZATION setting.

Available options:
• Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
• Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
• Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
• Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:
• Enabled. Failure will print verbose assertion details. This is the default.
• Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
• Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:
• Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
• Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
• Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

Found in: Compiler options

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

Available options:
• libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
• librvp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros:
- ESP_RETURN_ON_ERROR
- ESP_EXIT_ON_ERROR
- ESP_RETURN_ON_FALSE
- ESP_EXIT_ON_FALSE

*Default value:*
- No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

*Default value:*
- Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

*Default value:*
- No (disabled)

Contains:
- **CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

*Default value:*
- 0 if CONFIG_COMPILER_CXX_EXCEPTIONS
**CONFIG_COMPILER_CXX_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

*Default value:*

- No (disabled)

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected - those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

*Available options:*

- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

*Default value:*

- No (disabled)

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in: Compiler options*
If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

Contains:

- ADC and ADC Calibration
- Application Level Tracing
- Bluetooth
- Common ESP-related
- Core dump
- Driver Configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH
- ESP HTTP client
- ESP HTTPS OTA
- ESP HTTPS server
- ESP NETIF Adapter
- ESP PSRAM
- ESP Ringbuf
- ESP System Settings
- ESP-MQTT Configurations
- ESP-TLS
- Ethernet
- Event Loop Library
- FAT Filesystem support
- FreeRTOS
- GDB Stub
- Hardware Abstraction Layer (HAL) and Low Level (LL)
- Hardware Settings
- Heap memory debugging
- High resolution timer (esp_timer)
- HTTP Server
- IPC (Inter-Processor Call)
- LCD and Touch Panel
- Log output
- LWIP
- mbedTLS
- Newlib
- NVS
- OpenThread
- PHY
- Power Management
- Protocomm
- PThreads
- SPI Flash driver
- SPIFFS Configuration
- Supplicant
- TCP Transport
- Ultra Low Power (ULP) Co-processor
- Unity unit testing library
- Virtual file system
- Wear Levelling
- Wi-Fi
- Wi-Fi Provisioning Manager
Application Level Tracing Contains:

- `CONFIG_APPTTRACE_DESTINATION1`
- `CONFIG_APPTTRACE_DESTINATION2`
- FreeRTOS SystemView Tracing
- `CONFIG_APPTTRACE_GCOV_ENABLE`
- `CONFIG_APPTTRACE_BUF_SIZE`
- `CONFIG_APPTTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_APPTTRACE_UART_BAUDRATE`
- `CONFIG_APPTTRACE_UART_RX_GPIO`
- `CONFIG_APPTTRACE_UART_RX_BUFF_SIZE`
- `CONFIG_APPTTRACE_UART_TASK_PRIO`
- `CONFIG_APPTTRACE_UART_TX_MSG_SIZE`
- `CONFIG_APPTTRACE_UART_TX_GPIO`
- `CONFIG_APPTTRACE_UART_TX_BUFF_SIZE`

**CONFIG_APPTTRACE_DESTINATION1**

Data Destination 1

*Found in:* Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

*Available options:*
- JTAG (`APPTTRACE_DEST_JTAG`)
- None (`APPTTRACE_DEST_NONE`)

**CONFIG_APPTTRACE_DESTINATION2**

Data Destination 2

*Found in:* Component config > Application Level Tracing

Select destination for application trace: UART(XX) or none (to disable).

*Available options:*
- UART0 (`APPTTRACE_DEST_UART0`)
- UART1 (`APPTTRACE_DEST_UART1`)
- UART2 (`APPTTRACE_DEST_UART2`)
- USB_CDC (`APPTTRACE_DEST_USB_CDC`)
- None (`APPTTRACE_DEST_UART_NONE`)

**CONFIG_APPTTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in:* Component config > Application Level Tracing

This GPIO is used for UART TX pin.

**CONFIG_APPTTRACE_UART_RX_GPIO**

UART RX on GPIO#

*Found in:* Component config > Application Level Tracing

This GPIO is used for UART RX pin.
**CONFIG_APPTRACE_UART_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG_APPTRACE_UART_TX_MSG_SIZE**

UART TX message size

*Found in: Component config > Application Level Tracing*

Maximum size of the single message to transfer.

**CONFIG_APPTRACE_UART_TASK_PRIO**

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

*Range:*
- from 1 to 32

*Default value:*
- 1

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.
**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- `CONFIG_APPTRACE_SV_CPU`
- `CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE`
- `CONFIG_APPTRACE_SV_MAX_TASKS`
- `CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE`
- `CONFIG_APPTRACE_SV_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_TS_SOURCE`
- `CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE`
- `CONFIG_APPTRACE_SV_BUF_WAIT_TMO`

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_DEST**

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView will transfer data through defined interface.
Available options:

- Data destination JTAG (APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

Available options:

- CPU0 (APPTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (APPTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (APPTRACE_SV_TS_SOURCE_ESP_TIMER)

CONFIG_APPTRACE_SV_MAX_TASKS

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.
Chapter 2. API 参考

**CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**
ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Enter” event.

**CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**
ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Exit” event.

**CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**
ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR to Scheduler” event.

**CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE**
Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Execution” event.

**CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE**
Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Execution” event.

**CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE**
Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Ready State” event.

**CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE**
Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Ready State” event.

**CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE**
Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Create” event.
CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**Bluetooth** Contains:

- *Bluedroid Options*
- *CONFIG_BT_ENABLED*
- *Controller Options*
- *NimBLE Options*

CONFIG_BT_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**
Chapter 2. API

- **Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)**
  This option is recommended for classic Bluetooth or for dual-mode use cases
- **NimBLE - BLE only (BT_NIMBLE_ENABLED)**
  This option is recommended for BLE only use cases to save on memory
- **Disabled (BT_CONTROLLER_ONLY)**
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**CONFIG_BT_CONTROLLER**

Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

**Available options:**
- **Enabled (BT_CONTROLLER_ENABLED)**
  This option is recommended for Bluetooth controller use cases
- **Disabled (BT_CONTROLLER_DISABLED)**
  This option is recommended for Bluetooth Host only use cases

**Bluedroid Options**

Contains:

- **CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**
- **CONFIG_BT_BLUEDROID_MEM_DEBUG**
- **CONFIG_BT_BTU_TASK_STACK_SIZE**
- **CONFIG_BT_BTC_TASK_STACK_SIZE**
- **CONFIG_BT_BLE_ENABLED**
- **BT_DEBUG LOG LEVEL**
- **CONFIG_BT_ACL_CONNECTIONS**
- **CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**
- **CONFIG_BT_CLASSIC_ENABLED**
- **CONFIG_BT_HID_ENABLED**
- **CONFIG_BT_STACK_NO_LOG**
- **CONFIG_BT_BLE_42_FEATURES_SUPPORTED**
- **CONFIG_BT_BLE_50_FEATURES_SUPPORTED**
- **CONFIG_BT_MULTI_CONNECTION_ENABLE**
- **CONFIG_BT_MAX_DEVICE_NAME_LEN**
- **CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**
- **CONFIG_BT_SSP_ENABLED**
- **CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**
- **CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT**
- **CONFIG_BT_BLE_RPA_SUPPORTED**
- **CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**
- **CONFIG_BT_HFP_WBS_ENABLE**

**CONFIG_BT_BTC_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**
- 3072 if BT_BLUEDROID_ENABLED & BT_BLUEDROID_ENABLED
CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_PINNED_TO_CORE_1)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**
- 4096 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_MEM_DEBUG

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_CLASSIC_ENABLED

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_A2DP_ENABLE

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_SPP_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && BT_BLUEDROID_ENABLED
CONFIG_BT_L2CAP_ENABLED

BT L2CAP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

*Default value:*

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

*Default value:*

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_ROLE

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

*Available options:*

- Hands Free Unit (BT_HFP_CLIENT_ENABLE)
- Audio Gateway (BT_HFP_AG_ENABLE)

CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

*Available options:*

- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

*Default value:*

- Yes (enabled) if `BT_HFP_AUDIO_DATA_PATH_HCI` && `BT_HFP_AUDIO_DATA_PATH_PCM` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_HID_ENABLED

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host
Default value:
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_ROLE**

Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

**Available options:**
- Classic BT HID Host (BT_HID_HOST_ENABLED)
  This enables the BT HID Host
- Classic BT HID Device (BT_HID_DEVICE_ENABLED)
  This enables the BT HID Device

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**
- Yes (enabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module (GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_PPCP_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`
**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 8 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Service Attributes Count

**Range:**
- from 1 to 500 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**Default value:**
- 100 if CONFIG_BT_GATTS_ENABLE && BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

**Available options:**
- GATTS manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API esp_ble_gatts_send_service_change_indication()  
- GATTS automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally
CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

Default value:
• Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC cache characteristic count

Range:
• from 1 to 500 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

Default value:
• 40 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVS_FLASH

Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

Default value:
• No (disabled) if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT

The number of attempts to reconnect if the connection establishment failed

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

Range:
• from 0 to 7 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

Default value:
• 3 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_SMP_ENABLE

Include BLE security module(SMP)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

Default value:
• Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED
**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluebird Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUE_DROID_ENABLED`

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluebird Options*

This select can save the rodata code size

**Default value:**
- No (disabled) if `BT_BLUE_DROID_ENABLED` && `BT_BLUE_DROID_ENABLED`

**BT_DEBUG_LOG_LEVEL**

Contains:

- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`

Chapter 2. API

• VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

Available options:
• NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTM_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

Available options:
• NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_L2CAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:
• NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
• API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
• EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_RFCOMM_TRACE_LEVELVERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:
• NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
Chapter 2. API

• ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SDP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

Available options:
• NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_GAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

Available options:
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

Available options:
• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL
A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer

**Available options:**
- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVDT_TRACE_LEVEL**

AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVDT layer

**Available options:**
- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVCT_TRACE_LEVEL**

AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer

**Available options:**
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVRC_TRACE_LEVEL**

AVRC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

**Available options:**
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
Chapter 2. API

- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

**Available options:**
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

**Available options:**
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for APPL layer

**Available options:**
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**
• NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
• API (BT_LOG_GATT_TRACE_LEVEL_API)
• EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

_Found in: Component config > Bluetooth > Bluez > BluezDroid Options > BT DEBUG LOG LEVEL_

Define BT trace level for SMP layer

_Available options:_
• NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

_Found in: Component config > Bluetooth > Bluez > BluezDroid Options > BT DEBUG LOG LEVEL_

Define BT trace level for BTIF layer

_Available options:_
• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

_Found in: Component config > Bluetooth > Bluez > BluezDroid Options > BT DEBUG LOG LEVEL_

Define BT trace level for BTC layer

_Available options:_
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

*Available options:*
- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

*Available options:*
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count

*Range:*
- from 1 to 7 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

*Default value:*
- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MULTI_CONNECTION_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

*Default value:*
- Yes (enabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM
**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluez Options*

This select can make the allocation of memory will become more flexible

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluez Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluez Options*

Originally, when doing BLE active scan, Bluez will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluez will report adv data or scan response to application layer immediately.

* # Memory reserved at start of DRAM for Bluetooth stack

**Default value:**
- No (disabled) if BT_BLUEDROID_ENABLED & & CONFIG_BT_BLE_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluez Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

**Range:**
- from 1 to 60 if BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**Default value:**
- 30 if BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_MAX_DEVICE_NAME_LEN**

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluez Options*
Bluetooth Device name length shall be no larger than 248 octets. If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

**Range:**
- from 32 to 248 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**
- 32 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_RPA_SUPPORTED**

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For ESP32C3, ESP32S3, ESP32H4 and ESP32C2, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_50_FEATURES_SUPPORTED**

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**
- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_42_FEATURES_SUPPORTED**

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

**NimBLE Options**

Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_52_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_53_FEATURE_SUPPORT`
Chapter 2. API

- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_MESH

  - CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
  - CONFIG_BT_NIMBLE_RPA_TIMEOUT
  - CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
  - CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region.
  Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity”.
Available options:

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.

*Range:*
- from 1 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

*Default value:*
- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

*Default value:*
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

*Range:*
- from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity
Available options:

- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable central role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_BROADCASTER**

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable broadcaster role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_OBSERVER**

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable observer role

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*
Enable this flag to make bonding persistent across device reboots

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*
Enable BLE sm feature

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- **CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION**
- **CONFIG_BT_NIMBLE_SM_LEGACY**
- **CONFIG_BT_NIMBLE_SM_SC**

CONFIG_BT_NIMBLE_SM_LEGACY
Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*
Enable security manager legacy pairing

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC
Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*
Enable security manager secure connections

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS
Use predefined public-private key pair

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC*
If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_SM_SC` && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION**

Enable LE encryption

*Found in:* Component config > Bluetooth > NimBLE Options > `CONFIG_BT_NIMBLE_SECURITY_ENABLE`

Enable encryption connection

**Default value:**

• Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_DEBUG**

Enable extra runtime asserts and host debugging

*Found in:* Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**

• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME**

BLE GAP default device name

*Found in:* Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

**Default value:**

• “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN**

Maximum length of BLE device name in octets

*Found in:* Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

• 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in:* Component config > Bluetooth > NimBLE Options

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**Default value:**

• 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Memory Settings**

Contains:

- `CONFIG_BT_NIMBLE_ACL_BUF_COUNT`
- `CONFIG_BT_NIMBLE_ACL_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`
- `CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT**

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 24 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 12 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE**

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**
- 128 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 256 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT**

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**
- 24 if BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE
MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**
- 320 if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_COUNT
ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers.

**Default value:**
- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ACL_BUF_SIZE
ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**
- 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**
- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GATT_MAX_PROCS
Maximum number of GATT client procedures

*Found in: Component config > Bluetooth > NimBLE Options*

Maximum number of GATT client procedures that can be executed.

**Default value:**
- 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL
Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

**Default value:**
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH
Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection
Default value:
  • Yes (enabled) if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

*Range:*
  • from 1 to 41400 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*
  • 900 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

*Default value:*
  • No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
  • CONFIG_BT_NIMBLE_MESH_PROVISIONER
  • CONFIG_BT_NIMBLE_MESH_PROV
  • CONFIG_BT_NIMBLE_MESH_GATT_PROXY
  • CONFIG_BT_NIMBLE_MESH_FRIEND
  • CONFIG_BT_NIMBLE_MESH_LOW_POWER
  • CONFIG_BT_NIMBLE_MESH_PROXY
  • CONFIG_BT_NIMBLE_MESH_RELAY
  • CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
  • CONFIG_BT_NIMBLE_MESH_NODE_COUNT

CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIM-BLE_MESH_GATT_PROXY is set

*Default value:*
  • No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

*Default value:*
  • Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_PB_ADV
Enable mesh provisioning over advertising bearer

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Low Power Node

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

• “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_NODE_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**

• 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**

• 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

• Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

• 2000 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT**

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
• No (disabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT**

Maximum number connection reattempts

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Defines maximum number of connection reattempts.

**Range:**
- from 1 to 7 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**Default value:**
- 3 if BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT**

Enable BLE 5 feature

*Found in:* Component config > Bluetooth > NimBLE Options

Enable BLE 5 feature

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY**

Enable 2M Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable 2M-PHY

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY**

Enable coded Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable coded-PHY

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_EXT_ADV**

Enable extended advertising

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

**Range:**
- from 0 to 4 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**Default value:**
- 1 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && && BT_NIMBLE_ENABLED

**Default value:**
- 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && && BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transer Sync Events

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

This enables controller transfer periodic sync events to host

*Default value:*

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

*Range:*

- from 0 to 8 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

*Default value:*

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_53_FEATURE_SUPPORT

Enable BLE 5.3 feature

*Found in:* Component config > Bluetooth > NimBLE Options

Enable BLE 5.3 feature

Contains:

- `CONFIG_BT_NIMBLE_SUBRATE`

CONFIG_BT_NIMBLE_SUBRATE

Connection Subrate

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_53_FEATURE_SUPPORT

Enable support for Connection Subrate

CONFIG_BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in:* Component config > Bluetooth > NimBLE Options

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

*Available options:*

- Force Enable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_EN)
- Always enable the limitation on max tx/rx time for Coded-PHY connection
• Force Disable (BT_NIMBLE_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

**CONFIG_BT_NIMBLE_52_FEATURE_SUPPORT**

Enable BLE 5.2 Feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to select 5.2 features

Contains:

• **CONFIG_BT_NIMBLE_BLE_POWER_CONTROL**

**CONFIG_BT_NIMBLE_BLE_POWER_CONTROL**

Enable support for BLE Power Control

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_52_FEATURE_SUPPORT*

Set this option to enable the Power Control feature

**CONFIG_BT_NIMBLE_WHITELIST_SIZE**

BLE white list size

*Found in: Component config > Bluetooth > NimBLE Options*

BLE list size

*Range:*
  • from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

*Default value:*
  • 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST**

Throughput Test Mode enable

*Found in: Component config > Bluetooth > NimBLE Options*

Enable the throughput test mode

*Default value:*
  • No (disabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_BLUFI_ENABLE**

Enable blufi functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to enable blufi functionality.

*Default value:*
  • No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_USE_ESP_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

**Controller Options**

Contains:

- CONFIG_BTDM_CTRL_AUTO_LATENCY
- CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP
- CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED
- CONFIG_BTDM_CTRL_BLE_MAX_CONN
- CONFIG_BTDM_BLE_SCAN_DUPL
- CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY
- CONFIG_BTDM_CTRL_MODE
- CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
- CONFIG_BTDM_CTRL_BR_EDR_MAX_SCO_DATA_PATH
- CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN
- CONFIG_BTDM_CTRL_HCI_MODE_CHOICE
- HCI UART(H4) Options
- CONFIG_BTDM_CTRL_HLI
- CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT
- MODEM SLEEP Options
- CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG
- CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE

**CONFIG_BTDM_CTRL_MODE**

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Controller Options*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

**CONFIG_BTDM_CTRL_BLE_MAX_CONN**

BLE Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 9 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 3 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED
**CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN**

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 7 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 2 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN**

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH**

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Controller Options*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

**Available options:**
- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

**CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG**

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > Controller Options*

**Default value:**
- Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && BT_CONTROLLER_ENABLED

**Contains:**
- CONFIG_BTDM_CTRL_PCM_POLAR
- CONFIG_BTDM_CTRL_PCM_ROLE
Chapter 2. API

**CONFIG_BTDM_CTRL_PCM_ROLE**

PCM Role

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

**Available options:**

- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

**CONFIG_BTDM_CTRL_PCM_POLAR**

PCM Polar

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

**Available options:**

- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)

**CONFIG_BTDM_CTRL_AUTO_LATENCY**

Auto latency

*Found in: Component config > Bluetooth > Controller Options*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

**Default value:**

- No (disabled) if BTDM_CTRL_MODE_BTDM && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT**

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Controller Options*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)
Chapter 2. API Reference

**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

**Available options:**
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  - Normal option. Mostly, choose this VHCI when Bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  - If use external Bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options** Contains:
- `CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE`
- `CONFIG_BTDM_CTRL_HCI_UART_NO`

**CONFIG_BTDM_CTRL_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**Range:**
- from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**Default value:**
- 1 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

**Range:**
- from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**Default value:**
- 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**MODEM SLEEP Options** Contains:
- `CONFIG_BTDM_CTRL_LOW_POWER_CLOCK`
- `CONFIG_BTDM_CTRL_MODEM_SLEEP`

**CONFIG_BTDM_CTRL_MODEM_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable Bluetooth controller low power mode.

**Default value:**
- Yes (enabled) if BT_CONTROLLER_ENABLED
**CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE**

Bluetooth Modem sleep mode

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BTDM_CTRL_MODEM_SLEEP*

To select which strategy to use for modem sleep

**Available options:**
- **ORIG Mode (sleep with low power clock)** (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a Bluetooth sleep mode that can be used for dual mode controller. In this mode, Bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain Bluetooth reference clock.
- **EVED Mode (For internal test only)** (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
  EVED mode is for BLE only and is only for internal test. Do not use it for production. This mode is not compatible with DFS nor light sleep.

**CONFIG_BTDM_CTRL_LOW_POWER_CLOCK**

Bluetooth low power clock

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Select the low power clock source for Bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**
- **Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)**
  Main crystal can be used as low power clock for Bluetooth modem sleep. If this option is selected, Bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the Bluetooth low power clock source.
- **External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)**
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

**CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Controller Options*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscialltor (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.
Available options:
- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

CONFIG_BTDM_BLE_SCAN_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”，This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data” . This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**
- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
- from 10 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

**Default value:**
- 100 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.
Default value:
• No (disabled) if `CONFIG_BTDM_BLE_SCAN_DUPL` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
• from 10 to 1000 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `BT_CONTROLLER_ENABLED`

**Default value:**
• 100 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED**

BLE full scan feature supported

*Found in: Component config > Bluetooth > Controller Options*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**
• Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
• Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
Chapter 2. API

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

- from 50 to 1000 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**Default value:**
- 100 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

When adv report flow control is enabled, the ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
- from 1 to 1000 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**Default value:**
- 20 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_CTRL_HLI**

High level interrupt

*Found in:* Component config > Bluetooth > Controller Options

Using Level 4 interrupt for Bluetooth.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED` && `BT_CONTROLLER_ENABLED`

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in:* Component config

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:
- BLE Mesh and BLE coexistence support
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- BLE Mesh NET BUF DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- BLE Mesh specific test option
- BLE Mesh STACK DEBUG LOG LEVEL
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
• CONFIG_BLE_MESH_MODEL_KEY_COUNT
• CONFIG_BLE_MESH_APP_KEY_COUNT
• CONFIG_BLE_MESH_MODEL_GROUP_COUNT
• CONFIG_BLE_MESH_LABEL_COUNT
• CONFIG_BLE_MESH_SUBNET_COUNT
• CONFIG_BLE_MESH_TX_SEG_MAX
• CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_TX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_MEM_ALLOC_MODE
• CONFIG_BLE_MESH_MSG_CACHE_SIZE

• CONFIG_BLE_MESH_PB_ADV
• CONFIG_BLE_MESH_IVU_RECOVERY_IVI
• CONFIG_BLE_MESH_RELAY
• CONFIG_BLE_MESH_SETTINGS
• CONFIG_BLE_MESH_DEINIT
• CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
• Support for BLE Mesh Client/Server models
• Support for BLE Mesh Foundation models
• CONFIG_BLE_MESH_NODE
• CONFIG_BLE_MESH_PROVISIONER
• CONFIG_BLE_MESH_FRIEND
• CONFIG_BLE_MESH_LOW_POWER
• CONFIG_BLE_MESH_HCI_5_0
• CONFIG_BLE_MESH_IV_UPDATE_TEST
• CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

*Default value:*

• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

*Default value:*

• Yes (enabled) if BT_BLUEDROID_ENABLED && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

• Internal DRAM memory only
Chapter 2. API

- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:
- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)

Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

- Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**
- No (disabled) if (CONFIG_SPIRAM || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE**

Memory allocation for FreeRTOS objects

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**
- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

**CONFIG_BLE_MESH_DEINIT**

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*
If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**BLE Mesh and BLE coexistence support**
Contains:
- `CONFIG_BLE_MESH_SUPPORT_BLE_SCAN`
- `CONFIG_BLE_MESH_SUPPORT_BLE_ADV`

**CONFIG_BLE_MESH_SUPPORT_BLE_ADV**
Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT**
Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_SUPPORT_BLE_ADV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUPPORT_BLE_SCAN**
Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FAST_PROV**
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
Chapter 2. API 参考

**CONFIG_BLE_MESH_NODE**

Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

**CONFIG_BLE_MESH_PROVISIONER**

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

**CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM**

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

*Range:*
- from 1 to 100 if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_PROV_NODES**

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

*Range:*
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBASAME_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For examples, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

*Range:*

**Chapter 2. API**

- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_PB_ADV` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_PB_GATT` & `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` & `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

*Range:*
  - from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:*
  - 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

*Range:*
  - from 1 to 100 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH

*Default value:*
  - 5 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH
  - 3 if CONFIG_BLE_MESH_FAST_PROV && CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH
CONFIG_BLE_MESH_PB_GATT
Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY
BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_SERVER
BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE_ID_TIMEOUT
Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**
- from 1 to 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**Default value:**
- 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROXY_FILTER_SIZE
Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**
Chapter 2. API

- from 1 to 32767 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**Default value:**
- 4 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**Default value:**
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash), e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

**Range:**
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH
**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

*Range:*
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

*Default value:*
- 0 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

*Default value:*
- No (disabled) if `CONFIG_BLE_MESH_NODE` & `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

*Default value:*
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION

This value defines the name of the specified NVS partition used by the mesh stack.

*Default value:*
- “ble_mesh” if CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

*Default value:*
- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

This option specifies the maximum NVS namespaces supported by Provisioner.

*Range:*
- from 1 to 255 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

*Default value:*
- 2 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in:* Component config > CONFIG_BLE_MESH

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

*Range:*
- from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
- 3 if CONFIG_BLE_MESH
**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

*Range:*
- from 1 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses that can be supported by a node.

*Range:*
- from 0 to 4096 if `CONFIG_BLE_MESH`

*Default value:*
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into account.
consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

Range:
- from 2 to 65535 if `CONFIG_BLE_MESH`

Default value:
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

Range:
- from 2 to 65535 if `CONFIG_BLE_MESH`

Default value:
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

Range:
- from 6 to 256 if `CONFIG_BLE_MESH`

Default value:
- 60 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

Range:
- from 2 to 96 if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_IVU_RECOVERY_IVI**

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: Component config > CONFIG_BLE_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

*Default value:*

- No (disabled) if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

*Range:*

- from 1 to 255 if `CONFIG_BLE_MESH`

*Default value:*

- 1 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

*Range:*

- from 1 to 255 if `CONFIG_BLE_MESH`

*Default value:*

- 1 if `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*

- from CONFIG_BLE_MESH to CONFIG_BLE_MESH
Chapter 2. API

• from 36 to 384 if CONFIG_BLE_MESH

Default value:
• 384 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

Range:
• from 2 to 32 if CONFIG_BLE_MESH

Default value:
• 32 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY

Relay support

Found in: Component config > CONFIG_BLE_MESH

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

Default value:
• No (disabled) if CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT

Number of advertising buffers for relay packets

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF

Number of advertising buffers for relay packets available.

Range:
Chapter 2. API

• from 6 to 256 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**Default value:**
• 60 if CONFIG_BLE_MESH_RELAY_ADV_BUF && CONFIG_BLE_MESH_RELAY && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPN_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling bt_mesh_lpn_set(true). When an un provisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**
• No (disabled) if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
• from 0 to 3600 if CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
• 15 if CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH
CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

Range:
- from 1 to 3600 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 6 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

Range:
- from 1 to 7 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 1 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RECV_DELAY

Espressif Systems 1414 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 10 to 255 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 100 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 300 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_SCAN_LATENCY**

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LPN_GROUPS**

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*
Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  
**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR**
Automatically subscribe all nodes address

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND**
Support for Friend feature

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**
Friend Receive Window

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`  
**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**
Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`  
**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**
Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`
Default value:
  • 3 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

Range:
  • from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
  • 2 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

Range:
  • from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

Default value:
  • 1 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

Found in: Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

Default value:
  • No (disabled) if CONFIG_BLE_MESH && CONFIG_BLE_MESH

BLE Mesh STACK DEBUG LOG LEVEL  Contains:
  • CONFIG_BLE_MESH_STACK_TRACE_LEVEL

CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:
  • NONE (BLE_MESH_TRACE_LEVEL_NONE)
  • ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
  • WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
  • INFO (BLE_MESH_TRACE_LEVEL_INFO)
  • DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
  • VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)
Chapter 2. API

**BLE Mesh NET BUF DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

`BLE_MESH_NET_BUF`

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

*Available options:*

- **NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)**
- **ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)**
- **WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)**
- **INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)**
- **DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)**
- **VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)**

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout(ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

*Range:*

- **from 100 to 1200000 if CONFIG_BLE_MESH**

*Default value:*

- **4000 if CONFIG_BLE_MESH**

**Support for BLE Mesh Foundation models** Contains:

- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.
CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Health Server model.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH

Support for BLE Mesh Client/Server models Contains:
- CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
- CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
- CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
- CONFIG_BLE_MESH_GENERIC_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
- CONFIG_BLE_MESH_GENERIC_SERVER
- CONFIG_BLE_MESH_LIGHT_CTL_CLI
- CONFIG_BLE_MESH_LIGHT_HSL_CLI
- CONFIG_BLE_MESH_LIGHT_LC_CLI
- CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
- CONFIG_BLE_MESH_LIGHT_XYL_CLI
- CONFIG_BLE_MESH_LIGHTING_SERVER
- CONFIG_BLE_MESH_SCENE_CLI
- CONFIG_BLE_MESH_SCHEDULER_CLI
- CONFIG_BLE_MESH_SENSOR_CLI
- CONFIG_BLE_MESH_SENSOR_SERVER
- CONFIG_BLE_MESH_TIME_SCENE_SERVER
- CONFIG_BLE_MESH_TIME_CLI

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic OnOff Client model.

CONFIG_BLE_MESH GENERIC_LEVEL_CLI

Generic Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Level Client model.

CONFIG_BLE_MESH GENERIC DEF_TRANS_TIME_CLI

Generic Default Transition Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Generic Default Transition Time Client model.
CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic Property Client model.

CONFIG_BLE_MESHSENSOR_CLI
Sensor Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Scene Client model.
**CONFIG_BLE_MESH_SCHEDULER_CLI**

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.

**CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI**

Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light Lightness Client model.

**CONFIG_BLE_MESH_LIGHT_CTL_CLI**

Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light CTL Client model.

**CONFIG_BLE_MESH_LIGHT_HSL_CLI**

Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light HSL Client model.

**CONFIG_BLE_MESH_LIGHT_XYL_CLI**

Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light XYL Client model.

**CONFIG_BLE_MESH_LIGHT_LC_CLI**

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

**CONFIG_BLE_MESH GENERIC_SERVER**

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_SENSOR_SERVER**

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TIME_SCENE_SERVER**

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LIGHTING_SERVER**

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option**  Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_SELF_TEST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, an unprovisioned device can automatically enter the mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver Configurations  Contains:

- DAC Configuration
- GPIO Configuration
- GPTimer Configuration
- I2S Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- PCNT Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration

Legacy ADC Configuration  Contains:

- CONFIG_ADC_DISABLE_DAC
- Legacy ADC Calibration Configuration
- CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled)

CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

Weather to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.
**Legacy ADC Calibration Configuration**  
Contains:

- `CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`
- `CONFIG_ADC_CAL_LUT_ENABLE`
- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`

**CONFIG_ADC_CAL_EFUSE_TP_ENABLE**

Use Two Point Values

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**

Use eFuse Vref

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CAL_LUT_ENABLE**

Use Lookup Tables

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**

- Yes (enabled)

**CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
**SPI Configuration**

Contains:

- `CONFIG_SPI_MASTER_ISR_IN_IRAM`
- `CONFIG_SPI_SLAVE_ISR_IN_IRAM`
- `CONFIG_SPI_MASTER_IN_IRAM`
- `CONFIG_SPI_SLAVE_IN_IRAM`

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**

- No (disabled)

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.
Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

Default value:
- Yes (enabled)

**TWAI Configuration**  Contains:
- `CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID`
- `CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC`
- `CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT`
- `CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI_ALERT_AND_LOG flag) will have no effect.

Default value:
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver Configurations > TWAI Configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

Default value:
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**

Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

Default value:
- Yes (enabled)
CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID

Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT

Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

Temperature sensor Configuration

Contains:
- CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG
- CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN

CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Wether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Wether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

UART Configuration

Contains:
- CONFIG_UART_ISR_IN_IRAM
CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

*Found in: Component config > Driver Configurations > UART Configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled) if `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`

GPIO Configuration  Contains:

- `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`
- `CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL`

CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL

Support light sleep GPIO pullup/pulldown configuration for ESP32

*Found in: Component config > Driver Configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.

CONFIG_GPIO_CTRL_FUNC_IN_IRAM

Place GPIO control functions into IRAM

*Found in: Component config > Driver Configurations > GPIO Configuration*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)

Sigma Delta Modulator Configuration  Contains:

- `CONFIG_SDM_ENABLE_DEBUG_LOG`
- `CONFIG_SDM_CTRL_FUNC_IN_IRAM`
- `CONFIG_SDM_SUPPRESS_DEPRECATED_WARN`

CONFIG_SDM_CTRL_FUNC_IN_IRAM

Place SDM control functions into IRAM

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)
**CONFIG_SDM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_SDM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**GPTimer Configuration**

Contains:
- **CONFIG_GPTIMER_ENABLE_DEBUG_LOG**
- **CONFIG_GPTIMER_ISR_IRAM_SAFE**
- **CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**
- **CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN**

**CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**

Place GPTimer control functions into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ISR_IRAM_SAFE**

GPTimer ISR IRAM-Safe

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > GPTimer Configuration*
Wether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Wether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**PCNT Configuration**
Contains:
- `CONFIG_PCNT_ENABLE_DEBUG_LOG`
- `CONFIG_PCNT_ISR_IRAM.Safe`
- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`
- `CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN`

**CONFIG_PCNT_CTRL_FUNC_IN_IRAM**
Place PCNT control functions into IRAM

*Found in: Component config > Driver Configurations > PCNT Configuration*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_PCNT_ISR_IRAM_SAFE**
PCNT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > PCNT Configuration*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > PCNT Configuration*

Wether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)
CONFIG_PCNT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**RMT Configuration** Contains:
- `CONFIG_RMT_ENABLE_DEBUG_LOG`
- `CONFIG_RMT_ISR_IRAM_SAFE`
- `CONFIG_RMT_SUPPRESS_DEPRECATE_WARN`

CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_RMT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

MCPWM Configuration Contains:
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG`
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM`
- `CONFIG_MCPWM_ISR_IRAM_SAFE`
- `CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN`
CONFIG_MCPWM_ISR_IRAM_SAFE

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled)

CONFIG_MCPWM_CTRL_FUNC_IN_IRAM

Place MCPWM control functions into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Place MCPWM control functions (like set_compare_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_MCPWM_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**I2S Configuration**

Contains:
- CONFIG_I2S_ENABLE_DEBUG_LOG
- CONFIG_I2S_ISR_IRAM_SAFE
- CONFIG_I2S_SUPPRESS_DEPRECATE_WARN

CONFIG_I2S_ISR_IRAM_SAFE

I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).
Default value:
  • No (disabled)

**CONFIG_I2S.Suppress_Deprecate.Warn**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

Default value:
  • No (disabled)

**CONFIG_I2S_Enable_Debug_Log**
Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

Default value:
  • No (disabled)

**DAC Configuration**
Contains:
  • CONFIG_DAC_DMA.Auto_16Bit.Align
  • CONFIG_DAC_ISR.IRAM.Safe
  • CONFIG_DAC_Enable_Debug_Log
  • CONFIG_DAC_CTRL.Func.In.IRAM
  • CONFIG_DAC.Suppress_Deprecate.Warn

**CONFIG_DAC_CTRL.Func.In.IRAM**
Place DAC control functions into IRAM

*Found in: Component config > Driver Configurations > DAC Configuration*

Place DAC control functions (e.g. `dac_oneshot_output_voltage`) into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
  • No (disabled)

**CONFIG_DAC_ISR.IRAM.Safe**
DAC ISR IRAM-Safe

*Found in: Component config > Driver Configurations > DAC Configuration*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
  • No (disabled)
CONFIG_DAC_SUPPRESS_DEPRECATED_WARN
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_DAC_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

CONFIG_DAC_DMA_AUTO_16BIT_ALIGN
Align the continuous data to 16 bit automatically

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**
- Yes (enabled)

eFuse Bit Manager Contains:
- CONFIG_EFUSE_CODE_SCHEME_SELECTOR
- CONFIG_EFUSE_VIRTUAL
- CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_CUSTOM_TABLE
Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME
Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.
Chapter 2. API 参考

**Default value:**
- "main/esp_efuse_custom_table.csv" if CONFIG_EFUSE_CUSTOM_TABLE

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the efuse partition.

`partition.csv`: `efuse_em, data, efuse, . 0x2000`

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure.boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**
- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS** Contains:
- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT
**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**
- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

**CONFIG_ESP_TLS_USE_SECURE_ELEMENT**

Use Secure Element (ATECC608A) with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESP-WROOM32SE, which can be used for TLS connection.

**CONFIG_ESP_TLS_USE_DS_PERIPHERAL**

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**
- Yes (enabled) if ESP_TLS_USING_MBEDTLS && SOC_DIG_SIGN_SUPPORTED

**CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS**

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

**CONFIG_ESP_TLS_SERVER**

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_SERVER_SESSION_TICKETS**

Enable server session tickets

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Enable session ticket support as specified in RFC5077
**CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT**

Server session ticket timeout in seconds

*Found in:*  
Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Sets the session ticket timeout used in the TLS server.

*Default value:*  
• 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

**CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK**

Certificate selection hook

*Found in:*  
Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

**CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL**

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in:*  
Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

mbedtls_ssl_get_verify_result() can be called after the handshake is complete to retrieve status of verification.

**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in:*  
Component config > ESP-TLS

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_INSECURE**

Allow potentially insecure options

*Found in:*  
Component config > ESP-TLS

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in:*  
Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.
CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust up to the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

CONFIG_ESP_DEBUG_WOLFSSL
Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

ADC and ADC Calibration Contains:
- ADC Calibration Configurations
- CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE
- CONFIG_ADC_DISABLE_DAC_OUTPUT
- CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM
Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**
- No (disabled)

CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE
ADC continuous mode driver ISR IRAM-Safe

*Found in: Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**
- No (disabled)

ADC Calibration Configurations Contains:
- CONFIG_ADC_CALI_EFUSE_VREF_ENABLE
- CONFIG_ADC_CALI_LUT_ENABLE
- CONFIG_ADC_CALI_EFUSE_TP_ENABLE
CONFIG_ADC_CALI_EFUSE_TP_ENABLE

Use Two Point Values

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CALI_EFUSE_VREF_ENABLE

Use eFuse Vref

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CALI_LUT_ENABLE

Use Lookup Tables

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)

CONFIG_ADC_DISABLE_DAC_OUTPUT

Disable DAC when ADC2 is in use

*Found in: Component config > ADC and ADC Calibration*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**
- Yes (enabled)

Common ESP-related Contains:
- CONFIG_ESP_ERR_TO_NAME_LOOKUP

CONFIG_ESP_ERR_TO_NAME_LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order
to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**Ethernet** Contains:
- `CONFIG_ETH_TRANSMIT_MUTEX`
- `CONFIG_ETH_USE_ESP32_EMAC`
- `CONFIG_ETH_USE_OPENETH`
- `CONFIG_ETH_USE_SPI_ETHERNET`

**CONFIG_ETH_USE_ESP32_EMAC**
Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**
- Yes (enabled)

Contains:
- `CONFIG_ETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_DMA_TX_BUFFER_NUM`
- `CONFIG_ETH_SOFT_FLOW_CONTROL`
- `CONFIG_ETH_DMA_BUFFER_SIZE`
- `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0`
- `CONFIG_ETH_PHY_INTERFACE`
- `CONFIG_ETH_RMII_CLK_OUT_GPIO`
- `CONFIG_ETH_RMII_CLK_MODE`

**CONFIG_ETH_PHY_INTERFACE**
PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

**Available options:**
- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)

**CONFIG_ETH_RMII_CLK_MODE**
RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**
- Input RMII clock from external (ETH_RMII_CLK_INPUT) MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- Output RMII clock from internal (ETH_RMII_CLK_OUTPUT) ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.
**CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

**Default value:**
- No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_RMII_CLK_OUT_GPIO**

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

**Range:**
- from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**Default value:**
- 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_DMA_BUFFER_SIZE**

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

**Range:**
- from 256 to 1600

**Default value:**
- 512

**CONFIG_ETH_DMA_RX_BUFFER_NUM**

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.
Range:
  • from 3 to 30
Default value:
  • 10

CONFIG_ETH_SOFT_FLOW_CONTROL
Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

Default value:
  • No (disabled) if CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 && CONFIG_ETH_USE_ESP32_EMAC

CONFIG_ETH_USE_SPI_ETHERNET
Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

Default value:
  • Yes (enabled)

Contains:
  • CONFIG_ETH_SPI_ETHERNET_DM9051
  • CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
  • CONFIG_ETH_SPI_ETHERNET_W5500

CONFIG_ETH_SPI_ETHERNET_DM9051
Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

CONFIG_ETH_SPI_ETHERNET_W5500
Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL
Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.
**CONFIG_ETH_USE_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:
- CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 4 if CONFIG_ETH_USE_OPENETH

**CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 1 if CONFIG_ETH_USE_OPENETH

**CONFIG_ETH_TRANSMIT_MUTEX**

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**
- No (disabled)

**Event Loop Library**

Contains:
- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR
CONFIG_ESP_EVENT_LOOP_PROFILING
Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**
- No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR
Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**Default value:**
- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR
Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

**Default value:**
- Yes (enabled)

GDB Stub   Contains:
- **CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using `info threads` command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS
Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

**Default value:**
- 32 if **CONFIG_ESP_GDBSTUB_SUPPORT_TASKS**
Chapter 2. API

ESP HTTP client  Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

`CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

`CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

`CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

HTTP Server  Contains:

- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

`CONFIG_HTTPD_MAX_REQ_HDR_LEN`

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512
Chapter 2. API

**CONFIG_HTTPD_MAX_URI_LEN**

Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**
- 512

**CONFIG_HTTPD_ERR_RESP_NO_DELAY**

Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**
- Yes (enabled)

**CONFIG_HTTPD_PURGE_BUF_LEN**

Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**
- 32

**CONFIG_HTTPD_LOG_PURGE_DATA**

Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)

**CONFIG_HTTPD_WS_SUPPORT**

WebSocket server support

*Found in: Component config > HTTP Server*

This sets the WebSocket server support.

**Default value:**
- No (disabled)
CONFIG_HTTPD_QUEUE_WORK_BLOCKING

httpd_queue_work as blocking API

*Found in: Component config > HTTP Server*

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to LWIP_UDP_RECVMBOX_SIZE to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

ESP HTTPS OTA Contains:

- CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP
- CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

Provide decryption callback

*Found in: Component config > ESP HTTPS OTA*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**
- No (disabled)

CONFIG_ESP_HTTPS_OTA.Allow_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**
- No (disabled)

ESP HTTPS server Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

Hardware Settings Contains:

- Chip revision
- ETM Configuration
- GDMA Configuration
- MAC Config
- Main XTAL Config
- MMU Config
- Peripheral Control
Chip revision  
**Contains:**

- `CONFIG_ESP32_REV_MIN`

**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) (`ESP32_REV_MIN_0`)
- Rev v1.0 (ECO1) (`ESP32_REV_MIN_1`)
- Rev v1.1 (ECO1.1) (`ESP32_REV_MIN_1.1`)
- Rev v2.0 (ECO2) (`ESP32_REV_MIN_2`)
- Rev v3.0 (ECO3) (`ESP32_REV_MIN_3`)
- Rev v3.1 (ECO4) (`ESP32_REV_MIN_3.1`)

**MAC Config**  
**Contains:**

- `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES`

**CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES**

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**

- Two (`ESP32_UNIVERSAL_MAC_ADDRESSES_TWO`)
- Four (`ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR`)

**Sleep Config**  
**Contains:**

- `CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU`
- `CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY`
- `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND`
- `CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND`
- `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH`
- `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`
**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

**Default value:**

- No (disabled) if CONFIG_SPIRAM

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

Light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c2, esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

PSRAM leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**Default value:**

- Yes (enabled) if CONFIG_SPIRAM

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Flash leakage current workaround in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**Default value:**

- Yes (enabled)
CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO PU

All pins of mspi need pull up

*Found in: Component config > Hardware Settings > Sleep Config*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > Hardware Settings > Sleep Config*

When the chip exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

*Range:*
  - from 0 to 5000

*Default value:*
  - 2000

RTC Clock Config  Contains:

- CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD
- CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB
- CONFIG_RTC_XTAL_CAL_RETRY
- CONFIG_RTC_CLK_CAL_CYCLES
- CONFIG_RTC_CLK_SRC

CONFIG_RTC_CLK_SRC

RTC clock source

*Found in: Component config > Hardware Settings > RTC Clock Config*

Choose which clock is used as RTC clock source.

- **“Internal 150kHz oscillator” option provides lowest deep sleep current** consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
- **“External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.**
- **“External 32kHz oscillator” allows using 32kHz clock generated by an external circuit.** In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin cannot be used as a GPIO in this case.
- **“Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current** (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.
Available options:

- Internal 150kHz RC oscillator (RTC_CLK_SRC_INT_RC)
- External 32kHz crystal (RTC_CLK_SRC_EXT_CRYS)
- External 32kHz oscillator at 32K_XN pin (RTC_CLK_SRC_EXT_OSC)
- Internal 8.5MHz oscillator, divided by 256 (~33kHz) (RTC_CLK_SRC_INT_8MD256)

**CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD**

Additional current for external 32kHz crystal

*Found in: Component config > Hardware Settings > RTC Clock Config*

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allow all wakeup sources, and save some code size.

- “None” option will not provide additional current to external crystal
- “Method 1” option cannot ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
- “Method 2” option can solve the external 32k issue, but the touchpad cannot work in this method.

Available options:

- None (RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
- Method 1 (RTC_EXT_CRYST_ADDIT_CURRENT)
- Method 2 (RTC_EXT_CRYST_ADDIT_CURRENT_V2)

**CONFIG_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 27000 if RTC_CLK_SRC_EXT_CRYS \(\lor\) RTC_CLK_SRC_EXT_OSC \(\lor\) RTC_CLK_SRC_INT_8MD256
- from 0 to 32766

**Default value:**

- 3000 if RTC_CLK_SRC_EXT_CRYS \(\lor\) RTC_CLK_SRC_EXT_OSC \(\lor\) RTC_CLK_SRC_INT_8MD256
- 1024
**CONFIG_RTC_XTAL_CAL_RETRY**

Number of attempts to repeat 32k XTAL calibration

---

**Found in:** Component config > Hardware Settings > RTC Clock Config

---

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

---

**Default value:**

- 1 if RTC_CLK_SRC_EXT_CRYSTAL

**CONFIG_RTC_CLOCK_BBPLL_POWER_ON_WITH_USB**

Keep BBPLL clock always work

---

**Found in:** Component config > Hardware Settings > RTC Clock Config

---

When software switches the CPU clock source from BBPLL clock to XTAL, usually the BBPLL will be switched off. This helps to save some power consumption in sleep modes. However this may also happen during the software reset, resulting in the inactive (disconnected from host) of the USB_SERIAL_JTAG device during software reset.

When USB_SERIAL_JTAG is being used, whether to turn off the clock source during software reset and in sleep modes is determined by RTC_CLOCK_BBPLL_POWER_ON_WITH_USB.

- When RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is enabled, the clock will be kept, so that the USB_SERIAL_JTAG will keep alive during software reset. The side-effect is the increasing of power consumption during sleep modes, even though USB_SERIAL_JTAG will not work in sleep modes.
- When RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is disabled, the clock will be turned off. USB_SERIAL_JTAG will be inactive during software reset and in sleep modes. This saves some power consumption in sleep modes.

When USB_SERIAL_JTAG is not being used, software will always turn off BBPLL regardless of RTC_CLOCK_BBPLL_POWER_ON_WITH_USB is set or not.

**Default value:**

- Yes (enabled) if ESP_CONSOLE_USB_SERIAL_JTAG || ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG

**Peripheral Control**

Contains:

- **CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

**CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**

Place peripheral control functions into IRAM

---

**Found in:** Component config > Hardware Settings > Peripheral Control

---

Place peripheral control functions (e.g. periph_module_reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**ETM Configuration**

Contains:

- **CONFIG_ETM_ENABLE_DEBUG_LOG**
CONFIG_ETM_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_ETM_SUPPORTED

MMU Config

GDMA Configuration  Contains:
- CONFIG_GDMA_ISR_IRAM_SAFE
- CONFIG_GDMA_CTRL_FUNC_IN_IRAM

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**

Place GDMA control functions into IRAM

*Found in: Component config > Hardware Settings > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

**CONFIG_GDMA_ISR_IRAM_SAFE**

GDMA ISR IRAM-Safe

*Found in: Component config > Hardware Settings > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

Main XTAL Config  Contains:
- CONFIG_XTAL_FREQ_SEL

**CONFIG_XTAL_FREQ_SEL**

Main XTAL frequency

*Found in: Component config > Hardware Settings > Main XTAL Config*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock’s operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator’s frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.
Available options:
  • 24 MHz (XTAL_FREQ_24)
  • 26 MHz (XTAL_FREQ_26)
  • 32 MHz (XTAL_FREQ_32)
  • 40 MHz (XTAL_FREQ_40)
  • Autodetect (XTAL_FREQ_AUTO)

LCD and Touch Panel  Contains:
  • LCD Peripheral Configuration

LCD Peripheral Configuration  Contains:
  • CONFIG_LCD_ENABLE_DEBUG_LOG
  • CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE
  • CONFIG_LCD_RGB_RESTART_IN_VSYNC
  • CONFIG_LCD_RGB_ISR_IRAM_SAFE

CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE
LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

Default value:
  • 32

CONFIG_LCD_ENABLE_DEBUG_LOG
Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

Default value:
  • No (disabled)

CONFIG_LCD_RGB_ISR_IRAM_SAFE
RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

Default value:
  • No (disabled) if SOC_LCD_RGB_SUPPORTED

CONFIG_LCD_RGB_RESTART_IN_VSYNC
Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.
**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

**ESP NETIF Adapter**

Contains:

- `CONFIG_ESP_NETIF_BRIDGE_EN`
- `CONFIG_ESP_NETIF_L2_TAP`
- `CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`
- `CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB`

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event `SYSTEM_EVENT_STA_LOST_IP` will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

*Range:*
- from 0 to 65535

*Default value:*
- 120

**CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

*Available options:*

- LwIP (ESP_NETIF_TCPIP_LWIP)
  - lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)
  - Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_L2_TAP**

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

**CONFIG_ESP_NETIF_L2_TAP_MAX_FDS**

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

*Range:*
• from 1 to 10 if CONFIG_ESP_NETIF_L2_TAP

Default value:
• 5 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

Range:
• from 1 to 100 if CONFIG_ESP_NETIF_L2_TAP

Default value:
• 20 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

Found in: Component config > ESP NETIF Adapter

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge available!

Default value:
• No (disabled)

PHY

Contains:

• CONFIG_ESP_PHY_ENABLE_USB
• CONFIG_ESP_PHY_MAX_WIFI_TX_POWER
• CONFIG_ESP_PHY_REDUCE_TX_POWER
• CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE
• CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

Found in: Component config > PHY

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

Default value:
• Yes (enabled)
Chapter 2. API

**CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

**Default value:**

- No (disabled)

**Contains:**

- **CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**
- **CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

**CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID**

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

**Default value:**

- No (disabled) if **CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

**Default value:**

- No (disabled) if **CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION** && **CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN**

**CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if **CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN** && **CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION**
**CONFIG_ESP_PHY_INIT_DATA_ERROR**

Terminate operation when PHY init data error

*Found in:* Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION > CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**
- No (disabled) if CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN && CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

**CONFIG_ESP_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in:* Component config > PHY

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
- from 10 to 20

**Default value:**
- 20

**CONFIG_ESP_PHY_REDUCE_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in:* Component config > PHY

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_PHY_ENABLE_USB**

Enable USB when phy init

*Found in:* Component config > PHY

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**
- No (disabled) if ESP_CONSOLE_USB_SERIAL_JTAG || ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG

**Power Management**

Contains:

- CONFIG_PM_SLP_DISABLE_GPIO
- CONFIG_PM_SLP_IRAM_OPT
- CONFIG_PMRTOS_IDLE_OPT
- CONFIG_PM_ENABLE
**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP` || `__DOXYGEN__`

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_PROFILING**

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_TRACE**

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_SLP_IRAM_OPT**

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.
**CONFIG_PM_RTOS_IDLE_OPT**

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

**CONFIG_PM_SLP_DISABLE_GPIO**

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_disable` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

**ESP PSRAM**

Contains:

- `CONFIG_SPIRAM`

**CONFIG_SPIRAM**

Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**

- No (disabled)

**SPI RAM config**

Contains:

- `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_SPIWP_SD3_PIN`
- `CONFIG_SPIRAM_BANKSWITCH_ENABLE`
- `CONFIG_SPIRAM_2T_MODE`
- `CONFIG_SPIRAM_CACHE_WORKAROUND`
- `CONFIG_SPIRAM_BOOT_INIT`
- `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`
- `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL`
- `CONFIG_SPIRAM_MEMTEST`
- `CONFIG_SPIRAM_SPEED`
- `CONFIG_SPIRAM_OCCUPY_SPI_HOST`
- `CONFIG_SPIRAM_USE`
- SPIRAM cache workaround debugging
- SPIRAM workaround libraries placement
Chapter 2. API

- `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- `CONFIG_SPIRAM_TYPE`
- `CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN`

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

**Available options:**
- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

*Note: If the third mode (80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80Mhz will only be visible if the flash SPI speed is also 80Mhz. (ESP_TOOLPY_FLASHFREQ_80M is true)*

**Available options:**
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM`

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM_BOOT_INIT` & `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` & `CONFIG_SPIRAM`
CONFIG_SPIRAM_USE

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

*Available options:*
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM) (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Runs a rudimentary memory test on initialization. aborts when memory test fails. Disable this for slightly faster startup.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM

CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

*Range:*
- from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

*Default value:*
- 16384 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

*Default value:*
- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM

CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*
Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

Range:
- from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

Default value:
- 32768 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme *extram_bss*.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

Default value:
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM

**CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY**

Allow .noinit segment placed in external memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

Default value:
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

Default value:
Chapter 2. API

SPIRAM cache workaround debugging

Contains:

- CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY

CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY

Workaround strategy

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM cache workaround debugging

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

Available options:

- Insert memw after vulnerable instructions (default) (SPIRAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPIRAM_CACHE_WORKAROUND_STRATEGY_NOPS)

SPIRAM workaround libraries placement

Contains:

- CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM
- CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM

CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM

Put libc’s jump related functions in IRAM

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:

- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM
**CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM**

Put libc’s math related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: abs, div, labs, ldiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM**

Put libc’s number parsing related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM**

Put libc’s I/O related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: wcrtomb, ffwritee, wbuf, wsetup, fputwc, wcrtomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM**

Put libc’s time related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: asctime, asctime_r, ctime, ctime_r, lctime, lctime_r, gmtime, gmtime_r, strftime, mktime, tzset, tzset_r, tzset, time, gettzinfo, systimes, month_lengths, timelocal, tzvart, tzlock, tzcalc_limits, and strftime. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM**

Put libc’s characters related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*
The functions affected by this option are: ctype, toupper, tolower, toascii,strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM CACHE_LIBMEM_IN_IRAM**

Put libc’s memory related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM CACHE_LIBSTR_IN_IRAM**

Put libc’s string related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpy, strcspn, strdup, strdup_r, strlcat, strlcpy, strlen, strlwr, strncasecmp, strncat, strncmp, strncpy, strndup, strndup_r, strsep, strspn, strstr, strtok_r, and strupr. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM CACHE_LIBRAND_IN_IRAM**

Put libc’s random related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: srand, rand, and rand_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM CACHE_LIBENV_IN_IRAM**

Put libc’s environment related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: environ, envlock, and getenv_r. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`
• Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**

Put libc’s file related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, rshift, sbrk, stdio, systm, syscall, sysopen, creat, sysread, syswrite, impure, fwalk, and findfp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

• Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM**

Put libc’s miscellaneous functions in IRAM, see help

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: raise and system Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

*Default value:*

• Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM`

**CONFIG_SPIRAM_BANKSWITCH_ENABLE**

Enable bank switching for >4MiB external RAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

#Note that this is limited to 62 banks, as esp_psram_extram_writeback_cache needs some kind of mapping of #some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is #enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

*Default value:*

• Yes (enabled) if `(SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM`

**CONFIG_SPIRAM_BANKSWITCH_RESERVE**

Amount of 32K pages to reserve for bank switching

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE*

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.
Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

**Range:**
- from 1 to 62 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` && `CONFIG_SPIRAM`  

**Default value:**  
- 8 if `CONFIG_SPIRAM_BANKSWITCH_ENABLE` && `CONFIG_SPIRAM`  

**CONFIG_SPIRAMALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

**Default value:**  
- No (disabled) if SPIRAM_USE_MALLOC && `CONFIG_SPIRAM`  

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**  
- HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)  
- VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)  
- Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD**

Contains:

- `CONFIG_D0WD_PSRAM_CLK_IO`  
- `CONFIG_D0WD_PSRAM_CS_IO`

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`  

**Default value:**  
- 17 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`
Chapter 2. API

**CONFIG_D0WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D0WD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*
  - from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

*Default value:*
  - 16 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**PSRAM clock and cs IO for ESP32-D2WD**

Contains:

- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`

**CONFIG_D2WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*
  - from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

*Default value:*
  - 9 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**CONFIG_D2WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

*Range:*
  - from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

*Default value:*
  - 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**PSRAM clock and cs IO for ESP32-PICO**

Contains:

- `CONFIG_PICO_PSRAM_CS_IO`

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.
For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**Default value:**
- 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

**Default value:**
- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

**Range:**
- from 0 to 33 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

**Default value:**
- 7 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.
### Default value:
- No (disabled) if `CONFIG_SPIRAM` & `CONFIG_SPIRAM` 

#### ESP Ringbuf
Contains:
- `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`
- `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

#### `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`
Place non-ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**
- No (disabled)

#### `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`
Place ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which is configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**
- No (disabled)

### ESP System Settings
Contains:
- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- Brownout Detector
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`

- Memory
- Memory protection
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- Trace memory
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
Chapter 2. API

- CONFIG_ESP_CONSOL Lease UART_NUM
- CONFIG_ESP_CONSOL Lease UART RX_GPIO
- CONFIG_ESP_CONSOL Lease UART TX_GPIO

CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ

CPU frequency

Found in: Component config > ESP System Settings

CPU frequency to be set on application startup.

Available options:
- 40 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_40)
- 80 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_80)
- 160 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_160)
- 240 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_240)

Memory Contains:

- CONFIG_ESP32_IRAM AS 8BIT ACCESSIBLE MEMORY
- CONFIG_ESP32_RTCDATA IN FAST_MEM
- CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_RTCDATA IN FAST_MEM

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

Found in: Component config > ESP System Settings > Memory

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

Default value:
- No (disabled) if CONFIG_FREERTOS_UNICORE

CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

Use fixed static RAM size

Found in: Component config > ESP System Settings > Memory

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

Default value:
- No (disabled)

CONFIG_ESP32_FIXED_STATIC_RAM_SIZE

Fixed Static RAM size

Found in: Component config > ESP System Settings > Memory > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_RESERVE_DRAM if Bluetooth controller is enabled.

Range:
• from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**Default value:**
• “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY**

Enable IRAM as 8 bit accessible memory

*Found in: Component config > ESP System Settings > Memory*

If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

**Trace memory**  
Contains:
• CONFIG_ESP32_TRAX

**CONFIG_ESP32_TRAX**

Use TRAX tracing feature

*Found in: Component config > ESP System Settings > Trace memory*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**
• No (disabled)

**CONFIG_ESP32_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP System Settings > Trace memory > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**
• No (disabled) if CONFIG_ESP32_TRAX && CONFIG_FREERTOS_UNICORE

**CONFIG_ESP_SYSTEM_PANIC**

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**
• Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)  
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
• Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)  
  Outputs the relevant registers over the serial port and immediately reset the processor.
• Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
• GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
• GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime.

CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES
Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP
Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection**
Contains:

* CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT
* CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT
Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

• Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

CONFIG_ESP_SYSTEM_MEMPROT_FEATURE
Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data
and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

Default value:
- Yes (enabled) if SOC_MEMPROT_SUPPORTED

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**

Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

Default value:
- Yes (enabled) if CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**

System event queue size

*Found in: Component config > ESP System Settings*

Configure system event queue size in different application.

Default value:
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**

Event loop task stack size

*Found in: Component config > ESP System Settings*

Configure system event task stack size in different application.

Default value:
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**

Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.

Default value:
- 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

Available options:
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
Chapter 2. API

- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute an expression with shared stack.

*Default value:*
- 2048

**CONFIG_ESP_CONSOLE_UART**

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

*Available options:*
- Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
- USB CDC (ESP_CONSOLE_USB_CDC)
- USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
- Custom UART (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_NONE)

**CONFIG_ESP_CONSOLE_SECONDARY**

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in Channel for console output menu.

*Available options:*
- No secondary console (ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
    This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONSOLE_USB_SERIAL_JTAG above.
**CONFIG_ESP_CONSOLE_UART_NUM**

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app. If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

**Available options:**
- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSOLE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app). If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 1 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

**Note:** The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently
accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided
from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may
not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is recon-
figured after the bootloader exits and the app starts.

Range:
  - from 1200 to 4000000 if `CONFIG_PM_ENABLE`
  - from 1200 to 1000000 if `CONFIG_PM_ENABLE`

Default value:
  - 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time,
either because a task turned off interrupts and did not turn them on for a long time, or because an
interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

Default value:
  - Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in miliseconds. Make this higher than the FreeRTOS tick rate.

Range:
  - from 10 to 10000

Default value:
  - 300 if `CONFIG_SPIRAM` && `CONFIG_ESP_INT_WDT`
  - 800 if `CONFIG_SPIRAM` && `CONFIG_ESP_INT_WDT`

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

Default value:
  - Yes (enabled) if `CONFIG_ESP_INT_WDT` && `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_TASK_WDT_EN**

Enable Task Watchdog Timer

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this
option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or
initialized after startup (see Task Watchdog Timer API Reference)

Default value:
  - Yes (enabled)
CONFIG_ESP_TASK_WDT_INIT
Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**
- Yes (enabled)

CONFIG_ESP_TASK_WDT_PANIC
Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)

CONFIG_ESP_TASK_WDT_TIMEOUT_S
Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0
Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1
Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled) if CONFIG_ESP_TASK_WDT_INIT && CONFIG_FREERTOS_UNICORE
**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

---

**CONFIG_ESP_DEBUG_STUBS_ENABLE**

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**
- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if `CONFIG_ESP32_TRAX` && `ESP32S2_TRAX` && `ESP32S3_TRAX`

---

**CONFIG_ESP_DEBUG_OCDAWARE**

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

---

**CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL**

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**
- Level 5 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_5`) Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (`ESP_SYSTEM_CHECK_INT_LEVEL_4`) Using level 4 interrupt for Interrupt Watchdog and other system checks.

**Brownout Detector** Contains:
- `CONFIG_ESP_BROWNOUT_DET`
CONFIG_ESP_BROWNOUT_DET

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
- Yes (enabled)

CONFIG_ESP_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_7)

CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE

Permanently disable BASIC ROM Console

*Found in: Component config > ESP System Settings*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**
- No (disabled)

**IPC (Inter-Processor Call)**

Contains:
- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be
enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

Range:
- from 512 to 65536

Default value:
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

Default value:
- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`

**High resolution timer (esp_timer)**

Contains:
- `CONFIG_ESP_TIMER_PROFILING`
- `CONFIG_ESP_TIMER_TASK_STACK_SIZE`
- `CONFIG_ESP_TIMER_INTERRUPT_LEVEL`
- `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD`

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

Default value:
- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

Range:
- from 2048 to 65536

Default value:
- 3584
Chapter 2. API Reference

**CONFIG_ESP TIMER INTERRUPT LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
- from 1 to 3
- from 1 to 1

**Default value:**
- 1

**CONFIG_ESP TIMER SUPPORTS ISR DISPATCH METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)

**Wi-Fi**

Contains:
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA`
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM`
- `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`
- `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE`
- `CONFIG_ESP32_WIFI_TX_BUFFER`
- `CONFIG_ESP32_WIFI_AMPU_RX_ENABLED`
- `CONFIG_ESP32_WIFI_AMPU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_CSI_ENABLED`
- `CONFIG ESP_WIFI_FTM_ENABLE`
- `CONFIG ESP_WIFI_GCMP_SUPPORT`
- `CONFIG ESP_WIFI_GMAC_SUPPORT`
- `CONFIG ESP32_WIFI_IRAM_OPT`
- `CONFIG ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG ESP32_WIFI_SBPUF_NUM`
- `CONFIG ESP32_WIFI_NVS_ENABLED`
- `CONFIG ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG ESP_WIFI_SLP_BEACON_LOST_OPT`
- `CONFIG ESP_WIFI_SLP_IRAM_OPT`
- `CONFIG ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG ESP32_WIFI_TASK_CORE_ID`
CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

*Default value:*
- Yes (enabled) if `CONFIG_BT_ENABLED`

CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

*Range:*
- from 2 to 25

*Default value:*
- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

*Range:*
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

*Default value:*
- 32

CONFIG_ESP32_WIFI_TX_BUFFER

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*
Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

*Range:*
- from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER

*Default value:*
- 16 if ESP32_WIFI_STATIC_TX_BUFFER

**CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

*Range:*
- from 16 to 128 if CONFIG_SPIRAM

*Default value:*
- 32 if CONFIG_SPIRAM

**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.
For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**
- from 1 to 128

**Default value:**
- 32

**CONFIG_ESP32_WIFI_CSI_ENABLED**

WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**
- No (disabled)

**CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED**

WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**
- from 2 to 32

**Default value:**
- 6

**CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED**

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)
CONFIG_ESP32_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`

CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if `CONFIG_SPIRAM`

CONFIG_ESP32_WIFI_NVS_ENABLED

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_TASK_CORE_ID

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect
five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
- 752

**CONFIG_ESP32_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

**Range:**
- from 6 to 32

**Default value:**
- 32

**CONFIG_ESP32_WIFI_IRAM_OPT**

WiFi IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_SPIRAM`
- Yes (enabled)

**CONFIG_ESP32_WIFI_RX_IRAM_OPT**

WiFi RX IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `CONFIG_SPIRAM`
- Yes (enabled)

**CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE**

Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s.

PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be
explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA**

Enable OWE STA

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_SLP_IRAM_OPT**

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 50 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**Default value:**
- 10 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
Chapter 2. API

**CONFIG_ESP_WIFI_FTM_ENABLE**

WiFi FTM

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT**

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**

- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

**CONFIG_ESP_WIFI_FTM RESPONDER_SUPPORT**

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**

- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

**CONFIG_ESP_WIFI_GCMP_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
• Yes (enabled)

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT**

Wifi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT**

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

*Range:*
  • from 5 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
  • 10 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD**

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

*Range:*
  • from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
  • 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME**

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

*Range:*
  • from 0 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*
  • 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME**

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

*Range:*
  • from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

*Default value:*

---

Submit Document Feedback

Release v5.1-dev-2066-g7869f4e151
• 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM

Maximum espnow encrypt peers number

Found in: Component config > Wi-Fi

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number.

When using ESP mesh, this value should be set to a maximum of 6.

Range:
• from 0 to 16

Default value:
• 6

Core dump Contains:

• CONFIG_ESP_COREDUMP_CHECK_BOOT
• CONFIG_ESP_COREDUMP_DATA_FORMAT
• CONFIG_ESP_COREDUMP_CHECKSUM
• CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART
• CONFIG_ESP_COREDUMP_UART_DELAY
• CONFIG_ESP_COREDUMP_DECODE
• CONFIG_ESP_COREDUMP_MAX_TASKS_NUM
• CONFIG_ESP_COREDUMP_STACK_SIZE

CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART

Data destination

Found in: Component config > Core dump

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

Available options:
• Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
• UART (ESP_COREDUMP_ENABLE_TO_UART)
• None (ESP_COREDUMP_ENABLE_TO_NONE)

CONFIG_ESP_COREDUMP_DATA_FORMAT

Core dump data format

Found in: Component config > Core dump

Select the data format for core dump.

Available options:
• Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
• ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)
**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

**Available options:**
- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**
- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

**CONFIG_ESP_COREDUMP_UART_DELAY**

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**
- 0 if ESP_COREDUMP_ENABLE_TO_UART

**CONFIG_ESP_COREDUMP_STACK_SIZE**

Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG_ESP_COREDUMP_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

**Available options:**
- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don’t decode (ESP_COREDUMP_DECODE_DISABLE)
Chapter 2. API Reference

FAT Filesystem support
Contains:

- `CONFIG_FATFS_API_ENCODING`
- `CONFIG_FATFS_USE_FASTSEEK`
- `CONFIG_FATFS_LONG_FILENAMES`
- `CONFIG_FATFS_MAX_LFN`
- `CONFIG_FATFS_FS_LOCK`
- `CONFIG_FATFS_VOLUME_COUNT`
- `CONFIG_FATFS_CHOOSE_CODEPAGE`
- `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
- `CONFIG_FATFS_SECTOR_SIZE`
- `CONFIG_FATFS_TIMEOUT_MS`
- `CONFIG_FATFS_PER_FILE_CACHE`

`CONFIG_FATFS_VOLUME_COUNT`
Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**
- from 1 to 10

**Default value:**
- 2

`CONFIG_FATFS_LONG_FILENAMES`
Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

`CONFIG_FATFS_SECTOR_SIZE`
Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

**Available options:**
- 512 (FATFS_SECTOR_512)
- 4096 (FATFS_SECTOR_4096)

`CONFIG_FATFS_CHOOSE_CODEPAGE`
OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.
Available options:

- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_MAX_LFN

Max long filename length

*Found in:* Component config > FAT Filesystem support

Maximum long filename length. Can be reduced to save RAM.

**Range:**
- from 12 to 255

**Default value:**
- 255

CONFIG_FATFS_API_ENCODING

API character encoding

*Found in:* Component config > FAT Filesystem support

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

CONFIG_FATFS_FS_LOCK

Number of simultaneously open files protected by lock function

*Found in:* Component config > FAT Filesystem support

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.
* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**
- from 0 to 65535

**Default value:**
- 0

**CONFIG_FATFS_TIMEOUT_MS**
Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**
Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY. If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**
Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**
- Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**
Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a
file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**
- No (disabled)

**CONFIG_FATFS_FASTSEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in:* Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
- 64 if CONFIG_FATFS_USE_FASTSEEK

**FreeRTOS** Contains:
- **Kernel**
- **Port**

**Kernel** Contains:
- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_USE_IDLE_HOOK`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_USE_TICK_HOOK`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_SMP`
- `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`

**CONFIG_FREERTOS_SMP**

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in:* Component config > FreeRTOS > Kernel

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.
Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**CONFIG_FREERTOS_HZ**

configTICK_RATE_HZ

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK_RATE_HZ documentation for more details).

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

configUSE_PORT_OPTIMISED_TASK_SELECTION

*Found in: Component config > FreeRTOS > Kernel*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_UNICORE

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

configCHECK_FOR_STACK_OVERFLOW

*Found in: Component config > FreeRTOS > Kernel*

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

**Note:** If users do not provide their own vApplicationStackOverflowHook() function, a default function will be provided by ESP-IDF.

**Available options:**
- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
- Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW = 1)
• Check using canary bytes (Method 2) (FREERTOS_CHECK_STACKOVERFLOW_CANARY)

Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower.
(configCHECK_FOR_STACK_OVERFLOW = 2)

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

configNUM_THREAD_LOCAL_STORAGE_POINTERS

*Found in: Component config > FreeRTOS > Kernel*

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

*Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.*

*Range:*
  • from 1 to 256

*Default value:*
  • 1

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

configMINIMAL_STACK_SIZE (Idle task stack size)

*Found in: Component config > FreeRTOS > Kernel*

Sets the idle task stack size in bytes (see configMINIMAL_STACK_SIZE documentation for more details).

*Note:*
  • ESP-IDF specifies stack sizes in bytes instead of words.
  • The default size is enough for most use cases.
  • The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
  • Conversely, the stack size can be reduced to the minimum if none of the idle features are used.

*Range:*
  • from 768 to 32768

*Default value:*
  • 1536

CONFIG_FREERTOS_USE_IDLE_HOOK

configUSE_IDLE_HOOK

*Found in: Component config > FreeRTOS > Kernel*

Enables the idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

*Note:*
  • The application must provide the hook function `void vApplicationIdleHook( void );`
  • `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
  • The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

*Default value:*
  • No (disabled)
**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

Use FreeRTOS minimal idle hook

*Found in: Component config > FreeRTOS > Kernel*

Enables the minimal idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

*Note:*
- The application must provide the hook function `void vApplicationMinimalIdleHook(void);`
- `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

*Default value:*
- No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

`configUSE_TICK_HOOK`

*Found in: Component config > FreeRTOS > Kernel*

Enables the tick hook (see configUSE_TICK_HOOK documentation for more details).

*Note:*
- The application must provide the hook function `void vApplicationTickHook(void);`
- `vApplicationTickHook()` is called from FreeRTOS's tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

*Default value:*
- No (disabled)

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

`configMAX_TASK_NAME_LEN`

*Found in: Component config > FreeRTOS > Kernel*

Sets the maximum number of characters for task names (see configMAX_TASK_NAME_LEN documentation for more details).

*Note: For most uses, the default of 16 characters is sufficient.*

*Range:*
- from 1 to 256

*Default value:*
- 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

`configENABLE_BACKWARD_COMPATIBILITY`

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE_BACKWARD_COMPATIBILITY documentation for more details).

*Default value:*
- No (disabled)
CONFIG_FREERTOS_TIMER_TASK_PRIORITY

`configTIMER_TASK_PRIORITY`

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see `configTIMER_TASK_PRIORITY` documentation for more details).

**Range:**
- from 1 to 25

**Default value:**
- 1

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

`configTIMER_TASK_STACK_DEPTH`

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s stack size (see `configTIMER_TASK_STACK_DEPTH` documentation for more details).

**Range:**
- from 1536 to 32768

**Default value:**
- 2048

CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

`configTIMER_QUEUE_LENGTH`

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s command queue length (see `configTIMER_QUEUE_LENGTH` documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

`configQUEUE_REGISTRY_SIZE`

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see `configQUEUE_REGISTRY_SIZE` documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**
- from 0 to 20

**Default value:**
- 0

CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES

`configTASK_NOTIFICATION_ARRAY_ENTRIES`

*Found in: Component config > FreeRTOS > Kernel*
Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more lightweight compared to alternatives such as semaphores.

Range:
- from 1 to 32

Default value:
- 1

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

configUSE_TRACE_FACILITY

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE_TRACE_FACILITY documentation for more details).

Default value:
- No (disabled)

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

cfgUSE_STATS_FORMATTING_FUNCTIONS

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*

Set configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE_STATS_FORMATTING_FUNCTIONS documentation for more details).

Default value:
- No (disabled) if CONFIG_FREERTOS_USE_TRACE_FACILITY

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

Default value:
- No (disabled) if CONFIG_FREERTOS_SMP && CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS

**CONFIG_FREERTOSGENERATE_RUN_TIME_STATS**

cfgGENERATE_RUN_TIME_STATS

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see configGENERATE_RUN_TIME_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS_RUN_TIME_STATS_CLK.

Default value:
- No (disabled)
Chapter 2. API 参考

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

```c
configUSE_TICKLESS_IDLE
```

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using `FREERTOS_IDLE_TIME_BEFORE_SLEEP` option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

*Default value:*
  - No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

```c
configEXPECTED_IDLE_TIME_BEFORE_SLEEP
```

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

*Range:*
  - from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

*Default value:*
  - 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Port**

Contains:

- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_FPU_IN_ISR`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

*Default value:*
  - Yes (enabled)
CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK

Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

Default value:
- No (disabled)

CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

Default value:
- Yes (enabled)

CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB(void *pxTCB)` callback

Default value:
- No (disabled)

CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

Default value:
Chapter 2. API

• Yes (enabled) if CONFIG_FREERTOS_SMP

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

Found in: Component config > FreeRTOS > Port

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

Range:
  • from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
  • from 1536 to 32768

Default value:
  • 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
  • 1536

CONFIG_FREERTOS_INTERRUPT_BACKTRACE

Enable backtrace from interrupt to task context

Found in: Component config > FreeRTOS > Port

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

Default value:
  • Yes (enabled)

CONFIG_FREERTOS_FPU_IN_ISR

Use float in Level 1 ISR

Found in: Component config > FreeRTOS > Port

When enabled, the usage of float type is allowed inside Level 1 ISRs. Note that usage of float types in higher level interrupts is still not permitted.

Default value:
  • No (disabled)

CONFIG_FREERTOS_CORETIMER

Tick timer source (Xtensa Only)

Found in: Component config > FreeRTOS > Port

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

Available options:
  • Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
    Select this to use timer 0
  • Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
    Select this to use timer 1
  • SYSTIMER 0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
    Select this to use systimer with the 1 interrupt priority.
Chapter 2. API

- SYSTIMER 0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
  Select this to use systimer with the 3 interrupt priority.

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in:* Component config > FreeRTOS > Port

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**

- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.

- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

**CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH**

Place FreeRTOS functions into Flash

*Found in:* Component config > FreeRTOS > Port

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

**CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH**

Place task snapshot functions into flash

*Found in:* Component config > FreeRTOS > Port

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**

- No (disabled) if CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT && CONFIG_ESP_PANIC_HANDLER_IRAM

**CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS port*._CRITICAL calls

*Found in:* Component config > FreeRTOS > Port

If enabled, context of port*._CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*._CRITICAL from ISR context would cause assert failure

**Default value:**
• No (disabled)

**CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT**

Enable task snapshot functions

*Found in: Component config > FreeRTOS > Port*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked. Task snapshots are used by Task Watchdog (TWDT), GDB Stub and Core dump.

**Default value:**

• Yes (enabled)

**Hardware Abstraction Layer (HAL) and Low Level (LL)**

Contains:

• **CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**
  
  Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**

• Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
• Disabled (HAL_ASSERTION_DISABLE)
• Silent (HAL_ASSERTION_SILENT)
• Enabled (HAL_ASSERTION_ENABLE)

• **CONFIG_HAL_LOG_LEVEL**

  HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

**Available options:**

• No output (HAL_LOG_LEVEL_NONE)
• Error (HAL_LOG_LEVEL_ERROR)
• Warning (HAL_LOG_LEVEL_WARN)
• Info (HAL_LOG_LEVEL_INFO)
• Debug (HAL_LOG_LEVEL_DEBUG)
• Verbose (HAL_LOG_LEVEL_VERBOSE)

• **CONFIG_HAL_SYSTIMER_USE_ROM IMPL**

  Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.
If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER

**CONFIG_HAL_WDT_USE_ROM_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_WDT

**Heap memory debugging**  
Contains:

- `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`
- `CONFIG_HEAP_TASK_TRACKING`
- `CONFIG_HEAP_CORRUPTION_DETECTION`
- `CONFIG_HEAP_TRACING_DEST`
- `CONFIG_HEAP_TRACING_STACK_DEPTH`
- `CONFIG_HEAP_TLSF_USE_ROM_IMPL`

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**
- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**
- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)
CONFIG_HEAP_TRACING_STACK_DEPTH

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames use more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

CONFIG_HEAP_TASK_TRACKING

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

Default value:
- No (disabled)

CONFIG_HEAP_TLSF_USE_ROM_IMPL

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

Default value:
- Yes (enabled) if ESP_ROM_HAS_HEAP_TLSF

Log output Contains:

- CONFIG_LOG_DEFAULT_LEVEL
- CONFIG_LOG_TIMESTAMP_SOURCE
- CONFIG_LOG_MAXIMUM_LEVEL
- CONFIG_LOG_COLORS

CONFIG_LOG_DEFAULT_LEVEL

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.
By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**
- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used to enable debugging output only at a critical point, for a particular tag, or to minimize start up time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Boostrap log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)

**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:
- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
• NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**

• Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTS)
• System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

• Checksums
• DHCP server
  • CONFIG_LWIP_DHCP_OPTIONS_LEN
  • CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID
  • CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID
  • CONFIG_LWIP_DHCP_DOES_ARP_CHECK
  • CONFIG_LWIP_DHCP_RESTORE_LAST_IP
  • CONFIG_LWIP_PPP_CHAP_SUPPORT
  • CONFIG_LWIP_L2_TO_L3_COPY
  • CONFIG_LWIP_IPV6_DHCP6
  • CONFIG_LWIP_IP4_FRAG
  • CONFIG_LWIP_IP6_FRAG
  • CONFIG_LWIP_IP_FORWARD
  • CONFIG_LWIP_NETBUF_RECVINFO
  • CONFIG_LWIP_AUTOIP
  • CONFIG_LWIP_IPV6
  • CONFIG_LWIP_ENABLE_LCP_ECHO
  • CONFIG_LWIP_ESP_LWIP_ASSERT
  • CONFIG_LWIP_DEBUG
  • CONFIG_LWIP_IRAM_OPTIMIZATION
  • CONFIG_LWIP_STATS
  • CONFIG_LWIP_TIMERS_ONDEMAND
  • CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES
  • CONFIG_LWIP_PPP_MPPE_SUPPORT
  • CONFIG_LWIP_PPP_MSCHAP_SUPPORT
  • CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
  • CONFIG_LWIP_PPP_PAP_SUPPORT
  • CONFIG_LWIP_PPP_DEBUG_ON
  • CONFIG_LWIP_PPP_SUPPORT
  • CONFIG_LWIP_IP4_REASSEMBLY
  • CONFIG_LWIP_IP6_REASSEMBLY
  • CONFIG_LWIP_SLIP_SUPPORT
  • CONFIG_LWIP_SO_LINGER
  • CONFIG_LWIP_SO_REUSE
  • CONFIG_LWIP_NETIF_API
  • Hooks
  • ICMP
  • CONFIG_LWIP_LOCAL_HOSTNAME
  • LWIP RAW API
  • CONFIG_LWIP_IPV6_NUM_NEIGHBORS
  • CONFIG_LWIP_IPV6_MEMP_NUM_QUEUE
  • CONFIG_LWIP_MAX_SOCKETS
  • CONFIG_LWIP_BRIDGEIF_MAX_PORTS
  • CONFIG_LWIP_NUM_NETIF_CLIENT_DATA
  • CONFIG_LWIP_ESP_GETUFOURS_ARP
  • SNTP
• CONFIG_LWIP_USE_ONLY_LWIP_SELECT
• CONFIG_LWIP_NETIF_LOOPBACK
• TCP
• CONFIG_LWIP_TCP_IP_TASK_AFFINITY
• CONFIG_LWIP_TCP_IP_TASK_STACK_SIZE
• CONFIG_LWIP_TCP_IP_RECVMBOX_SIZE
• UDP
• CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS

CONFIG_LWIP_LOCAL_HOSTNAME

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

*Default value:*

- "espressif"

CONFIG_LWIP_NETIF_API

Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

*Default value:*

- No (disabled)

CONFIG_LWIP_TCP_IP_CORE_LOCKING

Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.

*Default value:*

- No (disabled)

CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

*Default value:*

- Yes (enabled)
CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2 (WIFI Driver) will be copied to a new buffer before sending it to layer3 (LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

*Default value:*
- No (disabled)

CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

*Default value:*
- No (disabled)

CONFIG_LWIP_TIMERS_ONDEMAND

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

*Default value:*
- Yes (enabled)

CONFIG_LWIP_MAX_SOCKETS

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

*Range:*
- from 1 to 16

*Default value:*
- 10
CONFIG_LWIP_USE_ONLY_LWIP_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

**Default value:**

- No (disabled)

CONFIG_LWIP_SO_LINGER

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1, l_linger can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

CONFIG_LWIP_SO_REUSE

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**

- Yes (enabled)

CONFIG_LWIP_SO_REUSE_RXTOALL

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

CONFIG_LWIP_SO_RCVBUF

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)
Chapter 2. API 参考

CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)
**CONFIG_LWIP_IPV4_NAPT**

Enable NAT (new/experimental)

*Found in:* Component config > LWIP > CONFIG_LWIP_IP_FORWARD

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if CONFIG_LWIP_IP_FORWARD

**CONFIG_LWIP_STATS**

Enable LWIP statistics

*Found in:* Component config > LWIP

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

**CONFIG_LWIP_ESP_GRATUITOUS_ARP**

Send gratuitous ARP periodically

*Found in:* Component config > LWIP

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_GARP_TMR_INTERVAL**

GARP timer interval(seconds)

*Found in:* Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**
- 60

**CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**

TCPIP task receive mail box size

*Found in:* Component config > LWIP

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
- from 6 to 64 if CONFIG_LWIP_WND_SCALE
- from 6 to 1024 if CONFIG_LWIP_WND_SCALE

**Default value:**
- 32
CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_OPTIONS_LEN

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

**Range:**
- from 68 to 255

**Default value:**
- 68
- 108
**CONFIG_LWIP_NUM_NETIF_CLIENT_DATA**

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

**Range:**
- from 0 to 256

**Default value:**
- 0

**DHCP server** Contains:
- **CONFIG_LWIP_DHCPS**

**CONFIG_LWIP_DHCPS**

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCPS_LEASE_UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**
- from 1 to 3600

**Default value:**
- 60

**CONFIG_LWIP_DHCPS_MAX_STATION_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

**Range:**
- from 1 to 64

**Default value:**
- 8

**CONFIG_LWIP_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.
See RFC 3927.

**Default value:**
- No (disabled)

**Contains:**
- `CONFIG_LWIP_AUTOIP_TRIES`
- `CONFIG_LWIP_AUTOIP_MAX_CONFLICTS`
- `CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL`

**CONFIG_LWIP_AUTOIP_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 2 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 9 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if `CONFIG_LWIP_AUTOIP`

**Default value:**
- 20 if `CONFIG_LWIP_AUTOIP`

**CONFIG_LWIP_IPV6**

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
Chapter 2. API

**CONFIG_LWIP_IPV6_AUTOCONFIG**

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPv6 stateless address autoconfiguration (SLAAC).

Default value:

- No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

Default value:

- 3

**CONFIG_LWIP_IPV6_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

Default value:

- No (disabled)

**CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

Default value:

- 0 if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG_LWIP_IPV6_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

Default value:

- No (disabled) if `CONFIG_LWIP_IPV6_AUTOCONFIG`
**CONFIG_LWIP_NETIF_STATUS_CALLBACK**

Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
- No (disabled)

**CONFIG_LWIP_NETIF_LOOPBACK**

Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**
- Yes (enabled)

Contains:

- `CONFIG_LWIP_LOOPBACK_MAX_PBUFS`

**CONFIG_LWIP_LOOPBACK_MAX_PBUFS**

Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**
- from 0 to 16

**Default value:**
- 8

**TCP**

Contains:

- `CONFIG_LWIP_TCP_WND_DEFAULT`
- `CONFIG_LWIP_TCP_SND_BUF_DEFAULT`
- `CONFIG_LWIP_TCP_RECVMBX_SIZE`
- `CONFIG_LWIP_TCP_RTO_TIME`
- `CONFIG_LWIP_MAX_ACTIVE_TCP`
- `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT`
- `CONFIG_LWIP_MAX_LISTENING_TCP`
- `CONFIG_LWIP_TCP_MAXRTX`
- `CONFIG_LWIP_TCP_SYNMAXRTX`
- `CONFIG_LWIP_TCP_MSL`
- `CONFIG_LWIP_TCP_MSS`
- `CONFIG_LWIP_TCP_OVERSIZE`
- `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- `CONFIG_LWIP_WND_SCALE`
- `CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION`
- `CONFIG_LWIP_TCP_TMR_INTERVAL`
**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

*Range:*

  • from 1 to 1024

*Default value:*

  • 16

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

*Range:*

  • from 1 to 1024

*Default value:*

  • 16

**CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

*Default value:*

  • Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

*Range:*

  • from 3 to 12

*Default value:*

  • 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.
Range:  
- from 3 to 12  
Default value:  
- 6  
- 12

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

Range:  
- from 536 to 1460  
Default value:  
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval(ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

Default value:  
- 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

Default value:  
- 60000

**CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT**

Maximum FIN segment lifetime

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

Default value:  
- 20000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, …).
This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCP_WND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, …).

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 5744

**CONFIG_LWIP_TCP_RECCVMBOX_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: \( \frac{LWIP_TCP_WND_DEFAULT}{TCP_MSS} + 2 \). e.g. if \( LWIP_TCP_WND_DEFAULT=14360 \), \( TCP_MSS=1436 \), then the recommended receive mail box size is \( \frac{14360}{1436} + 2 = 12 \).

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum LWIP_TCP_RECCVMBOX_SIZE packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.
Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCP_SACK_OUT**
Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**
Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**
Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

**CONFIG_LWIP_TCP_RCV_SCALE**
Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if CONFIG_LWIP_WND_SCALE

**Default value:**
- 0 if CONFIG_LWIP_WND_SCALE
### Chapter 2. API 参考

#### CONFIG_LWIP_TCP_RTO_TIME

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

*Default value:*
- 3000
- 1500

#### UDP

Contains:
- **CONFIG_LWIP_UDP_RECVMBOX_SIZE**
- **CONFIG_LWIP_MAX_UDP_PCBS**

#### CONFIG_LWIP_MAX_UDP_PCBS

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

*Range:*
- from 1 to 1024

*Default value:*
- 16

#### CONFIG_LWIP_UDP_RECVMBOX_SIZE

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECCVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECCVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECCVMBOX_SIZE means more memory. On the other hand, if the receiv mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

*Range:*
- from 6 to 64

*Default value:*
- 6

#### Checksums

Contains:
- **CONFIG_LWIP_CHECKSUM_CHECK_ICMP**
- **CONFIG_LWIP_CHECKSUM_CHECK_IP**
- **CONFIG_LWIP_CHECKSUM_CHECK_UDP**
Chapter 2. API 参考

**CONFIG_LWIP_CHECKSUM_CHECK_IP**
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_UDP**
Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

**CONFIG_LWIP_CHECKSUM_CHECK_ICMP**
Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCPIP_TASK_STACK_SIZE**
TCP/IP Task Stack Size

*Found in: Component config > LWIP*
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072

**CONFIG_LWIP_TCPIP_TASK_AFFINITY**
TCP/IP task affinity

*Found in: Component config > LWIP*
Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)
**CONFIG_LWIP_PPP_SUPPORT**

Enable PPP support (new/experimental)

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible. PPP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

*Contains:*
- `CONFIG_LWIP_PPP_ENABLE_IPV6`

**CONFIG_LWIP_PPP_ENABLE_IPV6**

Enable IPv6 support for PPP connections (IPv6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**
- Yes (enabled) if `CONFIG_LWIP_PPP_SUPPORT` && `CONFIG_LWIP_IPV6`

**CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE**

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**
- from 3 to 20

**Default value:**
- 3

**CONFIG_LWIP_IPV6_NUM_ND6_NUM_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**
- from 3 to 10

**Default value:**
- 5

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`
CONFIG_LWIP_PPP_PAP_SUPPORT
Enable PAP support

Found in: Component config > LWIP
Enable Password Authentication Protocol (PAP) support

Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_CHAP_SUPPORT
Enable CHAP support

Found in: Component config > LWIP
Enable Challenge Handshake Authentication Protocol (CHAP) support

Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MSCHAP_SUPPORT
Enable MSCHAP support

Found in: Component config > LWIP
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MPPE_SUPPORT
Enable MPPE support

Found in: Component config > LWIP
Enable Microsoft Point-to-Point Encryption (MPPE) support

Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_ENABLE_LCP_ECHO
Enable LCP ECHO

Found in: Component config > LWIP
Enable LCP echo keepalive requests

Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_LCP_ECHO_INTERVAL
Echo interval (s)

Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Interval in seconds between keepalive LCP echo requests, 0 to disable.

Range:
• from 0 to 1000000 if CONFIG_LWIP_ENABLE_LCP_ECHO

Default value:
• 3 if CONFIG_LWIP_ENABLE_LCP_ECHO
CONFIG_LWIP_LCP_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

CONFIG_LWIP_PPP_DEBUG_ON

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_SLIP_SUPPORT

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`

CONFIG_LWIP_SLIP_DEBUG_ON

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*

Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

ICMP

Contains:
- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

CONFIG_LWIP_ICMP

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**
Chapter 2. API

- Yes (enabled)

**CONFIG_LWIP_MULTICAST_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

*Default value:*
- No (disabled)

**CONFIG_LWIP_BROADCAST_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

*Default value:*
- No (disabled)

**LWIP RAW API**  Contains:
- **CONFIG_LWIP_MAX_RAW_PCBS**

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

*Range:*
- from 1 to 1024

*Default value:*
- 16

**SNTP**  Contains:
- **CONFIG_LWIP_SNTP_MAX_SERVERS**
- **CONFIG_LWIP_SNTP_UPDATE_DELAY**
- **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**CONFIG_LWIP_SNTP_MAX_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of snntp_setserver/snntp_setservername functions is limited to this value.

*Range:*
- from 1 to 16

*Default value:*
- 1
**CONFIG_LWIP_DHCP_GET_NTP_SRV**

Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see snntp_servermode_dhcp() func.)

**Default value:**
- No (disabled)

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**Default value:**
- 1 if **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**CONFIG_LWIP_SNP_UPDATE_DELAY**

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**
- from 15000 to 4294967295

**Default value:**
- 3600000

**CONFIG_LWIP_BRIDGEIF_MAX_PORTS**

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consist of.

**Range:**
- from 1 to 63

**Default value:**
- 7

**CONFIG_LWIP_ESP_LWIP_ASSERT**

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE
Hooks Contains:

- `CONFIG_LWIP_HOOK_ND6_GET_GW`
- `CONFIG_LWIP_HOOK_IP6_INPUT`
- `CONFIG_LWIP_HOOK_IP6_ROUTE`
- `CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE`
- `CONFIG_LWIP_HOOK_TCP_ISN`

**CONFIG_LWIP_HOOK_TCP_ISN**

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

**CONFIG_LWIP_HOOK_IP6_ROUTE**

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

**CONFIG_LWIP_HOOK_ND6_GET_GW**

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*
Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:***
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_INPUT**

IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:***
- No hook declared (LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_INPUT_CUSTOM)

**CONFIG_LWIP_DEBUG**

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FDB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FW_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_DEBUG`
- `CONFIG_LWIP_DHCP_DEBUG`
- `CONFIG_LWIP_DHCP_STATE_DEBUG`
- `CONFIG_LWIP_DNS_DEBUG`
- `CONFIG_LWIP_ETHARP_DEBUG`
- `CONFIG_LWIP_ICMP_DEBUG`
- `CONFIG_LWIP_ICMP6_DEBUG`
- `CONFIG_LWIP_IP_DEBUG`
- `CONFIG_LWIP_IP6_DEBUG`
- `CONFIG_LWIP_NETIF_DEBUG`
- `CONFIG_LWIP_PBUF_DEBUG`
- `CONFIG_LWIP_Sntp_DEBUG`
- `CONFIG_LWIP_SOCKETS_DEBUG`
- `CONFIG_LWIP_TCP_DEBUG`
- `CONFIG_LWIP_DEBUG_ESP_LOG`

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*
Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_NETIF_DEBUG**

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_PBUF_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ETHARP_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_API_LIB_DEBUG**

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_SOCKETS_DEBUG**

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_IP_DEBUG**

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_ICMP_DEBUG
Enable ICMP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG && CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG
Enable DHCP state tracking

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_DHCP_DEBUG
Enable DHCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP6_DEBUG
Enable IP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP6_DEBUG
Enable ICMP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_TCP_DEBUG
Enable TCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SNTP_DEBUG
Enable SNTP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
• No (disabled) if CONFIG_LWIP_DEBUG
**CONFIG_LWIP_DNS_DEBUG**

Enable DNS debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:* No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_DEBUG**

Enable bridge generic debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:* No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_FDB_DEBUG**

Enable bridge FDB debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:* No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_FW_DEBUG**

Enable bridge forwarding debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:* No (disabled) if CONFIG_LWIP_DEBUG

### mbedTLS

- CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_ROM_MD5
- CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal ( *), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
• Internal IRAM (MBEDTLS_IRAM_8BIT_MEM_ALLOC)
  Allows to use IRAM memory region as 8bit accessible region.
  TLS input and output buffers will be allocated in IRAM section which is 32bit aligned mem-
  ory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of
  certain clock cycles per unaligned read/write.

**CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN**

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection
supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or
you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of
MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

*Range:*
  - from 512 to 16384

*Default value:*
  - 16384

**CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN**

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length
(MBEDTLS_SSL_MAX_CONTENT_LEN).

*Range:*
  - from 512 to 16384

*Default value:*
  - 16384

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length
(MBEDTLS_SSL_MAX_CONTENT_LEN).

*Range:*
  - from 512 to 16384
Default value:
• 4096

CONFIG_MBEDTLS_DYNAMIC_BUFFER

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

Default value:
• No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS && CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

Default value:
• No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

Default value:
• No (disabled)
**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

**Available options:**
- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

**mbedTLS v3.x related**  Contains:
- DTLS-based configurations
- CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION
- CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
- CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
- CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
- CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_3**

Support TLS 1.3 protocol

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE && CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE**

Enable TLS 1.3 middlebox compatibility mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

**CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH**

Variable SSL buffer length

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS_ECP_RESTARTABLE or if you want to access ECDH context fields directly.
Chapter 2. API

Default value:
- No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

**CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK**

Enable trusted certificate callbacks

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedTLS documentation for required API and more details.

Default value:
- No (disabled)

**CONFIG_MBEDTLS_SSL_CONTEXT.Serialization**

Enable serialization of the TLS context structures

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable serialization of the TLS context structures. This is a local optimization in handling a single, potentially long-lived connection.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:
- No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER.CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedTLS documentation for required API and more details.

Default value:
- Yes (enabled) if `MBEDTLS_DYNAMIC_FREE_PEER_CERT`

**DTLS-based configurations**

Contains:
- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

Default value:
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`
**CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in:* Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for incoming DTLS messages

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**
- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

---

**CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in:* Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**
- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

---

**CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY**

Record plaintext padding (for DTLS 1.2)

*Found in:* Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**
- 16 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

---

**CONFIG_MBEDTLS_SSL_DTLS_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in:* Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use _srtp extension.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

---

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`
Chapter 2. API

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

Enable trusted root certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE**

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Available options:**
- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE**

Add custom certificates to the default bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH**

Custom certificate bundle path

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE*

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS**

Maximum no of certificates allowed in certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

**Default value:**
- 200
CONFIG_MBEDTLS_ECP_RESTARTABLE
Enable mbedtls ecp restartable

*Found in: Component config > mbedtls*
Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

*Found in: Component config > mbedtls*
Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

*Found in: Component config > mbedtls*
Enable hardware accelerated AES encryption & decryption. Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_GCM
Enable partially hardware accelerated GCM

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HARDWARE_AES*
Enable partially hardware accelerated GCM. GHASH calculation is still done in software. If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM && CONFIG_MBEDTLS_HARDWARE_AES

CONFIG_MBEDTLS_HARDWARE_MPI
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedtls*
Enable hardware accelerated multiple precision integer operations. Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results. These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST
**CONFIG_MBEDTLS_HARDWARE_SHA**

Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_ECC**

Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED

**CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

**CONFIG_MBEDTLS_ROM_MD5**

Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY
Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME
Enable mbedtls time support

*Found in: Component config > mbedTLS*

Enable use of time.h functions (time() and gmtime()) by mbedTLS.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_PLATFORM_TIME_ALT
Enable mbedtls time support: platform-specific

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function `mbedtls_platform_set_time()` that allows to set an alternative time function pointer.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HAVE_TIME_DATE
Enable mbedtls certificate expiry check

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**
Chapter 2. API 参考

- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedTLS*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**
- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**  Contains:

- `CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE`
- `CONFIG_MBEDTLS_PSK_MODES`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE`

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

*Default value:*
  - No (disabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK

Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:*
  - Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

*Default value:*
  - Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK

Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

*Default value:*
  - Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-
Default value:
  • Yes (enabled) if `CONFIG_MBEDTLS_DHМ_C`

**CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**

Support Elliptic Curve based ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
  • Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**

Enable ECDHE-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
  • Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
  • Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**

Enable ECDH-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
  • Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**

Enable ECDH-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
  • Yes (enabled)
CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_ECJPAKE_C` && `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`

CONFIG_MBEDTLS_SSL_RENEGOTIATION

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2

Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1

Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO DTLS

Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS**

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS**

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**

Contains:
- `CONFIG_MBEDTLS_AES_C`
- `CONFIG_MBEDTLS_BLOWFISH_C`
- `CONFIG_MBEDTLS_CAMELLIA_C`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_DES_C`
- `CONFIG_MBEDTLS_GCM_C`
- `CONFIG_MBEDTLS_NIST_KW_C`
- `CONFIG_MBEDTLS_XTEA_C`

**CONFIG_MBEDTLS_AES_C**

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CAMELLIA_C**

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites. 3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_BLOWFISH_C
Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)
The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_XTEA_C
XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_CCM_C
CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_GCM_C
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**
- No (disabled)
**CONFIG_MBEDTLS_RIPEMD160_C**

Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*

Enable the RIPEMD-160 hash algorithm.

**Default value:**
- No (disabled)

**Certificates**

Contains:
- **CONFIG_MBEDTLS_PEM_PARSE_C**
- **CONFIG_MBEDTLS_PEM_WRITE_C**
- **CONFIG_MBEDTLS_X509_CRL_PARSE_C**
- **CONFIG_MBEDTLS_X509_CSRPARSE_C**

**CONFIG_MBEDTLS_PEM_PARSE_C**

Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_PEM_WRITE_C**

Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_X509_CRL_PARSE_C**

X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_X509_CSRPARSE_C**

X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*

Support for parsing X.509 Certificate Signing Requests

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_MBEDTLS_ECP_C**
Elliptic Curve Ciphers
*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DH_C**
Diffie-Hellman-Merkle key exchange (DHM)
*Found in: Component config > mbedTLS*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file `mbedtls/dhm.h` file.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_C**
Elliptic Curve Diffie-Hellman (ECDH)
*Found in: Component config > mbedTLS*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECDSA_C**
Elliptic Curve DSA
*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECJPAKE_C**
Elliptic curve J-PAKE
*Found in: Component config > mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED**
Enable SECP192R1 curve
*Found in: Component config > mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if `CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY` & `CONFIG_MBEDTLS_ECP_C`
CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
Enable SECP224R1 curve

Default value:
- Yes (enabled) if \((CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN \mid CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY) \land CONFIG\_MBEDTLS\_ECP\_C\)

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve

Default value:
- Yes (enabled) if \((CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN \mid CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY) \land CONFIG\_MBEDTLS\_ECP\_C\)

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve

Default value:
- Yes (enabled) if \((CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN \mid CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY) \land CONFIG\_MBEDTLS\_ECP\_C\)

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve

Default value:
- Yes (enabled) if \((CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN \mid CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY) \land CONFIG\_MBEDTLS\_ECP\_C\)

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve

Default value:
- Yes (enabled) if \((CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN \mid CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY) \land CONFIG\_MBEDTLS\_ECP\_C\)
**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedTLS*

support for DP Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED**

Enable CURVE25519 curve

*Found in: Component config > mbedTLS*

Enable support for CURVE25519 Elliptic Curve.

**Default value:**
- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`
CONFIG_MBEDTLS_ECP_NIST_OPTIM

NIST ‘modulo p’ optimisations

*Found in: Component config > mbedTLS*

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.

*Default value:*
  - Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C

Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_CHACHA20_C

Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

*Default value:*
  - No (disabled)

CONFIG_MBEDTLS_CHACHA保利_C

ChaCha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS>* CONFIG_MBEDTLS_CHACHA20_C

Enable support for ChaCha20-Poly1305 AEAD algorithm.

*Default value:*
  - No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C

CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

*Default value:*
  - No (disabled)
CONFIG_MBEDTLS_THREADING_C
Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

*Default value:*
  * No (disabled)*

CONFIG_MBEDTLS_THREADING_ALT
Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

*Default value:*
  * Yes (enabled) if CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_THREADING_PTHREAD
Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

*Default value:*
  * No (disabled) if CONFIG_MBEDTLS_THREADING_C*

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI
Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

*Default value:*
  * No (disabled)*

CONFIG_MBEDTLS_SECURITY_RISKS
Show configurations with potential security risks

*Found in: Component config > mbedTLS*

*Default value:*
  * No (disabled)*

Contains:
  * CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT*

CONFIG_MBEDTLS_ALLOW_UNSUPPORTED_CRITICAL_EXT
X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_SECURITY_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions
Default value:
• No (disabled) if `CONFIG_MBEDTLS_SECURITY_RISKS`

ESP-MQTT Configurations Contains:
• `CONFIG_MQTT_CUSTOM_OUTBOX`
• `CONFIG_MQTT_TRANSPORT_SSL`
• `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
• `CONFIG_MQTT_PROTOCOL_311`
• `CONFIG_MQTT_PROTOCOL_5`
• `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
• `CONFIG_MQTT_USE_CUSTOM_CONFIG`
• `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
• `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
• `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
• `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**
Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

Default value:
• Yes (enabled)

**CONFIG_MQTT_PROTOCOL_5**
Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

Default value:
• No (disabled)

**CONFIG_MQTT_TRANSPORT_SSL**
Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedTLS

Default value:
• Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**
Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

Default value:
• Yes (enabled)
CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

Enable MQTT over Websocket Secure

Found in: Component config > ESP-MQTT Configurations

Enable MQTT transport over Websocket Secure.

Default value:
- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL

Use Incremental Message Id

Found in: Component config > ESP-MQTT Configurations

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

Default value:
- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED

Skip publish if disconnected

Found in: Component config > ESP-MQTT Configurations

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

Default value:
- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES

Report deleted messages

Found in: Component config > ESP-MQTT Configurations

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

Default value:
- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

Found in: Component config > ESP-MQTT Configurations

Custom MQTT configurations.

Default value:
- No (disabled)
**CONFIG_MQTT_TCP_DEFAULT_PORT**

Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over TCP port

*Default value:*

- 1883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_SSL_DEFAULT_PORT**

Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over SSL port

*Default value:*

- 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & & `CONFIG_MQTT_TRANSPORT_SSL`

**CONFIG_MQTT_WS_DEFAULT_PORT**

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket port

*Default value:*

- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & & `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

**CONFIG_MQTT_WS_DEFAULT_PORT**

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

*Default value:*

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & & `CONFIG_MQTT_TRANSPORT_WEBSOCKET` & & `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

**CONFIG_MQTT_BUFFER_SIZE**

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

*Default value:*

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_STACK_SIZE**

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

*Default value:*

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`
Chapter 2. API

**CONFIG_MQTT_DISABLE_API_LOCKS**

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

**Default value:**
- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_PRIORITY**

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**
- 5 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**CONFIG_MQTT_TASK_CORE_SELECTION**

Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

**Available options:**
- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqtt)
set_property(TARGET ${mqtt}
PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

**Default value:**
- No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**
Chapter 2. API

• 30000 if \texttt{CONFIG_MQTT_USE_CUSTOM_CONFIG}

\textbf{Newlib} Contains:

• \texttt{CONFIG_NEWLIB_NANO_FORMAT}
• \texttt{CONFIG_NEWLIB_STDIN_LINE_ENDING}
• \texttt{CONFIG_NEWLIB_STDOUT_LINE_ENDING}
• \texttt{CONFIG_NEWLIB_TIME_SYSCALL}

\textbf{CONFIG_NEWLIB_STDOUT_LINE_ENDING}

Line ending for UART output

\textit{Found in: Component config > Newlib}

This option allows configuring the desired line endings sent to UART when a newline (‘\n’, LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR
LF: no modification is applied, stdout is sent as is
CR: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

\textbf{Available options:}

• CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
• LF (NEWLIB_STDOUT_LINE_ENDING_LF)
• CR (NEWLIB_STDOUT_LINE_ENDING_CR)

\textbf{CONFIG_NEWLIB_STDIN_LINE_ENDING}

Line ending for UART input

\textit{Found in: Component config > Newlib}

This option allows configuring which input sequence on UART produces a newline (‘\n’, LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF
LF: no modification is applied, input is sent to stdin as is
CR: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

\textbf{Available options:}

• CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
• LF (NEWLIB_STDIN_LINE_ENDING_LF)
• CR (NEWLIB_STDIN_LINE_ENDING_CR)

\textbf{CONFIG_NEWLIB_NANO_FORMAT}

Enable ‘nano’ formatting options for printf/scanf family

\textit{Found in: Component config > Newlib}

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’ : \url{https://sourceware.org/newlib/README}
If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**CONFIG_NEWLIB_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used**, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.6(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC_STORE registers are** used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
- None (NEWLIB_TIME_SYSCALL_USE_NONE)

**NVS**

Contains:

- **CONFIG_NVS_ENCRYPTION**
- **CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**
- **CONFIG_NVS_ASSERT_ERROR_CHECK**

**CONFIG_NVS_ENCRYPTION**

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if **CONFIG_SECURE_FLASH_ENC_ENABLED**

**CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.
CONFIG_NVS_ASSERT_ERROR_CHECK
Use assertions for error checking

*Found in: Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**
- No (disabled)

**OpenThread**  Contains:
- `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_ENABLED
OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC
Enable dynamic log level control

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable dynamic log level control for OpenThread

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_LOG_LEVEL
OpenThread log verbosity

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select OpenThread log level.

**Available options:**
- No logs (OPENTHREAD_LOG_LEVEL_NONE)
- Error logs (OPENTHREAD_LOG_LEVEL_CRIT)
- Warning logs (OPENTHREAD_LOG_LEVEL_WARN)
- Notice logs (OPENTHREAD_LOG_LEVEL_NOTE)
- Info logs (OPENTHREAD_LOG_LEVEL_INFO)
- Debug logs (OPENTHREAD_LOG_LEVEL_DEBUG)

CONFIG_OPENTHREAD_RADIO_TYPE
Config the Thread radio type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Configure how OpenThread connects to the 15.4 radio

**Available options:**
- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
• Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.

**CONFIG_OPENTHREAD_DEVICE_TYPE**

Config the Thread device type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**

- **Full Thread Device (OPENTHREAD_FTD)**
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.

- **Minimal Thread Device (OPENTHREAD_MTD)**
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.

- **Radio Only Device (OPENTHREAD_RADIO)**
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

**CONFIG_OPENTHREAD_CLI**

Enable OpenThread Command-Line Interface

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

**CONFIG_OPENTHREAD_DIAG**

Enable diag

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

**CONFIG_OPENTHREAD_COMMISSIONER**

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if CONFIG_OPENTHREAD_ENABLED
CONFIG_OPENTHREAD_JOINER

Enable Joiner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SRP_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_BORDER_ROUTER

Enable Border Router

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

**Range:**
- from 50 to 100 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 65 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_DNS64_CLIENT

Use dns64 client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to acquire NAT64 address from dns servers.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

Protocomm Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`
CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0
Support protocomm security version 0 (no security)

Found in: Component config > Protocomm

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1
Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2
Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

Found in: Component config > Protocomm

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

Default value:
• Yes (enabled)

PThreads Contains:
• CONFIG_PTHREAD_TASK_NAME_DEFAULT
• CONFIG_PTHREAD_TASK_CORE_DEFAULT
• CONFIG_PTHREAD_TASK_PRIO_DEFAULT
• CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT
• CONFIG_PTHREAD_STACK_MIN

CONFIG_PTHREAD_TASK_PRIO_DEFAULT
Default task priority

Found in: Component config > PThreads

Priority used to create new tasks with default pthread parameters.

Range:
• from 0 to 255

Default value:
• 5
**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**Default value:**
- 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
- 768

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

**Available options:**
- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

**Default value:**
- “pthread”

**SPI Flash driver**  
Contains:
- Auto-detect flash chips
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE_ERASE_CHIP_DRIVER_LIST
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- SPI Flash behavior when brownout
- CONFIG_SPI_FLASH_SHARE_SPI1_BUS
- CONFIG_SPI_FLASH_ROM_IMPL
- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_DANGEROUS_WRITE
CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**
- No (disabled) if `CONFIG_SPI_FLASH_VERIFY_WRITE`

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:
- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for spi flash APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**
- 0
CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_ROM_IMPL

Use esp_flash implementation in ROM

*Found in: Component config > SPI Flash driver*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:
- SPI_FLASH_AUTO_SUSPEND (C3, S3)

**Default value:**
- No (disabled) if ESP_ROM_HAS_SPI_FLASH

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**
- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_SHARE_SPI1_BUS

Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.
**CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

*Default value:*
  - No (disabled)

**CONFIG_SPI_FLASH_YIELD_DURING_ERASE**

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS and SPI\_FLASH\_ERASE\_YIELD\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check SPI Flash API reference documentation under section OS Function.

*Default value:*
  - Yes (enabled)

**CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS**

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

*Default value:*
  - 20

**CONFIG_SPI_FLASH_ERASE_YIELD_TICKS**

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

*Default value:*
  - 1

**CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE**

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

*Range:*
  - from 256 to 8192
Default value:
- 8192

**CONFIG_SPI_FLASH_SIZE_OVERRIDE**
Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

Default value:
- No (disabled)

**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**
Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

Default value:
- No (disabled)

**CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**
Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the default_registered_chips structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

Default value:
- No (disabled)

**SPI Flash behavior when brownout**
Contains:
- **CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

**CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**
Enable sending reset when brownout for XMC flash chips

*Found in: Component config > SPI Flash driver > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

**DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.**

Default value:
- Yes (enabled)
Auto-detect flash chips Contains:

- CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP
- CONFIG_SPI_FLASH_SUPPORT_GD_CHIP
- CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
- CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP
- CONFIG_SPI_FLASH_SUPPORT_TH_CHIP
- CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by chip\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by chip\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by chip\_drv member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by chip\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)
CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- No (disabled)
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- No (disabled)
- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)

SPIFFS Configuration  Contains:

- Debug Configuration
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_FOLLOW_SYMLINKS
- CONFIG_SPIFFS_MAX_PARTITIONS
- CONFIG_SPIFFS_USE_MTIME
- CONFIG_SPIFFS_GC_MAX_RUNS
- CONFIG_SPIFFS_OBJ_NAME_LEN
- CONFIG_SPIFFS_META_LENGTH
- SPIFFS Cache Configuration
- CONFIG_SPIFFS_PAGE_SIZE
- CONFIG_SPIFFS_MTIME_WIDE_64_BITS

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.
Chapter 2. API

**SPIFFS Cache Configuration**
Contains:

- `CONFIG_SPIFFS_CACHE`

**CONFIG_SPIFFS_CACHE**
Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disables memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_CACHE_WR**
Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_CACHE_STATS**
Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_PAGE_CHECK**
Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_GC_MAX_RUNS**
Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.
Range:
- from 1 to 10000

Default value:
- 10

**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

Default value:
- No (disabled)

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

Range:
- from 256 to 1024

Default value:
- 256

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

Range:
- from 1 to 256

Default value:
- 32

**CONFIG_SPIFFS_FOLLOW_SYMLINKS**

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

Default value:
- No (disabled)
Chapter 2. API

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**

- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**

- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8
Chapter 2. API

Debug Configuration

Contains:

- `CONFIG_SPIFFS_DBG`
- `CONFIG_SPIFFS_API_DBG`
- `CONFIG_SPIFFS_CACHE_DBG`
- `CONFIG_SPIFFS_CHECK_DBG`
- `CONFIG_SPIFFS_TEST_VISUALISATION`
- `CONFIG_SPIFFS_GC_DBG`

`CONFIG_SPIFFS_DBG`

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

`CONFIG_SPIFFS_API_DBG`

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

`CONFIG_SPIFFS_GC_DBG`

Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

`CONFIG_SPIFFS_CACHE_DBG`

Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

`CONFIG_SPIFFS_CHECK_DBG`

Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)
CONFIG_SPIFFS_TEST_VISUALISATION

Enable SPIFFS Filesystem Visualization

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enable this option to enable SPIFFS_vis function in the API.

Default value:
• No (disabled)

TCP Transport Contains:
• Websocket

Websocket Contains:
• CONFIG_WS_TRANSPORT

CONFIG_WS_TRANSPORT

Enable Websocket Transport

Found in: Component config > TCP Transport > Websocket

Enable support for creating websocket transport.

Default value:
• Yes (enabled)

CONFIG_WS_BUFFER_SIZE

Websocket transport buffer size

Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT

Size of the buffer used for constructing the HTTP Upgrade request during connect

Default value:
• 1024

CONFIG_WS_DYNAMIC_BUFFER

Using dynamic websocket transport buffer

Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

Default value:
• No (disabled)

Ultra Low Power (ULP) Co-processor Contains:
• CONFIG_ULP_COPROC_ENABLED
• ULP RISC-V Settings
Chapter 2. API

### CONFIG_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Co-processor

*Found in: Component config > Ultra Low Power (ULP) Co-processor*

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**
- No (disabled)

### CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V. Please note that ESP32 only supports ULP FSM.

**Available options:**
- ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
- ULP RISC-V (ULP_COPROC_TYPE_RISCV)

### CONFIG_ULP_COPROC_RESERVE_MEM

RTC Slow memory reserved for coprocessor

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if `CONFIG_ULP_COPROC_ENABLED`

**Default value:**
- 512 if `CONFIG_ULP_COPROC_ENABLED`

### ULP RISC-V Settings

#### Unity unit testing library

Contains:

- `CONFIG.Unity_ENABLE_COLOR`
- `CONFIG.Unity_ENABLE.IDF_TEST_RUNNER`
- `CONFIG.Unity_ENABLE_FIXTURE`
- `CONFIG.Unity_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG.Unity_ENABLE.64BIT`
- `CONFIG.Unity_ENABLE_DOUBLE`
- `CONFIG.Unity_ENABLE_FLOAT`

### CONFIG.Unity_ENABLE_FLOAT

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**Default value:**
- Yes (enabled)
CONFIG_UNITY_ENABLE_DOUBLE
Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_64BIT
Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_COLOR
Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER
Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE
Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)
CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL
Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

Virtual file system  Contains:
- **CONFIG_VFS_SUPPORT_IO**

CONFIG_VFS_SUPPORT_IO
Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component:
- open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:
- close, read, write, ioctl, fcntl.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SUPPORT_DIR
Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component:
- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**
- Yes (enabled)

CONFIG_VFS_SUPPORT_SELECT
Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.
**Default value:**
- Yes (enabled) if \( \text{CONFIG\_VFS\_SUPPORT\_IO} \) && \( \text{CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT} \)

**CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT**

Suppress select() related debug outputs

*Found in:* Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > CONFIG\_VFS\_SUPPORT\_SELECT

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

**CONFIG\_VFS\_SUPPORT\_TERMIOS**

Provide termios.h functions

*Found in:* Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

**Host File System I/O (Semihosting)**

Contains:
- \( \text{CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS} \)

**CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in:* Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)

Define maximum number of host filesystem mount points.

**Default value:**
- 1

**Wear Levelling**

Contains:
- \( \text{CONFIG\_WL\_SECTOR\_MODE} \)
- \( \text{CONFIG\_WL\_SECTOR\_SIZE} \)

**CONFIG\_WL\_SECTOR\_SIZE**

Wear Levelling library sector size

*Found in:* Component config > Wear Levelling

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.
With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**

- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager**

Contains:

- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_BLE_SEC_CONN`
- `CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION`
- `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30
CONFIG_WIFI_PROV_BLE_BONDING

Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

CONFIG_WIFI_PROV_BLE_SEC_CONN

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager*

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV*

**Default value:**
- Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

**Supplicant**  Contains:

- CONFIG_WPA_TESTING_OPTIONS
- CONFIG_WPA_WPS_SOFTAP_REGISTRAR
- CONFIG_WPA_11KV_SUPPORT
- CONFIG_WPA_11R_SUPPORT
- CONFIG_WPA_DPP_SUPPORT
- CONFIG_WPA_MBO_SUPPORT
- CONFIG_WPA_SUITE_B_192
- CONFIG_WPA_WAPI_PSK
- CONFIG_WPA_DEBUG_PRINT
- CONFIG_WPA_WPS_STRICT
- CONFIG_WPA_MBEDTLS_CRYPTO
CONFIG_WPA_MBEDTLS_CRYPTO

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**
- Yes (enabled)

CONFIG_WPA_MBEDTLS_TLS_CLIENT

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Supplicant > CONFIG_WPA_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0, TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**
- Yes (enabled)

CONFIG_WPA_WAPI_PSK

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**
- No (disabled)

CONFIG_WPA_SUITE_B_192

Enable NSA suite B support with 192 bit key

*Found in: Component config > Supplicant*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**
- No (disabled)

CONFIG_WPA_DEBUG_PRINT

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**
- No (disabled)
CONFIG_WPA_TESTING_OPTIONS

Add DPP testing code

*Found in: Component config > Supplicant*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

CONFIG_WPA_WPS STRICT

Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**
- No (disabled)

CONFIG_WPA_11KV_SUPPORT

Enable 802.11k, 802.11v APIs Support

*Found in: Component config > Supplicant*

Select this option to enable 802.11k 802.11v APIs (RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)

CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if CONFIG_WPA_11KV_SUPPORT

CONFIG_WPA_MBO_SUPPORT

Enable Multi Band Operation Certification Support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)
CONFIG_WPA_DPP_SUPPORT
Enable DPP support

*Found in:* Component config > Supplicant

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

CONFIG_WPA_11R_SUPPORT
Enable 802.11R (Fast Transition) Support

*Found in:* Component config > Supplicant

Select this option to enable WiFi Fast Transition Support.

**Default value:**
- No (disabled)

CONFIG_WPA_WPS_SOFTAP.REGISTRAR
Add WPS Registrar support in SoftAP mode

*Found in:* Component config > Supplicant

Select this option to enable WPS registrar support in softAP mode.

**Default value:**
- No (disabled)

**Deprecated options and their replacements**

2.8.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
  - protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

- Proof-of-possession (support with protocomm_security1 only)
- Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (for protocomm_security1 and protocomm_security2) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Enabling protocomm security version

Protocomm component provides project configuration menu to enable/disable support of respective security versions. The respective configuration options can be found as follows:

- Support protocomm security version 0 (no security): \texttt{CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0}
  (this option is enabled by default)
Chapter 2. API 参考

- Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption): `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1` (this option is enabled by default)
- Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption): `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

备注：Enabling multiple security versions allow to control them dynamically but also increases firmware size.

Transport Example (SoftAP + HTTP) with Security 2

For sample usage, see [wifi_provisioning/src/scheme_softap.c](https://github.com/espressif/esp-idf/blob/master/wifi_provisioning/src/scheme_softap.c)

```c
static const char sec2_salt[] = {0x7f, 0x5f, 0xe2, 0xbe, 0xba, 0xc7, 0x81, 0x0c};
static const char sec2_verifier[] = {0x83, 0x4b, inlen, 0xf7, 0xef, outlen, 0x23, 0x11, 0xac, 0x23, 0x14, 0x7c, 0x2a, 0xe5, 0x5c, 0x07, 0x7a, 0x93, 0x8a};

* This simply echoes back the received data. *
static esp_err_t echo_req_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;
    /* Output data length updated */
    *outbuf = malloc(inlen);
    /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}
```

    /* Set security for communication at application level. Just like for_
     * request handlers, setting security creates an end point and_
     * registers
     * the handler provided by protocomm_security1. One can similarly use_
     * protocomm_security0. Only one type of security can be set for a_
     * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security2,_
                           sec2_params);

    /* Private data passed to the end point must be valid throughout the_
    *(下頁續)*/
```
Chapter 2. API

Transport Example (SoftAP + HTTP) with Security 1

For sample usage, see wifi_provisioning/src/scheme_softap.c

```
/* Endpoint handler to be registered with protocomm. */
* This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
   const uint8_t *inbuf, ssize_t inlen,
   uint8_t **outbuf, ssize_t *outlen,
   void *priv_data)
{

   /* Session ID may be used for persistence */
   printf("Session ID : %d", session_id);

   /* Echo back the received data */
   *outlen = inlen;  /* Output data length updated */
   *outbuf = malloc(inlen);  /* This will be deallocated outside */
   memcpy(*outbuf, inbuf, inlen);

   /* Private data that was passed at the time of endpoint creation */
   uint32_t *priv = (uint32_t *) priv_data;
   if (priv) {
       printf("Private data : %d", *priv);
   }

   return ESP_OK;
}
```

** of protocomm endpoint. This need not be static, ie. could be
* dynamically
* allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;
/* Add a new endpoint for the protocomm instance, identified by a_
* unique name
* and register a handler function along with private data to be_
* passed at the_
* time of handler execution. Multiple endpoints can be added as long_
* as they
* are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
   echo_req_handler, (void *) &priv_data);

```
/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
   /* Remove endpoint identified by it's unique name */
   protocomm_remove_endpoint(pc, "echo_req_endpoint");

   /* Remove security endpoint identified by it's name */
   protocomm_unset_security(pc, "security_endpoint");

   /* Stop HTTP server */
   protocomm_httpd_stop(pc);

   /* Delete (deallocate) the protocomm instance */
   protocomm_delete(pc);
}
```

Chapter 2. API 参考

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

`protocomm_t *protocomm_new(void)`
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the `protocomm_t` structure initialized to NULL.

- `protocomm_t *`: On success
- `NULL`: No memory for allocating new instance

`void protocomm_delete(protocomm_t *pc)`
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

- `pc` - [in] Pointer to the protocomm instance to be deleted

`esp_err_t protocomm_add_endpoint(protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)`
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier(name) string
- `h` - [in] Endpoint handler function
- `priv_data` - [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

- `ESP_OK`: Success
- `ESP_FAIL`: Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_NO_MEM`: Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG`: Null instance/name/handler arguments

`esp_err_t protocomm_remove_endpoint(protocomm_t *pc, const char *ep_name)`
Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

-备注:

Espressif Systems

Submit Document Feedback
This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier (name) string

**Return**
- `ESP_OK`: Success
- `ESP_ERR_NOT_FOUND`: Endpoint with specified name doesn’t exist
- `ESP_ERR_INVALID_ARG`: Null instance/name arguments

```c
esp_err_t protocomm_open_session(protocomm_t *pc, uint32_t session_id)
```

Allocates internal resources for new transport session.

**Notes:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

```c
esp_err_t protocomm_close_session(protocomm_t *pc, uint32_t session_id)
```

Frees internal resources used by a transport session.

**Notes:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

```c
esp_err_t protocomm_req_handle(protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Notes:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.
Chapter 2. API

• **inbuf**: [in] Input buffer contains input request data which is to be processed by the registered handler
• **inlen**: [in] Length of the input buffer
• **outbuf**: [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
• **outlen**: [out] Buffer length of the allocated output buffer

ESP_OK: Request handled successfully
ESP_FAIL: Internal error in execution of registered handler
ESP_ERR_NO_MEM: Error allocating internal resource
ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
ESP_ERR_INVALID_ARG: Null instance/name arguments

```c
esp_err_t protocomm_set_security(protocomm_t *pc, const char* ep_name, const protocomm_security_t *sec, const void *sec_params)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**备注:**

• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
• The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

```c
esp_err_t protocomm_unset_security(protocomm_t *pc, const char* ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**参数**

• **pc**: [in] Pointer to the protocomm instance
• **ep_name**: [in] Endpoint identifier(name) string

**返回**

• ESP_OK: Success
• ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE: Security endpoint already set
• ESP_ERR_NO_MEM: Error allocating endpoint resource
• ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

```c
esp_err_t protocomm_unset_security(protocomm_t *pc, const char* ep_name)
```
**esp_err_t** `protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version)`

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**备注:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

---

### 参数

- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier (name) string
- `version` - [in] Version identifier (name) string

### 返回

- ESP_OK: Success
- ESP_FAIL: Error adding endpoint | Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Version endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

**esp_err_t** `protocomm_unset_version(protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

### 参数

- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier (name) string

### 返回

- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

---

### Type Definitions

typedef **esp_err_t** (*`protocomm_req_handler_t`)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm **protocomm_t**

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

**备注:** Structure of the protocomm object is kept private

---

### Header File

- components/protocomm/include/security/protocomm_security.h

### Structures

- **protocomm_security1_params**

  Protocomm Security 1 parameters: Proof Of Possession.
Public Members

const uint8_t *data
    Pointer to buffer containing the proof of possession data

uint16_t len
    Length (in bytes) of the proof of possession data

struct protocomm_security2_params
    Protocomm Security 2 parameters: Salt and Verifier.

Public Members

const char *salt
    Pointer to the buffer containing the salt

uint16_t salt_len
    Length (in bytes) of the salt

const char *verifier
    Pointer to the buffer containing the verifier

uint16_t verifier_len
    Length (in bytes) of the verifier

struct protocomm_security
    Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注: This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
    Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
    Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
    Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Starts a new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Closes a secure transport session with specified ID
esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t

Protocomm Security 1 parameters: Proof Of Possession.

typedef protocomm_security1_params_t protocomm_security_pop_t

typedef struct protocomm_security2_params protocomm_security2_params_t

Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

protocomm_security_t

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

备注: This structure should not have any dynamic members to allow re-entrancy

Header File

- components/protocomm/include/security/protocomm_security0.h

Header File

- components/protocomm/include/security/protocomm_security1.h

Header File

- components/protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.
This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Parameters**
- `pc` [in] Protocomm instance pointer obtained from `protocomm_new()`
- `config` [in] Pointer to config structure for initializing HTTP server

**Return**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Null arguments
- `ESP_ERR_NOT_SUPPORTED`: Transport layer bound to another protocomm instance
- `ESP_ERR_INVALID_STATE`: Transport layer already bound to this protocomm instance
- `ESP_ERR_NO_MEM`: Memory allocation for server resource failed
- `ESP_ERR_HTTPD_*`: HTTP server error on start

```c
esp_err_t protocomm_httpd_stop(protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters**
- `pc` [in] Same protocomm instance that was passed to `protocomm_httpd_start()`

**Return**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Null / incorrect protocomm instance pointer

**Unions**

```c
union protocomm_httpd_config_data_t
```

`#include <protocomm_httpd.h>` Protocomm HTTPD Configuration Data

**Public Members**

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active

**Structures**

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

```c
uint16_t port
```

Port on which the HTTP server will listen

```c
size_t stack_size
```

Stack size of server task, adjusted depending upon stack usage of endpoint handler
unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

• components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
Start Bluetooth Low Energy based transport layer for provisioning.
Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

参数
• pc [in] Protocomm instance pointer obtained from protocomm_new()
• config [in] Pointer to config structure for initializing BLE

返回
• ESP_OK: Success
• ESP_FAIL: Simple BLE start error
• ESP_ERR_NO_MEM: Error allocating memory for internal resources
• ESP_ERR_INVALID_STATE: Error in ble config
• ESP_ERR_INVALID_ARG: Null arguments

esp_err_t protocomm_ble_stop (protocomm_t *pc)
Stop Bluetooth Low Energy based transport layer for provisioning.
Stops service/task responsible for BLE based interactions for provisioning

备注: You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

参数 pc [in] Same protocomm instance that was passed to protocomm_ble_start()

返回
• ESP_OK: Success
• ESP_FAIL: Simple BLE stop error
• ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance
Structures

struct name_uuid

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

cnst char *name
    Name of the handler, which is passed to protocomm layer

tuint16_t uuid
    UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config

Config parameters for protocomm BLE service.

Public Members

char device_name[MAX_BLE_DEVNAME_LEN + 1]
    BLE device name being broadcast at the time of provisioning

tuint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
    128 bit UUID of the provisioning service

tuint8_t *manufacturer_data
    BLE device manufacturer data pointer in advertisement

 ssize_t manufacturer_data_len
    BLE device manufacturer data length in advertisement

 ssize_t nu_lookup_count
    Number of entries in the Name-UUID lookup table

struct protocomm_ble_name_uuid_t *nu_lookup
    Pointer to the Name-UUID lookup table

unsigned ble_bonding
    BLE bonding

unsigned ble_sm_sc
    BLE security flag

Macros

MAX_BLE_DEVNAME_LEN
    BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes
**Chapter 2. API 参考**

**BLE_UUID128_VAL_LENGTH**

**MAX_BLE_MANUFACTURER_DATA_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

**Type Definitions**

typedef struct name_uuid protocomm_ble_name_uuid_t

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t

Config parameters for protocomm BLE service.

**Enumerations**

enum protocomm_transport_ble_event_t

Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

*Values:

enumerator PROTOCOL_TRANSPORT_BLE_CONNECTED

enumerator PROTOCOL_TRANSPORT_BLE_DISCONNECTED

### 2.8.2 Unified Provisioning

**Overview**

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol**: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. **Transport Flexibility**: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. **Security Scheme Flexibility**: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. **Compact Data Representation**: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.
Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.
Chapter 2. API

1. Transport specific discovery and connection
   - Some form of beaconing
   - Client connects

2. Session Establishment
   - Get Version Request
     - Get Version Response
   - Session Setup Request
     - Session Setup Response

One or multiple steps as per protocol

3. Configuration
   - App specific Set Config (optional)
     - Set Config Response (optional)
   - Wi-Fi SetConfig(SSID, Passphrase...)
     - Wi-Fi SetConfig response
   - Wi-Fi ApplyConfig cmd
     - Wi-Fi ApplyConfig resp
   - Wi-Fi GetStatus cmd (repeated)
     - Wi-Fi GetStatus resp (repeated)

4. Close connection
   - Close Connection
Chapter 2. API

It relies on the base layer called **Protocol Communication** (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present, unified provisioning supports the following security schemes:

1. **Security0** - No security (No encryption)
2. **Security1** - Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
   a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
   b. No Auth (Null PoP) - Shared key derived through key exchange only
3. **Security2** - SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocomm security version section in **Protocol Communication** (Protocol Communication) for more details.
Security Scheme

Security scheme details are shown in the below sequence diagram -

Security2 Scheme

Security2 scheme is based on the Secure Remote Password (SRP6a) protocol - RFC 5054. The protocol requires the Salt and Verifier to be generated beforehand with help of the identifying username `I` and the plaintext password `p`. The Salt and Verifier are then stored on ESP32. The password `p` and username `I` are to be provided to the Phone App (Provisioning entity) by suitable means for example QR code sticker.

Security2 scheme details are shown in the below sequence diagram -

Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage.

Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

• Android:
  – BLE Provisioning app on Play Store.
  – SoftAP Provisioning app on Play Store.
  – Source code on GitHub: esp-idf-provisioning-android.
• iOS:
  – BLE Provisioning app on app store.
  – SoftAP Provisioning app on app Store.
  – Source code on GitHub: esp-idf-provisioning-ios.
• Linux/MacOS/Windows: tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.8.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Initialization  

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other wifi_prov_mgr APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
  .scheme = wifi_prov_scheme_ble,
  .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

Generate Key Pair

Client (PhoneApp)

Device (ESP)

a (cli_privkey) = 256 bit random value, A (cli_pubkey) = g^a.
g - generator, N - large safe prime.
All arithmetic operations are performed in ring of integers modulo N,
thus all occurrences like y^z should be read as y^z modulo N.

SessionCmd0(cli_pubkey A, username)

Obtain salt and verifier stored on esp
Salt s = 256 bit random value,
Verifier v = g^x where x = H(s || p)

b (dev_privkey) = 256 bit random value
B (dev_pubkey) = k*v + g^b where k = H(N, g)

Shared Key K = H(S) where,
S = (A*v^u) + b
u = H(A, B)

SessionResp0(dev_pubkey B, dev_rand)

shared_key(K) = H(S) where,
S = (B - k^y) + (a + u)
K = H(A, B),
v = g^x,
x = H(s || p).

Verification Token

client_proof M = H(H(N) XOR H(g) || H(l) || s || A || B || K)

SessionCmd1(client_proof M)

device generates M1 = H(H(N) XOR H(g) || H(l) || s || A || B || K)
device verifies this M1 with the M1 obtained from Client

Device generate device_proof M2 = H(A, M, K)

dev_rand = gen_16byte_random() This random number is to be used for AES-GCM operation
for encryption and decryption of data using the shared secret

SessionResp1(device_proof M2, dev_rand)

Verify Device

Client calculates device proof M2 as M2 = H(A, M, K)
client verifies this M2 with M2 obtained from device

Submit Document Feedback
The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future re-boot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`: Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`: Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`: Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE`: Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`’s that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data) {
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV:
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials\nSSID : %s\nPassword : %s",
                        wifi_sta_cfg->ssid,
                        wifi_sta_cfg->password);
                break;
            case WIFI_PROV_CRED_FAIL:
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t*)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\nReason : %s\nPlease reset to factory and retry\nprovisioning",
```

(下页继续)
Chapter 2. API 参考

(*reason == WIFI_prov_STA_AUTH_ERROR) ?
"Wi-Fi station authentication failed" : 
"access-point not found")
break;
}
case WIFI_prov_CRED_SUCCESS:
    ESP_LOGI(TAG, "Provisioning successful");
break;
case WIFI_prov_END:
    /* De-initialize manager once provisioning is finished */
    wifi_prov_mgr_deinit();
break;
default:
    break;
}
}

The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().

Check Provisioning State  Whether device is provisioned or not can be checked at runtime by calling wifi_prov_mgr_is_provisioned(). This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the esp_wifi_APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call esp_wifi_APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start Provisioning Service  At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is wifi_prov_scheme_softap
- BLE Device name (service key is ignored) when scheme is wifi_prov_scheme_ble

Also, since internally the manager uses protocomm, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the pop is simply ignored

See Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );
```
The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**备注:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check Provisioning State.

### Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT’s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID. When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:
### Table 9: Endpoints provided by Provisioning Service

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-ctrl</td>
<td><a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a></td>
<td>Endpoint used for controlling Wi-Fi provisioning state</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ....` Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding `.proto` files can be found under `wifi_provisioning/proto`):

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - **group_channels** (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one
which will have \( 14 \% 3 = 2 \) channels. So, when scan is started, the first 3 channels will be scanned, 
followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been 
escanned. One may need to adjust this parameter as having only few channels in a group may slow down 
the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should 
work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and 
hence achieve the fastest overall scanning time.

- **period_ms** (input) - Scan parameter specifying how long to wait on each channel
- **scan_status** - Gives the status of scanning process:
  - **scan_finished** (output) - When scan has finished this returns true
  - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening 
    this number will keep on updating
- **scan_result** - For fetching scan results. This can be called even if scan is still on going
  - **start_index** (input) - Starting index from where to fetch the entries from the results list
  - **count** (input) - Number of entries to fetch from the starting index
  - **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

The client can also control the provisioning state of the device using `wifi_ctrl` endpoint. The `wifi_ctrl` endpoint supports 
the following protobuf commands:

- **ctrl_reset** - Resets internal state machine of the device and clears provisioned credentials only in case of pro-
  visioning failures.
- **ctrl_reprov** - Resets internal state machine of the device and clears provisioned credentials only in case the 
device is to be provisioned again for new credentials after a previous successful provisioning

### Additional Endpoints

In case users want to have some additional protocomm endpoints customized to their re-
quirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is 
the registration of a handler for this endpoint. See `protocomm` for the function signature of an endpoint handler. 
A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the 
protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
    --key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
    --custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint 
at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

### When / How To Stop Provisioning Service?

The default behavior is that once the device successfully connects 
using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE 
/ SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not 
received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / 
passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for 
disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials 
will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. 
Now the provisioning service will only be stopped after an explicit call to 
`wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping 
the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified 
by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some 
time after the Wi-Fi connection is successfully established. For example, if the application requires the de-
vice to connect to some cloud service and obtain another set of credentials, and exchange this credentials
over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

Application Examples

For complete example implementation see `provisioning/wifi_prov_mgr`

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: `esp-idf-provisioning-android`.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app store.
  - Source code on GitHub: `esp-idf-provisioning-ios`.

- **Linux/MacOS/Windows:** `tools/esp_prov` (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

API Reference

Header File

- `components/wifi_provisioning/include/wifi_provisioning/manager.h`

Functions

```c
esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

`config` is configuration structure

```c
void wifi_prov_mgr_deinit (void)
```

Stop provisioning (if running) and release resource used by the manager.

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component
If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

备注： Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

### 参数

- **provisioned** - [out] True if provisioned, else false
- **ESP_OK** : Retrieved provision state successfully
- **ESP_FAIL** : Wi-Fi not initialized
- **ESP_ERR_INVALID_ARG** : Null argument supplied

```c
esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests.
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure.

备注： This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true.

### 参数

- **security** - [in] Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0 : For no security
  - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2 : SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- **wifi_prov_sec_params** - [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0. This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-inited.
- **service_name** - [in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service_key** - [in] Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

### 返回

- **ESP_OK** : Provisioning started successfully
- **ESP_FAIL** : Failed to start provisioning service
- **ESP_ERR_INVALID_STATE** : Provisioning manager not initialized or already started
### Chapter 2. API 参考

**void wifi_prov_mgr_stop_provisioning (void)**

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

**void wifi_prov_mgr_wait (void)**

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

**esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)**

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

**备注:** This must be called before executing wifi_prov_mgr_start_provisioning()

参数 cleanup_delay —[in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

返回

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: Manager not initialized or provisioning service already started

**esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char *capabilities, size_t total_capabilities)**

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.
备注：This must be called before executing wifi_prov_mgr_start_provisioning()

参数
- **label** [in] String indicating the application name.
- **version** [in] String indicating the application version. There is no constraint on format.
- **capabilities** [in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total_capabilities** [in] Size of capabilities array

返回
- **ESP_OK**: Success
- **ESP_ERR_INVALID_STATE**: Manager not initialized or provisioning service already started
- **ESP_ERR_NO_MEM**: Failed to allocate memory for version string
- **ESP_ERR_INVALID_ARG**: Null argument

**esp_err_t wifi_prov_mgr_endpoint_create**(const char* ep_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

备注：This API can only be called BEFORE provisioning is started

备注：Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

备注：After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

参数 **ep_name** [in] unique name of the endpoint

返回
- **ESP_OK**: Success
- **ESP_FAIL**: Failure

**esp_err_t wifi_prov_mgr_endpoint_register**(const char* ep_name, protocomm_req_handler_t handler, void* user_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

备注：This API can only be called AFTER provisioning has started

备注：Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application
Chapter 2. API 参考

备注：After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered.

### 参数
- **ep_name** – [in] Name of the endpoint
- **handler** – [in] Endpoint handler function
- **user_ctx** – [in] User data

### 返回
- **ESP_OK** : Success
- **ESP_FAIL** : Failure

```c
void wifi_prov_mgr_endpoint_unregister (const char* ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

### 参数 ep_name – [in] Name of the endpoint

```c
esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
```

Get state of Wi-Fi Station during provisioning.

- **state** – [out] Pointer to wifi_prov_sta_state_t variable to be filled

### 返回
- **ESP_OK** : Successfully retrieved Wi-Fi state
- **ESP_FAIL** : Provisioning app not running

```c
esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
```

Get reason code in case of Wi-Fi station disconnection during provisioning.

- **reason** – [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

### 返回
- **ESP_OK** : Successfully retrieved Wi-Fi disconnect reason
- **ESP_FAIL** : Provisioning app not running

```c
esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
```

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started.

- **wifi_cfg** – [in] Pointer to Wi-Fi configuration structure

### 返回
- **ESP_OK** : Wi-Fi configured and started successfully
- **ESP_FAIL** : Failed to set configuration

```c
esp_err_t wifi_prov_mgr_reset_provisioning (void)
```

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

### 返回
- **ESP_OK** : Reset provisioning config successfully
**Chapter 2. API Reference**

- ESP_FAIL: Failed to reset provisioning config

```c
esp_err_t wifi_prov_mgr_reset_sm_state_on_failure( void )
```

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

```c
esp_err_t wifi_prov_mgr_reset_sm_state_for_reprovision( void )
```

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

```c
void user_data
```

User context data to pass as parameter to callback function

**Structures**

```c
struct wifi_prov_event_handler_t
```

Event handler that is used by the manager while provisioning service is active.

**Public Members**

```c
wifi_prov_scheme event_scheme
```

Callback function to be executed on provisioning events

```c
void* user_data
```

User context data to pass as parameter to callback function

**Structures**

```c
struct wifi_prov_scheme
```

Structure for specifying the provisioning scheme to be followed by the manager.

```c
wifi_prov_scheme_ble
wifi_prov_scheme_softap
wifi_prov_scheme_console
```

Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**
esp_err_t (*prov_start)(protocomm_t *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (*prov_stop)(protocomm_t *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void *(*new_config)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()

void (*delete_config)(void *config)

Function which is to be called by the manager to delete a configuration generated using new_config()

esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t wifi_mode

Sets mode of operation of Wi-Fi during provisioning This is set to:

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport

struct wifi_prov_mgr_config_t

Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme

Provisioning scheme to use. Following schemes are already available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT
**wifi_prov_event_handler_t** `app_event_handler`  
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

### Macros

**WIFI_PROV_EVENT_HANDLER_NONE**  
Event handler can be set to none if not used.

### Type Definitions

typedef void (*`wifi_prov_cb_func_t`)(void *user_data, `wifi_prov_cb_event_t` event, void *event_data)

typedef struct `wifi_prov_scheme` `wifi_prov_scheme_t`  
Structure for specifying the provisioning scheme to be followed by the manager.

<table>
<thead>
<tr>
<th>备注：</th>
<th>Ready to use schemes are available:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <code>wifi_prov_scheme_ble</code> : for provisioning over BLE transport + GATT server</td>
<td></td>
</tr>
<tr>
<td>- <code>wifi_prov_scheme_softap</code> : for provisioning over SoftAP transport + HTTP server</td>
<td></td>
</tr>
<tr>
<td>- <code>wifi_prov_scheme_console</code> : for provisioning over Serial UART transport + Console (for debugging)</td>
<td></td>
</tr>
</tbody>
</table>

 typedef enum `wifi_prov_security` `wifi_prov_security_t`  
Security modes supported by the Provisioning Manager. These are same as the security modes provided by protocomm

typedef `protocomm_security2_params_t` `wifi_prov_security2_params_t`  
Security 2 params structure This needs to be passed when using WIFI_PROV_SECURITY_2.

### Enumerations

typedef enum `wifi_prov_cb_event_t`  
Events generated by manager. These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

<table>
<thead>
<tr>
<th>Values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>-wifi_prov_init</td>
</tr>
<tr>
<td>-WIFI_PROV_START</td>
</tr>
<tr>
<td>-WIFI_PROV_CRED_RECV</td>
</tr>
</tbody>
</table>

enumerator **WIFI_PROV_INIT**  
Emitted when the manager is initialized

enumerator **WIFI_PROV_START**  
Indicates that provisioning has started

enumerator **WIFI_PROV_CRED_RECV**  
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure
enumerator WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t.

enumerator WIFI_PROV_CRED_SUCCESS
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV.

enumerator WIFI_PROV_END
Signals that provisioning service has stopped.

enumerator WIFI_PROV_DEINIT
Signals that manager has been de-initialized.

enum wifi_prov_security
Security modes supported by the Provisioning Manager. These are same as the security modes provided by protocomm.

Values:

enumerator WIFI_PROV_SECURITY_0
No security (plain-text communication).

enumerator WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
This secure communication mode consists of SRP6a based authentication and key exchange
- AES-GCM encryption/decryption

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions

void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

备注: The data being pointed to by the argument must be valid at least until provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

参数 uuid128 - [in] A custom 128 bit UUID

返回
  • ESP_OK : Success
  • ESP_ERR_INVALID_ARG : Null argument

esp_err_t wifi_prov_scheme_ble_set_mfg_data (uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning().

备注: It is important to understand that the length of the custom manufacturer data should be within limits. The manufacturer data goes into the scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e., \((\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\). If the mfg_data length exceeds this limit, the length will be truncated.

参数
  • mfg_data - [in] Custom manufacturer data
  • mfg_data_len - [in] Manufacturer data length

返回
  • ESP_OK : Success
  • ESP_ERR_INVALID_ARG : Null argument

Macros

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File

• components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions

void wifi_prov_scheme_softap_set_httpd_handle (void *handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

备注: This API should be called before wifi_prov_mgr_start_provisioning()
Chapter 2. API

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h

- components/wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions

```c
esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t* inbuf, ssize_t inlen,
                                          uint8_t** outbuf, ssize_t *outlen, void *priv_data)
```

Handler for receiving and responding to requests from master.

This is to be registered as the wifi_config endpoint handler (protocomm
protocomm_req_handler_t) using protocomm_add_endpoint()

Structures

```c
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.

**Public Members**

```c
char ip_addr[IP4ADDR_STRLEN_MAX]
```

IP Address received by station

```c
char bssid[6]
```

BSSID of the AP to which connection was established

```c
char ssid[33]
```

SSID of the to which connection was established

```c
uint8_t channel
```

Channel of the AP

```c
uint8_t auth_mode
```

Authorization mode of the AP

```c
struct wifi_prov_config_get_data_t
```

WiFi status data to be sent in response to get_status request from master.

**Public Members**

```c
wifi_prov_sta_state_t wifi_state
```

WiFi state of the station

```c
wifi_prov_sta_fail_reason_t fail_reason
```

Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)
Chapter 2. API Reference

### wifi_prov_sta_conn_info_t conn_info
Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

```c
struct wifi_prov_sta_conn_info_t
{
    // Connection information
    // ...
}
```

### struct wifi_prov_config_set_data_t
WiFi config data received by slave during set_config request from master.

#### Public Members

- `char ssid[33]`  
  SSID of the AP to which the slave is to be connected
- `char password[64]`  
  Password of the AP
- `char bssid[6]`  
  BSSID of the AP
- `uint8_t channel`  
  Channel of the AP

### struct wifi_prov_config_handlers
Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

#### Public Members

- `esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)`  
  Handler function called when connection status of the slave (in WiFi station mode) is requested
- `esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)`  
  Handler function called when WiFi connection configuration (e.g. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values
- `esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)`  
  Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.

- `wifi_prov_ctx_t *ctx`  
  Context pointer to be passed to above handler functions upon invocation

### Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.
typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

**Enumerations**

enum wifi_prov_sta_state_t

WiFi STA status for conveying back to the provisioning master.

Values:

- enumerator WIFI_PROV_STA_CONNECTING
- enumerator WIFI_PROV_STA_CONNECTED
- enumerator WIFI_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t

WiFi STA connection fail reason.

Values:

- enumerator WIFI_PROV_STA_AUTH_ERROR
- enumerator WIFI_PROV_STA_AP_NOT_FOUND

本部分的 API 示例代码存放在 ESP-IDF 示例项目的 provisioning 目录下。

2.9 存储 API

2.9.1 FAT 文件系统

ESP-IDF 使用 FatFs 库来实现 FAT 文件系统。FatFs 库位于 fatfs 组件中，您可以直接使用，也可以借助 C 标准库和 POSIX API 通过 VFS（虚拟文件系统）使用 FatFs 库的大多数功能。

此外，我们对 FatFs 库进行了扩展，新增了支持可插拔磁盘 I/O 调度层，从而允许在运行时将 FatFs 驱动映射到物理磁盘。

FatFs 与 VFS 配合使用

头文件 fatfs/vfs/esp_vfs_fat.h 定义了连接 FatFs 和 VFS 的函数。

函数 esp_vfs_fat_register() 分配一个 FATFS 结构，并在 VFS 中注册特定路径前缀。如果文件路径以此前缀开头，则对此文件的后续操作将转至 FatFs API。
函数 `esp_vfs_fat_unregister_path()` 删除在 VFS 中的注册，并释放 FATFS 结构。多数应用程序在使用 `esp_vfs_fat_` 函数时，采用如下步骤：

1. **调用 `esp_vfs_fat_register()`，指定**：
   - 挂载文件系统的路径前缀（例如，“/sdcard”或“/spiflash”）
   - FatFs 驱动编号
   - 一个用于接收指向 FATFS 结构指针的变量
2. **调用 `ff_diskio_register()`**，为步骤 1 中的驱动编号注册磁盘 I/O 驱动；
3. **调用 FatFs 函数 `f_mount`，随后调用 `f_diskio` 或 `f_mkfs`，并使用与传递到 `esp_vfs_fat_register()` 相同的驱动编号挂载文件系统。请参考 FatFs 文档，查看更多信息；
4. **调用 C 标准库和 POSIX API 对路径中带有步骤 1 中所述前缀的文件（例如，“/sdcard/hello.txt”）执行打开、读取、写入、擦除、复制等操作。文件系统默认使用 8.3 文件名格式 (SFN)。若您需要使用长文件名 (LFN)，启用 `CONFIG_FATFS_LONG_FILENAMES` 选项。请参考这里，查看更多信息；
5. **您可以选择启用 `CONFIG_FATFS_USE_FASTSEEK` 选项，使用 POSIX lseek 来快速执行。快速查找不适用于编辑模式下的文件，所以，使用快速查找时，应在只读模式下打开（或者关闭然后重新打开）文件；
6. **您也可以选择直接调用 FatFs 库函数，但需要使用没有 VFS 前缀的路径（例如，“/hello.txt”）
7. 关闭所有打开的文件；
8. **调用 FatFs 函数 `f_mount` 并使用 NULL FATFS* 参数，为与上述编号相同的驱动卸载文件系统；
9. **调用 FatFs 函数 `ff_diskio_register()` 并使用 NULL `ff_diskio_impl_t*` 参数和相同的驱动编号，来释放注册的磁盘 I/O 驱动；
10. **调用 `esp_vfs_fat_unregister_path()` 并使用文件系统挂载的路径将 FatFs 从 VFS 中移除，并释放步骤 1 中分配的 FATFS 结构。

便捷函数 `esp_vfs_fat_sdmmc_mount`、`esp_vfs_fat_sdspi_mount` 和 `esp_vfs_fat_sdmmcUnmount` 对上述步骤进行了封装，并加入了对 SD 卡初始化的处理。我们将在下一章节详细介绍以上函数。

```c
esp_err_t esp_vfs_fat_register(const char* base_path, const char* fat_drive, size_t max_files, FATFS* out_fs)
```

Register FatFs with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

**备注:** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

**参数**

- `base_path` – path prefix where FATFS should be registered
- `fat_drive` – FATFS drive specification; if only one drive is used, can be an empty string
- `max_files` – maximum number of files which can be open at the same time
- `out_fs` – [out] pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

**返回**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

```c
esp_err_t esp_vfs_fat_unregister_path(const char* base_path)
```

Un-register FatFs from VFS.

**备注:** FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one
above is that this one will release the correct drive, while the one above will release the last registered one

参数 **base_path** — path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

### FatFs 与 VFS 和 SD 卡配合使用

头文件 fatfs/vfs/esp_vfs_fat.h 定义了便捷函数 esp_vfs_fat_sdmmc_mount()，esp_vfs_fat_sdspi_mount() 和 esp_vfs_fat_sdcard_unmount()。这些函数分别执行上一章节的步骤 1-3 和步骤 7-9，并初始化 SD 卡，但仅提供有限的错误处理功能。我们鼓励开发人员查看源代码，将更多高级功能集成到产品应用中。

便捷函数 esp_vfs_fat_sdmmc_mount() 用于卸载文件系统并释放从 esp_vfs_fat_sdmmc_mount() 函数获取的资源。

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

备注: Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

参数
- **base_path** — path where partition should be registered (e.g. “/sdcard”)
- **host_config** — Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD_SI_HOST_DEFAULT() macro.
- **slot_config** — Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config** — pointer to structure with extra parameters for mounting FATFS
- **out_card** [out] if not NULL, pointer to the card information structure will be returned via this argument

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers
**esp_err_t esp_vfs_fat_sdmmc_unmount**(void)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

**Deprecated:**
Use esp_vfs_fat_sdcard_unmount() instead.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

**esp_err_t esp_vfs_fat_sdspi_mount**(const char*base_path, const sdmmc_host_t*host_config_input, const sdspi_device_config_t*slot_config, const esp_vfs_fat_mount_config_t*mount_config, sdmmc_card_t**out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**备注:** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by spi_bus_initialize() before.

**参数**

- **base_path** – path where partition should be registered (e.g. “/sdcard”)
- **host_config_input** – Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.
- **slot_config** – Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to sdspi_device_config_t structure initialized using SDSPI_DEVICE_CONFIG_DEFAULT().
- **mount_config** – pointer to structure with extra parameters for mounting FATFS
- **out_card** [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

**返回**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

**struct esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

**Public Members**
bool `format_if_mount_failed`
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int `max_files`
Max number of open files.

`size_t allocation_unit_size`
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool `disk_status_check_enable`
Enables real `ff_disk_status` function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

`esp_err_t esp_vfs_fat_sdcardUnmount` (const char* `base_path`, `sdmmc_card_t* card`)
Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

FatFs 与 VFS 配合使用（只读模式下）

头文件 `fatfs/vfs/esp_vfs_fat.h` 也定义了两个便捷函数 `esp_vfs_fat_spiflash_mount_ro()` 和 `esp_vfs_fat_spiflashUnmount_ro()`。上述两个函数分别对 FAT 只读分区执行步骤 1-3 和步骤 7-9。有些数据分区仅在工厂配置时写入一次，之后在整个硬件生命周期内都不会再有任何改动。利用上述两个函数处理这种数据分区非常方便。

`esp_err_t esp_vfs_fat_spiflashMount_ro` (const char* `base_path`, const char* `partition_label`, const 
`esp_vfs_fat_mount_config_t* mount_config`)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

备注：Wear levelling is not used when FAT is mounted in read-only mode using this function.

参数
- base_path – path where FATFS partition should be mounted (e.g. “/spiflash”)
• **partition_label** – label of the partition which should be used
• **mount_config** – pointer to structure with extra parameters for mounting FATFS

返回
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
• ESP_ERR_NO_MEM if memory cannot be allocated
• ESP_FAIL if partition cannot be mounted
• other error codes from SPI flash driver, or FATFS drivers

```c
esp_err_t esp_vfs_fat_spiflash_unmount_ro(const char*base_path, const char*partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

参数
• **base_path** – path where partition should be registered (e.g. “/spiflash”)
• **partition_label** – label of partition to be unmounted

返回
• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro has not been called

FatFs 磁盘 I/O 层

我们对 FatFs API 函数进行了扩展，实现了运行期间注册磁盘 I/O 驱动。

上述 API 为 SD/MMC 卡提供了磁盘 I/O 函数实现方式，可使用 `ff_diskio_register_sdmmc()` 函数注册指定的 FatFs 驱动编号。

```c
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister disk io driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

参数
• **pdrv** – drive number
• **discio_impl** – pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```c
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

DSTATUS (*init)(unsigned char pdrv)

disk initialization function

```c
DSTATUS (*status)(unsigned char pdrv)
```

disk status check function

```c
DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
```

sector read function
### Chapter 2. API Reference

**DRESULT** (*write*) (unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

**DRESULT** (*ioctl*) (unsigned char pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void **ff_diskio_register_sdmmc** (unsigned char pdrv, sdmmc_card_t *card)

Register SD/MMC disk io driver

- **pdrv** - drive number
- **card** - pointer to *sdmmc_card_t* structure describing a card; card should be initialized before calling _f_mount_.

**esp_err_t** **ff_diskio_register_wl_partition** (unsigned char pdrv, wl_handle_t flash_handle)

Register spi flash partition

- **pdrv** - drive number
- **flash_handle** - handle of the wear levelling partition.

**esp_err_t** **ff_diskio_register_raw_partition** (unsigned char pdrv, const esp_partition_t *part_handle)

Register spi flash partition

- **pdrv** - drive number
- **part_handle** - pointer to raw flash partition.

### FatFs 分区生成器

我们为 FatFs (wl_fatfsgen.py) 提供了分区生成器，该生成器集成在构建系统中，方便用户在自己的项目中使用。

该生成器可以在主上创建文件系统镜像，并用指定的主机文件夹内容对其进行填充。

该脚本是建立在分区生成器的基础（fatfsgen.py），目前除了可以生成分区外，也可以初始化磨损均衡。

目前的最新版本支持短文件名，长文件名、FAT12 和 FAT16。长文件名的上限是 255 个字符，文件名中可以包含多个 . 符号以及其他字符，如 +, /, ;, =, [ and ] 等。

#### 构建系统中使用 FatFs 分区生成器

通过调用 fatfs_create_partition_image 可以直接从 CMake 构建系统中调用 FatFs 分区生成器:

```bash
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

如果不希望在生成分区时使用磨损均衡，可以使用 fatfs_create_rawflash_image:

```bash
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

fatfs_create_spiflash_image 以及 fatfs_create_rawflash_image 必须从项目的 CMake-Lists.txt 中调用。

如果您决定使用 fatfs_create_rawflash_image（不支持磨损均衡），请注意它仅支持在设备中以只读模式安装。

该函数的参数如下:

1. **partition** - 分区的名称，需要在分区表中定义（如 storage/fatfsgen/partitions_example.csv）。
2. **base_dir** - 目录名称，该目录会被编码为 FatFs 分区，也可以选择将其被烧录进设备。但注意必须在分区表中指定合适的分区大小。
3. FLASH_IN_PROJECT 标志 - 可选参数，用户可以通过指定 FLASH_IN_PROJECT，选择在执行 idf.py flash -p <PORT> 时让分区镜像自动与应用程序二进制文件、分区表等一同烧录进设备。

4. PRESERVE_TIME 标志 - 可选参数，用户可强制让目标镜像保留源文件夹的时间戳。如果不保留，每个目标镜像的时间戳都将设置为 FATFS 默认初始时间（1980 年 1 月 1 日）。

例如:

```python
fatfs_create_partition_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

没有指定 FLASH_IN_PROJECT 时也可以生成分区镜像，但是用户需要使用 esptool.py 或自定义的构建系统目标对其手动烧录。

相关示例请查看 storage/fatfsgen。

**FatFs 分区分析器**

我们为 FatFs 提供分区分析器 (fatfsparse.py)。

该分析器为 FatFs 分区生成器 (fatfsgen.py) 的逆向工具，可以根据 FatFs 镜像在主机上生成文件夹结构。

您可以使用:

```
./fatfsparse.py [-h] [--wl-layer {detect,enabled,disabled}] fatfs_image.img
```

### 2.9.2 量产程序

**介绍**

这一程序主要用于量产时为每一设备创建工厂 NVS（非易失性存储器）分区镜像。NVS 分区镜像由 CSV（逗号分隔值）文件生成，文件中包含了用户提供的配置项及配置值。

注意，该程序仅创建用于量产的二进制镜像，您需要使用以下工具将镜像烧录到设备上：

- esptool.py
- Flash 下载工具（仅适用于 Windows）。下载后解压，然后按照 doc 文件夹中的说明操作。
- 使用定制的生产工具直接烧录程序

**准备工作**

该程序依赖于 esp-idf 的 NVS 分区程序

- 操作系统要求:
  - Linux、MacOS 或 Windows（标准版）
- 安装依赖包:
  - Python

**备注:**

使用该程序之前，请确保:

- Python 路径已添加到 PATH 环境变量中；
- 已经安装 requirement.txt 中的软件包，requirement.txt 在 esp-idf 根目录下。
具体流程

CSV 配置文件

CSV 配置文件中包含设备待烧录的配置信息，定义了待烧录的配置项。
配置文件中数据格式如下（REPEAT 标签可选）：

```plaintext
name1,namespace,   <!-- 第一个条目应该为 "namespace" 类型
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

备注：文件第一行应始终为 namespace 条目。

每行应包含三个参数：key, type 和 encoding，并以逗号分隔。如果有 REPEAT 标签，则主 CSV 文件中所有设备此键值均相同。
有关各个参数的详细说明，请参阅 NVS 分区生成程序的 README 文件。

CSV 配置文件示例如下：

```plaintext
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

备注：
请确保：
- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。

主 CSV 文件

主 CSV 文件中包含设备待烧录的详细信息，文件中每行对应一个设备实体。

**主 CSV 文件的数据格式如下：**

```plaintext
key1,key2,key3,....
value1,value2,value3,....
```

备注：文件中键 (key) 名应始终置于文件首行。从配置文件中获取的键，在此文件中的排列顺序应与其在配置文件中的排列顺序相同。主 CSV 文件同时可以包含其它列（键），这些列将被视为元数据，而不会编译进最终二进制文件。
每行应包含相应键的键值 (value)，并用逗号隔开。如果某键带有 REPEAT 标签，则仅需在第二行（即第一个条目）输入对应的值，后面其他行为空。

参数描述如下：

**value**  Data value

value 是与键对应的键值。

主 CSV 文件示例如下：

```console
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**备注：** 如果出现 REPEAT 标签，则会在相同目录下生成一个新的主 CSV 文件用作主输入文件，并在每行为带有 REPEAT 标签的键插入键值。

量产程序还会创建中间 CSV 文件，NVS 分区程序将使用此 CSV 文件作为输入，然后生成二进制文件。

中间 CSV 文件的格式如下：

```console
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

此步骤将为每一设备生成一个中间 CSV 文件。

**运行量产程序**

**使用方法：**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**可选参数：**

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h,--help</td>
<td>显示帮助信息并退出</td>
</tr>
</tbody>
</table>

**命令：**

运行 mfg_gen.py [command] -h 查看更多帮助信息

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>生成 NVS 分区</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>生成加密密钥</td>
</tr>
</tbody>
</table>

为每个设备生成工厂镜像 (默认)

**使用方法：**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
    [--keyfile KEYFILE] [--inputkey INPUTKEY]
    [--outdir OUTDIR]
    conf values prefix size
```
位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>待解析的 CSV 配置文件路径</td>
</tr>
<tr>
<td>values</td>
<td>待解析的主 CSV 文件路径</td>
</tr>
<tr>
<td>prefix</td>
<td>每个输出文件名前缀的唯一名称</td>
</tr>
<tr>
<td>size</td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>--fileid FILEID</td>
<td>每个文件名后缀的唯一值标识符（主 CSV 文件中的任意键），默认为数值 1, 2, 3...</td>
</tr>
<tr>
<td>--version [1,2]</td>
<td>- 设定多页 Blob 版本。  - 版本 1 - 禁用多页 Blob。  - 版本 2 - 启用多页 Blob。  - 默认版本：版本 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>生成 NVS 分区加密密钥</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>内含 NVS 分区加密密钥的文件</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>

请运行以下命令为每个设备生成工厂镜像，量产程序同时提供了一个 CSV 示例文件:

```bash
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000
```

主 CSV 文件应在 file 类型下设置一个相对路径，相对于运行该程序的当前目录。

为每个设备生成工厂加密镜像

运行以下命令为每个设备生成工厂加密镜像，量产程序同时提供了一个 CSV 示例文件。

- 通过量产程序生成加密密钥来进行加密:
  ```bash
  python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --keygen
  ```

备注：创建的加密密钥格式为 <outdir>/keys/keys-<prefix>-<fileid>.bin。加密密钥存储于新建文件的 keys/ 目录下，与 NVS 密钥分区兼容。更多信息请参考 NVS 密钥分区。

- 提供加密密钥用作二进制输入文件来进行加密:
  ```bash
  python mfg_gen.py generate samples/sample_config.csv samples/sample_values_--singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
  ```

仅生成加密密钥

使用方法:

```bash
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数：+ | -h, --help | 显示帮助信息并退出 |
| +------------------|------------------|
| | --keyfile KEYFILE | 加密密钥文件的输出路径 |
| | --outdir OUTDIR | 输出目录，用于存储创建的文件（默认当前目录） |

Submit Document Feedback
运行以下命令仅生成加密密钥:

```
python mfg_gen.py generate-key
```

**备注：** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。时间戳格式为：
%m-%d_%H-%M。如需自定义目标文件名，请使用 `keyfile` 参数。

生成的加密密钥二进制文件还可以用于为每个设备的工厂镜像加密。

`fileid` 参数的默认值为 1, 2, 3…，与 CSV 文件中的行一一对应，内含设备配置值。

运行量产程序时，将在指定的 `outdir` 目录下创建以下文件夹:

* `bin/` 存储生成的二进制文件
* `csv/` 存储生成的中间 CSV 文件
* `keys/` 存储加密密钥（创建工厂加密镜像时会用到）

### 2.9.3 非易失性存储库

#### 简介

非易失性存储 (NVS) 库主要用于在 flash 中存储键值格式的数据。本文档将详细介绍 NVS 常用的一些概念。

**底层存储** NVS 库通过调用 `esp_partition` API 使用主 flash 的部分空间，即类型为 data 且子类型为 `nvs` 的所有分区。应用程序可调用 `nvs_open()` API 选择使用带有 `nvs` 标签的分区，也可以通过调用 `nvs_open_from_partition()` API 选择使用指定名称的任意分区。

NVS 库后续版本可能会增加其他存储器后端，来将数据保存至其他 flash 芯片（SPI 或 I2C 接口）、RTC 或 FRAM 中。

**备注：** 如果 NVS 分区被截断（例如，更改分区表布局时），则应删除分区内容。可以使用 ESP-IDF 构建系统中的 `idf.py erase-flash` 命令擦除 flash 上的所有内容。

**备注：** NVS 最适合存储一些较小的数据，而非字符串或二进制大对象 (BLOB) 等较大的数据。如需存储较大的 BLOB 或者字符串，请考虑使用基于磨损均衡的 FAT 文件系统。

**键值对** NVS 的操作对象为键值对，其中键是 ASCII 字符串，当前支持的最大键长为 15 个字符。值可以为以下几种类型:

* 整数型：`uint8_t`、`int8_t`、`uint16_t`、`int16_t`、`uint32_t`、`int32_t`、`uint64_t` 和 `int64_t`；
* 以 `0` 结尾的字符串；
* 可变长度的二进制数据 (BLOB)

**备注：** 字符串值当前上限为 4000 字节，其中包括空终止符。BLOB 值上限为 508,000 字节或分区大小的 97.6% 减去 4000 字节，以较低值为准。

后续可能会增加对 float 和 double 等其他类型数据的支持。

键必须唯一，为现有的键写入新的值可能产生如下结果：
Chapter 2. API 参考

- 如果新旧值数据类型相同，则更新值；
- 如果新旧值数据类型不同，则返回错误。

读取时也会执行数据类型检查。如果读取操作的数据类型与该值的数据类型不匹配，则返回错误。

命名空间 为了减少不同组件之间键名的潜在冲突，NVIS 将每个键值对分配给一个命名空间。命名空间的命名规则遵循键名的命名规则，例如，最多可占 15 个字符。此外，单个 NVIS 分区最多只能容纳 254 个不同的命名空间。命名空间的名称在调用 nvs_open() 或 nvs_open_from_partition() 中指定，调用后将返回一个不透明句柄，用于后续调用 nvs_get_*、nvs_set_* 和 nvs_commit 函数。这样，一个句柄关联一个命名空间。键名便不会与其他命名空间中相同键名冲突。请注意，不同 NVIS 分区中具有相同名称的命名空间将被视为不同的命名空间。

NVIS 迭代器 迭代器允许根据指定的分区名称、命名空间和数据类型轮询 NVIS 中存储的键值对。

您可以使用以下函数，执行相关操作：
- nvs_entry_find: 创建一个不透明句柄，用于后续调用 nvs_entry_next 和 nvs_entry_info 函数；
- nvs_entry_next：让迭代器指向下一个键值对；
- nvs_entry_info：返回每个键值对的信息。

总的来说，所有通过 nvs_entry_find() 获得的迭代器（包括 NULL 迭代器）都必须使用 nvs_release_iterator() 释放。一般情况下，nvs_entry_find() 和 nvs_entry_next() 会将给定的迭代器设置为 NULL 或为一个有效的迭代器。但如果出现参数错误（如返回 ESP_ERR_NVS_NOT_FOUND），给定的迭代器不会被修改。因此，在调用 nvs_entry_find() 之前最好将迭代器初始化为 NULL，这样可以避免在释放迭代器之前进行复杂的错误检查。

安全性、篡改性及鲁棒性 NVIS 与 ESP32 flash 加密系统不直接兼容。但如果 NVIS 加密与 ESP32 flash 加密一起使用时，数据仍可以加密形式存储。详情请参阅 NVIS 加密。

如果未启用 NVIS 加密，任何对 flash 芯片有物理访问权限的用户都可以修改、擦除或添加键值对。NVIS 加密启用后，如果不知道相应的 NVIS 加密密钥，则无法修改或添加键值对并将其识别为有效键值对。但是，针对擦除操作没有相应的防篡改功能。

当 flash 处于不一致状态时，NVIS 库会尝试恢复。在任何时候点关闭设备电源，然后重新打开电源，不会导致数据丢失；但如果关闭设备电源时正在写入新的键值对，这一键值对可能会丢失。该库应该能够在 flash 中存在任何随机数据的情况下正常初始化。

NVIS 加密 NVIS 分区内存储的数据可使用 AES-XTS 进行加密，类似于 IEEE P1619 磁盘加密标准中提到的加密方式。为了实现加密，每个条目被均视为一个扇区，并将条目相对地址（相对于分区开头）传送加密算法，用作扇区号。可通过 CONFIG_NVS_ENCRYPTION 启用 NVIS 加密。NVIS 加密所需的密钥存储于其他分区，并且被 flash 保护。因此，在使用 NVIS 加密前应先启用 flash 保护。

启用 flash 保护时，默认启用 NVIS 加密。这是因为 Wi-Fi 驱动在默认的 NVIS 分区中存储了凭证（如 SSID 和密码）。如已启用平台级加密，那么同时默认启用 NVIS 加密有其必要性。

使用 NVIS 加密，分区表必须包含 NVIS 密钥分区。在分区表选项 (menuconfig > Partition Table) 下，为 NVIS 加密提供了两个包含 NVIS 密钥分区的分区表。您可以通过工程配置菜单 (idf.py menuconfig) 进行选择。请参考 security/flash_encryption 中的例子，了解如何配置和使用 NVIS 加密功能。

NVIS 密钥分区 应用程序如果想使用 NVIS 加密，则需要编译进一个类型为 data，子类型为 key 的密钥分区。该分区应标记为 key 密且最小为 4096 字节。如需了解更多信息，请参考分区表。在分区表选项 (menuconfig > Partition Table) 下提供了两个包含 NVIS 密钥分区的额外分区表，可以直接用于 NVIS 加密，这些分区的具体结构见下表：
### Chapter 2. API 参考

| +---------------------------------------------+ | 1. XTS encryption key (32) | |
| +---------------------------------------------+ | XTS tweak key (32) | |
| +---------------------------------------------+ | CRC32 (4) | |

可以通过以下两种方式生成NVS 密钥分区 中的 XTS 加密密钥：

1. 在 ESP 芯片上生成密钥：
   启用 NVS 密钥时，可用 nvs_flash_init() API 函数来初始化加密的默认 NVS 分区，在内部生成 ESP 芯片上的 XTS 加密密钥。在找到 NVS 密钥分区后，API 函数利用 nvs_flash/include/nvs_flash.h 提供的 nvs_flash_generate_keys() 函数，自动生成并存储该分区中的 NVS 密钥。当各自的密钥分区为空时，才会生成并存储新的密钥。可以借助 nvs_flash_secure_init_partition() 用同一密钥分区来读取安全配置，以初始化一个定制的加密 NVS 分区。

   API 函数 nvs_flash_secure_init() 和 nvs_flash_secure_init_partition() 不在内部产生密钥。当这些 API 函数用于初始化加密的 NVS 分区时，可以在启动后使用 nvs_flash.h 提供的 nvs_flash_generate_keys() API 函数生成密钥，以加密的形式把密钥写入密钥分区内。

   **备注**：请注意，使用该方法启动应用前，必须先完全解除 nvs_keys 分区，否则该应用可能会认为 nvs_keys 分区不为空，并且包含数据格式错误。从而导致 ESP_ERR_NVS_CORRUPT_KEY_PART 报错。如果遇到这种情况，可以使用以下命令：

   ```bash
   parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --
   --partition-table-offset PARTITION_TABLE_OFFSET erase_partition --
   --partition-type=data --partition-subtype=nvs_keys
   ```

2. 使用预先生成的密钥分区：
   若 NVS 密钥分区 中的密钥不是由应用程序生成，则需要使用预先生成的密钥分区。可以使用 NVS 分区生成工具生成包含 XTS 加密密钥的 NVS 密钥分区。用户可以借助以下两个命令，将预先生成的密钥分区储存于 flash 上：

   i) 建立并烧录分区表

   ```bash
   idf.py partition-table partition-table-flash
   ```

   ii) 调用 parttool.py，将密钥存储在 flash 上的 NVS 密钥分区 中。详见 doc:`/api-guides/partition-tables` 的分区工具部分。

   ```bash
   parttool.py --port PORT --partition-table-offset PARTITION_TABLE_-
   --OFFSET write_partition --partition-name="name of nvs_key_partition" -
   --input NVS_KEY_PARTITION_FILE
   ```

   **备注**：如需在设备处于 flash 加密开发模式时更新 NVS 密钥分区，请调用 parttool.py 对 NVS 密钥分区进行加密。同时，由于设备上的分区表也已加密，您还需要在构建目录 (build/partition_table) 中提供一个指向未加密分区表的指针。您可以使用如下命令：

   ```bash
   parttool.py --esptool-write-args encrypt --port PORT --partition-table-
   --file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_-
   --OFFSET write_partition --partition-name="name of nvs_key_partition" -
   --input NVS_KEY_PARTITION_FILE
   ```

由于分区已标记为已加密，而且启用了 Flash 加密，引导程序在首次启动时将使用 flash 加密对密钥分区进行加密。

应用程序可以使用不同的密钥对不同的 NVS 分区进行加密，这样就会需要多个加密密钥分区。应用程序应为解密操作提供正确的密钥或密钥分区。
加密读取/写入 nvs_get_* 和 nvs_set_* 等 NVS API 函数同样可以对 NVS 加密分区执行读写操作。

加密默认的 NVS 分区：无需额外步骤即可启用默认 NVS 分区的加密。启用 CONFIG_NVS_ENCRYPTION 时，nvs_flash_init() API 函数会在内部使用找到的第一个 NVS 密钥分区执行额外步骤，以启用默认 NVS 分区的加密（详情请参考 API 文档）。另外，nvs_flash_secure_init() API 函数也可以用来启用默认 NVS 分区的加密。

加密一个自定义的 NVS 分区：使用 nvs_flash_secure_init_partition() API 函数启用自定义 NVS 分区的加密。若非 nvs_flash_init_partition()。

使用 nvs_flash_secure_init() 和 nvs_flash_secure_init_partition() API 函数时，应用程序如需在加密状态下执行 NVS 读写操作，应遵循以下步骤：
1. 使用 esp_partition_find* API 查找密钥分区和 NVS 数据分区；
2. 使用 nvs_flash_read_security_cfg 或 nvs_flash_generate_keys API 填充 nvs_sec_cfg_t 结构；
3. 使用 nvs_flash_secure_init 或 nvs_flash_secure_init_partition API 初始化 NVS flash 分区；
4. 使用 nvs_open 或 nvs_open_from_partition API 打开命名空间；
5. 使用 nvs_get_* 或 nvs_set_* API 执行 NVS 读取/写入操作；
6. 使用 nvs_flash_deinit API 释放已初始化的 NVS 分区。

NVS 分区生成程序

NVS 分区生成程序帮助生成 NVS 分区二进制文件，可使用烧录程序将二进制文件单独烧录至特定分区。烧录至分区上的键值对由 CSV 文件提供，详情请参考 NVS 分区生成程序。

应用示例

ESP-IDF storage 目录下提供了数个代码示例：

storage/nvs_rw_value

演示如何读取及写入 NVS 单个整数值。

此示例中的值表示 ESP32 模组重启次数。NVS 中数据不会因为模组重启而丢失，因此只有将这一值存储于 NVS 中，才能起到重启次数计数器的作用。

该示例也演示了如何检测读取/写入操作是否成功，以及某个特定值是否在 NVS 中尚未初始化。诊断程序以纯文本形式提供，帮助您追踪程序流程，及时发现问题。

storage/nvs_rw_blob

演示如何读取及写入 NVS 单个整数值和 BLOB（二进制大对象），并在 NVS 中存储这一数值，即使 ESP32 模组重启也不会消失。

- value - 记录 ESP32 模组软重启次数和硬重启次数。
- blob - 内含记录模组运行次数的表格。此表格将被从 NVS 读取至动态分配的 RAM 上。每次手动软重启后，表格内运行次数即增加一次，新加的运行次数被写入 NVS。下拉 GPIO0 即可手动软重启。

该示例也演示了如何执行诊断程序以检测读取/写入操作是否成功。

storage/nvs_rw_value_cxx

这个例子与 storage/nvs_rw_value 完全一样，只是使用了 C++ 的 NVS 枚举类。

内部实现

键值对日志 NVS 按顺序存储键值对，新的键值对添加在最后。因此，如需更新某一键值对，实际是在日志最后增加一对新的键值对，同时将旧的键值对标记为已擦除。
页面和条目 NVS 库在其操作中主要使用两个实体：页面和条目。页面是一个逻辑结构，用于存储部分的系统日志。逻辑页面对应 flash 的一个物理扇区，正在使用的页面具有与之相关联的序列号。序列号赋予了页面顺序，较高的序列号对应较早创建的页面。页面有以下几种状态：

空或未初始化 页面对应的 flash 扇区为空白状态（所有字节均为 0xff）。此时，页面未存储任何数据且没有关联的序列号。

活跃状态 此时 flash 已完成初始化，页头部写入 flash，页面已具备有效序列号。页面中存在一些空条目，可写入数据。任意时刻，至多有一个页面处于活跃状态。

写满状态 Flash 已写满键值对，状态不再改变。用户无法向写满状态下的页面写入键值对，但仍可将一些键值对标记为已擦除。

擦除状态 未擦除的键值对将移至其他页面，以便擦除当前页面。这一状态仅用于临时状态，即 API 调用返回时，页面应脱离这一状态。如果设备突然断电，下次开机时，设备将继续把未擦除的键值对移至其他页面，并继续擦除当前页面。

损坏状态 页头部包含无效数据，无法进一步解析该页面中的数据，因此之前写入该页面的所有条目均无法访问。相应的 flash 扇区并不会被立即擦除，而是与其他处于未初始化状态的扇区一起等待后续使用。这一状态可能对调试有用。

Flash 扇区映射至逻辑页面并没有特定的顺序，NVS 库会检查存储在 flash 扇区的页面序列号，并根据序列号组织页面。

页面结构 当前，我们假设 flash 扇区大小为 4096 字节，并且 ESP32 flash 加密命令在 32 字节块上运行。未来有可能引入一些编译时可配置项（可通过 menuconfig 进行配置），以适应具有不同扇区大小的 flash 芯片。但目前尚不清楚 SPI flash 驱动和 SPI flash cache 之类的系统组件是否支持其他扇区大小。

页面由头部、条目状态位图和条目三部分组成。为了实现与 ESP32 flash 加密功能兼容，条目大小设置为 32 字节。如果键值为整数型，条目则保存一个键值对；如果键值为字符串或 BLOB 类型，则条目仅保存一个键值对的部分内容（更多信息请见条目结构描述）。

页面结构如下图所示，括号内数字表示该部分的大小（以字节为单位）。

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

头部和条目状态位图写入 flash 时不加密。如果启用了 ESP32 flash 加密功能，则条目写入 flash 时将会加密。

通过将 0 写入某些位可以定义页面状态值，表示状态改变。因此，如果需要变更页面状态，并不一定要擦除页面，除非要将其更改为 擦除状态。
Chapter 2. API 参考

头部中的 `version` 字段反映了所用的 NVS 格式版本。为实现向后兼容，版本升级从 `0xff` 开始依次递减（例如，`version-1` 为 `0xff`，`version-2` 为 `0xfe`，以此类推）。

头部中 `CRC32` 值是由不包含状态值的条目计算所得（4 到 28 字节）。当前未使用的条目用 `0xff` 字节填充。

条目结构和条目状态位图的详细信息见下文描述。

条目和条目状态位图 每个条目处于以下三种状态之一，每个状态在条目状态位图中用两位表示。位图中的最后两位 (256 - 2 * 126) 未使用。

空（2’ b11）条目还未写入任何内容，处于未初始化状态（全部字节为 `0xff`）。

写入（2’ b10）一个键值对（或跨多个条目的键值对的部分内容）已写入条目中。

擦除（2’ b00）条目中的键值对已丢弃，条目内容不再解析。

条目结构 如果键值类型为基础类型，即 1 - 8 个字节长度的整型数，条目将保存一个键值对；如果键值类型为字符串或 BLOB 类型，条目将保存整个键值对的部分内容。另外，如果键值为字符串类型且跨多个条目，则键值所跨的所有条目均保存在同一页面。BLOB 则可以切分为多个块，实现跨多个页面。

BLOB 索引是一个附加的固定长度元数据条目，用于追踪 BLOB 块。目前条目仍支持早期 BLOB 格式（可读取可修改），但这些 BLOB 一经修改，则以新格式储存至条目。

条目结构中各个字段含义如下：

命令空间（NS, NameSpace）该条目的命名空间索引，详细信息参见命名空间实现章节。

类型（Type）一个字节表示的值的数据类型，`nvs_flash/include/nvs_handle.hpp` 下的 `ItemType` 枚举了可能的类型。

跨度（Span）该键值对所用的条目数量。如果键值为整数型，条目数量即为 1，如果键值为字符串或 BLOB，则条目数量取决于值的长度。

块索引（ChunkIndex）用于存储 BLOB 类型数据块的索引。如果键值为其他数据类型，则此处索引应写入 `0xff`。

CRC32 对条目下所有字节进行校验后，所得的结果和（CRC32 字段不计算在内）。

键（Key）即以结尾的 ASCII 字符串，字符串最长为 15 字节，不包含最后一个字节的零终止符。

数据（Data）如果键值类型为整数型，则数据字段仅包含键值。如果键值小于 8 个字节，使用 `0xff` 填充未使用的部分（右侧）。如果键值类型为 BLOB 索引条目，则该字段的八个字节将保存以下数据块信息：

- 块大小 整个 BLOB 数据的大小（以字节为单位）。该字段仅用于 BLOB 索引类型条目。
- **ChunkCount** 存储过程中 BLOB 分成的数据块总量，该字段仅用于 BLOB 索引类型条目。
- **ChunkStart** BLOB 第一个数据块的块开始，后续数据块索引依次递增，步长为 1。该字段仅用于 BLOB 索引类型条目。

如果键值类型为字符串或 BLOB 数据块，数据字段的这八个字节将保存该键值的一些附加信息，如下所示：
- **数据大小** 实际数据的大小（以字节为单位）。如果键值类型为字符串，此字段也应将终止符包含在内。此字段仅用于字符串和 BLOB 类型条目。
- **CRC32** 数据所有字段的校验和，该字段仅用于字符串和 BLOB 类型条目。

可变长度值（字符串和 BLOB）写入后续条目，每个条目 32 字节。第一个条目的 **Span** 字段将指明使用了多少条目。

**命名空间** 如上所述，每个键值对属于一个命名空间。命名空间标识符（字符串）也作为键值对的键，存储在索引为 0 的命名空间中。与这些键对应的值就是这些命名空间的索引。

| NS=0 Type=uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi" |
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi" |
| NS=0 Type=uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm" |
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm" |

**条目哈希列表** 为了减少对 flash 执行的读操作次数，Page 类对象均设有一个列表，包含一对数据：条目索引和条目哈希值。该列表可大大提高检索速度，而无需迭代所有条目并逐个从 flash 中读取。

Page::findItem 首先从哈希列表中检索条目哈希值。如果条目存在，则在页面内给出条目索引。由于哈希冲突，在哈希列表中检索条目哈希值可能会得到不同的条目，对 flash 中条目再次迭代可解决这一冲突。

哈希列表中每个节点均包含一个 24 位哈希值和 8 位条目索引。哈希值根据条目命名空间、键名和块索引由 CRC32 计算所得，计算结果保留 24 位。为减少将 32 位条目存储在链表中的开销，链表采用了数组的双向链表。每个数组占用 128 个字节，包含 29 个条目，两个链表指针和一个 32 位计数组段。因此，每页额外需要的 RAM 最少为 128 字节，最多为 640 字节。

**API 参考**

**Header File**
- components/nvs_flash/include/nvs_flash.h

**Functions**

```c
esp_err_t nvs_flash_init(void)
```

Initializes the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)

b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.

c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.
Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

初始化
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

```
esp_err_t nvs_flash_init_partition (const char* partition_label)

Initialize NVS flash storage for the specified partition.
```

参数 `partition_label` – [in] Label of the partition. Must be no longer than 16 characters.

返回
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```
esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t* partition)

Initialize NVS flash storage for the partition specified by partition pointer.
```

参数 `partition` – [in] pointer to a partition obtained by the ESP partition API.

返回
- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```
esp_err_t nvs_flash_deinit (void)

Deinitialize NVS storage for the default NVS partition.
```

Default NVS partition is the partition with “nvs” label in the partition table.

返回
- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```
esp_err_t nvs_flash_deinit_partition (const char* partition_label)

Deinitialize NVS storage for the given NVS partition.
```

参数 `partition_label` – [in] Label of the partition

返回
- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

```
esp_err_t nvs_flash_erase (void)

Erase the default NVS partition.
```

Erases all contents of the default NVS partition (one with label “nvs”).
Chapter 2. API

If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**esp_err_t nvs_flash_erase_partition (const char *part_name)**

Erase specified NVS partition.

Erase all content of a specified NVS partition.

**esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)**

Erase custom partition.

Erase all content of specified custom partition.

**esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)**

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**参数** part_name – [in] Name (label) of the partition which should be erased

**返回**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)

**参数** partition – [in] pointer to a partition obtained by the ESP partition API.

**返回**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**备注:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.
Chapter 2. API

one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_secure_init_partition` (const char *partition_label, `nvs_sec_cfg_t` *cfg)

Initialize NVS flash storage for the specified partition.

**参数**

- **partition_label** – [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** – [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**返回**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_generate_keys` (const `esp_partition_t` *partition, `nvs_sec_cfg_t` *cfg)

Generate and store NVS keys in the provided esp partition.

**参数**

- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**返回**

- ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; - or error codes from esp_partition_write/erase APIs.

`esp_err_t nvs_flash_read_security_cfg` (const `esp_partition_t` *partition, `nvs_sec_cfg_t` *cfg)

Read NVS security configuration from a partition.

备注：Provided partition is assumed to be marked ‘encrypted’.

**Structures**

`struct nvs_sec_cfg_t`

Key for encryption and decryption.

**Public Members**

- `uint8_t eky[NVS_KEY_SIZE]`
  XTS encryption and decryption key
- `uint8_t tky[NVS_KEY_SIZE]`
  XTS tweak key
Chapter 2. API

Macros

**NVS_KEY_SIZE**

Header File

- components/nvs_flash/include/nvs.h

Functions

**esp_err_t nvs_set_i8** (*nvs_handle_t handle, const char *key, int8_t value*)

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until **nvs_commit** is called.

- **handle** - [in] Handle obtained from **nvs_open** function. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** - [in] The value to set.

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of **nvs**, provided that flash operation doesn’t fail again.

**esp_err_t nvs_set_u8** (*nvs_handle_t handle, const char *key, uint8_t value*)

set uint8_t value for given key

This function is the same as **nvs_set_i8** except for the data type.

**esp_err_t nvs_set_i16** (*nvs_handle_t handle, const char *key, int16_t value*)

set int16_t value for given key

This function is the same as **nvs_set_i8** except for the data type.

**esp_err_t nvs_set_u16** (*nvs_handle_t handle, const char *key, uint16_t value*)

set uint16_t value for given key

This function is the same as **nvs_set_i8** except for the data type.

**esp_err_t nvs_set_i32** (*nvs_handle_t handle, const char *key, int32_t value*)

set int32_t value for given key

This function is the same as **nvs_set_i8** except for the data type.

**esp_err_t nvs_set_u32** (*nvs_handle_t handle, const char *key, uint32_t value*)

set uint32_t value for given key

This function is the same as **nvs_set_i8** except for the data type.

**esp_err_t nvs_set_i64** (*nvs_handle_t handle, const char *key, int64_t value*)

set int64_t value for given key

This function is the same as **nvs_set_i8** except for the data type.
**Chapter 2. API**

*esp_err_t* `nvs_set_u64` *(nvs_handle_t handle, const char* key, uint64_t value)*

Set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

*esp_err_t* `nvs_set_str` *(nvs_handle_t handle, const char* key, const char* value)*

Set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

**参数**

- **handle** - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** - [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**返回**

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

*esp_err_t* `nvs_get_i8` *(nvs_handle_t handle, const char* key, int8_t*out_value)*

Get int8_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```c
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still have its default value.
```

**参数**

- **handle** - [in] Handle obtained from `nvs_open` function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

**返回**

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

Espressif Systems 1661 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
  get uint8_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
  get int16_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
  get uint16_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
  get int32_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
  get uint32_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
  get int64_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
  get uint64_t value for given key
  This function is the same as nvs_get_i8 except for the data type.

esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)
  get string value for given key
  These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type
doesn’t match the type which was used when setting a value, an error is returned.
  In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to
store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable
pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero
terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and
has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated
C strings, and nvs_get/set_blob used for arbitrary data structures.
```

```c
// Example (without error checking) of using nvs_get_str to get a string into
  a dynamic array:
  size_t required_size;
  nvs_get_str(my_handle, "server_name", NULL, &required_size);
  char* server_name = malloc(required_size);
  nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
  into a static array:
```

(下页继续)
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);

参数
- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - [out] Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** - [inout] A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

返回
- **ESP_OK** if the value was retrieved successfully
- **ESP_FAIL** if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- **ESP_ERR_NVS_NOT_FOUND** if the requested key doesn’t exist
- **ESP_ERR_NVS_INVALID_HANDLE** if handle has been closed or is NULL
- **ESP_ERR_NVS_INVALID_NAME** if key name doesn’t satisfy constraints
- **ESP_ERR_NVS_INVALID_LENGTH** if length is not sufficient to store data

`esp_err_t nvs_get_blob(nvs_handle_t handle, const char*key, void*out_value, size_t*length)`
get blob value for given key

This function behaves the same as nvs_get_str, except for the data type.

`esp_err_t nvs_open(const char*namespace_name, nvs_open_mode_t open_mode, nvs_handle_t*out_handle)`
Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

参数
- **namespace_name** - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode** - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** - [out] If successful (return code is zero), handle will be returned in this argument.

返回
- **ESP_OK** if storage handle was opened successfully
- **ESP_FAIL** if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- **ESP_ERR_NVS_NOT_INITIALIZED** if the storage driver is not initialized
- **ESP_ERR_NVS_PART_NOT_FOUND** if the partition with label “nvs” is not found
- **ESP_ERR_NVS_NOT_FOUND** if namespace doesn’t exist yet and mode is NVS_READONLY
- **ESP_ERR_NVS_INVALID_NAME** if namespace name doesn’t satisfy constraints
- **ESP_ERR_NO_MEM** in case memory could not be allocated for the internal structures
- **ESP_ERR_NVS_NOT_ENOUGH_SPACE** if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

`esp_err_t nvs_open_from_partition(const char*part_name, const char*namespace_name, nvs_open_mode_t open_mode, nvs_handle_t*out_handle)`
Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

参数
• part_name – [in] Label (name) of the partition of interest for object read/write/erase
• namespace_name – [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’ t be empty.
• open_mode – [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
• out_handle – [out] If successful (return code is zero), handle will be returned in this argument.

返回
• ESP_OK if storage handle was opened successfully
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
• ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
• ESP_ERR_NVS_NOT_FOUND id namespace doesn’ t exist yet and mode is NVS_READONLY
• ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as readonly
• ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

esp_err_t nvs_set_blob (nvs_handle_t handle, const char* key, const void* value, size_t length)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

参数
• handle – [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
• key – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’ t be empty.
• value – [in] The value to set.
• length – [in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

返回
• ESP_OK if value was set successfully
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
• ESP_ERR_NVS_INVALID_NAME if key name doesn’ t satisfy constraints
• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’ t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’ t fail again.
• ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

esp_err_t nvs_erase_key (nvs_handle_t handle, const char *key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.
### Chapter 2. API 参考

#### 参数
- **handle** - [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

#### 返回
- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

```c
esp_err_t nvs_erase_all(nvs_handle_t handle)
```

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

- **handle** - [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

#### 返回
- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

```c
esp_err_t nvs_commit(nvs_handle_t handle)
```

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

- **handle** - [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

#### 返回
- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

```c
void nvs_close(nvs_handle_t handle)
```

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

- **handle** - [in] Storage handle to close

```c
esp_err_t nvs_get_stats(const char *part_name, nvs_stats_t *nvs_stats)
```

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free_entries:

nvs_stats_t nvs_stats;

nvs_get_stats(NULL, &nvs_stats);
```

(下页继续)
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n", 
    nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_entries);

参数

- **part_name**  - [in] 党同名 NVS 在分区表中。如果不传递 NULL，则将使用 NVS_DEFAULT_PART_NAME（“nvs”）。
- **nvs_stats**  - [out] 返回填充结构 nvs_states_t。它提供有关使用内存的分区信息。

返回

- ESP_OK 如果更改写入成功。返回参数 nvs_stats 将被填充。
- ESP_ERR_NVS_PART_NOT_FOUND 如果带有标签 “name” 的分区未找到。返回参数 nvs_stats 将被填充 0。
- ESP_ERR_NVS_NOT_INITIALIZED 如果存储器驱动未初始化。返回参数 nvs_stats 将被填充 0。
- ESP_ERR_INVALID_ARG 如果 nvs_stats 为 NULL。
- ESP_ERR_INVALID_STATE 如果存在无效状态的页面。由于 not all pages will be counted. Counting will be interrupted at the first INVALID page。

```c
esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t *used_entries)
```

计数所有命名空间的条目。

一个条目表示 NVS 中的最小存储单元。字符串和 blob 可能占用多个条目。

注意，要找出命名空间中已占用的条目总数，请将返回值 used_entries（如果 err 等于 ESP_OK）。因为命名空间条目只占用一个条目。

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs... 
in one namespace:
    nvs_handle_t handle;
    nvs_open("namespace1", NVS_READWRITE, &handle);
    ...
    size_t used_entries;
    size_t total_entries_namespace;
    if (nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
        // the total number of entries occupied by the namespace
        total_entries_namespace = used_entries + 1;
    }
```

参数

- **handle**  - [in] 从 nvs_open 函数获得的句柄。
- **used_entries**  - [out] 返回命名空间中已占用的条目数。

返回

- ESP_OK 如果更改已写入成功。返回参数 used_entries 将被填充有效值。
- ESP_ERR_NVS_NOT_INITIALIZED 如果存储器驱动未初始化。返回参数 used_entries 将被填充 0。
- ESP_ERR_NVS_INVALID_HANDLE 如果 handle 已关闭或为 NULL。返回参数 used_entries 将被填充 0。
- ESP_ERR_INVALID_ARG 如果 used_entries 为 NULL。
- 其他错误代码来自底层存储驱动。返回参数 used_entries 将被填充 0。

```c
esp_err_t nvs_entry_find (const char *part_name, const char *namespace_name, nvs_type_t type, 
    nvs_iterator_t *output_iterator)
```
Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified
// partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_--ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
    // guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

**参数**
- **part_name** - [in] Partition name
- **namespace_name** - [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** - [in] One of nvs_type_t values.
- **output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**返回**
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVST_NOT_FOUND if no element of specified criteria has been found.
- ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
- ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned.

**esp_err_t nvs_entry_next (nvs_iterator_t *iterator)**

Advances the iterator to next item matching the iterator criteria.

Note that any copies of the iterator will be invalid after this call.

**参数**
- **iterator** - [inout] Iterator obtained from nvs_entry_find function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, iterator is set to NULL. If ESP_ERR_INVALID_ARG occurs, iterator is not changed.

**返回**
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVST_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if iterator is NULL.
- Possibly other errors in the future for internal programming or flash errors.

**esp_err_t nvs_entry_info (const nvs_iterator_t iterator, nvs_entry_info_t *out_info)**

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.

**参数**
- **iterator** - [in] Iterator obtained from nvs_entry_find function. Must be non-NULL.
- **out_info** - [out] Structure to which entry information is copied.

**返回**
- ESP_OK if all parameters are valid; current iterator data has been written to out_info.
```c
void nvs_release_iterator(nvs_iterator_t iterator)

参数 iterator - [in] Release iterator obtained from nvs_entry_find function. NULL argument is allowed.
```

### Structures

```c
struct nvs_entry_info_t
```

- Information about entry obtained from nvs_entry_info function

#### Public Members

- char namespace_name[NVS_NS_NAME_MAX_SIZE]
  - Namespace to which key-value belong

- char key[NVS_KEY_NAME_MAX_SIZE]
  - Key of stored key-value pair

- nvs_type_t type
  - Type of stored key-value pair

- struct nvs_stats_t

  备注:  Info about storage space NVS.

#### Public Members

- size_t used_entries
  - Amount of used entries.

- size_t free_entries
  - Amount of free entries.

- size_t total_entries
  - Amount all available entries.

- size_t namespace_count
  - Amount name space.

### Macros

- **ESP_ERR_NVS_BASE**
  - Starting number of error codes

- **ESP_ERR_NVS_NOT_INITIALIZED**
  - The storage driver is not initialized
ESP_ERR_NVS_NOT_FOUND
A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH
The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY
Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE
There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME
Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE
Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
Key name is too long

ESP_ERR_NVS_PAGE_FULL
Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND
NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED
XTS encryption failed while writing NVS entry
Chapter 2. API

ESP_ERR_NVS_XTS_DECR_FAILED
XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED
XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE
Maximum length of NVS key name (including null terminator)

NVS_NS_NAME_MAX_SIZE
Maximum length of NVS namespace name (including null terminator)

Type Definitions

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries
Enumerations

enum nvs_open_mode_t
    Mode of opening the non-volatile storage.
    
    enumerator NVS_READONLY
        Read only
    
    enumerator NVS_READWRITE
        Read and write

enum nvs_type_t
    Types of variables.
    
    enumerator NVS_TYPE_U8
        Type uint8_t
    
    enumerator NVS_TYPE_I8
        Type int8_t
    
    enumerator NVS_TYPE_U16
        Type uint16_t
    
    enumerator NVS_TYPE_I16
        Type int16_t
    
    enumerator NVS_TYPE_U32
        Type uint32_t
    
    enumerator NVS_TYPE_I32
        Type int32_t
    
    enumerator NVS_TYPE_U64
        Type uint64_t
    
    enumerator NVS_TYPE_I64
        Type int64_t
    
    enumerator NVS_TYPE_STR
        Type string
    
    enumerator NVS_TYPE_BLOB
        Type blob
    
    enumerator NVS_TYPE_ANY
        Must be last
2.9.4 NVS 分区生成程序

介绍

NVS 分区生成程序 (nvs_flash/nvs_partition_generator/nvs_partition_gen.py) 根据 CSV 文件中的键值对生成二进制文件。该二进制文件与非易失性存储器 (NVS) 中定义的 NVS 结构兼容。NVS 分区生成程序适合用于生成二进制数据 (Blob)，其中包括设备生产时可从外部烧录的 ODM/OEM 数据。这也使得生产制造商在使用同一个应用固件的基础上，通过自定义参数，如序列号，为每个设备生成不同配置的二进制 NVS 分区。

准备工作

在加密模式下使用该程序，需安装下列软件包：

- cryptography package

根据目录下的 requirements.txt 包含必需 python 包，请预先安装。

CSV 文件格式

CSV 文件每行需包含四个参数，以逗号隔开。具体参数描述见下表：

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>主键，应用程序可通过查询此键来获取数据。</td>
<td>file、data 和 namespace。</td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>支持 8、16、32,string,hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。</td>
<td>file 类型当前仅支持 hex2bin、base64、string 和 binary 编码。</td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>支持 u8、u16、u32、i32、u64、i64、string、hex2bin、base64 和 binary。决定二进制 bin 文件中 value 被编码成的类型。string 和 binary 编码的区别在于，string 数据以 NULL 字符结尾，binary 数据则不是。</td>
<td>namespace 字段的 encoding 和 value 应为空。namespace 的 encoding 和 value 为固定值，不可设置。这些单元格中的所有值都会被忽略。</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td></td>
</tr>
</tbody>
</table>

备注：CSV 文件的第一行应始终为列标题，不可设置。

此类 CSV 文件的 Dump 示例如下：

```
key, type, encoding, value  <- 列标题
namespace_name, namespace,,  <- 第一个条目为 "namespace"
key1, data, u8, i
key2, file, string, /path/to/file
```

备注：

请确保：

- 逗号 ‘,’ 前后无空格；
- CSV 文件每行末尾无空格。
NVS 条目和命名空间 (namespace) 的关联

如 CSV 文件中出现命名空间条目，后续条目均会被视为该命名空间的一部分，直至找到下一个命名空间条目。找到新命名空间条目后，后续所有条目都为新命名空间的一部分。

备注：CSV 文件中第一个条目应始终为 namespace。

支持多页 Blob

默认情况下，二进制 Blob 可跨多页，格式参考条目结构章节。如需使用旧版格式，可在程序中禁用该功能。

支持加密

NVS 分区生成程序还可使用 AES-XTS 加密生成二进制加密文件。更多信息详见 NVS 加密。

支持解密

如果 NVS 二进制文件采用了 AES-XTS 加密，该程序还可对此类文件进行解密。更多信息详见 NVS 加密。

运行程序

使用方法：

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

可选参数：

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
</tbody>
</table>

命令：

运行 nvs_partition_gen.py (command) -h 查看更多帮助信息

<table>
<thead>
<tr>
<th>序号</th>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>生成 NVS 分区</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>生成加密密钥</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>加密 NVS 分区</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>解密 NVS 分区</td>
</tr>
</tbody>
</table>

生成 NVS 分区（默认模式） 使用方法：

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR]
```

input output size
Chapter 2. API 参考

位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>待解析的 CSV 文件路径</td>
</tr>
<tr>
<td>output</td>
<td>NVS 二进制文件的输出路径</td>
</tr>
<tr>
<td>size</td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>version</td>
<td>版本为 1.2。</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件。（默认当前目录）</td>
</tr>
</tbody>
</table>

运行如下命令创建 NVS 分区，该程序同时会提供 CSV 示例文件:

```bash
python nvs_partition_gen.py generate_sample_singlepage_blob.csv sample.bin 0x3000
```

仅生成加密钥分区 使用方法:

```bash
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

可选参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>-keyfile KEYFILE</td>
<td>加密密钥分区文件的输出路径</td>
</tr>
<tr>
<td>-outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>

运行以下命令仅生成加密密钥分区:

```bash
python nvs_partition_gen.py generate-key
```

生成 NVS 加密分区 使用方法:

```bash
python nvs_partition_gen.py encrypt [-h] [--version (1,2)] [-keygen] [--keyfile KEYFILE] [-inputkey INPUTKEY] [-outdir OUTDIR] input output size
```

位置参数:

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>待解析 CSV 文件的路径</td>
</tr>
<tr>
<td>output</td>
<td>NVS 二进制文件的输出路径</td>
</tr>
<tr>
<td>size</td>
<td>NVS 分区大小（以字节为单位，且为 4096 的整数倍）</td>
</tr>
</tbody>
</table>

可选参数:
### 参数

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>-version [1,2]</td>
<td>设置多页 Blob 版本。版本 1: 禁用多页 Blob;版本 2: 启用多页 Blob;默认版本: 版本 2。</td>
</tr>
<tr>
<td>--keygen</td>
<td>生成 NVS 分区加密密钥</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>密钥文件的输出路径</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>内含 NVS 分区加密密钥的文件</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>

运行以下命令加密 NVS 分区，该程序同时会提供一个 CSV 示例文件。

- 通过 NVS 分区生成程序生成加密密钥来加密:

```bash
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
--0x3000 --keygen
```

**备注:** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。

- 通过 NVS 分区生成程序生成加密密钥、并将密钥存储于自定义的文件中:

```bash
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
--0x3000 --keygen --keyfile sample_keys.bin
```

**备注:** 创建的加密密钥格式为 `<outdir>/keys/keys-<timestamp>.bin`。

- 将加密密钥用作二进制输入文件来进行加密:

```bash
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
--0x3000 --inputkey sample_keys.bin
```

### 解密 NVS 分区 使用方法:

```bash
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

**位置参数:**

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>待解析的 NVS 加密分区文件路径</td>
</tr>
<tr>
<td>key</td>
<td>含有解密密钥的文件路径</td>
</tr>
<tr>
<td>output</td>
<td>已解密的二进制文件输出路径</td>
</tr>
</tbody>
</table>

**可选参数:**

<table>
<thead>
<tr>
<th>参数</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>显示帮助信息并退出</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>输出目录，用于存储创建的文件（默认当前目录）</td>
</tr>
</tbody>
</table>
运行以下命令解密已加密的 NVS 分区:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

您可以自定义格式版本号：- 版本 1: 禁用多 页 Blob - 版本 2: 启用多 页 Blob

**版本 1: 禁用多 页 Blob** 如需禁用多 页 Blob，请按照如下命令将版本参数设置为 1，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**版本 2: 启用多 页 Blob** 如需启用多 页 Blob，请按照如下命令将版本参数设置为 2，以此格式运行分区生成程序。该程序同时会提供一个 CSV 示例文件:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

备注：NVS 分区最小为 0x3000 字节。

备注：将二进制文件烧录至设备时，请确保与应用的 sdkconfig 设置一致。

说明

- 分区生成程序不会对重复键进行检查，而将数据同时写入这两个重复键中。请注意不要使用同名的键。
- 新页面创建后，前一页的空白处不会再写入数据。CSV 文件中的字段须按次序排列以优化内存；
- 暂不支持 64 位数据类型。

### 2.9.5 NVS 分区解析程序

**介绍**

NVS 分区解析程序 nvs_flash/nvs_partition_parser/nvs_read.py 加载并解析 NVS 存储分区，以便于调试和数据提取。该程序还支持完整性检查功能，可扫描分区中可能存在的错误。

**加密分区**

此程序不支持解密。如需解密 NVS 分区，请使用 NVS 分区生成程序。该工具支持 NVS 分区加密。

**使用方法**

该程序通过 -d 或 -dump 选项提供了六种不同的输出方式：
- *all* (默认) - 打印所有含有元数据的条目。
- *written* - 只打印含有元数据的写入条目。
- *minimal* - 打印写入的 namespace: key = value 对。
- *namespaces* - 打印所有写入的命名空间。
- *blobs* - 打印所有 blob 和字符串（若 blob 和字符串是以分块的形式，则对其进行重组）。
• storage_info - 打印每一页的条目状态计数。

注意：该程序还提供 none 选项，该选项不会打印任何东西。如果 NVS 分区的内容并不相关，可以将该选项和完整性检查选项一起使用。

该程序支持完整性检查功能，选择选项 -i 或 --integrity-check 即可运行。此功能可扫描整个分区，并打印出可能存在的错误。当此功能和 -d none 一起使用时，可只打印可能存在的错误。

### 2.9.6 SD/SDIO/MMC 驱动程序

概述

SD/SDIO/MMC 驱动是一种基于 SDMMC 和 SD SPI 主机驱动的协议级驱动程序，目前已支持 SD 存储器、SDIO 卡和 eMMC 芯片。

SDMMC 主机驱动和 SD SPI 主机驱动（driver/include/driver/sdmmc_host.h 和 driver/include/driver/sdspi_host.h）为以下功能提供 API:

- 发送命令至从设备
- 接收和发送数据
- 处理总线错误

初始化函数及配置函数:

- 如需初始化和配置 SDMMC 主机，请参阅 SDMMC 主机 API
- 如需初始化和配置 SD SPI 主机，请参阅 SD SPI 主机 API

本文档中所述的 SDMMC 协议层仅处理 SD 协议相关事项，例如卡初始化和数据传输命令。

协议层通过 sdmmc_host_t 结构体和主机协同工作，该结构体包含指向主机各类函数的指针。

应用示例

ESP-IDF storage/sd_card 目录下提供了 SDMMC 驱动与 FatFs 库组合使用的示例，演示了先初始化卡，然后使用 POSIX 和 C 库 API 向卡读写数据。请参考示例目录下 README.md 文件，查看更多详细信息。

复合法（存储 + IO） 该驱动程序不支持 SD 复合法，复杂卡会被视为 IO 卡。

线程安全 多数应用程序仅需在一个任务中使用协议层。因此，协议层在 sdmmc_card_t 结构体或在访问 SDMMC 或 SD SPI 主机驱动程序时不使用任何类型的锁。这种锁通常在较高层级实现，例如文件系统驱动程序。

协议层 API

协议层具备 sdmmc_host_t 结构体，此结构体描述了 SD/MMC 主机驱动，列出了其功能，并提供指向驱动程序函数的指针。协议层将卡信息储存于 sdmmc_card_t 结构体中，向 SD/MMC 主机发送命令时，协议层使用 sdmmc_command_t 结构体来描述命令、参数、预期返回值和需传输的数据 (如有)。
用于 SD 存储卡的 API

1. 初始化主机，调用主机驱动函数，例如 `sdmmc_host_init()` 和 `sdmmc_host_init_slot()`；
2. 初始化卡，调用 `sdmmc_card_init()`，并将参数 host（主机驱动信息）和参数 card（指向 `sdmmc_card_t` 结构体的指针）传递给此函数。函数运行结束后，将会向 `sdmmc_card_t` 结构体填充该卡的信息；
3. 读取或写入卡的数据，请分别调用 `sdmmc_read_sectors()` 和 `sdmmc_write_sectors()`，并将参数 card（指向卡信息结构的指针）传递给函数；
4. 如果不再使用该卡，请调用主机驱动函数，例如 `sdmmc_host_deinit()`，以禁用主机外设，并释放驱动程序分配的资源。

用于 eMMC 芯片的 API 从协议层的角度而言，eMMC 存储芯片与 SD 存储卡相同。尽管 eMMC 是芯片，不具备卡的外形，但由于协议相似(`sdmmc_card_t, sdmmc_card_init`)，用于 SD 卡的一些概念同样适用于 eMMC 芯片。注意，eMMC 芯片不可通过 SPI 使用，因此它与 SD API 主机驱动不兼容。

如需初始化 eMMC 内存并执行读/写操作，请参照上一章节 SD 卡操作步骤。

用于 SDIO 卡的 API 由于卡初始化和检测过程与 SD 存储卡相同，唯一的区别是 SDIO 模式下数据传输命令不同。

在卡初始化和卡检测（通过运行 `sdmmc_card_init()`）期间，驱动仅配置 IO 卡如下寄存器：

1. I/O 中止 (0x06) 寄存器：在该寄存器中设置 RES（位可重置卡的 IO 部分）
2. 总线接口控制 (0x07) 寄存器：如果主机和插槽配置中启用 4 线模式，则驱动程序会尝试在该寄存器中设置总线宽度字段。如果字段设置成功，则从机支持 4 线模式，主机也切换至 4 线模式；
3. 高速 (0x13) 寄存器：如果主机配置中启用高速模式，则该寄存器的 HS 位会被设置。

注意，驱动程序不会在 (1) I/O 使能寄存器和 Int 使能寄存器，及 (2) I/O 块大小中，设置任何位。应用程序可通过调用 `sdmmc_io_read_byte()` 来设置相关位。

如需卡配置或传输数据，请根据您的具体情况选择下表中的函数：

<table>
<thead>
<tr>
<th>操作</th>
<th>函数读取</th>
<th>函数写入</th>
</tr>
</thead>
<tbody>
<tr>
<td>使用 IO_RW_DIRECT (CMD52) 读写单个字节。</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>使用 IO_RW_EXTENDED (CMD53) 读写多个字节。</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>块模式下，使用 IO_RW_EXTENDED (CMD53) 读写数据</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

使用 `sdmmc_io_enable_int()` 函数，应用程序可启用 SDIO 中断。在单线模式下使用 SDIO 时，还需要连接 D1 线来启用 SDIO 中断。

如果您需要应用程序保持等待直到发生 SDIO 中断，请使用 `sdmmc_io_wait_int()` 函数。

如果您您与 ESP32 的 SDIO 从设备通信，请使用 ESSL 组件 (ESP 串行从设备链接)，请参阅 `ESP Serial Slave Link` 和 peripherals/sdio/host。

**API 参考**

**Header File**
- components/sdmmc/include/sdmmc_cmd.h

**Functions**

```c
esp_err_t sdmmc_card_init (const sdmmc_host_t *host, sdmmc_card_t *out_card)
```

Probe and initialize SD/MMC card using given host

Espressif Systems 1678 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
Chapter 2. API reference

备注: Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

参数
- host - pointer to structure defining host controller
- out_card - pointer to structure which will receive information about the card when the function completes

返回
- ESP_OK on success
- One of the error codes from SDMMC host controller

void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)
Print information about the card to a stream.

参数
- stream - stream obtained using fopen or fdopen
- card - card information structure initialized using sdmmc_card_init

esp_err_t sdmmc_get_status (sdmmc_card_t *card)
Get status of SD/MMC card

参数 card - pointer to card information structure previously initialized using sdmmc_card_init
返回
- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
Write given number of sectors to SD/MMC card

参数
- card - pointer to card information structure previously initialized using sdmmc_card_init
- src - pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- start_sector - sector where to start writing
- sector_count - number of sectors to write

返回
- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
Read given number of sectors from the SD/MMC card

参数
- card - pointer to card information structure previously initialized using sdmmc_card_init
- dst - pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- start_sector - sector where to start reading
- sector_count - number of sectors to read

返回
- ESP_OK on success
- One of the error codes from SDMMC host controller

esp_err_t sdmmc_erase_sectors (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
Erase given number of sectors from the SD/MMC card

备注: When sdmmc_erase_sectors used with cards in SDSPI mode, it was observed that card requires re-init
after erase operation.

### 参数
- card – 指向先前初始化的SD/MMC卡信息结构
- start_sector – 要开始擦除的扇区
- sector_count – 要擦除的扇区数量
- arg – 擦除命令(CMD38)的参数

### 返回
- ESP_OK表示成功
- 其中一个错误代码来自SDMMC主机控制器

```c
esp_err_t sdmmc_can_discard(sdmmc_card_t *card)
```
检查SD/MMC卡是否支持Discard

- 参数 card – 指向先前初始化的SD/MMC卡信息结构

### 返回
- ESP_OK表示受支持的卡/设备
- ESP_FAIL表示不受支持的卡/设备

```c
esp_err_t sdmmc_can_trim(sdmmc_card_t *card)
```
检查SD/MMC卡是否支持Trim

- 参数 card – 指向先前初始化的SD/MMC卡信息结构

### 返回
- ESP_OK表示受支持的卡/设备
- ESP_FAIL表示不受支持的卡/设备

```c
esp_err_t sdmmc_mmc_can_sanitize(sdmmc_card_t *card)
```
检查SD/MMC卡是否支持Sanitize

- 参数 card – 指向先前初始化的SD/MMC卡信息结构

### 返回
- ESP_OK表示受支持的卡/设备
- ESP_FAIL表示不受支持的卡/设备

```c
esp_err_t sdmmc_mmc_sanitize(sdmmc_card_t *card, uint32_t timeout_ms)
```
Sanitize未映射的数据

- 参数 card – 指向先前初始化的SD/MMC卡信息结构
- timeout_ms – 擦除选定范围所需的时间

### 返回
- ESP_OK表示成功
- 其中一个错误代码来自SDMMC主机控制器

```c
esp_err_t sdmmc_full_erase(sdmmc_card_t *card)
```
Erase完成SD/MMC卡

- 参数 card – 指向先前初始化的SD/MMC卡信息结构

### 返回
- ESP_OK表示成功
- 其中一个错误代码来自SDMMC主机控制器
**esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)**

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**参数**
- card - pointer to card information structure previously initialized using sdmmc_card_init
- function - IO function number
- reg - byte address within IO function
- out_byte - [out] output, receives the value read from the card

**返回**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)**

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**参数**
- card - pointer to card information structure previously initialized using sdmmc_card_init
- function - IO function number
- reg - byte address within IO function
- in_byte - value to be written
- out_byte - [out] if not NULL, receives new byte value read from the card (read-after-write).

**返回**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)**

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see sdmmc_io_read_blocks.

**参数**
- card - pointer to card information structure previously initialized using sdmmc_card_init
- function - IO function number
- addr - byte address within IO function where reading starts
- dst - buffer which receives the data read from card
- size - number of bytes to read

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)**

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see sdmmc_io_write_blocks.

**参数**
- card - pointer to card information structure previously initialized using sdmmc_card_init
- function - IO function number
- addr - byte address within IO function where writing starts
- src - data to be written
- size - number of bytes to write

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
Chapter 2: API

- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)**

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see sdmmc_io_read_bytes.

**参数**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **addr** - byte address within IO function where writing starts
- **dst** - buffer which receives the data read from card
- **size** - number of bytes to read, must be divisible by the card block size.

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)**

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

**参数**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **function** - IO function number
- **addr** - byte address within IO function where writing starts
- **src** - data to be written
- **size** - number of bytes to read, must be divisible by the card block size.

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)**

Enable SDIO interrupt in the SDMMC host

**参数**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init

**返回**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

**esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)**

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**参数**
- **card** - pointer to card information structure previously initialized using sdmmc_card_init
- **timeout_ticks** - time to wait for the interrupt, in RTOS ticks

**返回**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

**esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)**

Get the data of CIS region of an SDIO card.
You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

### Parameters
- `card` - Pointer to card information structure previously initialized using `sdmmc_card_init`
- `out_buffer` - Output buffer of the CIS data
- `buffer_size` - Size of the buffer.
- `inout_cis_size` - Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`.
    The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

### Return
- `ESP_OK`: on success
- `ESP_ERR_INVALID_RESPONSE`: if the card does not (correctly) support CIS.
- `ESP_ERR_INVALID_SIZE`: `CIS_CODE_END` found, but `buffer_size` is less than required size, which is stored in the `inout_cis_size` then.
- `ESP_ERR_NOT_FOUND`: if the `CIS_CODE_END` not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`

```c
esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
```

### Parse and print the CIS information of an SDIO card.

### Notes
Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in `sdmmc_io.c` and contribute to the IDF through the Github repository.

```c
using sdmmc_card_init
```

---

### Parameters
- `buffer` - Buffer to parse
- `buffer_size` - Size of the buffer.
- `fp` - File pointer to print to, set to NULL to print to stdout.

### Return
- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: if the value from the card is not supported to be parsed.
- `ESP_ERR_INVALID_SIZE`: if the CIS size fields are not correct.

### Header File
- `components/driver/include/driver/sdmmc_types.h`

### Structures

```c
struct sdmmc_csd_t
```
Decoded values from SD card Card Specific Data register

### Public Members

```c
int csd_ver
```
CSD structure format
int mmc_ver
  MMC version (for CID format)

int capacity
  total number of sectors

int sector_size
  sector size in bytes

int read_block_len
  block length for reads

int card_command_class
  Card Command Class for SD

int tr_speed
  Max transfer speed

struct sdmmc_cid_t
  Decoded values from SD card Card IDentification register

Public Members

int mfg_id
  manufacturer identification number

int oem_id
  OEM/product identification number

char name[8]
  product name (MMC v1 has the longest)

int revision
  product revision

int serial
  product serial number

int date
  manufacturing date

struct sdmmc_scr_t
  Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

Public Members
Chapter 2. API 参考

- `uint32_t sd_spec`
  SD Physical layer specification version, reported by card

- `uint32_t erase_mem_state`
  Data state on card after erase whether 0 or 1 (card vendor dependent)

- `uint32_t bus_width`
  Bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

- `uint32_t reserved`
  Reserved for future expansion

- `uint32_t rsvd_mnf`
  Reserved for manufacturer usage

**struct sdmmc_ssr_t**
Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

**Public Members**

- `uint32_t alloc_unit_kb`
  Allocation unit of the card, in multiples of kB (1024 bytes)

- `uint32_t erase_size_au`
  Erase size for the purpose of timeout calculation, in multiples of allocation unit

- `uint32_t cur_bus_width`
  SD current bus width

- `uint32_t discard_support`
  SD discard feature support

- `uint32_t fule_support`
  SD FULE (Full User Area Logical Erase) feature support

- `uint32_t erase_timeout`
  Timeout (in seconds) for erase of a single allocation unit

- `uint32_t erase_offset`
  Constant timeout offset (in seconds) for any erase operation

- `uint32_t reserved`
  Reserved for future expansion

**struct sdmmc_ext_csd_t**
Decoded values of Extended Card Specific Data
Public Members

`uint8_t rev`
Extended CSD Revision

`uint8_t power_class`
Power class used by the card

`uint8_t erase_mem_state`
data state on card after erase whether 0 or 1 (card vendor dependent)

`uint8_t sec_feature`
secure data management features supported by the card

`struct sdmmc_switch_func_rsp_t`
SD SWITCH_FUNC response buffer

Public Members

`uint32_t data[512 / 8 / sizeof(uint32_t)]`
response data

`struct sdmmc_command_t`
SD/MMC command information

Public Members

`uint32_t opcode`
SD or MMC command index

`uint32_t arg`
SD/MMC command argument

`sdmmc_response_t response`
response buffer

`void *data`
buffer to send or read into

`size_tdatalen`
length of data buffer

`size_tblklen`
block length

`int flags`
see below
**Chapter 2. API**

eesp_err_t error

error returned from transfer

uint32_t timeout_ms

response timeout, in milliseconds

struct sdmmc_host_t

SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

**Public Members**

uint32_t flags

flags defining host properties

int slot

slot number, to be passed to host functions

int max_freq_khz

max frequency supported by the host

float io_voltage

I/O voltage used by the controller (voltage switching is not supported)

eesp_err_t (*init)(void)

Host function to initialize the driver

eesp_err_t (*set_bus_width)(int slot, size_t width)

host function to set bus width

size_t (*get_bus_width)(int slot)

host function to get bus width

eesp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)

host function to set DDR mode

eesp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)

host function to set card clock frequency

eesp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)

host function to do a transaction

eesp_err_t (*deinit)(void)

host function to deinitialize the driver

eesp_err_t (*deinit_p)(int slot)

host function to deinitialize the driver, called with the slot
Chapter 2. API

**esp_err_t (*io_int_enable)(int slot)**
Host function to enable SDIO interrupt line

**esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)**
Host function to wait for SDIO interrupt line to be active

**int command_timeout_ms**
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

**esp_err_t (*get_real_freq)(int slot, int *real_freq)**
Host function to provide real working freq, based on SDMMC controller setup

**struct sdmmc_card_t**
SD/MMC card information structure

### Public Members

**sdmmc_host_t host**
Host with which the card is associated

**uint32_t ocr**
OCR (Operation Conditions Register) value

**sdmmc_cid_t cid**
decoded CID (Card IDentification) register value

**sdmmc_response_t raw_cid**
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

**sdmmc_csd_t csd**
decoded CSD (Card-Specific Data) register value

**sdmmc_scr_t scr**
decoded SCR (SD card Configuration Register) value

**sdmmc_ssr_t ssr**
decoded SSR (SD Status Register) value

**sdmmc_ext_csd_t ext_csd**
decoded EXT_CSD (Extended Card Specific Data) register value

**uint16_t rca**
RCA (Relative Card Address)

**uint16_t max_freq_khz**
Maximum frequency, in kHz, supported by the card
int real_freq_khz
    Real working frequency, in kHz, configured on the host controller

uint32_t is_mem
    Bit indicates if the card is a memory card

uint32_t is_sdio
    Bit indicates if the card is an IO card

uint32_t is mmc
    Bit indicates if the card is MMC

uint32_t num_io_functions
    If is_sdio is 1, contains the number of IO functions on the card

uint32_t log bus width
    log2(bus width supported by card)

uint32_t is ddr
    Card supports DDR mode

uint32_t reserved
    Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
    host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
    host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT
    host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI
    host supports SPI protocol

SDMMC_HOST_FLAG_DDR
    host supports DDR mode for SD/MMC

SDMMC_HOST_FLAG_DEINIT_ARG
    host deinit function called with the slot argument

SDMMC_FREQ_DEFAULT
    SD/MMC Default speed (limited by clock divider)

SDMMC_FREQ_HIGHSPEED
    SD High speed (limited by clock divider)
**Type Definitions**

```c
typedef uint32_t sdmmc_response_t[4]
```
SD/MMC command response buffer

**Enumerations**

```c
enum sdmmc_erase_arg_t
```
SD/MMC erase command (38) arguments

- **SDMMC_ERASE_ARG**
  - Erase operation on SD, Trim operation on MMC

- **SDMMC_DISCARD_ARG**
  - Discard operation for SD/MMC

### 2.9.7 SPI Flash API

**概述**

spi_flash 组件提供外部 flash 数据读取、写入、擦除和内存映射相关的 API 函数，同时也提供了更高层的、面向分区的 API 函数（定义在 esp API 中）。

与 ESP-IDF V4.0 之前的 API 不同，这一版 esp_* API 功能并不局限于主 SPI flash 芯片（即运行程序的 SPI flash 芯片），使用不同的芯片指令，您可以访问连接到 SPI0/1 或 SPI2 总线的外部 flash 芯片。

**备注**：大多数 esp_* API 使用 SPI1，SPI2 等外设而非通过 SPI0 上的 cache。这使得它们不仅访问主 flash，也能访问外部 flash。
而由于 cache 的限制，所有经过 cache 的操作都只能对主 flash 进行。这些操作的地址同样受到 cache 能力的限制。Cache 无法访问外部 flash 或者高于它能力的地址段。这些 cache 操作包括：mmap，加密读写，执行代码或者访问在 flash 中的变量。

备注：ESP-IDF V4.0 之后的 flash API 不再是 原子 的。因此，如果读操作执行过程中发生写操作，且读操作和写操作的 flash 地址出现重叠，读操作返回的数据可能会包含旧数据和新数据（新数据为写操作更新产生的数据）。

备注：仅有主 flash 芯片支持加密操作，外接（经 SPI 使用其他不同片选访问，或经其它 SPI 总线访问）的 flash 芯片则不支持加密操作。硬件的限制也决定了仅有主 flash 支持从 cache 当中读取。

Flash 功能支持情况

支持的 Flash 列表 不同厂家的 flash 特性有不同的操作方式，因此需要特殊的驱动支持。当前驱动支持大多数厂家 flash 24 位地址范围内的快速/慢速读，以及二线模式 (DIO/DOUT)，因为它们不需要任何厂家的自定义命令。

当前驱动支持以下厂家/型号的 flash 的四线模式 (QIO/QOUT)：

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Flash 可选的功能

Optional features for flash　Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

• Auto Suspend & Resume
• Flash unique ID
• High performance mode
• OPI flash support
• 32-bit Address Flash Chips

备注：

• The features listed above needs to be supported by both esp chips and flash chips.
• If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
• If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

注意：This document only shows that IDF code has supported the features of those flash chips. It’s not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.
Chapter 2. API 参考

**Auto Suspend & Resume**

ESP Chips List:

1. ESP32C3

Flash Chips List:

1. XM25QxxC series.

**Flash unique ID**

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

ALL

Flash Chips List:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

**High performance mode**

备注: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:

1. ESP32S3

Flash Chips (name & ID) List:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

**OPI flash support**

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:

1. ESP32S3
Chapter 2. API 参考

Flash Chips List:

1. MX25UM25645G

**32-bit Address Flash Chips**   Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBBytes memory. However, for larger memory (usually equal to or larger than 16 MBBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:

ALL ESP Chips support this.

Flash Chips List:

1. W25Q256
2. GD25Q256

有一些功能可能不是所有的 flash 芯片都支持，或不是所有的 ESP 芯片都支持。这些功能包括：

- 32 比特地址的 flash 支持 - 通常意味着拥有大于 16MB 内存空间的大容量 flash 需要更长的地址去访问。

- flash 的私有 ID (unique ID) - 表示 flash 支持它自己的 64-bits 独有 ID。

如果您想使用这些功能，则需保证 ESP32 支持这些功能，且产品里所使用的 flash 芯片也要支持这些功能。请参阅 Optional features for flash，查看更多信息。

您也可以自定义 flash 芯片驱动。请参阅 Overriding Default Chip Drivers，查看详细信息。

警告: Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers**   During the SPI Flash driver’s initialization (i.e., esp_flash_init()), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

**Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List**

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (default_registered_chips) provided by IDF. Instead, the linker will search for the structure of the same name (default_registered_chips) that must be provided by the user.
2. Add a new component in your project, e.g. custom_chip_driver.
3. Copy the necessary chip driver files from the spi_flash component in IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the default_registered_chips structure)
   - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files
   Modify the files above properly.
Chapter 2. API

When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***get_caps` function. The steps are as follows.

1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
2. Write a function named `spi_flash_chip_***get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

4. Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```c
idf_component_get_property(spi_flash_lib spi_flash COMPONENT_LIB)
set_property(TARGET ${spi_flash_lib} APPEND PROPERTY INTERFACE_LINK_LIBRARIES$<LINK_ONLY:${COMPONENT_LIB}>)
```

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

**Example** See also `storage/custom_flash_driver`.

### 初始化 Flash 设备

在使用 `esp_flash_*` API 之前，您需要在 SPI 总线上初始化芯片，步骤如下：

1. 调用 `spi_bus_initialize()` 初始化 SPI 总线。此函数将初始化总线上设备间共享的资源，如 I/O、DMA、中断等。
2. 调用 `spi_bus_add_flash_device()` 将 flash 设备连接到总线上。然后分配内存，填充 `esp_flash_t` 结构体，同时初始化 CS I/O。
3. 调用 `esp_flash_init()` 与芯片进行通信。后续操作会依据芯片类型不同而有差异。

**备注：** 当前，已支持多个 flash 芯片连接到同一总线。

### SPI Flash 访问 API

如下所示为处理 flash 中数据的函数集：
Chapter 2. API 参考

- `esp_flash_read()`：将数据从 flash 读取到 RAM；
- `esp_flash_write()`：将数据从 RAM 写入到 flash；
- `esp_flash_erase_region()`：擦除 flash 中指定区域的数据；
- `esp_flash_erase_chip()`：擦除整个 flash；
- `esp_flash_get_chip_size()`：返回 menuconfig 中设置的 flash 芯片容量（以字节为单位）。

一般来说，请尽量避免对 SPI flash 芯片直接使用原始 SPI flash 函数。如需对 SPI flash 芯片进行操作，请使用分区专用函数。

SPI Flash 容量

SPI flash 容量由引导加载程序镜像头部（烧录偏移为 0x1000）的一个字段进行配置。

默认情况下，引导程序被写入 flash 时，esptool.py 会自动检测 SPI flash 容量，同时使用正确容量更新引导程序的头部。您也可以在工程配置中设置 `CONFIG_ESPTOOLPY_FLASHSIZE`，生成固定的 flash 容量。

如需在运行时覆盖已配置的 flash 容量，请配置 g_rom_flashchip 结构中的 chip_size。`esp_flash_*` 函数使用此容量（于软件和 ROM 中）进行边界检查。

SPII Flash 并发约束

SPII flash 并发约束 指令/数据 cache（用以执行固件）与 SPII 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPII/1 总线。因此，SPII 外设上的操作会对整个系统造成显著的影响。这类操作包括调用 SPI flash API 或者 SPII 总线上的其他驱动。任何 flash 操作（如读取、写入、擦除）或是由其他用户定义的 SPI 操作（对主 flash 或是其他 SPI 从机）。

在 ESP32 上，flash 读取/写入/擦除时，cache 必须被禁用。

当 cache 被禁用时 此时，在 flash 擦写操作中，所有的 CPU 都只能执行 IRAM 中的代码，而且必须从 DRAM 中读取数据。如果您使用本文档中 API 函数，上述限制将自动生效且透明（无需您额外关注），但这些限制可能影响系统中其他任务的性能。

要避免意外读取 flash cache，一个 CPU 在启动 flash 写入或擦除操作时，另一个 CPU 将阻塞。在 flash 操作完成前，所有 CPU 上，所有的非 IRAM 安全的中断都会被禁用。

另请参阅 OS 函数和 SPI 总线。

除 SPII/1 以外，SPI 总线上的其他 flash 芯片不受这种限制。

请参阅应用程序内存分布，查看内部 RAM（如 IRAM、DRAM）和 flash cache 的区别。

IRAM 安全中断处理程序 如果您需要在 flash 操作期间运行中断处理程序（比如低延迟操作），请在 注册中断处理程序 时设置 `ESP_INTR_FLAG_IRAM`。

请确保中断处理程序访问的所有数据和函数（包括其调用的数据和函数）都存储在 IRAM 或 DRAM 中。参见如何将代码放入 IRAM。

在函数或符号未被正确放入 IRAM/DRAM 的情况下，中断处理程序在 flash 操作期间从 flash cache 中读取数据时，会导致程序崩溃。这可能是因为代码未被正确放入 IRAM 而产生非法指令异常，也可能是因为常数未被正确放入 DRAM 而读取到垃圾数据。

备注：在 ISR 中处理字符串时，不建议使用 printf 和其他输出函数。为了方便调试，在从 ISRs 中获取数据时，请使用 ESP_DRAM_LOGE() 和类似的宏。请确保 TAG 和格式字符串都放置于 DRAM 中。
Chapter 2. API 参考

非 IRAM 安全中断处理程序 如果在注册时没有设置 ESP_INTR_FLAG_IRAM 标志，当 cache 被禁用时，将不会执行中断处理程序。一旦 cache 恢复，非 IRAM 安全的中断将重新启用，中断处理程序随即再次正常运行。这意味着，只要 cache 被禁用，将不会发生相应的硬件事件。

注意：指令/数据 cache（用以执行固件）与 SPI 外设（由像 SPI flash 驱动一样的驱动程序控制）共享 SPI0/1 总线。因此，在 SPI1 总线上调用 SPI flash API（包括访问 flash）会对整个系统造成显著的影响。请参阅 SPI flash 并发约束，查看详细信息。

分区表 API

ESP-IDF 工程使用分区表保存 SPI flash 各区信息，包括引导程序、各种应用程序二进制文件、数据及文件系统等。请参阅 分区表，查看详细信息。

该组件在 esp_partition.h 中声明了一些 API 函数，用以枚举在分区表中找到的分区，并对这些分区执行操作：

- `esp_partition_find()`：在分区表中查找特定类型的条目，返回一个不透明迭代器；
- `esp_partition_get()`：返回一个结构体，描述给定迭代器的分区；
- `esp_partition_next()`：将迭代器移至下一个找到的分区；
- `esp_partition_iterator_release()`：释放 `esp_partition_find` 中返回的迭代器；
- `esp_partition_find_first()`：返回描述 `esp_partition_find` 中找到的第一个分区的结构；
- `esp_partition_read()`、`esp_partition_write()` 和 `esp_partition_erase_range()` 等同于 `esp_flash_read()`、`esp_flash_write()` 和 `esp_flash_erase_region()`，但在分区表内进行。

备注：请在应用程序代码中使用上述 `esp_partition_*` API 函数，而非低层级的 `esp_flash_*` API 函数。分区表 API 函数根据存储在分区表中的数据，进行边界检查并计算在 flash 中的正确偏移量。

SPI Flash 加密

您可以对 SPI flash 内容进行加密，并在硬件层对其进行透明解密。

请参阅 flash 加密，查看详细信息。

内存映射 API

ESP32 的内存硬件可以将 flash 部分区域映射到指令地址空间和数据地址空间。此映射仅用于读操作，不能通过写入 flash 映射的存储区域来改变 flash 中的内容。

Flash 在 64 KB 页进行映射。内存映射硬件既可将 flash 映射到数据地址空间，也能映射到指令地址空间。请查看技术参考手册，了解内存映射硬件的详细信息及有关限制。

请注意，有些页被用于将应用程序映射到内存中，因此实际可用的页会少于硬件提供的总数。

启用 Flash 加密 时，使用内存映射区域从 flash 读取数据是解密闪 的唯一方法，解密需在硬件层进行。

内存映射 API 在 spi_flash_mmap.h 和 esp_partition.h 中声明：

- `spi_flash_mmap()`：将 flash 物理地址区域映射到 CPU 指令空间或数据空间；
- `spi_flash_munmap()`：取消上述区域的映射；
- `esp_partition_mmap()`：将分区的一部分映射至 CPU 指令空间或数据空间；
- `spi_flash_mmap()` 和 `esp_partition_mmap()` 的区别如下：
- `spi_flash_mmap()`：需要给定一个 64 KB 对齐的物理地址；
- `esp_partition_mmap()`：给定分区内任意偏移量即可，此函数根据需要将返回的指针调整至指
向映射内存。

Espressif Systems 1696 Release v5.1-dev-2066-g7869f4e151
内存映射以页为单位，即使传递给 esp_partition_mmap 的是一个分区，分区外的数据也是也是可以被读取到的，不会受到分区边界的影响。

备注：由于 mmap 是由 cache 支持的，因此，mmap 也只能用在主 flash 上。

SPI Flash 实现

esp_flash_t 结构体包含芯片数据和该 API 的三个重要部分：
1. 主机驱动，为访问芯片提供硬件支持；
2. 芯片驱动，为不同芯片提供兼容性服务；
3. OS 函数，在不同阶段（一级或二级 Boot 或者应用程序阶段）为部分 OS 函数（如锁、延迟）提供支持。

主机驱动 主机驱动依赖 hal/include/hal 文件夹下 spi_flash_types.h 定义的 spi_flash_host_driver_t 接口。该接口提供了一些常用的函数，用于与芯片通信。
在 SPI HAL 文件中，有些函数是基于现有的 ESP32 memory-spi 来实现的，但是，由于 ESP32 的速度限制，HAL 层无法提供某些芯片的高级功能（所以这些命令根本不在 HAL 的文件中被实现）。
memapi_host_driver.h 和 .c 文件使用 HAL 提供的 common_command 函数实现上述命令的高速版本，并将所有它实现的及 HAL 函数封装为 spi_flash_host_driver_t 供上层调用。
您甚至可以仅通过 GPIO 来实现自己的主机驱动。只要实现了 spi_flash_host_driver_t 中所有函数，不管底层硬件是什么，esp_flash_API 都可以访问 flash。

芯片驱动 芯片驱动在 spi_flash_chip_driver.h 中进行定义，并将主机驱动提供的基本函数进行封装以供 API 层使用。
有些操作需在执行前先发送命令，或在执行后读取状态，因此有些芯片需要不同的命令或值以及通信方式。
generic chip 芯片代表了常见的 flash 芯片，其他芯片驱动可以在这种通用芯片的基础上进行开发。
芯片驱动依赖主机驱动。

OS 函数 OS 函数层目前支持访问Flash和延迟的方法。
锁（见 SPI 总线锁）用于解决同一 SPI 总线上的设备访问和 SPI flash 芯片访问之间的冲突。例如：
1. 经 SPI 总线访问 flash 芯片时，应当禁用 cache（平时用于获取代码和 PSRAM 数据）。
2. 经其他总线访问 flash 芯片时，应当使用 flash 上 SPI 主驱动器注册的 ISR 以避免冲突。
3. SPI 主驱动器上某些没有 CS 线或者 CS 线受软件（如 SDSPI）控制的设备需要在一段时间内独占总线。
延时则用于某些长时操作，需要主机处于等待状态或执行轮询。
顶层 API 将芯片驱动和 OS 函数封装成一个完整的组件，并提供参数检查。
使用 OS 函数还可以在一定程度上避免在擦除大块 flash 区域时出现看门狗超时的情况。在这段时间内，
CPU 将被 flash 擦除任务占用，从而阻止其他任务的执行，包括为看门狗定时器 (WDT) 供电的空闲任务。若已选中配置选项 CONFIG_ESP_TASK_WDT_PANIC，并且 flash 操作时间长于看门狗的超时时间，系统将重新启动。
不过，由于不同的 flash 芯片擦除时间不同，flash 驱动几乎无法兼容，很难完全规避超时的风险。因此，
您需要格外注意这一点。请遵照以下指南：
1. 建议启用 CONFIG_SPI_FLASH_YIELD_DURING_ERASE 选项，允许调度器在擦除 flash 时进行重新调度。
此外，还可以使用下列参数。
• 在 menuconfig 中增加 CONFIG_SPI_FLASH_ERASE_YIELD_TICKS 或减少 CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS 的时间。
2. 注意，在进行长时间的 SPI flash 操作时，启用 `CONFIG_ESP_TASK_WDT_PANIC` 选项将会在超时不触发恐慌处理程序。不过，启动该选项也可以帮助处理应用程序中的意外异常，您可以根据实际情况决定是否启用这个选项。

3. 在开发过程中，请根据项目对擦除 flash 的具体要求和时间限制，谨慎进行 flash 操作。在配置 flash 擦除超时周期时，请在实际产品要求的基础上留出合理的冗余时间，从而提高产品的可靠性。

另请参考

- `OTA API` 提供了高层 API 用于更新存储在 flash 中的 app 固件。
- `NVS API` 提供了结构化 API 用于存储 SPI flash 中的碎片数据。

实现细节

必须确保操作期间，两个 CPU 均未从 flash 运行代码。实现细节如下：

- 单核模式下，SDK 在执行 flash 操作前将禁用中断或调度算法。
- 双核模式下，SDK 需确保两个 CPU 均未运行 flash 代码。

如果用 SPI flash API 在 CPU A (PRO 或 APP) 上应用，它使用 `esp_ipc_call` API 在 CPU B 上运行 `spi_flash_op_block_func` 函数。`esp_ipc_call` API 会在 CPU B 上唤醒一个高优先级任务，即运行 `spi_flash_op_block_func` 函数。运行该函数将禁用 CPU B 上的 `cache`，并使用 `s_flash_op_can_start` 旗帜来标志 `cache` 已禁用。然后，CPU A 上的任务也会禁用 `cache` 并继续执行 flash 操作。

执行 flash 操作时，CPU A 和 CPU B 仍然可以执行中断操作。默认中断代码均存储于 RAM 中，如果新添加了中断分配 API，则应添加一个标志位以请求在 flash 操作期间禁用该新分配的中断。

Flash 操作完成后，CPU A 上的函数将设置另一标志位，即 `s_flash_op_complete`，用以通知 CPU B 上的任务可以重新启用 `cache` 并释放 CPU。接着，CPU A 上的函数也重新启用 `cache`，并将控制权返还给调用者。

另外，所有 API 函数均受互斥量 `s_flash_op_mutex` 保护。

在单核环境中（启用 `CONFIG_FREERTOS_UNICORE`），您需要禁用上述两个 `cache` 以防发生 CPU 间通信。

**SPI Flash API 参考**

**Header File**

- `components/spi_flash/include/esp_flash_spi_init.h`

**Functions**

```c
esp_err_t spi_bus_add_flash_device (esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

**参数**

- `out_chip` - Pointer to hold the initialized chip.
- `config` - Configuration of the chips to initialize.

**返回**

- `ESP_ERR_INVALID_ARG` - `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM` - failed to allocate memory for the chip structures.
- `ESP_OK` - success.
Chapter 2. API 参考

**esp_err_t spi_bus_remove_flash_device (esp_flash_t *chip)**
Remove a SPI Flash device from the SPI bus.

**参数**
- chip: The flash device to remove.

**返回**
- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

**Structures**

struct esp_flash_spi_device_config_t
Configurations for the SPI Flash to init.

**Public Members**

*spi_host_device_t* **host_id**
Bus to use.

int **cs_io_num**
GPIO pin to output the CS signal.

*esp_flash_io_mode_t* **io_mode**
IO mode to read from the Flash.

enum *esp_flash_speed_s* **speed**
Speed of the Flash clock. Replaced by freq_mhz.

int **input_delay_ns**
Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs_id**
CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq_mhz**
The frequency of flash chip(MHZ)

**Header File**
- components/spi_flash/include/esp_flash.h

**Functions**

*esp_err_t* **esp_flash_init (esp_flash_t *chip)**
Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**备注:** Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Chapter 2. API 参考**

**备注:** If the chip->drv pointer is NULL, chip.chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

参数 chip - Pointer to SPI flash chip to use. If NULL, esp.flash_default_chip is substituted. 
返回 ESP_OK on success, or a flash error code if initialisation fails.

bool esp_flash_chip_driver_initialized (const esp.flash_t *chip)  
Check if appropriate chip driver is set.

参数 chip - Pointer to SPI flash chip to use. If NULL, esp.flash_default_chip is substituted. 
返回 true if set, otherwise false.

**esp_err_t esp_flash_read_id (esp.flash_t *chip, uint32_t *out_id)**  
Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

参数
- chip - Pointer to identify flash chip. Must have been successfully initialised via esp.flash_init()  
- out_id - [out] Pointer to receive ID value. 
返回 ESP_OK on success, or a flash error code if operation failed.

**esp_err_t esp_flash_get_size (esp.flash_t *chip, uint32_t *out_size)**  
Detect flash size based on flash ID.

备注: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call esp.flash_get_physical_size instead.

参数
- chip - Pointer to identify flash chip. Must have been successfully initialised via esp.flash_init()  
- out_size - [out] Detected size in bytes, standing for the size in the binary image header. 
返回 ESP_OK on success, or a flash error code if operation failed.

**esp_err_t esp_flash_get_physical_size (esp.flash_t *chip, uint32_t *flash_size)**  
Detect flash size based on flash ID.

备注: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

参数
- chip - Pointer to identify flash chip. Must have been successfully initialised via esp.flash_init()  
- flash_size - [out] Detected size in bytes. 
返回 ESP_OK on success, or a flash error code if operation failed.

**esp_err_t esp_flash_read_unique_chip_id (esp.flash_t *chip, uint64_t *out_id)**  
Read flash unique ID via the common “RDUID” SPI flash command.
ID is a 64-bit value.

**参数**
- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **out_id** – [out] Pointer to receive unique ID value.

**返回**
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

```c
esp_err_t esp_flash_erase_chip(esp_flash_t *chip)
```
Erase flash chip contents.

**参数**
- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

**返回**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)
```
Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**参数**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **start** – Address to start erasing flash. Must be sector aligned.
- **len** – Length of region to erase. Must also be sector aligned.

**返回**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```
Read if the entire chip is write protected.

**备注：** A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**参数**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protected** – [out] Pointer to boolean, set to the value of the write protect flag.

**返回**
- ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protected)
```
Set write protection for the SPI flash chip.
Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

### Parameters
- **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().
- **write_protect** - Boolean value for the write protect flag

### Return
- ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

### Parameters
- **chip** - Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **out_regions** - [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** - [out] Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

### Return
- ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

### Parameters
- **chip** - Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **region** - Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(‘…’).
- **out_protected** - [out] Pointer to a flag which is set based on the protected status for this region.

### Return
- ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.
Chapter 2. API

**备注：** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**备注：** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

### 参数

- **chip** – Pointer to identify flash chip. Must have been successfully initialsed via esp_flash_init()
- **region** – Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(
- **protect** – Write protection flag to set.

### 返回

ESP_OK on success, or a flash error code if operation failed.

**esp_err_t esp_flash_read (esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)**

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**备注：** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

### 参数

- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialsed via esp_flash_init()
- **buffer** – Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** – Address on flash to read from. Must be less than chip->size field.
- **length** – Length (in bytes) of data to read.

### 返回

- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

**esp_err_t esp_flash_write (esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)**

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

### 参数

- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialsed via esp_flash_init()
- **address** – Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** – Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** – Length (in bytes) of data to write.

### 返回

- ESP_OK on success,
Chapter 2. API

- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

```c
esp_err_t esp_flash_write_encrypted (esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**备注:** Both address & length must be 16 byte aligned, as this is the encryption block size

### 参数
- **chip** – Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** – Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** – Pointer to a buffer with the data to write.
- **length** – Length (in bytes) of data to write. 16 byte aligned.

### 返回
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

```c
esp_err_t esp_flash_read_encrypted (esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

### 参数
- **chip** – Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** – Address on flash to read from.
- **out_buffer** – Pointer to a buffer for the data to read to.
- **length** – Length (in bytes) of data to read.

### 返回
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

```c
static inline bool esp_flash_is_quad_mode (const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

### 参数
- **chip** – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

### 返回
true if flash works in quad mode, otherwise false

**Structures**

```c
struct esp_flash_region_t
```

Structure for describing a region of flash.

**Public Members**

```c
uint32_t offset
```

Start address of this region.

```c
uint32_t size
```

Size of the region.
struct `esp_flash_os_functions_t`  

OS-level integration hooks for accessing flash chips inside a running OS.  

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.  

For advanced developers, you may replace some of them with your implementations at your own risk.  

**Public Members**  

```c
esp_err_t (*start)(void *arg)
```

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).  

```c
esp_err_t (*end)(void *arg)
```

Called after completing any flash operation.  

```c
esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)
```

Called before any erase/write operations to check whether the region is limited by the OS.  

```c
esp_err_t (*delay_us)(void *arg, uint32_t us)
```

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.  

```c
void *(get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)
```

Called for get temp buffer when buffer from application cannot be directly read into/write from.  

```c
void *(release_temp_buffer)(void *arg, void *temp_buf)
```

Called for release temp buffer.  

```c
esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)
```

Yield to other tasks. Called during erase operations.  

**Return** ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.  

```c
esp_err_t (*yield)(void *arg, uint32_t *out_status)
```

Yield to other tasks. Called during erase operations.  

```c
int64_t (*get_system_time)(void *arg)
```

Called for get system time.  

```c
void *(set_flash_op_status)(uint32_t op_status)
```

Call to set flash operation status  

**struct `esp_flash_t`**  

Structure to describe a SPI flash chip connected to the system.  

Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.  

For advanced developers, you may replace some of them with your implementations at your own risk.
Public Members

spi_flash_host_inst_t* host

Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t* chip_drv

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t* os_func

Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void** os_func_data

Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode

Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call esp_flash_get_physical_size.

uint32_t chip_id

Detected chip id.

uint32_t busy

This flag is used to verify chip’s status.

uint32_t hpm_dummy_ena

This flag is used to verify whether flash works under HPM status.

uint32_t reserved_flags

reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions

typedef struct spi_flash_chip_t spi_flash_chip_t

typedef struct esp_flash_t esp_flash_t
Chapter 2. API

Header File

- components/spi_flash/include/spi_flash_mmap.h

Functions

```c
esp_err_t spi_flash_mmap (size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.

**参数**
- `src_addr` - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- `size` - Size of region to be mapped. This size will be rounded up to a 64kB boundary
- `memory` - Address space where the region should be mapped (data or instruction)
- `out_ptr` [out] - Output, pointer to the mapped memory region
- `out_handle` [out] - Output, handle which should be used for spi_flash_munmap call

**返回**
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated

```c
esp_err_t spi_flash_mmap_pages (const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)
```

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

**参数**
- `pages` - An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- `page_count` - Number of entries in the pages array
- `memory` - Address space where the region should be mapped (instruction or data)
- `out_ptr` [out] - Output, pointer to the mapped memory region
- `out_handle` [out] - Output, handle which should be used for spi_flash_munmap call

**返回**
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

```c
void spi_flash_munmap (spi_flash_mmap_handle_t handle)
```

Release region previously obtained using spi_flash_mmap.

**备注:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

```c
void spi_flash_mmap_dump (void)
```

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.
uint32_t spi_flash_mmap_get_free_pages(spi_flash_mmap_memory_t memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

参数 memory - memory type of MMU table free page
返回 number of free pages which can be mmaped

size_t spi_flash_cache2phys(const void* cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

参数 cached - Pointer to flashed cached memory.
返回

• SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
• Otherwise, returns physical offset in flash

const void *spi_flash_phys2cache(size_t phys_offs, spi_flash_mmap_memory_t memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

备注： Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

备注： This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

参数

• phys_offs – Physical offset in flash memory to look up.
• memory - Address space type to look up a flash cache address mapping for (instruction or data)

返回

• NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
• Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size
SPI_FLASH_MMU_PAGE_SIZE
Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions
typedef uint32_t spi_flash_mmap_handle_t
Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations
enum spi_flash_mmap_memory_t
Enumeration which specifies memory space requested in an mmap call.
Values:
enumerator SPI_FLASH_MMAP_DATA
map to data memory (Vaddr0), allows byte-aligned access, 4 MB total
enumerator SPI_FLASH_MMAP_INST
map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

Header File
- components/hal/include/hal/spi_flash_types.h

Structures
struct spi_flash_trans_t
Definition of a common transaction. Also holds the return value.

Public Members

uint8_t reserved
Reserved, must be 0.

uint8_t mosi_len
Output data length, in bytes.

uint8_t miso_len
Input data length, in bytes.

uint8_t address_bitlen
Length of address in bits, set to 0 if command does not need an address.

uint32_t address
Address to perform operation on.
Chapter 2. API 参考

const uint8_t *mosi_data
  Output data to salve.

uint8_t *miso_data
  [out] Input data from slave, little endian

uint32_t flags
  Flags for this transaction. Set to 0 for now.

uint16_t command
  Command to send.

uint8_t dummy_bitlen
  Basic dummy bits to use.

uint32_t io_mode
  Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
  Configuration structure for the flash chip suspend feature.
  
  **Public Members**

  uint32_t sus_mask
    SUS/SUS1/SUS2 bit in flash register.

  uint32_t cmd_rdsr
    Read flash status register(2) command.

  uint32_t sus_cmd
    Flash suspend command.

  uint32_t res_cmd
    Flash resume command.

  uint32_t reserved
    Reserved, set to 0.

struct spi_flash_encryption_t
  Structure for flash encryption operations.
  
  **Public Members**

  void (*flash_encryption_enable)(void)
    Enable the flash encryption.

  void (*flash_encryption_disable)(void)
    Disable the flash encryption.
Chapter 2. API

void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t *buffer, uint32_t size)
Prepare flash encryption before operation.

备注: address and buffer must be 8-word aligned.

Param address  The destination address in flash for the write operation.
Param buffer   Data for programming
Param size     Size to program.

void (*flash_encryption_done)(void)
flash data encryption operation is done.

void (*flash_encryption_destroy)(void)
Destroy encrypted result

bool (*flash_encryption_check)(uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer

Param address  the address of written flash partition.
Param length   Buffer size.

struct spi_flash_host_inst_t
SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
Pointer to the implementation function table.

struct spi_flash_host_driver_s
Host driver configuration and context structure.

Public Members

esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.
void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
   Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
   Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
   Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
   Disable write protection.

void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
   Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
   Check whether the SPI host supports direct write.
   When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
   Slicer for write data. The program_page should be called iteratively with the return value of this function.

   Param address  Beginning flash address to write
   Param len     Length request to write
   Param align_addr Output of the aligned address to write to
   Param page_size Physical page size of the flash chip
   Return Length that can be actually written in one program_page call

esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
   Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
   Check whether the SPI host supports direct read.
   When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.

int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
   Slicer for read data. The read should be called iteratively with the return value of this function.

   Param address  Beginning flash address to read
   Param len     Length request to read
   Param align_addr Output of the aligned address to read
   Param page_size Physical page size of the flash chip
   Return Length that can be actually read in one read call

uint32_t (*host_status)(spi_flash_host_inst_t *host)
   Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

```c
void (*poll_cmd_done)(spi_flash_host_inst_t *host)
```

Internal use, poll the HW until the last operation is done.

```c
esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
```

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

```c
void (*check_suspend)(spi_flash_host_inst_t *host)
```

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

```c
void (*resume)(spi_flash_host_inst_t *host)
```

Resume flash from suspend manually

```c
void (*suspend)(spi_flash_host_inst_t *host)
```

Set flash in suspend status manually

```c
esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

Macros

```c
#define SPI_FLASH_TRANS_FLAG_CMD16
```

Send command of 16 bits.

```c
#define SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
```

Not applying the basic io mode configuration for this transaction.

```c
#define SPI_FLASH_TRANS_FLAG_BYTE_SWAP
```

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

```c
#define SPI_FLASH_CONFIG_CONF_BITS
```

OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

```c
#define SPI_FLASH_OPI_FLAG
```

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

```c
#define SPI_FLASH_READ_MODE_MIN
```

Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum esp_flash_speed_s esp_flash_speed_t

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.
typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations

enum esp_flash_speed_s
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator ESP_FLASH_5MHZ
The flash runs under 5MHz.

enumerator ESP_FLASH_10MHZ
The flash runs under 10MHz.

enumerator ESP_FLASH_20MHZ
The flash runs under 20MHz.

enumerator ESP_FLASH_26MHZ
The flash runs under 26MHz.

enumerator ESP_FLASH_40MHZ
The flash runs under 40MHz.

enumerator ESP FLASH _80MHZ
The flash runs under 80MHz.

enumerator ESP FLASH _120MHZ
The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator ESP FLASH _SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t
Mode used for reading from SPI flash.

Values:

enumerator SPI_FLASH_SLOWRD
Data read using single I/O, some limits on speed.

enumerator SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

enumerator SPI_FLASH_DOUT
Data read using dual I/O.
enumerator **SPI_FLASH_DIO**
Both address & data transferred using dual I/O.

enumerator **SPI_FLASH_QOUT**
Data read using quad I/O.

enumerator **SPI_FLASH_QIO**
Both address & data transferred using quad I/O.

enumerator **SPI_FLASH_OPI_STR**
Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI_FLASH_OPI_DTR**
Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI_FLASH_READ_MODE_MAX**
The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

**Header File**

- components/hal/include/hal/esp_flash_err.h

**Macros**

**ESP_ERR_FLASH_NOTInicialised**
`esp_flash_chip_t` structure not correctly initialised by `esp_flash_init()`.

**ESP_ERR_FLASH_UNSUPPORTED_HOST**
Requested operation isn’t supported via this host SPI bus (chip->spi field).

**ESP_ERR_FLASH_UNSUPPORTED_CHIP**
Requested operation isn’t supported by this model of SPI flash chip.

**ESP_ERR_FLASH_PROTECTED**
Write operation failed due to chip’s write protection being enabled.

**Enumerations**

enum [anonymous]

Values:

enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**
The chip doesn’t have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**
Chip did not respond to the command, or timed out.
Chapter 2. API 参考

Header File

- components/esp_partition/include/esp_partition.h

Functions

- esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

  Find partition based on one or more parameters.

  参数
  - type - Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
  - subtype - Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
  - label - (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

  返回 iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

- const esp_partition_t *esp_partition_find_first(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

  Find first partition based on one or more parameters.

  参数
  - type - Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
  - subtype - Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
  - label - (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

  返回 pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

- const esp_partition_t *esp_partition_get(esp_partition_iterator_t iterator)

  Get esp_partition_t structure for given partition.

  参数 iterator - Iterator obtained using esp_partition_find. Must be non-NULL.

  返回 pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

- esp_partition_iterator_t esp_partition_next(esp_partition_iterator_t iterator)

  Move partition iterator to the next partition found.

  Any copies of the iterator will be invalid after this call.

  参数 iterator - Iterator obtained using esp_partition_find. Must be non-NULL.

  返回 NULL if no partition was found, valid esp_partition_iterator_t otherwise.

- void esp_partition_iterator_release(esp_partition_iterator_t iterator)

  Release partition iterator.

  参数 iterator - Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

- const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)

  Verify partition data.

  Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)
This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

参数 partition – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

返回
  • If partition not found, returns NULL.
  • If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

`esp_err_t esp_partition_read` (const `esp_partition_t *partition`, size_t src_offset, void *dst, size_t size)
Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

参数
  • partition – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
  • dst – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
  • src_offset – Address of the data to be read, relative to the beginning of the partition.
  • size – Size of data to be read, in bytes.

返回 ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_write` (const `esp_partition_t *partition`, size_t dst_offset, const void *src, size_t size)
Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

备注: Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

参数
  • partition – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
  • dst_offset – Address where the data should be written, relative to the beginning of the partition.
  • src – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
  • size – Size of data to be written, in bytes.

返回 ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_read_raw` (const `esp_partition_t *partition`, size_t src_offset, void *dst, size_t size)
Read data from the partition without any transformation/decryption.
This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst` – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `src_offset` – Address of the data to be read, relative to the beginning of the partition.
- `size` – Size of data to be read, in bytes.

**Return**
- ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset` – Address where the data should be written, relative to the beginning of the partition.
- `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size` – Size of data to be written, in bytes.

**Return**
- ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.

Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `offset` – Offset from the beginning of partition where erase operation should start. Must be aligned to `partition->erase_size`.
- `size` – Size of the range which should be erased, in bytes. Must be divisible by `partition->erase_size`.

**Return**
- ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or `dst` are NULL; ESP_ERR_INVALID_SIZE, if `erase` would go out of bounds of the partition; or one of error codes from lower-level flash driver.
**esp_err_t esp_partition_mmap**

(const esp_partition_t *partition, size_t offset, size_t size,
 esp_partition_mmap_memory_t memory, const void **out_ptr,
 esp_partition_mmap_handle_t *out_handle)

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to esp_partition_munmap function.

**参数**
- `partition` – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- `offset` – Offset from the beginning of partition where mapping should start.
- `size` – Size of the area to be mapped.
- `memory` – Memory space where the region should be mapped
- `out_ptr` – Output, pointer to the mapped memory region
- `out_handle` – Output, handle which should be used for esp_partition_munmap call

**返回** ESP_OK, if successful

void **esp_partition_munmap** 

(esp_partition_mmap_handle_t handle)

Release region previously obtained using esp_partition_mmap.

---

**备注：** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

**参数** handle – Handle obtained from spi_flash_mmap

**esp_err_t esp_partition_get_sha256**

(const esp_partition_t *partition, uint8_t *sha_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**参数**
- `partition` – [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- `sha_256` – [out] Returned SHA-256 digest for a given partition.

**返回**
- ESP_OK: In case of successful operation.
- ESP_ERR_IMAGE_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

**bool esp_partition_check_identity**

(const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

**参数**
- `partition_1` – [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- `partition_2` – [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).
Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the `esp_flash_t` structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

### Parameters

- **flash_chip** - Pointer to the structure identifying the flash chip
- **offset** - Address in bytes, where the partition starts
- **size** - Size of the partition in bytes
- **label** - Partition name
- **type** - One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications cannot be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** - One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** - [out] Output, if non-NULL, receives the pointer to the resulting `esp_partition_t` structure

### Return

- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Deregister the partition previously registered using the `esp_partition_register_external` function.

### Structures

**struct esp_partition_t**

Partition information structure

This is not the format in flash, that format is esp_partition_info_t.

However, this is the format used by this API.

### Public Members

**esp_flash_t *flash_chip**

SPI flash chip on which the partition resides
**Chapter 2. API**

*esp_partition_type_t* `type`
partition type (app/data)

*esp_partition_subtype_t* `subtype`
partition subtype

`uint32_t` `address`
starting address of the partition in flash

`uint32_t` `size`
size of the partition, in bytes

`uint32_t` `erase_size`
size the erase operation should be aligned to

`char` `label[17]`
partition label, zero-terminated ASCII string

`bool` `encrypted`
flag is set to true if partition is encrypted

**Macros**

`ESP_PARTITION_SUBTYPE_OTA(i)`
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

**Type Definitions**

typedef `uint32_t` `esp_partition_mmap_handle_t`
Opaque handle for memory region obtained from `esp_partition_mmap`.

typedef `struct esp_partition_iterator_opaque_*` `esp_partition_iterator_t`
Opaque partition iterator type.

**Enumerations**

typedef enum `esp_partition_mmap_memory_t`
Enumeration which specifies memory space requested in an mmap call.

*Values:*

- enumerator `ESP_PARTITION_MMAP_DATA`
  map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

- enumerator `ESP_PARTITION_MMAP_INST`
  map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

typedef enum `esp_partition_type_t`
Partition type.
Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

Values:

enumerator `ESP_PARTITION_TYPE_APP`
Application partition type.

data type `ESP_PARTITION_TYPE_DATA`
Data partition type.

data type `ESP_PARTITION_TYPE_ANY`
Used to search for partitions with any type.

enum `esp_partition_subtype_t`
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

Values:

enumerator `ESP_PARTITION_SUBTYPE_APP_FACTORY`
Factory application partition.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_MIN`
Base for OTA partition subtypes.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_0`
OTA partition 0.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_1`
OTA partition 1.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_2`
OTA partition 2.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_3`
OTA partition 3.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_4`
OTA partition 4.

data type `ESP_PARTITION_SUBTYPE_APP_OTA_5`
OTA partition 5.
enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**
OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**
OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**
OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**
OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**
OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**
OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**
OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**
OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**
OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**
OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**
Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**
Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**
OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**
PHY init data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**
NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**
COREDUMP partition.
enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**
Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**
Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**
Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EFUSE**
ESP_FUSE partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**
FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**
SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ANY**
Used to search for partitions with any subtype.

**Flash 加密 API 参考**

**Header File**

- components/bootloader_support/include/esp_flash_encrypt.h

**Functions**

bool **esp_flash_encryption_enabled** (void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

- 返回 true if flash encryption is enabled.

```c
esp_err_t esp_flash_encrypt_check_and_update (void)
```

bool **esp_flash_encrypt_state** (void)
Returns the Flash Encryption state and prints it.

- 返回 True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp_flash_encrypt_initialized_once** (void)
Checks if the first initialization was done.
If the first initialization was done then FLASH_CRYPT_CNT != 0

- 返回 true - the first initialization was done false - the first initialization was NOT done

```c
esp_err_t esp_flash_encrypt_init (void)
The first initialization of Flash Encryption key and related eFuses.
```

- 返回 ESP_OK if all operations succeeded

```c
esp_err_t esp_flash_encrypt_contents (void)
Encrypts flash content.
```

- 返回 ESP_OK if all operations succeeded
**esp_err_t** **esp_flash_encrypt_enable** (void)

Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

返回 ESP_OK if all operations succeeded

**bool** **esp_flash_encrypt_is_write_protected** (bool print_error)

Returns True if the write protection of FLASH_CRYPT_CNT is set.

参数 **print_error** - Print error if it is write protected

返回 true - if FLASH_CRYPT_CNT is write protected

**esp_err_t** **esp_flash_encrypt_region** (uint32_t src_addr, size_t data_length)

Encrypt-in-place a block of flash sectors.

备注: This function resets RTC_WDT between operations with sectors.

参数

- **src_addr** - Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** - Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

返回 ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

**void** **esp_flash_write_protect_crypt_cnt** (void)

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

备注: On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

**esp_flash_enc_mode_t** **esp_get_flash_encryption_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

返回

**void** **esp_flash_encryption_init_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

备注: This function is called automatically during app startup, it doesn’t need to be called from the app.
```c
esp_err_t esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.

- ESP_OK - Successfully

void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from “Development” to “Release”.
If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:
- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

Enumerations
enum esp_flash_enc_mode_t
Values:
- enumerator ESP_FLASH_ENC_MODE_DISABLED
- enumerator ESP_FLASH_ENC_MODE_DEVELOPMENT
- enumerator ESP_FLASH_ENC_MODE_RELEASE

2.9.8 SPIFFS 文件系统

概述
SPIFFS 是一个用于 SPI NOR flash 设备的嵌入式文件系统，支持磨损均衡、文件系统一致性检查等功能。

说明
- 目前，SPIFFS 尚不支持目录，但可以生成扁平结构。如果 SPIFFS 挂载在 /spiffs 下，在 /spiffs/tmp/myfile.txt 路径下创建一个文件则会在 SPIFFS 中生成一个名为 /tmp/myfile.txt 的文件，而不是在 /spiffs/tmp下生成名为 myfile.txt 的文件
- SPIFFS 并非实时找，每次写操作耗时不等
- 目前，SPIFFS 尚不支持检测或处理已损坏的块。
- SPIFFS 只能稳定地使用约 75% 的指定分区容量。
- 当文件系统空间不足时，垃圾收集器会尝试多次扫描文件系统来寻找可用空间。根据所需空间的不同，写操作会被调用多次，每次函数调用将花费几秒。同一操作可能会花费不同长的时间缘于 SPIFFS 的设计，且已在官方的 SPIFFS github 仓库或是 <https://github.com/espressif/esp-idf/issues/1737> 中被多次报告。这个问题可以通过 SPIFFS 配置部分缓解。
- 被删除文件通常不会被完全清除，会在文件系统中遗留下无法使用的部分。
- 如果 ESP32 在文件系统操作期间断电，可能会导致 SPIFFS 损坏。但通过 esp_spiffs_check 函数恢复文件系统。详情请参阅官方 SPIFFS FAQ <https://github.com/pellepl/spiffs/wiki/FAQ>。
## 工具

**spiffsgen.py**

```python
python spiffsgen.py <image_size> <base_dir> <output_file>
```

参数（必选）说明如下：
- **image_size**: 分区大小，用于烧录生成的 SPIFFS 镜像；
- **base_dir**: 创建 SPIFFS 镜像的目录；
- **output_file**: SPIFFS 镜像输出文件。

其他参数（可选）也参与控制镜像的生成，用户可以运行以下帮助命令，查看这些参数的具体信息：

```python
python spiffsgen.py --help
```

上述可选参数对应 SPIFFS 构建配置选项。若想顺利生成可用的镜像，请确保使用的参数或配置与构建 SPIFFS 时所用的参数或配置相同。运行帮助命令将显示参数所对应的 SPIFFS 构建配置。如未指定参数，将使用帮助信息中的默认值。

镜像生成后，用户可以使用 esptool.py 或 parttool.py 烧录镜像。

用户可以在命令行或脚本中手动单独调用 spiffsgen.py，也可以直接从构建系统调用 spiffs_create_partition_image 来使用 spiffsgen.py:

```python
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_.—dep dep dep...])
```

在构建系统中使用 spiffsgen.py 更为方便，构建配置会自动传递给 spiffsgen.py 工具，确保生成的镜像可用于构建。比如，单独调用 spiffsgen.py 时需要用到 **image_size** 参数，但在构建系统中调用 spiffs_create_partition_image 时，仅需要 **partition** 参数，镜像大小将直接从工程分区表中获取。

使用 spiffs_create_partition_image，必须从组件 CMakeLists.txt 文件调用。

用户也可以指定 FLASH_IN_PROJECT，然后使用 idf.py flash 将镜像与应用程序二进制文件、分区表等一起自动烧录至设备，例如：

```python
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

指定 FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT 也可以生成镜像，但须使用 esptool.py、parttool.py 或自定义构建系统目标手动烧录。

有时基本目录中的内容是在构建时生成的，用户可以使用 DEPENDS/SPIFFS_IMAGE_DEPENDS 指定目标，因此可以在生成镜像之前执行此目标：

```python
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

请参考 storage/spiffsgen，查看示例。

**mkspiffs** 用户也可以使用 mkspiffs 工具创建 SPIFFS 分区镜像。与 spiffsgen.py 相似，mkspiffs 也可以用于从指定文件夹中生成镜像，然后使用 esptool.py 烧录镜像。

该工具需要获取以下参数：
- **Block Size**: 4096（SPI flash 标准）
- **Page Size**: 256（SPI flash 标准）
- **Image Size**: 分区大小（以字节为单位，可从分区表中获取）
- **Partition Offset**: 分区起始地址（可从分区表中获取）

运行以下命令，将文件夹打包成 1 MB 大小的镜像:

```bash
mkspiffs -i image_size -o base_dir -o output_file
```
选择合适的 SPIFFS 工具  上面介绍的两款 SPIFFS 工具功能相似，需根据实际情况，选择合适的一款。 以下情况优先选用 spiffsgen.py 工具：

1. 仅需在构建时简单生成 SPIFFS 镜像，请选择使用 spiffsgen.py，因为 spiffsgen.py 可以直接在构建系统中使用函数或命令生成 SPIFFS 镜像。
2. 主机没有可用的 C/C++ 编译器时，可以选择使用 spiffsgen.py 工具，因为 spiffsgen.py 不需要编译。

以下情况优先选用 mkspiffs 工具：

1. 如果用户除了需要生成镜像外，还需要拆包 SPIFFS 镜像，请选择使用 mkspiffs 工具，因为 spiffsgen.py 目前尚不支持此功能。
2. 如果用户当前环境中 Python 解释器不可用，但主机编译器可用，或者有预编译的 mkspiffs 二进制文件，此时请选择使用 mkspiffs 工具。但是，mkspiffs 没有集成到构建系统，用户必须自己完成以下工作：在构建期间编译 mkspiffs（如果未使用预编译的二进制文件），为输出文件创建构建规则或目标，将适当的参数传递给工具等。

另请参阅

- 分区表

应用示例

storage/spiffs 目录下提供了 SPIFFS 应用示例。该示例初始化并挂载了一个 SPIFFS 分区，然后使用 POSIX 和 C 库写入和读取数据。请参考 example 目录下的 README.md 文件，获取详细信息。

高级 API 参考

Header File

- components/spiffs/include/esp_spiffs.h

Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```

Register and mount SPIFFS to VFS with given path prefix.

- 参数 conf – Pointer to esp_vfs_spiffs_conf_t configuration structure
- 返回 ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

```c
esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)
```

Unregister and unmount SPIFFS from VFS

- 参数 partition_label – Same label as passed to esp_vfs_spiffs_register.
- 返回 ESP_OK if successful

运行以下命令，将镜像烧录到 ESP32（偏移量：0x110000）：

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000_→spiffs.bin
```
Chapter 2. API

bool esp_spiffs_mounted(const char *partition_label)
Check if SPIFFS is mounted
参数 partition_label – Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.
返回
• true if mounted
• false if not mounted

esp_err_t esp_spiffs_format (const char *partition_label)
Format the SPIFFS partition
参数 partition_label – Same label as passed to esp_vfs_spiffs_register.
返回
• ESP_OK if successful
• ESP_FAIL on error

esp_err_t esp_spiffs_info (const char *partition_label, size_t *total_bytes, size_t *used_bytes)
Get information for SPIFFS
参数
• partition_label – Same label as passed to esp_vfs_spiffs_register
• total_bytes – [out] Size of the file system
• used_bytes – [out] Current used bytes in the file system
返回
• ESP_OK if success
• ESP_ERR_INVALID_STATE if not mounted

esp_err_t esp_spiffs_check (const char *partition_label)
Check integrity of SPIFFS
参数 partition_label – Same label as passed to esp_vfs_spiffs_register
返回
• ESP_OK if successful
• ESP_ERR_INVALID_STATE if not mounted
• ESP_FAIL on error

esp_err_t esp_spiffs_gc (const char *partition_label, size_t size_to_gc)
Perform garbage collection in SPIFFS partition.
Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.
参数
• partition_label – Label of the partition to be garbage-collected. The partition must be already mounted.
• size_to_gc – The number of bytes that the GC process should attempt to make available.
返回
• ESP_OK on success
• ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
• ESP_ERR_INVALID_STATE if the partition is not mounted
• ESP_FAIL on all other errors
### Structures

**struct esp_vfs_spiffs_conf_t**

Configuration structure for esp_vfs_spiffs_register.

#### Public Members

- **const char* base_path**
  
  File path prefix associated with the filesystem.

- **const char* partition_label**
  
  Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

- **size_t max_files**
  
  Maximum files that could be open at the same time.

- **bool format_if_mount_failed**
  
  If true, it will format the file system if it fails to mount.

### 2.9.9 虚拟文件系统组件

#### 概述

虚拟文件系统 (VFS) 组件为驱动程序提供一个统一接口，可以操作类文件对象。这类驱动程序可以是 FAT、SPIFFS 等真实文件系统，也可以是提供文件类接口的设备驱动程序。

VFS 组件支持 C 库函数（如 fopen 和 fprintf 等）与文件系统 (FS) 驱动程序协同工作。在高层级，每个 FS 驱动程序均与某些路径分属相关联。当一个 C 库函数需要打开文件时，VFS 组件将搜索与该文件所在文件路径相关联的 FS 驱动程序，并将调用传递给该驱动程序。针对该文件的读取、写入等其他操作的调用也将传递给该驱动程序。

例如，您可以使用 /fat 前缀注册 FAT 文件系统驱动，之后即可调用 fopen("/fat/file.txt", "w")。之后，VFS 将调用 FAT 驱动的 open 函数，并将参数 /file.txt 和合适的打开模式传递给 open 函数；后续对返回的 FILE* 数据流调用 C 库函数也同样会传递给 FAT 驱动。

#### 注册 FS 驱动程序

如需注册 FS 驱动程序，应用程序首先要定义一个 esp_vfs_t 结构体实例，并用指向 FS API 的函数指针填充它。

```c
esp_vfs_t myfs = {   
    .flags = ESP_VFS_FLAG_DEFAULT, 
    .write = &myfs_write, 
    .open = &myfs_open, 
    .fstat = &myfs_fstat, 
    .close = &myfs_close, 
    .read = &myfs_read, 
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```
在上述代码中需要用到 read, write 或 read_p, write_p, 具体使用哪组函数由 FS 驱动程序 API 的声明方式决定。

示例 1: 声明 API 函数时不带额外的上下文指针参数, 即 FS 驱动程序为单例模式, 此时使用 write

```c
ssize_t myfs_write(int fd, const void *data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

示例 2: 声明 API 函数时需要一个额外的上下文指针作为参数, 即可支持多个 FS 驱动程序实例, 此时使用 write_p

```c
ssize_t myfs_write(myfs_t *fs, int fd, const void *data, size_t size);
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));
// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

同步输入/输出多路复用 VFS 组件支持通过 select() 进行同步输入/输出多路复用，其实现方式如下：
1. 调用 select(), 使用时提供的文件描述符可以属于不同的 VFS 驱动。
2. 文件描述符被分为几组，每组属于一个 VFS 驱动。
3. 非套接字 VFS 驱动的文件描述符由 start_select() 移交给指定的 VFS 驱动，后文会对此进行详述。该函数代表指定驱动 select() 的实现。这是一个非阻塞的调用，意味着在设置好检查与指定文件描述符相关事件的环境后，该函数应该立即返回。
4. 套接字 VFS 驱动的文件描述符由 socket_select() 移交给套接字 VFS 驱动，后文会对此进行详述。这是一个阻塞调用，意味着只有当有一个与套接字文件描述符相关的事件或非套接字驱动发出信号让 socket_select() 退出时，它才会返回。
5. 从各个 VFS 驱动程序收集结果，并通过对事件检查环境取消初始化来终止所有驱动程序。
6. select() 调用结束并返回适当的结果。

非套接字 VFS 驱动 如果要使用非套接字 VFS 驱动的文件描述符调用 select(), 那么需要用函数 start_select() 和 end_select() 注册该驱动，具体如下：

```c
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

调用 start_select() 函数可以设置环境，检测指定 VFS 驱动的文件描述符读取/写入/错误条件。
调用 end_select() 函数可以终止/取消初始化/释放由 start_select() 设置的环境。
备注：在少数情况下，在调用 end_select() 之前可能并没有调用过 start_select()。因此
end_select() 的实现必须在该情况下返回错误而不能崩溃。

如需获取更多信息，请参考 vfs/vfs_uart.c 中 UART 外设的 VFS 驱动。尤其是函数
esp_vfs_dev_uart_register()，uart_start_select() 和 uart_end_select()。

请参考以下示例，查看如何使用 VFS 文件描述符调用 select()。

- peripherals/uart/uart_select
- system/select

套接字 VFS 驱动
套接字 VFS 驱动会使用自实现的 socket_select() 函数，在读取/写入/错误条件时，非套接字 VFS 驱动会通知该函数。

可通过对定义以下函数注册套接字 VFS 驱动：

```c
// In definition of esp_vfs_t:
.socket_select = &lwip_select,
.get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
.stop_socket_select = &lwip_stop_socket_select,
.stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

函数 socket_select() 是套接字驱动对 select() 的内部实现。该函数只对套接字 VFS 驱动的文件
描述符起作用。

get_socket_select_semaphore() 返回信号对象 (semaphore)，用于非套接字驱动程序中，以终止
socket_select() 的等待。

stop_socket_select() 通过传递 get_socket_select_semaphore() 函数返回的对象来终止
socket_select() 函数的等待。

stop_socket_select_isr() 与 stop_socket_select() 的作用相似，但是前者可在 ISR 中使用。

请参考 lwip/port/esp32/vfs_lwip.c 以了解使用 LWIP 的套接字驱动参考实现。

备注：如果 select() 用于套接字文件描述符，您可以禁用 CONFIG_VFS_SUPPORT_SELECT 选项来减少
代码量，提高性能。不要在 select() 调用过程中更改套接字驱动，否则会出现一些未定义行为。

路径

已注册的 FS 驱动程序均有一个路径前缀与之关联，此路径前缀即为分区的挂载点。

如果挂载点中嵌套了其他挂载点，则在打开文件时使用具有最长匹配路径前缀的挂载点。例如，假设以下文件系统已在 VFS 中注册：

- 在 /data 下注册 FS 驱动程序 1
- 在 /data/static 下注册 FS 驱动程序 2

那么：

- 打开 /data/log.txt 会调用驱动程序 FS 1；
- 打开 /data/static/index.html 需调用 FS 驱动程序 2；
- 即使 FS 驱动程序 2 中没有 /index.html，也不会在 FS 驱动程序 1 中查找 /static/index.
  html。

挂载点名称必须以路径分隔符 (/) 开头，且分隔符后至少包含一个字符。但在以下情况中，VFS 同样支
持空的挂载点名称：1. 应用程序需要提供一个”下使用的文件系统；2. 应用程序需要同时覆
盖 VFS 功能。如果没有与路径匹配的前缀，就会使用到这种文件系统。
Chapter 2. API 参考

VFS 不会对路径中的点(\.)进行特殊处理，也不会将 .. 视为对父目录的引用。在上述示例中，使用
/data/static/./log.txt 路径不会调用 FS 驱动程序 1 打开 /log.txt。特定的 FS 驱动程序 (如
FATFS) 可以以不同的方式处理文件名中的点。

执行打开文件操作时，FS 驱动程序仅得到文件的相对路径 (挂载点前缀已经被去除):

1. 以 /data 为路径前缀注册 myfs 驱动;
2. 应用程序使用 fopen(“/data/config.json”, ...)；
3. VFS 调用 myfs_open(“/config.json”, ...);
4. myfs 驱动打开 /config.json 文件。

VFS 对文件路径长度没有限制，但文件系统路径前缀受 ESP_VFS_PATH_MAX 限制，即路径前缀上限为
ESP_VFS_PATH_MAX。各个文件系统驱动则可能会对文件的文件名长度设置一些限制。

文件描述符

文件描述符是一组很小的正整数，从 0 到 FD_SETSIZE - 1，FD_SETSIZE 在 newlib sys/types.h
中定义。最大文件描述符由 CONFIG_LWIP_MAX_SOCKETS 定义。且为套接字保留。VFS 中包含一个名为
s_fd_table 的查找表，用于将全局文件描述符映射至 s_vfs 数组中注册的 VFS 驱动索引。

标准 IO 流 (stdin, stdout, stderr)

如果 menuconfig 中 UART for console output 选项没有设置为 None, 则 stdin, stdout 和 stderr
将默认从 UART 读取或写入。UART0 或 UART1 可用作标准 IO。默认情况下，UART0 使用 115200 波特率，
TX 管脚为 GPIO1, RX 管脚为 GPIO3。您可以在 menuconfig 中更改上述参数。

对 stdout 或 stderr 执行写入操作将会向 UART 发送 FIFO 发送字符，对 stdin 执行读取操作则会从
UART 接收 FIFO 中取出字符。

默认情况下，VFS 使用简单的函数对 UART 进行读写操作。在所有数据放进 UART FIFO 之前，写操作
将处于 busy-wait 状态，读操作处于非阻塞状态。只返回 FIFO 中已有数据，由于读操作为非阻塞，高层级
C 库函数调用 (如 fscanf(“%d\n", &var);) 可能获取不到所需结果。

如果应用程序使用 UART 驱动，则可以调用 esp_vfs_dev_uart_use_driver 函数来指导 VFS 使用
驱动中断、读写阻塞功能等。您也可以调用 esp_vfs_dev_uart_use_nonblocking 来恢复非阻塞
函数。

VFS 还为输入和输出提供换行符转换功能 (可选)。多数应用程序在程序内部发送或接收
以 LF (’\n’) 结尾的行，但不同的终端程序可能需要不同的换行符，比如 CR 或 CRLF，
应用程序可以通过 menuconfig 或者调用 esp_vfs_dev_uart_port_set_rx_line_endings 和
esp_vfs_dev_uart_port_set_tx_line_endings 为输入输出配置换行符。

标准流和 FreeRTOS 任务 stdin, stdout 和 stderr 的 FILE 对象在所有 FreeRTOS 任务之间共享，
指向这些对象的指针分别存储在每个任务的 struct _reent 中。

预处理器把如下代码解释为 fprintf(__getreent()->_stderr, “42\n”);

```c
fprintf(stderr, "42\n");
```

其中 __getreent () 函数将为每个任务返回一个指向 newlib libc 中 struct _reent 的指针。每个
任务的 TCB 均拥有一个 struct _reent 结构体。任务初始化后，struct _reent 结构体中的
_stdtin, _stdout 和 _stderr 将会被赋予 _GLOBAL_REENT 中 Stdin, Stdout 和 Stderr 的值，
_GLOBAL_REENT 即为 FreeRTOS 启动之后所用结构体。

这样设计带来的结果是:

- 允许设置给定任务的 stdin, stdout 和 stderr，而不影响其他任务，如通过 stdin =
  fopen(”/dev/uart/1", ”r”);
- 但使用 fclose 关闭默认 stdin, stdout 或 stderr 将同时关闭相应的 FILE 流对象，因此会影
  响其他任务;

---

Espressif Systems 1733 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
Event fds

eventfd() 是一个很强大的工具，可以循环通知基于 select() 的自定义事件。在 ESP-IDF 中，
eventfd() 的实现和 man(2) eventfd 中的描述相同，主要区别如下：

- 在调用 eventfd() 之前必须先调用 esp_vfs_eventfd_register();
- 标志中没有 EFD_CLOEXEC, EFD_NONBLOCK 和 EFD_SEMAPHORE 选项；
- EFD_SUPPORT_ISR 选项已经被添加到标志中。在中断处理程序中读取和写入 eventfd 需要这个标志。

注意，用 EFD_SUPPORT_ISR 创建 eventfd 将导致在读取、写入文件时，以及在设置这个文件的 select() 开始和结束时，暂时禁用中断。

API 参考

Header File

- components/vfs/include/esp_vfs.h

Functions

ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct _reent *r, int fd)

int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)

int esp_vfs_unlink (struct _reent *r, const char *path)

int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)

int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

参数

- **base_path** – file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.

- **vfs** – Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
• ctx – If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

```c
esp_err_t esp_vfs_register_fd_range(const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)
```

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

参数
- vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- ctx – Pointer to context structure. Meaning is the same as for esp_vfs_register().
- min_fd – The smallest file descriptor this VFS will use.
- max_fd – Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

```c
esp_err_t esp_vfs_register_with_id(const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)
```

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

参数
- vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- ctx – Pointer to context structure. Meaning is the same as for esp_vfs_register().
- vfs_id – Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

```c
esp_err_t esp_vfs_unregister(const char* base_path)
```

Unregister a virtual filesystem for given path prefix

参数 base_path – file prefix previously used in esp_vfs_register call

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered.

```c
esp_err_t esp_vfs_unregister_with_id(esp_vfs_id_t vfs_id)
```

Unregister a virtual filesystem with the given index

参数 vfs_id – The VFS ID returned by esp_vfs_register_with_id

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered.

```c
esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int*fd)
```

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

参数
- vfs_id – VFS identifier returned by esp_vfs_register_with_id.
- fd – The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
esp_err_t esp_vfs_register_fd_with_local_fd(esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)
```

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

参数
- vfs_id – VFS identifier returned by esp_vfs_register_with_id.
- local_fd – The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
• **permanent** – Whether the fd should be treated as permnet (not removed after close())
• **fd** – The registered file descriptor will be written to this address.

返回 ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
esp_err_t esp_vfs_unregister_fd (esp_vfs_id_t vfs_id, int fd)
```

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

参数

• **vfs_id** – VFS identificator returned by esp_vfs_register_with_id.
• **fd** – File descriptor which should be unregistered.

返回 ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
int esp_vfs_select (int nfds, fd_set* readfds, fd_set* writefds, fd_set* errorfds, struct timeval* timeout)
```

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

参数

• **nfds** – Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
• **readfds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
• **writefds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
• **errorfds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
• **timeout** – If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

返回 The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_select_triggered (esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

参数 **sem** – semaphore structure which was passed to the driver by the start_select call

```c
void esp_vfs_select_triggered_isr (esp_vfs_select_sem_t sem, BaseType_t*woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

参数

• **sem** – semaphore structure which was passed to the driver by the start_select call
• **woken** – is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread (int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pread()

参数

• **fd** – File descriptor used for read
• **dst** – Pointer to the buffer where the output will be written
• **size** – Number of bytes to be read
• **offset** – Starting offset of the read
A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

```c
ssize_t esp_vfs_pwrite (int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pwrite()

**Parameters**
- **fd** - File descriptor used for write
- **src** - Pointer to the buffer from where the output will be read
- **size** - Number of bytes to write
- **offset** - Starting offset of the write

A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for select()

**Public Members**

```c
bool is_sem_local
```

Type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

```c
void *sem
```

Semaphore instance

```c
struct esp_vfs_t
```

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

**Public Members**

```c
int flags
```

ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

```c
ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
```

Write with context pointer

```c
ssize_t (*write)(int fd, const void *data, size_t size)
```

Write without context pointer
Chapter 2. API 参考

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
   Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)
   Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
   Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)
   Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
   pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
   pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
   pwrite with context pointer

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
   pwrite without context pointer

int (*open_p)(void *ctx, const char *path, int flags, int mode)
   open with context pointer

int (*open)(const char *path, int flags, int mode)
   open without context pointer

int (*close_p)(void *ctx, int fd)
   close with context pointer

int (*close)(int fd)
   close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
   fstat with context pointer

int (*fstat)(int fd, struct stat *st)
   fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
   stat with context pointer

int (*stat)(const char *path, struct stat *st)
   stat without context pointer
int (*link_p)(void *ctx, const char *n1, const char *n2)
    link with context pointer

int (*link)(const char *n1, const char *n2)
    link without context pointer

int (*unlink_p)(void *ctx, const char *path)
    unlink with context pointer

int (*unlink)(const char *path)
    unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
    rename with context pointer

int (*rename)(const char *src, const char *dst)
    rename without context pointer

    seekdir with context pointer

void (*seekdir)(DIR *pdir, long offset)
    seekdir without context pointer
int (*closedir_p)(void *ctx, DIR *pdir)
closedir with context pointer

int (*closedir)(DIR *pdir)
closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
rmdir with context pointer

int (*rmdir)(const char *name)
rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
fcntl with context pointer

int (*fcntl)(int fd, int cmd, int arg)
fcntl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
fsync with context pointer

int (*fsync)(int fd)
fsync without context pointer

int (*access_p)(void *ctx, const char *path, int amode)
access with context pointer

int (*access)(const char *path, int amode)
access without context pointer

int (*truncate_p)(void *ctx, const char *path, off_t length)
truncate with context pointer

int (*truncate)(const char *path, off_t length)
truncate without context pointer
int (*ftruncate_p)(void *ctx, int fd, off_t length)
  ftruncate with context pointer

int (*ftruncate)(int fd, off_t length)
  ftruncate without context pointer

int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)
  utime with context pointer

int (*utime)(const char *path, const struct utimbuf *times)
  utime without context pointer

int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)
  tcsetattr with context pointer

int (*tcsetattr)(int fd, int optional_actions, const struct termios *p)
  tcsetattr without context pointer

int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)
  tcgetattr with context pointer

int (*tcgetattr)(int fd, struct termios *p)
  tcgetattr without context pointer

int (*tcdrain_p)(void *ctx, int fd)
  tcdrain with context pointer

int (*tcdrain)(int fd)
  tcdrain without context pointer

int (*tcflush_p)(void *ctx, int fd, int select)
  tcflush with context pointer

int (*tcflush)(int fd, int select)
  tcflush without context pointer

int (*tcflow_p)(void *ctx, int fd, int action)
  tcflow with context pointer

int (*tcflow)(int fd, int action)
  tcflow without context pointer

pid_t (*tcgetsid_p)(void *ctx, int fd)
  tcgetsid with context pointer

pid_t (*tcgetsid)(int fd)
  tcgetsid without context pointer
int (*`tcsendbreak_p`)(void *ctx, int fd, int duration)
    tcsendbreak with context pointer

int (*`tcsendbreak`)(int fd, int duration)
    tcsendbreak without context pointer

*esp_err_t* (*`start_select`*)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
    esp_vfs_select_sem_t sem, void **end_select_args)
    start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the
given VFS

int (*`socket_select`)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *
    timeout)
    socket select function for socket FDs with the functionality of POSIX select(); this should be set only for
the socket VFS

void (*`stop_socket_select`)(void *sem)
    called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver;
set only for the socket driver

void (*`stop_socket_select_isr`)(void *sem, BaseType_t *woken)
    stop_socket_select which can be called from ISR; set only for the socket driver

void (*`get_socket_select_semaphore`)(void)
    end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select
for the given VFS

*esp_err_t* (*`end_select`)(void *end_select_args)
    get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket
driver

Macros

**`MAX_FDS`**
    Maximum number of (global) file descriptors.

**`ESP_VFS_PATH_MAX`**
    Maximum length of path prefix (not including zero terminator)

**`ESP_VFS_FLAG_DEFAULT`**
    Default value of flags member in esp_vfs_t structure.

**`ESP_VFS_FLAG_CONTEXT_PTR`**
    Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

typedef int `esp_vfs_id_t`

Header File

- components/vfs/include/esp_vfs_dev.h
Functions

void esp_vfs_dev_uart_register (void)
   add /dev/uart virtual filesystem driver

   This function is called from startup code to enable serial output

void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
   Set the line endings expected to be received on UART.

   This specifies the conversion between line endings received on UART and newlines (’
   ’, LF) passed into stdin:

   • ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
   • ESP_LINE_ENDINGS_CR: convert CR to LF
   • ESP_LINE_ENDINGS_LF: no modification

备注: this function is not threadsafe w.r.t. reading from UART

参数 mode - line endings expected on UART

void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
   Set the line endings to sent to UART.

   This specifies the conversion between newlines (’
   ’, LF) on stdout and line endings sent over UART:

   • ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
   • ESP_LINE_ENDINGS_CR: convert LF to CR
   • ESP_LINE_ENDINGS_LF: no modification

备注: this function is not threadsafe w.r.t. writing to UART

参数 mode - line endings to send to UART

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
   Set the line endings expected to be received on specified UART.

   This specifies the conversion between line endings received on UART and newlines (’
   ’, LF) passed into stdin:

   • ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
   • ESP_LINE_ENDINGS_CR: convert CR to LF
   • ESP_LINE_ENDINGS_LF: no modification

备注: this function is not threadsafe w.r.t. reading from UART

参数
Chapter 2. API

```c
int esp_vfs_dev_uart_port_set_tx_line_endings(int uart_num, esp_line_endings_t mode)
```

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (`\n`, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. writing to UART

```c
void esp_vfs_dev_uart_use_nonblocking(int uart_num)
```

set VFS to use simple functions for reading and writing UART. Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**
- `uart_num`: UART peripheral number

```c
void esp_vfs_dev_uart_use_driver(int uart_num)
```

set VFS to use UART driver for reading and writing

**Note:** application must configure UART driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_driver(void)
```

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking(void)
```

set VFS to use simple functions for reading and writing UART. Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Header File**
- `components/vfs/include/esp_vfs_eventfd.h`
Functions

```c
esp_err_t esp_vfs_eventfd_register(const esp_vfs_eventfd_config_t *config)
```
Registers the event vfs.

返回 ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

```c
esp_err_t esp_vfs_eventfd_unregister(void)
```
Unregisters the event vfs.

返回 ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

```c
int eventfd(unsigned int initval, int flags)
```

Structures

```c
struct esp_vfs_eventfd_config_t
```
Eventfd vfs initialization settings.

Public Members

```c
size_t max_fds
```
The maximum number of eventfds supported

Macros

```c
EFD_SUPPORT_ISR
ESP_VFS_EVENTD_CONFIG_DEFAULT()
```

2.9.10 磨损均衡 API

概述

ESP32 所使用的 flash，特别是 SPI flash，多数具备扇区结构，且每个扇区仅允许有限次数的擦除/修改操作。为了避免过度使用某一扇区，乐鑫提供了磨损均衡组件，无需用户介入即可帮助用户均衡各个扇区之间的磨损。

磨损均衡组件包含了通过分区组件对外部 SPI flash 进行数据读取、写入、擦除与存储器映射相关的 API 函数。磨损均衡组件还具有软件上更高级别的 API 函数，与 FAT 文件系统 协同工作。

磨损均衡组件与 FAT 文件系统组件共用 FAT 文件系统的扇区。扇区大小为 4096 字节，是标准 flash 扇区的大小。在这种模式下，磨损均衡组件性能达到最佳，但需要在 RAM 中占用更多内存。

为了节省内存，磨损均衡组件还提供了另外两种模式，均使用 512 字节大小的扇区：

- **性能模式**：先将数据保存在 RAM 中，擦除扇区，然后将数据存储回 flash。如果设备在扇区擦写过程中突然断电，则整体扇区（4096 字节）数据将全部丢失。
- **安全模式**：数据先保存在 flash 中空余扇区，擦除扇区后，数据即存储回去。如果设备断电，上电后可立即恢复数据。

设备默认设置如下：

- 定义扇区大小为 512 字节
- 默认使用性能模式
您可以使用配置菜单更改设置。
磨损均衡组件不会将数据缓存在 RAM 中。写入和擦除函数直接修改 flash，函数返回后，flash 即完成修改。

磨损均衡访问 API

处理 flash 数据常用的 API 如下所示：

- `wl_mount` - 为指定分区挂载并初始化磨损均衡模块
- `wlUnmount` - 卸载分区并释放磨损均衡模块
- `wl_erase_range` - 擦除 flash 中指定的地址范围
- `wl_write` - 将数据写入分区
- `wl_read` - 从分区读取数据
- `wl_size` - 返回可用内存的大小（以字节为单位）
- `wl_sector_size` - 返回一个扇区的大小

请尽量避免直接使用原始磨损均衡函数，建议您使用文件系统特定的函数。

内存大小

内存大小是根据分区参数在磨损均衡模块中计算所得，由于模块使用 flash 分区扇区存储内部数据，因此计算所得内存大小有少许偏差。

另请参阅

- `FAT 文件系统`
- `分区表`

应用示例

`storage/wear_levelling` 中提供了一款磨损均衡驱动与 FatFs 库结合使用的示例。该示例初始化磨损均衡驱动，挂载 FAT 文件系统分区，并使用 POSIX（可移植操作系统接口）和 C 库 API 中写入和读取数据。如需了解更多信息，请参考 `storage/wear_levelling/README.md`。

高级 API 参考

头文件

- `fatfs/vfs/esp_vfs_fat.h`

函数

```c
esp_err_t esp_vfs_fat_spiflash_mount_rw_wl(const char* base_path, const char* partition_label,
const esp_vfs_fat_mount_config_t *mount_config,
wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.
Chapter 2. API

参数
- **base_path** - path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** - label of the partition which should be used
- **mount_config** - pointer to structure with extra parameters for mounting FATFS
- **wl_handle** - [out] wear levelling driver handle

返回
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

结构 **esp_vfs_fat_mount_config_t**

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

**Public Members**

布尔变量 **format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

整型变量 **max_files**

Max number of open files.

大小数型变量 **allocation_unit_size**

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

布尔变量 **disk_status_check_enable**

Enables real if_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmouted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

错误码 **esp_err_t esp_vfs_fat_spiflash_unmount_rw_wl**(const char*base_path, wl_handle_t wl_handle)

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_rw_wl.

参数
- **base_path** – path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** – wear levelling driver handle returned by esp_vfs_fat_spiflash_mount_rw_wl

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called
Chapter 2. API 参考

中层 API 参考

Header File

- components/wear_levelling/include/wear_levelling.h

Functions

```c
esp_err_t wl_mount(const esp_partition_t *partition, wl_handle_t *out_handle)
```

Mount WL for defined partition.

参数

- `partition` – that will be used for access
- `out_handle` – handle of the WL instance

返回

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

```c
esp_err_t wlUnmount(wl_handle_t handle)
```

Unmount WL for defined partition.

参数 `handle` – WL partition handle

返回

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

```c
esp_err_t wl_erase_range(wl_handle_t handle, size_t start_addr, size_t size)
```

Erase part of the WL storage.

参数

- `handle` – WL handle that are related to the partition
- `start_addr` – Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(⋯)`.
- `size` – Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(⋯)`.

返回

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```c
esp_err_t wl_write(wl_handle_t handle, size_t dest_addr, const void *src, size_t size)
```

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

备注: Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.
• ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
• or one of error codes from lower-level flash driver.

\textit{esp_err_t} \texttt{wl_read} (\texttt{wl_handle_t} handle, size_t src_addr, void* dest, size_t size)

Read data from the WL storage.

\begin{itemize}
  \item \texttt{handle} - WL module instance that was initialized before
  \item \texttt{dest} - Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
  \item \texttt{src_addr} - Address of the data to be read, relative to the beginning of the partition.
  \item \texttt{size} - Size of data to be read, in bytes.
\end{itemize}

\begin{itemize}
  \item ESP_OK, if data was read successfully;
  \item ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
  \item ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
  \item or one of error codes from lower-level flash driver.
\end{itemize}

\texttt{size_t} \texttt{wl_size} (\texttt{wl_handle_t} handle)

Get size of the WL storage.

\begin{itemize}
  \item \texttt{handle} - WL module handle that was initialized before
  \item usable size, in bytes
\end{itemize}

\texttt{size_t} \texttt{wl_sector_size} (\texttt{wl_handle_t} handle)

Get sector size of the WL instance.

\begin{itemize}
  \item \texttt{handle} - WL module handle that was initialized before
  \item sector size, in bytes
\end{itemize}

\textbf{Macros}

\texttt{WL_INVALID_HANDLE}

\textbf{Type Definitions}

\texttt{typedef int32_t \textit{wl_handle_t}}

\texttt{wear levelling handle}

\section*{2.10 System API}

\subsection*{2.10.1 App Image Format}

An application image consists of the following structures:

1. The \texttt{esp_image_header_t} structure describes the mode of SPI flash and the count of memory segments.
2. The \texttt{esp_image_segment_header_t} structure describes each segment, its length, and its location in ESP32's memory, followed by the data with a length of \texttt{data_len}. The data offset for each segment in the image is calculated in the following way:

\begin{itemize}
  \item offset for 0 Segment = sizeof(\texttt{esp_image_header_t}) + sizeof(\texttt{esp_image_segment_header_t}).
  \item offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(\texttt{esp_image_segment_header_t}).
\end{itemize}
You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
>> esp tool.py --chip esp32 image_info build/app.bin

esp tool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM
Segment 2: len 0x00000 load 0x3ff80000 file_offs 0x00013d00 SOC_RTC_DRAM
Segment 3: len 0x00000 load 0x3ff80000 file_offs 0x00013d08 SOC_RTC_DRAM
Segment 4: len 0x028e0 load 0x3ff80000 file_offs 0x00013d10 DRAM
Segment 5: len 0x000000 load 0x3ff828e0 file_offs 0x000165f6 DRAM
Segment 6: len 0x00040 load 0x40080000 file_offs 0x00016600 SOC_IRAM

Segment 13: len 0x00000 load 0x50000004 file_offs 0x00089b74 SOC_RTC_DATA
Checksum: e8 (valid) Validation Hash: ...
```

```
--407089ca0eae2b8b83b4120979d3354b1c938a49cb7a0c977f240474ef2ec76b (valid)
```

You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 (...) 81120) map
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 size=0x00000 ( 0) load
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 size=0x00000 ( 0) load
I (571) esp_image: segment 3: paddr=0x00033d18 vaddr=0x3ff80000 size=0x028e0 (...) 10464) load
I (612) esp_image: segment 4: paddr=0x00036600 vaddr=0x3ff828e0 size=0x00000 ( 0) load
I (654) esp_image: segment 5: paddr=0x00036608 vaddr=0x40080000 size=0x00040 (...) 1024) load
I (695) esp_image: segment 6: paddr=0x00036a10 vaddr=0x40080400 size=0x09600 (...) 38400) load
I (737) esp_image: segment 7: paddr=0x00040018 vaddr=0x400d0018 size=0x62e4c ...) 405068) map
I (847) esp_image: segment 8: paddr=0x000a2e6c vaddr=0x40089a00 size=0x06cec (...) 27884) load
I (888) esp_image: segment 9: paddr=0x000a9b60 vaddr=0x400c0000 size=0x00000 ( 0) load
I (929) esp_image: segment 10: paddr=0x000a9b58 vaddr=0x50000000 size=0x00004 ( 4) load
I (971) esp_image: segment 11: paddr=0x000a9b74 vaddr=0x50000004 size=0x00000 ( 0) load
I (1012) esp_image: segment 12: paddr=0x000a9b7c vaddr=0x50000004 size=0x00000 ( 0) load
```

For more details on the type of memory segments and their address ranges, see ESP32 Technical Reference Manual > System and Memory > Embedded Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded
boundary, so the application image might need padding.

4. If the hash_appended field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the option `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have an additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes),
   - signature data (64 bytes).

6. If the option `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to RSA or ECDSA (V2) then the application image will have an additional signature sector of 4K size. For more details on the format of this signature sector, please refer to `Signature Block Format`.

**Application Description**

The DROM segment of the application binary starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- magic_word - the magic word for the `esp_app_desc` structure.
- secure_version - see `Anti-rollback`.
- version - see `App version`.
- project_name is filled from PROJECT_NAME.*
- time and date - compile time and date.
- idf_ver - version of ESP-IDF.
- app_elf_sha256 - contains sha256 for the application ELF file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 31 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

To obtain the `esp_app_desc_t` structure for the currently running application, use `esp_app_get_description()`.

To obtain the `esp_app_desc_t` structure for another OTA partition, use `esp_ota_get_partition_description()`.

**Adding a Custom Structure to an Application**

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is sizeof(`esp_image_header_t`) + sizeof(`esp_image_segment_header_t`) + sizeof(`esp_app_desc_t`).

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into CMakeLists.txt.

**API Reference**

**Header File**

- components/bootloader_support/include/esp_app_format.h
Chapter 2. API

**Structures**

```
struct esp_image_header_t
    Main header of binary image.
```

**Public Members**

uint8_t `magic`
    Magic word ESP_IMAGE_HEADER_MAGIC

uint8_t `segment_count`
    Count of memory segments

uint8_t `spi_mode`
    Flash read mode (esp_image_spi_mode_t as uint8_t)

uint8_t `spi_speed`
    Flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t `spi_size`
    Flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t `entry_addr`
    Entry address

uint8_t `wp_pin`
    WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t `spi_pin_drv[3]`
    Drive settings for the SPI flash pins (read by ROM bootloader)

`esp_chip_id_t chip_id`
    Chip identification number

uint8_t `min_chip_rev`
    Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

uint16_t `min_chip_rev_full`
    Minimal chip revision supported by image, in format: major * 100 + minor

uint16_t `max_chip_rev_full`
    Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t `reserved[4]`
    Reserved bytes in additional header space, currently unused
uint8_t hash_append

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t

Header of binary image segment.

Public Members

uint32_t load_addr

Address of segment

uint32_t data_len

Length of data

Macros

ESP_IMAGE_HEADER_MAGIC

The magic word for the esp_image_header_t structure.

ESP_IMAGE_MAX_SEGMENTS

Max count of segments in the image.

Enumerations

denum esp_chip_id_t

ESP chip ID.

Values:

enumerator ESP_CHIP_ID_ESP32

chip ID: ESP32

enumerator ESP_CHIP_ID_ESP32S2

chip ID: ESP32-S2

enumerator ESP_CHIP_ID_ESP32C3

chip ID: ESP32-C3

enumerator ESP_CHIP_ID_ESP32S3

chip ID: ESP32-S3

enumerator ESP_CHIP_ID_ESP32C2

chip ID: ESP32-C2

enumerator ESP_CHIP_ID_ESP32C6

chip ID: ESP32-C6
enumerator ESP_CHIP_ID_INVALID
                   Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
    SPI flash mode, used in esp_image_header_t.
    Values:

enumerator ESP_IMAGE_SPI_MODE_QIO
    SPI mode QIO

enumerator ESP_IMAGE_SPI_MODE_QOUT
    SPI mode QOUT

enumerator ESP_IMAGE_SPI_MODE_DIO
    SPI mode DIO

enumerator ESP_IMAGE_SPI_MODE_DOUT
    SPI mode DOUT

enumerator ESP_IMAGE_SPI_MODE_FAST_READ
    SPI mode FAST_READ

enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
    SPI mode SLOW_READ

enum esp_image_spi_freq_t
    SPI flash clock division factor.
    Values:

enumerator ESP_IMAGE_SPI_SPEED_DIV_2
    The SPI flash clock frequency is divided by 2 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_3
    The SPI flash clock frequency is divided by 3 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_4
    The SPI flash clock frequency is divided by 4 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_1
    The SPI flash clock frequency equals to the clock source

enum esp_image_flash_size_t
    Supported SPI flash sizes.
    Values:

enumerator ESP_IMAGE_FLASH_SIZE_1MB
    SPI flash size 1 MB
2.10.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with minimal overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see 特定应用程序的跟踪
2. Lightweight logging to the host, see 记录日志到主机
3. System behaviour analysis, see 基于 SEGGER SystemView 的系统行为分析

API Reference

Header File

* components/app_trace/include/esp_app_trace.h

Functions

```c
esp_err_t esp_apptrace_init (void)
```

Initializes application tracing module.

备注：Should be called before any esp_apptrace_xxx call.
Chapter 2. API 参考

返回 ESP_OK on success, otherwise see esp_err_t

does not protect internal data by lock.

参数
- `buf` - Address of buffer to use for down channel (host to target) data.
- `size` - Size of the buffer.

uint8_t * esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

参数
- `dest` - Indicates HW interface to send data.
- `size` - Size of data to write to trace buffer.
- `tmo` - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 non-NULL on success, otherwise NULL.

esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

参数
- `dest` - Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- `ptr` - Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- `tmo` - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

参数
- `dest` - Indicates HW interface to send data.
- `data` - Address of data to write to trace buffer.
- `size` - Size of data to write to trace buffer.
- `tmo` - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

int esp_apptrace_vprintf_to (esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

参数
- `dest` - Indicates HW interface to send data.
- `tmo` - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- `fmt` - Address of format string.
- `ap` - List of arguments.

返回 Number of bytes written.
int esp_apptrace_vprintf (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

参数
  • fmt – Address of format string.
  • ap – List of arguments.
  返回 Number of bytes written.

esp_err_t esp_apptrace_flush (esp_apptrace_dest_t dest, uint32_t tmo)
Flushes remaining data in trace buffer to host.

参数
  • dest – Indicates HW interface to flush data on.
  • tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
  返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t esp_apptrace_flush_nolock (esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)
Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

参数
  • dest – Indicates HW interface to flush data on.
  • min_sz – Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
  • tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
  返回 ESP_OK on success, otherwise see esp_err_t

esp_err_t esp_apptrace_read (esp_apptrace_dest_t dest, void *data, uint32_t size, uint32_t tmo)
Reads host data from trace buffer.

参数
  • dest – Indicates HW interface to read the data on.
  • data – Address of buffer to put data from trace buffer.
  • size – Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
  • tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
  返回 ESP_OK on success, otherwise see esp_err_t

uint8_t *esp_apptrace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)
Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

参数
  • dest – Indicates HW interface to receive data.
  • size – Address to store size of available data in down buffer. Must be initialized with requested value.
  • tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
  返回 non-NULL on success, otherwise NULL.

esp_err_t esp_apptrace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

参数
  • dest – Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
  • ptr – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
• tmo – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK on success, otherwise see esp_err_t

bool esp_apprtrace_host_is_connected(esp_apprtrace_dest_t dest)
Checks whether host is connected.
参数 dest – Indicates HW interface to use.
返回 true if host is connected, otherwise false

void *esp_apprtrace_fopen(esp_apprtrace_dest_t dest, const char *path, const char *mode)
Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.
参数
• dest – Indicates HW interface to use.
• path – Path to file.
• mode – Mode string. See fopen for details.
返回 non zero file handle on success, otherwise 0

int esp_apprtrace_fclosel(esp_apprtrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.
参数
• dest – Indicates HW interface to use.
• stream – File handle returned by esp_apprtrace_fopen.
返回 Zero on success, otherwise non-zero. See fclose for details.

size_t esp_apprtrace_fwritel(esp_apprtrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.
参数
• dest – Indicates HW interface to use.
• ptr – Address of data to write.
• size – Size of an item.
• nmemb – Number of items to write.
• stream – File handle returned by esp_apprtrace_fopen.
返回 Number of written items. See fwrite for details.

size_t esp_apprtrace_freadl(esp_apprtrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
Read file on host. This function has the same semantic as ‘fread’ except for the first argument.
参数
• dest – Indicates HW interface to use.
• ptr – Address to store read data.
• size – Size of an item.
• nmemb – Number of items to read.
• stream – File handle returned by esp_apprtrace_fopen.
返回 Number of read items. See fread for details.

int esp_apprtrace_fseekl (esp_apprtrace_dest_t dest, void *stream, long offset, int whence)
Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.
参数
• dest – Indicates HW interface to use.
• stream – File handle returned by esp_apprtrace_fopen.
• offset – Offset. See fseek for details.
• whence – Position in file. See fseek for details.
返回 Zero on success, otherwise non-zero. See fseek for details.
int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

参数
- dest - Indicates HW interface to use.
- stream - File handle returned by esp_apptrace_fopen.

返回 Current position in file. See ftell for details.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)

Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

参数 dest - Indicates HW interface to use.

返回 ESP_OK on success, otherwise see esp_err_t

void esp_gcov_dump (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t

Application trace data destinations bits.

Values:

enumerator ESP_APPTRACE_DEST_JTAG

JTAG destination.

enumerator ESP_APPTRACE_DEST_TRAX

xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator ESP_APPTRACE_DEST_UART

UART destination.

enumerator ESP_APPTRACE_DEST_MAX

enumerator ESP_APPTRACE_DEST_NUM

Header File

- components/app_trace/include/esp_sysview_trace.h

Functions

static inline esp_err_t esp_sysview_flush (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

参数 tmo - Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

返回 ESP_OK.

int esp_sysview_vprintf (const char *format, va_list args)

vprintf-like function to sent log messages to the host.

参数
- format - Address of format string.
- args - List of arguments.
**Chapter 2. API 参考**

**2.10.3 Call function with external stack**

**Overview**

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as printf. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter.

**Usage**

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that function
- the size of stack in bytes
- a pointer to the shared stack function

The user defined function will be deferred as a callback and can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
```

```c
//Allocate a stack buffer, from heap or as a static form:
portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
assert(shared_stack != NULL);

//Allocate a mutex to protect its usage:
SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
assert(printf_lock != NULL);

//Call the desired function using the macro helper:
esp_execute_shared_stack_function(printf_lock,
         shared_stack, 8192,
         external_stack_function);

vSemaphoreDelete(printf_lock);
free(shared_stack);
```

### API Reference

**Header File**

- components/esp_system/include/esp_expression_with_stack.h

**Functions**

`void esp_execute_shared_stack_function(SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)`

Calls user defined shared stack space function.

备注：if either lock, stack or stack size is invalid, the expression will be called using the current stack.

### 参数

- `lock` - Mutex object to protect in case of shared stack
- `stack` - Pointer to user allocated stack
- `stack_size` - Size of current stack in bytes
- `function` - Pointer to the shared stack function to be executed

### Macros

`ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)`

### Type Definitions

typedef void (*shared_stack_function)(void)

## 2.10.4 Chip Revision

### Overview

A new chip versioning logic was introduced in new chips. Chips have several eFuse version fields:

- Major wafer version (WAFER_VERSION_MAJOR eFuse)
- Minor wafer version (WAFER_VERSION_MINOR eFuse)
• Ignore maximal revision (DISABLE_WAFTER_VERSION_MAJOR eFusse)

The new versioning logic is being introduced to distinguish changes in chips as breaking changes and non-breaking changes. Chips with non-breaking changes can run the same software as the previous chip. The previous chip means that the major version is the same.

If the newly released chip does not have breaking changes, that means it can run the same software as the previous chip, then in that chip we keep the same major version and increment the minor version by 1. Otherwise, if there is a breaking change in the newly released chip, meaning it can not run the same software as the previous chip, then in that chip we increase the major version and set the minor version to 0.

The software supports a number of revisions, from the minimum to the maximum (the min/max configs are defined in Kconfig). If the software is unaware of a new chip (when the chip version is out of range), it will refuse to run on it unless the Ignore maximum revision restrictions bit is set. This bit removes the upper revision limit.

Minimum versions limits the software to only run on a chip revision that is high enough to support some features. Maximum version is the maximum version that is well-supported by current software. When chip version is above the maximum version, software will reject to boot, because it may not work on, or work with risk on the chip.

Adding the major and minor wafer revision make the versioning logic is branchable.

<table>
<thead>
<tr>
<th>ECO</th>
<th>Revision (Major.Minor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECO0</td>
<td>v0.0</td>
</tr>
<tr>
<td>ECO1</td>
<td>v1.0</td>
</tr>
<tr>
<td>ECO1.1</td>
<td>v1.1</td>
</tr>
<tr>
<td>ECO2</td>
<td>v2.0</td>
</tr>
<tr>
<td>ECO3</td>
<td>v3.0</td>
</tr>
<tr>
<td>ECO4</td>
<td>v3.1</td>
</tr>
</tbody>
</table>

Chip Revision vX.Y, where:
- **X** means Major wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- **Y** means Minor wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

The vX.Y chip version format will be used further instead of the ECO number.

### Representing Revision Requirement Of A Binary Image

The 2nd stage bootloader and the application binary images have the `esp_image_header_t` header, which stores the revision numbers of the chip on which the software can be run. This header has 3 fields related to revisions:

- **min_chip_rev** - Minimal chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32_REV_MIN`.
- **min_chip_rev_full** - Minimal chip MINOR revision required by image in format: major * 100 + minor. Its value is determined by `CONFIG_ESP32_REV_MIN`.
max_chip_rev_full - Maximal chip revision required by image in format: major * 100 + minor. Its value is determined by CONFIG_ESP32_REV_MAX_FULL. It cannot be changed by user. Only Espressif can change it when a new version will be supported in IDF.

Chip Revision APIs

These APIs help to get chip revision from eFuses:

• efuse_hal_chip_revision(). It returns revision in the major * 100 + minor format.
• efuse_hal_get_major_chip_version(). It returns Major revision.
• efuse_hal_get_minor_chip_version(). It returns Minor revision.

The following Kconfig definitions (in major * 100 + minor format) that can help add the chip revision dependency to the code:

• CONFIG_ESP32_REV_MIN_FULL
• CONFIG_ESP_REV_MIN_FULL
• CONFIG_ESP32_REV_MAX_FULL
• CONFIG_ESP_REV_MAX_FULL

Maximal And Minimal Revision Restrictions

The order for checking the minimum and maximum revisions:

1. The 1st stage bootloader (ROM bootloader) does not check minimal and maximal revision fields from esp_image_header_t before running the 2nd stage bootloader.
2. The 2nd stage bootloader checks at the initialization phase that bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximal revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Further, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

Issues

1. If the 2nd stage bootloader is run on the chip revision < minimum revision shown in the image, a reboot occurs. The following message will be printed:

   Image requires chip rev >= v3.0, but chip is v1.0

To resolve this issue:

• make sure the chip you are using is suitable for the software, or use a chip with the required minimum revision or higher.
• update the software with CONFIG_ESP32_REV_MIN to get it <= the revision of chip being used

2. If application does not match minimal and maximal chip revisions, a reboot occurs. The following message will be printed:
To resolve this issue, update the IDF to a newer version that supports the used chip (CONFIG_ESP32_REV_MAX_FULL). Another way to fix this is to set the Ignore maximal revision bit in eFuse or use a chip that is suitable for the software.

**Backward Compatible With Bootloaders Built By Older ESP-IDF Versions**

The old bootloaders (IDF < 5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version.

The old bootloaders did not read the minor wafer version eFuse, the major version can be only <= 3. So it means that the old bootloader can detect correctly only chip version in range v0.0 - v3.0, where the minor version is always 0.

Please check the chip version using `esptool chip_id` command.

**API Reference**

**Header File**

- `components/hal/include/hal/efuse_hal.h`

**Functions**

- `void efuse_hal_get_mac(uint8_t *mac)`
  - Get factory mac address
- `uint32_t efuse_hal_chip_revision(void)`
  - Returns chip version.
  
  返回 Chip version in format: Major * 100 + Minor
- `uint32_t efuse_hal_get_major_chip_version(void)`
  - Returns major chip version.
- `uint32_t efuse_hal_get_minor_chip_version(void)`
  - Returns minor chip version.

### 2.10.5 控制台终端

ESP-IDF 提供了 console 组件，它包含了开发基于串口的交互式控制终端所需要的所有模块，主要支持以下功能：

- 由 linenoise 库具体实现，它支持处理退格键和方向键，支持回看命令的历史记录，支持命令的自动补全和参数提示。
- 将命令行拆分为参数列表。
- 参数解析，由 argtable3 库具体实现，该库提供解析 GNU 样式的命令行参数的 API。
- 用于注册和调度命令的函数。
- 帮助创建 REPL (Read-Evaluate-Print-Loop) 环境的函数。

**备注**：这些功能模块可以一起使用也可以独立使用，例如仅使用行编辑和命令注册的功能，然后使用 getopt 函数或者自定义的函数来实现参数解析，而不是直接使用 argtable3 库。同样地，还可以使用更简单的命令输入方法（比如 fgets 函数）和其他用于命令分割和参数解析的方法。
行编辑

行编辑功能允许用户通过按键插入编辑命令，使用退格键删除符号，使用左右键在命令中移动光标，使用上下键导航到之前输入的命令，使用制表键（“Tab”）来自动补全命令。

备注：此功能依赖于终端应用程序对 ANSI 转义符的支持。因此，显示原始 UART 数据的串口监视器不能与行编辑器一同使用。如果运行 system/console 示例程序时看到的输出结果是 [6n 或者类似的转义字符而不是命令行提示符 esp>` 时，就表明当前的串口监视器不支持 ANSI 转义字符。已知可用的串口监视器有 GNU screen、minicom 和 idf_monitor.py（可以通过在项目目录下执行`idf.py monitor`来调用）。

前往这里可以查看 linenoise 库提供的所有函数的描述。

配置 linenoise 库不需要显式地初始化，但是在调用行编辑函数之前，可能需要对某些配置的默认值稍作修改。

linenoiseClearScreen()

使用转义字符清除终端屏幕，并将光标定位在左上角。

linenoiseSetMultiLine()

在单行和多行编辑模式之间进行切换。单行模式下，如果命令的长度超过终端的宽度，会在行内滚动命令文本以显示文本的结尾。在这种情况下，文本的开头部分会被隐藏。单行模式在每次按下按键时发送给屏幕刷新的数据比较少，与多行模式相比更不容易发生故障。另一方面，在单行模式下编辑命令和复制命令将变得更加困难。默认情况下开启的是单行模式。

linenoiseAllowEmpty()

设置 linenoise 库收到空行的解析行为，设置为 true 时返回长度为零的字符串（""），设置为 false 时返回 NULL。默认情况下，将返回长度为零的字符串。

linenoiseSetMaxLineLen()

设置 linenoise 库中每行的最大长度。默认长度为 4096。如果需要优化 RAM 内存的使用，则可以通过这个函数设置一个小于默认 4 KB 的值来实现。

主循环 linenoise()

在大多数情况下，控制台应用程序都会具有相同的工作形式——在某个循环中不断读取输入的内容，然后解析再处理。linenoise() 是专门用来获取用户按键输入的函数。当回车键被按下后会返回完整的行内容。因此可以用它来完成前面循环中的“读取”任务。

linenoiseFree()

必须调用此函数才能释放从 linenoise() 函数获取的命令行缓冲区。

提示和补全 linenoiseSetCompletionCallback()

当用户按下制表键时，linenoise 会调用 补全回调函数，该回调函数会检查当前已经输入的内容，然后调用 linenoiseAddCompletion() 函数来提供所有可能的补全后的命令列表。启用补全功能，需要事先调用 linenoiseSetCompletionCallback() 函数来注册补全回调函数。

console 组件提供了一个现成的函数来为注册的命令提供补全功能esp_console_get_completion()（见下文）。

linenoiseAddCompletion()

补全回调函数会通过调用此函数来通知 linenoise 库当前键入命令所有可能的补全结果。

linenoiseSetHintsCallback()
每当用户的输入改变时，linenoise 就会调用此回调函数，检查到目前为止输入的命令行内容，然后提供带有提示信息的字符串（例如命令参数列表），然后会在同一行上用不同的颜色显示出该文本。

```
linenoiseSetFreeHintsCallback()
```

如果提示回调函数返回的提示字符串是动态分配的或者需要以其它方式回收，就需要使用 `linenoiseSetFreeHintsCallback()` 注册具体的清理函数。

### 历史记录

```
linenoiseHistorySetMaxLen()
```

该函数设置要保留在内存中的最近输入的命令的数量。用户通过使用向上/向下箭头来导航历史记录。

```
linenoiseHistoryAdd()
```

Linenoise 不会自动向历史记录中添加命令，应用程序需要调用此函数来将命令字符串添加到历史记录中。

```
linenoiseHistorySave()
```

该函数将命令的历史记录从 RAM 中保存为文本文件，例如保存到 SD 卡或者 Flash 的文件系统中。

```
linenoiseHistoryLoad()
```

与 `linenoiseHistorySave` 相对应，从文件中加载历史记录。

```
linenoiseHistoryFree()
```

释放用于存储命令历史记录的内存。当使用完 linenoise 库后需要调用此函数。

### 将命令行拆分成参数列表

console 组件提供 `esp_console_split_argv()` 函数来将命令行字符串拆分为参数列表。该函数会返回参数的数量 (argc) 和一个指针数组。该指针数组可以作为 argv 参数传递给任何接受 argc, argv 格式参数的函数。

根据以下规则来将命令行拆分成参数列表：

- 参数由空格分隔
- 如果参数本身需要使用空格，可以使用 `\`（反斜杠）对它们进行转义
- 其它能被识别的转义字符有 `\`（显示反斜杠本身）和 `\"`（显示双引号）
- 可以使用双引号来引用参数，引号只可能出现在参数的开头和结尾，参数中的引号必须如上所述进行转义。参数周围的引号会被 `esp_console_split_argv()` 函数删除

示例：

```
  abc def 1 20 .3 → [abc, def, 1, 20, .3]
  abc "123 456" def → [abc, 123 456, def]
  `a\ b\c" → [a b\c]
```

### 参数解析

对于参数解析，console 组件使用 argtable3 库。有关 argtable3 的介绍请查看 教程 或者 Github 仓库中的示例代码。

### 命令的注册与调度

console 组件包含了一些工具函数，用来注册命令，将用户输入的命令和已经注册的命令进行匹配，使用命令行输入的参数调用命令。
应用 程 序 首 先 调 用 `esp_console_init()` 来 初始化 命 令 注 册 模 块，然 后 调 用 `esp_console_cmd_register()` 函数注册命令处理程序。

对于每个命令，应用程序需要提供以下信息（需要以 `esp_console_cmd_t` 结构体的形式给出）：

- 命令名字（不含空格的字符串）
- 帮助文档，解释该命令的用途
- 可选的提示文本，列出命令的参数。如果应用程序使用 `Argtable3` 库来解析参数，则可以通过提供指向 `Argtable` 参数定义结构体的指针来自动生成提示文本
- 命令处理函数

命令注册模块还提供了其它函数：

`esp_console_run()`

该函数接受命令行字符串，使用 `esp_console_split_argv()` 函数将其拆分为 `argv` 形式的参数列表，在已经注册的组件列表中查找命令，如果找到，则执行其对应的处理程序。

`esp_console_register_help_command()`

将 `help` 命令添加到已注册命令列表中，此命令将会以列表的方式打印所有注册的命令及其参数和帮助文本。

`esp_console_get_completion()`

与 `linenoise` 库中的 `linenoiseSetCompletionCallback()` 一同使用的回调函数，根据已经注册的命令列表为 `linenoise` 提供补全功能。

`esp_console_get_hint()`

与 `linenoise` 库中的 `linenoiseSetHintsCallback()` 一同使用的回调函数，为 `linenoise` 提供已经注册的命令的参数提示功能。

初始化 REPL 环境

除了上述的各种函数，`console` 组件还提供了一些 API 来帮助创建一个基本的 REPL 环境。

在一个典型的 `console` 应用中，你只需要调用 `esp_console_new_repl_uart()`，它会为你初始化好构建在 UART 基础上的 REPL 环境，其中包括安装 UART 驱动，基本的 `console` 配置，创建一个新的线程来执行 REPL 任务，注册一些基本的命令（比如 `help` 命令）。

之后你可以使用 `esp_console_cmd_register()` 来注册其它命令。REPL 环境在初始化后需要再调用 `esp_console_start_repl()` 函数才能开始运行。

应用程序示例

`system/console` 目录下提供了 `console` 组件的示例应用程序，展示了具体的使用方法。该示例介绍了如何初始化 UART 和 VFS 的功能，设置 `linenoise` 库，从 UART 中读取命令并加以处理，然后将历史命令存储到 Flash 中。更多信息，请参阅示例代码目录中的 README.md 文件。

此外，ESP-IDF 还提供了众多基于 `console` 组件的示例程序，它们可以辅助应用程序的开发。例如，`peripherals/i2c/i2c_tools`, `wifi/iperf` 等等。

API 参考

Header File

- components/console/esp_console.h
Chapter 2. API reference

**Functions**

`esp_err_t esp_console_init(const esp_console_config_t *config)`
initialize console module

**备注:** Call this once before using other console module features

**参数** config – console configuration

**返回**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_STATE if already initialized
- ESP_ERR_INVALID_ARG if the configuration is invalid

`esp_err_t esp_console_deinit(void)`
de-initialize console module

**备注:** Call this once when done using console module functions

**返回**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized yet

`esp_err_t esp_console_cmd_register(const esp_console_cmd_t *cmd)`
Register console command.

**参数** cmd – pointer to the command description; can point to a temporary value

**返回**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

`esp_err_t esp_console_run(const char *cmdline, int *cmd_ret)`
Run command line.

**参数**
- cmdline – command line (command name followed by a number of arguments)
- cmd_ret – [out] return code from the command (set if command was run)

**返回**
- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOTFOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

`size_t esp_console_split_argv(char *line, char **argv, size_t argv_size)`
Split command line into arguments in place.

* - This function finds whitespace-separated arguments in the given input line.
* - 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3']
* - Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.
* - 'abc "123 456" def' -> ['abc', '123 456', 'def']
Chapter 2. API 参考

```
* - Escape sequences may be used to produce backslash, double quote, and space:
  * 'a\ b\c"' -> [ 'a b\c"' ]
```

备注: Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

参数
- line - pointer to buffer to parse; it is modified in place
- argv - array where the pointers to arguments are written
- argv_size - number of elements in argv_array (max. number of arguments)
- argc - number of arguments found

返回 number of arguments found (argc)

```c
void esp_console_get_completion(const char* buf, linenoiseCompletions *lc)
```

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

参数
- buf - the string typed by the user
- lc - linenoiseCompletions to be filled in

```c
const char *esp_console_get_hint(const char* buf, int*color, int*bold)
```

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*)&esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

参数
- buf - line typed by the user
- color - [out] ANSI color code to be used when displaying the hint
- bold - [out] set to 1 if hint has to be displayed in bold

返回 string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

```c
esp_err_t esp_console_register_help_command(void)
```

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

返回
- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

```c
esp_err_t esp_console_new_repl_uart(const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over UART driver.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlyinglinenoise and esp_console functions.

备注: This is an all-in-one function to establish the environment needed for REPL, includes:
• Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
• Configures the stdin/stdout to go through the UART driver
• Initializes linenoise
• Spawn new thread to run REPL in the background

### Parameters
- **dev_config** - [in] UART device configuration
- **repl_config** - [in] REPL configuration
- **ret_repl** - [out] return REPL handle after initialization succeed, return NULL otherwise

### Return
- ESP_OK on success
- ESP_FAIL Parameter error

```c
esp_err_t esp_console_new_repl_usb_cdc(const esp_console_dev_usb_cdc_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL environment over USB CDC.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

### Structures
- **struct esp_console_config_t**
  Parameters for console initialization.
Public Members

size_t max_cmdline_length
    length of command line buffer, in bytes

size_t max_cmdline_args
    maximum number of command line arguments to parse

int hint_color
    ASCII color code of hint text.

int hint_bold
    Set to 1 to print hint text in bold.

struct esp_console_repl_config_t
    Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t max_history_len
    maximum length for the history

const char *history_save_path
    file path used to save history commands, set to NULL won’t save to filesystem

uint32_t task_stack_size
    repl task stack size

uint32_t task_priority
    repl task priority

const char *prompt
    prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
    maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
    Parameters for console device: UART.

Public Members

int channel
    UART channel number (count from zero)

int baud_rate
    Communication baud rate.
int `tx_gpio_num`
   GPIO number for TX path, -1 means using default one.

int `rx_gpio_num`
   GPIO number for RX path, -1 means using default one.

struct `esp_console_dev_usb_cdc_config_t`
   Parameters for console device: USB CDC.

---

备注: It’s an empty structure for now, reserved for future

---

struct `esp_console_cmd_t`
   Console command description.

   **Public Members**

   const char *`command`
      Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

   const char *`help`
      Help text for the command, shown by help command. If set, the pointer must be valid until the call to `esp_console_deinit`. If not set, the command will not be listed in ‘help’ output.

   const char *`hint`
      Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be generated automatically

   `esp_console_cmd_func_t` `func`
      Pointer to a function which implements the command.

   void *`argtable`
      Array or structure of pointersto `arg_xxx` structures, may be NULL. Used to generate hint text if ‘hint’ is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the duration of `esp_console_cmd_register` call.

struct `esp_console_repl_s`
   Console REPL base structure.

   **Public Members**

   `esp_err_t (*del)(esp_console_repl_t *repl)`
      Delete console REPL environment.
      
      **Param** repl [in] REPL handle returned from `esp_console_new_repl_xxx`
      **Return**
      - ESP_OK on success
      - ESP_FAIL on errors
Chapter 2. API

Macros

ESP_CONSOLE_CONFIG_DEFAULT()
Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT()
Default console repl configuration value.

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT()

Type Definitions

typedef struct linenoiseCompletions linenoiseCompletions
typedef int (*esp_console_cmd_func_t)(int argc, char **argv)
Console command main function.

Param argc number of arguments
Param argv array with argc entries, each pointing to a zero-terminated string argument
Return console command return code, 0 indicates "success"

typedef struct esp_console_repl_s esp_console_repl_t
Type defined for console REPL.

2.10.6 eFuse Manager

Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

Hardware description

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.
eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool efuse_table_gen.py. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the common CSV file.

CSV files:

- common (esp Efuse_table.csv) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command idf.py efuse-common-table). Note that changes in this file can lead to incorrect operation.
- custom - (optional and can be enabled by CONFIG_EFUSE_CUSTOM_TABLE) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running idf.py efuse-custom-table.

Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

| # field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment |

Individual params in CSV file the following meanings:

- **field_name** Name of field. The prefix ESP_EFUSE_ will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table). The field name supports structured format using . to show that the field belongs to another field (see WR_DIS and RD_DIS in the common table).
- **efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.
- **bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.
- **bit_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on CONFIG_EFUSE_CODE_SCHEME_SELECTOR, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.
- **comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

<table>
<thead>
<tr>
<th># Factory MAC address #</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 64, 8, Factory MAC addr [1]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 56, 8, Factory MAC addr [2]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 48, 8, Factory MAC addr [3]</td>
</tr>
<tr>
<td>EFUSE_BLK0, 40, 8, Factory MAC addr [4]</td>
</tr>
</tbody>
</table>
This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

</tbody>
</table>

The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3.ALIAS.

The IDF names for structured efuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by _.. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS.RD_DIS, ESP_EFUSE_WR_DIS.FIELD_2.B1, etc.

The efuse_table_gen tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

**Solution:** Describe SERIAL_NUMBER to be included in USER_DATA.(USER_DATA.SERIAL_NUMBER).

**Solution:** Change bit_start for FIELD.MAJOR_NUMBER from 60 to 0, so MAJOR_NUMBER is in the FIELD range.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:
After generation in the folder `$IDF_PATH/components/efuse/esp32` create:

- `esp_efuse_table.c` file.
- In include folder `esp_efuse_table.c` file.

To generate a custom files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In include folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

**Supported coding scheme**

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- run a `espefuse.py -p PORT summary` command.
- from `esptool` utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `CONFIG_EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the `ESP_ERR_CODING` error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.
In case 3/4 coding scheme, the writing process is divided into the coding units and we cannot use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks esp_efuse_read... operations.

After changing the coding scheme, run efuse_common_table and efuse_custom_table commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through esp_efuse_batch_write_begin() function then write some fields as usual using the esp_efuse_write... functions. At the end to burn them, call the esp_efuse_batch_write_commit() function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

备注: If there is already pre-written data in the eFuse block using the 3/4 or Repeat encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- esp_efuse_read_field_blob() - returns an array of read eFuse bits.
- esp_efuse_read_field_cnt() - returns the number of bits programmed as “1”.
- esp_efuse_write_field_blob() - writes an array.
- esp_efuse_write_field_cnt() - writes a required count of bits as “1”.
- esp_efuse_get_field_size() - returns the number of bits by the field name.
- esp_efuse_read_reg() - returns value of eFuse register.
- esp_efuse_write_reg() - writes value to eFuse register.
- esp_efuse_get_coding_scheme() - returns eFuse coding scheme for blocks.
- esp_efuse_read_block() - reads key to eFuse block starting at the offset and the required size.
- esp_efuse_write_block() - writes key to eFuse block starting at the offset and the required size.
- esp_efuse_batch_write_begin() - set the batch mode of writing fields.
- esp_efuse_batch_write_commit() - writes all prepared data for batch writing mode and reset the batch writing mode.
- esp_efuse_batch_write_cancel() - reset the batch writing mode and prepared data.
- esp_efuse_get_key_dis_read() - Returns a read protection for the key block.
- esp_efuse_set_key_dis_read() - Sets a read protection for the key block.
- esp_efuse_get_key_dis_write() - Returns a write protection for the key block.
- esp_efuse_set_key_dis_write() - Sets a write protection for the key block.
- esp_efuse_get_key_purpose() - Returns the current purpose set for an eFuse key block.
- esp_efuse_write_key() - Programs a block of key data to an eFuse block
- esp_efuse_write_keys() - Programs keys to unused eFuse blocks
- esp_efuse_find_purpose() - Finds a key block with the particular purpose set.
- esp_efuse_get_keypurpose_dis_write() - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- esp_efuse_key_block_unused() - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this esp_efuse_get_pkg_ver().
## How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv...

Verifying efuse table...

Max number of bits in BLK 192

</table>

Used bits in efuse table:
The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the *Structured efuse fields* technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE REV to an existing USER_DATA field. Use . (dot) to show an attachment in a field.

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.

3. Run a `show_efuse_table` command to check eFuse table. To generate source files run `efuse_common_table` or `efuse_custom_table` command.

You may get errors such as intersects with or out of range. Please see how to solve them in the *Structured efuse fields* article.

**Bit Order**

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump
```

```none
USER_DATA (BLOCK3) [3 ] read_regs: 03020100 07060504 0B0A0908
<RF0E0D00C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4 (BLOCK4) [4 ] read_regs: 03020100 07060504 0B0A0908
<RF0E0D00C 13121111 17161514 1B1A1918 1F1E1D1C
```

where is the register representation:

```none
EFUSE_RD_USR_DATA0_REG = 0x03020100
EFUSE_RD_USR_DATA1_REG = 0x07060504
EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
EFUSE_RD_USR_DATA4_REG = 0x13121111
EFUSE_RD_USR_DATA5_REG = 0x17161514
EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C
```

where is the byte representation:

```none
byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] = 0x1F
```

(下页继续)
For example, the csv file describes the `USER_DATA` field, which occupies all 256 bits (a whole block).

```
| USER_DATA, | 0, 256, User data |
| USER_DATA.FIELD1, | 16, 16, Field1 |
| ID, | 8, 3, ID bit[0..2] |
| | 16, 2, ID bit[3..4] |
| | 32, 3, ID bit[5..7] |
```

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count;  // can be used for this case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2);  // reads only first 2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID);  // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count;  // can NOT be used because it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
// [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

**Debug eFuse & Unit tests**

**Virtual eFuses**  The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse_em` partition. `partition.csv`: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure _boot and flash_encryption features with this option).

**espefuse.py**  esptool includes a useful tool for reading/writing ESP32 eFuse bits - espefuse.py.

Enumerations
enum esp_efuse_block_t
    Type of eFuse blocks for ESP32.

    Values:

    enumerator EFUSE_BLK0
        Number of eFuse block. Reserved.

    enumerator EFUSE_BLK1
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK_KEY0
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK_ENCRYPT_FLASH
        Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

    enumerator EFUSE_BLK2
        Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

    enumerator EFUSE_BLK_KEY1
        Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

    enumerator EFUSE_BLK_SECURE_BOOT
        Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

    enumerator EFUSE_BLK3
        Number of eFuse block. Uses for the purpose of the user.

    enumerator EFUSE_BLK_KEY2
        Number of eFuse block. Uses for the purpose of the user.

    enumerator EFUSE_BLK_KEY_MAX

    enumerator EFUSE_BLK_MAX

enum esp_efuse_coding_scheme_t
    Type of coding scheme.

    Values:

    enumerator EFUSE_CODING_SCHEME_NONE
        None
enumerator **EFUSE CODING_SCHEME_3_4**

3/4 coding

eumerator **EFUSE CODING_SCHEME_REPEAT**

Repeat coding

euno **esp_efuse_purpose_t**

Type of key purpose (virtual because ESP32 has only fixed purposes for blocks)

*Values:*

eumerator **ESP_EFUSE_KEY_PURPOSE_USER**

BLOCK3

eumerator **ESP_EFUSE_KEY_PURPOSE_SYSTEM**

BLOCK0

eumerator **ESP_EFUSE_KEY_PURPOSE_FLASH_ENCRYPTION**

BLOCK1

eumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_V2**

BLOCK2

eumerator **ESP_EFUSE_KEY_PURPOSE_MAX**

MAX PURPOSE

**Header File**

- components/efuse/include/esp_efuse.h

**Functions**

```c
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
```

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**备注:** Please note that reading in the batch mode does not show uncommitted changes.

**参数**

- **field** – 【in】 A pointer to the structure describing the fields of efuse.
- **dst** – 【out】 A pointer to array that will contain the result of reading.
- **dst_size_bits** – 【in】 The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**返回**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
bool esp_efuse_read_field_bit (const esp_efuse_desc_t *field[])  
Read a single bit eFuse field as a boolean value.

备注: The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp Efuse_read_field_blob() and check the returned value instead.

备注: If assertions are enabled and the parameter is invalid, execution will abort.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数 field –[in] A pointer to the structure describing the fields of efuse.

返回
- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

esp_err_t esp_efuse_read_field_cnt (const esp_efuse_desc_t *field[], size_t*out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1”.
If the bits are set not sequentially, they will still be counted.

备注: Please note that reading in the batch mode does not show uncommitted changes.

参数
- field –[in] A pointer to the structure describing the fields of efuse.
- out_cnt –[out] A pointer that will contain the number of programmed as “1” bits.

返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

esp_err_t esp_efuse_write_field_blob (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.
The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

参数
- field –[in] A pointer to the structure describing the fields of efuse.
- src –[in] A pointer to array that contains the data for writing.
- src_size_bits –[in] The number of bits required to write.

返回
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t esp_efuse_write_field_cnt (const esp_efuse_desc_t *field[], size_t cnt)

Writes a required count of bits as “1” to EFUSE field.
If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.
**Chapter 2. API Reference**

### `esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])`

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling `esp_efuse_write_field_cnt()` with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

**Parameters**
- `field` - [in] Pointer to the structure describing the eFuse field.

**Return Values**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

### `esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)`

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Parameters**
- `blk` - [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Return Values**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

### `esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**
- `blk` - [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Return Values**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

### `int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

**Parameters**
- `field` - [in] A pointer to the structure describing the fields of eFuse.

**Return Values**
- Returns the number of bits used by field.

### `uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of eFuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Parameters**
- `blk` - [in] Block number of eFuse.

---

**Notes:** Please note that reading in the batch mode does not show uncommitted changes.
Chapter 2. API リファレンス

- **num_reg** - [in] The register number in the block.

**esp_err_t esp_efuse_write_reg** (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Parameters**
- **blk** - [in] Block number of EFuse.
- **num_reg** - [in] The register number in the block.
- **val** - [in] Value to write.

**Return**
- **ESP_OK**: The operation was successfully completed.
- **ESP_ERR_EFUSE_REPEATED_PROG**: Error repeated programming of programmed bits is strictly forbidden.

**esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme** (esp_efuse_block_t blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Parameters**
- **blk** - [in] Block number of EFuse.

**Return**
- Return efuse coding scheme for blocks

**esp_err_t esp_efuse_read_block** (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)

Read key to efuse block starting at the offset and the required size.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**
- **blk** - [in] Block number of EFuse.
- **dst_key** - [in] A pointer to array that will contain the result of reading.
- **size_bits** - [in] The number of bits required to read.

**Return**
- **ESP_OK**: The operation was successfully completed.
- **ESP_ERR_INVALID_ARG**: Error in the passed arguments.
- **ESP_ERR_CODING**: Error range of data does not match the coding scheme.

**esp_err_t esp_efuse_write_block** (esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)

Write key to efuse block starting at the offset and the required size.

**Parameters**
- **blk** - [in] Block number of EFuse.
- **src_key** - [in] A pointer to array that contains the key for writing.
- **size_bits** - [in] The number of bits required to write.

**Return**
- **ESP_OK**: The operation was successfully completed.
- **ESP_ERR_INVALID_ARG**: Error in the passed arguments.
- **ESP_ERR_CODING**: Error range of data does not match the coding scheme.
- **ESP_ERR_EFUSE_REPEATED_PROG**: Error repeated programming of programmed bits.
uint32_t esp_efuse_get_pkg_ver (void)

Returns chip package from efuse.

void esp_efuse_reset (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

备注: This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialize.

void esp_efuse_disable_basic_rom_console (void)

Disable BASIC ROM Console via efuse.

By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

Call this function (from bootloader or app) to permanently disable the console on this chip.

esp_err_t esp_efuse_disable_rom_download_mode (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

备注: Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

备注: If ROM Download Mode is already disabled, this function does nothing and returns success.

返回

• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
• ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)

Set boot ROM log scheme via eFuse.

备注: By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

参数 log_scheme – Supported ROM log scheme

返回

• ESP_OK If the eFuse was successfully burned, or had already been burned.
• ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
• ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

uint32_t esp_efuse_read_secure_version (void)

Return secure_version from efuse field.

返回 Secure version from efuse field
bool esp_efuse_check_secure_version (uint32_t secure_version)

Check secure_version from app and secure_version and from efuse field.

  参数 secure_version – Secure version from app.
  返回
  • True: If version of app is equal or more then secure_version from efuse.

esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

  参数 secure_version –[in] Secure version from app.
  返回
  • ESP_OK: Successful.
  • ESP_FAIL: secure version of app cannot be set to efuse field.
  • ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

esp_err_t esp_efuse_batch_write_begin (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new...
                               // value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1...
                              // because uncommitted changes are not readable, it will be available only...
                              // after commit.
...
// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be...
                                 // done in the last commit().
...
// Write all of these fields to the efuse registers
```
Chapter 2. API

```c
esp_efuse_batch_write_commit();
esp_efuse_read_...(ESP_EFUSE_1);  // this function returns ESP_EFUSE_1 == 3.
```

备注：Please note that reading in the batch mode does not show uncommitted changes.

返回
- ESP_OK: Successful.

**esp_err_t esp_efuse_batch_write_cancel**(void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

返回
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

**esp_err_t esp_efuse_batch_write_commit**(void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

返回
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

**bool esp_efuse_block_is_empty**(esp_efuse_block_t block)

Checks that the given block is empty.

返回
- True: The block is empty.
- False: The block is not empty or was an error.

**bool esp_efuse_get_key_dis_read**(esp_efuse_block_t block)

Returns a read protection for the key block.

参数 block -[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 True: The key block is read protected False: The key block is readable.

**esp_err_t esp_efuse_set_key_dis_read**(esp_efuse_block_t block)

Sets a read protection for the key block.

参数 block -[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**bool esp_efuse_get_key_dis_write**(esp_efuse_block_t block)

Returns a write protection for the key block.

参数 block -[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 True: The key block is write protected False: The key block is writeable.

**esp_err_t esp_efuse_set_key_dis_write**(esp_efuse_block_t block)

Sets a write protection for the key block.

参数 block -[in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Chapter 2. API 参考

返回
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed
  bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_key_block_unused(esp_efuse_block_t block)

Returns true if the key block is unused, false otherwise.

参数 block – key block to check.

返回
- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool esp_efuse_find_purpose(esp_efuse_purpose_t purpose, esp_efuse_block_t *block)

Find a key block with the particular purpose set.

参数
- purpose – [in] Purpose to search for.
- block – [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
  which will be set to the key block if found. Can be NULL, if only need to test the key
  block exists.

返回
- True: If found,
- False: If not found (value at block pointer is unchanged).

bool esp_efuse_get_keypurpose_dis_write(esp_efuse_block_t block)

Returns a write protection of the key purpose field for an efuse key block.

备注: For ESP32: no keypurpose, it returns always True.

参数 block – [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回 True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t esp_efuse_get_key_purpose(esp_efuse_block_t block)

Returns the current purpose set for an efuse key block.

参数 block – [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

返回
- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

esp_err_t esp_efuse_write_key(esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key,
  size_t key_size_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

参数
- block – [in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to
  EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- purpose – [in] Purpose to set for this key. Purpose must be already unset.
- key – [in] Pointer to data to write.
- key_size_bytes – [in] Bytes length of data to write.

返回
- ESP_OK: Successful.
Chapter 2. API

- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys (const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)`

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

参数
- `purposes` - [in] Array of purposes (purpose[number_of_keys]).
- `keys` - [in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- `number_of_keys` - [in] The number of keys to write (up to 6 keys).

返回
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_check_errors (void)`

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

备注：Refer to ESP32-C3 only.

返回
- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

Structures

`struct esp_efuse_desc_t`  
Type definition for an eFuse field.

Public Members

`esp_efuse_block_t efuse_block`  
Block of eFuse

`uint8_t bit_start`  
Start bit [0..255]

`uint16_t bit_count`  
Length of bit field [1..-]
Chapter 2. API

Macros

ESP_ERR_EFUSE
Base error code for efuse api.

ESP_OK_EFUSE_CNT
OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL
Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG
Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING
Error while a encoding operation.

ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS
Error not enough unused key blocks available

ESP_ERR_DAMAGED_READING
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to
the efuse component and not returned by any public API.

Enumerations

enum esp_efuse_rom_log_scheme_t
Type definition for ROM log scheme.

Values:

enumerator ESP_EFUSE_ROM_LOG_ALWAYS_ON
Always enable ROM logging

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
ROM logging is enabled when specific GPIO level is low during start up

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
ROM logging is enabled when specific GPIO level is high during start up

enumerator ESP_EFUSE_ROM_LOG_ALWAYS_OFF
Disable ROM logging permanently

2.10.7 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.
For general information about error codes in ESP-IDF, see Error Handling.
For the full list of error codes defined in ESP-IDF, see Error Code Reference.
Chapter 2. API 参考

API Reference

Header File

- components/esp_common/include/esp_check.h

Macros

ESP_RETURN_ON_ERROR(x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension ##__VA_ARGS__. The second one is using the C++20 feature VA_OPT(.). This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using ##__VA_ARGS__. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

ESP_RETURN_ON_ERROR_ISR(x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

ESP_GOTO_ON_ERROR(x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_ERROR_ISR(x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

ESP_RETURN_ON_FALSE(a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

ESP_RETURN_ON_FALSE_ISR(a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE(a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR(a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- components/esp_common/include/esp_err.h

Functions

const char *esp_err_to_name(esp_err_t code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数 code - esp_err_t error code
返回 string error message

const char *esp_err_to_name_r(esp_err_t code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

参数
- **code** - esp_err_t error code
- **buf** - [out] buffer where the error message should be written
- **buflen** - Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

返回 buf containing the string error message

**Macros**

ESP_OK  
esp_err_t value indicating success (no error)

ESP_FAIL  
Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM  
Out of memory

ESP_ERR_INVALID_ARG  
Invalid argument

ESP_ERR_INVALID_STATE  
Invalid state

ESP_ERR_INVALID_SIZE  
Invalid size

ESP_ERR_NOT_FOUND  
Requested resource not found

ESP_ERR_NOT_SUPPORTED  
Operation or feature not supported

ESP_ERR_TIMEOUT  
Operation timed out

ESP_ERR_INVALID_RESPONSE  
Received response was invalid

ESP_ERR_INVALID_CRC  
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION  
Version was invalid

ESP_ERR_INVALID_MAC  
MAC address was invalid
**Chapter 2. API 参考**

**ESP_ERR_NOT_FINISHED**
There are items remained to retrieve

**ESP_ERR_WIFI_BASE**
Starting number of WiFi error codes

**ESP_ERR_MESH_BASE**
Starting number of MESH error codes

**ESP_ERR_FLASH_BASE**
Starting number of flash error codes

**ESP_ERR_HW_CRYPTO_BASE**
Starting number of HW cryptography module error codes

**ESP_ERR_MEMPROT_BASE**
Starting number of Memory Protection API error codes

**ESP_ERROR_CHECK (x)**
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK.
Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

**ESP_ERROR_CHECK_WITHOUT_ABORT (x)**
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

**Type Definitions**
typedef int esp_err_t

### 2.10.8 ESP HTTPS OTA

**Overview**

`esp_https_ota` provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

**Application Example**

```c
esp_err_t do_firmware_upgrade() {
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
```
Server Verification

Please refer to ESP-TLS: TLS Server Verification for more information on server verification. The root certificate (in PEM format) needs to be provided to the esp_http_client_config_t::cert_pem member.

备注：The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason being that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the ESP x509 Certificate Bundle feature for verification, which covers most of the trusted root certificates (using the esp_http_client_config_t::crt_bundle_attach member).

Partial Image Download over HTTPS

To use partial image download feature, enable partial_http_download configuration in esp_https_ota_config_t. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting max_http_request_size to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using partial_http_download with max_http_request_size of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer 没有安全启动的安全OTA升级.

Advanced APIs

esp=https_ota also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP_HTTPS OTA APIs: system/ota/advanced_https_ota.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable CONFIG_ESP_HTTPS_OTA_DECRYPT_CB in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: system/ota/pre_encrypted_ota.
Chapter 2. API 参考

API Reference

Header File

• components/esp_https_ota/include/esp_https_ota.h

Functions

esp_err_t esp_https_ota (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert.pem member of ota_config->http_config.

备注： This API handles the entire OTA operation, so if this API is being used then no other APIs from esp_https_ota component should be called. If more information and control is needed during the HTTPS OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns successfully, esp_restart() must be called to boot from the new firmware image.

参数 ota_config [in] pointer to esp_https_ota_config_t structure.

返回

• ESP_OK: OTA data updated, next reboot will use specified partition.
• ESP_FAIL: For generic failure.
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
• ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• For other return codes, refer OTA documentation in esp-idf’s app_update component.

esp_err_t esp_https_ota_begin (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then esp_https_ota_perform should be called to continue with the OTA process and there should be a call to esp_https_ota_finish on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert.pem member of http_config, which is a part of ota_config. In case of error, this API explicitly sets handle to NULL.

备注： This API is blocking, so setting is_async member of http_config structure will result in an error.

参数 ota_config [in] pointer to esp_https_ota_config_t structure

handle [out] pointer to an allocated data of type esp_https_ota_handle_t which will be initialised in this function

返回

• ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
• ESP_FAIL: For generic failure.
• ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
• For other return codes, refer documentation in app_update component and esp_http_client component in esp-idf.
**esp_err_t esp_https_ota_perform** *(esp_https_ota_handle_t https_ota_handle)*

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

参数 https_ota_handle — [in] pointer to esp_https_ota_handle_t structure

返回

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**bool esp_https_ota_is_complete_data_received** *(esp_https_ota_handle_t https_ota_handle)*

Checks if complete data was received or not.

备注: This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

参数 https_ota_handle — [in] pointer to esp_https_ota_handle_t structure

返回

- false
- true

**esp_err_t esp_https_ota_finish** *(esp_https_ota_handle_t https_ota_handle)*

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

备注: If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

参数 https_ota_handle — [in] pointer to esp_https_ota_handle_t structure

返回

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

**esp_err_t esp_https_ota_abort** *(esp_https_ota_handle_t https_ota_handle)*

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

备注: esp_https_ota_abort should not be called after calling esp_https_ota_finish
Chapter 2. API

### Parameters

**https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

**new_app_info** - [out] pointer to an allocated esp_app_desc_t structure

### Return

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument

### Remarks

This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

### esp_err_t esp_https_ota_get_img_desc

```c

| Structures |
|---|---|
| **esp_https_ota_config_t** | ESP HTTPS OTA configuration. |
Chapter 2. API 参考

Public Members

const esp_http_client_config_t *http_config
ESP HTTP client configuration

http_client_init_cb_t http_client_init_cb
Callback after ESP HTTP client is initialised

bool bulk_flash_erase
Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool partial_http_download
Enable Firmware image to be downloaded over multiple HTTP requests

int max_http_request_size
Maximum request size for partial HTTP download

Macros

ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)

Enumerations

enum esp_https_ota_event_t
Events generated by OTA process.

备注: Expected data type for different OTA events:

- ESP_HTTPS_OTA_START : NULL
- ESP_HTTPS_OTA_CONNECTED : NULL
- ESP_HTTPS_OTA_GET_IMG_DESC : NULL
- ESP_HTTPS_OTA_VERIFY_CHIP_ID : esp_chip_id_t
- ESP_HTTPS_OTA_DECRYPT_CB : NULL
- ESP.Https_OTA_WRITE_FLASH : int
- ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION : esp_partition_subtype_t
- ESP_HTTPS_OTA_FINISH : NULL
- ESP_HTTPS_OTA_ABORT : NULL

Values:

enumerator ESP_HTTPS_OTA_START
OTA started
**Chapter 2. API**

**Enumerator**: ESP_HTTPS_OTA_CONNECTED

*Connected to server*

**Enumerator**: ESP_HTTPS_OTA_GET_IMG_DESC

*Read app description from image header*

**Enumerator**: ESP_HTTPS_OTA_VERIFY_CHIP_ID

*Verify chip id of new image*

**Enumerator**: ESP_HTTPS_OTA_DECRYPT_CB

*Callback to decrypt function*

**Enumerator**: ESP_HTTPS_OTA_WRITE_FLASH

*Flash write operation*

**Enumerator**: ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION

*Boot partition update after successful ota update*

**Enumerator**: ESP_HTTPS_OTA_FINISH

*OTA finished*

**Enumerator**: ESP_HTTPS_OTA_ABORT

*OTA aborted*

## 2.10.9 Event Loop Library

**Overview**

The event loop library allows components to declare events to which other components can register handlers that will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

### Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

- Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as esp_event_handler_t.
2. An event loop is created using esp_event_loop_create(), which outputs a handle to the loop of type esp_event_loop_handle_t. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here.
3. Components register event handlers to the loop using esp_event_handler_register_with(). Handlers can be registered with multiple loops, more on that here.
4. Event sources post an event to the loop using esp_event_post_to().
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.

6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data) {
    // Event handler logic
}

void app_main() {
    // 2. A configuration structure of type esp_event_loop_args_t is needed to specify the properties of the loop to be created. A handle of type esp_event_loop_handle_t is obtained, which is needed by the other APIs to reference the loop to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...,
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID specifies a hypothetical event that handler run_on_event should execute on when it gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);
    ...

    // 4. Post events to the loop. This queues the event on the event loop. At some point in time the event loop executes the event handler registered to the posted event, in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but posting can be done from any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);
    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);
    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}
```
Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

备注： In IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENTDEFINE_BASE).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.
Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e., using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. `ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE, MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order**

The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:
Chapter 2. API Reference

- NMEA Parser, which will decode the statements received from GPS.

**Header File**

- components/esp_event/include/esp_event.h

**Functions**

```c
esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args, esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

- `event_loop_args` - [in] configuration structure for the event loop to create
- `event_loop` - [out] handle to the created event loop

- **Return**
  - ESP_OK: Success
  - ESP_ERR_INVALID_ARG: `event_loop_args` or `event_loop` was NULL
  - ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
  - ESP_FAIL: Failed to create task loop
  - Others: Fail

```c
esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)
```

Delete an existing event loop.

- `event_loop` - [in] event loop to delete, must not be NULL

- **Return**
  - ESP_OK: Success
  - Others: Fail

```c
esp_err_t esp_event_loop_create_default (void)
```

Create default event loop.

- **Return**
  - ESP_OK: Success
  - ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
  - ESP_FAIL: Failed to create task loop
  - Others: Fail

```c
esp_err_t esp_event_loop_delete_default (void)
```

Delete the default event loop.

- **Return**
  - ESP_OK: Success
  - Others: Fail

```c
esp_err_t esp_event_loop_run (esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)
```

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in `event_loop_args` argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.
In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

备注: encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

参数
- `event_loop` [in] event loop to dispatch posted events from, must not be NULL
- `ticks_to_run` [in] number of ticks to run the loop

返回
- ESP_OK: Success
- Others: Fail

```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

备注: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

参数
- `event_base` [in] the base ID of the event to register the handler for
- `event_id` [in] the ID of the event to register the handler for
- `event_handler` [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` [in] data, aside from event data, that is passed to the handler when it is called

返回
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.
Chapter 2. API

**备注:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### 参数
- **event_loop** - [in] the event loop to register this handler function to, must not be NULL
- **event_base** - [in] the base ID of the event to register the handler for
- **event_id** - [in] the ID of the event to register the handler for
- **event_handler** - [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** - [in] data, aside from event data, that is passed to the handler when it is called

### 返回
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
                                                esp_event_base_t event_base, int32_t event_id,
                                                esp_event_handler_t event_handler, void *event_handler_arg,
                                                esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**备注:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### 参数
- **event_loop** - [in] the event loop to register this handler function to, must not be NULL
- **event_base** - [in] the base ID of the event to register the handler for
- **event_id** - [in] the ID of the event to register the handler for
- **event_handler** - [in] the handler function which gets called when the event is dispatched
- **event_handler_arg** - [in] data, aside from event data, that is passed to the handler when it is called
- **instance** - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same
for all registrations. If no unregistration is needed, but the handler should be deleted when
the event loop is deleted, instance can be NULL.

### Return
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance
  is NULL
- Others: Fail

#### esp_err_t esp_event_handler_instance_register

```c
def esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,
        esp_event_handler_t event_handler, void *event_handler_arg,
        esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler
to the default event loop.

### Notes
- the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure
  that `event_handler_arg` still points to a valid location by the time the handler gets called

#### Parameters
- **event_base** - [in] the base ID of the event to register the handler for
- **event_id** - [in] the ID of the event to register the handler for
- **event_handler** - [in] the handler function which gets called when the event is dis-
  patched
- **event_handler_arg** - [in] data, aside from event data, that is passed to the handler
  when it is called
- **instance** - [out] An event handler instance object related to the registered event handler
  and data, can be NULL. This needs to be kept if the specific callback instance should be
  unregistered before deleting the whole event loop. Registering the same event handler
  multiple times is possible and yields distinct instance objects. The data can be the same
  for all registrations. If no unregistration is needed, but the handler should be deleted when
  the event loop is deleted, instance can be NULL.

### Return
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance
  is NULL
- Others: Fail

#### esp_err_t esp_event_handler_unregister

```c
def esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id,
        esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any
combination of `event_base` and `event_id` which were previously registered. To unregister a handler, the `event_base`
and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_register()` when that
handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unreg-
ister handlers that were registered with the same wildcard arguments.

### Notes
- When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base
  will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also
  not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.
Chapter 2. API 参考

- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **event_handler** - [in] the handler to unregister

返回
- ESP_OK: success
- ESP_ERR_INVALID_ARG: invalid combination of event base and event ID
- Others: fail

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop,
                                         esp_event_base_t event_base, int32_t event_id,
                                         esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

**参数**
- **event_loop** - [in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **event_handler** - [in] the handler to unregister

返回
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop,
                                       esp_event_base_t event_base, int32_t event_id,
                                       esp_event_handler_instance_t instance)
```

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

备注: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

**参数**
- **event_loop** - [in] the event loop with which to unregister this handler function, must not be NULL
- **event_base** - [in] the base of the event with which to unregister the handler
- **event_id** - [in] the ID of the event with which to unregister the handler
- **instance** - [in] the instance object of the registration to be unregistered

返回
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_unregister(esp_event_base_t event_base, int32_t event_id,
                                              esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.
This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

**参数**
- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `instance` [in] the instance object of the registration to be unregistered

**返回**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**参数**
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `ticks_to_wait` [in] number of ticks to block on a full event queue

**返回**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of `event_data` and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as `esp_event_post_to`, except the additional specification of the event loop to post the event to.

**参数**
- `event_loop` [in] the event loop to post to, must not be NULL
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `ticks_to_wait` [in] number of ticks to block on a full event queue

**返回**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of `esp_event_post` for posting events from interrupt handlers.
Chapter 2. API

### esp_event_isr_post_to

```c
esp_err_t esp_event_isr_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, BaseType_t* task_unblocked)
```

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

#### 参数
- `event_loop` [in] the event loop to post to, must not be NULL
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `task_unblocked` [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

#### 返回
- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

### esp_event_dump

```c
esp_err_t esp_event_dump(FILE* file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:
event loop
handler
handler
...
event loop
handler
handler
...

where:

```
event loop
    format: address, name rx: total_received dr: total_dropped
    where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue being full
``` 

```
handler
    format: address ev: base, id inv: total_invoked run: total_runtime
    where:
    address - address of the handler function
    base, id - the event specified by event base and ID this handler executes
    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler
``` 

备注：this function is a noop when CONFIG_ESP_EVENTLOOP_PROFILING is disabled

参数 file - [in] the file stream to output to
返回

ESP_OK: Success
ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
Others: Fail

Structures

```
struct esp_event_loop_args_t
    Configuration for creating event loops.
```

Public Members

```
int32_t queue_size
    size of the event loop queue

const char *task_name
    name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
    priority of the event loop task, ignored if task name is NULL
```
uint32_t **task_stack_size**

stack size of the event loop task, ignored if task name is NULL

BaseType_t **task_core_id**

core to which the event loop task is pinned to, ignored if task name is NULL

**Macros**

- **ESP_EVENT_DECLARE_BASE** (id)

- **ESP_EVENT_DEFINE_BASE** (id)

- **ESP_EVENT_ANY_BASE**

  register handler for any event base

- **ESP_EVENT_ANY_ID**

  register handler for any event id

**Type Definitions**

typedef void **esp_event_loop_handle_t**

a number that identifies an event with respect to a base

typedef void (**esp_event_handler_t**)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)

  function called when an event is posted to the queue

typedef void **esp_event_handler_instance_t**

  context identifying an instance of a registered event handler

**Related Documents**

**2.10.10 FreeRTOS**

**Overview**

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

**备注**: ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

- For more information about the SMP changes of ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS (SMP)
- For more information about the features added to ESP-IDF FreeRTOS, see FreeRTOS Supplemental Features.
Configuration

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various #define config... macros to FreeRTOSConfig.h. Through these macros, the kernel’s scheduling behavior and various kernel features can be enabled or disabled. However, in ESP-IDF FreeRTOS, the “FreeRTOSConfig.h“ file is considered a private and must not be modified by users. Any FreeRTOS configuration that is exposed to the user will be done so via menuconfig.

ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see Project Configuration.

- **CONFIG_FREERTOS_UNICORE** will run ESP-IDF FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Futhermore, this option may affect behavior of components other than frees. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core. Alternatively, users can also search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

- **CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER** will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call vTaskDelete()), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

ESP-IDF FreeRTOS Applications

Unlike Vanilla FreeRTOS, users must not call **vTaskStartScheduler()**. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined **void app_main(void)** function.

- Typically, users would spawn the rest of their applications task from **app_main**.
- The **app_main** function is allowed to return at any point (i.e., before the application terminates).
- The **app_main** function is called from the main task.

The main task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Affinity</th>
<th>Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Task (main)</td>
<td>CPU0</td>
<td>1</td>
<td>Task that simply calls <strong>app_main</strong>. This task will self delete when <strong>app_main</strong> returns</td>
</tr>
<tr>
<td>Idle Tasks (IDLEx)</td>
<td>CPU0 and CPU1</td>
<td>0</td>
<td>Idle tasks created for (and pinned to) each CPU</td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>CPU0 and CPU1</td>
<td>24</td>
<td>IPC tasks created for (and pinned to) each CPU. IPC tasks are used to implement the IPC feature. See <strong>Inter-Processor Call</strong> for more details.</td>
</tr>
</tbody>
</table>

Task API

Header File

Functions

BaseType_t **xTaskCreatePinnedToCore** (TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)
Create a new task with a specified affinity and add it to the list of tasks that are ready to run. This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for(;;)
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task pinned to core 0, storing the handle. Note that the
    // passed parameter ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared
    // static. If it was just an
    // automatic stack variable it might no longer exist, or at least have
    // been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreatePinnedToCore( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass,
                             tskIDLE_PRIORITY, &xHandle, 0 );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

备注：If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

参数
- `pxTaskCode` - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- `pcName` - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- `usStackDepth` - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters` - Pointer that will be used as the parameter for the task being created.
- `uxPriority` - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- `pvCreatedTask` - [out] Used to pass back a handle by which the created task can be referenced.
- `xCoreID` - If the value is tskNO_AFFINITY, the created task is not pinned to any CPU.
and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (configNUM_CORES - 1) will cause the function to fail.

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h.

TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity and add it to the list of tasks that are ready to run.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Example usage:

```c
#define STACK_SIZE 200

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // call to xTaskCreatePinnedToCore().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task pinned to core 0 without using any dynamic memory allocation.
    xHandle = xTaskCreateStaticPinnedToCore(
                 vTaskCode, "NAME", STACK_SIZE, 1, tskIDLE_PRIORITY, xStack,
                 pxTaskBuffer, 0 ); // Specify the task's core affinity
```
// puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
// been created, and xHandle will be the task's handle. Use the handle
// to suspend the task.
vTaskSuspend( xHandle );
}

参数

- **pxTaskCode** – Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** – A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** – The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** – Pointer that will be used as the parameter for the task being created.
- **uxPriority** – The priority at which the task will run.
- **pxStackBuffer** – Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** – Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID** – If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (configNUM_CORES - 1) will cause the function to fail.

返回 If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

```c
static inline BaseType_t xTaskCreate( TaskFunction_t pxTaskCode, const char *const pcName, const configSTACK_DEPTH_TYPE ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t * const pxCreatedTask )
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
```

(下页继续)
// Task code goes here.

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter
    ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared
    static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have
    // been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    // PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}

备注：If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

参数

- **pxTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to ( 2 ^ portPRIVILEGE_BIT ).
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.

返回 pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline TaskHandle_t xTaskCreateStatic(TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate()
function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then
the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be
created without using any dynamic memory allocation.

Example usage:

```c
#define STACK_SIZE 200

// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    // Task code goes here.
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( vTaskCode, "NAME", STACK_SIZE, ( void * ) 1, tskIDLE_PRIORITY, xStack,
                                  &xTaskBuffer ); // Variable to hold the task's data...

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}
```

备注：If program uses thread local variables (ones specified with “__thread” keyword) then storage for them
will be allocated on the task’s stack.

参数
- `pxTaskCode` — Pointer to the task entry function. Tasks must be implemented to never
return (i.e. continuous loop), or should be terminated using vTaskDelete function.

- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.

- **ulStackDepth** - The size of the stack task specified as the number of bytes. Note that this differs from vanilla FreeRTOS.

- **pvParameters** - Pointer that will be used as the parameter for the task being created.

- **uxPriority** - The priority at which the task will run.

- **puxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.

- **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

```c
BaseType_t xTaskCreateRestricted(const TaskParameters_t *const pxTaskDefinition, TaskHandle_t *pxCreatedTask)
```

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters = {
    vATask, // pvTaskCode - the function that implements the task.
    "ATask", // pcName - just a text name for the task to assist debugging.
    100, // usStackDepth - the stack size DEFINED IN WORDS.
    NULL, // pvParameters - passed into the task function as the function parameters.
    (1UL | portPRIVILEGE_BIT), // uxPriority - task priority, set the portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by the task, with appropriate access permissions. Different processors have different memory alignment requirements - refer to the FreeRTOS documentation for full information.
    {
        // Base address Length Parameters
        { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
        { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_WRITE }
    }
};

int main( void )
{
    TaskHandle_t xHandle;
    // Add the task to the list of tasks that are ready to run.
}
```
// Create a task from the const structure defined above. The task handle
// is requested (the second parameter is not NULL) but in this case just for
// demonstration purposes as its not actually used.
xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

// Start the scheduler.
vTaskStartScheduler();

// Will only get here if there was insufficient memory to create the idle
// and/or timer task.
for(;;);

参数

• **pxTaskDefinition** – Pointer to a structure that contains a member for each of the
  normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an
  optional stack buffer and the memory region definitions.

• **pxCreatedTask** – Used to pass back a handle by which the created task can be refer-
  enced.

返回

pdPASS if the task was successfully created and added to a ready list, otherwise an error code
defined in the file projdefs.h

```c
void vTaskAllocateMPURegions (TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
```

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to
hold the task’s data structures. The second block is used by the task as its stack. If a task is created using
xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the
task’s data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a
task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used
to hold the task’s data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected
task to be created without using any dynamic memory allocation.

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel’s privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
  vATask, // pvTaskCode - the function that implements the task.
  "ATask", // pcName - just a text name for the task to assist debugging.
  100,    // usStackDepth - the stack size DEFINED IN BYTES.
  NULL,   // pvParameters - passed into the task function as the function...
  --parameters.
  (1UL | portPRIVILEGE_BIT ),// uxPriority - task priority, set the
  --portPRIVILEGE_BIT if the task should run in a privileged state.
  cStackBuffer,  // puxStackBuffer - the buffer to be used as the task stack.
  // xRegions - Allocate up to three separate memory regions for access by
  // the task, with appropriate access permissions. Different processors have
  // different memory alignment requirements - refer to the FreeRTOS_
  --documentation
```
Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.

Example usage:

```c
// Define an array of MemoryRegion_t structures that configures an MPU region // allowing read/write access for 1024 bytes starting at the beginning of the // ucOneKByte array. The other two of the maximum 3 definable regions are // unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] = {
    // Base address Length Parameters
    { ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
    { 0, 0, 0 },
    { 0, 0, 0 }
};

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of // memory as defined by the MPU configuration. At some point it is // desired that these MPU regions are replaced with that defined in the // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions() // for this purpose. NULL is used as the task handle to indicate that this // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only // access its stack and the ucOneKByte array (unless any other statically // defined or shared regions have been declared elsewhere).
}
```
### API Reference

#### Chapter 2. API

- **pxTaskDefinition** - Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPP-ORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask_t - which is then used to hold the task’s data structure.
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.
- **xTask** - The handle of the task being updated.
- **pxRegions** - A pointer to a MemoryRegion_t structure that contains the new memory region definitions.

#### Return
- **pdPASS** if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h.

#### void vTaskDelete(TaskHandle_t xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

**NOTE:** The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

**Example usage:**

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_--);

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

- **xTaskToDelete** - The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

#### void vTaskDelay(constTickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes.
xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

**参数 xTicksToDelay** —The amount of time, in tick periods, that the calling task should block.

BaseType_t xTaskDelayUntil(TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path through the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, xTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();

    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```
### 参数

- **pxPreviousWakeTime** - Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within xTaskDelayUntil().

- **xTimeIncrement** - The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

#### 返回
Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task was delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.

#### BaseType_t xTaskAbortDelay(TaskHandle_t xTask)

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

- **参数 xTask** - The handle of the task to remove from the Blocked state.

#### 返回
If the task referenced by xTask was not in the Blocked state then pdFAIL is returned. Otherwise pdPASS is returned.

#### UBaseType_t uxTaskPriorityGet(const TaskHandle_t xTask)

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

#### Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed its priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // ...
    }

    // ...
}
```

(下页続き)
参数 xTask –Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

返回 The priority of xTask.

UBaseType_t uxTaskPriorityGetFromISR (const TaskHandle_t xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState eTaskGetState (TaskHandle_t xTask)

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

参数 xTask –Handle of the task to be queried.

返回 The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void vTaskGetInfo (TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction ( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

参数

- **xTask** –Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** –A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** –The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be
skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE.

- **eState** - The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

```c
void vTaskPrioritySet(TaskHandle_t xTask, UBaseType_t uxNewPriority)
```

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction(void)
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate(vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet(xHandle, tskIDLE_PRIORITY + 1);

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet(NULL, tskIDLE_PRIORITY + 1);
}
```

**参数**

- **xTask** - Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** - The priority to which the task will be set.

```c
void vTaskSuspend(TaskHandle_t xTaskToSuspend)
```

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```c
void vAFunction(void)
{
    TaskHandle_t xHandle;
```

(下一页)
// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_~);

// ...

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Suspend ourselves.
vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}

参数 xTaskToSuspend --Handle to the task being suspended. Passing a NULL handle will
cause the calling task to be suspended.

void vTaskResume( TaskHandle_t xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section
for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running
again by a single call to vTaskResume ()

Example usage:

void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_~);

    // ...

    // Use the handle to suspend the created task.
vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    //...
// Resume the suspended task ourselves.
  vTaskResume( xHandle );

// The created task will once again get microcontroller processing
// time in accordance with its priority within the system.

### 参数 xTaskToResume - Handle to the task being readied.

**BaseType**: xTaskResumeFromISR (TaskHandle_t xTaskToResume)

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

### 参数 xTaskToResume - Handle to the task being readied.

返回 pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

**void vTaskStartScheduler (void)**

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:

```c
void vAFunction( void )
{
  // Create at least one task before starting the kernel.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

  // Start the real time kernel with preemption.
  vTaskStartScheduler();

  // Will not get here unless a task calls vTaskEndScheduler()
}
```

备注: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

**void vTaskEndScheduler (void)**

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler() was called, as if vTaskStartScheduler() had just returned.

See the demo application file main.c in the demo/PC directory for an example that uses vTaskEndScheduler().
vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

```c
void vTaskCode ( void * pvParameters )
{
  for (; ; )
  {
    // Task code goes here.
    // At some point we want to end the real time kernel processing
    // so call ...
    vTaskEndScheduler ();
  }
}

void vAFunction ( void )
{
  // Create at least one task before starting the kernel.
  xTaskCreate ( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );
  // Start the real time kernel with preemption.
  vTaskStartScheduler ();
  // Will only get here when the vTaskCode () task has called
  // vTaskEndScheduler (). When we get here we are back to single task
  // execution.
}
```

void vTaskSuspendAll ( void )

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1 ( void * pvParameters )
{
  for ( ; ; )
  {
    // Task code goes here.
    // ... 
    // At some point the task wants to perform a long operation during
    // which it does not want to get swapped out. It cannot use
    // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
    // operation may cause interrupts to be missed - including the
    // ticks.
    // Prevent the real time kernel swapping out the task.
    vTaskSuspendAll ();
    // Perform the operation here. There is no need to use critical
    // sections as we have all the microcontroller processing time.
```
BaseType_t xTaskResumeAll (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1 ( void *pvParameters )
{
    for (;; )
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if ( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}
```

If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t xTaskGetTickCount (void)

The count of ticks since vTaskStartScheduler was called.
TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

返回 The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

返回 The number of tasks that the real time kernel is currently managing. This includes all ready,
blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task
will also be included in the count.

cchar *pcTaskGetName (TaskHandle_t xTaskToQuery)

返回 The text (human readable) name of the task referenced by the handle xTaskToQuery. A task
can query its own name by either passing in its own handle, or by setting xTaskToQuery to
NULL.

TaskHandle_t xTaskGetHandle (const char* pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

返回 The handle of the task that has the human readable name pcNameToQuery. NULL is re-
turned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeR-
TOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be
available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their re-
turn type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.

参数 xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to
check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in bytes not words, unlike vanilla
FreeRTOS) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be
available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their re-
turn type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.

参数 xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to
check the stack of the calling task.

返回 The smallest amount of free stack space there has been (in bytes not words, unlike vanilla
FreeRTOS) since the task referenced by xTask was created.
uint8_t* pxTaskGetStackStart(TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

参数 xTask – Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

返回 A pointer to the start of the stack.

void vTaskSetApplicationTaskTag(TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask.

参数
• xTask – Handle of the task to set the hook function for. Passing xTask as NULL has the effect of setting the calling tasks hook function.
• pxHookFunction – Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag(TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR(TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void* pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

参数
• xTaskToSet – Task to set thread local storage pointer for
• xIndex – The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue – Pointer value to set.

void *pvTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

参数
• xTaskToQuery – Task to get thread local storage pointer for
• xIndex – The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

返回 Pointer value

void vTaskSetThreadLocalStoragePointerAndDelCallback(TaskHandle_t xTaskToSet, BaseType_t xIndex, void* pvValue, TlsDeleteCallbackFunction_t pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted.
For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

### Parameters

- **xTaskToSet** - Task to set thread local storage pointer for.
- **xIndex** - The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- **pvValue** - Pointer value to set.
- **pvDelCallback** - Function to call to dispose of the local storage pointer when the task is deleted.

```c
void vApplicationGetIdleTaskMemory (StaticTask_t **ppxIdleTaskTCBBuffer, StackType_t **ppxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

### Parameters

- **ppxIdleTaskTCBBuffer** - A handle to a statically allocated TCB buffer.
- **ppxIdleTaskStackBuffer** - A handle to a statically allocated Stack buffer for the idle task.
- **pulIdleTaskStackSize** - A pointer to the number of elements that will fit in the allocated stack buffer.

```c
BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)
```

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

### Parameters

- **xTask** - Handle of the task to call the hook for.
- **pvParameter** - Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

```c
TaskHandle_t xTaskGetIdleTaskHandle (void)
```

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

```c
UBaseType_t uxTaskGetSystemState (TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)
```

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

### Example usage:

```c
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats ( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
}
```

(下頁続き)
uint32_t ulTotalRunTime, ulStatsAsPercentage;

// Make sure the write buffer does not contain a string.
*pcWriteBuffer = 0x00;

// Take a snapshot of the number of tasks in case it changes while this
// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter / ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t\t\t%lu\t\t%lu%%\n",-
                        pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,-
                        ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t\t\t<1%%\n",-
                        pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }
            pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
        }
    }
    else
    {
        // The array is no longer needed, free the memory it consumes.
        vPortFree( pxTaskStatusArray );
    }
}
参数

- **pxTaskStatusArray** – A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** – The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** – If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see https://www.FreeRTOS.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

返回

The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

```c
void vTaskList (char *pcWriteBuffer)

List all the current tasks.

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full sprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

参数 **pcWriteBuffer** – A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```
configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:
This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

参数

pcWriteBuffer - A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

uint32_t ulTaskGetIdleRunTimeCounter (void)

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer’s current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

返回
The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

BaseType_t xTaskGenericNotify (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.
A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

- **eSetBits** - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.
- **eIncrement** - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.
- **eSetValueWithOverwrite** - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.
- **eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.
- **eNoAction** - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

**参数**
- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.
- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - **pulPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

**返回**
Dependent on the value of eAction. See the description of the eAction parameter.

```c
BaseType_t xTaskGenericNotifyFromISR(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken)
```

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).
Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyFromISR() is equivalent to calling xTaskNotifyIndexedFromISR() with the uxIndexToNotify parameter set to 0.

eSetBits - The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.

eIncrement - The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

eSetValueWithOverwrite - The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

参数
- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  - **eSetBits** – The task’s notification value is bitwise ORed with ulValue.
  - **eIncrement** – The task’s notification value is incremented. ulValue is not used.
  - **eSetValueWithOverwrite** – The task’s notification value is set to ulValue.
  - **eSetValueWithoutOverwrite** – If the task already had a notification pending then no action is performed.
  - **eNoAction** – The task receives a notification without its notification value being updated. ulValue is not used.

 submit document feedback
• **pxHigherPriorityTaskWoken** - xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

返回 Dependent on the value of eAction. See the description of the eAction parameter.

```c
BaseType_t xTaskGenericNotifyWait( UBaseType_t uxIndexToWorldOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)
```
Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications. See [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html) for details.

**configUSE_TASK_NOTIFICATIONS** must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant **configTASK_NOTIFICATION_ARRAY_ENTRIES** sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTake Indexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake Indexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWorldOn parameter set to 0.

**参数**

- **uxIndexToWorldOn** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWorldOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.

- **ulBitsToClearOnEntry** – Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task is marked as waiting for a new notification (provided a notification is not already pending). Optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or OxffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.
• **ulBitsToClearOnExit** - If a notification is pending or received before the calling task exits the `xTaskNotifyWait()` function then the task’s notification value (see the `xTaskNotify()` API function) is passed out using the `pulNotificationValue` parameter. Then any bits that are set in `ulBitsToClearOnExit` will be cleared in the task’s notification value (note * `pulNotificationValue` is set before any bits are cleared). Setting `ulBitsToClearOnExit` to `ULONG_MAX` (if `limits.h` is included) or `0xffffffffUL` (if `limits.h` is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting `ulBitsToClearOnExit` to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in `pulNotificationValue` will match the task’s notification value).

• **pulNotificationValue** – Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.

• **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

If a notification was received (including notifications that were already pending when `xTaskNotifyWait()` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

```c
void vTaskGenericNotifyGiveFromISR(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken)
```

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.
**xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

**uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.

**pxHigherPriorityTaskWoken** - vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```
uint32_t ulTaskGenericNotifyTake( UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, 
    TickType_t xTicksToWait)
```

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.
参数

- **uxIndexToWaitOn** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xFnTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.

- **xClearCountOnExit** – if `xClearCountOnExit` is `pdFALSE` then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** – The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when `uTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS(value_in_ms)` can be used to convert a time specified in milliseconds to a time specified in ticks.

返回 The task’s notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

```c
BaseType_t xTaskGenericNotifyStateClear (TaskHandle_t xTask, UBaseType_t uxIndexToClear)
```

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set `xTask` to `NULL` to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

参数

- **xTask** – The handle of the RTOS task that will have a notification state cleared. Set `xTask` to `NULL` to clear a notification state in the calling task. To obtain a task’s handle create the task using `xTaskCreate()` and make use of the `pxCreateTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task’s name in a call to `xTaskGetHandle()`.

- **uxIndexToClear** – The index within the target task’s array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `uTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

返回 `pdTRUE` if the task’s notification state was set to `eNotWaitingNotification`, otherwise `pdFALSE`.

```c
uint32_t ulTaskGenericNotifyValueClear (TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.
Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK-notification_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

### 参数
- **xTask** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than configTASK-notification_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** – Bitmask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

### 返回
The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

```c
void vTaskSetTimeOutState ( TimeOut_t *const pxTimeOut )
```

```c
BaseType_t xTaskCheckForTimeOut ( TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait )
```

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

### Example Usage:

```c
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
```
vTaskSetTimeOutState( &xTimeOut );

// Loop until the buffer contains the wanted number of bytes, or a // timeout occurs.
while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
{
  // The buffer didn't contain enough data so this task is going to // enter the Blocked state. Adjusting xTicksToWait to account for // any time that has been spent in the Blocked state within this // function so far to ensure the total amount of time spent in the // Blocked state does not exceed MAX_TIME_TO_WAIT.
  if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
  {
    // Timed out before the wanted number of bytes were available, // exit the loop.
    break;
  }

  // Wait for a maximum of xTicksToWait ticks to be notified that the // receive interrupt has placed more data into the buffer.
  ulTaskNotifyTake( pdTRUE, xTicksToWait );
}

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer. // The actual number of bytes read (which might be less than // uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance, pucBuffer, uxWantedBytes );

return uxReceived;

参见:
https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

参数
- pxTimeOut – The time status as captured previously using vTaskSetTimeOutState. If the timeout has not yet occurred, it is updated to reflect the current time status.
- pxTicksToWait – The number of ticks to check for timeout i.e. if pxTicksToWait ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

返回 若timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

BaseType_t xTaskCatchUpTicks (TickType_t xTicksToCatchUp)

xTaskNotifyWait (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyWaitIndexed (ulBitsToClearOnEntry, ulBitsToClearOnExit, ulValue, eAction, xTicksToWait)

xTaskNotifyGiveIndexed (xTaskToNotify, ulValue, eAction)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.
A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGiveIndexed().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.

参数
- xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config-TASK-notification ARRAY_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

返回 xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

**Type Definitions**

typedef struct tskTaskControlBlock *TaskHandle_t

typedef BaseType_t (*TaskHookFunction_t)(void*)

typedef void (*TlsDeleteCallbackFunction_t)(int, void*)

Prototype of local storage pointer deletion callback.
Chapter 2. API 参考

Enumerations

enum eTaskState
    Task states returned by eTaskGetState.
    Values:
        enumerator eRunning
        enumerator eReady
        enumerator eBlocked
        enumerator eSuspended
        enumerator eDeleted
        enumerator eInvalid

enum eNotifyAction
    Values:
        enumerator eNoAction
        enumerator eSetBits
        enumerator eIncrement
        enumerator eSetValueWithOverwrite
        enumerator eSetValueWithoutOverwrite

enum eSleepModeStatus
    Possible return values for cTaskConfirmSleepModeStatus().
    Values:
        enumerator eAbortSleep
        enumerator eStandardSleep
        enumerator eNoTasksWaitingTimeout

Queue API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h
Functions

`BaseType_t xQueueGenericSend(QueueHandle_t xQueue, const void *pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition)`

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage ) );

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, /*.queueSEND_TO_BACK */ ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0, /*.queueSEND_TO_BACK */ );
    }

    // ... Rest of task code.
}
```

参数

- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
• `xTicksToWait` - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.
• `xCopyPosition` - Can take the value `queueSEND_TO_BACK` to place the item at the back of the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

```c
_mode(pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

BaseType_t xQueuePeek (QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

This macro must not be used in an interrupt service routine. See `xQueuePeekFromISR()` for an alternative that can be called from an interrupt service routine.

Example usage:
```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    ...

    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
```
Chapter 2. API

// message is not immediately available.
if (xQueuePeek( xQueue, & pxRxedMessage ), ( TickType_t ) 10 )
{
    // pcRxedMessage now points to the struct AMessage variable posted
    // by vATask, but the item still remains on the queue.
}

// ... Rest of task code.

参数
- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

```c
BaseType_t xQueuePeekFromISR (QueueHandle_t xQueue, void*const pvBuffer)
```

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

参数
- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

```c
BaseType_t xQueueReceive (QueueHandle_t xQueue, void*const pvBuffer, TickType_t xTicksToWait)
```

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;
```
```c
// Create a queue capable of containing 10 pointers to AMessage structures. // These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// Send a pointer to a struct AMessage object. Don't block if the // queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

// Task to receive from the queue.
void vADifferentTask( void * pvParameters )
{
    struct AMessage * pxRxedMessage;
    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a // message is not immediately available.
        if( xQueueReceive( xQueue, & pxRxedMessage , ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted // by vATask.
        }
    }

    // ... Rest of task code.
}
```

参数

- `xQueue` - The handle to the queue from which the item is to be received.
- `pvBuffer` - Pointer to the buffer into which the received item will be copied.
- `xTicksToWait` - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

返回 `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

```c
UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
Return the number of messages stored in a queue.
```

参数 `xQueue` - A handle to the queue being queried.

```c
UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )
Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.
```

参数 `xQueue` - A handle to the queue being queried.
void **QueueDelete**(QueueHandle_t xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

参数 xQueue - A handle to the queue to be deleted.

BaseType_t **QueueGenericSendFromISR**(QueueHandle_t xQueue, const void *const pvItemToQueue, BaseType_t *const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition)

It is preferred that the macros **QueueSendFromISR()**, **QueueSendToFrontFromISR()** and **QueueSendToBackFromISR()** be used in place of calling this function directly. **QueueGiveFromISR()** is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post each byte.
        xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary. Note that the
    // name of the yield function required is port specific.
    if( xHigherPriorityTaskWokenByPost )
    {
        taskYIELD_YIELD_FROM_ISR();
    }
}
```

参数

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** [out] **QueueGenericSendFromISR()** will set *pxHigherPriorityTaskWoken* to *pdTRUE* if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If **QueueGenericSendFromISR()** sets this value to *pdTRUE* then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

返回 *pdTRUE* if the data was successfully sent to the queue, otherwise errQUEUE_FULL.
BaseType_t xQueueGiveFromISR(QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t xQueueReceiveFromISR(QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = (TickType_t)0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.
    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, & xTaskWokenByReceive ) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }
    if( cTaskWokenByPost != ( char ) pdFALSE;
    {
        taskYIELD();
    }
```

(下页继续)
参数
- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** - [out] A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock, *pxTaskWoken will get set to pdTRUE, otherwise **pxTaskWoken will remain unchanged.

返回 pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

```c
BaseType_t xQueueIsQueueEmptyFromISR(const QueueHandle_t xQueue)

BaseType_t xQueueIsQueueFullFromISR(const QueueHandle_t xQueue)

UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)

void vQueueAddToRegistry(QueueHandle_t xQueue, const char* pcQueueName)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

```c
configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.
```

参数
- **xQueue** - The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** - The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

```c
void vQueueUnregisterQueue(QueueHandle_t xQueue)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

参数 **xQueue** - The handle of the queue being removed from the registry.

```c
const char* pcQueueGetName(QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue’s handle.

参数 **xQueue** - The handle of the queue the name of which will be returned.

返回 If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

```c
QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t* pucQueueStorage, StaticQueue_t* pxStaticQueue, const uint8_t ucQueueType)
```
Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

**QueueSetHandle_t xQueueCreateSet**(const UBaseType_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to xQueueCreateSet() before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to xQueueAddToSet(). xQueueSelectFromSet() is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on [https://www.FreeRTOS.org/RTOS-queue-sets.html](https://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

参数 **uxEventQueueLength** — Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to \((5 + 12 + 1)\), or 18.
- If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to \((1 + 1 + 1)\), or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to \((5 + 3)\), or 8.

返回 If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

**BaseType_t xQueueAddToSet**(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

参数

- **xQueueOrSemaphore** — The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- **xQueueSet** — The handle of the queue set to which the queue or semaphore is being added.

返回 If the queue or semaphore was successfully added to the queue set then pdPASS is returned.
If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.
**Chapter 2. API**

### BaseType_t xQueueRemoveFromSet

*(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)*

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**参数**
- **xQueueOrSemaphore** – The handle of the queue or semaphore being removed from the queue set (cast to a QueueSetMemberHandle_t type).
- **xQueueSet** – The handle of the queue set in which the queue or semaphore is included.

**返回** If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

### QueueSetMemberHandle_t xQueueSelectFromSet

*(QueueSetHandle_t xQueueSet, const TickType_t xTicksToWait)*

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Note 1:** See the documentation on [https://www.FreeRTOS.org/RTOS-queue-sets.html](https://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

**Note 2:** Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

**Note 3:** A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**参数**
- **xQueueSet** – The queue set on which the task will (potentially) block.
- **xTicksToWait** – The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**返回** xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

### QueueSetMemberHandle_t xQueueSelectFromSetFromISR

*(QueueSetHandle_t xQueueSet)*

A version of xQueueSelectFromSet() that can be used from an ISR.

### Macros

**xQueueCreate**(uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

**Example usage:**
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

ьюQueueLength – The maximum number of items that the queue can contain.
ьюItemSize – The number of bytes each item in the queue will require. Items are
queued by copy, not by reference, so this is the number of bytes that will be copied for
each posted item. Each item on the queue must be the same size.

If the queue is successfully create then a handle to the newly created queue is returned. If
the queue cannot be created then 0 is returned.

xQueueCreateStatic(ьюQueueLength,ьюItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used
to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue
is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside
the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using
xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue.
xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// (queue length) * (queue item size) bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
                        ITEM_SIZE   // The size of each item in the queue
                        & ucQueueStorage[ 0 ] ), // The buffer that will...
                        ITEM_SIZE   // The size of each item in the queue
                        & xQueueBuffer ); // The buffer that will hold the...
                        ITEM_SIZE   // The size of each item in the queue

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue is now a handle to a valid queue.
    // ... Rest of task code.
}

参数

• uxQueueLength – The maximum number of items that the queue can contain.
• uxItemSize – The number of bytes each item in the queue will require. Items are
    queued by copy, not by reference, so this is the number of bytes that will be copied for
    each posted item. Each item on the queue must be the same size.
• pucQueueStorage – If uxItemSize is not zero then pucQueueStorageBuffer must point
    to a uint8_t array that is at least large enough to hold the maximum number of items that
    can be in the queue at any one time - which is ( uxQueueLength * uxItemsSize ) bytes. If
    uxItemSize is zero then pucQueueStorageBuffer can be NULL.
• pxQueueBuffer – Must point to a variable of type StaticQueue_t, which will be used
    to hold the queue’s data structure.

返回 If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is
NULL then NULL is returned.

xQueueSendToFront (xQueue, pvItemToQueue, xTicksToWait)
Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be
called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in
an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
```
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...
if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

### 参数
- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

### 返回
- **pdTRUE** if the item was successfully posted, otherwise **errQUEUE_FULL**.

**xQueueSendToBack**(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;
```
void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !-pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

    // ... Rest of task code.
}

参数
• xQueue  - The handle to the queue on which the item is to be posted.
• pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
• xTicksToWait - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

返回  pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend(xQueue, pvItemToQueue, xTicksToWait)
This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equiva-
lent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = & xMessage;
        xQueueSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

**参数**

- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

**返回**

pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueOverwrite (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is
queued by copy, not by reference.
This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly recommended *not* to use xQueueOverwrite() on queues that can contain more than one value, and doing so will trigger an assertion if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in the queue. A block time of zero is used as it is known that the queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more. A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    // The value read should be the last value written, even though the queue was already full when the value was written.
    if( ulValReceived != 100 )
    {
        // Error!
    }

    // ...
}
```

**Params**

- `xQueue` - The handle of the queue to which the data is being sent.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

**Return**

xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.
xQueueSendToFrontFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR ( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while ( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ( );
    }
}
```

参数

- **xQueue** – The handle to the queue on which the item is to be posted.
- **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** – [out] xQueueSendToFrontFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to un-block, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):
```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );
        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while ( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR( );
    }
}
```

### 参数
- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- `pxHigherPriorityTaskWoken` - [out] `xQueueSendToBackFromISR()` will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToBackFromISR()` sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### 返回
- pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

### xQueueOverwriteFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
A version of `xQueueOverwrite()` that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly recommended not to use xQueueOverwriteFromISR() on queues that can contain more than one value, and doing so will trigger an assertion if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}
```
```c
void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    // ...

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a...
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}
```

### 参数
- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### 返回
xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

### xQueueSendFromISR
(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFromFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):
```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR();
    }
}
```

### 参数
- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### 返回
- pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

### xQueueReset(xQueue)
Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

### Type Definitions

- typedef struct QueueDefinition *QueueHandle_t
- typedef struct QueueDefinition *QueueSetHandle_t
  
  Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

- typedef struct QueueDefinition *QueueSetMemberHandle_t
  
  Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

### Semaphore API

### Header File
Macros

- `semBINARY_SEMAPHORE_QUEUE_LENGTH`
- `semSEMAPHORE_QUEUE_ITEM_LENGTH`
- `semGIVE_BLOCK_TIME`

`vSemaphoreCreateBinary` (xSemaphore)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

This old `vSemaphoreCreateBinary`() macro is now deprecated in favour of the `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary`() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary ().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

参数

- `xSemaphore` – Handle to the created semaphore. Should be of type `SemaphoreHandle_t`.

`xSemaphoreCreateBinary`()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the
required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

xSemaphoreCreateBinaryStatic (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:
Chapter 2. API

SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}

参数

• pxStaticSemaphore – Must point to a variable of type StaticSemaphore_t, which will
  then be used to hold the semaphore’s data structure, removing the need for the memory
  to be allocated dynamically.

返回 If the semaphore is created then a handle to the created semaphore is returned. If
pxSemaphoreBuffer is NULL then NULL is returned.

xSemaphoreTake(xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...
            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
            // ..
    }
}
// We could not obtain the semaphore and can therefore not access
// the shared resource safely.
}
}

参数

- **xSemaphore** - A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** - The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

返回 pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**xSemaphoreTakeRecursive**(xMutex, xBlockTime)

*Macro* to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.
            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
```
// no sense. Instead the calls are likely to be buried inside
// a more complex call structure.
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times. Again it is unlikely that real code would have
// these calls sequentially, but instead buried in a more complex
// call structure. This is just for illustrative purposes.
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
}
else
{
    // We could not obtain the mutex and can therefore not access
    // the shared resource safely.
}

// A handle to the mutex being obtained. This is the handle returned by
// xSemaphoreCreateRecursiveMutex();
• xMutex

• xBlockTime - The time in ticks to wait for the semaphore to become available. The
  macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time
  of zero can be used to poll the semaphore. If the task already owns the semaphore then
  xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlock-
  Time.

返回 pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the
semaphore becoming available.

xSemaphoreGive(xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using
xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR() for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = vSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // More code here
        }
    }
}
// We would expect this call to fail because we cannot give
// a semaphore without first "taking" it!
}

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
{
    // We now have the semaphore and can access the shared resource.
    // ...

    // We have finished accessing the shared resource so can free the
    // semaphore.
    if( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
        // We would not expect this call to fail because we must have
        // obtained the semaphore to get here.
    }
}

参数

- xSemaphore - A handle to the semaphore being released. This is the handle returned
  when the semaphore was created.

返回 pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are
implemented using queues. An error can occur if there is no space on the queue to post a
message - indicating that the semaphore was not first obtained correctly.

xSemaphoreGiveRecursive (xMutex)

Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been
created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available
again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task
until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
if ( xMutex != NULL )
{
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if ( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.
        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, it would be more likely that the calls
        // to xSemaphoreGiveRecursive() would be called as a call stack
        // unwound. This is just for demonstrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}

参数
• xMutex - A handle to the mutex being released, or ‘given’. This is the handle returned
  by xSemaphoreCreateMutex().
返回 pdTRUE if the semaphore was given.

xSemaphoreGiveFromISR( xSemaphore, pxHigherPriorityTaskWoken )
Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro.
This macro can be used from an ISR.

Example usage:

#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;
// Repetitive task.
void vATask( void *pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void *pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.
    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount ++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}

参数

- xSemaphore - A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- pxHigherPriorityTaskWoken - xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

返回 pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.
**xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)**

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**参数**

- **xSemaphore** - A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** -[out] xSemaphoreTakeFromISR() will set *px-HigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**返回** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex ()**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**返回** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.
xSemaphoreCreateMutexStatic(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask ( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

参数

- **pxMutexBuffer** - Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

返回

- If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateCounting(uxMaxCount, uxInitialCount)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
void vATask( void * pvParameters )
{
  // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
  // This is a macro so pass the variable in directly.
  xSemaphore = xSemaphoreCreateRecursiveMutex();
  if( xSemaphore != NULL )
  {
    // The semaphore was created successfully.
    // The semaphore can now be used.
  }
}
```

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using `xSemaphoreCreateRecursiveMutex()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateRecursiveMutex()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a recursive mutex is created using `xSemaphoreCreateRecursiveMutexStatic()` then the application writer must provide the memory that will get used by the mutex. `xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;
```
void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );
    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can
be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which
the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreate-
Counting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreate-
Counting() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory
that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting
semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing
the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event
(decrementing the semaphore count value). The count value is therefore the difference between the number of
events that have occurred and the number that have been processed. In this case it is desirable for the initial
count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a
resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value
reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back
- incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to
the maximum count value, indicating that all resources are free.

Example usage:

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;
    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );
    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
    }
}
// The semaphore can now be used.

return xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

参数

- pxStaticSemaphore - Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.
- uxMaxCount - The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- uxInitialCount - The count value assigned to the semaphore when it is created.

返回

- If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.
- Handle to the created semaphore. Null if the semaphore could not be created.

xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer must provide the memory. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;
```
// Counting semaphore cannot be used before they have been created. Create
// a counting semaphore using xSemaphoreCreateCountingStatic(). The max
// value to which the semaphore can count is 10, and the initial value
// assigned to the count will be 0. The address of xSemaphoreBuffer is
// passed in and will be used to hold the semaphore structure, so no dynamic
// memory allocation will be used.
xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.

参数

• **uxMaxCount** - The maximum count value that can be reached. When the semaphore
  reaches this value it can no longer be ‘given’.
• **uxInitialCount** - The count value assigned to the semaphore when it is created.
• **pxSemaphoreBuffer** - Must point to a variable of type StaticSemaphore_t, which will
  then be used to hold the semaphore’s data structure, removing the need for the memory
  to be allocated dynamically.

返回

If the counting semaphore was successfully created then a handle to the created counting
semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore
if the mutex is held by a task.

参数

• **xSemaphore** - A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of deter-
mining the identity of the mutex holder as the holder may change between the function exiting and the returned
value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type
semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the
semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0
if the semaphore is not available.

Chapter 2. API

## Functions

**TimerHandle_t xTimerCreate** (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)

`TimerHandle_t xTimerCreate( const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction);`

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see [https://www.FreeRTOS.org/a00111.](https://www.FreeRTOS.org/a00111.html)). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

### Example usage:

```c
* #define NUM_TIMERS 5
* 
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
* 
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
* 
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
*   int32_t lArrayIndex;
*   const int32_t xMaxExpiryCountBeforeStopping = 10;
*   
*   // Optionally do something if the pxTimer parameter is NULL.
*   configASSERT( pxTimer );
*   
*   // Which timer expired?
*   lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*   
*   // Increment the number of times that pxTimer has expired.
*   lExpireCounters[ lArrayIndex ] += 1;
*   
*   // If the timer has expired 10 times then stop it from running.
*   if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
*     {
*       // Do not use a block time if calling a timer API function from a
*       // timer callback function, as doing so could cause a deadlock!
*       xTimerStop( pxTimer, 0 );
*     }
* } 
* 
* void main( void )
* {
*   int32_t x;
```
// Create then start some timers. Starting the timers before the scheduler
// has been started means the timers will start running immediately that
// the scheduler starts.
for( x = 0; x < NUM_TIMERS; x++ )
{
    xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
        ( 100 * x ), // The timer period
        pdTRUE, // The timers will auto-reload themselves when they expire.
        ( void * ) x, // Assign each timer a unique id equal to its array index.
        vTimerCallback // Each timer calls the same callback when it expires.
    );

    if( xTimers[ x ] == NULL )
        // The timer was not created.
    }
else
    // Start the timer. No block time is specified, and even if one was
    // it would be ignored because the scheduler has not yet been started.
    if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
        // The timer could not be set into the Active state.
}

// ... Create tasks here.
// ... Starting the scheduler will start the timers running as they have already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );
}

参数

- pcTimerName - A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- xTimerPeriodInTicks - The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.
• **uxAutoReload** – If `uxAutoReload` is set to `pTRUE` then the timer will expire repeatedly with a frequency set by the `xTimerPeriodInTicks` parameter. If `uxAutoReload` is set to `pFALSE` then the timer will be a one-shot timer and enter the dormant state after it expires.

• **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

• **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “void vCallbackFunction(TimerHandle_t xTimer);”.

If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created because there is insufficient FreeRTOS heap remaining to allocate the timer structures then `NULL` is returned.

### Example usage:

```c
static void prvTimerCallback( TimerHandle_t xExpiredTimer ) {
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t * )pvTimerGetTimerID( xExpiredTimer );

    // Increment the variable to show the timer callback has executed.
    ( puxVariableToIncrement )++;
}
```

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using `xTimerCreate()` then the required memory is automatically dynamically allocated inside the `xTimerCreate()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a software timer is created using `xTimerCreateStatic()` then the application writer must provide the memory that will get used by the software timer. `xTimerCreateStatic()` therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.
void main( void )
{
  // Create the software time. xTimerCreateStatic() has an extra parameter
  // than the normal xTimerCreate() API function. The parameter is a
  // pointer
  // to the StaticTimer_t structure that will hold the software timer
  // structure. If the parameter is passed as NULL then the structure
  // will be
  // allocated dynamically, just as if xTimerCreate() had been called.
  xTimer = xTimerCreateStatic( "T1", 0, &uxVariableToIncrement, prvTimerCallback, &xTimerBuffer );
  // The buffer that will
  // hold the software timer structure.
  // The scheduler has not started yet so a block time is not used.
  xReturned = xTimerStart( xTimer, 0 );
  // ...
  // Create tasks here.
  // ...

  // Starting the scheduler will start the timers running as they have
  // already
  // been set into the active state.
  vTaskStartScheduler();

  // Should not reach here.
  for( ;; );
}

参数

- **pcTimerName** – A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** – The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.
• **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

• **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

• **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction(TimerHandle_t xTimer);”.

• **pxTimerBuffer** – Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

```c
void *pvTimerGetTimerID (const TimerHandle_t xTimer)
void *pvTimerGetTimerID( TimerHandle_t xTimer );
```

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

```c
参数 xTimer – The timer being queried.
返回 The ID assigned to the timer being queried.
```

```c
void vTimerSetTimerID (TimerHandle_t xTimer, void *pvNewID)
void vTimerSetTimerID( TimerHandle_t xTimer, void *pvNewID );
```

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

```c
参数
    • xTimer – The timer being updated.
    • pvNewID – The ID to assign to the timer.
```

```c
BaseType_t xTimerIsTimerActive (TimerHandle_t xTimer)
BaseType_t xTimerIsTimerActive( TimerHandle_t xTimer );
```

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.
Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```c
// This function assumes xTimer has already been created.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer is active, do something.
    }
    else
    {
        // xTimer is not active, do something else.
    }
}
```

**参数** xTimer — The timer being queried.

**返回** pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

**TaskHandle_t xTimerGetTimerDaemonTaskHandle** (void)

TaskHandle_t xTimerGetTimerDaemonTaskHandle( void );

Simply returns the handle of the timer service/daemon task. It it not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

**BaseType_t xTimerPendFunctionCallFromISR** (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken);

BaseType_t xTimerPendFunctionCallFromISR( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken );

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```c
/* // The callback function that will execute in the context of the daemon... task. */
/* // Note callback functions must all use this same prototype. */
void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
{
    BaseType_t xInterfaceToService;
    /*
    // The interface that requires servicing is passed in the second
    */
```

(下页继续)
API

Chapter 2. API

* // parameter. The first parameter is not used in this case.
* xInterfaceToService = ( BaseType_t ) ulParameter2;
* }
* // ...Perform the processing here...
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*   BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*   // Query the hardware to determine which interface needs processing.
*   xInterfaceToService = prvCheckInterfaces();
*   // The actual processing is to be deferred to a task. Request the
*   // vProcessInterface() callback function is executed, passing in the
*   // number of the interface that needs processing. The interface to
*   // service is passed in the second parameter. The first parameter is
*   // not used in this case.
*   xHigherPriorityTaskWoken = pdFALSE;
*   xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
*                                xInterfaceToService, &xHigherPriorityTaskWoken );
*   // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*   // switch should be requested. The macro used is port specific and will
*   // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*   // the documentation page for the port being used.
*   portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
*
**

参数

- **xFunctionToPend** - The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1** - The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2** - The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken** - As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

```
BaseType_t xTimerPendFunctionCall ( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).
• **xFunctionToPend** – The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.

• **pvParameter1** – The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.

• **ulParameter2** – The value of the callback function’s second parameter.

• **xTicksToWait** – Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

返回 pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

```c
const char *pcTimerGetName(TimerHandle_t xTimer)
const char * const pcTimerGetName(TimerHandle_t xTimer);
```

Returns the name that was assigned to a timer when the timer was created.

参数 **xTimer** – The handle of the timer being queried.

返回 The name assigned to the timer specified by the xTimer parameter.

```c
void vTimerSetReloadMode(TimerHandle_t xTimer, const UBaseType_t uxAutoReload);
void vTimerSetReloadMode(TimerHandle_t xTimer, const UBaseType_t uxAutoReload);
```

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数

• **xTimer** – The handle of the timer being updated.

• **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```c
UBaseType_t uxTimerGetReloadMode(TimerHandle_t xTimer)
UBaseType_t uxTimerGetReloadMode(TimerHandle_t xTimer);
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

参数 **xTimer** – The handle of the timer being queried.

返回 If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

```c
TickType_t xTimerGetPeriod(TimerHandle_t xTimer)
```

Returns the period of a timer.

参数 **xTimer** – The handle of the timer being queried.

返回 The period of the timer in ticks.

```c
TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer)
```

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

参数 **xTimer** – The handle of the timer being queried.

返回 If the timer is running then the time in ticks at which the timer will next expire is returned.

If the timer is not running then the return value is undefined.
void vApplicationGetTimerTaskMemory(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

参数
- ppxTimerTaskTCBBuffer - A handle to a statically allocated TCB buffer
- ppxTimerTaskStackBuffer - A handle to a statically allocated Stack buffer for the idle task
- pulTimerTaskStackSize - A pointer to the number of elements that will fit in the allocated stack buffer

xTimerStart (xTimer, xTicksToWait)

BaseType_t xTimerStart( TimerHandle_t xTimer, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.
Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:
See the xTimerCreate() API function example usage scenario.

参数
• xTimer - The handle of the timer being started/restarted.
• xTicksToWait - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

xTimerStop (xTimer, xTicksToWait)
BaseType_t xTimerStop( TimerHandle_t xTimer, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:
See the xTimerCreate() API function example usage scenario.

参数
• xTimer - The handle of the timer being stopped.
• xTicksToWait - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

返回 pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
**xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

* BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
void vAFunction( TimerHandle_t xTimer ) {
    if( xTimerIsTimerActive( xTimer ) ) { // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    } else { // xTimer is not active, change its period to 500ms. This will also cause the timer to start. Block for a maximum of 100 ticks if the change period command cannot immediately be sent to the timer command queue.
        if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS ) { // The command was successfully sent.
            } else { // The command could not be sent, even after waiting for 100 ticks to pass. Take appropriate action here.
            }
        }
    }
}
```

**Parameter**

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
• **xTicksToWait** – Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when `xTimerChangePeriod()` was called. `xTicksToWait` is ignored if `xTimerChangePeriod()` is called before the scheduler is started.

返回 pdFAIL will be returned if the change period command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerDelete** (xTimer, xTicksToWait)

BaseType_t `xTimerDelete(TimerHandle_t xTimer, TickType_t xTicksToWait);`

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerDelete()` deletes a timer that was previously created using the `xTimerCreate()` API function.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerDelete()` to be available.

Example usage:

See the `xTimerChangePeriod()` API function example usage scenario.

参数

• **xTimer** – The handle of the timer being deleted.
• **xTicksToWait** – Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

返回 pdFAIL will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerReset** (xTimer, xTicksToWait)

BaseType_t `xTimerReset(TimerHandle_t xTimer, TickType_t xTicksToWait);`

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after `xTimerReset()` was called, where ‘n’ is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.
The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```c
// When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In this case, the timer is a one-shot timer.

TimerHandle_t xBacklightTimer = NULL;

// The callback function assigned to the one-shot timer. In this case the parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer ) {
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press event handler.
void vKeyPressEventHandler( char cKey ) {
    // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. Wait 10 ticks for the command to be successfully sent if it cannot be sent immediately.
    vSetBacklightState( BACKLIGHT_ON );
    if( xTimerReset( xBacklightTimer, 100 ) != pdPASS ) {
        // The reset command was not executed successfully. Take appropriate action here.
    }
    // Perform the rest of the key processing here.
}

void main( void ) {
    int32_t x;
    // Create then start the one-shot timer that is responsible for turning the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a text name, not used by the kernel.
        ( 5000 / portTICK_PERIOD_MS), // The timer period in ticks.
        pdFALSE, // The timer is a one-shot timer.
        0, // The id is not used by the callback so can take any value.
        vBacklightTimerCallback // The callback function that switches the LCD back-light off.
    );
    if( xBacklightTimer == NULL ) {
        // The timer was not created.
    } else {
```
// Start the timer. No block time is specified, and even if one was
// it would be ignored because the scheduler has not yet been
// started.
if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
{
    // The timer could not be set into the Active state.
}

// ... Create tasks here. // ...

// Starting the scheduler will start the timer running as it has already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for( ;; );

参数
- **xTimer** - The handle of the timer being reset/started/restarted.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

返回 pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/demon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/demon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerStartFromISR** (xTimer, pxHigherPriorityTaskWoken)

BaseType_t xTimerStartFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );

A version of xTimerStart() that can be called from an interrupt service routine.

Example usage:

```c
// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}
```

(续上页)
The key press interrupt service routine.

```c
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then restart the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. This is an interrupt service routine so can only
    // call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // xTimerStartFromISR() or xTimerResetFromISR() could be called here
    // as both cause the timer to re-calculate its expiry time.
    // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
    // declared (in this function).
    if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The start command was not executed successfully. Take appropriate
        // action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

参数

- `xTimer` - The handle of the timer being started/restarted.
- `pxHigherPriorityTaskWoken` - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

返回 pdFAIL will be returned if the start command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

```c
BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );
```
A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xTimer has already been created and started. When
  * // an interrupt occurs, the timer should be simply stopped.
  * 
  * // The interrupt service routine that stops the timer.
  * void vAnExampleInterruptServiceRoutine( void )
  * {
  *   BaseType_t xHigherPriorityTaskWoken = pdFALSE;
  *   
  *     // The interrupt has occurred - simply stop the timer.
  *     xHigherPriorityTaskWoken was set to pdFALSE where it was defined
  *     // (within this function). As this is an interrupt service routine, only
  *     // FreeRTOS API functions that end in "FromISR" can be used.
  *     if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
  *       {
  *         // The stop command was not executed successfully. Take appropriate
  *         // action here.
  *       }
  *     
  *     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
  *     // should be performed. The syntax required to perform a context switch
  *     // from inside an ISR varies from port to port, and from compiler to
  *     // compiler. Inspect the demos for the port you are using to find the
  *     // actual syntax required.
  *     if( xHigherPriorityTaskWoken != pdFALSE )
  *       {
  *         // Call the interrupt safe yield function here (actual function
  *         // depends on the FreeRTOS port being used).
  *       }
  *   }
  */
```
Example usage:

```c
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*   BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*   // The interrupt has occurred - change the period of xTimer to 500ms.
*   xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*   // (within this function). As this is an interrupt service routine, only
*   // FreeRTOS API functions that end in "FromISR" can be used.
*   if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
*     {
*       // The command to change the timers period was not executed
*       // successfully. Take appropriate action here.
*       }
*       // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*       // should be performed. The syntax required to perform a context switch
*       // from inside an ISR varies from port to port, and from compiler to
*       // compiler. Inspect the demos for the port you are using to find the
*       // actual syntax required.
*       if( xHigherPriorityTaskWoken != pdFALSE )
*         {
*           // Call the interrupt safe yield function here (actual function
*           // depends on the FreeRTOS port being used).
*           }
*   }
```
A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```c
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}
```

```c
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );
    // xTimerStartFromISR() or xTimerResetFromISR() could be called here as both cause the timer to re-calculate its expiry time. xHigherPriorityTaskWoken was initialised to pdFALSE when it was declared (in this function).
    if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate action here.
    }
    // Perform the rest of the key processing here.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
    }
}
```

**Parameters**

- `xTimer` - The handle of the timer that is to be started, reset, or restarted.
- `pxHigherPriorityTaskWoken` - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue.
Calling `xTimerResetFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerResetFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerResetFromISR()` function. If `xTimerResetFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns: `pdFAIL` will be returned if the reset command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerResetFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**Type Definitions**

typedef struct tmrTimerControl *TimerHandle_t

typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)

typedef void (*PendedFunction_t)(void*, uint32_t)

**Event Group API**

**Header File**

- `components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h`

**Functions**

`EventGroupHandle_t xEventGroupCreate(void)`

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event group is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

**Example usage:**

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
```

(下頁敘述)
If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See https://www.FreeRTOS.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a small block of memory, in which the event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
EventGroupHandle_t xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

参数 pxEventGroupBuffer – pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

返回 If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

EventBits_t xEventGroupWaitBits ( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.
Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup, // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait for.
        pdTRUE, // BIT_0 and BIT_4 should be cleared before returning.
        pdFALSE, // Don't wait for both bits, either bit will do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}
```

参数:

- **xEventGroup** — Event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor** — A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit** — If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- **xWaitForAllBits** — If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
- **xTicksToWait** — The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.
The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

```c
EventBits_t xEventGroupClearBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear)
```
Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction ( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( xEventGroup, // The event group being updated.
                                   BIT_0 | BIT_4 ); // The bits being cleared.
    if(( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ))
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
    }
    else if( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
    }
    else if( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
}
```

参数
- `xEventGroup` - The event group in which the bits are to be cleared.
- `uxBitsToClear` - A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

返回 The value of the event group before the specified bits were cleared.

```c
EventBits_t xEventGroupSetBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)
```
Set bits within an event group. This function cannot be called from an interrupt. `xEVENTGroupSetBitsFromISR()` is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:
```c
#define BIT_0 (1 << 0)
#define BIT_4 (1 << 4)

void aFunction(EventGroupHandle_t xEventGroup)
{
    EventBits_t uxBits;
    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4); // The bits being set.
    if( (uxBits & (BIT_0 | BIT_4)) == (BIT_0 | BIT_4) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( (uxBits & BIT_0) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( (uxBits & BIT_4) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set. It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}
```

### 参数
- **xEventGroup** — The event group in which the bits are to be set.
- **uxBitsToSet** — A bitwise value that indicates the bit or bits to set. For example, to set bit 0, set `uxBitsToSet` to `0x01`. To set bit 0 and bit 1, set `uxBitsToSet` to `0x03`.

### 返回
The value of the event group at the time the call to `xEventGroupSetBits()` returns. There are two reasons why the returned value might have the bits specified by the `uxBitsToSet` parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the `xClearOnExit` parameter of `xEventGroupWaitBits()`). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called `xEventGroupSetBits()` will execute and may change the event group value before the call to `xEventGroupSetBits()` returns.

```c
EventBits_t xEventGroupSync(EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet, const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)
```

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the `uxBitsToWait` parameter are set, or become set within that time. In this case all the bits specified by `uxBitsToWait` will be automatically cleared before the function returns.
Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT    ( 1 << 0 )
#define TASK_1_BIT    ( 1 << 1 )
#define TASK_2_BIT    ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
        // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
                                 xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call
            // to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {

    }
```

// Perform task functionality here.

// Set bit 2 in the event flag to note this task has reached the
// synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
xEventGroupSync(xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY);

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.

Parameters:
- **xEventGroup** – The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToSet** – The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the uxBitsToWait parameter are set.
- **uxBitsToWaitFor** – A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1 and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xTicksToWait** – The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by uxBitsToWaitFor to become set.

Return: The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

```c
EventBits_t xEventGroupGetBitsFromISR(EventGroupHandle_t xEventGroup)
```

A version of xEventGroupGetBits() that can be called from an ISR.

```c
void vEventGroupDelete(EventGroupHandle_t xEventGroup)
```

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

Macros:
```c
xEventGroupClearBitsFromISR(xEventGroup, uxBitsToClear)
```

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:
```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup,
        // The event group being updated.
        BIT_0 | BIT_4 );// The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

### Parameters

- **xEventGroup** - The event group in which the bits are to be cleared.
- **uxBitsToClear** – A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to 0x08. To clear bit 3 and bit 0 set `uxBitsToClear` to 0x09.

#### Retuns

If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

### Function: `xEventGroupSetBitsFromISR` (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

#### Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,
        // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    &xHigherPriorityTaskWoken
```
参数
- xEventGroup – The event group in which the bits are to be set.
- uxBitsToSet – A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- pxHigherPriorityTaskWoken – As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

返回 If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

xEventGroupGetBits (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

参数
- xEventGroup – The event group being queried.

返回 The event group bits at the time xEventGroupGetBits() was called.

Type Definitions
typedef struct EventGroupDef_t *EventGroupHandle_t
typedef TickType_t EventBits_t

Stream Buffer API

Header File
- components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h

Functions
size_t xStreamBufferSend (StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then
the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
size_t xBytesSent;
uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
char *pcStringToSend = "String to send";
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

// Send an array to the stream buffer, blocking for a maximum of 100ms to
// wait for enough space to be available in the stream buffer.
xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, ...
           sizeof( ucArrayToSend ), x100ms );
if( xBytesSent != sizeof( ucArrayToSend ) )
{
  // The call to xStreamBufferSend() times out before there was enough
  // space in the buffer for the data to be written, but it did
  // successfully write xBytesSent bytes.
}

// Send the string to the stream buffer. Return immediately if there is not
// enough space in the buffer.
xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, ...
           strlen( pcStringToSend ), 0 );
if( xBytesSent != strlen( pcStringToSend ) )
{
  // The entire string could not be added to the stream buffer because
  // there was not enough free space in the buffer, but xBytesSent bytes
  // were sent. Could try again to send the remaining bytes.
}
}
```

**参数**
- **xStreamBuffer** – The handle of the stream buffer to which a stream is being sent.
- **pvTxData** – A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** – The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** – The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.
- **pxHigherPriorityTaskWoken** – The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

```c
size_t xStreamBufferSendFromISR( StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
```
Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.:

Among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
        ( void * ) pcStringToSend,
        strlen( pcStringToSend ),
        &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**
- **xStreamBuffer** – The handle of the stream buffer to which a stream is being sent.
- **pvTxData** – A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** – The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** – It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted),
then, internally, xStreamBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn’t have enough free space for all the bytes to be written.

```c
size_t xStreamBufferReceive (StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)

Receives bytes from a stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                      ( void * ) ucRxData,
                      sizeof( ucRxData ),
                      xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains another xRecievedBytes bytes of data, which can
        // be processed here....
    }
}
```

参数

- **xStreamBuffer** - The handle of the stream buffer from which bytes are to be received.
- **pvRxData** - A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** - The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in...
tick periods, so the absolute time it represents is dependent on the tick frequency. The macro \texttt{pdMS\_TO\_TICKS()} can be used to convert a time specified in milliseconds into a time specified in ticks. Setting \texttt{xTicksToWait} to \texttt{portMAX\_DELAY} will cause the task to wait indefinitely (without timing out), provided \texttt{INCLUDE\_vTaskSuspend} is set to 1 in \texttt{FreeRTOSConfig.h}. A task does not use any CPU time when it is in the Blocked state.

The number of bytes actually read from the stream buffer, which will be less than \texttt{xBufferLengthBytes} if the call to \texttt{xStreamBufferReceive()} timed out before \texttt{xBufferLengthBytes} were available.

\begin{verbatim}
size_t xStreamBufferReceiveFromISR(StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken)
\end{verbatim}

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use \texttt{xStreamBufferReceive()} to read bytes from a stream buffer from a task. Use \texttt{xStreamBufferReceiveFromISR()} to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
  uint8_t ucRxData[ 20 ];
  size_t xReceivedBytes;
  BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

  // Receive the next stream from the stream buffer.
  xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
                                               ( void * ) ucRxData,
                                               sizeof( ucRxData ),
                                               &xHigherPriorityTaskWoken );

  if( xReceivedBytes > 0 )
  {
    // ucRxData contains xReceivedBytes read from the stream buffer.
    // Process the stream here....
  }

  // If xHigherPriorityTaskWoken was set to pdTRUE inside
  // xStreamBufferReceiveFromISR() then a task that has a priority above the
  // priority of the currently executing task was unblocked and a context
  // switch should be performed to ensure the ISR returns to the unblocked
  // task. In most FreeRTOS ports this is done by simply passing
  // xHigherPriorityTaskWoken into taskYIELD\_FROM\_ISR(), which will test the
  // variables value, and perform the context switch if necessary. Check the
  // documentation for the port in use for port specific instructions.
  taskYIELD\_FROM\_ISR( xHigherPriorityTaskWoken );
}
```

参数

- \texttt{xStreamBuffer} – The handle of the stream buffer from which a stream is being received.
- \texttt{pvRxData} – A pointer to the buffer into which the received bytes are copied.
- \texttt{xBufferLengthBytes} – The length of the buffer pointed to by the \texttt{pvRxData} parameter. This sets the maximum number of bytes to receive in one call. \texttt{xStreamBufferReceive()} will return as many bytes as possible up to a maximum set by \texttt{xBufferLengthBytes}.
- \texttt{pxHigherPriorityTaskWoken} – It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling \texttt{xStreamBufferReceive-}
FromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

参数 xStreamBuffer – The handle of the stream buffer to be deleted.

BaseType_t xStreamBufferIsFull (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

参数 xStreamBuffer – The handle of the stream buffer being queried.

返回 If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferIsEmpty (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

参数 xStreamBuffer – The handle of the stream buffer being queried.

返回 If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReset (StreamBufferHandle_t xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

参数 xStreamBuffer – The handle of the stream buffer being reset.

返回 If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size_t xStreamBufferSpacesAvailable (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

参数 xStreamBuffer – The handle of the stream buffer being queried.

返回 The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size_t xStreamBufferBytesAvailable (StreamBufferHandle_t xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

参数 xStreamBuffer – The handle of the stream buffer being queried.

返回 The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType_t xStreamBufferSetTriggerLevel (StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)

A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single
byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

参数
- xStreamBuffer – The handle of the stream buffer being updated.
- xTriggerLevel – The new trigger level for the stream buffer.

返回 If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferSendCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数
- xStreamBuffer – The handle of the stream buffer to which data was written.
- pxHigherPriorityTaskWoken – pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType_t xStreamBufferReceiveCompletedFromISR(StreamBufferHandle_t xStreamBuffer, BaseType_t pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

参数
- xStreamBuffer – The handle of the stream buffer from which data was read.
- pxHigherPriorityTaskWoken – pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

返回 If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.
Macros

**xStreamBufferCreate** (xBuffersizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

 configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```c
void vAFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

    // Create a stream buffer that can hold 100 bytes. The memory used to hold
    // both the stream buffer structure and the data in the stream buffer is
    // allocated dynamically.
    xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

    if( xStreamBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // stream buffer.
    }
    else
    {
        // The stream buffer was created successfully and can now be used.
    }
}
```

参数

- **xBuffersizeBytes** – The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** – The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

返回 If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**xStreamBufferCreateStatic** (xBuffersizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

 configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:
// Used to dimension the array used to hold the streams. The available space // will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream // buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                             xTriggerLevel,
                                             ucBufferStorage,
                                             &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.

    // Other code that uses the stream buffer can go here.
}

参数

- **xBUFFER SIZE BYTES** — The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTRIGGER LEVEL BYTES** — The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucSTREAM BUFFER STORAGE AREA** — Must point to a uint8_t array that is at least xBUFFER SIZE BYTES + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxSTATIC STREAM BUFFER** — Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.

返回 If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

Type Definitions
typedef struct StreamBufferDef_t *StreamBufferHandle_t

Message Buffer API

Header File
Macros

**xMessageBufferCreate** (xBufferSizeBytes)

Creates a new message buffer using dynamically allocated memory. See **xMessageBufferCreateStatic()** for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for **xMessageBufferCreate()** to be available.

Example use:

```c
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

**参数**

- **xBufferSizeBytes** - The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

**返回** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

**xMessageBufferCreateStatic** (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See **xMessageBufferCreate()** for a version that uses dynamically allocated memory.

Example use:

```c
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
```
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                                ucBufferStorage,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}

参数

• xBufferSizeBytes -- The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).

• pucMessageBufferStorageArea -- Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.

• pxStaticMessageBuffer -- Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

返回

如果消息缓冲器创建成功，则返回一个指向创建的缓冲器的指针。如果pucMessageBufferStorageArea或pxStaticMessageBuffer为NULL，则返回NULL。

xMessageBufferSend(xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

将一个离散消息发送到消息缓冲器。消息的长度可以是任何能在缓冲器的空闲空间中放入的长度，并且会被放入缓冲器。

: 与其他FreeRTOS对象不同，消息缓冲器的实现（以及消息缓冲器本身）假定只有一个任务或中断会写入缓冲器（发送者），而只有一个任务或中断会从缓冲器读取（接收者）。发送者和接收者可以是不同的任务或中断，但不像其他FreeRTOS对象，它并不保证有多个不同的发送者或多个不同的接收者。如果发送者和接收者都需要在写入API函数（如xMessageBufferSend()）的线程内执行，并且设置发送超时时间为0。同样，如果存在多个不同的发送者或接收者，则每个发送者和接收者都需要在读取API函数（如xMessageBufferRead()）的线程内执行，并且设置接收超时时间为0。

使用xMessageBufferSend()将消息发送到任务。使用xMessageBufferSendFromISR()将消息发送到中断服务程序（ISR）。

Example use:

void vAFunction( MessageBufferHandle_t xMessageBuffer )
{

(下页继续)
```c
size_t xBytesSent;
uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
char *pcStringToSend = "String to send";
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

// Send an array to the message buffer, blocking for a maximum of 100ms to
// wait for enough space to be available in the message buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
                                 sizeof( ucArrayToSend ), x100ms );

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xMessageBufferSend() times out before there was enough
    // space in the buffer for the data to be written.
}

// Send the string to the message buffer. Return immediately if there is
// not enough space in the buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
                                 strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}
```

### 参数
- **xMessageBuffer** - The handle of the message buffer to which a message is being sent.
- **pvTxData** - A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** - The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** - The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

### 返回
The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

### xMessageBufferSendFromISR
(xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not
safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**

- `xMessageBuffer` - The handle of the message buffer to which a message is being sent.
- `pvTxData` - A pointer to the message that is to be copied into the message buffer.
- `xDataLengthBytes` - The length of the message. That is, the number of bytes to copy from `pvTxData` into the message buffer. When a message is written to the message buffer an additional sizeof(`size_t`) bytes are also written to store the message’s length. sizeof( `size_t`) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- `pxHigherPriorityTaskWoken` - It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set `*pxHigherPriorityTaskWoken` to `pdTRUE`. If xMessageBufferSendFromISR() sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This
will ensure that the interrupt returns directly to the highest priority Ready state task. *px-
HigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function.
See the code example below for an example.

The number of bytes actually written to the message buffer. If the message buffer didn’t have
enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes
is returned.

**xMessageBufferReceive** (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)
Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of
the buffer.

- Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implement-
ation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that
will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It
is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not
safe to have multiple different writers or multiple different readers. If there are to be multiple different writers
then the application writer must place each call to a writing API function (such as xMessageBufferSend())
inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers
then the application writer must place each call to a reading API function (such as xMessageBufferRead())
inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-
FromISR() to read from a message buffer from an interrupt service routine (ISR).

**Example use:**

```c
void vAFunction( MessageBuffer_t xMessageBuffer )
{
  uint8_t ucRxData[20];
  size_t xReceivedBytes;
  const TickType_t xBlockTime = pdMS_TO_TICKS(20);

  // Receive the next message from the message buffer. Wait in the Blocked
  // state (so not using any CPU processing time) for a maximum of 100ms for
  // a message to become available.
  xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
    (void*) ucRxData,
    sizeof( ucRxData ),
    xBlockTime );

  if( xReceivedBytes > 0 )
  {
    // ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
  }
}
```

**参数**
- **xMessageBuffer** – The handle of the message buffer from which a message is being
  received.
- **pvRxData** – A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** – The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** – The maximum amount of time the task should remain in the Blocked
  state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent

---

**Submit Document Feedback**
on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time
specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-
MAX_DELAY will cause the task to wait indefinitely (without timing out), provided IN-
CLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time
when they are in the Blocked state.

返回 The length, in bytes, of the message read from the message buffer, if any. If xMessageBuf-
ferReceive() times out before a message became available then zero is returned. If the length
of the message is greater than xBufferLengthBytes then the message will be left in the message
buffer and zero is returned.

\textbf{xMessageBufferReceiveFromISR}(xMessageBuffer, pvRxData, xBufferLengthBytes,
pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages
can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementa-
tion, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that
will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It
is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not
safe to have multiple different writers or multiple different readers. If there are to be multiple different writers
then the application writer must place each call to a writing API function (such as xMessageBufferSend())
inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers
then the application writer must place each call to a reading API function (such as xMessageBufferRead())
inside a critical section and set the receive block time to 0.

Use \textbf{xMessageBufferReceive()} to read from a message buffer from a task. Use \textbf{xMessageBufferReceive-
FromISR()} to read from a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
  uint8_t ucRxData[ 20 ];
  size_t xReceivedBytes;
  BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

  // Receive the next message from the message buffer.
  xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
    (void *) ucRxData,
    sizeof( ucRxData ),
    &xHigherPriorityTaskWoken );

  if( xReceivedBytes > 0 )
  {
    // A ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
  }

  // If xHigherPriorityTaskWoken was set to pdTRUE inside
  // xMessageBufferReceiveFromISR() then a task that has a priority above the
  // priority of the currently executing task was unblocked and a context
  // switch should be performed to ensure the ISR returns to the unblocked
  // task. In most FreeRTOS ports this is done by simply passing
  // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
  // variables value, and perform the context switch if necessary. Check the
  // documentation for the port in use for port specific instructions.
```

(下页继续)
PortYIELD_FROM_ISR(xHigherPriorityTaskWoken);

参数

- **xMessageBuffer** - The handle of the message buffer from which a message is being received.
- **pvRxData** - A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** - It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

返回 The length, in bytes, of the message read from the message buffer, if any.

vMessageBufferDelete(xMessageBuffer)

Delete a message buffer that was previously created using a call to xMessageBufferCreate() or xMessageBufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

参数

- **xMessageBuffer** - The handle of the message buffer to be deleted.

xMessageBufferIsFull(xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

参数

- **xMessageBuffer** - The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferIsEmpty(xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

参数

- **xMessageBuffer** - The handle of the message buffer being queried.

返回 If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

xMessageBufferReset(xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

参数

- **xMessageBuffer** - The handle of the message buffer being reset.
If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a a message to be available, then pdFAIL is returned.

**xMessageBufferSpaceAvailable** *(xMessageBuffer)*

Returns the number of bytes of free space in the message buffer.

**参数**

- **xMessageBuffer** – The handle of the message buffer being queried.

**返回** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**xMessageBufferNextLengthBytes** *(xMessageBuffer)*

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

**参数**

- **xMessageBuffer** – The handle of the message buffer being queried.

**返回** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**xMessageBufferSendCompletedFromISR** *(xMessageBuffer, pxHigherPriorityTaskWoken)*

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**参数**

- **xMessageBuffer** – The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** – *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xMessageBufferSendCompletedFromISR(). If calling xMessageBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *px-HigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**返回** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**xMessageBufferReceiveCompletedFromISR** *(xMessageBuffer, pxHigherPriorityTaskWoken)*

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xMessageBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**参数**
Chapter 2. API

- `xMessageBuffer` - The handle of the stream buffer from which data was read.
- `pxHigherPriorityTaskWoken` - `pxHigherPriorityTaskWoken` should be initialised to `pdFALSE` before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

Type Definitions

typedef void *MessageBufferHandle_t

Type by which message buffers are referenced. For example, a call to `xMessageBufferCreate()` returns an `MessageBufferHandle_t` variable that can then be used as a parameter to `xMessageBufferSend()`, `xMessageBufferReceive()`, etc.

2.10.11 FreeRTOS Supplemental Features

ESP-IDF uses a modified version of FreeRTOS v10.4.3 that contains significant changes for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However, in addition to ESP-IDF FreeRTOS, various features are also provided by ESP-IDF to supplement the features offered by FreeRTOS.

This document describes these supplemental features added to ESP-IDF. This document is split into the following sections:

### Contents

- **FreeRTOS Supplemental Features**
  - Overview
  - Ring Buffers
  - ESP-IDF Tick and Idle Hooks
  - TLSP Deletion Callbacks
  - Component Specific Properties
  - API Reference

### Overview

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However, various new features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties**: Currently added only one component specific property `ORIG_INCLUDE_PATH`.

### Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity
of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, items are always retrieved from the ring buffer by reference. As a result, all retrieved items must also be returned to the ring buffer by using \texttt{vRingbufferReturnItem()} or \texttt{vRingbufferReturnItemFromISR()}, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

\textbf{No-Split buffers} will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. \textit{Only this buffer type allows you to get the data item address and write to the item by yourself.} Refer the documentation of the functions \texttt{xRingbufferSendAcquire()} and \texttt{xRingbufferSendComplete()} for more details.

\textbf{Allow-Split buffers} will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

\textbf{Byte buffers} do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

\textbf{备注:} No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

\textbf{备注:} Each item stored in No-Split or Allow-Split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

\textbf{Usage} The following example demonstrates the usage of \texttt{xRingbufferCreate()} and \texttt{xRingbufferSend()} to create a ring buffer and then send an item to it.

```
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of \texttt{xRingbufferSendAcquire()} and \texttt{xRingbufferSendComplete()} instead of \texttt{xRingbufferSend()} to acquire memory on the ring buffer (of type \texttt{RINGBUF_TYPE_NOSPLIT}) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"
```
typedef struct {
    llldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))

...  //Retrieve space for DMA descriptor and corresponding data buffer
    //This has to be done with SendAcquire, or the address may be different when
    we copy
    dma_item_t item;
    UBaseType_t res = xRingbufferSendAcquire(buf_handle, &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
    if (res != pdTRUE) {
        printf("Failed to acquire memory for item\n");
    }
    item->dma_desc = (lldesc_t) {
        .size = buffer_size,
        .length = buffer_size,
        .eof = 0,
        .owner = 1,
        .buf = &item->buf,
    };
    //Actually send to the ring buffer for consumer to use
    res = xRingbufferSendComplete(buf_handle, &item);
    if (res != pdTRUE) {
        printf("Failed to send item\n");
    }

The following example demonstrates retrieving and returning an item from a No-Split ring buffer using
xRingbufferReceive() and vRingbufferReturnItem()

    ...  //Receive an item from no-split ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

    //Check received item
    if (item != NULL) {
        //Print item
        for (int i = 0; i < item_size; i++) {
            printf("%c", item[i]);
        }
        printf("\n");
        //Return Item
        vRingbufferReturnItem(buf_handle, (void *)item);
    } else {
        //Failed to receive item
        printf("Failed to receive item\n");
    }

The following example demonstrates retrieving and returning an item from an Allow-Split ring buffer using
xRingbufferReceiveSplit() and vRingbufferReturnItem()
The following example demonstrates retrieving and returning an item from a byte buffer using \texttt{xRingbufferReceiveUpTo()} and \texttt{vRingbufferReturnItem()}

For ISR safe versions of the functions used above, call \texttt{xRingbufferSendFromISR()}, \texttt{xRingbufferReceiveFromISR()}, \texttt{xRingbufferReceiveSplitFromISR()}, \texttt{xRingbufferReceiveUpToFromISR()}, and \texttt{vRingbufferReturnItemFromISR()}

\begin{verbatim}
//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf(\"\n\n\return Item\n\n\fromISR()\\
\end{verbatim}

\textbf{备注}：Two calls to RingbufferReceive[UpTo][FromISR]() are required if the bytes wraps around the end of the ring buffer.

\textbf{Sending to Ring Buffer}  The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.
For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is rounded up to the nearest 32-bit aligned size in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

Using SendAcquire and SendComplete Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

![Diagram](image-url)
After that, we fill (use) the buffers, and send them to the ring buffer by `SendComplete` in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if `SendComplete` is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

**Wrap around**  The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.

![Diagram](image)

**図 33: Wrap around in No-Split buffers**

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

![Diagram](image)

**図 34: Wrap around in Allow-Split buffers**

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**備注:**  Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.
Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.
### Ring Buffers with Queue Sets

Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

// Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

// Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

// Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

// Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    // Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    // Handle item
    ...
} else {
    ...
}
```

### Ring Buffers with Static Allocation

The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`
Chapter 2. API 参考

- The ring buffer’s storage area of size xBufferSize. Note that xBufferSize must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

备注: When deleting a ring buffer created via xRingbufferCreateStatic(), the function vRingbufferDelete() will not free any of the memory blocks. This must be done manually by the user after vRingbufferDelete() is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE 400  // 32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT

... 

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t) * BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_storage, buffer_struct);

... 

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

**Priority Inversion** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will wait repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second-highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

**ESP-IDF Tick and Idle Hooks**

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:
Chapter 2. API

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the `void vApplicationTickHook( void )` callback.
- FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following drawbacks:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each CPU’s tick interrupt and idle tasks ends up calling the same hook.

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per CPU)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each CPU

ESP-IDF hooks can be registered and deregistered using the following API:

- For tick hooks:
  - Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()`.
  - Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`.

- For idle hooks:
  - Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()`.
  - Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`.

备注： The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the SPI flash API documentation for more details.

### TLSP Deletion Callbacks

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task’s TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task’s TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task’s lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP’s associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:
[The callback must never attempt to block or yield] and critical sections should be kept as short as possible.

The callback is called shortly before a deleted task’s memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

**Component Specific Properties**

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

**API Reference**

**Ring Buffer API**

**Header File**

- `components/esp_ringbuf/include/freertos/ringbuf.h`

**Functions**

- `RingbufHandle_t xRingbufferCreate(size_t xBufferSize, RingbufferType_t xBufferType)`
  
  Create a ring buffer.

  备注: `xBufferSize` of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

  **参数**
  
  - `xBufferSize` - [in] Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
  - `xBufferType` - [in] Type of ring buffer, see documentation.

  **返回**
  
  A handle to the created ring buffer, or NULL in case of error.

- `RingbufHandle_t xRingbufferCreateNoSplit(size_t xItemSize, size_t xItemNum)`
  
  Create a ring buffer of type `RINGBUF_TYPE_NOSPLIT` for a fixed `item_size`.

  This API is similar to `xRingbufferCreate()`, but it will internally allocate additional space for the headers.

  **参数**
  
  - `xItemSize` - [in] Size of each item to be put into the ring buffer
  - `xItemNum` - [in] Maximum number of items the buffer needs to hold simultaneously

  **返回**
  
  A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

- `RingbufHandle_t xRingbufferCreateStatic(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)`
  
  Create a ring buffer but manually provide the required memory.

  备注: `xBufferSize` of no-split/allow-split buffers MUST be 32-bit aligned.

  **参数**
  
  - `xBufferSize` - [in] Size of the buffer in bytes.
  - `xBufferType` - [in] Type of ring buffer, see documentation
  - `pucRingbufferStorage` - [in] Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by `xBufferSize`
• `pxStaticRingbuffer` - [in] Pointed to a struct of type `StaticRingbuffer_t` which will be used to hold the ring buffer’s data structure

返回 A handle to the created ring buffer

```c
BaseType_t xRingbufferSend(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize,
                             TickType_t xTicksToWait)
```

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

参数
- `xRingbuffer` - [in] Ring buffer to insert the item into
- `pvItem` - [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- `xItemSize` - [in] Size of data to insert.
- `xTicksToWait` - [in] Ticks to wait for room in the ring buffer.

返回
- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

```c
BaseType_t xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize,
                                    BaseType_t *pxHigherPriorityTaskWoken)
```

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

备注: For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

参数
- `xRingbuffer` - [in] Ring buffer to insert the item into
- `pvItem` - [in] Pointer to data to insert. NULL is allowed if `xItemSize` is 0.
- `xItemSize` - [in] Size of data to insert.
- `pxHigherPriorityTaskWoken` - [out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

返回
- `pdTRUE` if succeeded
- `pdFALSE` when the ring buffer does not have space.

```c
BaseType_t xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize,
                                   TickType_t xTicksToWait)
```

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

备注: Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.
Chapter 2. API 参考

aligned fashion.

参数
- xRingbuffer [in] Ring buffer to allocate the memory
- ppvItem [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- xItemSize [in] Size of item to acquire.
- xTicksToWait [in] Ticks to wait for room in the ring buffer.

返回
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType_t **xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)
Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

备注： Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

参数
- xRingbuffer [in] Ring buffer to insert the item into
- pvItem [in] Pointer to item in allocated memory to insert.

返回
- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

备注： A call to vRingbufferReturnItem() is required after this to free the item retrieved.

参数
- xRingbuffer [in] Ring buffer to retrieve the item from
- pxItemSize [out] Pointer to a variable to which the size of the retrieved item will be written.
- xTicksToWait [in] Ticks to wait for items in the ring buffer.

返回
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)
Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval.

备注： A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

备注： Byte buffers do not allow multiple retrievals before returning an item
Chapter 2. API

### Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

#### Parameters
- **xRingbuffer** [in] Ring buffer to retrieve the item from
- **pxItemSize** [out] Pointer to a variable to which the size of the retrieved item will be written.

#### Returns
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty. *pxItemSize is untouched in that case.

```c
BaseType_t xRingbufferReceiveSplit(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)
```

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

#### Notes
- Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.
- This function should only be called on allow-split buffers.

```c
BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)
```

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer in an ISR. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

#### Notes
- Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.
- This function should only be called on allow-split buffers.
Chapter 2. API

- **xRingbuffer** - [in] Ring buffer to retrieve the item from
- **ppvHeadItem** - [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** - [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** - [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** - [out] Pointer to size of second part (unmodified if item is not split)

void *xRingbufferReceiveUpTo (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

**备注:** A call to vRingbufferReturnItem() is required after this to free up the data retrieved.

**备注:** This function should only be called on byte buffers

**备注:** Byte buffers do not allow multiple retrievals before returning an item

**备注:** Two calls to RingbufferReceiveUpTo() are required if the bytes wrap around the end of the ring buffer.

**参数**
- **xRingbuffer** - [in] Ring buffer to retrieve the item from
- **pxItemSize** - [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** - [in] Ticks to wait for items in the ring buffer.
- **xMaxSize** - [in] Maximum number of bytes to return.

**返回**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

void *xRingbufferReceiveUpToFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

**备注:** A call to vRingbufferReturnItemFromISR() is required after this to free up the data received.

**备注:** This function should only be called on byte buffers

**备注:** Byte buffers do not allow multiple retrievals before returning an item
### 参数
- **xRingbuffer** - [in] Ring buffer to retrieve the item from
- **pxItemSize** - [out] Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** - [in] Maximum number of bytes to return.

### 返回
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

```c
void vRingbufferReturnItem(RingbufHandle_t xRingbuffer, void *pvItem)
```

Return a previously-retrieved item to the ring buffer.

**备注:** If a split item is retrieved, both parts should be returned by calling this function twice

### 参数
- **xRingbuffer** - [in] Ring buffer the item was retrieved from
- **pvItem** - [in] Item that was received earlier

```c
void vRingbufferReturnItemFromISR(RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)
```

Return a previously-retrieved item to the ring buffer from an ISR.

**备注:** If a split item is retrieved, both parts should be returned by calling this function twice

### 参数
- **xRingbuffer** - [in] Ring buffer the item was retrieved from
- **pvItem** - [in] Item that was received earlier
- **pxHigherPriorityTaskWoken** - [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

```c
void vRingbufferDelete(RingbufHandle_t xRingbuffer)
```

Delete a ring buffer.

**备注:** This function will not deallocate any memory if the ring buffer was created using xRingbufferCreateStatic(). Deallocation must be done manually by the user.

### 参数 **xRingbuffer** - [in] Ring buffer to delete

```c
size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer)
```

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

**备注:** The max item size for a no-split buffer is limited to ((buffer_size/2)-header_size). This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.
size_t xRingbufferGetCurFreeSize (RingbufHandle_t xRingbuffer)
Get current free size available for an item/data in the buffer.
This gives the real time free space available for an item/data in the ring buffer. This represents the maximum
size an item/data can have if it was currently sent to the ring buffer.

参数 xRingbuffer -[in] Ring buffer to query
返回 Current free size, in bytes, available for an entry

BaseType_t xRingbufferAddToQueueSetRead (RingbufHandle_t xRingbuffer, QueueHandle_t xQueueSet)
Add the ring buffer’s read semaphore to a queue set.
The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds
the ring buffer’s read semaphore to a queue set.

参数 • xRingbuffer -[in] Ring buffer to add to the queue set
• xQueueSet -[in] Queue set to add the ring buffer’s read semaphore to
返回 • pdTRUE on success, pdFALSE otherwise

BaseType_t xRingbufferCanRead (RingbufHandle_t xRingbuffer, QueueHandle_t xQueueSet)
Check if the selected queue set member is the ring buffer’s read semaphore.
This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this
ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

参数 • xRingbuffer -[in] Ring buffer which should be checked
• xMember -[in] Member returned from xQueueSelectFromSet
返回 • pdTRUE when semaphore belongs to ring buffer
• pdFALSE otherwise.

BaseType_t xRingbufferRemoveFromQueueSetRead (RingbufHandle_t xRingbuffer, QueueHandle_t xQueueSet)
Remove the ring buffer’s read semaphore from a queue set.
This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to
indicate when data has been written to the ring buffer.

参数 • xRingbuffer -[in] Ring buffer to remove from the queue set
• xQueueSet -[in] Queue set to remove the ring buffer’s read semaphore from
返回 • pdTRUE on success
• pdFALSE otherwise

void vRingbufferGetInfo (RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead,
UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)
Get information about ring buffer status.

Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

### Arguments

- `xRingbuffer` [in] Ring buffer to remove from the queue set
- `uxFree` [out] Pointer use to store free pointer position
- `uxRead` [out] Pointer use to store read pointer position
- `uxWrite` [out] Pointer use to store write pointer position
- `uxAcquire` [out] Pointer use to store acquire pointer position
- `uxItemsWaiting` [out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```

Debugging function to print the internal pointers in the ring buffer.

### Structures

**struct xSTATIC_RINGBUFFER**

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

### Type Definitions

```c
typedef void *RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

### Enumerations

```c
enum RingbufferType_t
```

Values:

- **RINGBUF_TYPE_NOSPLIT**
  
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_ALLOWSPLIT**
  
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.
enumerator **RINGBUF_TYPE_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator **RINGBUF_TYPE_MAX**

### Hooks API

#### Header File

- `components/esp_system/include/esp_freertos_hooks.h`

#### Functions

**esp_err_t esp_register_freertos_idle_hook_for_cpu** *(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)*

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_idle_cb</td>
<td>Callback to be called</td>
</tr>
<tr>
<td>cpuid</td>
<td>id of the core</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OK</td>
<td>Callback registered to the specified core’s idle hook</td>
</tr>
<tr>
<td>ESP_ERR_NO_MEM</td>
<td>No more space on the specified core’s idle hook to register callback</td>
</tr>
<tr>
<td>ESP_ERR_INVALID_ARG</td>
<td>cpuid is invalid</td>
</tr>
</tbody>
</table>

**esp_err_t esp_register_freertos_idle_hook** *(esp_freertos_idle_cb_t new_idle_cb)*

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_idle_cb</td>
<td>Callback to be called</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OK</td>
<td>Callback registered to the calling core’s idle hook</td>
</tr>
<tr>
<td>ESP_ERR_NO_MEM</td>
<td>No more space on the calling core’s idle hook to register callback</td>
</tr>
</tbody>
</table>

**esp_err_t esp_register_freertos_tick_hook_for_cpu** *(esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)*

Register a callback to be called from the specified core’s tick hook.

<table>
<thead>
<tr>
<th>参数</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tick_cb</td>
<td>Callback to be called</td>
</tr>
<tr>
<td>cpuid</td>
<td>id of the core</td>
</tr>
</tbody>
</table>

警告: Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.
**Chapter 2. API 参考**

返回
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

*esp_err_t* `esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)`

Register a callback to be called from the calling core’s tick hook.

参数 `new_tick_cb` - [in] Callback to be called

返回
- ESP_OK: Callback registered to the calling core’s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

void `esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)`

Unregister an idle callback from the idle hook of the specified core.

参数
- `old_idle_cb` - [in] Callback to be unregistered
- `cpuid` - [in] id of the core

void `esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)`

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

参数 `old_idle_cb` - [in] Callback to be unregistered

void `esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)`

Unregister a tick callback from the tick hook of the specified core.

参数
- `old_tick_cb` - [in] Callback to be unregistered
- `cpuid` - [in] id of the core

void `esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)`

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

参数 `old_tick_cb` - [in] Callback to be unregistered

**Type Definitions**

typedef bool (*`esp_freertos_idle_cb_t`) (void)

typedef void (*`esp_freertos_tick_cb_t`) (void)

**2.10.12 Heap Memory Allocation**

**Stack and Heap**

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)
Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

### Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM** (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM** (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be **32-bit aligned**.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see 存储器类型.

It’s also possible to connect external SPI RAM to the ESP32, which can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability **MALLOC_CAP_8BIT** (accessible in single byte reads and writes). To test the free DRAM heap size at runtime, call `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc_default(size)`. This will allocate memory with capability **MALLOC_CAP_DEFAULT**, which is byte-addressable.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

### Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.
Heap Sizes

At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>
<thead>
<tr>
<th>Heap Size Details</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>I (252) heap_init: Initializing. RAM available for dynamic allocation:</td>
<td></td>
</tr>
<tr>
<td>I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM</td>
<td></td>
</tr>
<tr>
<td>I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM</td>
<td></td>
</tr>
<tr>
<td>I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM</td>
<td></td>
</tr>
<tr>
<td>I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM</td>
<td></td>
</tr>
<tr>
<td>I (284) heap_init: At 4008944C len 0016BB4 (90 KiB): IRAM</td>
<td></td>
</tr>
</tbody>
</table>

Finding available heap

See Heap Information.

Special Capabilities

DMA-Capable Memory

Use the MALLOC_CAP_DMA flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory

If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the MALLOC_CAP_32BIT flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Please note that on ESP32 series chips, MALLOC_CAP_32BIT cannot be used for storing floating-point variables. This is because MALLOC_CAP_32BIT may return instruction RAM, and the floating-point assembly instructions on ESP32 cannot access instruction RAM.

Memory allocated with MALLOC_CAP_32BIT can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory

When external RAM is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via heap_caps_malloc(MALLOC_CAP_SPIRAM), depending on configuration. See 設置片外 RAM for more details.

To use the region above the 4MiB limit, you can use the himem API.

Thread Safety

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context (see Calling heap related functions from ISR). However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Calling related functions from ISR

The following functions from the heap component can be called form interrupt handler (ISR):

- heap_caps_malloc()
- heap_caps_malloc_default()
- heap_caps_realloc_default()
- heap_caps_malloc_prefer()
- heap_caps_realloc_prefer()
- heap_caps_calloc_prefer()
- heap_caps_free()
- heap_caps_realloc()
- heap_caps_calloc()
Chapter 2. API

- heap_caps_aligned_alloc()
- heap_caps_aligned_free()

Note however this practice is strongly discouraged.

Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- Heap Information (free space, etc.)
- Heap Corruption Detection
- Heap Tracing (memory leak detection, monitoring, etc.)

Implementation Notes

Knowledge about the regions of memory in the chip comes from the "soc" component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling multi_heap_free() on that particular multi_heap instance.

API Reference - Heap Allocation

Header File

- components/heap/include/esp_heap_caps.h

Functions

esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)
registers a callback function to be invoked if a memory allocation operation fails.

参数 callback – caller defined callback to be invoked
返回 ESP_OK if callback was registered.

void *heap_caps_malloc (size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

参数
- size - Size, in bytes, of the amount of memory to allocate
- caps - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回 A pointer to the memory allocated on success, NULL on failure

void heap_caps_free (void *ptr)
Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).
### heap_caps_realloc

```c
void *heap_caps_realloc(void *ptr, size_t size, uint32_t caps)
```

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).

- **ptr** - Pointer to previously allocated memory, or NULL for a new allocation.
- **size** - Size of the new buffer requested, or 0 to free the buffer.
- **caps** - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

### heap_caps_aligned_alloc

```c
void *heap_caps_aligned_alloc(size_t alignment, size_t size, uint32_t caps)
```

Allocate an aligned chunk of memory which has the given capabilities.

Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

- **alignment** - How the pointer received needs to be aligned must be a power of two
- **size** - Size, in bytes, of the amount of memory to allocate
- **caps** - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

### heap_caps_aligned_free

```c
void heap_caps_aligned_free(void *ptr)
```

Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

### heap_caps aligned calloc

```c
void *heap_caps_aligned_calloc(size_t alignment, size_t n, size_t size, uint32_t caps)
```

Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

- **alignment** - How the pointer received needs to be aligned must be a power of two
- **n** - Number of continuing chunks of memory to allocate
- **size** - Size, in bytes, of a chunk of memory to allocate
- **caps** - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

### heap_caps calloc

```c
void *heap_caps_calloc(size_t n, size_t size, uint32_t caps)
```

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

- **n** - Number of continuing chunks of memory to allocate
Chapter 2. API

- **size**: Size, in bytes, of a chunk of memory to allocate
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

返回: A pointer to the memory allocated on success, NULL on failure

```c
size_t heap_caps_get_total_size(uint32_t caps)
```

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

参数: `caps` - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回: total size in bytes

```c
size_t heap_caps_get_free_size(uint32_t caps)
```

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

备注: Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

```c
size_t heap_caps_get_minimum_free_size(uint32_t caps)
```

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

备注: Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

```c
size_t heap_caps_get_largest_free_block(uint32_t caps)
```

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of `s` for which `heap_caps_malloc(s, caps)` will succeed.

参数: `caps` - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
返回: Size of the largest free block in bytes.

```c
void heap_caps_get_info(multi_heap_info_t *info, uint32_t caps)
```

Get heap info for all regions with the given capabilities.

Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

参数:
- `info` - Pointer to a structure which will be filled with relevant heap metadata.
- `caps` - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
void heap_caps_print_heap_info (uint32_t caps)
Print a summary of all memory with the given capabilities.
Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

参数 caps - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool heap_caps_check_integrity_all (bool print_errors)
Check integrity of all heap memory in the system.
Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.
Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

备注: Please increase the value of CONFIG_ESP_INT_WDT_TIMEOUT_MS when using this API with PSRAM enabled.

参数 print_errors - Print specific errors if heap corruption is found.
返回 True if all heaps are valid, False if at least one heap is corrupt.

bool heap_caps_check_integrity (uint32_t caps, bool print_errors)
Check integrity of all heaps with the given capabilities.
Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.
See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

备注: Please increase the value of CONFIG_ESP_INT_WDT_TIMEOUT_MS when using this API with PSRAM capability flag.

参数
• caps - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
• print_errors - Print specific errors if heap corruption is found.
返回 True if all heaps are valid, False if at least one heap is corrupt.

bool heap_caps_check_integrity_addr (intptr_t addr, bool print_errors)
Check integrity of heap memory around a given address.
This function can be used to check the integrity of a single region of heap memory, which contains the given address.
This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

备注: The entire heap region around the address is checked, not only the adjacent heap blocks.

参数
• addr - Address in memory. Check for corruption in region containing this address.
• print_errors - Print specific errors if heap corruption is found.
返回 True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.
void `heap_caps_malloc_extmem_enable` (size_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

参数 limit – Limit, in bytes.

void *`heap_caps_malloc_prefer` (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

参数
- size – Size, in bytes, of the amount of memory to allocate
- num – Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void *`heap_caps_realloc_prefer` (void *ptr, size_t size, size_t num, ...)

Reallocate a chunk of memory as preference in decreasing order.

参数
- ptr – Pointer to previously allocated memory, or NULL for a new allocation.
- size – Size of the new buffer requested, or 0 to free the buffer.
- num – Number of variable parameters

返回 Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

void *`heap_caps_calloc_prefer` (size_t n, size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

参数
- n – Number of continuing chunks of memory to allocate
- size – Size, in bytes, of a chunk of memory to allocate
- num – Number of variable parameters

返回 A pointer to the memory allocated on success, NULL on failure

void `heap_caps_dump` (uint32_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

参数 caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void `heap_caps_dump_all` (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.
Output is the same as for heap_caps_dump.

```c
size_t heap_caps_get_allocated_size(void *ptr)
```

Return the size that a particular pointer was allocated with.

**备注:** The app will crash with an assertion failure if the pointer is not valid.

参数 `ptr` – Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

返回 Size of the memory allocated at this block.

**Macros**

**MALLOC_CAP_EXEC**

- Flags to indicate the capabilities of the various memory systems.
  - Memory must be able to run executable code

**MALLOC_CAP_32BIT**

- Memory must allow for aligned 32-bit data accesses.

**MALLOC_CAP_8BIT**

- Memory must allow for 8/16/...-bit data accesses.

**MALLOC_CAP_DMA**

- Memory must be able to accessed by DMA.

**MALLOC_CAP_PID2**

- Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC_CAP_PID3**

- Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC_CAP_PID4**

- Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC_CAP_PID5**

- Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC_CAP_PID6**

- Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC_CAP_PID7**

- Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC_CAP_SPIRAM**

- Memory must be in SPI RAM.

**MALLOC_CAP_INTERNAL**

- Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.
Chapter 2. API

**MALLOC_CAP_DEFAULT**
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC_CAP_IRAM_8BIT**
Memory must be in IRAM and allow unaligned access.

**MALLOC_CAP_RETENTION**
Memory must be able to accessed by retention DMA.

**MALLOC_CAP_RTCRAM**
Memory must be in RTC fast memory.

**MALLOC_CAP_INVALID**
Memory can’t be used / list end marker.

**Type Definitions**

typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
callback called when an allocation operation fails, if registered

- **Param size** in bytes of failed allocation
- **Param caps** capabilities requested of failed allocation
- **Param function_name** function which generated the failure

**API Reference - Initialisation**

**Header File**

- components/heap/include/esp_heap_caps_init.h

**Functions**

void **heap_caps_init** (void)
Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap_caps_enable_nonos_stack_heaps** (void)
Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

**esp_err_t** **heap_caps_add_region** (intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can’t be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.
Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

### Parameters

- **start** – Start address of new region.
- **end** – End address of new region.

### Returns

- **ESP_OK** on success
- **ESP_ERR_INVALID_ARG** if a parameter is invalid
- **ESP_ERR_NOT_FOUND** if the specified start address doesn’t reside in a known region, or any error returned by `heap_caps_add_region_with_caps()`.

**`esp_err_t heap_caps_add_region_with_caps(const uint32_t caps[], intptr_t start, intptr_t end)`**

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

### Example

<table>
<thead>
<tr>
<th>Existing region: 0x1000 &lt;-&gt; 0x3000</th>
</tr>
</thead>
<tbody>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x3000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x2000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x1000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x3000 &lt;-&gt; 0x4000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x2000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x2000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
</tbody>
</table>
Chapter 2. API 参考

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

Header File

- components/heap/include/multi_heap.h

Functions

void *multi_heap_aligned_alloc(multi_heap_handle_t heap, size_t size, size_t alignment)
allocate a chunk of memory with specific alignment

参数
- **heap** - Handle to a registered heap.
- **size** - size in bytes of memory chunk
- **alignment** - how the memory must be aligned

返回 pointer to the memory allocated, NULL on failure

void *multi_heap_malloc(multi_heap_handle_t heap, size_t size)
malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

参数
- **heap** - Handle to a registered heap.
- **size** - Size of desired buffer.

返回 Pointer to new memory, or NULL if allocation fails.

void multi_heap_aligned_free(multi_heap_handle_t heap, void *p)
free() a buffer aligned in a given heap.

备注：This function is deprecated, consider using multi_heap_free() instead

参数
- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_aligned_alloc() for the same heap.

void multi_heap_free(multi_heap_handle_t heap, void *p)
free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument `p` must be NULL or have been allocated in the specified heap.

参数
- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

void *multi_heap_realloc(multi_heap_handle_t heap, void *p, size_t size)
realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument `p` must be NULL or have been allocated in the specified heap.

参数
- **heap** - Handle to a registered heap.
- **p** - NULL, or a pointer previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.
Chapter 2. API Reference

- **size** - Desired new size for buffer.

Returns: New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

```c
size_t multi_heap_get_allocated_size(multi_heap_handle_t heap, void *p)
```

Return the size that a particular pointer was allocated with.

Parameters:
- `heap` - Handle to a registered heap.
- `p` - Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

Returns: Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

```c
multi_heap_handle_t multi_heap_register(void *start, size_t size)
```

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

Parameters:
- `start` - Start address of the memory to use for a new heap.
- `size` - Size (in bytes) of the new heap.

Returns: Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

```c
void multi_heap_set_lock(multi_heap_handle_t heap, void *lock)
```

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters:
- `heap` - Handle to a registered heap.
- `lock` - Optional pointer to a locking structure to associate with this heap.

```c
void multi_heap_dump(multi_heap_handle_t heap)
```

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters: `heap` - Handle to a registered heap.

```c
bool multi_heap_check(multi_heap_handle_t heap, bool print_errors)
```

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAILPRINTF` in `multi_heap_platform.h`.

**Remark:** This function is not thread-safe as it sets a global variable with the value of `print_errors`.

Parameters:
- `heap` - Handle to a registered heap.
- `print_errors` - If true, errors will be printed to stderr.

Returns: true if heap is valid, false otherwise.
Chapter 2. API

size_t multi_heap_free_size (multi_heap_handle_t heap)

    Return free heap size.
    
    Returns the number of bytes available in the heap.
    
    Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().
    
    Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

    参数 heap - Handle to a registered heap.
    返回 Number of free bytes.

size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)

    Return the lifetime minimum free heap size.
    
    Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().
    
    Returns the lifetime “low watermark” of possible values returned from multi_free_heap_size(), for the specified heap.

    参数 heap - Handle to a registered heap.
    返回 Number of free bytes.

void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)

    Return metadata about a given heap.
    
    Fills a multi_heap_info_t structure with information about the specified heap.

    参数
    • heap - Handle to a registered heap.
    • info - Pointer to a structure to fill with heap metadata.

Structures

struct multi_heap_info_t

    Structure to access heap metadata via multi_heap_get_info.

Public Members

size_t total_free_bytes

    Total free bytes in the heap. Equivalent to multi_free_heap_size().

size_t total_allocated_bytes

    Total bytes allocated to data in the heap.

size_t largest_free_block

    Size of the largest free block in the heap. This is the largest malloc-able size.

size_t minimum_free_bytes

    Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

size_t allocated_blocks

    Number of (variable size) blocks allocated in the heap.

size_t free_blocks

    Number of (variable size) free blocks in the heap.
The total number of (variable size) blocks in the heap.

**Type Definitions**

typedef struct multi_heap_info *multi_heap_handle_t

Opaque handle to a registered heap.

### 2.10.13 Heap Memory Debugging

**Overview**

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the *Heap Memory Allocation* page.

**Heap Information**

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low watermark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

**Heap Corruption Detection**

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory.

**Assertions** The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.
Memory Allocation Failed Hook  Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char *function_name)
{  
  printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n", function_name, requested_size, caps);
}

void app_main()
{
  ...
  esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_failed_hook);
  ...
  void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
  ...
}
```

Finding Heap Corruption  Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_cpu_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, heap tracing in HEAP_TRACE_ALL mode lets you see which callers are allocating which addresses from the heap. See Heap Tracing To Find Heap Corruption for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

Configuration  Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.
In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting CONFIG_HEAP_CORRUPTION_DETECTION can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice). Calling heap_caps_check_integrity() in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time free() is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When heap_caps_check_integrity() is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes reading/writing an address related to 0xCECECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”. The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.
Manual Heap Checks in Comprehensive Mode  Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in `system/heap_task_tracking`

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks  If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see `CONFIG_HEAP_TRACING_DEST`).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in internal RAM
...
```

(下页续接)
Chapter 2. API

gॉ

(线索)

```c
void app_main()
{
    ...  
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccoun 0x2e9b7384 caller...
    0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
    ~blink.c:27
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccoun 0x2e9b79c0 caller...
    0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
    ~blink.c:29
0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52
40 bytes ‘leaked’ in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In HEAP_TRACE_LEAKS mode, for each traced memory allocation which has not already been freed a line is printed with:

- XX bytes is the number of bytes allocated
- @ 0x... is the heap address returned from malloc/calloc.
- CPU x is the CPU (0 or 1) running when the allocation was made.
- ccoun 0x... is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging -> Enable heap tracing -> Heap tracing stack depth. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each heap_trace_record_t record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.
A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

### Host-Based Mode

Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to **Component settings** -> **Heap Memory Debugging** -> **CONFIG_HEAP_TRACING_DEST** and select **Host-Based**.
- In the project configuration menu, navigate to **Component settings** -> **Application Level Tracing** -> **CONFIG_APPTRACE_DESTINATION** and select **Trace memory**.
- In the project configuration menu, navigate to **Component settings** -> **Application Level Tracing** -> **FreeRTOS SystemView Tracing** and enable **CONFIG_APPTRACE_SV_ENABLE**.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like **HEAP_TRACE_ALL** was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

**备注:** In order to use this feature you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

```bash
target remote :3333
mon reset halt
flushregs
tb heap_trace_start
commands
```

(下页继续)
Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Tracedata will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:
   ```
   xtensa-esp32-elf-gdb -x gdbinit <path/to/program/elf>
   ```
5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script:
   ```
   $IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b <path/to/program/elf> /tmp/heap_log.svdat
   ```

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '[/tmp/heap.svdat]'...

```
Heap Tracing To Find Heap Corruption

Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a
nearby address.
If you have some idea at what time the corruption occurred, enabling heap tracing in \texttt{HEAP\_TRACE\_ALL} mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

\textbf{Performance Impact}  
Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

\textbf{False-Positive Memory Leaks}  
Not everything printed by \texttt{heap\_trace\_dump()} is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after \texttt{heap\_trace\_start()} but then freed after \texttt{heap\_trace\_stop()} will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after \texttt{heap\_trace\_stop()} is called.
- The first time a task uses stdout - for example, when it calls \texttt{printf()} - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of \texttt{printf()}, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the \texttt{TIME\_WAIT} state. After the \texttt{TIME\_WAIT} period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

\textbf{API Reference - Heap Tracing}

\textbf{Header File}
- \texttt{components/heap/include/esp\_heap\_trace.h}

\textbf{Functions}
\begin{verbatim}
esp_err_t heap_trace_init_standalone (heap_trace_record_t *record_buffer, size_t num_records)
Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call
heap_trace_init_standalone(NULL, 0);
\end{verbatim}

\begin{itemize}
\item \texttt{record_buffer} – Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
\item \texttt{num_records} – Size of the heap trace buffer, as number of record structures.
\end{itemize}

\begin{itemize}
\item ESP\_ERR\_NOT\_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
\end{itemize}
Chapter 2. API 参考

• ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
• ESP_OK Heap tracing initialised successfully.

\texttt{esp_err_t heap_trace_init_tohost (void)}

Initialise heap tracing in host-based mode.

- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

\texttt{esp_err_t heap_trace_start (heap_trace_mode_t mode)}

Start heap tracing. All heap allocations & frees will be traced, until \texttt{heap_trace_stop()} is called.

\textbf{备注:} heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

\textbf{备注:} Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

参数 \texttt{mode} - Mode for tracing.
- HEAP_TRACE_ALL means all heap allocations and frees are traced.
- HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

\textbf{备注:} ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

\texttt{esp_err_t heap_trace_stop (void)}

Stop heap tracing.

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped.

\texttt{esp_err_t heap_trace_resume (void)}

Resume heap tracing which was previously stopped.

Unlike \texttt{heap_trace_start()}, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when \texttt{heap_trace_start()} was last called (or HEAP_TRACE_ALL if \texttt{heap_trace_start()} was never called).

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

\texttt{size_t heap_trace_get_count (void)}

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.
**esp_err_t heap_trace_get** (size_t index, heap_trace_record_t *record)

Return a raw record from the heap trace buffer.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Index (zero-based) of the record to return.</td>
</tr>
<tr>
<td>record [out]</td>
<td>Record where the heap trace record will be copied.</td>
</tr>
</tbody>
</table>

备注：It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

-exit-

**void heap_trace_dump** (void)

Dump heap trace record data to stdout.

备注：It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

**Structures**

```c
struct heap_trace_record_t
```

Trace record data type. Stores information about an allocated region of memory.

**Public Members**

```c
uint32_t ccount
```

C_COUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

```c
void *address
```

Address which was allocated.

```c
size_t size
```

Size of the allocation.

```c
void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
```

Call stack of the caller which allocated the memory.

```c
void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
```

Call stack of the caller which freed the memory (all zero if not freed.)

**Macros**

```c
CONFIG_HEAP_TRACING_STACK_DEPTH
```

2.10.14 High Resolution Timer (ESP Timer)

Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events and dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the \textbf{CONFIG\_ESP\_TIMER\_INTERUPT\_LEVEL} option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

\textbf{esp\_timer} set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, \textbf{esp\_timer} uses a 64-bit hardware timer, where the implementation depends on the target. LAC timer is used for ESP32.

Timer callbacks can be dispatched by two methods:

- \textbf{ESP\_TIMER\_TASK}. Timers are dispatched from a high-priority \textbf{esp\_timer} task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

- \textbf{ESP\_TIMER\_ISR}. Available only if \textbf{CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD} is enabled (by default disabled).

\textbf{ESP\_TIMER\_TASK}. Timer callbacks are dispatched from a high-priority \textbf{esp\_timer} task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than \textbf{esp\_timer} are running, callback dispatching will be delayed until \textbf{esp\_timer} task has a chance to run. For example, this will happen if an SPI Flash operation is in progress.

\textbf{ESP\_TIMER\_ISR}. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot \textbf{esp\_timer}. If \textbf{esp\_timer\_start\_once()} is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic \textbf{esp\_timer} also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

Using \textbf{esp\_timer} APIs

Single timer is represented by \textbf{esp\_timer\_handle\_t} type. Timer has a callback function associated with it. This callback function is called from the \textbf{esp\_timer} task each time the timer elapses.

- To create a timer, call \textbf{esp\_timer\_create()}.
Chapter 2. API

- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

**Callback functions**

备注：Keep the callback functions as short as possible otherwise it will affect all timers.

Timer callbacks which are processed by ESP_TIMER_ISR method should not call the context switch call - `portYIELD_FROM_ISR()`, instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

**esp_timer during the light sleep**

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with `skip_unhandled_events` option will not wake up the system.

**Handling callbacks**

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

**Obtaining Current Time**

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

Submit Document Feedback
• Start from zero after the chip wakes up from deep sleep
• Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of esp_timer APIs: system/esp_timer.

API Reference

Header File

• components/esp_timer/include/esp_timer.h

Functions

**esp_err_t esp_timer_early_init (void)**

Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

备注: This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

返回

• ESP_OK on success

**esp_err_t esp_timer_init (void)**

Initialize esp_timer library.

备注: This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

返回

• ESP_OK on success
• ESP_ERR_NO_MEM if allocation has failed
• ESP_ERR_INVALID_STATE if already initialized
• other errors from interrupt allocator

**esp_err_t esp_timer_deinit (void)**

De-initialize esp_timer library.

备注: Normally this function should not be called from applications

返回

• ESP_OK on success
• ESP_ERR_INVALID_STATE if not yet initialized
**esp_err_t esp_timer_create** (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)

Create an esp_timer instance.

备注：When done using the timer, delete it with esp_timer_delete function.

参数
- **create_args** – Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out_handle** – [out] Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

**esp_err_t esp_timer_start_once** (esp_timer_handle_t timer, uint64_t timeout_us)

Start one-shot timer.

参数
- **timer** – timer handle created using esp_timer_create
- **timeout_us** – timer timeout, in microseconds relative to the current moment

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_start_periodic** (esp_timer_handle_t timer, uint64_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

参数
- **timer** – timer handle created using esp_timer_create
- **period** – timer period, in microseconds

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_restart** (esp_timer_handle_t timer, uint64_t timeout_us)

Restart a currently running timer.

If the given timer is a one-shot timer, the timer is restarted immediately and will timeout once in timeout_us microseconds. If the given timer is a periodic timer, the timer is restarted immediately with a new period of timeout_us microseconds.

参数
- **timer** – timer Handle created using esp_timer_create
- **timeout_us** – Timeout, in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is not running
### Chapter 2. API 参考

**esp_err_t esp_timer_stop(esp_timer_handle_t timer)**

Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

- **参数** timer — timer handle created using esp_timer_create
- **返回**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if the timer is not running

**esp_err_t esp_timer_delete(esp_timer_handle_t timer)**

Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

- **参数** timer — timer handle allocated using esp_timer_create
- **返回**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if the timer is running

**int64_t esp_timer_get_time(void)**

Get time in microseconds since boot.

- **返回** number of microseconds since underlying timer has been started

**int64_t esp_timer_get_next_alarm(void)**

Get the timestamp when the next timeout is expected to occur.

- **返回** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

**int64_t esp_timer_get_next_alarm_for_wake_up(void)**

Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

- **返回** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by esp_timer_get_time.

**esp_err_t esp_timer_get_period(esp_timer_handle_t timer, uint64_t *period)**

Get the period of a timer.

This function fetches the timeout period of a timer.

---

**备注：** The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

- **参数**
  - timer — timer handle allocated using esp_timer_create
  - period — memory to store the timer period value in microseconds
- **返回**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if the arguments are invalid

**esp_err_t esp_timer_get_expiry_time(esp_timer_handle_t timer, uint64_t *expiry)**

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

---

**备注：** This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.
### Chapter 2. API 参考

#### 参数
- **timer** - timer handle allocated using esp_timer_create
- **expiry** - memory to store the timeout value in microseconds

#### 返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

---

**esp_err_t esp_timer_dump** (FILE *stream)

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

```
name period alarm times_armed times_triggered total_callback_run_time
```

where:

- `name` — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer
- `period` — period of timer, in microseconds, or 0 for one-shot timer
- `alarm time` — time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

- `times_armed` — number of times the timer was armed via esp_timer_start_X
- `times_triggered` — number of times the callback was called
- `total_callback_run_time` — total time taken by callback to execute, across all calls

#### 参数
- **stream** - stream (such as stdout) to dump the information to

#### 返回
- ESP_OK on success
- ESP_ERR_NO_MEM if can not allocate temporary buffer for the output

---

**void esp_timer_isr_dispatch_need_yield** (void)

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

---

**bool esp_timer_is_active** (esp_timer_handle_t timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

#### 参数
- **timer** — timer handle created using esp_timer_create

#### 返回
- 1 if timer is still active
- 0 if timer is not active.

---

**esp_err_t esp_timer_new_etm_alarm_event** (esp_etm_event_handle_t *out_event)

Get the ETM event handle of esp_timer underlying alarm event.

#### 备注: The created ETM event object can be deleted later by calling esp_etm_del_event

---

**备注: The ETM event is generated by the underlying hardware & quot; systimer, therefore, if the esp_timer
is not clocked by systimer, then no ETM event will be generated.**

#### 参数
- **out_event** — [out] Returned ETM event handle

#### 返回
- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Structures**

```c
struct esp_timer_create_args_t
```

Timer configuration passed to `esp_timer_create`.

**Public Members**

```c
esp_timer_cb_t callback
```

Function to call when timer expires.

```c
void *arg
```

Argument to pass to the callback.

```c
esp_timer_dispatch_t dispatch_method
```

Call the callback from task or from ISR.

```c
const char *name
```

Timer name, used in `esp_timer_dump` function.

```c
bool skip_unhandled_events
```

Skip unhandled events for periodic timers.

**Type Definitions**

```c
typedef struct esp_timer *esp_timer_handle_t
```

Opaque type representing a single `esp_timer`.

```c
typedef void (*esp_timer_cb_t)(void *arg)
```

Timer callback function type.

```c
Param arg  pointer to opaque user-specific data
```

**Enumerations**

```c
enum esp_timer_dispatch_t
```

Method for dispatching timer callback.

**Values:**

```c
enumerator ESP_TIMER_TASK
```

Callback is called from timer task.

```c
enumerator ESP_TIMER_MAX
```

Count of the methods for dispatching timer callback.

## 2.10.15 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.
Chapter 2. API 参考

API Reference

Header File

- components/esp_rom/include/esp_rom_sys.h

Functions

void esp_rom_software_reset_system (void)

Software Reset digital core include RTC.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

void esp_rom_software_reset_cpu (int cpu_no)

Software Reset cpu core.

It is not recommended to use this function in esp-idf, use esp_restart() instead.

参数 cpu_no:	The CPU to reset, 0 for PRO CPU, 1 for APP CPU.

int esp_rom_printf (const char *fmt, ...)

Print formatted string to console device.

备注: float and long long data are not supported!

参数

- fmt: Format string
- ...: Additional arguments, depending on the format string

返回: int: Total number of characters written on success; A negative number on failure.

void esp_rom_delay_us (uint32_t us)

Pauses execution for us microseconds.

参数 us: Number of microseconds to pause

void esp_rom_install_channel_putc (int channel, void (*putc)(char c))

esp_rom_printf can print message to different channels simultaneously. This function can help install the low
level putc function for esp_rom_printf.

参数

- channel: Channel number (starting from 1)
- putc: Function pointer to the putc implementation. Set NULL can disconnect
esp_rom_printf with putc.

void esp_rom_install_uart_printf (void)

Install UART1 as the default console channel, equivalent to esp_rom_install_channel_putc(1,
esp_rom_uart_putc)

soc_reset_reason_t esp_rom_get_reset_reason (int cpu_no)

Get reset reason of CPU.

参数 cpu_no: CPU number

返回: Reset reason code (see in soc/reset_reasons.h)

void esp_rom_route_intr_matrix (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)

Route peripheral interrupt sources to CPU’s interrupt port by matrix.

Usually there’re 4 steps to use an interrupt:

a. Route peripheral interrupt source to CPU. e.g. esp_rom_route_intr_matrix(0,
ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)

b. Set interrupt handler for CPU

c. Enable CPU interrupt
Chapter 2. API 参考

d. Enable peripheral interrupt

参数
- cpu_core - The CPU number, which the peripheral interrupt will inform to
- periph_intr_id - The peripheral interrupt source number
- cpu_intr_num - The CPU interrupt number

uint32_t esp_rom_get_cpu_ticks_per_us (void)
Get the real CPU ticks per us.

2.10.16 Inter-Processor Call

备注： The IPC is an Inter-Processor Call and NOT Inter-Process Communication as found on other operating systems.

Overview

Due to the dual core nature of the ESP32, there are instances where a certain callback must be run in the context of a particular CPU such as:
- When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU’s interrupt source as well).
- On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
- Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see High-Level Interrupts for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

IPC in Task Context

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU’s IPC task.

When using IPCs in a task context, users need to consider the following:
- IPC callbacks should ideally be simple and short. An IPC callback should avoid attempting to block or yield.
- The IPC tasks are created at the highest possible priority (i.e., configMAX_PRIORITIES - 1) thus the callback should also run at that priority as a result. However, CONFIG_ESP_IPC_USES_CALLERS_PRIORITY is enabled by default which will temporarily lower the priority of the target CPU’s IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via CONFIG_ESP_IPC_TASK_STACK_SIZE.
- The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.
**API Usage**  Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`
- The callback should avoid attempting to block or yield as this will result in the target CPU’s IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling `vTaskPrioritySet(NULL, x)`).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback’s execution has completed, or return immediately once the callback’s execution has started.

- `esp_ipc_call()` will trigger an IPC call on the target CPU. This function will block until the target CPU’s IPC task begins execution of the callback.
- `esp_ipc_call_blocking()` will trigger an IPC on the target CPU. This function will block until the target CPU’s IPC task completes execution of the callback.

**IPC in ISR Context**

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a High Priority Interrupt context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` option
- When the callback executes:
  - The calling CPU will disable interrupts of level 3 and lower
  - Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution of the IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

**API Usage**  High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
- The callback is invoked via the `CALLX0` instruction with register windowing disabled, thus the callback:
  - Must not call any register window related instructions (e.g., entry and retw).
  - Must not call other C functions as register windowing is disabled
- The callback should be placed in IRAM at a 4-byte aligned address
- (On invocation of/after returning from) the callback, the registers `a2, a3, a4` are (saved/restored) automatically thus:
  - `a2` will contain the `void *arg` of the callback
  - `a3/a4` are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU’s cycle count.
Chapter 2. API 参考

```c
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
// use only a2, a3 and a4 regs here.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret

unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void*)cycle_count);
```

**备注:** The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the `system/ipc/ipc_isr`.

**备注:** For more examples of High Priority Interrupt IPC callbacks, see `components/esp_system/port/arch/xtensa/esp_ipc_isr_routines.S` and `components/esp_system/test/test_ipc_isr.S`

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.
- `esp_ipc_isr_release_other_cpu()` resumes the target CPU.

### API Reference

#### Header File

- `components/esp_system/include/esp_ipc.h`

#### Functions

- **esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)**

  Execute a callback on a given CPU.

  Execute a given callback on a particular CPU. The callback must be of type “esp_ipc_func_t” and will be invoked in the context of the target CPU’s IPC task.

  - This function will block the target CPU’s IPC task has begun execution of the callback
  - If another IPC call is ongoing, this function will block until the ongoing IPC call completes
  - The stack size of the IPC task can be configured via the CONFIG_ESP_IPC_TASK_STACK_SIZE option

**备注:** In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.
### Chapter 2. API 参考

#### 参数
- `cpu_id` - [in] CPU where the given function should be executed (0 or 1)
- `func` - [in] Pointer to a function of type `void func(void* arg)` to be executed
- `arg` - [in] Arbitrary argument of type `void*` to be passed into the function

#### 返回
- `ESP_ERR_INVALID_ARG` if `cpu_id` is invalid
- `ESP_ERR_INVALID_STATE` if the FreeRTOS scheduler is not running
- `ESP_OK` otherwise

```c
esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)
```

Execute a callback on a given CPU until and block until it completes.

This function is identical to `esp_ipc_call()` except that this function will block until the execution of the callback completes.

---

**备注:** In single-core mode, returns `ESP_ERR_INVALID_ARG` for `cpu_id 1`.

---

#### Type Definitions

```c
typedef void (*esp_ipc_func_t)(void *arg)
```

IPC Callback.

A callback of this type should be provided as an argument when calling `esp_ipc_call()` or `esp_ipc_call_blocking()`.

---

#### Header File

- `components/esp_system/include/esp_ipc_isr.h`

---

#### Functions

```c
void esp_ipc_isr_asm_call(esp_ipc_isr_func_t func, void *arg)
```

Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a `CALLX0` instruction, and has `a2, a3, a4` as scratch registers. See docs for more details

**备注:** This function is not available in single-core mode.

---

#### 参数
- `func` - [in] Pointer to a function of type `void func(void* arg)` to be executed
- `arg` - [in] Arbitrary argument of type `void*` to be passed into the function

---
void **esp_ipc_isr_asm_call_blocking** (*esp_isr_func_t* func, void *arg)

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

**参数**

- **func** - [in] Pointer to a function of type void(func(void* arg)) to be executed
- **arg** - [in] Arbitrary argument of type void* to be passed into the function

void **esp_ipc_isr_stall_other_cpu** (void)

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

**备注:** This function is internally implemented using IPC ISR

**备注:** This function is used for DPORT workaround.

**备注:** If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

void **esp_ipc_isr_release_other_cpu** (void)

Release the other CPU.

This function will release the other CPU that was previously stalled from calling esp_ipc_isr_stall_other_cpu().

**备注:** This function is internally implemented using IPC ISR

**备注:** This function is used for DPORT workaround.

**备注:** If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

void **esp_ipc_isr_stall_pause** (void)

Pause the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

void **esp_ipc_isr_stall_abort** (void)

Abort a CPU stall.

This function will abort any stalling routine of the other CPU due to a pervious call to esp_ipc_isr_stall_other_cpu(). This function aborts the stall in a non-recoverable manner, thus should only be called in case of a panic.

**备注:** This function is used in panic handling code
void esp_ipc_isr_stall_resume(void)

  Resume the CPU stall feature.
  
  This function will resume the CPU stall feature that was previously paused by calling esp_ipc_isr_stall_pause(). Once resumed, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have effect again.

Type Definitions

typedef void (*esp_ipc_isr_func_t)(void *arg)

  IPC ISR Callback.
  
  A callback of this type should be provided as an argument when calling esp_ipc_isr_asm_call() or esp_ipc_isr_asm_call_blocking().

### 2.10.17 Interrupt allocation

**Overview**

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The esp_intr_alloc() abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc() (or esp_intr_alloc_intrstatus()). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per esp_intr_alloc() call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let’s say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB’s ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

**Multicore issues**

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.
**Internal peripheral interrupts** Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in esp_intr_alloc.h as `ETS_INTERNAL_/*_INTR_SOURCE`.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc()` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts** The remaining interrupt sources are from external peripherals. These are defined in soc/soc.h as `ETS_*_INTR_SOURCE`.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

**IRAM-Safe Interrupt Handlers**

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses. Refer to the `SPI flash API documentation` for more details.

**Multiple Handlers Sharing A Source**

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist two ways to stop an interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt.** Please note that leaving some status bits unhandled without masking them, while
disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

**API Reference**

**Header File**
- `components/esp_hw_support/include/esp_intr_alloc.h`

**Functions**

- **`esp_intr_mark_shared`** *(int intno, int cpu, bool is_in_iram)*

  Mark an interrupt as a shared interrupt.

  This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

  参数
  - **intno** – The number of the interrupt (0-31)
  - **cpu** – CPU on which the interrupt should be marked as shared (0 or 1)
  - **is_in_iram** – Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

  返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

- **`esp_intr_reserve`** *(int intno, int cpu)*

  Reserve an interrupt to be used outside of this framework.

  This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

  参数
  - **intno** – The number of the interrupt (0-31)
  - **cpu** – CPU on which the interrupt should be marked as shared (0 or 1)

  返回 ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

- **`esp_intr_alloc`** *(int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)*

  Allocate an interrupt with the given parameters.

  This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

  The interrupt will always be allocated on the core that runs this function.

  If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

  参数
  - **source** – The interrupt source. One of the ETS_*._INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*._INTR_SOURCE sources as defined in this header.
  - **flags** – An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
  - **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
  - **arg** – Optional argument for passed to the interrupt handler
  - **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

  返回 ESP_ERR_INVALID_ARG if the combination of arguments is invalid.

  ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise
Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

### esp_err_t esp_intr_alloc_intrstatus (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

#### Parameters

- **source** - The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags** - An ORed mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** - The address of an interrupt status register
- **intrstatusmask** - A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** - The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg** - Optional argument for passed to the interrupt handler
- **ret_handle** - Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

#### Returns

- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags ESP_OK otherwise

### esp_err_t esp_intr_free (intr_handle_t handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

### esp_err_t esp_intr_get_cpu (intr_handle_t handle)

Get CPU number an interrupt is tied to.

#### Parameters

- **handle** - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

#### Returns

- ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

### int esp_intr_get_intno (intr_handle_t handle)

Get the allocated interrupt for a certain handle.

#### Parameters

- **handle** - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

#### Returns

- The interrupt number
**esp_err_t esp_intr_disable (intr_handle_t handle)**

Disable the interrupt associated with the handle.

**备注:**

a. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

b. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**参数 handle** - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

**返回** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**esp_err_t esp_intr_enable (intr_handle_t handle)**

Enable the interrupt associated with the handle.

**备注:** For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**参数 handle** - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

**返回** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**esp_err_t esp_intr_set_in_iram (intr_handle_t handle, bool is_in_iram)**

Set the “in IRAM” status of the handler.

**备注:** Does not work on shared interrupts.

**参数**

- **handle** - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- **is_in_iram** - Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

**返回** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**void esp_intr_noniram_disable (void)**

Disable interrupts that aren’t specifically marked as running from IRAM.

**void esp_intr_noniram_enable (void)**

Re-enable interrupts disabled by esp_intr_noniram_disable.

**void esp_intr_enable_source (int inum)**

enable the interrupt source based on its number

**参数** inum - interrupt number from 0 to 31

**void esp_intr_disable_source (int inum)**

disable the interrupt source based on its number

**参数** inum - interrupt number from 0 to 31

**static inline int esp_intr_flags_to_level (int flags)**

Get the lowest interrupt level from the flags.

**参数** flags - The same flags that pass to esp_intr_alloc_intrstatus API
Macros

ESP_INTR_FLAG_LEVEL1
Interrupt allocation flags.
These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

ESP_INTR_FLAG_LEVEL2
Accept a Level 2 interrupt vector.

ESP_INTR_FLAG_LEVEL3
Accept a Level 3 interrupt vector.

ESP_INTR_FLAG_LEVEL4
Accept a Level 4 interrupt vector.

ESP_INTR_FLAG_LEVEL5
Accept a Level 5 interrupt vector.

ESP_INTR_FLAG_LEVEL6
Accept a Level 6 interrupt vector.

ESP_INTR_FLAG_NMI
Accept a Level 7 interrupt vector (highest priority)

ESP_INTR_FLAG_SHARED
Interrupt can be shared between ISRs.

ESP_INTR_FLAG_EDGE
Edge-triggered interrupt.

ESP_INTR_FLAG_IRAM
ISR can be called if cache is disabled.

ESP_INTR_FLAG_INTRDISABLED
Return with this interrupt disabled.

ESP_INTR_FLAG_LOWMED
Low and medium prio interrupts. These can be handled in C.

ESP_INTR_FLAG_HIGH
High level interrupts. Need to be handled in assembly.

ESP_INTR_FLAG_LEVELMASK
Mask for all level flags.

ETS_INTERNAL_TIMER0_INTR_SOURCE
Platform timer 0 interrupt source.
The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do
not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS_INTERNAL_TIMER1_INTR_SOURCE**
Platform timer 1 interrupt source.

**ETS_INTERNAL_TIMER2_INTR_SOURCE**
Platform timer 2 interrupt source.

**ETS_INTERNAL_SW0_INTR_SOURCE**
Software int source 1.

**ETS_INTERNAL_SW1_INTR_SOURCE**
Software int source 2.

**ETS_INTERNAL_PROFILING_INTR_SOURCE**
Int source for profiling.

**ETS_INTERNAL_UNUSED_INTR_SOURCE**
Interrupt is not assigned to any source.

**ETS_INTERNAL_INTR_SOURCE_OFF**
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly.

**ESP_INTR_ENABLE** (inum)
Enable interrupt by interrupt number.

**ESP_INTR_DISABLE** (inum)
Disable interrupt by interrupt number.

**Type Definitions**

typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function.

typedef struct intr_handle_data_t intr_handle_data_t
Interrupt handler associated data structure.

typedef intr_handle_data_t *intr_handle_t
Handle to an interrupt handler.

### 2.10.18 Logging library

**Overview**

The logging library provides two ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime:** all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.
There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**How to use this library**

In each C file that uses logging functionality, define the TAG variable as shown below:

```c
static const char* TAG = "MyModule";
```

Then use one of the logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_→* 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- ESP_LOGE - error (lowest)
- ESP_LOGW - warning
- ESP_LOGI - info
- ESP_LOGD - debug
- ESP_LOGV - verbose (highest)

Additionally, there are ESP_EARLY_LOGx versions for each of these macros, e.g. ESP_EARLY_LOGE. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP_EARLY_LOGx macros.

There are also ESP_DRAM_LOGx versions for each of these macros, e.g. ESP_DRAM_LOGE. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**备注：** Inside critical sections interrupts are disabled so it’s only possible to use ESP_DRAM_LOGx (preferred) or ESP_EARLY_LOGx. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro.

At file scope, define it before including esp_log.h, e.g:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```c
TARGET_COMPILE_DEFINITIONS("${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_→_VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:
The DRAM and EARLY log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling `esp_log_level_set("\", level).

Logging to Host via JTAG

By default, the logging library uses the vprintf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

API Reference

Header File

- components/log/include/esp_log.h

Functions

`void esp_log_level_set(const char *tag, esp_log_level_t level)`

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

备注: Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

参数

- `tag` - Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value "\" resets log level for all tags to the given value.
- `level` - Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`esp_log_level_t esp_log_level_get(const char *tag)`

Get log level for a given tag, can be used to avoid expensive log statements.

备注: The current log level for the given tag.

参数 `tag` - Tag of the log to query current level. Must be a non-NULL zero terminated string.

返回 The current log level for the given tag

`vprintf_like_t esp_log_set_vprintf(vprintf_like_t func)`

Set function used to output log entries.
By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread contexts.

- **func** - new Function used for output. Must have same signature as vprintf.
- **oldFunction** - old Function used for output.

```c
uint32_t esp_log_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

```c
char * esp_log_system_timestamp (void)
```

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

```c
uint32_t esp_log_early_timestamp (void)
```

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

```c
void esp_log_write (esp_log_level_t level, const char *tag, const char *format, ...)
```

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

```c
void esp_log_writev (esp_log_level_t level, const char *tag, const char *format, va_list args)
```

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

Espressif Systems 1993

Chapter 2. API  參考

Macros

**ESP_LOG_BUFFER_HEX_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

参数
- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes
- **level** – level of the log

**ESP_LOG_BUFFER_CHAR_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

参数
- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes
- **level** – level of the log

**ESP_LOG_BUFFER_HEXDUMP** (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>W (195) log_example: 0x3ffb4280</td>
<td>45 53 50 33 32 20 69 73 20 67 72 65 61 74...</td>
</tr>
<tr>
<td>→ 2c 20</td>
<td>ESP32 is great,</td>
</tr>
<tr>
<td>W (195) log_example: 0x3ffb4290</td>

</tbody>
</table>

It is highly recommended to use terminals with over 102 text width.

参数
- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes
- **level** – level of the log

**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

參見:

esp_log_buffer_hex_level

参数
- **tag** – description tag
- **buffer** – Pointer to the buffer array
- **buff_len** – length of buffer in bytes

**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

參見:

esp_log_buffer_char_level

参数
- **tag** – description tag
Chapter 2. API 参考

- **buffer** - Pointer to the buffer array
- **buff_len** - length of buffer in bytes

**ESP_EARLY_LOGE** (tag, format, ...)

Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

```c
ESP_EARLY_LOGE(tag, format, ...)
```

参见:

`printf, ESP_LOGE, ESP_DRAM_LOGE`

In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_WARN level.

```c
ESP_EARLY_LOGW(tag, format, ...)
```

参见:

`ESP_EARLY_LOGE, ESP_LOGE, printf`

**ESP_EARLY_LOGI** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_INFO level.

```c
ESP_EARLY_LOGI(tag, format, ...)
```

参见:

`ESP_EARLY_LOGE, ESP_LOGE, printf`

**ESP_EARLY_LOGD** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_DEBUG level.

```c
ESP_EARLY_LOGD(tag, format, ...)
```

参见:

`ESP_EARLY_LOGE, ESP_LOGE, printf`

**ESP_EARLY_LOGV** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_VERBOSE level.

```c
ESP_EARLY_LOGV(tag, format, ...)
```

参见:

`ESP_EARLY_LOGE, ESP_LOGE, printf`

**_ESP_LOG_EARLY_ENABLED** (log_level)

**ESP_LOG_EARLY_IMPL** (tag, format, log_level, log_tag_letter, ...)

**ESP_LOGE** (tag, format, ...)

**ESP_LOGW** (tag, format, ...)

**ESP_LOGI** (tag, format, ...)

**ESP_LOGD** (tag, format, ...)

**ESP_LOGV** (tag, format, ...)
**ESP_LOG_LEVEL** (level, tag, format, ...)  
runtime macro to output logs at a specified level.

```
参见:
printf
```

参数:
- **tag** — tag of the log, which can be used to change the log level by *esp_log_level_set* at runtime.
- **level** — level of the output log.
- **format** — format of the output log. See *printf*
- ... — variables to be replaced into the log. See *printf*

**ESP_LOG_LEVEL_LOCAL** (level, tag, format, ...)  
runtime macro to output logs at a specified level. Also check the level with *LOG_LOCAL_LEVEL*.

参见:
printf, ESP_LOG_LEVEL

**ESP_DRAM_LOGE** (tag, format, ...)
Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

Similar to

Usage:  
*ESP_DRAM_LOGE*(DRAM_STR("my_tag"), "format", orESP_DRAM_LOGE(TAG, "format", ...)); where TAG is a char* that points to a str in the DRAM.

参见:

ESP_EARLY_LOGE, the log level cannot be changed per-tag, however *esp_log_level_set*( "*", level) will set the default level which controls these log lines also.

参见:

esp_rom_printf, ESP_LOGE

备注: Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

备注: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

**ESP_DRAM_LOGW** (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_WARN level.

参见:

ESP_DRAM_LOGW, ESP_LOGW, esp_rom_printf
**Chapter 2. API 參考**

**ESP_DRAM_LOGI** (tag, format,...)  
macro to output logs when the cache is disabled at ESP_LOG_INFO level.

参見: ESP_DRAM_LOGI,ESP_LOGI,esp_rom_printf

**ESP_DRAM_LOGD** (tag, format,...)  
macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

参見: ESP_DRAM_LOGD,ESP_LOGD,esp_rom_printf

**ESP_DRAM_LOGV** (tag, format,...)  
macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

参見: ESP_DRAM_LOGV,ESP_LOGV,esp_rom_printf

**Type Definitions**

typedef int (*vprintf_like_t)(const char*, va_list)

**Enumerations**

cenum esp_log_level_t  
Log level.  
Values:

enumerator ESP_LOG_NONE  
No log output

enumerator ESP_LOG_ERROR  
Critical errors, software module can not recover on its own

enumerator ESP_LOG_WARN  
Error conditions from which recovery measures have been taken

enumerator ESP_LOG_INFO  
Information messages which describe normal flow of events

enumerator ESP_LOG_DEBUG  
Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator ESP_LOG_VERBOSE  
Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

2.10.19 宮項系統 API
## 软件复位

函数 `esp_restart()` 用于执行芯片的软件复位。调用此函数时，程序停止执行，两个 CPU 复位，应用程序由 bootloader 加载并重启。

函数 `esp_register_shutdown_handler()` 用于注册复位前会自动调用的例程（复位过程由 `esp_restart()` 函数触发），这与 `atexit` POSIX 函数的功能类似。

## 复位原因

ESP-IDF 应用程序启动或复位的原因有多种。调用 `esp_reset_reason()` 函数可获取最近一次复位的原因。复位的所有可能原因，请查看 `esp_reset_reason_t` 中的描述。

## 堆内存

ESP-IDF 中有两个与堆内存相关的函数:

- 函数 `esp_get_free_heap_size()` 用于查询当前可用的堆内存大小。
- 函数 `esp_get_minimum_free_heap_size()` 用于查询整个过程中可用的最小堆内存大小（例如应用程序生命周期内可用的最小堆内存大小）。

请注意，ESP-IDF 支持功能不同的的多个堆。上文中函数返回的堆内存大小可使用 `malloc` 函数族来进行分配。有关堆内存的更多信息，请参阅“堆内存分配”。

## MAC 地址

以下 API 用于查询和自定义支持的网络接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址。

要获取特定接口（如 Wi-Fi、蓝牙、以太网）的 MAC 地址，请调用函数 `esp_read_mac()`。

在 ESP-IDF 中，各个网络接口的 MAC 地址是根据单个 基准 MAC 地址 (Base MAC address) 计算出来的。默认情况下使用乐鑫指定的基准 MAC 地址，该基准地址在产品生产过程中已预烧录至 ESP32 eFuse。

<table>
<thead>
<tr>
<th>接口</th>
<th>MAC 地址 (默认 4 个全局地址)</th>
<th>MAC 地址 (2 个全局地址)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi 站点</td>
<td>base_mac</td>
<td>base_mac</td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td>base_mac 后一组字节后加1</td>
<td>本地 MAC（由 Wi-Fi 站点 MAC 生成）</td>
</tr>
<tr>
<td>蓝牙</td>
<td>base_mac 后一组字节后加2</td>
<td>base_mac 后一组字节后加1</td>
</tr>
<tr>
<td>以太网</td>
<td>base_mac 后一组字节后加3</td>
<td>本地 MAC（由蓝牙 MAC 生成）</td>
</tr>
</tbody>
</table>

**备注：** 配置选项 配置了乐鑫提供的全局 MAC 地址的数量。

### 自定义基准 MAC

乐鑫已将默认的基准 MAC 地址预烧录至 eFuse BLK0 中。如需设置自定义基准 MAC 地址，请在初始化任一网络接口或调用 `esp_read_mac()` 函数前调用 `esp_base_mac_addr_set()` 函数。自定义基准 MAC 地址可以存储在任何支持的存储设备中（如 flash，NVS）。

分配自定义基 MAC 地址时，应避免 MAC 地址重叠。请根据上面的表格配置选 `option CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES`，设置可从自定义基 MAC 地址生成的有解放全局 MAC 地址。

**备注：** 也可以调用函数 `esp_netif_set_mac()`，在网络初始化后设置网络接口使用的特定 MAC。但建议使用此处介绍的自定义基准 MAC 地址的方法，以避免原始 MAC 地址在更改前短暂出现在网络上。
**eFuse 中的自定义 MAC 地址**

ESP-IDF 提供了 `esp_efuse_mac_get_custom()` 函数，从 eFuse 读取自定义 MAC 地址时，调用该函数将从 eFuse BLK3 加载 MAC 地址。此函数假设自定义 MAC 地址的存储格式如下:

<table>
<thead>
<tr>
<th>字段</th>
<th>比特数</th>
<th>比特范围</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0：无效；其他：有效</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT，多项式 0x07</td>
</tr>
</tbody>
</table>

**备注：**如果启用了 3/4 编码方案，则必须同时烧写该块中的所有 eFuse 字段。

调用 `esp_efuse_mac_get_custom()` 函数获得 MAC 地址后，请调用 `esp_base_mac_addr_set()` 函数将此 MAC 地址设置为基准 MAC 地址。

**本地 MAC 地址和全局 MAC 地址**

在 ESP32 中，乐鑫已预烧录足够数量的有效乐鑫全局 MAC 地址，供所有内部接口使用。上文中的表格已经介绍了如何根据基准 MAC 地址计算出具体接口的 MAC 地址。

当使用自定义 MAC 地址时，可能并非所有接口都能被分配到一个全局 MAC 地址。此时，接口会被分配一个本地 MAC 地址。请注意，这些地址仅用于单个本地网络。

**本地 MAC 地址和全局 MAC 地址的定义，请参见此处。**

内部调用函数 `esp_derive_local_mac()`，可从全局 MAC 地址生成本地 MAC 地址。具体流程如下：

1. 在全局 MAC 地址的第一个字节组中设置 U/L 位（位值为 0x2），创建本地 MAC 地址。
2. 如果该位已存在于全局 MAC 地址中（即现有的“全局”MAC 地址实际上已经是本地 MAC 地址），则本地 MAC 地址的第一个字节组与 0x4 异或。

**芯片版本**

`esp_chip_info()` 函数用于填充 `esp_chip_info_t` 结构体中的芯片信息，包括芯片版本、CPU 数量和芯片中已启用功能的位掩码。

**SDK 版本**

调用函数 `esp_get_idf_version()` 可返回一个字符串，该字符串包含了用于编译应用程序的 ESP-IDF 版本，与构建系统中通过 IDF_VER 变量所获得的值相同。该版本字符串的格式即 `git describe` 命令的运行结果。

也有其它版本可用于在构建过程中获取 ESP-IDF 版本，它们可根据 ESP-IDF 版本启用或禁用部分程序。

- `ESP_IDF_VERSION_MAJOR, ESP_IDF_VERSION_MINOR` 和 `ESP_IDF_VERSION_PATCH` 分别被定义为代表主版本、次要版本和补丁版本的整数。
- `ESP_IDF_VERSION_VAL` 和 `ESP_IDF_VERSION` 可在确认版本时使用:

```c
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // 启用 ESP-IDF v4.0 中的功能
#endif
```
应用程序版本

应用程序版本存储在 esp_app_desc_t 结构体中。该结构体位于 DROM 扇区，有一个从二进制文件头部计算的固定偏移值。该结构体位于 esp_image_header_t 和 esp_image_segment_header_t 结构体之后，字段 Version 类型为字符串，最大长度为 32 字节。

若需手动设置版本，需要在项目的 CMakeLists.txt 文件中设置 PROJECT_VER 变量，即在 CMakeLists.txt 文件中，在包含 project.cmake 之前添加 set(PROJECT_VER "0.1.0.1")。

如果设置了 CONFIG_APP_PROJECT_VER_FROM_CONFIG 选项，则将使用 CONFIG_APP_PROJECT_VER 的值。否则，如果在项目中未设置 PROJECT_VER 变量，则该变量将从 $(PROJECT_PATH)/version.txt 文件（若有）中检索，或使用 git 命令 git describe 检索。如果两者都不可用，则 PROJECT_VER 将被设置为“1”。应用程序可通过调用 esp_app_get_description() 或 esp_ota_get_partition_description() 函数来获取应用程序的版本信息。

API 参考

Header File

- components/esp_system/include/esp_system.h

Functions

* esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)
  
  Register shutdown handler.
  
  This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

  参数 handle -function to execute on restart

  返回
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if the handler has already been registered
  - ESP_ERR_NO_MEM if no more shutdown handler slots are available

* esp_err_t esp_unregister_shutdown_handler(shutdown_handler_t handle)
  
  Unregister shutdown handler.

  This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

  参数 handle

  返回
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

* void esp_restart(void)
  
  Restart PRO and APP CPUs.

  This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

* esp_reset_reason_t esp_reset_reason(void)
  
  Get reason of last reset.

  返回 See description of esp_reset_reason_t for explanation of each value.

* uint32_t esp_get_free_heap_size(void)
  
  Get the size of available heap.

  备注: Note that the returned value may be larger than the maximum contiguous block which can be allocated.

  返回 Available heap size, in bytes.
uint32_t esp_get_free_internal_heap_size (void)
    Get the size of available internal heap.

    备注：Note that the returned value may be larger than the maximum contiguous block which can be allocated.

    返回 Available internal heap size, in bytes.

uint32_t esp_get_minimum_free_heap_size (void)
    Get the minimum heap that has ever been available.

    返回 Minimum free heap ever available

void esp_system_abort (const char *details)
    Trigger a software abort.

    参数 details Details that will be displayed during panic handling.

Type Definitions

typedef void (*shutdown_handler_t)(void)
    Shutdown handler type

Enumerations

enum esp_reset_reason_t
    Reset reasons.

    Values:

    enumerator ESP_RST_UNKNOWN
        Reset reason can not be determined.

    enumerator ESP_RST_POWERON
        Reset due to power-on event.

    enumerator ESP_RST_EXT
        Reset by external pin (not applicable for ESP32)

    enumerator ESP_RST_SW
        Software reset via esp_restart.

    enumerator ESP_RST_PANIC
        Software reset due to exception/panic.

    enumerator ESP_RST_INT_WDT
        Reset (software or hardware) due to interrupt watchdog.

    enumerator ESP_RST_TASK_WDT
        Reset due to task watchdog.

    enumerator ESP_RST_WDT
        Reset due to other watchdogs.
enumerator **ESP_RST_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP_RST_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP_RST_SDIO**

Reset over SDIO.

**Header File**

- components/esp_common/include/esp_idf_version.h

**Functions**

const char* `esp_get_idf_version` (void)

Return full IDF version string, same as `git describe` output.

备注：If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

返回 constant string from IDF_VER

**Macros**

**ESP_IDF_VERSION_MAJOR**

Major version number (X.X.X)

**ESP_IDF_VERSION_MINOR**

Minor version number (x.X.x)

**ESP_IDF_VERSION_PATCH**

Patch version number (x.x.X)

**ESP_IDF_VERSION_VAL** (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

**ESP_IDF_VERSION**

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

**Header File**

- components/esp_hw_support/include/esp_mac.h
Chapter 2. API 参考

**Functions**

esp_err_t esp_base_mac_addr_set (const uint8_t* mac)

Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by network interfaces.

If using a custom base MAC address, call this API before initializing any network interfaces. Refer to the ESP-IDF Programming Guide for details about how the Base MAC is used.

备注：Base MAC must be a unicast MAC (least significant bit of first byte must be zero).

备注：If not using a valid OUI, set the “locally administered” bit (bit value 0x02 in the first byte) to avoid collisions.

参数 mac – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG If mac is NULL or is not a unicast MAC

esp_err_t esp_base_mac_addr_get (uint8_t* mac)

Return base MAC address which is set using esp_base_mac_addr_set.

备注：If no custom Base MAC has been set, this returns the pre-programmed Espressif base MAC address.

参数 mac – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

ESP_ERR_INVALID_MAC base MAC address has not been set

esp_err_t esp_efuse_mac_get_custom (uint8_t* mac)

Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to EFUSE BLK3 in a specified format.

Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

备注：This function is currently only supported on ESP32.

参数 mac – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

ESP_ERR_INVALID_MAC CUSTOM_MAC address has not been set

ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE (for esp32)

ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE (for esp32)

esp_err_t esp_efuse_mac_get_default (uint8_t* mac)

Return base MAC address which is factory-programmed by Espressif in EFUSE.

参数 mac – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)

返回 ESP_OK on success ESP_ERR_INVALID_ARG mac is NULL

Espressif Systems 2003 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
# Chapter 2. API 参考

**esp_err_t esp_read_mac**(uint8_t *mac, esp_mac_type_t type)

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using esp_base_mac_addr_get(). Then calculates the MAC address of the specific interface requested, refer to ESP-IDF Programming Guide for the algorithm.

The MAC address set by the esp_iface_mac_addr_set() function will not depend on the base MAC address.

参数
- **mac** – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)
- **type** – Type of MAC address to return

返回 ESP_OK on success

**esp_err_t esp_derive_local_mac**(uint8_t *local_mac, const uint8_t *universal_mac)

Derive local MAC address from universal MAC address.

This function copies a universal MAC address and then sets the “locally administered” bit (bit 0x2) in the first octet, creating a locally administered MAC address.

If the universal MAC address argument is already a locally administered MAC address, then the first octet is XORed with 0x4 in order to create a different locally administered MAC address.

参数
- **local_mac** – base MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for IEEE 802.15.4)
- **universal_mac** – Source universal MAC address, length: 6 bytes.

返回 ESP_OK on success

**esp_err_t esp_iface_mac_addr_set**(const uint8_t *mac, esp_mac_type_t type)

Set custom MAC address of the interface. This function allows you to overwrite the MAC addresses of the interfaces set by the base MAC address.

参数
- **mac** – MAC address, length: 6 bytes/8 bytes. length: 6 bytes for MAC-48 8 bytes for EUI-64(used for ESP_MAC_IEEE802154 type)
- **type** – Type of MAC address

返回 ESP_OK on success

**size_t esp_mac_addr_len_get**(esp_mac_type_t type)

Return the size of the MAC type in bytes.

If CONFIG_IEEE802154_ENABLED is set then for these types: ESP_MAC_IEEE802154, ESP_MAC_BASE, ESP_MAC_EFUSE_FACTORY and ESP_MAC_EFUSE_CUSTOM the MAC size is 8 bytes. If CONFIG_IEEE802154_ENABLED is not set then for all types it returns 6 bytes.

参数 **type** – Type of MAC address

返回 0 MAC type not found (not supported) 6 bytes for MAC-48. 8 bytes for EUI-64.

**Macros**

MAC2STR (a)

MACSTR

**Enumerations**

Functions

```c
void esp_chip_info(esp_chip_info_t *out_info)
```

Fill an `esp_chip_info_t` structure with information about the chip.

参数 out_info [out] structure to be filled

Structures

```c
struct esp_chip_info_t
```

The structure represents information about the chip.

Public Members

```c
esp_chip_model_t model
```

chip model, one of esp_chip_model_t

```c
uint32_t features
```

bit mask of CHIP_FEATURE_x feature flags

```c
uint16_t revision
```

chip revision number (in format MXX; where M - wafer major version, XX - wafer minor version)

```c
uint8_t cores
```

number of CPU cores
Macros

CHIP_FEATURE_EMB_FLASH
Chip has embedded flash memory.

CHIP_FEATURE_WIFI_BGN
Chip has 2.4GHz WiFi.

CHIP_FEATURE_BLE
Chip has Bluetooth LE.

CHIP_FEATURE_BT
Chip has Bluetooth Classic.

CHIP_FEATURE_IEEE802154
Chip has IEEE 802.15.4.

CHIP_FEATURE_EMB_PSRAM
Chip has embedded psram.

Enumerations

enum esp_chip_model_t
Chip models.

Values:

enumerator CHIP_ESP32
ESP32.

enumerator CHIP_ESP32S2
ESP32-S2.

enumerator CHIP_ESP32S3
ESP32-S3.

enumerator CHIP_ESP32C3
ESP32-C3.

* components/esp_hw_support/include/esp_cpu.h
Chapter 2. API 参考

**Functions**

```c
void esp_cpu_stall (int core_id)

Stall a CPU core.

参数 core_id – The core’s ID
```

```c
void esp_cpu_unstall (int core_id)

Resume a previously stalled CPU core.

参数 core_id – The core’s ID
```

```c
void esp_cpu_reset (int core_id)

Reset a CPU core.

参数 core_id – The core’s ID
```

```c
void esp_cpu_wait_for_intr (void)

Wait for Interrupt.

This function causes the current CPU core to execute its Wait For Interrupt (WFI or equivalent) instruction. After executing this function, the CPU core will stop execution until an interrupt occurs.

int esp_cpu_get_core_id (void)

Get the current core’s ID.

This function will return the ID of the current CPU (i.e., the CPU that calls this function).

返回 The current core’s ID [0..SOC_CPU_CORES_NUM - 1]
```

```c
void *esp_cpu_get_sp (void)

Read the current stack pointer address.

返回 Stack pointer address
```

```c
esp_cpu_cycle_count_t esp_cpu_get_cycle_count (void)

Get the current CPU core’s cycle count.

Each CPU core maintains an internal counter (i.e., cycle count) that increments every CPU clock cycle.

返回 Current CPU’s cycle count, 0 if not supported.
```

```c
void esp_cpu_set_cycle_count (esp_cpu_cycle_count_t cycle_count)

Set the current CPU core’s cycle count.

Set the given value into the internal counter that increments every CPU clock cycle.

参数 cycle_count – CPU cycle count
```

```c
void *esp_cpu_pc_to_addr (uint32_t pc)

Convert a program counter (PC) value to address.

If the architecture does not store the true virtual address in the CPU’s PC or return addresses, this function will convert the PC value to a virtual address. Otherwise, the PC is just returned.

参数 pc – PC value

返回 Virtual address
```

```c
void esp_cpu_intr_get_desc (int core_id, int intr_num, esp_cpu_intr_desc_t *intr_desc_ret)

Get a CPU interrupt’s descriptor.

Each CPU interrupt has a descriptor describing the interrupt’s capabilities and restrictions. This function gets the descriptor of a particular interrupt on a particular CPU.

参数

- core_id – [in] The core’s ID
- intr_num – [in] Interrupt number
- intr_desc_ret – [out] The interrupt’s descriptor
```
void **esp_cpu_intr_set_ivt_addr** (const void *ivt_addr)
Set the base address of the current CPU’s Interrupt Vector Table (IVT)

- **Parameter ivt_addr**: Interrupt Vector Table’s base address

bool **esp_cpu_intr_has_handler** (int intr_num)
Check if a particular interrupt already has a handler function.

Check if a particular interrupt on the current CPU already has a handler function assigned.

**Note**: This function simply checks if the IVT of the current CPU already has a handler assigned.

- **Parameter intr_num**: Interrupt number (from 0 to 31)
- **Return**: True if the interrupt has a handler function, false otherwise.

void **esp_cpu_intr_set_handler** (int intr_num, **esp_cpu_intr_handler_t** handler, void *handler_arg)
Set the handler function of a particular interrupt.

Assign a handler function (i.e., ISR) to a particular interrupt on the current CPU.

**Note**: This function simply sets the handler function (in the IVT) and does not actually enable the interrupt.

- **Parameters**
  - **intr_num**: Interrupt number (from 0 to 31)
  - **handler**: Handler function
  - **handler_arg**: Argument passed to the handler function

void **esp_cpu_intr_get_handler_arg** (int intr_num)
Get a handler function’s argument of.

Get the argument of a previously assigned handler function on the current CPU.

- **Parameter intr_num**: Interrupt number (from 0 to 31)
- **Return**: The argument passed to the handler function

void **esp_cpu_intr_enable** (uint32_t intr_mask)
Enable particular interrupts on the current CPU.

- **Parameter intr_mask**: Bit mask of the interrupts to enable

void **esp_cpu_intr_disable** (uint32_t intr_mask)
Disable particular interrupts on the current CPU.

- **Parameter intr_mask**: Bit mask of the interrupts to disable

**uint32_t** **esp_cpu_intr_get_enabled_mask** (void)
Get the enabled interrupts on the current CPU.

- **Return**: Bit mask of the enabled interrupts

void **esp_cpu_intr_edge_ack** (int intr_num)
Acknowledge an edge interrupt.

- **Parameter intr_num**: Interrupt number (from 0 to 31)

void **esp_cpu_configure_region_protection** (void)
Configure the CPU to disable access to invalid memory regions.
**esp_err_t esp_cpu_set_breakpoint** (int bp_num, const void *bp_addr)

Set and enable a hardware breakpoint on the current CPU.

**备注**: This function is meant to be called by the panic handler to set a breakpoint for an attached debugger during a panic.

**备注**: Overwrites previously set breakpoint with same breakpoint number.

**参数**
- **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]
- **bp_addr** – Address to set a breakpoint on

**返回** ESP_OK if breakpoint is set. Failure otherwise

**esp_err_t esp_cpu_clear_breakpoint** (int bp_num)

Clear a hardware breakpoint on the current CPU.

**备注**: Clears a breakpoint regardless of whether it was previously set

**参数** **bp_num** – Hardware breakpoint number [0..SOC_CPU_BREAKPOINTS_NUM - 1]

**返回** ESP_OK if breakpoint is cleared. Failure otherwise

**esp_err_t esp_cpu_set_watchpoint** (int wp_num, const void *wp_addr, size_t size, esp_cpu_watchpoint_trigger_t trigger)

Set and enable a hardware watchpoint on the current CPU.

Set and enable a hardware watchpoint on the current CPU, specifying the memory range and trigger operation. Watchpoints will break/panic the CPU when the CPU accesses (according to the trigger type) on a certain memory range.

**备注**: Overwrites previously set watchpoint with same watchpoint number.

**参数**
- **wp_num** – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]
- **wp_addr** – Watchpoint’s base address
- **size** – Size of the region to watch. Must be one of 2^n, with n in [0..6].
- **trigger** – Trigger type

**返回** ESP_ERR_INVALID_ARG on invalid arg, ESP_OK otherwise

**esp_err_t esp_cpu_clear_watchpoint** (int wp_num)

Clear a hardware watchpoint on the current CPU.

**备注**: Clears a watchpoint regardless of whether it was previously set

**参数** **wp_num** – Hardware watchpoint number [0..SOC_CPU_WATCHPOINTS_NUM - 1]

**返回** ESP_OK if watchpoint was cleared. Failure otherwise.

**bool esp_cpu_dbgr_is_attached**(void)

Check if the current CPU has a debugger attached.

**返回** True if debugger is attached, false otherwise
Chapter 2. API 參考

void esp_cpu_dbgbr_break (void)
    Trigger a call to the current CPU’s attached debugger.

intptr_t esp_cpu_get_call_addr (intptr_t return_address)
    Given the return address, calculate the address of the preceding call instruction. This is typically used to answer the question “where was the function called from?”.
    参数 return_address – The value of the return address register. Typically set to the value of __builtin_return_address(0).
    返回 Address of the call instruction preceding the return address.

bool esp_cpu_compare_and_set (volatile uint32_t *addr, uint32_t compare_value, uint32_t new_value)
    Atomic compare-and-set operation.
    参数
        • addr – Address of atomic variable
        • compare_value – Value to compare the atomic variable to
        • new_value – New value to set the atomic variable to
    返回 Whether the atomic variable was set or not

Structures

struct esp_cpu_intr_desc_t
    CPU interrupt descriptor.
    Each particular CPU interrupt has an associated descriptor describing that particular interrupt’s characteristics. Call esp_cpu_intr_get_desc() to get the descriptors of a particular interrupt.

Public Members

int priority
    Priority of the interrupt if it has a fixed priority, (-1) if the priority is configurable.

esp_cpu_intr_type_t type
    Whether the interrupt is an edge or level type interrupt, ESP_CPU_INTR_TYPE_NA if the type is configurable.

uint32_t flags
    Flags indicating extra details.

Macros

ESP_CPU_INTR_DESC_FLAG_SPECIAL
    Interrupt descriptor flags of esp_cpu_intr_desc_t.
    The interrupt is a special interrupt (e.g., a CPU timer interrupt)

ESP_CPU_INTR_DESC_FLAG_RESVD
    The interrupt is reserved for internal use

Type Definitions

typedef uint32_t esp_cpu_cycle_count_t
    CPU cycle count type.
    This data type represents the CPU’s clock cycle count
typedef void (*esp_cpu_intr_handler_t)(void *arg)
  CPU interrupt handler type.

Enumerations

enum esp_cpu_intr_type_t
  CPU interrupt type.

Values:

enumerator ESP_CPU_INTR_TYPE_LEVEL
enumerator ESP_CPU_INTR_TYPE_EDGE
enumerator ESP_CPU_INTR_TYPE_NA

enum esp_cpu_watchpoint_trigger_t
  CPU watchpoint trigger type.

Values:

enumerator ESP_CPU_WATCHPOINT_LOAD
enumerator ESP_CPU_WATCHPOINT_STORE
enumerator ESP_CPU_WATCHPOINT_ACCESS

Header File

  - components/esp_app_format/include/esp_app_desc.h

Functions

const esp_app_desc_t *esp_app_get_description (void)
  Return esp_app_desc structure. This structure includes app version.
  Return description for running app.

int esp_app_get_elf_sha256 (char *dst, size_t size)
  Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

  参数
  - dst - Destination buffer
  - size - Size of the buffer

  返回 Number of bytes written to dst (including null terminator)

Structures

struct esp_app_desc_t
  Description about application.
Public Members

- `uint32_t magic_word`
  Magic word ESP_APP_DESC_MAGIC_WORD

- `uint32_t secure_version`
  Secure version

- `uint32_t reserv1[2]`
  reserv1

- `char version[32]`
  Application version

- `char project_name[32]`
  Project name

- `char time[16]`
  Compile time

- `char date[16]`
  Compile date

- `char idf_ver[32]`
  Version IDF

- `uint8_t app_elf_sha256[32]`
  sha256 of elf file

- `uint32_t reserv2[20]`
  reserv2

Macros

- `ESP_APP_DESC_MAGIC_WORD`
  The magic word for the esp_app_desc structure that is in DROM.

2.10.20  空中升级 (OTA)

OTA 流程概览

OTA 升级机制可以让设备在固件正常运行时根据接收数据（如通过 Wi-Fi 或蓝牙）进行自我更新。

要运行 OTA 机制，需配置设备的分区表，该分区表至少包括两个 OTA 应用程序分区（即 `ota_0` 和 `ota_1`) 和一个 OTA 数据分区。

OTA 功能启动后，向当前未用于启动的 OTA 应用分区写入新的应用固件镜像。镜像验证后，OTA 数据分区更新，指定在下一次启动时使用该镜像。
OTA 数据分区

所有使用 OTA 功能的项目，其分区表必须包含一个 OTA 数据分区（类型为 data，子类型为 ota）。

工厂启动设置下，OTA 数据分区中应没有数据（所有字节擦写成 0xFF）。如果分区表中没有工厂应用程序，ESP-IDF 软件引导加载程序会启动工厂应用程序。如果分区表中没有工厂应用程序，则启动第一个可用的 OTA 分区（通常是 ota_0）。

第一次 OTA 升级后，OTA 数据分区更新。指定下一次启动哪个 OTA 应用程序分区。

OTA 数据分区是两个 0x2000 字节大小的 flash 虚拟分区，防止写入时电源故障引发问题。两个扇区单独擦除、写入匹配数据，若存在不一致，则用计算器字段判定哪个扇区为最新数据。

应用程序回滚

应用程序回滚的主要目的是确保设备在更新后正常工作。如果新版应用程序出现严重错误，该功能可使设备回滚到之前正常运行的应用版本。在使能回滚并且 OTA 升级应用程序至新版本后，可能出现的结果如下：

- 应用程序运行正常，esp_ota_mark_app_valid_cancel_rollback() 将正在运行的程序状态标记为 ESP_OTA_IMG_VALID，启动此应用程序无限制。
- 应用程序出现严重错误，无法继续工作，必须回滚到之前的版本，esp_ota_mark_app_invalid_rollback_and_reboot() 将正在运行的版本标记为 ESP_OTA_IMG_INVALID 然后复位。引导加载程序不执行此版本，而是启动之前正常运行的版本。
- 如果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 使能，则无需调用函数便可复位，回滚至之前的任意版本。

注解：应用程序的状态不是写到程序的二进制镜像，而是写入 otadata 分区。该分区有一个 ota_seq 计数器，该计数器是 OTA 应用分区的指针，指向下次启动时启动应用所占的分区（ota_0, ota_1, …）。在 otadata 分区中。

应用程序 OTA 状态

状态控制了选取启动应用程序的过程：

<table>
<thead>
<tr>
<th>状态</th>
<th>引导加载程序选取启动应用程序的限制</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>可以选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>无限制，可以选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>无限制，可以选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_NEW</td>
<td>可选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING_VERIFY</td>
<td>可选取。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING_VERIFY</td>
<td>可选取。</td>
</tr>
<tr>
<td>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</td>
<td>会选取一次。在开启过程中，状态立变位ESP_OTA_IMG_PENDING_VERIFY。</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>会选取，状态变为 “ESP_OTA_IMG_ABORTED”。</td>
</tr>
</tbody>
</table>

如 果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 没有使能（默认情况），则 esp_ota_mark_app_valid_cancel_rollback() 和 esp_ota_mark_app_invalid_rollback_and_reboot() 为可选功能，ESP_OTA_IMG_NEW 和 ESP_OTA_IMG_PENDING_VERIFY 不会使用。

Kconfig 中的 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 可以帮助用户追踪新版应用程序的第一次启动。应用程序需调用 esp_ota_mark_app_valid_cancel_rollback() 函数确认可以运行，否则将在重启时回滚至旧版本。该功能可让用户在启动阶段控制应用程序的可操作性。新版应用程序仅有一次机会尝试是否能成功启动。

回滚过程

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 使能时，回滚过程如下：

- 新版应用程序下载成功，esp_ota_set_boot_partition() 函数将分区设为可启动，状态设为 ESP_OTA_IMG_NEW。该状态表示应用程序为新版本，第一次启动需要检测。
- 重新启动 esp_restart()。
• 引导加载程序检查 ESP OTA_IMG_PENDING_VERIFY 状态，如有设置，则将其写入 ESP OTA_IMG_ABORTED.

• 引导加载程序选取一个新的应用程序来引导，这样应用程序状态就不再设置为 ESP OTA_IMG_INVALID 或 ESP OTA_IMG_ABORTED.

• 引导加载程序检查所选取的新版应用程序，若状态设置为 ESP OTA_IMG_NEW，则写入 ESP OTA_IMG_PENDING_VERIFY. 该状态表示，需确认应用程序的可操作性，如不确认，发生重启，则状态会重写 ESP OTA_IMG_ABORTED（见上文），该应用程序不可再启动，将回滚至上一版本。

• 新版应用程序启动时，应进行自测。

• 若通过自测，则必须调用函数 esp_ota_mark_app_valid_cancel_rollback()，为新版应用程序等待确认其可操作性（ESP OTA_IMG_PENDING_VERIFY 状态）。

• 若未通过自测，则调用函数 esp_ota_mark_app_invalid_rollack_and_reboot()，回滚至之前能正常工作的应用程序版本，同时将无效的新版本应用程序设置为 ESP OTA_IMG_INVALID。

• 如果新版应用程序可操作性没有确认，则状态一直为 ESP OTA_IMG_PENDING_VERIFY. 下一次启动时，状态变更为 ESP OTA_IMG_ABORTED, 阻止其再次启动，之后回滚到之前的版本。

意外复位 如果在新版本应用第一次启动时发生断电或意外崩溃，则会回滚至之前正常运行的版本。

建议：尽快完成自测，防止因断电回滚。

只有 OTA 分区可以回滚。工厂分区不会回滚。

启动无效/中止的应用程序 用户可以启动此前设置为 ESP OTA_IMG_INVALID 或 ESP OTA_IMG_ABORTED 的应用程序

- 获取最后一个无效分区 esp_ota_get_last_invalid_partition()。
- 将获取的分区传递给 esp_ota_set_boot_partition()，更新 otadata。
- 重启 esp_restart()。引导加载程序会启动指定应用程序。

要确定是否在应用程序启动时进行自测，可以调用 esp_ota_get_state_partition() 函数。如果结果为 ESP OTA_IMG_PENDING_VERIFY，则需要自测，后续确认应用程序的可操作性。

如何设置状态 下文简单描述了如何设置应用程序状态：

- ESP OTA_IMG_INVALID 由函数 esp_ota_mark_app_valid_cancel_rollack() 设置。

- 如果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 没有使能，ESP OTA_IMAGE_UNDEFFINED 由函数 esp_ota_set_boot_partition() 设置。

- 如果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 没有使能，ESP OTA_IMG_NEW 由函数 esp_ota_set_boot_partition() 设置。

- ESP OTA_IMG_INVALID 由函数 esp_ota_mark_app_invalid_rollack_and_reboot() 设置。

- 如果应用程序的可操作性无法确认，发生重启（CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 使能），则设置 ESP OTA_IMG_ABORTED。

- 如果 CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE 使能，选取的应用程序状态为 ESP OTA_IMG_NEW, 则在引导加载程序中设置 ESP OTA_IMG_PENDING_VERIFY。

防御回滚

防御回滚机制可以防止回滚到安全版本号低于芯片 eFuse 中烧录程序的应用程序版本。

设置 CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK, 启动防御回滚机制。在引导加载程序中选取可启动的应用程序，会额外检查芯片和应用程序镜像的安全版本号。可启动固件中的应用安全版本号必须等于或高于芯片中的应用安全版本号。

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK 和 CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK_ENABLE 一起使用。此时，只有安全版本号等于或高于芯片中的应用安全版本号时才会回滚。

Epressif Systems 2014 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
典型的防回滚机制

- 新发布的固件解决了此前版本的安全问题。
- 开发者在确保固件可以运行之后，增加安全版本号，发布固件。
- 下载新版应用程序。
- 运行函数 `esp_ota_set_boot_partition()`，将新版应用程序设为可启动。如果新版应用程序的安全版本号低于芯片中的应用安全版本号，新版应用程序会被擦除，无法更新到新固件。
- 重新启动。
- 在引导加载程序中选取安全版本号等于或高于芯片中应用安全版本号的应用程序。如果 `otadata` 处于初始阶段，通过串行通道加载了安全版本号高于芯片中应用安全版本号的固件，则引导加载程序中 `eFuse` 的安全版本号会立即更新。
- 新版应用程序启动，之后进行可操作性检测，如果通过检测，则调用函数 `esp_ota_mark_app_valid_cancel_rollback()`，将应用程序标记为 `ESP_OOTA_IMG_VALID`，更新芯片中应用程序的安全版本号。注意，如果调用函数 `esp_ota_mark_app_invalid_rollback_and_reboot()`，可能会因为设备中没有可启动的应用程序而回滚失败，返回 ESP_ERR_OTA.Rollback_FAILED 错误。应用程序状态一直为 `ESP_OOTA_IMG_PENDING_VERIFY`。
- 如果运行的应用程序处于 `ESP_OOTA_IMG_VALID` 状态，则可再次更新。

建议：

如果想避免因服务器应用程序的安全版本号低于运行的应用程序，造成不必要的下载和擦除，必须从镜像的第一个包中获取 `new_app_info.secure_version`，和 `eFuse` 的安全版本号比较。如果 `esp_efuse_check_secure_version(new_app_info.secure_version)` 函数为真，则下载继续，反之则中断。

```c
bool image_header_was_checked = false;
while (1) {
   int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
   ...
   if (data_read > 0) {
      if (image_header_was_checked == false) {
         esp_app_desc_t new_app_info;
         if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)) {
            // check current version with downloading
            if (esp_efuse_check_secure_version(new_app_info.secure_version) == false) {
               ESP_LOGE(TAG, "This a new app can not be downloaded due to a secure version is lower than stored in efuse.");
               http_cleanup(client);
               task_fatal_error();
            }
         }
         image_header_was_checked = true;
         esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
         }
      esp_ota_write(update_handle, (const void *)ota_write_data, data_read);
   }
   ...
```

限制：

- `secure_version` 字段最多有 32 位。也就是说，防回滚最多可以做 32 次。用户可以使用 `CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD` 减少该 `eFuse` 字段的长度。
- 防回滚仅在 `eFuse` 编码机制设置为 `NONE` 时生效。
- 防回滚不支持工厂和测试分区，因此分区表中不应有设置为 `工厂` 或 `测试` 的分区。
security_version:

- 存储在应用程序镜像中的 esp_app_desc 里。版本号用 CONFIG_BOOTLOADER_APP_SECURE_VERSION 设置。

- ESP32 中版本号存储在 eFuse 的 EFUSE_BLK3_RDATA4_REG 里（若 eFuse 的位烧号为 1，则永远无法恢复为 0）。寄存器设置了多少位，应用程序的安全版本号就为多少。

没有安全启动的安全 OTA 升级

即便硬件安全启动没有使能，也可验证已签名的 OTA 升级。可通过设置 CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT 和 CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT 实现。

具体可参考 Signed App Verification Without Hardware Secure Boot。

OTA 工具 (otatool.py)

app_update 组件中有 otatool.py 工具，用于在目标设备上完成下列 OTA 区分相关操作：

- 读取 otadata 分区 (read_otadata)
- 擦除 otadata 分区，将设备复位至工厂应用程序 (erase_otadata)
- 切换 OTA 分区 (switch_ota_partition)
- 擦除 OTA 分区 (erase_ota_partition)
- 写入 OTA 分区 (write_ota_partition)
- 读取 OTA 分区 (read_ota_partition)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用该 OTA 工具，或者从 Shell 脚本调用该 OTA 工具。前者可使用工具的 Python API，后者可使用命令行界面。

Python API 首先，确保已导入 otatool 模块。

```python
import sys
import os

idf_path = os.environ['IDF_PATH']  # 从环境中获取 IDF_PATH 的值
otatool_dir = os.path.join(idf_path, 'components', 'app_update')  # otatool.py 位于 $IDF_PATH/components/app_update 下

sys.path.append(otatool_dir)  # 使 Python 寻找 otatool 模块
from otatool import *  # 导入 otatool 模块内的所有名称
```

要使用 OTA 工具的 Python API，第一步是创建 OtoolTarget 对象：

```python
# 创建 partool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = OtoolTarget('/dev/ttyUSB1')
```

现在，可使用创建的 OtoolTarget 在目标设备上完成操作：

```python
# 擦除 otadata，将设备复位至工厂应用程序
target.erase_otadata()

# 擦除 OTA 应用程序分区 0
target.erase_ota_partition(0)

# 将启动分区切换至 OTA 应用程序分区 1
target.switch_ota_partition(1)

# 读取 OTA 分区 ‘ota_3’，将内容保存至文件 ‘ota_3.bin’
target.read_ota_partition("ota_3", "ota_3.bin")
```
要操作的 OTA 分区通过应用程序分区序号或分区名称指定。
更多关于 Python API 的信息，请查看 OTA 工具的代码注释。

**命令行界面**  `otatool.py` 的命令行界面具有如下结构：

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - 执行主命令（`otatool.py`）所需的实际参数，多与目标设备有关
- subcommand - 要执行的操作
- subcommand-args - 所选操作的实际参数
```

更多信息可用 `-help` 指令查看：

```
# 撤除 otadata，将设备复位至工厂应用程序
otatool.py --port "/dev/ttyUSB1" erase_otadata

# 撤除 OTA 应用程序分区 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# 将启动分区切换至 OTA 应用程序分区 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# 读取 OTA 分区 'ota_3'，将内容保存至文件 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

**相关文档**

**应用程序示例**

端对端的 OTA 固件升级示例请参考 system/ota。

**API 参考**

**Header File**

```
components/app_update/include/esp_ota_ops.h
```

**Functions**

```
const esp_app_desc_t *esp_ota_get_app_description (void)
```

```
Return esp_app_desc structure. This structure includes app version.
```

```
Return description for running app.
```
This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_description`.

**Return** Pointer to esp_app_desc structure.

```c
int esp_ota_get_app_elf_sha256 (char *dst, size_t size)
```

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_app_get_elf_sha256`.

**Parameters**
- `dst` – Destination buffer
- `size` – Size of the buffer

**Return** Number of bytes written to dst (including null terminator)

```c
esp_err_t esp_ota_begin (const esp_partition_t *partition, size_t image_size, esp_ota_handle_t *out_handle)
```

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

**Note:** If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

**Parameters**
- `partition` – Pointer to info for partition which will receive the OTA update. Required.
- `image_size` – Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- `out_handle` – On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

**Return**
- ESP_OK: OTA operation commenced successfully.
- ESP_ERR_INVALID_ARG: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
- ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
- ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
- ESP_ERR_OTA_INVALID_SIZE: Partition doesn’t fit in configured flash size.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state. Before performing an update, the application must be valid.
**esp_err_t esp_ota_write** *(esp_ota_handle_t handle, const void *data, size_t size)*

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

**参数**
- **handle** - Handle obtained from esp_ota_begin
- **data** - Data buffer to write
- **size** - Size of data buffer in bytes.

**返回**
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**esp_err_t esp_ota_write_with_offset** *(esp_ota_handle_t handle, const void *data, size_t size, uint32_t offset)*

Write OTA update data to partition at an offset.

This function can write data in non-contiguous manner. If flash encryption is enabled, data should be 16 bytes aligned.

**参数**
- **handle** - Handle obtained from esp_ota_begin
- **data** - Data buffer to write
- **size** - Size of data buffer in bytes
- **offset** - Offset in flash partition

**返回**
- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents

**esp_err_t esp_ota_end** *(esp_ota_handle_t handle)*

Finish OTA update and validate newly written app image.

**备注:** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).
Chapter 2. API

- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

\[ \text{esp_err_t} \ \text{esp_ota_abort} (\text{esp_ota_handle_t} \ handle) \]
Abort OTA update, free the handle and memory associated with it.

\begin{itemize}
  \item \text{handle} - obtained from esp_ota_begin().
\end{itemize}

\begin{itemize}
  \item ESP_OK: Handle and its associated memory is freed successfully.
  \item ESP_ERR_NOT_FOUND: OTA handle was not found.
\end{itemize}

\[ \text{esp_err_t} \ \text{esp_ota_set_boot_partition} (\text{const} \ \text{esp_partition_t} *\text{partition}) \]
Configure OTA data for a new boot partition.

备注: If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

\begin{itemize}
  \item \text{partition} - Pointer to info for partition containing app image to boot.
\end{itemize}

\begin{itemize}
  \item ESP_OK: OTA data updated, next reboot will use specified partition.
  \item ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
  \item ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
  \item ESP_ERR_NOT_FOUND: OTA data partition not found.
  \item ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.
\end{itemize}

\[ \text{const} \ \text{esp_partition_t} *\text{esp_ota_get_boot_partition} (\text{void}) \]
Get partition info of currently configured boot app.

- If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.
- If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

\begin{itemize}
  \item \text{return} Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.
\end{itemize}

\[ \text{const} \ \text{esp_partition_t} *\text{esp_ota_get_running_partition} (\text{void}) \]
Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

\begin{itemize}
  \item \text{return} Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.
\end{itemize}
const esp_partition_t *esp_ota_get_next_update_partition (const esp_partition_t *start_from)

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

参数 start_from — If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

参数 start_from — If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

esp_err_t esp_ota_get_partition_description (const esp_partition_t *partition, esp_app_desc_t *app_desc)

Returns esp_app_desc structure for app partition. This structure includes app version.

参数

- partition — [in] Pointer to app partition. (only app partition)
- app_desc — [out] Structure of info about app.

返回

- ESP_OK Successful.
- ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

uint8_t esp_ota_get_app_partition_count (void)

Returns number of OTA partitions provided in partition table.

参数

- Number of OTA partitions

esp_err_t esp_ota_mark_app_valid_cancel.Rollback (void)

This function is called to indicate that the running app is working well.

返回

- ESP_OK: if successful.

esp_err_t esp_ota_mark_app_invalid.Rollback_and_reboot (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

返回

- ESP_FAIL: if not successful.
- ESP_ERR_OTA.Rollback_FAILED: The rollback is not possible due to flash does not have any apps.

const esp_partition_t *esp_ota_get_last_invalid_partition (void)

Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

参数

partition.
Chapter 2. API

• **partition** [in] Pointer to partition.
• **ota_state** [out] state of partition (if this partition has a record in odata).

返回
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
• ESP_ERR_NOT_SUPPORTED: partition is not ota.
• ESP_ERR_NOT_FOUND: Partition table does not have odata or state was not found for given partition.

```c
esp_err_t esp_ota_erase_last_boot_app_partition (void)
```
Erase previous boot app partition and corresponding odata select for this partition.
When current app is marked to as valid then you can erase previous app partition.

返回
• ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible (void)
```
Checks applications on the slots which can be booted in case of rollback.
These applications should be valid (marked in odata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

返回
• True: Returns true if the slots have at least one app (except the running app).
• False: The rollback is not possible.

** Macros **

**OTA_SIZE_UNKNOWN**
Used for esp_ota_begin() if new image size is unknown

**OTA_WITH_SEQUENTIAL_WRITES**
Used for esp_ota_begin() if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

**ESP_ERR_OTA_BASE**
Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT**
Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID**
Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED**
Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER**
Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED**
Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE**
Chapter 2. API 参考

Error if current active firmware is still marked in pending validation state (ESP_OOTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

Type Definitions

typedef uint32_t esp_ota_handle_t

Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

OTA 升级失败排查

图 38: OTA 升级失败时如何排查（点击放大）

2.10.21  Performance Monitor

The Performance Monitor component provides APIs to use ESP32 internal performance counters to profile functions and applications.

Espressif Systems 2023 Release v5.1-dev-2066-g7869f4e151 Submit Document Feedback
Application Example

An example which combines performance monitor is provided in `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.

High level API Reference

Header Files

- `perfmon/include/perfmon.h`

API Reference

Header File

- `components/perfmon/include/xtensa_perfmon_access.h`

Functions

```c
esp_err_t xtensa_perfmon_init(int id, uint16_t select, uint16_t mask, int kernelcnt, int tracelevel)
```

Init Performance Monitor.

Initialize performance monitor register with define values

<table>
<thead>
<tr>
<th>参数</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>id</strong> [in]</td>
<td>performance counter number</td>
</tr>
<tr>
<td><strong>select</strong> [in]</td>
<td>select value from PMCTRLx register</td>
</tr>
<tr>
<td><strong>mask</strong> [in]</td>
<td>mask value from PMCTRLx register</td>
</tr>
<tr>
<td><strong>kernelcnt</strong> [in]</td>
<td>kernelcnt value from PMCTRLx register</td>
</tr>
<tr>
<td><strong>tracelevel</strong> [in]</td>
<td>tracelevel value from PMCTRLx register</td>
</tr>
</tbody>
</table>

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if one of the arguments is not correct

```c
esp_err_t xtensa_perfmon_reset(int id)
```

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

<table>
<thead>
<tr>
<th>参数</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>id</strong> [in]</td>
<td>performance counter number</td>
</tr>
</tbody>
</table>

返回

- ESP_OK on success
- ESP_ERR_INVALID_ARG if id out of range

```c
void xtensa_perfmon_start(void)
```

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

```c
void xtensa_perfmon_stop(void)
```

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

```c
uint32_t xtensa_perfmon_value(int id)
```

Read PM counter.

Read value of defined PM counter.

<table>
<thead>
<tr>
<th>参数</th>
<th>说明</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>id</strong> [in]</td>
<td>performance counter number</td>
</tr>
</tbody>
</table>

返回

- Performance counter value
**esp_err_t xtensa_perfmon_overflow**(int id)

Read PM overflow state.

- **id** -[in] performance counter number

  - ESP_OK if there is no overflow (overflow = 0)
  - ESP_FAIL if overflow occur (overflow = 1)

**void xtensa_perfmon_dump**(void)

Dump PM values.

Dump all PM register to the console.

**Header File**

- components/perfmon/include/xtensa_perfmon_apis.h

**Functions**

**esp_err_t xtensa_perfmon_exec**(const xtensa_perfmon_config_t *config)

Execute PM.

- **config** -[in] pointer to the configuration structure

  - ESP_OK if no errors
  - ESP_ERR_INVALID_ARG if one of the required parameters not defined
  - ESP_FAIL - counter overflow

**void xtensa_perfmon_view_cb**(void *params, uint32_t select, uint32_t mask, uint32_t value)

Dump PM results.

Callback to dump perfmon result to a FILE* stream specified in perfmon_config_t::callback_params. If callback_params is set to NULL, will print to stdout.

- **params** -[in] used parameters passed from configuration (callback_params). This parameter expected as FILE* hanle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- **select** -[in] select value for current counter
- **mask** -[in] mask value for current counter
- **value** -[in] counter value for current counter

**Structures**

**struct xtensa_perfmon_config**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

**Public Members**

**int repeat_count**

how much times function will be called before the callback will be repeated
float max_deviation
    Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void *call_params
    This pointer will be passed to the call_function as a parameter

void (*call_function)(void *params)
    pointer to the function that have to be called

void (*callback)(void *params, uint32_t select, uint32_t mask, uint32_t value)
    pointer to the function that will be called with result parameters

void *callback_params
    parameter that will be passed to the callback

int tracelevel
    trace level for all counters. In case of negative value, the filter will be ignored. If it’s >=0, then the
    perfmon will count only when interrupt level > tracelevel. It’s useful to monitor interrupts.

uint32_t counters_size
    amount of counter in the list

counters_size const uint32_t *select_mask
    list of the select/mask parameters

Type Definitions

typedef struct xtensa_perfmon_config xtensa_perfmon_config_t
    Performance monitor configuration structure.
    Structure to configure performance counter to measure dedicated function

2.10.22 电源管理

概述

ESP-IDF 中集成的电源管理算法可以根据应用程序组件的需求，调整外围总线 (APB) 频率和 CPU 频率，并使芯片进入 Light-sleep 模式，尽可能减少运行应用程序的功耗。

应用程序组件可以通过创建和获取电源管理锁来控制功耗。

例如:

- 对于从 APB 获得时钟频率的外设，其驱动可以要求在使用该外设时，将 APB 频率设置为 80 MHz。
- RTOS 可以要求 CPU 在有任务准备开始运行时以最高配置频率工作。
- 一些外设可能需要中断才能启用，因此其驱动也会要求禁用 Light-sleep 模式。

请求较高的 APB 频率或 CPU 频率以及禁用 Light-sleep 模式会增加功耗，因此请将组件使用的电源管理
锁降到最少。
### 电源管理配置

编译时可使用 `CONFIG_PM_ENABLE` 选项启用电源管理功能。

启用电源管理功能将会增加中断延迟。额外延迟与多个因素有关，例如：CPU 频率、单/双核模式、是否需要进行频率切换等。CPU 频率为 240 MHz 且未启用频率调节时，最小额外延迟为 0.2 us；如果启用频率调节，且在中断人口将频率由 40 MHz 调节至 80 MHz，则最大额外延迟为 40 us。

通过调用 `esp_pm_configure()` 函数可以在应用程序中启用动态调频 (DFS) 功能和自动 Light-sleep 模式。此函数的参数 `esp_pm_config_esp32_t` 定义了频率调节的相关设置。在此参数结构中，需要初始化以下三个字段：

- `max_freq_mhz`：最大 CPU 频率 (MHz)，即获取 `ESP_PM_CPU_FREQ_MAX` 额后所使用的频率。该字段通常设置为 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`。
- `min_freq_mhz`：最小 CPU 频率 (MHz)，即仅获取 `ESP_PM_APB_FREQ_MAX` 额后所使用的频率。该字段可设置为晶振 (XTAL) 频率值，或者 XTAL 频率值整数。注意，10 MHz 是生成 1 MHz 的 `REF_TICK` 默认时钟所需的最小频率。
- `light_sleep_enable`：没有获取任何管理锁时，决定系统是否需要自动进入 Light-sleep 状态 (true/false)。

如果在 `menuconfig` 中启用 `CONFIG_PM_DFS_INIT_AUTO` 选项，最大 CPU 频率将由 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 设置决定。最小 CPU 频率将锁定为 XTAL 频率。

### 备注

自动 Light-sleep 模式基于 FreeRTOSTickless Idle 方式，因此如果在 menuconfig 中没有启用 `CONFIG_FREERTOS_USE_TICKLESS_IDLE` 选项，在请求自动 Light-sleep 时，`esp_pm_configure()` 将会返回 `ESP_ERR_NOT_SUPPORTED` 错误。

例如，`EXT0` 和 `EXT1` 唤醒源可以通过 GPIO 唤醒芯片。

### 电源管理

应用程序可以通过获取或释放管理锁来控制电源管理算法。应用程序获取电源管理锁后，电源管理算法的操作将受到下面的限制，释放电源管理锁后，限制解除。

电源管理锁设有获取/释放计数器，如果已多次获取电源管理锁，则需要将电源管理锁释放相同次数以解除限制。

ESP32 支持下表中三种电源管理锁。

<table>
<thead>
<tr>
<th>电源管理锁</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESP_PM_CPU_FREQ_MAX</code></td>
<td>请求使用 <code>esp_pm_configure()</code> 将 CPU 频率设置为最大值。ESP32 可以将该值设置为 80 MHz、160 MHz 或 240 MHz。</td>
</tr>
<tr>
<td><code>ESP_PM_APB_FREQ_MAX</code></td>
<td>请求将 APB 频率设置为最大值，ESP32 支持的最大频率为 80 MHz。</td>
</tr>
<tr>
<td><code>ESP_PM_NO_LIGHT_SLEEP</code></td>
<td>禁止自动切至 Light-sleep 模式。</td>
</tr>
</tbody>
</table>

### ESP32 电源管理算法

下表列出了启用动态调频时如何切换 CPU 频率和 APB 频率。您可以使用 `esp_pm_configure()` 或者 `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ` 指定 CPU 最大频率。
<table>
<thead>
<tr>
<th>CPU 最高频率</th>
<th>电源管理器获取情况</th>
<th>APB 频率和 CPU 频率</th>
</tr>
</thead>
</table>
| 240      | 获取 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX | CPU: 240 MHz  
APB: 80 MHz |
|          | 使用 esp_pm_configure() 为二者设置最小值 |
| 160      | 获取 ESP_PM_CPU_FREQ_MAX | CPU: 160 MHz  
APB: 80 MHz |
|          | 获取 ESP_PM_APB_FREQ_MAX, 未获得 ESP_PM_CPU_FREQ_MAX | |
|          | 使用 esp_pm_configure() 为二者设置最小值 |
| 80       | 获取 ESP_PM_CPU_FREQ_MAX 或 ESP_PM_APB_FREQ_MAX | CPU: 80 MHz  
APB: 80 MHz |
|          | 使用 esp_pm_configure() 为二者设置最小值 |

如果没有获取任何管理锁，调用 esp_pm_configure() 将启动 Light-sleep 模式。Light-sleep 模式持续时间由以下因素决定：

- 处于阻塞状态的 FreeRTOS 任务数（有限超时）
- 高分辨率定时器 API 注册的计数器数量

您也可以设置 Light-sleep 模式在最近事件（任务解除阻塞，或计时器超时）之前持续多久才唤醒芯片。
为了跳过不必要的唤醒，可以将 skip_unhandled_events 选项设置为 true 来初始化 esp_timer。带有此标志的定时器不会唤醒系统，有助于减少功耗。

**动态调频和外设驱动**

启用动态调频后，APB 频率可在一个 RTOS 滴答周期内多次更改。有些外设不受 APB 频率变更的影响，但有些外设可能会出现问题。例如，Timer Group 外设定时器依赖计数器，但计数器计数的速度将随 APB 频率的变更而变更。

以下外设不受 APB 频率变更的影响：

- UART：如果 REF_TICK 或者 XTI 用作时钟源，则 UART 不受 APB 频率变更影响。请查看 uart_config_t::source_clk。
- LEDC：如果 REF_TICK 用作时钟源，则 LEDC 不受 APB 频率变更影响。请查看 ledc_timer_config() 函数。
- RMT：如果 REF_TICK 或者 XTI 被用作时钟源，则 RMT 不受 APB 频率变更影响。请查看 rmt_config_t::flags 以及 RMT_CHANNEL_FLAGS_AWARE_DFS 宏。
- GPTimer：如果 XTI 用作时钟源，则 GPTimer 不受 APB 频率变更影响。请查看 gptimer_config_t::clock_src。
- TSENS：XTAL 或 RTC_8M 用作时钟源，因此不受 APB 频率变化影响。

目前以下外设驱动程序可感知动态调频，并在调频期间使用 ESP_PM_APB_FREQ_MAX 预置：
• SPI master
• I2C
• I2S（如果APLL锁在使用中，I2S则会启用ESP_PM_NO_LIGHT_SLEEP锁）
• SDMMC

启用以下驱动程序时，将占用ESP_PM_APB_FREQ_MAX锁：

• SPI slave：从调用spi_slave_initialize()至spi_slave_free()期间。
• Ethernet：从调用esp_eth_driver_install()至esp_eth_driver_uninstall()期间。
• WiFi：从调用esp_wifi_start()至esp_wifi_stop()期间。如果启用了调制解调器睡眠模式，广播关闭时将释放此管理锁。
• TWAI：从调用twai_driver_install()至twai_driver_uninstall()期间（只有在TWAI时钟源选择为TWAI_CLK_SRC_APB的时候生效）。
• Bluetooth：从调用esp_bt_controller_enable()至esp_bt_controller_disable()期间。如果启用了蓝牙调制解调器，广播关闭时将释放此管理锁。但依然占用ESP_PM_NO_LIGHT_SLEEP锁，除非将CONFIG_BTDM_CTRL_LOW_POWER_CLOCK选项设置为“外部32 kHz晶振”。

以下外设驱动程序无法感知动态调频，应用程序需自己获取/释放管理锁：

• PCNT
• Sigma-delta
• 旧版定时器驱动（Timer Group）
• MCPWM

API 参考

Header File

• components/esp_pm/include/esp_pm.h

Functions

esp_err_t esp_pm_configure (const void *config)

Set implementation-specific power management configuration.

参数 config - pointer to implementation-specific configuration structure (e.g. esp_pm_config.esp32)

返回
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the configuration values are not correct
• ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if CONFIG_PM_ENABLE is not enabled in sdkconfig

esp_err_t esp_pm_get_configuration (void *config)

Get implementation-specific power management configuration.

参数 config - pointer to implementation-specific configuration structure (e.g. esp_pm_config.esp32)

返回
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the pointer is null

esp_err_t esp_pm_lock_create (esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp_pm_lock_acquire to take the lock.

This function must not be called from an ISR.
### API

#### esp_pm_lock_acquire

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

**Parameters**
- `handle` - Handle obtained from esp_pm_lock_create function

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

#### esp_pm_lock_release

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

**Parameters**
- `handle` - Handle obtained from esp_pm_lock_create function

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

#### esp_pm_lock_delete

The lock must be released before calling this function.

This function must not be called from an ISR.

**Parameters**
- `handle` - Handle obtained from esp_pm_lock_create function

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle argument is NULL
- ESP_ERR_INVALID_STATE if the lock is still acquired
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig
Chapter 2. API 参考

**esp_err_t esp_pm_dump_locks** (FILE *stream)

Dump the list of all locks to stderr

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream.

This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

参数 `stream`—stream to print information to; use stdout or stderr to print to the console; use fmemopen/open_memstream to print to a string buffer.

返回
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

## Type Definitions

typedef struct esp_pm_lock *esp_pm_lock_handle_t

Opaque handle to the power management lock.

## Enumerations

enum esp_pm_lock_type_t

Power management constraints.

Values:

enumerator ESP_PM_CPU_FREQ_MAX

Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

enumerator ESP_PM_APB_FREQ_MAX

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

enumerator ESP_PM_NO_LIGHT_SLEEP

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

## Header File

- components/esp_pm/include/esp32/pm.h

## Structures

struct esp_pm_config_esp32_t

Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.

## Public Members

int max_freq_mhz

Maximum CPU frequency, in MHz
int min_freq_mhz
Minimum CPU frequency to use when no locks are taken, in MHz

bool light_sleep_enable
Enter light sleep when no locks are taken

2.10.23 POSIX Threads Support

Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard pthread.h header, which is included in the toolchain libc. An additional ESP-IDF specific header, esp_pthread.h, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for std::thread, std::mutex, std::condition_variable, etc. are implemented using pthreads (via GCC libstdc++). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions sleep, vTaskDelay(), or usleep.

备注：If calling a standard libc or C++ sleep function, such as usleep defined in unistd.h, then the task will only block and yield the CPU if the sleep time is longer than one FreeRTOS tick period. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

By default, all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a custom API.

Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or pthread.h, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

Thread APIs

- pthread_create() - The attr argument is supported for setting stack size and detach state only. Other attribute fields are ignored. Unlike FreeRTOS task functions, the start_routine function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until pthread_join() is called on it.
- pthread_join()
- pthread_detach()
- pthread_exit()
- sched_yield()
• pthread_self() - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
• pthread_equal()

Thread Attributes
• pthread_attr_init()
• pthread_attr_destroy() - This function doesn’t need to free any resources and instead resets the attr structure to defaults (implementation is same as pthread_attr_init()).
• pthread_attr_getstacksize() / pthread_attr_setstacksize()
• pthread_attr_getdetachstate() / pthread_attr_setdetachstate()

Once
• pthread_once()

Static initializer constant PTHREAD_ONCE_INIT is supported.

备注：This function can be called from tasks created using either pthread or FreeRTOS APIs

Mutexes  POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with xSemaphoreCreateMutex().
• pthread_mutex_init()
• pthread_mutex_destroy()
• pthread_mutex_lock()
• pthread_mutex_timedlock()
• pthread_mutex_trylock()
• pthread_mutex_unlock()
• pthread_mutexattr_init()
• pthread_mutexattr_destroy()
• pthread_mutexattr_gettype() / pthread_mutexattr_settype()

Static initializer constant PTHREAD_MUTEX_INITIALIZER is supported, but the non-standard static initializer constants for other mutex types are not supported.

备注：These functions can be called from tasks created using either pthread or FreeRTOS APIs

Condition Variables
• pthread_cond_init() - The attr argument is not implemented and is ignored.
• pthread_cond_destroy()
• pthread_cond_signal()
• pthread_cond_broadcast()
• pthread_cond_wait()
• pthread_cond_timedwait()

Static initializer constant PTHREAD_COND_INITIALIZER is supported.

• The resolution of pthread_cond_timedwait() timeouts is the RTOS tick period (see CONFIG_FREERTOS_HZ). Timeouts may be delayed up to one tick period after the requested timeout.

备注：These functions can be called from tasks created using either pthread or FreeRTOS APIs
Chapter 2. API 参考

Read/Write Locks

- `pthread_rwlock_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_unlock()`

Static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

备注：These functions can be called from tasks created using either pthread or FreeRTOS APIs.

Thread-Specific Data

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

备注：These functions can be called from tasks created using either pthread or FreeRTOS APIs. When calling these functions from tasks created using FreeRTOS APIs, `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS` config option must be enabled to ensure the thread-specific data is cleaned up before the task is deleted.

备注：There are other options for thread local storage in ESP-IDF, including options with higher performance. See Thread Local Storage.

Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a feature request on GitHub <https://github.com/espressif/esp-idf/issues> with the details.

ESP-IDF Extensions

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently, the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`).

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_pthread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration.
then any new thread created will inherit the creator’s configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

**Examples**

- `system/pthread` demonstrates using the pthreads API to create threads
- `cxx/pthread` demonstrates using C++ Standard Library functions with threads

**API Reference**

**Header File**

- `components/pthread/include/esp_pthread.h`

**Functions**

- `esp_pthread_cfg_t esp_pthread_get_default_config (void)`
  
  Creates a default pthread configuration based on the values set via menuconfig.

  返回 A default configuration structure.

- `esp_err_t esp_pthread_set_cfg (const esp_pthread_cfg_t *cfg)`

  Configure parameters for creating pthread.

  This API allows you to configure how the subsequent `pthread_create()` call will behave. This call can be used to set up configuration parameters like stack size, priority, configuration inheritance etc.

  If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

  备注: Passing non-NULL attributes to `pthread_create()` will override the stack_size parameter set using this API

  参数 `cfg` - The pthread config parameters

  返回

  - ESP_OK if configuration was successfully set
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

- `esp_err_t esp_pthread_get_cfg (esp_pthread_cfg_t *p)`

  Get current pthread creation configuration.

  This will retrieve the current configuration that will be used for creating threads.

  参数 `p` - Pointer to the pthread config structure that will be updated with the currently configured parameters

  返回

  - ESP_OK if the configuration was available
  - ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

- `esp_err_t esp_pthread_init (void)`

  Initialize pthread library.

**Structures**

- `struct esp_pthread_cfg_t`
  
  pthread configuration structure that influences pthread creation
Public Members

`size_t stack_size`
- The stack size of the pthread.

`size_t prio`
- The thread’s priority.

`bool inherit_cfg`
- Inherit this configuration further.

`const char* thread_name`
- The thread name.

`int pin_to_core`
- The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

Macros

`PTHREAD_STACK_MIN`

### 2.10.24 Random Number Generation

ESP32 contains a hardware random number generator, values from it can be obtained using the APIs `esp_random()` and `esp_fill_random()`.

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling `bootloader_random_enable()` and not yet disabled by calling `bootloader_random_disable()`.
- While the ESP-IDF is running. This is because the default ESP-IDF bootloader implementation calls `bootloader_random_enable()` when the bootloader starts, and `bootloader_random_disable()` before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the ESP32 Technical Reference Manual > Random Number Generator (RNG) [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function `bootloader_random_enable()` to re-enable the internal entropy source. The function `bootloader_random_disable()` must be called to disable the entropy source again before using ADC, I2S, Wi-Fi or Bluetooth.

*备注：* The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a
continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

**API Reference**

**Header File**
- components/esp_hw_support/include/esp_random.h

**Functions**

```c
uint32_t esp_random (void)
```
Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

```c
void esp_fill_random (void *buf, size_t len)
```
Fill a buffer with random bytes from hardware RNG.

*备注:* This function is implemented via calls to esp_random(), so the same constraints apply.

**参数**
- `buf` – Pointer to buffer to fill with random numbers.
- `len` – Length of buffer in bytes

**Header File**
- components/bootloader_support/include/bootloader_random.h

**Functions**

```c
void bootloader_random_enable (void)
```
Enable an entropy source for RNG if RF subsystem is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be called from app code, if true random numbers are required without initialized RF subsystem. This might be the case in early startup code of the application when the RF subsystem has not started yet or if the RF subsystem should not be enabled for power saving.

void bootloader_random_disable (void)
    Disable entropy source for RNG.
    Disables internal entropy source. Must be called after bootloader_random_enable() and before RF subsystem features, ADC, or I2S (ESP32 only) are initialized.
    Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

void bootloader_fill_random (void *buffer, size_t length)
    Fill buffer with ‘length’ random bytes.

备注：If this function is being called from app code only, and never from the bootloader, then it’s better to call esp_fill_random().

参数
    • buffer - Pointer to buffer
    • length - This many bytes of random data will be copied to buffer

getrandom

A compatible version of the Linux getrandom() function is also provided for ease of porting:

```c
#include <sys/random.h>

ssize_t getrandom (void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling esp_fill_random() internally.

The flags argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with errno set to EFAULT) if the buf argument is NULL, and equal to buflen otherwise.

## 2.10.25 睡眠模式

概述

ESP32 具有 Light-sleep 和 Deep-sleep 两种睡眠节能模式。

在 Light-sleep 模式下，数字外设、CPU、以及大部分 RAM 都使用时钟门控，同时电源电压降低。退出该模式后，数字外设、CPU 和 RAM 恢复运行，内部状态保持不变。

在 Deep-sleep 模式下，CPU、大部分 RAM、以及所有由时钟 APB_CLK 驱动的数字外设都会被断电。芯片上继续处于供电状态的部分仅包括：

- RTC 控制器
- ULP 协处理器
- RTC 高速内存
- RTC 低速内存
Light-sleep 和 Deep-sleep 模式有多种唤醒源。这些唤醒源也可以组合在一起，此时任何一个唤醒源都可以触发唤醒。通过 API esp_sleep_enable_X_wakeup 可启用唤醒源，通过 API esp_sleep_disable_wakeup_source() 可禁用唤醒源，详见下一小节。在系统进入 Light-sleep 或 Deep-sleep 模式前，可以在任意时刻配置唤醒源。

此外，应用程序可以使用 API esp_sleep_pd_config() 强制 RTC 外设和 RTC 内存进入特定断电模式。

配置唤醒源后，应用程序就可以使用 API esp_light_sleep_start() 或 esp_deep_sleep_start() 进入睡眠模式。此时，系统将按照被请求的唤醒源配置硬件，同时 RTC 控制器会给 CPU 和数字外设断电。

如果保持 Wi-Fi 连接，请启用 Wi-Fi Modem-sleep 模式和自动 Light-sleep 模式（请参阅电源管理 API）。在这两种模式下，Wi-Fi 驱动程序发出请求时，系统将自动从睡眠中被唤醒，从而保持与 AP 的连接。

睡眠模式下的 Wi-Fi 和 Bluetooth 功能

在 Light-sleep 和 Deep-sleep 模式下，无线外设会被断电。因此，在进入这两种睡眠模式前，应用程序必须调用恰当的函数 (esp_bluedroid_disable()，esp_bt_controller_disable() 或 esp_wifi_stop()) 来禁用 Wi-Fi 和 Bluetooth。在 Light-sleep 或 Deep-sleep 模式下，即使不调用这些函数也无法连接 Wi-Fi 和 Bluetooth。

唤醒源

定时器  RTC 控制器中内嵌定时器，可用于在预定义的时间到达后唤醒芯片。时间精度为微秒，但其实时分辨率依赖于为 RTC SLOW_CLK 所选择的时钟源。

关于 RTC 时钟选项的更多细节，请参考 ESP32 技术参考手册 > ULP 协处理器 [PDF]。

在这种唤醒模式下，无需为睡眠模式中的 RTC 外设或内存供电。

调用 esp_sleep_enable_timer_wakeup() 函数可启用使用定时器唤醒睡眠模式。

触摸传感器  RTC IO 模块包含这样一个逻辑——当发生触摸传感器中断时，触发唤醒。要启用此唤醒源，用户需要在芯片进入睡眠模式前配置触摸传感器中断功能。

ESP32 修订版 0 和 1 仅在 RTC 外设没有被强制供电时支持该唤醒源（即 ESP_PD_DOMAIN_RTC_PERIPH 应被设置为 ESP_PD_OPTION_AUTO）。

可调用 esp_sleep_enable_touchpad_wakeup() 函数来启用该唤醒源。

外部唤醒 (ext0)  RTC IO 模块包含这样一个逻辑——当某个 RTC GPIO 被设置为预定义的逻辑值时，触发唤醒。RTC IO 是 RTC 外设电源域的一部分，因此如果该唤醒源被请求，RTC 外设将在 Deep-sleep 模式期间保持供电。

在此模式下，RTC IO 模块被使能，因此也可以使用内部上拉或下拉电阻。配置时，应用程序需要在调用函数 esp_deep_sleep_start() 前先调用函数 rtc_gpio_pullup_en() 和 rtc_gpio_pulldown_en()。

在 ESP32 修订版 0 和 1 中，此唤醒源与 ULP 和触摸传感器唤醒源都不兼容。

可调用 esp_sleep_enable_ext0_wakeup() 函数来启用此唤醒源。

警告：从睡眠模式中唤醒后，用于唤醒的 IO pad 将被配置为 RTC IO。因此，在将该 pad 用作数字 GPIO 之前，请调用 rtc_gpio_deinit() 函数对其进行重新配置。
外部唤醒 (ext)  
RTC 控制器中包含使用多个 RTC GPIO 触发唤醒的逻辑。您可以从以下两个逻辑函数中选择其一，用于触发唤醒：
- 当任意一个所选管脚为高电平时唤醒 (ESP_EXT1_WAKEUP_ANY_HIGH)
- 当所有所选管脚为低电平时唤醒 (ESP_EXT1_WAKEUP_ALL_LOW)

此唤醒源由 RTC 控制器实现。这种模式下的 RTC 外设和 RTC 内存可以被断电，但如果 RTC 外设被断电，则需要在 RTC 外设电源域在睡眠期间保持开启，并在进入睡眠前使用函数 `esp_sleep_pd_config()` 配置上拉或下拉电阻。

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);gpio_pulldown_en(gpio_num);
```

警告：从睡眠模式中唤醒后，用于唤醒的 IO pad 将被配置为 RTC IO。因此在将该 pad 用作数字 GPIO 前，请调用 `rtc_gpio_deinit()` 函数对其进行重新配置。

可调用 `esp_sleep_enable_ext1_wakeup()` 函数来启用此唤醒源。

ULP 协处理器唤醒 当芯片处于睡眠模式时，ULP 协处理器仍然运行，可用于唤醒传感器、监视 ADC 或触碰传感器的值，并在检测到特殊事件时唤醒芯片。ULP 协处理器是 RTC 外设电源域的一部分，运行在 RTC 低速内存中的程序。如果这一唤醒源被请求，RTC 低速内存将会在睡眠期间保持供电状态。

RTC 外设会在 ULP 协处理器开始运行前自动上电；一旦程序停止运行，RTC 外设会再次自动断电。

ESP32 修订版 0 和 1 仅在 RTC 外设没有被强制供电时支持该唤醒（即 ESP_PD_DOMAIN_RTC_PERIPH 应被设置为 ESP_PD_OPTION_AUTO）。

可调用 `esp_sleep_enable_ulp_wakeup()` 函数来启用此唤醒源。

GPIO 唤醒（仅适用于 Light-sleep 模式） 除了上述 EX0 和 EX1 唤醒源之外，还有一种从外部唤醒 Light-sleep 模式的方法——使用函数 `gpio_pullup_dis()`。启用该唤醒源后，可将每个管脚单独配置为高电平或低电平时唤醒。EX0 和 EX1 唤醒源只能用于 RTC IO，但此唤醒源既可以用于 RTC IO，也可以用于数字 IO。

可调用 `esp_sleep_enable_gpio_wakeup()` 函数来启用此唤醒源。

警告：在进入 Light-sleep 模式前，请查看您将要驱动的 GPIO 管脚的电源域。如果有管脚属于 VDD_SDIO 电源域，必须将此电源域配置为在睡眠期间保持供电。

例如，在 ESP32-WROOM-32 开发板上，GPIO16 和 GPIO17 连接到 VDD_SDIO 电源域。如果这两个管脚被配置为在睡眠期间保持高电平，按需需将对应电源域配置为保持供电。您可以使用函数 `esp_sleep_pd_config()`：

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

UART 唤醒（仅适用于 Light-sleep 模式） 当 ESP32 从外部设备接收 UART 输入时，通常需要在输入数据可用时唤醒芯片。UART 外设支持在 RX 管脚上检测到一定数量的上升沿时，将芯片从 Light-sleep 模式中唤醒。调用 `uart_set_wakeup_threshold()` 函数可设置检测上升沿的数量。请注意，触发唤醒的字符（及该字符前的任何字符）在唤醒后不会被 UART 接收，因此在发送数据之前，外部设备通常需要首先向 ESP32 额外发送一个字符以触发唤醒。

可调用 `esp_sleep_enable_uart_wakeup()` 函数来启用此唤醒源。

RTC 外设和内存断电

默认情况下，调用函数 `esp_deep_sleep_start()` 和 `esp_light_sleep_start()` 后，所有唤醒源不需要的 RTC 电源域都会被断电。可调用函数 `esp_sleep_pd_config()` 来修改这一设置。

Espressif Systems 2040 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
注意：在 ESP32 修订版 1 中，RTC 高速内存存在 Deep-sleep 期间将总是保持使能，以保证复位后可运行 Deep-sleep stub。如果应用程序在 Deep-sleep 模式后无需复位，您也可以对其进行修改。

如果程序中的某些值被放入 RTC 低速内存中（例如使用 RTC_DATA_ATTR 属性），RTC 低速内存将默认保持供电。如果有需要，也可以使用函数 esp_sleep_pd_config() 对其进行修改。

**Flash 断电**

默认情况下，调用函数 esp_light_sleep_start() 后，flash 不会断电，因为在 sleep 过程中断电 flash 存在风险。具体而言，flash 断电需要时间，但是在此期间，系统有可能被唤醒，导致 flash 重新被上电。此时，断电尚未完成又重新上电的硬件行为有可能导致 flash 无法正常工作。

理论上讲，在 flash 完全断电后可以仅唤醒系统。然而，实际情况是 flash 断电所需的时间很难预测。如果用户为 flash 供电电路添加了滤波电容，断电所需时间可能会更长。此外，即使可以预知 flash 彻底断电所需的时间，有时也不能通过设置足够长的睡眠时间来确保 flash 断电的安全（比如，突发的异步唤醒源会使得实际的睡眠时间不可控）。

**警告：**如果在 flash 的供电电路中添加了滤波电容，那么应该尽一切可能避免 flash 断电。

因为这些不可控的因素，ESP-IDF 很难保证 flash 断电的绝对安全。因此 ESP-IDF 不推荐用户断电 flash。对于一些功耗敏感型应用，可以通过设置 Kconfig 配置项 CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND 来减少 light sleep 期间 flash 的功耗。这种模式在几乎所有场合下都要比断电 flash 更好，兼顾了安全性和功耗。

值得一提的是，PSRAM 也有一个类似的 Kconfig 配置项 CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND。

考虑到有些用户能够充分评估断电 flash 的风险，并希望通过断电 flash 来获得更低的功耗，因此 ESP-IDF 提供了两种断电 flash 的机制：

- 设置 Kconfig 配置项 CONFIG_ESP_SLEEP_POWER_DOWN_FLASH 将使 ESP-IDF 以一个严格的条件来断电 flash。严格的条件具体指的是，RTC timer 是唯一的唤醒源。睡眠时间比 flash 彻底断电所需时间更长。
- 调用函数 esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF) 将使 ESP-IDF 以一个宽松的条件来断电 flash。宽松的条件具体指的是 RTC timer 唤醒源未被使能或睡眠时间比 flash 彻底断电所需时间更长。

**备注：**

- Light sleep 时，ESP-IDF 没有提供保证 flash 一定会断电的机制。
- 不管用户的配置如何，函数 esp_deep_sleep_start() 都会强制断电 flash。

**进入 Light-sleep 模式**

函数 esp_light_sleep_start() 可用于在配置唤醒源后进入 Light-sleep 模式，也可用于在未配置唤醒源的情况下进入 Light-sleep 模式。在后一种情况下，芯片将一直处于睡眠模式，直到从外部被复位。

**进入 Deep-sleep 模式**

函数 esp_deep_sleep_start() 可用于在配置唤醒源后进入 Deep-sleep 模式，也可用于在未配置唤醒源的情况下进入 Deep-sleep 模式。在后一种情况下，芯片将一直处于睡眠模式，直到从外部被复位。
配置 IO

一些 ESP32 IO 在默认情况下启用内部上拉或下拉电阻。如果这些管脚在 Deep-sleep 模式下中受外部电路驱动，电流会经过这些上下拉电阻时，可能会增加电流消耗。

想要隔离这些管脚以避免额外的电流消耗，请调用 `rtc_gpio_isolate()` 函数。

例如，在 ESP32-WROVER 模组上，GPIO12 在外部上拉，但其在 ESP32 芯片中也有内部下拉。这意味着在 Deep-sleep 模式中，电流会由这些外部和内部电阻，使电流消耗超出可能的最小值。

在函数 `esp_deep_sleep_start()` 前增加以下代码即可避免额外电流消耗：

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

UART 输出处理

在进入睡眠模式之前，调用函数 `esp_deep_sleep_start()` 会冲刷掉 UART FIFO 缓存。

当使用函数 `esp_light_sleep_start()` 进入 Light-sleep 模式时，UART FIFO 将不会被冲刷。与之相反，UART 输出将被暂停。FIFO 中的剩余字符将在 Light-sleep 唤醒后被发送。

检查睡眠唤醒原因

`esp_sleep_get_wakeup_cause()` 函数可用于检测是何种唤醒源在睡眠期间被触发。

对于触摸传感器唤醒源，可以调用函数 `esp_sleep_get_touchpad_wakeup_status()` 来确认触发唤醒的触摸管脚。

对于 `ext1` 唤醒源，可以调用函数 `esp_sleep_get_ext1_wakeup_status()` 来确认触发唤醒的触摸管脚。

禁用睡眠模式唤醒源

调用 API `esp_sleep_disable_wakeup_source()` 可以禁用给定唤醒源的触发器，从而禁用该唤醒源。此外，如果将参数设置为 `ESP_SLEEP_WAKEUP_ALL`，该函数可用于禁用所有触发器。

应用程序示例

- `protocols/sntp`：如何实现 Deep-sleep 模式的基本功能，周期性唤醒 ESP 模块，以从 NTP 服务器获取时间。
- `wifi/power_save`：如何实现 Modem-sleep 模式。
- `system/deep_sleep`：如何使用 Deep-sleep 唤醒触发器和 ULP 协处理器编程。

API 参考

Header File

- `components/esp_hw_support/include/esp_sleep.h`

Functions

`esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)`

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.
**API**

**esp_sleep_enable_ulp_wakeup**(void)

Enable wakeup by ULP coprocessor.

**esp_sleep_enable_timer_wakeup**(uint64_t time_in_us)

Enable wakeup by timer.

**esp_sleep_enable_touchpad_wakeup**(void)

Enable wakeup by touch sensor.

**esp_sleep_get_touchpad_wakeup_status**(void)

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

**esp_sleep_is_valid_wakeup_gpio**(gpio_num_t gpio_num)

Returns true if a GPIO number is valid for use as wakeup source.
For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

**Parameters**
- `gpio_num` - Number of the GPIO to test for wakeup source capability
- `level` - Input level which will trigger wakeup (0=low, 1=high)

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

**esp_err_t esp_sleep_enable_ext0_wakeup (gpio_num_t gpio_num, int level)**

Enable wakeup using a pin.

This function uses external wakeup feature of RTC IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pin is configured in `esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

**Note:** ESP32: ext0 wakeup source cannot be used together with touch or ULP wakeup sources.

**Parameters**
- `gpio_num` - GPIO number used as wakeup source. Only GPIOs with the RTC functionality can be used. For different SoCs, the related GPIOs are:
  - ESP32: 0, 2, 4, 12-15, 25-27, 32-39;
  - ESP32-S2: 0-21;
  - ESP32-S3: 0-21.
- `level` - Input level which will trigger wakeup (0=low, 1=high)

**Return**
- ESP_OK on success

**esp_err_t esp_sleep_enable_ext1_wakeup (uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)**

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

**Note:** This function does not modify pin configuration. The pins are configured in `esp_deep_sleep_start/esp_light_sleep_start`, immediately before entering sleep mode.

**Note:** Internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function.

**Parameters**
- `mask` - Bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map. For different SoCs, the related GPIOs are:
  - ESP32: 0, 2, 4, 12-15, 25-27, 32-39;
Chapter 2. API

– ESP32-S2: 0-21;

**mode** select logic function used to determine wakeup condition:
– ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
– ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

**esp_err_t esp_sleep_enable_gpio_wakeup (void)**
Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0
and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be
used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO
which is used for wakeup. Then call this function to enable wakeup feature.

**备注:** On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

**esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)**
Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the
application.

**备注:** ESP32 does not support wakeup from UART2.

**参数** uart_num – UART port to wake up from

**返回**
– ESP_OK on success
– ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

**esp_err_t esp_sleep_enable_bt_wakeup (void)**
Enable wakeup by bluetooth.

**返回**
– ESP_OK on success
– ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

**esp_err_t esp_sleep_disable_bt_wakeup (void)**
Disable wakeup by bluetooth.

**返回**
– ESP_OK on success
– ESP_ERR_NOT_SUPPORTED if wakeup from bluetooth is not supported

**esp_err_t esp_sleep_enable_wifi_wakeup (void)**
Enable wakeup by WiFi MAC.
Chapter 2. API

Return
- ESP_OK on success

`esp_err_t esp_sleep_disable_wifi_wakeup(void)`
Disable wakeup by WiFi MAC.

Return
- ESP_OK on success

`uint64_t esp_sleep_get_ext1_wakeup_status(void)`
Get the bit mask of GPIOs which caused wakeup (ext1)
If wakeup was caused by another source, this function will return 0.

Return bit mask, if GPIO caused wakeup, BIT(n) will be set

`esp_err_t esp_sleep_pd_config(esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)`
Set power down mode for an RTC power domain in sleep mode.
If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

**Parameter**
- domain - power domain to configure
- option - power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

`void esp_deep_sleep_start(void)`
Enter deep sleep with the configured wakeup options.
This function does not return.

`esp_err_t esp_light_sleep_start(void)`
Enter light sleep with the configured wakeup options.

Return
- ESP_OK on success (returned after wakeup)
- ESP_ERR_SLEEP_REJECT sleep request is rejected (wakeup source set before the sleep request)
- ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

`void esp_deep_sleep(uint64_t time_in_us)`
Enter deep-sleep mode.
The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:
- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop

This function does not return.

**Note:** The device will wake up immediately if the deep-sleep time is set to 0
参数 `time_in_us`—deep-sleep time, unit: microsecond

```c
void esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause()
```

Get the wakeup source which caused wakeup from sleep.

返回 cause of wake up from last sleep (deep sleep or light sleep)

```c
void esp_wake_deep_sleep()
```

Default stub to run on wake from deep sleep.

- Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.
- This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.
- See docs/deep-sleep-stub.rst for details.

```c
void esp_set_deep_sleep_wake_stub(esp_deep_sleep_wake_stub_fn_t new_stub)
```

Install a new stub at runtime to run on wake from deep sleep.

- If implementing esp_wake_deep_sleep() then it is not necessary to call this function.
- However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

```c
esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub()
```

Get current wake from deep sleep stub.

返回 Return current wake from deep sleep stub, or NULL if no stub is installed.

```c
void esp_default_wake_deep_sleep()
```

The default esp-idf-provided esp_wake_deep_sleep() stub.

- See docs/deep-sleep-stub.rst for details.

```c
void esp_deep_sleep_disable_rom_logging()
```

Disable logging from the ROM code after deep sleep.

- Using LSB of RTCSTORE4.

```c
void esp_sleep_config_gpio_isolate()
```

Configure to isolate all GPIO pins in sleep state.

```c
void esp_sleep_enable_gpio_switch(bool enable)
```

Enable or disable GPIO pins status switching between slept status and waked status.

参数 `enable`—decide whether to switch status or not

Type Definitions

typedef `esp_sleep_source_t` `esp_sleep_wakeup_cause_t`

typedef void (*`esp_deep_sleep_wake_stub_fn_t`)(void)

Function type for stub to run on wake from sleep.

Enumerations

enum `esp_sleep_ext1_wakeup_mode_t`

Logic function used for EXT1 wakeup mode.

Values:
enumerator **ESP_EXT1_WAKEUP_ALL_LOW**
  Wake the chip when all selected GPIOs go low.

enumerator **ESP_EXT1_WAKEUP_ANY_HIGH**
  Wake the chip when any of the selected GPIOs go high.

enum **esp_sleep_pd_domain_t**
  Power domains which can be powered down in sleep mode.
  
  *Values:*

  enumerator **ESP_PD_DOMAIN_RTC_PERIPH**
  RTC IO, sensors and ULP co-processor.

  enumerator **ESP_PD_DOMAIN_RTC_SLOW_MEM**
  RTC slow memory.

  enumerator **ESP_PD_DOMAIN_RTC_FAST_MEM**
  RTC fast memory.

  enumerator **ESP_PD_DOMAIN_XTAL**
  XTAL oscillator.

  enumerator **ESP_PD_DOMAIN_RTC8M**
  Internal 8M oscillator.

  enumerator **ESP_PD_DOMAIN_VDDSDIO**
  VDD_SDIO.

  enumerator **ESP_PD_DOMAIN_MAX**
  Number of domains.

enum **esp_sleep_pd_option_t**
  Power down options.
  
  *Values:*

  enumerator **ESP_PD_OPTION_OFF**
  Power down the power domain in sleep mode.

  enumerator **ESP_PD_OPTION_ON**
  Keep power domain enabled during sleep mode.

  enumerator **ESP_PD_OPTION_AUTO**
  Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp_sleep_source_t**
  Sleep wakeup cause.
  
  *Values:*

  enumerator **ESP_SLEEP_SRC_PBTN**
  Button press.

  enumerator **ESP_SLEEP_SRC_WAKEUP**
  Alternate wakeup.

  enumerator **ESP_SLEEP_SRC_RTC**
  RTC wakeup.

  enumerator **ESP_SLEEP_SRC_MAX**
  Number of sources.
enumerator `ESP_SLEEP_WAKEUP_UNDEFINED`
In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator `ESP_SLEEP_WAKEUP_ALL`
Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

enumerator `ESP_SLEEP_WAKEUP_EXT0`
Wakeup caused by external signal using RTC_IO.

enumerator `ESP_SLEEP_WAKEUP_EXT1`
Wakeup caused by external signal using RTC_CNTL.

enumerator `ESP_SLEEP_WAKEUP_TIMER`
Wakeup caused by timer.

enumerator `ESP_SLEEP_WAKEUP_TOUCHPAD`
Wakeup caused by touchpad.

enumerator `ESP_SLEEP_WAKEUP_ULP`
Wakeup caused by ULP program.

enumerator `ESP_SLEEP_WAKEUP_GPIO`
Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator `ESP_SLEEP_WAKEUP_UART`
Wakeup caused by UART (light sleep only)

enumerator `ESP_SLEEP_WAKEUP_WIFI`
Wakeup caused by WIFI (light sleep only)

enumerator `ESP_SLEEP_WAKEUP_COCPU`
Wakeup caused by COCPU int.

enumerator `ESP_SLEEP_WAKEUP_COCPU_TRAP_TRIG`
Wakeup caused by COCPU crash.

enumerator `ESP_SLEEP_WAKEUP_BT`
Wakeup caused by BT (light sleep only)

enum [anonymous]
Values:

enumerator `ESP_ERR_SLEEP_REJECT`

enumerator `ESP_ERR_SLEEP_TOO_SHORT_SLEEP_DURATION`
2.10.26  SoC Capabilities

This section lists definitions of the ESP32’s SoC hardware capabilities. These definitions are commonly used in IDF to control which hardware dependent features are supported and thus compiled into the binary.

备注：These defines are currently not considered to be part of the public API, and may be changed at any time.

2.10.27 系统时间

概述
ESP32 使用两种硬件时钟源建立和保持系统时间。根据应用目的及对系统时间的精度要求，既可以仅使用其中一种时钟源，也可以同时使用两种时钟源。这两种硬件时钟源为:

- **RTC 定时器**: RTC 定时器在任何睡眠模式下及在任何复位后均可保持系统时间（上电复位除外，因为上电复位会重置 RTC 定时器）。时钟频率偏差取决于 RTC 定时器的时钟源，该偏差只会在睡眠模式下影响时间精度。睡眠模式下，时钟频率为 6.667 μs。
- **高分辨率定时器**: 高分辨率定时器在睡眠模式下及在复位后不可用，但其时间精度更高。该定时器使用 APB_CLK 时钟源（通常为 80 MHz），时钟频率偏移小于 ±10 ppm，时间分辨率为 1 μs。

可供选择的硬件时钟源组合如下所示:

- RTC 和高分辨率定时器（默认）
- RTC
- 高分辨率定时器
- 无
默认时钟源的时间精度最高。建议使用该配置。此外，用户也可以通过配置选项 `CONFIG_NEWLIB_TIME_SYSCALL` 来选择其他时钟源。

**RTC 定时器时钟源**

RTC 定时器有以下时钟源:

- 内置 150 kHz RC 振荡器（默认）：Deep-sleep 模式下电流消耗最低，不依赖任何外部元件。但由于温度波动会影响该时钟源的频率稳定性，在 Deep-sleep 和 Light-sleep 模式下都有可能发生时间偏移。
- 外置 32 kHz 晶振：需要将一个 32 kHz 晶振连接到 32K_XP 和 32K_XN 管脚。频率稳定性更高，但在 Deep-sleep 模式下电流消耗较高（比默认模式高 1 μA）。
- 管脚 32K_XN 外置 32 kHz 振荡器：允许使用外部电路产生的 32 kHz 时钟。外部时钟信号必须连接到管脚 32K_XN。正弦波信号的振幅应小于 1.2 V，方波信号的振幅应小于 1 V。正常模式下，电压范围应为 0.1 < Vcm < 0.5 Vamp，其中 Vamp 代表信号振幅。使用此时钟源时，管脚 32K_XN 无法用作 GPIO 管脚。
- 内置 8.5 MHz 振荡器的 256 分频时钟 (~33 kHz)：频率稳定性优于内置 150 kHz RC 振荡器，同样无需外部元件，但 Deep-sleep 模式下电流消耗更高（比默认模式高 5 μA）。

时钟源的选择取决于系统时间精度要求和睡眠模式下的功耗要求。要修改 RTC 时钟源，请在项目配置中设置 `CONFIG_RTC_CLK_SRC`。

想要了解外置晶振或外置振荡器的更多布线要求，请参考 ESP32 硬件设计指南。

### 获取当前时间

要获取当前时间，请使用 POSIX 函数 `gettimeofday()`。此外，您也可以使用以下标准 C 库函数来获取时间并对它们进行操作：

```c
#include <time.h>

time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// 将时区设置为中国标准时间
setenv("TZ", "CST-8", 1);
tzset();
localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

若要求时间的分辨率为 1 μs，请使用以下代码片段:

```c
#include <time.h>

time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// 将时区设置为中国标准时间
setenv("TZ", "CST-8", 1);
tzset();
localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%s", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

若要求时间的分辨率为 1 μs，请使用以下代码片段:
```c
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

### SNTP 时间同步

要设置当前时间，可以使用 POSIX 函数 `settimeofday()` 和 `adjtime()`。 lwIP 中的 SNTP 库会在收到 NTP 服务器的响应报文后，调用这两个函数以更新当前的系统时间。当然，用户可以在 lwIP SNTP 库之外独立地使用这两个函数。

在 lwIP SNTP 库内部调用的函数依赖于系统时间的同步模式。可使用函数 `sntp_set_sync_mode()` 来设置下列同步模式之一。

- **SNTP_SYNC_MODE_IMMED** (默认)：使用函数 `settimeofday()` 后，收到 SNTP 服务器响应时立即更新系统时间。
- **SNTP_SYNC_MODE_SMOOTH**：使用函数 `adjtime()` 后，通过逐渐减小时间误差，平滑地更新时间。如果 SNTP 响应报文中的时间与当前系统时间相差大于 35 分钟，则会通过 `settimeofday()` 立即更新系统时间。

lwIP SNTP 库提供了 API 函数，用于设置某个事件的回调函数。您可能需要使用以下函数：

- `sntp_set_time_sync_notification_cb()`：用于设置回调函数，通知时间同步的过程。
- `sntp_get_sync_status()`：用于获取或设置时间同步状态。

通过 SNTP 开始时间同步，只需调用以下三个函数：

```c
sntp_setoperatingmode(SNTP_OPMODE_POLL);
sntp_setservername(0, "pool.ntp.org");
sntp_init();
```

添加此初始化代码后，应用程序将定期同步时间。时间同步周期由`CONFIG_LWIP_SNTP_UPDATE_DELAY`设置（默认为一小时）。如需修改，请在项目配置中设置`CONFIG_LWIP_SNTP_UPDATE_DELAY`。

如需查看示例代码，请前往 `protocols/sntp` 目录。该目录下的示例展示了如何基于 lwIP SNTP 库实现时间同步。

### 时区

要设置本地时区，请使用以下 POSIX 函数：

1. 调用 `setenv()`，将 `TZ` 环境变量根据设备位置设置为正确的值。时间字符串的格式与 GNU libc 文档中描述的相同（但实现方式不同）。
2. 调用 `tzset()`，为新的时区更新 C 库的运行数据。

完成上述步骤后，请调用标准 C 库函数 `localtime()`。该函数将返回排除时区偏差和夏令时干扰后的准确本地时间。

### 64 位 time_t

ESP-IDF 默认使用 32 位的 `time_t` 类型。为解决 Y2K38 漏洞，您在构建应用程序时可能需要使用 64 位的 `time_t` 类型。

目前，完成这一操作需要从头开始构建交叉编译器工具链，具体步骤请参阅 Linux 和 macOS 平台工具链的标准设置。要在工具链中启用对 64 位 `time_t` 的支持，您需要在构建工具链之前从 `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` 文件中删除 `--enable-newlib-long-time_t` 选项。

如需使程序同时兼容 32 位和 64 位的 `time_t`，可以使用以下方法：

- 在 C 或 C++ 源文件中，如果 `time_t` 是 32 位的，编译器会预定义 `_USE_LONG_TIME_T` 宏，该宏定义在 `<sys/types.h>` 中。
In CMake files, ESP-IDF configuration attribute `TIME_T_SIZE` will be set to the size of `time_t`. You can use `idf_build_get_property(var TIME_T_SIZE)` to get the value of this attribute and set it in the CMake variable `var`. For more details about `idf_build_get_property` information, see `ESP-IDF CMake API`.

Noting, the size of the `time_t` type will also affect the size of other types, such as `struct timeval`, `struct stat` and `struct utimbuf`.

### API 参考

#### Header File

- `components/lwip/include/apps/esp_sntp.h`

### Functions

- `void sntp_sync_time(struct timeval *tv)`
  - This function updates the system time.
  
  This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to immediate or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

  参数 `tv` - Time received from SNTP server.

- `void sntp_set_sync_mode(sntp_sync_mode_t sync_mode)`
  - Set the sync mode.
  
  Modes allowed: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

  参数 `sync_mode` - Sync mode.

- `sntp_sync_mode_t sntp_get_sync_mode(void)`
  - Get set sync mode.

  返回 `SNTP_SYNC_MODE_IMMED`: Update time immediately.
  `SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

- `sntp_sync_status_t sntp_get_sync_status(void)`
  - Get status of time sync.

  After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

  返回 `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

- `void sntp_set_sync_status(sntp_sync_status_t sync_status)`
  - Set status of time sync.

  参数 `sync_status` - status of time sync (see `sntp_sync_status_t`)

- `void sntp_set_time_sync_notification_cb(sntp_sync_time_cb_t callback)`
  - Set a callback function for time synchronization notification.

  参数 `callback` - a callback function
void \texttt{sntp\_set\_sync\_interval} (uint32\_t interval\_ms)
Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the \texttt{sntp\_restart()} function, otherwise, it will be applied after the last interval expired.

\textbf{参数} \texttt{interval\_ms} – The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32\_t \texttt{sntp\_get\_sync\_interval} (void)
Get the sync interval of SNTP operation.

\textbf{return} the sync interval

bool \texttt{sntp\_restart} (void)
Restart SNTP.

\textbf{return} True - Restart False - SNTP was not initialized yet

\textbf{Type Definitions}

\textbf{typedef} void (*\texttt{sntp\_sync\_time\_cb\_t})(struct timeval *tv)
SNTP callback function for notifying about time sync event.

\textbf{Param} \texttt{tv} Time received from SNTP server.

\textbf{Enumerations}

\textbf{enum} \texttt{sntp\_sync\_mode\_t}
SNTP time update mode.

\textbf{Values}:

\textbf{enumerator} \texttt{SNTP\_SYNC\_MODE\_IMMED}
Update system time immediately when receiving a response from the SNTP server.

\textbf{enumerator} \texttt{SNTP\_SYNC\_MODE\_SMOOTH}
Smooth time updating. Time error is gradually reduced using \texttt{adjtime} function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

\textbf{enum} \texttt{sntp\_sync\_status\_t}
SNTP sync status.

\textbf{Values}:

\textbf{enumerator} \texttt{SNTP\_SYNC\_STATUS\_RESET}

\textbf{enumerator} \texttt{SNTP\_SYNC\_STATUS\_COMPLETED}

\textbf{enumerator} \texttt{SNTP\_SYNC\_STATUS\_IN\_PROGRESS}

2.10.28 The himem allocation API
Overview

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.

In order to use the himem API, you have to enable it in the menuconfig using $CONFIG_SPIRAM_BANKSWITCH_ENABLE$, as well as set the amount of banks reserved for this in $CONFIG_SPIRAM_BANKSWITCH_RESERVE$. This decreases the amount of external memory allocated by functions like malloc(), but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.

Example

An example doing a simple memory test of the high memory range is available in esp-idf: system/himem

API Reference

Header File

- components/esp_psram/include/esp32/himem.h

Functions

```c
esp_err_t esp_himem_alloc(size_t size, esp_himem_handle_t *handle_out)
```

Allocate a block in high memory.

参数

- **size**: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- **handle_out**: [out] Handle to be returned

返回

- ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

```c
esp_err_t esp_himem_alloc_map_range(size_t size, esp_himem_rangehandle_t *handle_out)
```

Allocate a memory region to map blocks into.

参数

- **size**: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- **handle_out**: [out] Handle to be returned

返回

- ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory or address space
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

```c
esp_err_t esp_himem_map(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)
```

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.
Chapter 2. API 参考

备注：The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

参数

- **handle** - Handle to the block of memory, as given by `esp_himem_alloc`
- **range** - Range handle to map the memory in
- **ram_offset** - Offset into the block of physical memory of the block to map
- **range_offset** - Offset into the address range where the block will be mapped
- **len** - Length of region to map
- **flags** - One of `ESP_HIMEM_MAPFLAG_*`
- **out_ptr** - [out] Pointer to variable to store resulting memory pointer in

返回 - ESP_OK if the memory could be mapped

- ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
- ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
- ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

```c
esp_err_t esp_himem_free(esp_himem_handle_t handle)
```

Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.

参数 **handle** - Handle to the block of memory, as given by `esp_himem_alloc`

返回 - ESP_OK if the memory is succesfully freed

- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

```c
esp_err_t esp_himem_free_map_range(esp_himem_rangehandle_t handle)
```

Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

参数 **handle** - Handle to the range block, as given by `esp_himem_alloc_map_range`

返回 - ESP_OK if the memory is succesfully freed

- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

```c
esp_err_t esp_himem_unmap(esp_himem_rangehandle_t range, void *ptr, size_t len)
```

Unmap a region.

参数

- **range** - Range handle
- **ptr** - Pointer returned by `esp_himem_map`
- **len** - Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

返回 - ESP_OK if the memory is succesfully unmapped,

- ESP_ERR_INVALID_ARG if ptr or len are invalid.

```c
size_t esp_himem_get_phys_size(void)
```

Get total amount of memory under control of himem API.

返回 Amount of memory, in bytes

```c
size_t esp_himem_get_free_size(void)
```

Get free amount of memory under control of himem API.

返回 Amount of free memory, in bytes
size_t esp_himem_reserved_area_size (void)
Get amount of SPI memory address space needed for bankswitching.

备注：This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is
used, no memory is reserved.

返回 Amount of reserved area, in bytes

 Macros

ESP_HIMEM_BLKSZ

ESP_HIMEM_MAPFLAG_RO
Indicates that a mapping will only be read from. Note that this is unused for now.

 Type Definitions

typedef struct esp_himem_ramdata_t *esp_himem_handle_t
typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t

2.10.29 ULP 协处理器编程

ULP（Ultra Low Power，超低功耗）协处理器是一种简单的有限状态机（FSM），可以在主处理器处于
深度睡眠模式时，使用 ADC、温度传感器和外部 I2C 传感器执行测量操作。ULP 协处理器可以访问
RTC_SLOW_MEM 内存区域及 RTC_CNTL、RTC_IO、SARADC 外设中的寄存器。ULP 协处理器使用 32
位固定宽度的指令，32 位内存寻址，配备 4 个 16 位通用寄存器。在 ESP-IDF 项目中，此协处理器称作
ULP FSM。

安装工具链

ULP FSM 协处理器代码由汇编语言编写，使用 binutils-esp32ulp 工具链 进行编译。
如果您已经按照 快速入门指南 中的介绍安装好了 ESP-IDF 及其 CMake 构建系统，那么 ULP 工具链已经
被默认安装到了您的开发环境中。

编写 ULP FSM

使用受支持的指令集即可编写 ULP FSM 协处理器，此外也可使用主处理器上的 C 语言宏进行编程。以下小节分别介绍了这两种方法：

ESP32 ULP coprocessor instruction set  This document provides details about the instructions used by ESP32
ULP FSM coprocessor assembler.

ULP FSM coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter
register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.
ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word
units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.
All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.

The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing**    ESP32 ULP FSM coprocessor’s JUMP, ST, LD family of instructions expect the address argument to be expressed in the following way depending on the type of address argument used:

- When the address argument is presented as a label then the instruction expects the address to be expressed as 32-bit words.

  Consider the following example program:

  ```
  entry:
  NOP
  NOP
  NOP
  NOP
  loop:
  MOVE R1, loop
  JUMP R1
  ```

  When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However, `JUMP` instruction expects the address stored in register `R1` to be expressed in 32-bit words. To account for this common use case, the assembler will convert the address of label `loop` from bytes to words, when generating the `MOVE` instruction. Hence, the code generated code will be equivalent to:

  ```
  0000  NOP
  0004  NOP
  0008  NOP
  000c  NOP
  0010  MOVE R1, 4
  0014  JUMP R1
  ```

- The other case is when the argument of MOVE instruction is not a label but a constant. In this case assembler will **use the value as is**, without any conversion:

  ```
  .set    val, 0x10
  MOVE    R1, val
  ```

  In this case, value loaded into `R1` will be `0x10`.

  However, when an immediate value is used as an offset in LD and ST instructions, the assembler considers the address argument in bytes and converts it to 32-bit words before executing the instruction:

  ```
  ST R1, R2, 4 // offset = 4 bytes; Mem[R2 + 4 / 4] = R1
  ```

  In this case, the value in `R1` is stored at the memory location pointed by `[R2 + offset / 4]`.

  Consider the following code:

  ```
  .global array
  array: .long 0
  .long 0
  .long 0
  .long 0
  .long 0
  MOVE R1, array
  MOVE R2, 0x1234
  ST R2, R1, 0 // write value of R2 into the first array element, i.e. array[0]
  ST R2, R1, 4 // write value of R2 into the second array element (4 byte offset), i.e. array[1]
  ```
### ADD

**Syntax**  
ADD \( R_{dst}, R_{src1}, R_{src2} \)

**Operands**  
- \( R_{dst} \) - Register \([0..3]\)
- \( R_{src1} \) - Register \([0..3]\)
- \( R_{src2} \) - Register \([0..3]\)
- \( \text{Imm} \) - 16-bit signed value

**Cycles**  
2 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction adds source register to another source register or to a 16-bit signed value and stores the result in the destination register.

**Examples**

1. `ADD R1, R2, R3`  // \( R1 = R2 + R3 \)
2. `ADD R1, R2, 0x1234`  // \( R1 = R2 + 0x1234 \)

---

**Note about instruction execution time**  
ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1 << RTC_CLK_CAL_FRACT) * 256 / rtc_8md256_period;
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:
- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

The detailed description of all instructions is presented below:

**NOP - no operation**

**Syntax** NOP

**Operands** None

**Cycles** 2 cycle to execute, 4 cycle to fetch next instruction

**Description** No operation is performed. Only the PC is incremented.

**Example**

1: NOP
SUB - Subtract from register

Syntax  SUB Rdst, Rsrc1, Rsrc2
       SUB Rdst, Rsrc1, imm

Operands
- Rdst - Register R[0..3]
- Rsrc1 - Register R[0..3]
- Rsrc2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction subtracts the source register from another source register or subtracts a 16-bit signed value from a source register, and stores the result to the destination register.

Examples:
1: SUB R1, R2, R3  // R1 = R2 - R3
2: sub R1, R2, 0x1234 // R1 = R2 - 0x1234
3: .set value1, 0x03  // constant value1=0x03
   SUB R1, R2, value1  // R1 = R2 - value1
4: .global label  // declaration of variable label
   add R1, R2, label  // R1 = R2 + label
   ...
   label: nop  // definition of variable label

AND - Bitwise logical AND of two operands

Syntax  AND Rdst, Rsrc1, Rsrc2
       AND Rdst, Rsrc1, imm

Operands
- Rdst - Register R[0..3]
- Rsrc1 - Register R[0..3]
- Rsrc2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does a bitwise logical AND of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:
1: AND R1, R2, R3  // R1 = R2 & R3
2: AND R1, R2, 0x1234 // R1 = R2 & 0x1234
3: .set value1, 0x03  // constant value1=0x03
   AND R1, R2, value1  // R1 = R2 & value1
4: .global label  // declaration of variable label
Chapter 2. API

AND R1, R2, label   // R1 = R2 & label
...                  
label: nop           // definition of variable label

OR - Bitwise logical OR of two operands

Syntax  OR Rdst, Rsrc1, Rsrc2
       OR Rdst, Rsrc1, imm

Operands
  • Rdst - Register R[0..3]
  • Rsrc1 - Register R[0..3]
  • Rsrc2 - Register R[0..3]
  • Imm - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does a bitwise logical OR of a source register and another source register or a 16-bit signed value and stores the result to the destination register.

Examples:
1:   OR R1, R2, R3   // R1 = R2 || R3
2:   OR R1, R2, 0x1234 // R1 = R2 || 0x1234
3:   .set value1, 0x03 // constant value1=0x03
    OR R1, R2, value1   // R1 = R2 || value1
4:   .global label    // declaration of variable label
    OR R1, R2, label    // R1 = R2 || label
    ...                
    label: nop         // definition of variable label

LSH - Logical Shift Left

Syntax  LSH Rdst, Rsrc1, Rsrc2
       LSH Rdst, Rsrc1, imm

Operands
  • Rdst - Register R[0..3]
  • Rsrc1 - Register R[0..3]
  • Rsrc2 - Register R[0..3]
  • Imm - 16-bit signed value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction does a logical shift to left of the source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

备注: Shift operations which are greater than 15 bits will have an undefined result.

Examples:
1:   LSH R1, R2, R3   // R1 = R2 << R3
2:   LSH R1, R2, 0x03 // R1 = R2 << 0x03
3:   .set value1, 0x03 // constant value1=0x03
    LSH R1, R2, value1   // R1 = R2 << value1
4:   .global label    // declaration of variable label
**Chapter 2. API 参考**

---

**LSH**

**R1, R2, label**  // R1 = R2 << label

---

**RSH - Logical Shift Right**

**Syntax**

RSH  

**Rdst, Rsrc1, Rsrc2**

RSH  

**Rdst, Rsrc1, imm**

**Operands**

- **Rdst** - Register R[0..3]
- **Rsrc1** - Register R[0..3]
- **Rsrc2** - Register R[0..3]
- **Imm** - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction does a logical shift to right of a source register by the number of bits from another source register or a 16-bit signed value and stores the result to the destination register.

**Examples:**

1: RSH R1, R2, R3  // R1 = R2 >> R3

2: RSH R1, R2, 0x03  // R1 = R2 >> 0x03

3: .set value1, 0x03  // constant value1=0x03
   RSH R1, R2, value1  // R1 = R2 >> value1

4: .global label  // declaration of variable label
   RSH R1, R2, label  // R1 = R2 >> label
   label: nop  // definition of variable label

---

**MOVE - Move to register**

**Syntax**

MOVE  

**Rdst, Rsrc**

MOVE  

**Rdst, imm**

**Operands**

- **Rdst** – Register R[0..3]
- **Rsrc** – Register R[0..3]
- **Imm** – 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**

The instruction moves the value from the source register or a 16-bit signed value to the destination register.

**Examples:**

1: MOVE R1, R2  // R1 = R2

2: MOVE R1, 0x03  // R1 = 0x03

3: .set value1, 0x03  // constant value1=0x03
   MOVE R1, value1  // R1 = value1

4: .global label  // declaration of label
   MOVE R1, label  // R1 = address_of(label) / 4

Chapter 2. API

### ST – Store data to the memory

**Syntax** ST `Rsrc, Rdst, offset`

**Operands**
- `Rsrc` – Register R[0..3], holds the 16-bit value to store
- `Rdst` – Register R[0..3], address of the destination, in 32-bit words
- `Offset` – 13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction stores the 16-bit value of `Rsrc` to the lower half-word of memory with address `Rdst+offset`. The upper half-word is written with the current program counter (PC) (expressed in words, shifted left by 5 bits) OR’d with `Rdst` (0..3):

```
Mem[Rdst + offset / 4][31:0] = (PC[10:0], 3'b0, Rdst, Rsrc[15:0])
```

The application can use the higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

### Notes about addressing

Note: The offset specified in bytes is converted to a 32-bit word offset before execution. See the section about addressing for more details.

### Examples:

1:  
```
ST R1, R2, 0x12 // MEM[R2 + 0x12 / 4] = R1
```

2:  
```
.data  
Addr1: .word 123  // Define label Addr1 16 bit
.set offs, 0x00  // Define constant offs
.text  
MOVE R1, 1  // R1 = 1
MOVE R2, Addr1  // R2 = Addr1
ST R1, R2, offs // MEM[R2 + 0 / 4] = R1  
// MEM[Addr1 + 0] will be 32'h600001
```

### LD – Load data from the memory

**Syntax** LD `Rdst, Rsrc, offset`

**Operands**
- `Rdst` – Register R[0..3], destination
- `Rsrc` – Register R[0..3], holds address of destination, in 32-bit words
- `Offset` – 13-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads the lower 16-bit half-word from memory with address `[Rsrc + offset / 4]` into the destination register `Rdst`:

```
Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]
```

### Notes about addressing

Note: The offset specified in bytes is converted to a 32-bit word offset before execution. See the section about addressing for more details.

### Examples:
Chapter 2. API 参考

1:  LD  R1, R2, 0x12  // R1 = MEM[R2 + 0x12 / 4]

2:
.data
 Addr1: .word 123  // Data section definition
 .set offs, 0x00  // Define constant offs
 .text
  MOVE R1, 1  // R1 = 1
  MOVE R2, Addr1  // R2 = Addr1 / 4 (address of label is
                 // converted into words)
  LD  R1, R2, offs  // R1 = MEM[R2 + 0]
                 // R1 will be 123

JUMP – Jump to an absolute address

Syntax  JUMP Rdst
       JUMP ImmAddr
       JUMP Rdst, Condition
       JUMP ImmAddr, Condition

Operands
  • Rdst – Register R[0..3] containing address to jump to (expressed in 32-bit words)
  • ImmAddr – 13 bits address (expressed in bytes), aligned to 4 bytes
  • Condition:
    – EQ – jump if last ALU operation result was zero
    – OV – jump if last ALU has set overflow flag

Cycles  2 cycles to execute, 2 cycles to fetch next instruction

Description The instruction makes jump to the specified address. Jump can be either unconditional or based on an
ALU flag.

Examples:

1:  JUMP  R1  // Jump to address in R1 (address in R1 is in
         ←32-bit words)

2:  JUMP  0x120, EQ // Jump to address 0x120 (in bytes) if ALU
         ←result is zero

3:  JUMP  label  // Jump to label
     ...
     label: nop  // Definition of label

4:  .global  label  // Declaration of global label
  MOVE  R1, label  // R1 = label (value loaded into R1 is in words)
  JUMP  R1  // Jump to label
     ...
     label: nop  // Definition of label

JUMPR – Jump to a relative offset (condition based on R0)

Syntax  JUMPR Step, Threshold, Condition

Operands
  • Step – relative shift from current position, in bytes
  • Threshold – threshold value for branch condition
  • Condition:
    – EQ (equal) – jump if value in R0 == threshold
    – LT (less than) – jump if value in R0 < threshold
    – LE (less or equal) – jump if value in R0 <= threshold
    – GT (greater than) – jump if value in R0 > threshold
    – GE (greater or equal) – jump if value in R0 >= threshold
Cycles  Conditions $EQ$, $GT$ and $LT$: 2 cycles to execute, 2 cycles to fetch next instruction Conditions $LE$ and $GE$ are implemented in the assembler using two JUMPR instructions:

```c
// JUMPR target, threshold, LE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, LT

// JUMPR target, threshold, GE is implemented as:
JUMPR target, threshold, EQ
JUMPR target, threshold, GT
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

**Examples:**

```c
1: pos: JUMPR 16, 20, GE  // Jump to address (position + 16 bytes) if value in R0 >= 20

2:       // Down counting loop using R0 register
         MOVE R0, 16    // load 16 into R0
         label: SUB R0, R0, 1   // R0--
         NOP     // do something
         JUMPR label, 1, GE // jump to label if R0 >= 1
```

**JUMPS**—Jump to a relative address (condition based on stage count)

**Syntax** JUMPS Step, Threshold, Condition

**Operands**

- **Step**—relative shift from current position, in bytes
- **Threshold**—threshold value for branch condition
- **Condition:**
  - $EQ$ (equal)—jump if value in stage_cnt == threshold
  - $LT$ (less than)—jump if value in stage_cnt < threshold
  - $LE$ (less or equal)—jump if value in stage_cnt <= threshold
  - $GT$ (greater than)—jump if value in stage_cnt > threshold
  - $GE$ (greater or equal)—jump if value in stage_cnt >= threshold

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction:

```c
// JUMPS target, threshold, EQ is implemented as:
JUMPS next, threshold, LT
JUMPS target, threshold, LE

// JUMPS target, threshold, GT is implemented as:
JUMPS next, threshold, LE
JUMPS target, threshold, GE
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples:**
1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt_ -= 20

2: // Up counting loop using stage count register
STAGE_RST // set stage_cnt to 0
label: STAGE_INC 1 // stage_cnt++
NOP // do something
JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_RST** – Reset stage count register

**Syntax** STAGE_RST

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples:**

1: STAGE_RST // Reset stage count register

**STAGE_INC** – Increment stage count register

**Syntax** STAGE_INC Value

**Operands**

- Value – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction increments the stage count register by the given value.

**Examples:**

1: STAGE_INC 10 // stage_cnt += 10

2: // Up counting loop example:
STAGE_RST // set stage_cnt to 0
label: STAGE_INC 1 // stage_cnt++
NOP // do something
JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_DEC** – Decrement stage count register

**Syntax** STAGE_DEC Value

**Operands**

- Value – 8 bits value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction decrements the stage count register by the given value.

**Examples:**

1: STAGE_DEC 10 // stage_cnt -= 10;

2: // Down counting loop example
STAGE_RST // set stage_cnt to 0
STAGE_INC 16 // increment stage_cnt to 16
label: STAGE_DEC 1 // stage_cnt--;
NOP // do something
JUMPS label, 0, GT // jump to label if stage_cnt > 0
Chapter 2. API 参考

HALT – End the program

Syntax

HALT

Operands

No operands

Cycles

2 cycles to execute

Description

The instruction halts the ULP coprocessor and restarts the ULP wake up timer, if it is enabled.

Examples:

1: HALT // Halt the coprocessor

WAKE – Wake up the chip

Syntax

WAKE

Operands

No operands

Cycles

2 cycles to execute, 4 cycles to fetch next instruction

Description

The instruction sends an interrupt from the ULP coprocessor to the RTC controller.

• If the SoC is in deep sleep mode, and ULP wake up is enabled, this causes the SoC to wake up.
• If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.

Examples:

1: is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    AND r0, r0, 1
    JUMP is_rdy_for_wakeup, eq // Retry until the bit is set
    WAKE // Trigger wake up
    REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP_
←SLP_TIMER_EN)
    HALT // Stop the ULP program
    // After these instructions, SoC will wake up,
    // and ULP will not run again until started by the main program.

1: check_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP and RTC_
←CNTL_MAIN_STATE_IN_IDLE bit
    READ_RTC_REG(RTC_CNTL_LOW_POWER_ST_REG, 27, 1)
    MOVE r1, r0 // Copy result in to r1
    READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
    OR r0, r0, r1
    JUMP check_wakeup, eq // Retry until either of the bit are set
    WAKE // Trigger wake up
    HALT // Stop the ULP program

SLEEP – set ULP wake up timer period

Syntax

SLEEP sleep_reg

Operands

• sleep_reg – 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.

Cycles

2 cycles to execute, 4 cycles to fetch next instruction
**Description** The instruction selects which of the `SENS_ULP_CP_SLEEP_CYCx_REG (x = 0..4)` register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from `SENS_ULP_CP_SLEEP_CYC0_REG` is used.

**Examples:**

1:    SLEEP 1 // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG
2:    .set sleep_reg, 4 // Set constant
       SLEEP sleep_reg // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG

**WAIT --wait some number of cycles**

**Syntax** WAIT Cycles

**Operands**

```
• Cycles --number of cycles for wait
```

**Cycles** 2 + Cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction delays for given number of cycles.

**Examples:**

1:    WAIT 10 // Do nothing for 10 cycles
2:    .set wait_cnt, 10 // Set a constant
       WAIT wait_cnt // wait for 10 cycles

**ADC --do measurement with ADC**

**Syntax**

```
• ADC Rdst, Sar_sel, Mux
• ADC Rdst, Sar_sel, Mux, 0 --deprecated form
```

**Operands**

```
• Rdst --Destination Register R[0..3], result will be stored to this register
• Sar_sel --Select ADC: 0 = SARADC1, 1 = SARADC2
• Mux - Enable ADC channel. Channel number is [Mux-1]. If the user passes Mux value 1, then ADC channel 0 gets used.
```

**Cycles** 23 + max(1, SAR_AMP_WAIT1) + max(1, SAR_AMP_WAIT2) + max(1, SAR_AMP_WAIT3) + SARx_SAMPLE_CYCLE + SARx_SAMPLE_BIT cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction makes measurements from ADC.

**Examples:**

```
.. only:: esp32

1: ADC R1, 0, 1 // Measure value using ADC1 channel 0 and store result into R1
```

**I2C_RD - read single byte from I2C slave**

**Syntax**

```
• I2C_RD Sub_addr, High, Low, Slave_sel
```

**Operands**

```
• Sub_addr --Address within the I2C slave to read.
• High, Low --Define range of bits to read. Bits outside of [High, Low] range are masked.
• Slave_sel - Index of I2C slave address to use.
```

**Cycles** Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

**Description** I2C_RD instruction reads one byte from I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into `SENS_I2C_SLAVE_ADDRx` register field, where x == Slave_sel. 8 bits of read result is stored into R0 register.
Examples:

I2C_RD - read byte from sub-address

```
1: I2C_RD 0x10, 7, 0, 0 // Read byte from sub-address 0x10 of...
```

```
←slave with address set in SENS_I2C_SLAVE_ADDR0
```

I2C_WR - write single byte to I2C slave

Syntax

```
I2C_WR Sub_addr, Value, High, Low, Slave_sel
```

Operands

```
• Sub_addr – Address within the I2C slave to write.
• Value – 8-bit value to be written.
• High, Low – Define range of bits to write. Bits outside of [High, Low] range are masked.
• Slave_sel - Index of I2C slave address to use.
```

Cycles Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description I2C_WR instruction writes one byte to I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == Slave_sel.

Examples:

```
1: I2C_WR 0x20, 0x33, 7, 0, 1 // Write byte 0x33 to sub-address...
←0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.
```

REG_RD – read from peripheral register

Syntax

```
REG_RD Addr, High, Low
```

Operands

```
• Addr – Register address, in 32-bit words
• High – Register end bit number
• Low – Register start bit number
```

Cycles 4 cycles to execute, 4 cycles to fetch next instruction.

Description The instruction reads up to 16 bits from a peripheral register into a general purpose register: \[ R0 = \text{REG}[\text{Addr}][\text{High:Low}] \].

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```
addr_ulp = (addr_dport - DR_REG_RTC_CNTL_BASE) / 4
```

Examples:

```
1: REG_RD 0x120, 7, 4 // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}
```

REG_WR – write to peripheral register

Syntax

```
REG_WR Addr, High, Low, Data
```

Operands

```
• Addr – Register address, in 32-bit words.
• High – Register end bit number
• Low – Register start bit number
• Data – Value to write, 8 bits
```

Cycles 8 cycles to execute, 4 cycles to fetch next instruction.

Description The instruction writes up to 8 bits from an immediate data value into a peripheral register: \[ \text{REG}[\text{Addr}][\text{High:Low}] = \text{data} \].

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4

Examples:

1: REG_WR 0x120, 7, 0, 0x10 // set 8 bits: REG[0x120][7:0] = 0x10

Convenience macros for peripheral registers access

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h`, `soc/rtc_io_reg.h`, `soc/sens_reg.h`, and `soc/rtc_i2c_reg.h`.

**READ_RTC_REG**(rtc_reg, low_bit, bit_width) Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

**READ_RTC_FIELD**(rtc_reg, field) Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

**WRITE_RTC_REG**(rtc_reg, low_bit, bit_width, value) Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

**WRITE_RTC_FIELD**(rtc_reg, field, value) Write immediate value into a field in rtc_reg, up to 8 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

Programming ULP FSM coprocessor using C macros (legacy)

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP FSM coprocessor by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
    I_MOVI(R3, 16),  // R3 <- 16
    I_LD(R0, R3, 0),  // R0 <- RTC_SLOW_MEM[R3 + 0]
    I_LD(R1, R3, 1),  // R1 <- RTC_SLOW_MEM[R3 + 1]
    I_ADDR(R2, R0, R1),  // R2 <- R0 + R1
    I_ST(R2, R3, 2),  // R2 -> RTC_SLOW_MEM[R2 + 2]
    I_HALT()  // (下頁續接)
};
```

Espressif Systems 2079 Release v5.1-dev-2066-g7869f4e151
The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 —R3) and literal constants. See the API reference section at the end of this guide for descriptions of instructions and arguments they take.

备注: Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.

备注: Load, store and move instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM. This is different to how address arguments are handled in assembly code of the same instructions. See the section Note about addressing for more details for reference.

To generate branch instructions, special M_ preprocessor defines are used. M_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. M_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these M_ preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34),        // R0 <- 34
    M_LABEL(1),            // label_1
    I_MOVI(R1, 32),        // R1 <- 32
    I_LD(R1, R1, 0),       // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33),        // R2 <- 33
    I_LD(R2, R2, 0),       // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2),    // R3 <- R1 - R2
    I_ST(R3, R0, 0),       // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1),     // R0++
    M_BL(1, 64),           // if (R0 < 64) goto label_1
    I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

API Reference

Header File

- components/ulp/ulp_fsm/include/esp32/ulp.h
Functions
static inline uint32_t SOC_REG_TO_ULP_PERIPH_SEL (uint32_t reg)
Map SoC peripheral register to periph_sel field of RD_REG and WR_REG instructions.
参数 reg – peripheral register in RTC_CNTL_, RTC_IO_, SENS_, RTC_I2C peripherals.
返回 periph_sel value for the peripheral to which this register belongs.

Unions
union ulp_insn
#include <ulp.h> Instruction format structure.
All ULP instructions are 32 bit long. This union contains field layouts used by all of the supported instructions.
This union also includes a special “macro” instruction layout. This is not a real instruction which can be executed
by the CPU. It acts as a token which is removed from the program by the ulp_process_macros_and_load
function.
These structures are not intended to be used directly. Preprocessor definitions provided below fill the fields of
these structure with the right arguments.

uint32_t opcode
Opcode (OPCODE_DELAY)
Opcode (OPCODE_ST)
Opcode (OPCODE_LD)
Opcode (OPCODE_HALT)
Opcode (OPCODE_BRANCH)
Opcode (OPCODE_ALU)
Opcode (OPCODE_WR_REG)
Opcode (OPCODE_RD_REG)
Opcode (OPCODE_ADC)
Opcode (OPCODE_TSENS)
Opcode (OPCODE_I2C)
Opcode (OPCODE_END)
Opcode (OPCODE_MACRO)

struct ulp_insn::[anonymous] delay
Format of DELAY instruction
uint32_t dreg
  Register which contains data to store
  Register where the data should be loaded to
  Register which contains target PC, expressed in words (used if .reg == 1)
  Destination register
  Register where to store ADC result
  Register where to store temperature measurement result
  Destination register (for SUB_OPCODE_MACRO_LABELPC) >

uint32_t sreg
  Register which contains address in RTC memory (expressed in words)
  Register with operand A

uint32_t unused1
  Unused

uint32_t offset
  Offset to add to sreg
  Absolute value of target PC offset w.r.t. current PC, expressed in words

uint32_t unused2
  Unused

uint32_t sub_opcode
  Sub opcode (SUB_OPCODE_ST)
  Sub opcode (SUB_OPCODE_BX)
  Sub opcode (SUB_OPCODE_B)
  Sub opcode (SUB_OPCODE_BS)
  Sub opcode (SUB_OPCODE_ALU_REG)
  Sub opcode (SUB_OPCODE_ALU_CNT)
  Sub opcode (SUB_OPCODE_ALU_IMM)
  Sub opcode (SUB_OPCODE_WAKEUP)
  Sub opcode (SUB_OPCODE_SLEEP)
  SUB_OPCODE_MACRO_LABEL or SUB_OPCODE_MACRO_LABELPC
  SUB_OPCODE_MACRO_LABELPC or

struct ulp_insn::[anonymous] st
  Format of ST instruction

struct ulp_insn::[anonymous] ld
  Format of LD instruction

struct ulp_insn::[anonymous] halt
  Format of HALT instruction
uint32_t addr
Target PC, expressed in words (used if .reg == 0)
Address within either RTC_CNTL, RTC_IO, or SARADC

uint32_t reg
Target PC in register (1) or immediate (0)

uint32_t type
Jump condition (BX_JUMP_TYPE_xxx)

struct ulp_insn::{anonymous} bx
Format of BRANCH instruction (absolute address)

uint32_t imm
Immediate value to compare against
Immediate value of operand
Immediate value of operand B

uint32_t cmp
Comparison to perform: B_CMP_L or B_CMP_GE
Comparison to perform: JUMPS_LT, JUMPS_GE or JUMPS_LE

uint32_t sign
Sign of target PC offset: 0: positive, 1: negative

struct ulp_insn::{anonymous} b
Format of BRANCH instruction (relative address, conditional on R0)

struct ulp_insn::{anonymous} bs
Format of BRANCH instruction (relative address, conditional on the stage counter)

uint32_t treg
Register with operand B

uint32_t sel
Operation to perform, one of ALU_SEL_xxx
Operation to perform, one of ALU_SEL_Sxxx

struct ulp_insn::{anonymous} alu_reg
Format of ALU instruction (both sources are registers)

struct ulp_insn::{anonymous} alu_reg_s
Format of ALU instruction (stage counter and an immediate)

struct ulp_insn::{anonymous} alu_imm
Format of ALU instruction (one source is an immediate)
**Chapter 2. API 参考**

```c
uint32_t periph_sel
    Select peripheral: RTC_CNTL (0), RTC_IO (1), SARADC (2)

uint32_t data
    8 bits of data to write
    8 bits of data for write operation

uint32_t low
    Low bit

uint32_t high
    High bit

struct ulp_insn::[anonymous] wr_reg
    Format of WR_REG instruction

struct ulp_insn::[anonymous] rd_reg
    Format of RD_REG instruction

uint32_t mux
    Select SARADC pad (mux + 1)

uint32_t sar_sel
    Select SARADC0 (0) or SARADC1 (1)

struct ulp_insn::[anonymous] adc
    Format of ADC instruction

uint32_t wait_delay
    Cycles to wait after measurement is done

uint32_t reserved
    Reserved, set to 0

struct ulp_insn::[anonymous] tsens
    Format of TSENS instruction

uint32_t i2c_addr
    I2C slave address

uint32_t low_bits
    low bit of range for write operation (lower bits are masked)

uint32_t high_bits
    high bit of range for write operation (higher bits are masked)

uint32_t i2c_sel
    index of slave address register [7:0]
```
uint32_t rw
    Write (1) or read (0)

struct ulp_insn::[anonymous] i2c
    Format of I2C instruction

uint32_t wakeup
    Set to 1 to wake up chip

struct ulp_insn::[anonymous] end
    Format of END instruction with wakeup

uint32_t cycle_sel
    Select which one of SARADC_ULP_CP_SLEEP_CYCx_REG to get the sleep duration from

struct ulp_insn::[anonymous] sleep
    Format of END instruction with sleep

uint32_t label
    Label number

struct ulp_insn::[anonymous] macro
    Format of tokens used by MACROs

uint32_t instruction
    Encoded instruction for ULP coprocessor

**Macros**

R0
    general purpose register 0

R1
    general purpose register 1

R2
    general purpose register 2

R3
    general purpose register 3

OPCODE_WR_REG
    Instruction: write peripheral register (RTC_CNTL/RTC_IO/SARADC)

OPCODE_RD_REG
    Instruction: read peripheral register (RTC_CNTL/RTC_IO/SARADC)

RD_REG_PERIPH_RTC_CNTL
    Identifier of RTC_CNTL peripheral for RD_REG and WR_REG instructions
Chapter 2. API

**RD_REG_PERIPH_RTC_IO**
Identifier of RTC_IO peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_SENS**
Identifier of SARADC peripheral for RD_REG and WR_REG instructions

**RD_REG_PERIPH_RTC_I2C**
Identifier of RTC_I2C peripheral for RD_REG and WR_REG instructions

**OPCODE_I2C**
Instruction: read/write I2C

**SUB_OPCODE_I2C_RD**
I2C read

**SUB_OPCODE_I2C_WR**
I2C write

**OPCODE_DELAY**
Instruction: delay (nop) for a given number of cycles

**OPCODE_ADC**
Instruction: SAR ADC measurement

**OPCODE_ST**
Instruction: store indirect to RTC memory

**SUB_OPCODE_ST**
Store 32 bits, 16 MSBs contain PC, 16 LSBs contain value from source register

**OPCODE_ALU**
Arithmetic instructions

**SUB_OPCODE_ALU_REG**
Arithmetic instruction, both source values are in register

**SUB_OPCODE_ALU_IMM**
Arithmetic instruction, one source value is an immediate

**SUB_OPCODE_ALU_CNT**
Arithmetic instruction, stage counter and an immediate

**ALU_SEL_ADD**
Addition

**ALU_SEL_SUB**
Subtraction
Chapter 2. API Reference

**ALU_SEL_AND**
Logical AND

**ALU_SEL_OR**
Logical OR

**ALU_SEL_MOV**
Copy value (immediate to destination register or source register to destination register)

**ALU_SEL_LSH**
Shift left by given number of bits

**ALU_SEL_RSH**
Shift right by given number of bits

**ALU_SEL_SINC**
Increment the stage counter

**ALU_SEL_SDEC**
Decrement the stage counter

**ALU_SEL_SRST**
Reset the stage counter

**OPCODE_BRANCH**
Branch instructions

**SUB_OPCODE_BX**
Branch to absolute PC (immediate or in register)

**SUB_OPCODE_BR**
Branch to relative PC, conditional on R0

**SUB_OPCODE_BS**
Branch to relative PC, conditional on the stage counter

**BX_JUMP_TYPE_DIRECT**
Unconditional jump

**BX_JUMP_TYPE_ZERO**
Branch if last ALU result is zero

**BX_JUMP_TYPE_OVF**
Branch if last ALU operation caused and overflow

**SUB_OPCODE_B**
Branch to a relative offset
B_CMP_L
Branch if R0 is less than an immediate

B_CMP_GE
Branch if R0 is greater than or equal to an immediate

JUMPS_LT
Branch if the stage counter <

JUMPS_GE
Branch if the stage counter >=

JUMPS_LE
Branch if the stage counter <=

OPCODE_END
Stop executing the program

SUB_OPCODE_END
Stop executing the program and optionally wake up the chip

SUB_OPCODE_SLEEP
Stop executing the program and run it again after selected interval

OPCODE_TSENS
Instruction: temperature sensor measurement. Poor accuracy, not recommended for most use-cases

OPCODE_HALT
Halt the coprocessor

OPCODE_LD
Indirect load lower 16 bits from RTC memory

OPCODE_MACRO
Not a real opcode. Used to identify labels and branches in the program

SUB_OPCODE_MACRO_LABEL
Label macro

SUB_OPCODE_MACRO_BRANCH
Branch macro

SUB_OPCODE_MACRO_LABELPC
Label pointer macro

I_DELAY (cycles_)
Delay (nop) for a given number of cycles
I_HALT()
Halt the coprocessor.
This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

I_WR_REG(reg, low_bit, high_bit, val)
Write literal value to a peripheral register
reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_RD_REG(reg, low_bit, high_bit)
Read from peripheral register into R0
R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_WR_REG_BIT(reg, shift, val)
Set or clear a bit in the peripheral register.
Sets bit (1 « shift) of register reg to value val. This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_WAKE()
Wake the SoC from deep sleep.
This instruction initiates wake up from deep sleep. Use esp_deep_sleep_enable_ulp_wakeup to enable deep sleep wakeup triggered by the ULP before going into deep sleep. Note that ULP program will still keep running until the I_HALT instruction, and it will still be restarted by timer at regular intervals, even when the SoC is woken up.
To stop the ULP program, use I_HALT instruction.
To disable the timer which start ULP program, use I_END() instruction. I_END instruction clears the RTC_CNTL_ULP_CP_SLP_TIMER_EN_S bit of RTC_CNTL_STATE0_REG register, which controls the ULP timer.

I_END()
Stop ULP program timer.
This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.
ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

I_SLEEP_CYCLE_SEL(timer_idx)
Select the time interval used to run ULP program.
This instructions selects which of the SENS_SLEEP_CYCLES_Sx registers’ value is used by the ULP program timer. When the ULP program stops at I_HALT instruction, ULP program timer start counting. When the counter reaches the value of the selected SENS_SLEEP_CYCLES_Sx register, ULP program start running again from the start address (passed to the ulp_run function). There are 5 SENS_SLEEP_CYCLES_Sx registers, so 0 <= timer_idx < 5.
By default, SENS_SLEEP_CYCLES_S0 register is used by the ULP program timer.

I_TSENS(reg_dest, delay)
Perform temperature sensor measurement and store it into reg_dest.
Delay can be set between 1 and ((1 « 14) - 1). Higher values give higher measurement resolution.
I_ADC (reg_dest, adc_idx, pad_idx)
Perform ADC measurement and store result in reg_dest.
adc_idx selects ADC (0 or 1). pad_idx selects ADC pad (0 - 7).

I_ST (reg_val, reg_addr, offset_)
Store value from register reg_val into RTC memory.
The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:
• bits [31:21] hold the PC of current instruction, expressed in 32-bit words
• bits [20:18] = 3’b0
• bits [17:16] reg_addr (0..3)
• bits [15:0] are assigned the contents of reg_val

RTC_SLOW_MEM[addr + offset_] = { insn_PC[10:0], 3’b0, reg_addr, reg_val[15:0] }

I_LD (reg_dest, reg_addr, offset_)
Load value from RTC memory into reg_dest register.
Loads 16 LSBS from RTC memory word given by the sum of value in reg_addr and value of offset_.

I_BL (pc_offset, imm_value)
Branch relative if R0 less than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BGE (pc_offset, imm_value)
Branch relative if R0 greater or equal than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BXR (reg_pc)
Unconditional branch to absolute PC, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXI (imm_pc)
Unconditional branch to absolute PC, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXZR (reg_pc)
Branch to absolute PC if ALU result is zero, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXZI (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)
Branch to absolute PC if ALU overflow, address in register
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXFI (imm_pc)
Branch to absolute PC if ALU overflow, immediate address
Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2
I_SUBR (reg_dest, reg_src1, reg_src2)
   Subtraction: dest = src1 - src2
I_ANDR (reg_dest, reg_src1, reg_src2)
   Logical AND: dest = src1 & src2
I_ORR (reg_dest, reg_src1, reg_src2)
   Logical OR: dest = src1 | src2
I_MOVR (reg_dest, reg_src)
   Copy: dest = src
I_LSHR (reg_dest, reg_src, reg_shift)
   Logical shift left: dest = src << shift
I_RSHR (reg_dest, reg_src, reg_shift)
   Logical shift right: dest = src >> shift
I_ADDI (reg_dest, reg_src, imm_)
   Add register and an immediate value: dest = src1 + imm
I_SUBI (reg_dest, reg_src, imm_)
   Subtract register and an immediate value: dest = src - imm
I_ANDI (reg_dest, reg_src, imm_)
   Logical AND register and an immediate value: dest = src & imm
I_ORI (reg_dest, reg_src, imm_)
   Logical OR register and an immediate value: dest = src | imm
I_MOVI (reg_dest, imm_)
   Copy an immediate value into register: dest = imm
I_LSHI (reg_dest, reg_src, imm_)
   Logical shift left register value by an immediate: dest = src << imm
I_RSHI (reg_dest, reg_src, imm_)
   Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
   Define a label with number label_num.
   This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.

M_BRANCH (label_num)
   Token macro used by M_B and M_BX macros. Not to be used directly.

M_LABELPC (label_num)
   Token macro used by M_MOVL macro. Not to be used directly.

M_MOVL (reg_dest, label_num)
   Macro: Move the program counter at the given label into the register. This address can then be used with I_BXR, I_BXZR, I_BXFR, etc.
   This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.
Chapter 2. API

M_BL (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BGE (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)
Macro: unconditional branch to label.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)
Macro: branch to label if ALU result is zero.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)
Macro: branch to label if ALU overflow.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

I_STAGE_INC (imm_)
Increment the stage counter by immediate value.

I_STAGE_DEC (imm_)
Decrement the stage counter by immediate value.

I_STAGE_RST ()
Reset the stage counter.

M_BSLT (label_num, imm_value)
Macro: branch to label if the stage counter is less than immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSGE (label_num, imm_value)
Macro: branch to label if the stage counter is greater than or equal to immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BSLE (label_num, imm_value)
Macro: branch to label if the stage counter is less than or equal to immediate value.

This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.
**M_BSEQ** (label_num, imm_value)

Macro: branch to label if the stage counter is equal to immediate value. Implemented using two JUMPS instructions: JUMPS next, imm_value, LT JUMPS label_num, imm_value, LE

This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulp_insn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**M_BSGT** (label_num, imm_value)

Macro: branch to label if the stage counter is greater than immediate value. Implemented using two instructions: JUMPS next, imm_value, LE JUMPS label_num, imm_value, GE

This macro generates three ulp_insn_t values separated by commas, and should be used when defining contents of ulp_insn_t arrays. Second value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

**I_JUMPS** (pc_offset, imm_value, comp_type)

Branch relative if (stage counter [comp_type] imm_value) evaluates to true.

pc_offset is expressed in words, and can be from -127 to 127 imm_value is an 8-bit value to compare the stage counter against comp_type is the type of comparison to perform: JUMPS_LT (<), JUMPS_GE (>=) or JUMPS_LE (<=)

**I_I2C_RW** (sub_addr, val, low_bit, high_bit, slave_sel, rw_bit)

Perform an I2C transaction with a slave device. I_I2C_READ and I_I2C_WRITE are provided for convenience, instead of using this directly.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel. For read operations, 8 bits of read result is stored into R0 register. For write operations, val will be written to sub_addr at [high_bit:low_bit]. Bits outside of this range are masked.

**I_I2C_READ** (slave_sel, sub_addr)

Read a byte from the sub address of an I2C slave, and store the result in R0.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

**I_I2C_WRITE** (slave_sel, sub_addr, val)

Write a byte to the sub address of an I2C slave.

Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where x == slave_sel.

---

**编译 ULP 代码**

若需要将 ULP FSM 代码编译为某组件的一部分，则必须执行以下步骤：

1. 用汇编语言编写的 ULP FSM 代码必须导入到一个或多个 .S 扩展文件中，且这些文件必须放在组件目录中一个独立的目录中，例如 ulp/。
2. 注册后从组件 CMakeLists.txt 中调用 ulp_embed_binary 示例如下:

```cpp
... idf_component_register()

set(ulp_app_name ulp_${COMPONENT_NAME})
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")

ulp_embed_binary(${ulp_app_name} "${ulp_s_sources}" "${ulp_exp_dep_srcs}")
```

ulp_embed_binary 的第一个参数为 ULP 二进制文件名。指定的此名称也用于生成的其他文件，如: ELF 文件, .map 文件, 头文件和链接器导出文件。第二个参数指定 ULP FSM 程序集源文件。最后，第
三个参数指定组件源文件列表，其中包括被生成的头文件。此列表用以建立正确的依赖项，并确保在编译这些文件之前先创建生成的头文件。有关 ULP FSM 应用程序生成的头文件等其他概念，请参考下文。

3. 使用常规方法（例如 idl.py app）编译应用程序。
   在内部，构建系统将按照以下步骤编译 ULP FSM 程序:
   1. 通过 C 预处理器运行每个程序集文件 (foo.S)。此步骤在组件编译目录中生成预处理的程序集文件 (foo.ulp.S)，同时生成依赖文件 (foo.ulp.d)。
   2. 通过汇编器运行预处理过的汇编源码。此步骤会生成目标文件 (foo.ulp.o) 和清单 (foo.ulp.lst)。清单文件仅用于调试，不用于编译过程的后续步骤。
   3. 通过 C 预处理器运行链接器脚本模板。模板位于 components/ulp/ld 目录中。
   4. 将目标文件链接到 ELF 输出文件 (ulp_app_name.elf)。此步骤生成的.map 文件 (ulp_app_name.map) 默认用于调试。
   5. 将 ELF 文件中的内容转储为二进制文件 (ulp_app_name.bin)，以便嵌入到应用程序中。
   6. 使用 esp32ulp-elf-nm 在 ELF 文件中生成全局符号列表 (ulp_app_name.sym)。
   7. 创建 LD 导出脚本和头文件 (ulp_app_name.ld 和 ulp_app_name.h)，包含来自 ulp_app_name.sym 的符号。此步骤可借助 esp32ulp_mapgen.py 工具来完成。
   8. 将生成的二进制文件添加到要嵌入应用程序的二进制文件列表中。

访问 ULP FSM 程序变量

在 ULP FSM 程序中定义的全局符号也可以在主程序中使用。
例如，ULP FSM 程序可以定义 measurement_count 变量，此变量可以定义程序从深度睡眠中唤醒芯片之前需要进行的 ADC 测量的次数。

```
.globa l measurement_count

// later, use measurement_count
move r3, measurement_count
ld r3, r3, 0
```

主程序需要在启动 ULP 程序之前初始化 measurement_count 变量，构建系统通过生成定义 ULP 编程中的全局符号的 $(ULP_APP_NAME).h 和 $(ULP_APP_NAME).ld 文件实现上述操作。这些文件包含了在 ULP 程序中定义的所有全局符号，文件以 ulp_ 开头。

头文件包含对此类符号的声明:

```
extern uint32_t ulp_measurement_count;
```

注意，所有符号（包括变量、数组、函数）均被声明为 uint32_t，对于函数和数组，先获取符号地址，然后转换为适当的类型。

生成的链接器脚本文件定义了 RTC_SLOW_MEM 中的符号位置:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

如果要从主程序访问 ULP 程序变量，应先使用 include 语句包含生成的头文件，这样，就可以像访问常规变量一样访问 ulp 程序变量。操作如下:

```
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

注意，ULP FSM 程序在 RTC 内存中只能使用 32 位字的低 16 位，因为寄存器是 16 位的，并且不具备从字的高位加载的指令。同样，ULP 储存指令将寄存器值写入 32 位字的低 16 位中。高 16 位写入的值取决于存储指令的地址，因此在读取 ULP 协处理器写的变量时，主应用程序需要屏蔽高 16 位，例如:
启动 ULP FSM 程序

要运行 ULP FSM 程序，主应用程序需要调用 `ulp_load_binary()` 函数将 ULP 程序加载到 RTC 内存中，然后调用 `ulp_run()` 函数，启动 ULP 程序。

注意，在 menuconfig 中必须启用 Enable Ultra Low Power (ULP) Co-processor 选项，以便正常运行 ULP，并且必须设置 ULP Co-processor type 选项，以便选择要使用的 ULP 类型。RTC slow memory reserved for coprocessor 选项设置的值必须足够存储 ULP 代码和数据。如果应用程序组件包含多个 ULP 程序，则 RTC 内存必须足以容纳最大的程序。

每个 ULP 程序均以 BLOB 的形式嵌入到 ESP-IDF 应用程序中。应用程序可以引用此 BLOB，并以下面的方式加载此 BLOB（假设 ULP_APP_NAME 已被定义为 ulp_app_name）：

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");
void start_ulp_program() {
  ESP_ERROR_CHECK( ulp_load_binary(
      0 /* load address, set to 0 when using default linker scripts
      bin_start,
      (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

一旦上述程序加载到 RTC 内存后，应用程序即可启动此程序，并将入口点的地址传递给 `ulp_run` 函数：

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM ) );
```

上述生成的头文件 `$<ULP_APP_NAME>.h` 声明了入口点符号。在 ULP 应用程序的汇编源代码中，此符号必须标记为 `.global`:

```asm
.global entry
entry: // code starts here
```

ESP32 ULP 程序流程

ESP32 ULP 协处理器由定时器启动，而调用 `ulp_run()` 则可启动此定时器。定时器为 RTC_SLOW_CLK 的 Tick 事件计数（默认情况下，Tick 由内部 150 KHz RC 振荡器生成）。使用 SENS_ULP_CP_SLEEP_CYC0_REG 寄存器 (x = 0.4) 设置 Tick 数值。第一次启动 ULP 时，使用 SENS_ULP_CP_SLEEP_CYC0_REG 设置定时器 Tick 数值，之后，ULP 程序可以使用 sleep 指令来选择另一个 SENS_ULP_CP_SLEEP_CYC0_REG 寄存器。

此应用程序可以调用 `ulp_set_wakeup_period` 函数来设置 ULP 定时器周期值 (SENS_ULP_CP_SLEEP_CYC0_REG, x = 0.4)。

一旦定时器计数到 SENS_ULP_CP_SLEEP_CYC0_REG 寄存器设定的 Tick 数值，ULP 协处理器就会启动，并调用 `ulp_run()` 的入口点开始运行程序。

程序保持运行，直到遇到 halt 指令或非法指令。一旦程序停止，ULP 协处理器电源关闭，定时器再次启动。

如果想禁用定时器（有效防止 ULP 程序再次运行），可在 ULP 代码或主程序中清除 RTC_CNTL_STATE0_REG 寄存器中的 RTC_CNTL_ULP_CP_SLP_TIMER_EN 位。

应用示例

- 主处理器处于深睡眠状态时，ULP FSM 协处理器对 IO 脉冲进行计数：`system/ulp_fsm/ulp`。

Espressif Systems 2095 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
API 参考

Header File

- components/ulp/ulp_fsm/include/ulp_fsm_common.h

Functions

`esp_err_t ulp_process_macros_and_load (uint32_t load_addr, const ulp_insn_t *program, size_t *psize)`

Resolve all macro references in a program and load it into RTC memory.

参数
- `load_addr` – address where the program should be loaded, expressed in 32-bit words
- `program` – ulp_insn_t array with the program
- `psize` – size of the program, expressed in 32-bit words

返回
- ESP_OK on success
- ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
- one of ESP_ERR_ULP_xxx if program is not valid or cannot be loaded

`esp_err_t ulp_load_binary (uint32_t load_addr, const uint8_t *program_binary, size_t program_size)`

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

a. MAGIC, (value 0x00706c75, 4 bytes)
b. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
c. TEXT_SIZE, size of .text section (2 bytes)
d. DATA_SIZE, size of .data section (2 bytes)
e. BSS_SIZE, size of .bss section (2 bytes)
f. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
g. .text section
h. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

参数
- `load_addr` – address where the program should be loaded, expressed in 32-bit words
- `program_binary` – pointer to program binary
- `program_size` – size of the program binary

返回
- ESP_OK on success
- ESP_ERR_INVALID_ARG if load_addr is out of range
- ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

`esp_err_t ulp_run (uint32_t entry_point)`

Run the program loaded into RTC memory.

参数 `entry_point` – entry point, expressed in 32-bit words

返回 ESP_OK on success

Macros

`ESP_ERR_ULP_BASE`

Offset for ULP-related error codes

- 主处理器处于 Deep-sleep 状态时，ULP FSM 协处理器轮询 ADC：system/ulp_fsm/ulp_adc。
Chapter 2. API

ESP_ERR_ULP_SIZE_TOO_BIG
Program doesn’t fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR
Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL
More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL
Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE
Branch target is out of range of B instruction (try replacing with BX)

Type Definitions
typedef union ulp_insn ulp_insn_t

Header File
- components/ulp/ulp_common/include/ulp_common.h

Functions
esp_err_t ulp_set_wakeup_period (size_t period_index, uint32_t period_us)
Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wake up timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4 for ESP32, and one period value which can be programmed into RTC_CNTL_ULP_CP_TIMER_1_REG register for ESP32-S2/S3. By default, for ESP32, wake up timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

For ESP32-S2/S3 the SLEEP instruction not exist. Instead a WAKE instruction will be used.

Remarks: The ULP FSM requires two clock cycles to wake up before being able to run the program. Then additional 16 cycles are reserved after wake up waiting until the SM clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

Parameters
- period_index – wake up period setting number (0 - 4)
- period_us – wake up period, us

Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range
void ulp_timer_stop (void)
    Stop the ULP timer.

    备注： This will stop the ULP from waking up if halted, but will not abort any program currently executing on the ULP.

void ulp_timer_resume (void)
    Resume the ULP timer.

    备注： This will resume an already configured timer, but does no other configuration

RTC_SLOW_MEM
    RTC slow memory, 8k size

2.10.30 Watchdogs

Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using Project Configuration Menu, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

ESP-IDF has support for the following types of watchdog timers:

- Interrupt Watchdog Timer (IWDT)
- Task Watchdog Timer (TWDT)

The various watchdog timers can be enabled using the Project Configuration Menu. However, the TWDT can also be enabled during runtime.

Interrupt Watchdog Timer (IWDT)

{IDF_IWDT_TIMER_GROUP:default=“ Timer Group 1” , esp32c2=“ Timer Group 0” }

The purpose of the IWDT is to ensure that interrupt service routines (ISRs) are not blocked from running for a prolonged period of time (i.e., the IWDT timeout period). Blocking ISRs from running in a timely manner is undesirable as it can increase ISR latency, and also prevents task switching (as task switching is executed form an ISR). The things that can block ISRs from running include:

- Disabling interrupts
- Critical Sections (also disables interrupts)
- Other same/higher priority ISRs (will block same/lower priority ISRs from running it completes execution)
The IWDT utilizes the watchdog timer in {IDF_IWDT_TIMER_GROUP} as its underlying hardware timer and leverages the FreeRTOS tick interrupt on each CPU to feed the watchdog timer. If the tick interrupt on a particular CPU is not run at within the IWDT timeout period, it is indicative that something is blocking ISRs from being run on that CPU (see the list of reasons above).

When the IWDT times out, the default action is to invoke the panic handler and display the panic reason as Interrupt wdt timeout on CPU0 or Interrupt wdt timeout on CPU1 (as applicable). Depending on the panic handler’s configured behavior (see CONFIG_ESP_SYSTEM_PANIC), users can then debug the source of the IWDT timeout (via the backtrace, OpenOCD, gdbstub etc) or simply reset the chip (which may be preferred in a production environment).

If for whatever reason the panic handler is unable to run after an IWDT timeout, the IWDT has a secondary timeout that will hard-reset the chip (i.e., a system reset).

**Configuration**

- The IWDT is enabled by default via the `CONFIG_ESP_INT_WDT` option.
- The IWDT’s timeout is configured by setting the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` option.
  - Note that the default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances.
  - The timeout should always at least twice longer than the period between FreeRTOS ticks (see `CONFIG_FREERTOS_HZ`).

**Tuning** If you find the IWDT timeout is triggered because an interrupt or critical section is running longer than the timeout period, consider rewriting the code:

- Critical sections should be made as short as possible. Any non-critical code/computation should be placed outside the critical section.
- Interrupt handlers should also perform the minimum possible amount of computation. Users can consider deferring any computation to a task by having the ISR push data to a task using queues.

Neither critical sections or interrupt handlers should ever block waiting for another event to occur. If changing the code to reduce the processing time is not possible or desirable, it’s possible to increase the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` setting instead.

**Task Watchdog Timer (TWDT)**

The Task Watchdog Timer (TWDT) is used to monitor particular tasks, ensuring that they are able to execute within a given timeout period. The TWDT primarily watches the Idle Tasks of each CPU, however any task can subscribe to be watched by the TWDT. By watching the Idle Tasks of each CPU, the TWDT can detect instances of tasks running for a prolonged period of time without yielding. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. When a timeout occurs, an interrupt is triggered. Users can define the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and extend the default behavior.

**Usage** The following functions can be used to watch tasks using the TWDT:

- `esp_task_wdt_init()` to initialize the TWDT and subscribe the idle tasks.
- `esp_task_wdt_add()` subscribes other tasks to the TWDT.
- Once subscribed, `esp_task_wdt_reset()` should be called from the task to feed the TWDT.
- `esp_task_wdt_delete()` unsubsribes a previously subscribed task
- `esp_task_wdt_deinit()` unsubscribes the idle tasks and deinitializes the TWDT

In the case where applications need to watch at a more granular level (i.e., ensure that a particular functions/stub/code-path is called), the TWDT allows subscription of “users”.

- `esp_task_wdt_add_user()` to subscribe an arbitrary user of the TWDT. This function will return a user handle to the added user.
Chapter 2. API

- `esp_task_wdt_reset_user()` must be called using the user handle in order to prevent a TWDT timeout.
- `esp_task_wdt_delete_user()` unsubscribes an arbitrary user of the TWDT.

**Configuration** The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolize the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

备注: Erasing large flash areas can be time consuming and can cause a task to run continuously, thus triggering a TWDT timeout. The following two methods can be used to avoid this:

- Increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period.
- You can also call `esp_task_wdt_init()` to increase the watchdog timeout period before erasing a large flash area.

For more information, you can refer to **SPI Flash**.

The following config options control TWDT configuration. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT_EN` - enables TWDT feature. If this option is disabled, TWDT cannot be used, even if initialized at runtime.
- `CONFIG_ESP_TASK_WDT_INIT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_init()` again.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.

**JTAG & Watchdogs**

While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

**API Reference**

**Task Watchdog** A full example using the Task Watchdog is available in esp-idf: `system/task_watchdog`

**Header File**

- `components/esp_system/include/esp_task_wdt.h`

**Functions**

```c
esp_err_t esp_task_wdt_init(const esp_task_wdt_config_t *config)
```

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. This function will subscribe the idle tasks if configured to do so. For other tasks, users can subscribe them using `esp_task_wdt_add()` or `esp_task_wdt_add_user()`. This function won’t start the timer if no task have been registered yet.
Chapter 2. API 参考

备注: esp_task_wdt_init() must only be called after the scheduler is started. Moreover, it must not be called by multiple tasks simultaneously.

参数 config [in] Configuration structure
返回
• ESP_OK: Initialization was successful
• ESP_ERR_INVALID_STATE: Already initialized
• Other: Failed to initialize TWDT

esp_err_t esp_task_wdt_reconfigure(const esp_task_wdt_config_t *config)
Reconfigure the Task Watchdog Timer (TWDT)
The function reconfigures the running TWDT. It must already be initialized when this function is called.

备注: esp_task_wdt_reconfigure() must not be called by multiple tasks simultaneously.

参数 config [in] Configuration structure
返回
• ESP_OK: Reconfiguring was successful
• ESP_ERR_INVALID_STATE: TWDT not initialized yet
• Other: Failed to initialize TWDT

esp_err_t esp_task_wdt_deinit(void)
Deinitialize the Task Watchdog Timer (TWDT)
This function will deinitialize the TWDT, and unsubscribe any idle tasks. Calling this function whilst other tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

备注: esp_task_wdt_deinit() must not be called by multiple tasks simultaneously.

返回
• ESP_OK: TWDT successfully deinitialized
• Other: Failed to deinitialize TWDT

esp_err_t esp_task_wdt_add(TaskHandle_t task_handle)
Subscribe a task to the Task Watchdog Timer (TWDT)
This function subscribes a task to the TWDT. Each subscribed task must periodically call esp_task_wdt_reset() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数 task_handle — Handle of the task. Input NULL to subscribe the current running task to the TWDT
返回
• ESP_OK: Successfully subscribed the task to the TWDT
• Other: Failed to subscribe task

esp_err_t esp_task_wdt_add_user(const char *user_name, esp_task_wdt_user_handle_t *user_handle_ret)
Subscribe a user to the Task Watchdog Timer (TWDT)
This function subscribes a user to the TWDT. A user of the TWDT is usually a function that needs to run periodically. Each subscribed user must periodically call esp_task_wdt_reset_user() to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout.

参数
Chapter 2. API

返回
• ESP_OK: Successfully subscribed the user to the TWDT
• Other: Failed to subscribe user

esp_err_t esp_task_wdt_reset (void)
Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

返回
• ESP_OK: Successfully reset the TWDT on behalf of the currently running task
• Other: Failed to reset

def esp_task_wdt_reset_user (esp_task_wdt_user_handle_t user_handle)
Reset the Task Watchdog Timer (TWDT) on behalf of a user.

This function will reset the TWDT on behalf of a user. Each subscribed user must periodically call this function to prevent the TWDT from timing out. If one or more subscribed users fail to reset the TWDT on their own behalf, a TWDT timeout will occur.

参数 user_handle – [in] User handle
• ESP_OK: Successfully reset the TWDT on behalf of the user
• Other: Failed to reset

esp_err_t esp_task_wdt_delete (TaskHandle_t task_handle)
Unsubscribe a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call esp_task_wdt_reset().

参数 task_handle – [in] Handle of the task. Input NULL to unsubscribe the current running task.

返回
• ESP_OK: Successfully unsubscribed the task from the TWDT
• Other: Failed to unsubscribe task

esp_err_t esp_task_wdt_delete_user (esp_task_wdt_user_handle_t user_handle)
Unsubscribe a user from the Task Watchdog Timer (TWDT)

This function will unsubscribe a user from the TWDT. After being unsubscribed, the user should no longer call esp_task_wdt_reset_user().

参数 user_handle – [in] User handle

返回
• ESP_OK: Successfully unsubscribed the user from the TWDT
• Other: Failed to unsubscribe user

esp_err_t esp_task_wdt_status (TaskHandle_t task_handle)
Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

参数 task_handle – [in] Handle of the task. Input NULL to query the current running task.

返回
• ESP_OK: The task is currently subscribed to the TWDT
• ESP_ERR_NOT_FOUND: The task is not subscribed
• ESP_ERR_INVALID_STATE: TWDT was never initialized
Chapter 2. API

void esp_task_wdt_isr_user_handler (void)
User ISR callback placeholder.
This function is called by task_wdt_isr function (ISR for when TWDT times out). It can be defined in user
code to handle TWDT events.

备注: It has the same limitations as the interrupt function. Do not use ESP_LOGx functions inside.

Structures

struct esp_task_wdt_config_t
Task Watchdog Timer (TWDT) configuration structure.

Public Members

uint32_t timeout_ms
TWDT timeout duration in milliseconds

uint32_t idle_core_mask
Mask of the cores who’s idle task should be subscribed on initialization

bool trigger_panic
Trigger panic when timeout occurs

Type Definitions

typedef struct esp_task_wdt_user_handle_s *esp_task_wdt_user_handle_t
Task Watchdog Timer (TWDT) user handle.

此部分 API 代码示例存放在 ESP-IDF 示例项目的 system 目录下。

API 指南

4.1 应用层跟踪库

4.1.1 概述

ESP-IDF 中提供了应用层跟踪功能，用于分析应用程序的行为。这一功能在相应的库中实现，可以通过 menuconfig 开启。此功能允许用户在程序运行开销很小的前提下，通过 JTAG、UART 或 USB 接口在主机和 ESP32 之间传输任意数据。用户也可同时使用 JTAG 和 UART 接口。UART 接口主要用于连接 SEGGER SystemView 工具（参见 SystemView）。

开发人员可以使用这一功能库将应用程序的运行状态发送给主机，在运行时接收来自主机的命令或者其他类型的信息。该库的主要使用场景有：

1. 收集来自特定应用程序的数据，具体请参阅特定应用程序的跟踪。
2. 记录到主机的轻量级日志，具体请参阅记录日志到主机。
3. 系统行为分析，具体请参阅基于 SEGGER SystemView 的系统行为分析。
4. 获取源代码覆盖率，具体请参阅 Gcov（源代码覆盖）。

使用 JTAG 接口的跟踪组件工作示意图如下所示：

4.1.2 运行模式

该库支持两种运行模式：

后验模式：后验模式为默认模式，该模式不需和主机进行交互。在这种模式下，跟踪模块不会检查主机是否已经从 HW UP BUFFER 冲突区读走所有数据，而是直接使用新数据覆盖旧数据。如果用户仅对最新的跟踪数据感兴趣，例如需要分析程序在崩溃之前的行为，则推荐使用此模式。主机可以稍后根据用户的请求来读取数据，例如在使用 JTAG 接口的情况下，通过特殊的 OpenOCD 命令进行读取。

流模式：当主机连接到 ESP32 时，跟踪模块会进入此模式。在这种模式下，跟踪模块在新数据写入 HW UP BUFFER 之前会检查其是否有足够的空间。并在必要的时候等待主机读取数据并释放足够的内存。最大等待时间是由用户传递给相应 API 函数的超时时间参数决定的。因此当应用程序尝试使用有限的最大等待时间值来获取数据并使用缓冲区时，这些数据可能会被丢弃。尤其需要注意的是，如果在对实时要求严格的代码中（如中断处理函数、操作系统调度等）指定了无限的超时时间，将会导致系统故障。为了避免丢失此类关键数据，开发人员可以在 menuconfig 中开启 CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX 选项，以启用额外的数据缓冲区。此宏还指定了在上述条件下可以缓冲的数据大小，它有助于缓解由于 USB 总线拥塞等原因导致的向主机传输数据间歇性减缓的状况。但是，当跟踪数据流的平均比特率超出硬件接口的能力时，该选项无法发挥作用。

2107
4.1.3 配置选项与依赖项

使用此功能需要在主机端和目标端进行以下配置:

1. **主机端**: 应用程序跟踪通过 JTAG 来完成，因此需要在主机上安装并运行 OpenOCD。详细信息请参阅 JTAG 调试。

2. **目标端**: 在 menuconfig 中开启应用程序跟踪功能。前往 Component config > Application Level Tracing 菜单，选择跟踪数据的传输目标 (具体用于传输的硬件接口: JTAG 和/或 UART)，选择任一非 None 的目标都会启动开启 CONFIG_APPTRACE_ENABLE 选项。对于 UART 接口，用户必须定义波特率、TX 和 RX 管脚以及其他相关参数。

**备注**: 为了实现更高的数据速率并降低丢包率，建议优化 JTAG 的时钟频率，使其达到能够稳定运行的最大值。详细信息请参阅优化 JTAG 的速度。

以下为前述未提及的另外两个 menuconfig 选项:

1. **Threshold for flushing last trace data to host on panic (CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH)**。使用 JTAG 接口时，此选项是必选项。在该模式下，跟踪数据以 16 KB 数据块的形式暴露给主机。在后验模式中，一个块被填充后会被暴露给主机，同时之前的块不再可用。也就是说，跟踪数据以 16 KB 的粒度进行覆盖。发生 Panic 时，当前输入块的最新数据将会被暴露给主机，主机可以读取数据以进行后续分析。如果系统发生 Panic 时，仍有少量数据还来得及暴露给主机，那么之前收集的 16 KB 数据将丢失。主机只能获取少部分的最新跟踪数据，从而可能无法诊断问题。此 menuconfig 选项有助于避免此类情况，它控制发生 Panic 时刷新数据的阈值。例如，用户可能设置需要不少于 512 字节的跟踪数据，如果在发生 Panic 时待处理的数据少于 512 字节，则数据不会被刷新，也不会覆盖之前的 16 KB 数据。该选项仅在后验模式和使用 JTAG 工作时可发挥作用。

2. **Timeout for flushing last trace data to host on panic (CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO)**。该选项仅在流模式下才可发挥作用，它可用于控制跟踪模块在发生 Panic 时等待主机读取跟踪数据的最长时间。

3. **UART RX/TX ring buffer size (CONFIG_APPTRACE_UART_TX_BUFF_SIZE)**。缓冲区的大小取决于通过 UART 传输的数据量。
4. UART TX message size (ref:CONFIG_APPTRACE_UART_TX_MSG_size)。要传输的单条消息的最大尺寸。

4.1.4 如何使用此库

该库提供了用于在主机和 ESP32 之间传输任意数据的 API。在 menuconfig 中启用该库后，目标应用程序的跟踪模块会在系统启动时自动初始化。因此，用户需要做的就是调用相应的 API 来发送、接收或者刷新数据。

特定应用程序的跟踪

通常，用户需要决定在每个方向上传输数据的类型以及如何解析（处理）这些数据。要想在目标和主机之间传输数据，则需执行以下几个步骤：

1. 在目标端，用户需要实现将跟踪数据写入主机的算法。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APTRACE_DEST_TRAX, buf, strlen(buf),
                                 ESP_APTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

esp_apptrace_write() 函数使用 memcpy 把用户数据复制到内部缓存中。在某些情况下，使用 esp_apptrace_buffer_get() 和 esp_apptrace_buffer_put() 函数会更加理想，它们允许开发人员自行分配缓冲区并填充。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APTRACE_DEST_TRAX, 32, 100/
                                          "tmo in us");
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APTRACE_DEST_TRAX, ptr, 100/*tmo...
                                         in us");
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report...
     incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

另外，根据实际项目的需要，用户可能希望从主机接收数据。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
size_t sz = sizeof(buf);
/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
```

(下页继续)
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
} if (sz > 0) {
    /* we have data, process them */
    ...
}

esp_apptrace_read() 函数使用 memcpy 把主机端的数据复制到用户缓存区。在某些情况下，使用 esp_apptrace_down_buffer_get() 和 esp_apptrace_down_buffer_put() 函数可能更为理想。它们允许开发人员占用一块缓冲区并就地进行有关处理操作。下面的代码片段展示了如何执行此操作。

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, /*do not wait*/); 100/*tmo in us*/);
if (ptr == NULL) {  
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
} if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. 下一步是编译应用程序的镜像，并将其下载到目标板上。这一步可以参考文档，构建并烧写。
3. 运行 OpenOCD（参见 JTAG 调试）。
4. 连接到 OpenOCD 的 telnet 服务器。用户可在终端执行命令 telnet <oocd_host> 4444。如果用户是在运行 OpenOCD 的同一台机器上打开 telnet 会话，可以使用 localhost 替换上面命令中的 <oocd_host>。
5. 使用特殊的 OpenOCD 命令开始收集待跟踪的命令。此命令将传输跟踪数据并将其重定向到指定的文件或套接字（当前仅支持文件作为跟踪数据目标）。相关命令的说明，请参阅 启动调试器。
6. 最后，处理接收到的数据。由于数据格式由用户自己定义，本文档中略数据处理的具体流程。数据处理的范例可以参考位于 $IDF_PATH/tools/esp_app_trace 下的 Python 脚本 apptrace_proc.py（用于功能测试）和 logtrace_proc.py（请参阅记录日志到主机 章节中的详细信息）。

**OpenOCD 应用程序跟踪命令** HW UP BUFFER 在用户数据块之间共享，并且会代替 API 调用者（在任务或者中断上下文中）填充分配到的内存。在多线程环境中，正在填充缓冲区的任务/中断可能会被另一个高优先级的任务/中断抢占，因此主机可能会读取到尚未准备好的用户数据。对此，跟踪模块在所有用户数据块之前添加一个数据头，其中包含有分配的用户缓冲区的大小（2 字节）和实际写入的数据长度。
(2 字节)，也就是说数据头总共 4 字节，负责读取跟踪数据的 OpenOCD 命令在读取到不完整的用户数据块时会报错。但是无论如何，它都会将整个用户数据块（包括还未填充的区域）的内容放到输出文件中。

下文介绍了如何使用 OpenOCD 应用程序跟踪命令。

备注：目前，OpenOCD 还不支持将任意用户数据发送到目标的命令。

命令用法：

```c
esp aptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

子命令：

- **start** 开始跟踪（连续流模式）。
- **stop** 停止跟踪。
- **status** 获取跟踪状态。
- **dump** 转储所有后验模式的数据。

Start 子命令的语法：

```c
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** 用于保存来自两个 CPU 的数据文件的路径。该参数需要具有以下格式：file://path/to/file。
- **poll_period** 轮询跟踪数据的周期（单位：毫秒）。如果大于 0 则以非阻塞模式运行。默认为 1 毫秒。
- **trace_size** 最多要收集的数据量（单位：字节），接收到指定数量的数据后将会停止跟踪。默认为 -1（禁用跟踪大小停止触发器）。
- **stop_tmo** 空闲超时（单位：秒）。如果指定的时间段内都没有数据就会停止跟踪。默认为 -1（禁用跟踪超时停止触发器）。还可以将其设置为以目标跟踪命令之间的最长暂停值更长的值（可选）。
- **wait4halt** 如果设置为 0 则立即开始跟踪。否则命令会先等待目标停止（复位、打断点等），然后对其进行自动恢复并开始跟踪。默认值为 0。
- **skip_size** 开始时要跳过的字节数，默认为 0。

备注：如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令将不可用。必须通过复位电路板或者在 OpenOCD 的窗口中（非 telnet 会话窗口）使用快捷键 Ctrl+C。另一种选择是设置 trace_size 并等待，当收集到指定数据量时，跟踪会自动停止。

命令使用示例：

1. 将 2048 个字节的跟踪数据收集到 trace.log 文件中。该文件将保存在 openocd-esp32 目录中。

   ```c
   esp aptrace start file://trace.log 1 2048 5 0 0
   ```

   跟踪数据会被检查并以非阻塞的模式保存到文件中。如果收集满 2048 字节的数据或者在 5 秒内没有新的数据，那么该过程就会停止。

   备注：在将数据提供给 OpenOCD 之前，会对其进行缓冲。如果看到“Data timeout!”的消息，这表示目标可能在超时之前没有向 OpenOCD 发送足够的数据以清空缓冲区。要解决这个问题，可以增加超时时间或者使用函数 esp_aptrace_flush() 以特定间隔刷新数据。

2. 在非阻塞模式下无限地检索跟踪数据。

   ```c
   esp aptrace start file://trace.log 1 -1 -1 0 0
   ```

   对收集数据的大小没有限制，也不设置超时时间。要停止此过程，可以在 OpenOCD 的 telnet 会话窗口中发送 esp_aptrace stop 命令，或者在 OpenOCD 窗口中使用快捷键 Ctrl+C。

3. 检索跟踪数据并无限期保存。
记录日志到主机

记录日志到主机是 ESP-IDF 中一个非常实用的功能：通过应用层跟踪库将日志保存到主机端。某种程度上，这也算是一种半主机 (semihosting) 机制，相较于调用 ESP_LOGx 将待打印的字符串发送到 UART 的日志记录方式，此功能将大部分工作转移到了主机端，从而减少了本地工作量。

ESP-IDF的日志库会默认使用 vprintf 的函数将格式化的字符串输出到专用的 UART，一般来说涉及以下几个步骤：

1. 解析格式字符串以获取每个参数的类型。
2. 根据其类型，将每个参数都转换为字符串。
3. 格式字符串与转换后的参数一起发送到 UART。

虽然可以对类 vprintf 函数进行一定程度的优化，但由于在任何情况下都必须执行上述步骤，并且每个步骤都会消耗一定的时间（尤其是步骤 3），所以经常会发生以下这种情况：向程序中添加额外的打印信息以诊断问题，却改变了应用程序的行为，使得问题无法复现。在最严重的情况下，程序无法正常工作，最终导致报错甚至挂起。

想要解决此类问题，可以使用更高的波特率或者其他更快的接口，并将字符串格式化的工作转移到主机端。

通过应用层跟踪库的 esp_aptrace_vprintf 函数，可以将日志信息发送到主机。该函数不执行格式字符串的参数的完全解析，而仅仅计算传递参数的数量，并将它们与格式字符串地址一起发送给主机。主机端会通过一个特殊的 Python 脚本来处理并打印接收到的日志数据。

局限  目前通过 JTAG 实现记录日志还存在以下几点局限：

1. 不支持使用 ESP_EARLY_LOGx 宏进行跟踪。
2. 不支持大于超过 4 字节的 printf 参数（例如 double 和 uint64_t）。
3. 仅支持.rodata 段中的格式字符串和参数。
4. 最多支持 256 个 printf 参数。

如何使用  为了使用跟踪模块来记录日志，用户需要执行以下步骤：

1. 在目标端，需要安装特殊的类 vprintf 函数 esp_aptrace_vprintf，该函数负责将日志数据发送给主机。示例代码参见 system/app_trace_to_host。
2. 按照特定应用程序的跟踪 章节中的第 2-5 步进行操作。
3. 打印接收到的日志记录，请在终端运行以下命令：$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file。

Log Trace Processor 命令选项  命令用法：

logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>

位置参数（必要）：

.trace_file 日志跟踪文件的路径。
.elf_file 程序 ELF 文件的路径。

可选参数：

-h, --help 显示此帮助信息并退出。
--no-errors, -n 不打印错误信息。

基于 SEGGER SystemView 的系统行为分析

ESP-IDF 中另一个基于应用层跟踪库的实用功能是系统级跟踪，它会生成与 SEGGER SystemView 工具相兼容的跟踪信息。SEGGER SystemView 是一款实时记录和可视化工具，用来分析应用程序运行时的行为，可通过 UART 接口实时查看事件。

如何使用 若需使用这个功能，需要在 menuconfig 中开启 CONFIG_APPTRACE_SV_ENABLE 选项，具体路径为 Component config > Application Level Tracing > FreeRTOS SystemView Tracing。同一菜单栏下还开启了其它几个选项：

1. System View destination，选择需要使用的接口：JTAG 或 UART。使用 UART 接口时，可以将 SystemView 应用程序直接连接到 ESP32 并实时接收数据。
2. ESP32 timer to use as SystemView timestamp source（CONFIG_APPTRACE_SV_TS_SOURCE）。选择 SystemView 事件使用的时间戳源。在单核模式下，使用 ESP32 内部的循环计数器生成时间戳，其最大的工作频率是 240 MHz（时间戳粒度大约为 4 ns）。在双核模式下，使用工作在 40 MHz 的外部定时器，因此时间戳粒度为 25 ns。
3. 可以单独启用或禁用的 SystemView 事件集合（CONFIG_APPTRACE_SV_EVT_XXX）：
   - Trace Buffer Overflow Event
   - ISR Enter Event
   - ISR Exit Event
   - ISR Exit to Scheduler Event
   - Task Start Execution Event
   - Task Stop Execution Event
   - Task Start Ready State Event
   - Task Stop Ready State Event
   - Task Create Event
   - Task Terminate Event
   - System Idle Event
   - Timer Enter Event
   - Timer Exit Event

ESP-IDF 中已经包含了所有用于生成兼容 SystemView 跟踪信息的代码，用户只需配置必要的项目选项（如上所示），然后构建、烧写映像到目标板，接着参照前面的介绍，使用 OpenOCD 收集数据。

4. 想要通过 UART 接口进行实时跟踪，请在菜单配置选项 Component config > Application Level Tracing > FreeRTOS SystemView Tracing 中选择 Pro 或 App CPU。

OpenOCD SystemView 跟踪命令选项 命令用法：

esp sysview [start <options>] | [stop] | [status]

子命令：

start 开启跟踪（连续流模式）。
stop 停止跟踪。
status 获取跟踪状态。

Start 子命令语法：

start <ofile1> [ofile2] [poll_period [trace_size [stop_tmo]]]

ofile1 保存 PRO CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。
ofile2 保存 APP CPU 数据的文件路径。此参数需要具有如下格式：file://path/to/file。
poll_period 跟踪数据的轮询周期（单位：毫秒）。如果该值大于 0，则命令以非阻塞的模式运行，默认为 1 毫秒。
trace_size 最多要收集的数据量（单位：字节）。当收到指定数量的数据后，将停止跟踪。默认值是 -1 （禁用跟踪大小停止触发器）。
Chapter 4. API 指南

**stop_tmo** 空闲超时 (单位: 秒)。如果指定的时间内没有数据，将停止跟踪。默认值是 -1（禁用跟踪超时停止触发器）。

**备注:** 如果 poll_period 为 0，则在跟踪停止之前，OpenOCD 的 telnet 命令行将不可用。您需要复位板卡或者在 OpenOCD 的窗口（非 telnet 会话窗口）输入 Ctrl+C 命令来手动停止跟踪。另一个办法是设置 trace_size，等到收集满指定数量的数据后自动停止跟踪。

命令使用示例:
1. 将 SystemView 跟踪数据收集到文件 pro-cpu.SVDat 和 pro-cpu.SVDat 中。这些文件会被保存在 openocd-esp32 目录中。

   ```
   esp sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
   ```

   跟踪数据被检索并以非阻塞的方式保存。要停止此过程，需要在 OpenOCD 的 telnet 会话窗口输入 esp sysview stop 命令，也可以在 OpenOCD 窗口中按下快捷键 Ctrl+C。

2. 检索跟踪数据并无限保存。

   ```
   esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
   ```

   OpenOCD 的 telnet 命令行在跟踪停止前会无法使用。要停止跟踪，请在 OpenOCD 窗口使用 Ctrl+C 快捷键。

**数据可视化** 收集到跟踪数据后，用户可以使用特殊的工具对结果进行可视化并分析程序行为。

遗憾的是，SystemView 不支持从多个核心进行跟踪。所以当使用 JTAG 追踪双核模式下的 ESP32 时会生成两个文件：一个用于 PRO CPU，另一个用于 APP CPU。用户可以将每个文件加载到工具中单独分析。使用 UART 进行追踪时，可以在 menuconfig Pro 或 App 中点击 Component config > Application Level Tracing > FreeRTOS SystemView Tracing 并选择要追踪的 CPU。

在工具中单独分析每个核的跟踪数据是比较棘手的，但是 Eclipse 提供了 Impulse 插件，该插件可以加载多个跟踪文件，并且可以在同一视图中检查来自两个内核的事件。此外，与免费版的 SystemView 相比，此插件没有1,000,000个事件的限制。

关于如何安装、配置 Impulse 并使用它来可视化来自单个核心的跟踪数据，请参阅 [官方教程](#)。

**备注:** ESP-IDF 使用自己的 SystemView FreeRTOS 事件 ID 映射，因此用户需要将 SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt 替换成 $IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt。在使用上述链接配置 SystemView 序列化程序时，也应该使用该特定文件的内容。

**配置 Impulse 实现双核跟踪** 在安装好 Impulse 插件并确保 Impulse 能够在单独的选项卡中成功加载每个核心的跟踪文件后，用户可以添加特殊的 Multi Adapter 端口并将这两个文件加载到一个视图中。为此，用户需要在 Eclipse 中执行以下操作：

1. 打开 Signal Ports 视图，前往 Windows > Show View > Other 菜单，在 Impulse 文件夹中找到 Signal Ports 视图并双击。
2. 在 Signal Ports 视图中，右键 Ports 并选择 Add，然后选择 New Multi Adapter Port。
3. 在打开的对话框中按下 add 按钮，选择 New Pipe/File。
4. 在打开的对话框中选择 SystemView Serializer 并设置 PRO CPU 跟踪文件的路径，按下 OK 保存设置。
5. 对 APP CPU 的跟踪文件重复步骤 3 和 4。
6. 双击创建的端口，会打开此端口的视图。
7. 单击 Start/Stop Streaming 按钮，数据将被加载。
8. 使用 Zoom Out，Zoom In 和 Zoom Fit 按钮来查看数据。
9. 有关设置测量光标和其他的功能，请参阅 Impulse官方文档。
Chapter 4. API 指南

备注：如果您在可视化方面遇到了问题（未显示数据或者缩放操作异常），您可以尝试删除当前的信号层次结构，再双击必要的文件或端口。Eclipse 会请求您创建新的信号层次结构。

Gcov（源代码覆盖）

Gcov 和 Gcovr 简介 源代码覆盖率显示程序运行时间内执行的每一条程序执行路径的数量和频率。Gcov 是一款 GCC 工具，与编译器协同使用时，可生成日志文件，显示源文件每行的执行次数。Gcovr 是管理 Gcov 和生成代码覆盖率总结的工具。

一般来说，使用 Gcov 在主机上编译和运行程序会经过以下步骤：

1. 使用 GCC 及 --coverage 选项编译源代码。编译器在编译过程中生成一个 gcno 注释文件，该文件包含逻辑执行路径块图以及将每个块映射到源代码行号等信息。每个用 --coverage 选项编译的源文件都会生成自己的同名 gcno 文件（如 main.c 在编译时会生成 main.gcno)。
2. 执行程序。在执行过程中，程序会生成 gcda 数据文件。这些数据文件包含了执行路径的次数统计。程序将为每个用 --coverage 选项编译的源文件生成一个 gcda 文件（如 main.c 将生成 main.gcda)。
3. Gcov 或 Gcovr 可用于生成基于 gcno、.gcda 和源文件的代码覆盖。Gcov 将以 gcov 文件的形式为每个源文件生成基于文本的覆盖报告，而 Gcovr 将以 HTML 格式生成覆盖报告。

ESP-IDF 中的 Gcov 和 Gcovr 应用 在 ESP-IDF 中使用 Gcov 的过程比较复杂，因为程序不在主机上运行，而在目标机上运行。代码覆盖率数据（即 gcda 文件）最初存储在目标机上，OpenOCD 在运行时通过 JTAG 将代码覆盖率数据从目标机传输到主机上。在 ESP-IDF 中使用 Gcov 可以分为以下几个步骤：

1. 为 Gcov 设置项目
2. 转储代码覆盖数据
3. 生成代码覆盖报告

为 Gcov 设置项目

编译器选择 为了获取项目的代码覆盖率数据，必须用 --coverage 选项编译项目中的一个或多个源文件。在 ESP-IDF 中，这可以在组件级或单个源文件级实现：

- 在组件的 CMakeLists.txt 文件中添加 target_compile_options("${COMPONENT_LIB} PRIVATE --coverage") 可确保使用 --coverage 选项编译组件中的所有源文件。
- 在组件的 CMakeLists.txt 文件中添加 set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage) 可确保使用 --coverage 选项编译同一组件中选定的一源文件（如 source1.c 和 source2.c)。

当一个源文件用 --coverage 选项编译时（例如 gcov_example.c)，编译器会在项目的构建目录下生成 gcov_example.gcno 文件。

项目配置 在构建有源代码覆盖的项目之前，请运行 idf.py menuconfig 以启用以下项目配置选项。

- 通过 CONFIG_APPTRACE_DESTINATION1 选项选择 Trace Memory 来启用应用程序跟踪模块。
- 通过 CONFIG_APPTRACE_GCOV_ENABLE 选项启用 Gcov 主机。

转储代码覆盖数据 一旦项目使用 --coverage 选项编译并烧录到目标机上，应用程序运行时，代码覆盖率数据将存储在目标机内部（即在跟踪存储器中）。将代码覆盖率数据从目标机转移到主机上的过程称为转储。

覆盖率数据的转储通过 OpenOCD 进行（关于如何设置和运行 OpenOCD，请参考 JTAG 调试）。由于该过程需要通过向 OpenOCD 发出命令来触发转储，因此必须打开 telnet 会话，以向 OpenOCD 发出这些命令（运行 telnet localhost 4444)，GDB 也可以代替 telnet 来向 OpenOCD 发出命令，但是所有从 GDB 发出的命令都需要以 mon <oocd_command> 为前缀。

Submit Document Feedback
当目标机转储代码覆盖数据时,.gcda 文件存储在项目的构建目录中。例如，如果 main 组件的 gcov_example_main.c 在编译时使用了--coverage 选项，那么转储代码覆盖数据将在 build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda 中生成 gcov_example_main.gcda 文件。注意，编译过程中产生的.gcno 文件也放在同一目录下。

代码覆盖数据的转储可以在应用程序的整个生命周期内多次进行。每次转储都会用最新的代码覆盖信息更新 .gcda 文件，代码覆盖数据是累积的，因此最新的数据将包含应用程序整个生命周期中每个代码路径的总执行次数。

ESP-IDF 支持两种将代码覆盖数据从目标机转储到主机的方法：

- 运行中实时转储
- 硬编码转储

运行中实时转储 通过 telnet 会话调用 OpenOCD 命令 ESP32 gcov 来触发运行时的实时转储。一旦被调用，OpenOCD 将立即抢占 ESP32 的当前状态，并执行内置的 ESP-IDF Gcov 调试存根函数。调试存根函数将数据转储到主机。完成后，ESP32 将恢复当前状态。

硬编码转储 硬编码转储是由应用程序本身从程序内部调用 esp_gcov_dump() 函数触发的。在调用时，应用程序将停止并等待 OpenOCD 连接，同时检索代码覆盖数据。一旦 esp_gcov_dump() 函数被调用，主机会通过 telnet 会话执行 esp_gcov_dump OpenOCD 命令。该命令会将 OpenOCD 连接到 ESP32，检索代码覆盖数据，然后断开与 ESP32 的连接，从而恢复应用程序。在应用程序的生命周期中可多次触发硬编码转储。

在必要时（如应用程序初始化后或是应用程序主循环的每次迭代期间）放置 esp_gcov_dump()，当应用程序在生命周期的某刻需要代码覆盖率数据时，硬编码转储会非常有用。

GDB 可以用来在 esp_gcov_dump() 上设置断点，然后使用 gdbinit 脚本自动调用 mon esp gcov dump（关于 GDB 的使用可参考使用命令行调试）。

以下 GDB 脚本将在 esp_gcov_dump() 处添加一个断点，然后调用 mon esp gcov dump OpenOCD 命令。

```bash
b esp_gcov_dump
commands
mon esp gcov dump
end
```

备注：注意，所有的 OpenOCD 命令都应该在 GDB 中以 mon <oocd_command> 方式调用。

生成代码覆盖报告 一旦代码覆盖数据被转储，.gcno、.gcda 和源文件可以用来生成代码覆盖报告。该报告会显示源文件中每行被执行的次数。

Gcov 和 Gcovr 都可以用来生成代码覆盖报告。安装 Xtensa 工具链时会一起安装 Gcov，但 Gcovr 可能需要单独安装。关于如何使用 Gcov 或 Gcovr，请参考 Gcov 文档 和 Gcovr 文档。

在工程中添加 Gcov 构建目标 用户可以在自己的工程中定义额外的构建目标，从而通过一个简单的构建命令即可更方便地生成报告。

请在您工程的 CMakeLists.txt 文件中添加以下内容：

```cmake
include(${ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

您可使用以下命令：

- `cmake --build build/ --target gcovr-report`: 在 $(BUILD_DIR_BASE)/coverage_report/html 目录下生成 HTML 格式代码覆盖报告。

Espressif Systems 2116 Release v5.1-dev-2066-g7869f4e151
4.2 应用程序的启动流程

本文将会介绍 ESP32 从上电到运行 app_main 函数中所经历的步骤 (即启动流程)。

宏观上，该启动流程可以分为如下 3 个步骤:

1. **一级引导程序** 被固化在了 ESP32 内部的 ROM 中，它会从 flash 的 0x1000 偏移地址处加载二级引导程序至 RAM (IRAM & DRAM) 中。
2. **二级引导程序** 从 flash 中加载分区表和主程序镜像至内存中，主程序中包含了 RAM 段和通过 flash 高速缓存映射的只读段。
3. **应用程序启动阶段** 运行，这时第二个 CPU 和 RTOS 的调度器启动。

下面会对上述过程进行更为详细的阐述。

### 4.2.1 一级引导程序

SoC 复位后，PRO CPU 会立即开始运行，执行复位向量代码，而 APP CPU 仍然保持复位状态。在启动过程中，PRO CPU 会执行所有的初始化操作。APP CPU 的复位状态会在应用程序启动代码的 call_start_cpu0 函数中失效。复位向量代码位于 ESP32 芯片映射 ROM 处，且不能被修改。

复位向量调用的启动代码会根据 GPIO_STRAP_REG 寄存器的值来确定 ESP32 的启动模式，该寄存器保存着复位后 bootstrap 引脚的电平状态。根据不同的复位原因，程序会执行如下操作:

1. **从深度睡眠模式复位**：如 RTC_CNTL_STORE6_REG 寄存器的值非零，且 RTC_CNTL_STORE7_REG 寄存器中的 RTC 内存的 CRC 校验值有效，那么程序会使用 RTC_CNTL_STORE6_REG 寄存器的值作为入口地址，并立即跳转到该地址运行。如果 RTC_CNTL_STORE6_REG 的值为零，或 RTC_CNTL_STORE7_REG 中的 CRC 校验值无效，又或通过 RTC_CNTL_STORE6_REG 调用的代码返回，那么则像上电复位一样继续启动。

**注意**：如果想在这里运行自定义的代码，可以参考深度睡眠文档里面介绍的深度睡眠存根机制方法。

2. **上电复位**，软件 SoC 复位。看门狗 SoC 复位：检查 GPIO Strap 寄存器，判断是否请求自定义启动模式，如 UART 下载模式。如果是，ROM 会执行此自定义加载器模式。否则程序将从软件 CPU 复位一样继续启动。请参考 ESP32 技术规格书了解 SoC 启动模式以及具体执行过程。

3. **软件 CPU 复位**，看门狗 CPU 复位：根据 EFUSE 中的值配置 SPI flash，然后尝试从 flash 中加载代码，这部分将会在后面一小节详细介绍。

**备注**：正常启动模式下会使能 RTC 看门狗，因此，如果进程中断或停止，看门狗将自动重置 SOC 并重启启动过程。如果 strapping GPIOs 已更改，则可能导致 SoC 陷入新的启动模式。

二级引导程序的二进制镜像会从 flash 的 0x1000 偏移地址处加载。如果正在使用 Secure Boot，则 flash 的第一个 4 kB 扇区用于存储安全启动 IV 以及引导程序镜像的摘要，否则不使用该扇区。

### 4.2.2 二级引导程序

在 ESP-IDF 中，存放在 flash 的 0x1000 偏移地址处的二进制镜像就是二级引导程序。二级引导程序的源码可以在 ESP-IDF 的 components.bootloader 目录下找到。ESP-IDF 使用二级引导程序可以增加 flash 分区的灵活性（使用分区表），并且方便实现 flash 加密，安全引导和空中升级（OTA）等功能。

当一级引导程序校验并加载完二级引导程序后，它会从二进制镜像的头部找到二级引导程序的入口点，并跳转过去运行。
4.2.3 应用程序启动阶段

应用程序启动包含了从应用程序开始执行到 app_main 函数在主任务内部运行前的所有过程。可分为三个阶段:

- 硬件和基本 C 语言运行环境的端口初始化。
- 软件服务和 FreeRTOS 的系统初始化。
- 运行主任务并调用 app_main。

备注：通常不需要了解 ESP-IDF 应用程序初始化的所有阶段。如果需要仅从应用程序开发人员的角度了解初始化，请跳至运行主任务。

端口初始化

ESP-IDF 应用程序的入口是 components/esp_system/port/cpu_start.c 文件中的 call_start_cpu0 函数。这个函数由二级引导加载程序执行，并且从不返回。

该端口层的初始化功能会初始化基本的 C 运行环境（“CRT”），并对 SoC 的内部硬件进行了初始化。

- 为应用程序重新配置 CPU 异常（允许应用程序中断处理程序运行，并使用为应用程序配置的选项来处理严重错误，而不是使用 ROM 提供的简易版错误处理程序处理）。
- 如果没有设置选项 CONFIG_BOOTLOADER_WDT_DISABLE，则不使用 RTC 看门狗定时器。
- 初始化内部存储器（数据和 bss）。
- 完成 MMU 高速缓存配置。
- 如果配置了 PSRAM，则使能 PSRAM。
- 将 CPU 时钟设置为配置项的频率。
- 根据应用程序头部配置重新配置主 SPI flash，这是为了与 ESP-IDF V4.0 之前的引导程序版本兼容，请参考引导加载程序兼容性。
- 如果应用程序被配置为在多个内核上运行，则启动另一个内核并等待其初始化（在类似的“端口层”初始化函数 call_start_cpu1 内）。

call_start_cpu0 完成运行后，将会调用在 components/esp_system/startup.c 中找到的“系统层”初始化函数 start_cpu0。其他内核也将完成端口层的初始化，并调用同一文件中的 start_other_cores。
系统初始化

主要的系统初始化函数是 start_cpu0。默认情况下，这个函数与 start_cpu0_default 函数弱连接。这意味着可以覆盖这个函数，增加一些额外的初始化步骤。

主要的系统初始化阶段包括:

- 如果默认的目录级别允许，则记录该应用程序的相关信息（项目名称、应用程序版本等）。
- 初始化堆分配器（在执行之前，所有分配必须是静态的或在堆栈上）。
- 初始化 newlib 组件的系统调用和时间函数。
- 配置断电检测器。
- 根据串行控制台配置设置 libc stdin、stdout、和 stderr。
- 执行与安全有关的检查，包括为该配置烧录 fuse（包括禁用 ESP32 V3 的 ROM 下载模式，CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE）。
- 初始化 SPI flash API 支持。
- 调用全局 C++ 枚举函数和任何标有__attribute__((constructor)) 的 C 函数。

二级系统初始化允许单个组件被初始化。如果一个组件有一个用 ESP_SYSTEM_INIT_FN 宏注释的初始化函数，它将作为二级初始化的一部分被调用。

运行主任务

在所有其他组件都初始化后，主任务会被创建。FreeRTOS 调度器开始运行。

做完一些初始化任务后（需要启动调度器），主任务在固件中运行应用程序提供的函数 app_main。

运行 app_main 的主任务有一个固定的 RTOS 优先级（比最小值高）和一个可配置的堆栈大小。

主任务的内核亲和性也是可以配置的，请参考 CONFIG_ESP_MAIN_TASK_AFFINITY。

与普通的 FreeRTOS 任务（或嵌入式 C 的 main 函数）不同，app_main 任务可以返回。如果“app_main”函数返回，那么主任务将被删除。系统将继续运行其他 RTOS 任务。因此可以将 app_main 实现为一个创建其他应用任务然后返回的函数，或主应用任务本身。

APP CPU 的内核启动流程

APP CPU 的启动流程类似但更简单:

当运行系统初始化时，PRO CPU 上的代码会给 APP CPU 设置好入口地址，解除其复位状态，然后等待 APP CPU 上运行的代码设置一个全局标志，以表明 APP CPU 已经正常启动。完成后，APP CPU 跳转到 components/esp_system/port/cpu_start.c 中的 call_start_cpu1 函数。

当 start_cpu0 函数对 PRO CPU 进行初始化的时候，APP CPU 运行 start_cpu_other_cores 函数。与 start_cpu0 函数类似，start_cpu_other_cores 函数是弱链接的，默认为 start_cpu_other_cores_default 函数，但可以由应用程序替换为不同的函数。

start_cpu_other_cores_default 函数做了一些与内核相关的系统初始化，然后等待 PRO CPU 启动 FreeRTOS 的调度器。启动完成后，它会执行 esp_startup_start_app_other_cores 函数，这是一个默认为 esp_startup_start_app_other_cores_default 的弱链接函数。

默认情况下，esp_startup_start_app_other_cores_default 只会自旋，直到 PRO CPU 上的调度器触发中断，以启动 APP CPU 上的 RTOS 调度器。

4.3 BluFi
4.3.1 概览

BluFi 是一款基于蓝牙通道的 Wi-Fi 网络配置功能，适用于 ESP32。它通过安全协议将 Wi-Fi 的 SSID、密码等配置信息传输到 ESP32。基于这些信息，ESP32 可进而连接到 AP 或建立 SoftAP。

BluFi 流程的关键部分包括数据的分片、加密以及校验和验证。用户可按需自定义用于对称加密、非对称加密以及校验的算法。此处，我们采用 DH 算法进行密钥协商，128-AES 算法用于数据加密，CRC16 算法用于校验和验证。

4.3.2 BluFi 流程

BluFi 配网流程包含配置 SoftAP 和配置 Station 两部分。

下面以配置 Station 为例，介绍了广播、连接、服务发现、协商共享密钥、传输数据、回传连接状态等关键步骤。

1. ESP32 开启 GATT Server 模式，发送带有特定 advertising data 的广播。该广播不属于 BluFi Profile，您可以按需对其进行自定义。
2. 使用手机应用程序搜索到该广播后，手机将作为 GATT Client 连接 ESP32。该步骤对具体使用哪款手机应用程序并无特殊要求。
3. 成功建立 GATT 连接后，手机会向 ESP32 发送数据帧进行密钥协商（详见 BluFi 中定义的帧格式）。
4. ESP32 收到密钥协商的数据帧后，会按照自定义的协商方法进行解析。
5. 手机与 ESP32 进行密钥协商。协商过程可使用 DH/RSA/ECC 等加密算法。
6. 协商结束后，手机将向 ESP32 发送控制帧，用于设置安全模式。
7. ESP32 收到控制帧后，使用共享密钥以及安全配置对通信数据进行加密和解密。
8. 手机向 ESP32 发送 BluFi 中定义的帧格式 中定义的数据帧，包括 SSID、密码等 Wi-Fi 配置信息。
9. 手机向 ESP32 发送 Wi-Fi 连接请求的控制帧。ESP32 收到控制帧后，即默认手机已完成必要信息的传输，准备连接 Wi-Fi。
10. 连接到 Wi-Fi 后，ESP32 发送 Wi-Fi 连接状态报告的控制帧到手机。至此，配网结束。

备注：

1. ESP32 收到安全模式配置的控制帧后，会根据定义的安全模式进行相关操作。
2. 进行对称加密和解密时，加密和解密前后的数据长度必须一致。支持原地加密和解密。

4.3.3 BluFi 流程图

4.3.4 BluFi 中定义的帧格式

手机应用程序与 ESP32 之间的 BluFi 通信格式定义如下：

帧不分片格式：

<table>
<thead>
<tr>
<th>字段</th>
<th>值（字节）</th>
</tr>
</thead>
<tbody>
<tr>
<td>类型（最低有效位）</td>
<td>1</td>
</tr>
<tr>
<td>帧控制</td>
<td>1</td>
</tr>
<tr>
<td>序列号</td>
<td>1</td>
</tr>
<tr>
<td>数据长度</td>
<td>1</td>
</tr>
<tr>
<td>数据</td>
<td>$[\text{Data Length}]$</td>
</tr>
<tr>
<td>校验（最高有效位）</td>
<td>2</td>
</tr>
</tbody>
</table>

如果使用 帧控制 字段中的分片位，则 数据 字段中会出现 2 字节的 内容总长度。该 内容总长度 表示帧的剩余部分的总长度，并用于报告终端需要分配的内存大小。

帧分片格式：

Espressif Systems 2120 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
图 2: BluFi Flow Chart
## 字段

<table>
<thead>
<tr>
<th>字段</th>
<th>值（字节）</th>
</tr>
</thead>
<tbody>
<tr>
<td>类型（最低有效位）</td>
<td>1</td>
</tr>
<tr>
<td>帧控制（分片）</td>
<td>1</td>
</tr>
<tr>
<td>序列号</td>
<td>1</td>
</tr>
<tr>
<td>数据长度</td>
<td>1</td>
</tr>
<tr>
<td>数据</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• 内容总长度：2</td>
</tr>
<tr>
<td></td>
<td>• 数据内容长度：${\text{Data Length}} - 2$</td>
</tr>
<tr>
<td>校验（最高有效位）</td>
<td>2</td>
</tr>
</tbody>
</table>

通常情况下，控制帧不包含数据位，ACK 帧类型除外。

**ACK 帧格式（8 bit）：**

<table>
<thead>
<tr>
<th>字段</th>
<th>值（字节）</th>
</tr>
</thead>
<tbody>
<tr>
<td>类型 - ACK（最低有效位）</td>
<td>1</td>
</tr>
<tr>
<td>帧控制</td>
<td>1</td>
</tr>
<tr>
<td>序列号</td>
<td>1</td>
</tr>
<tr>
<td>数据长度</td>
<td>1</td>
</tr>
<tr>
<td>数据</td>
<td>ACK 序列号: 2</td>
</tr>
<tr>
<td>校验（最高有效位）</td>
<td>2</td>
</tr>
</tbody>
</table>

1. **类型字段**
   - 类型字段占 1 字节，分为 类型 和 子类型 两部分。其中，类型占低 2 位，表明该帧为数据帧或是控制帧；子类型占高 6 位，表示此数据帧或者控制帧的具体含义。
     - 控制帧，暂不进行加密，可校验。
     - 数据帧，可加密，可校验。

1.1 **控制帧（二进制：0x0 b’00）**
### Chapter 4. API 指南

<table>
<thead>
<tr>
<th>控制帧</th>
<th>含义</th>
<th>解释</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0 (b'000000)</td>
<td>ACK</td>
<td>ACK 帧的数据字段使用回复对象帧的数据值。</td>
<td>数据字段占用 1 字节，其序列值与回复对象帧的数据值相同。</td>
</tr>
<tr>
<td>0x1 (b'000001)</td>
<td>将 ESP 设备设置为安全模式。</td>
<td>通知 ESP 设备发送数据时使用的安全模式，在数据发送过程中多次重置，设置后将影响后续使用的安全模式。</td>
<td>数据字段占用 1 字节。高 4 位用于控制帧的安全模式设置，低 4 位用于数据帧的安全模式设置。</td>
</tr>
</tbody>
</table>
| 0x2 (b'000010) | Wi-Fi 的 opmode。 | 该帧包含设置 ESP 设备 Wi-Fi 模式 (opmode) 的设置信息。 | data[0] 用于设置 opmode，包括：
- 0x00: NULL
- 0x01: STA
- 0x02: SoftAP
- 0x03: SoftAP & STA
如果设置中包含 AP，请尽量优先设置 AP 模式的 SSID/密码/最大连接数等。 |
| 0x3 (b'000011) | 将 ESP 设备连接至 AP。 | 通知 ESP 设备必要的信息已经发送完毕，可以连接至 AP。 | 不包含数据字段。 |
| 0x4 (b'000100) | 断开 ESP 设备与 AP 的连接。 | | 不包含数据字段。 |
| 0x5 (b'000101) | 获取 ESP 设备的 Wi-Fi 模式和状态等信息。 | | 不包含数据字段。ESP 设备收到此控制帧后，会向手机发送一个报告 Wi-Fi 连接状态的帧来告知手机当前所处的 opmode、连接状态、SSID 等信息。
- 提供给手机端的信息类型由手机上的应用程序决定。 |
| 0x6 (b'000110) | 断开 STA 设备与 SoftAP 的连接。 | data[0-5] 为 STA 设备的 MAC 地址。如有多个 STA 设备，则第二个使用 data[6-11]，依次类推。 |
| 0x7 (b'000111) | 获取版本信息。 | | |
| 0x8 (b'001000) | 断开 BLE GATT 连接。 | ESP 设备收到该指令后主动断开 BLE GATT 连接。 |
| 0x9 (b'001001) | 获取 Wi-Fi 列表。 | 通知 ESP 设备扫描周围的 Wi-Fi 热点。 | 不包含数据字段。ESP 设备收到此控制帧后，会向手机发送一个包含 Wi-Fi 热点报告的帧。 |

1.2 数据帧 (二进制：0x1 b’01)
<table>
<thead>
<tr>
<th>数据帧</th>
<th>含义</th>
<th>解释</th>
<th>备注</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00 (b'000000')</td>
<td>发送协商数据。</td>
<td>协商数据会发送到应用层注册的回调函数中。</td>
<td>数据的长度取决于数据长度字段。</td>
</tr>
<tr>
<td>0x01 (b'000001')</td>
<td>发送 STA 模式的 BSSID。</td>
<td>在 SSID 隐藏的情况下，发送 STA 设备要连接的 AP 的 BSSID。</td>
<td>请参考备注 1。</td>
</tr>
<tr>
<td>0x02 (b'000010')</td>
<td>发送 STA 模式的 SSID。</td>
<td>发送 STA 设备要连接的 AP 的 SSID。</td>
<td>请参考备注 1。</td>
</tr>
<tr>
<td>0x03 (b'000011')</td>
<td>发送 STA 模式的密码。</td>
<td>发送 STA 设备要连接的 AP 的密码。</td>
<td>请参考备注 1。</td>
</tr>
<tr>
<td>0x04 (b'000100')</td>
<td>发送 SoftAP 模式的 SSID。</td>
<td>请参考备注 1。</td>
<td></td>
</tr>
<tr>
<td>0x05 (b'000101')</td>
<td>发送 SoftAP 模式的密码。</td>
<td>请参考备注 1。</td>
<td></td>
</tr>
<tr>
<td>0x06 (b'000110')</td>
<td>设置 SoftAP 模式的最大连接数。</td>
<td>data[0] 为连接数的值，范围从 1 到 4。当传输方向是 ESP 设备到手机时，表示向手机端提供所需信息。</td>
<td></td>
</tr>
</tbody>
</table>
| 0x07 (b'000111') | 设置 SoftAP 的认证模式。 | data[0] 包括：
  - 0x00: OPEN
  - 0x01: WEP
  - 0x02: WPA_PSK
  - 0x03: WPA2_PSK
  - 0x04: WPA_WPA2_PSK | 请参考备注 1。 |
| 0x08 (b'001000') | 设置 SoftAP 模式的通道数量。 | data[0] 代表支持的通道的数量，范围从 1 到 14。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。 |
| 0x09 (b'001001') | 用户名 | 在进行企业级加密时提供 GATT 客户端的用户名。 | 数据的长度取决于数据长度字段。 |
| 0x0a (b'001010') | CA 认证 | 在进行企业级加密时提供 CA 认证。 | 请参考备注 2。 |
| 0x0b (b'001011') | 客户端认证 | 在进行企业级加密时提供客户端认证。是否包含私钥，取决于认证的内容。 | 请参考备注 2。 |
| 0x0c (b'001100') | 服务端认证 | 在进行企业级加密时提供服务端认证。是否包含私钥，取决于认证的内容。 | 请参考备注 2。 |
| 0x0d (b'001101') | 客户端私钥 | 在进行企业级加密时提供客户端私钥。 | 请参考备注 2。 |
| 0xe (b'001110') | 服务端私钥 | 在进行企业级加密时提供服务端私钥。 | 请参考备注 2。 |
| 0x10 (b'001111') | Wi-Fi 连接状态报告 | 通知手机 ESP 设备的 Wi-Fi 状态，包括 STA 状态和 SoftAP 状态。用于 STA 设备连接手机或 SoftAP。但是，当手机接收 Wi-Fi 状态时，除了本帧之外，还可以回复其他帧。 | data[0] 表示 opmode，包括：
  - 0x00: NULL
  - 0x01: STA
  - 0x02: SoftAP
  - 0x03: SoftAP & STA |

**备注：**

- 0x11: STA 设备的连接状态
- 0x21: STA 设备连接状态，0x0 表示处于连接状态并获取 IP 地址；0x1 表示处于连接状态但未获取 IP 地址；0x2 表示处于正在连接状态；0x3 表示处于连接状态但未获取 IP 地址。
备注：
- 备注 1: 数据的长度取决于数据长度字段。若传输方向是从 ESP 设备到手机，则表示向手机端提供所需信息。
- 备注 2: 数据的长度取决于数据长度字段。如果数据长度不够，该帧可用分片。

2. Frame Control
帧控制字段，占 1 字节，每个位表示不同含义。

<table>
<thead>
<tr>
<th>位</th>
<th>含义</th>
</tr>
</thead>
</table>
| 0x01 | 表示帧是否加密。
- 1 表示加密。
- 0 表示未加密。
该帧的加解密部分包括数据字段加密之前的完整明文数据（不包括校验部分）。控制帧暂不加密，故控制帧此位为 0。 |
| 0x02 | 该数据字段表示帧尾是否包含校验位，如 SHA1、MD5、CRC 等。该数据字段包含序列、数据长度以及明文。控制帧和数据帧都可以选择包含或不包含校验位。 |
| 0x04 | 表示数据方向。
- 0 表示传输方向是从手机到 ESP 设备。
- 1 表示传输方向是从 ESP 设备到手机。 |
| 0x08 | 表示是否要求对方回复 ACK。
- 0 表示不要求回复 ACK。
- 1 表示要求回复 ACK。 |
| 0x10 | 表示是否有后续的数据分片。
- 0 表示此帧没有后续数据分片。
- 1 表示还有后续数据分片，用来传输较长的数据。
对于分片帧，在数据字段的前两个字节中，会给出当前数据字节和随后内容部分的总长度（即最大支持 64K 的数据内容）。 |
| 0x10-0x80 | 保留 |

3. 序列控制
序列控制字段。帧发送时，无论帧的类型是什么，序列都会自动加 1，用来防止重放攻击 (Replay Attack)。每次重新连接后，序列清零。

4. 长度
数据字段的长度，不包含校验部分。

5. 数据
对于不同的类型或子类型，数据字段的含义均不同。请参考上方表格。

6. 校验
此字段占两个字节，用来校验序列、数据长度以及明文。

### 4.3.5 ESP32 端的安全实现

1. 数据安全
为了保证 Wi-Fi SSID 和密码的传输过程是安全的，需要使用对称加密算法 (例如 AES、DES 等) 对报文进行加密。在使用对称加密算法之前，需要使用非对称加密算法 (DH、RSA、ECC 等) 协商出 (或生成出) 一个共享密钥。

2. 保证数据完整性
为了保证数据完整性，需要加入校验算法，例如 SHA1、MD5、CRC 等。

3. 身份安全（签名）
某些算法如 RSA 可以保证身份安全。但如 DH 这类的算法，本身不能保证身份安全，需要添加其他算法来签名。

4. 防止重放攻击 (Replay Attack)
添加其到序列字段中，并且在数据校验过程中使用。
在 ESP32 端的代码中，你可以决定和开发加密密钥协商等安全处理的流程。手机应用向 ESP32 发送协商数据，数据会传送给应用层处理，如果应用层不处理，可使用 BluFi 提供的 DH 加密算法来协商密钥。

应用层需向 BluFi 注册以下几个与安全相关的函数:

```c
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)
```

该函数用来接收协商期间的正常数据(normal data)，数据处理完成后，需要将待发送的数据使用 output_data 和 output_len 传出。

BluFi 会在调用前 Negotiate_data_handler 后，发送 Negotiate_data_handler 传回的 output_data。

这里的两个 “*” 是因为需要发出去的数据长度未知，所以需要函数自行分配 (malloc) 或者指向全局变量，并告知是否需要通过 NEED_FREE 释放内存。

```c
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)
```

加密和解密的数据长度必须一致。其中 IV8 为帧的 8 位序列，可作为 IV 的某 8 个位来使用。

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```

该函数用来进行校验，返回值为校验的值。BluFi 会使用该函数返回值与帧的校验值进行比较。

### 4.3.6 GATT 相关说明

**UUID**

BluFi Service UUID：0xFFFF，16 bit

BluFi（手机 -> ESP32）特性：0xFF01，主要权限：可写

BluFi（ESP32 -> 手机）特性：0xFF02，主要权限：可读可通知

### 4.4 引导加载程序 (Bootloader)

ESP-IDF 软件引导加载程序 (Bootloader) 主要执行以下任务:

1. 内部模块的最简化初始配置
2. 如果配置了 Flash 加密和/或 Secure，则对其进行初始化
3. 根据分区表和 ota_data (如果存在) 选择需要引导的应用程序 (app) 分区
4. 将此应用程序映象加载到 RAM (IRAM 和 DRAM) 中，最后把控制权转交给此应用程序

引导加载程序位于 flash 的 0x1000 偏移地址处。

关于启动过程以及 ESP-IDF 引导加载程序的更多信息，请参考 [应用程序的启动流程](#)

### 4.4.1 引导加载程序兼容性

建议使用最新发布的 ESP-IDF 版本。OTA（空中升级）更新可以在现场烧录新的应用程序,但不能烧录一个新的引导加载程序。因此，引导加载程序支持引导从 ESP-IDF 新版本中构建的应用程序。
但不支持引导从 ESP-IDF 旧版本中构建的程序。如果现有产品可能需要将应用程序降级到旧版本，那么在手动更新 ESP-IDF 时，请继续使用旧版本 ESP-IDF 引导加载程序的二进制文件。

备注：如果在生产中测试现有产品的 OTA 更新，请确保测试中使用的 ESP-IDF 引导加载程序二进制文件与生产中部署的相同。

ESP-IDF V2.1 之前的版本

与新版本相比，ESP-IDF V2.1 之前的版本构建的引导加载程序对硬件的配置更少。使用这些早期 ESP-IDF 版本的引导加载程序并构建新应用程序时，请启用配置选项 `CONFIG_APP_COMPATIBLE_PRE_V2_I_BOOTLOADERS`。

ESP-IDF V3.1 之前的版本

ESP-IDF V3.1 之前的版本构建的引导加载程序不支持分区表二进制文件中的 MD5 校验。使用这些 ESP-IDF 版本的引导加载程序并构建新应用程序时，请启用配置选项 `CONFIG_APP_COMPATIBLE_PRE_V3_I_BOOTLOADERS`。

配置 SPI Flash

每个 ESP-IDF 应用程序或引导加载程序的二进制文件中都包含一个文件头，其中内置了 `CONFIG_ESPTOOLPY_FLASHMODE`、`CONFIG_ESPTOOLPY_FLASHFREQ` 和 `CONFIG_ESPTOOLPY_FLASHSIZE`。这些是用于在启动时配置 SPI flash。ROM 中的一级引导程序从 flash 中读取二级引导程序文件头中配置信息，并使用这些信息来加载剩余的二级引导程序。然而，此时系统的时钟速度低于其被配置的速度，并且在这个阶段，只支持部分 flash 模式。因此，当二级引导程序运行时，它会从当前应用程序的二进制文件头中读取数据（而不是从引导加载程序的文件头中读取数据），并使用这些数据重新配置 flash。这样的配置流程可让 OTA 更新去更改当前使用的 SPI flash 的配置。

ESP-IDF V4.0 版本之前的引导加载程序使用其自身的文件头来配置 SPI flash，这意味着无法在 OTA 更新时更改 SPI flash 配置。为了与旧引导加载程序兼容，应用程序在其启动期间使用应用程序文件头中的配置信息重新初始化 flash 配置。

4.4.2 日志级别

引导加载程序日志的级别默认为“Info”。通过设置 `CONFIG_BOOTLOADER_LOG_LEVEL` 选项，可以增加或减少这个等级。这个日志级别与应用程序中使用的日志级别是分开的（见 Logging library）。

降低引导加载程序日志的详细程度可以稍微缩短整个项目的启动时间。

4.4.3 恢复出厂设置

在更新出现问题时，最好能有一种方法让设备回到已知的正常状态。这时可选择恢复出厂设置。

要回到原始出厂设置并清除所有用户设置，请在引导加载程序中配置 `CONFIG_BOOTLOADER_FACTORY_RESET`。

以下两种方式可以使设备恢复出厂设置。

- 清除一个或多个数据分区。`CONFIG_BOOTLOADER_DATA_FACTORY_RESET` 选项允许用户选择哪些数据分区在恢复出厂设置时需要被擦除。
- 用户可以使用以逗号分隔的列表形式指定分区的名称。为了提高可读性，可以选择添加空格（如：nvs, phy_init, nvs_custom）。

请确保选项里指定的分区名称和分区表中的名称相同。此处不能指定“app”类型的分区。
从“工厂”应用分区启动。当启用 CONFIG_BOOTLOADER_OTA_DATA_ERASE 选项，恢复出厂设置后，设备将从默认的“工厂”应用分区启动（如果分区表中没有“工厂”应用分区，则从默认的OTA应用分区启动）。这个恢复过程是通过擦除OTA数据分区来完成的，OTA数据分区中保存了当前选择的OTA分区槽。“工厂”应用分区槽（如果存在）永远不会通过OTA更新，因此重置为从“工厂”应用分区启动则意味着让固件应用程序恢复正常状态。

这两个配置选项都可以独立启用。

此外，下列配置选项用于配置触发恢复出厂设置的条件：

- **CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**: 输入管脚 (GPIO) 的编号。该管脚用于触发恢复出厂设置。必须在重置时将此管脚拉低或拉高（可配置）才能触发出厂重置事件。
- **CONFIG_BOOTLOADER_HOLD_TIME_GPIO**: 管脚电平保持时间（默认为5秒）。设备重置后，管脚电平必须保持该设定的时间，才能执行恢复出厂设置或引导测试分区（如适用）。
- **CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL**: 设置管脚电平高低。设备重置后，根据此设置将管脚拉高或拉低，才能触发出厂重置事件。如果管脚具有内部上拉，则上拉会在管脚采样前生效。有关管脚内部上拉的详细信息，请参考 ESP32 的技术规格书。

### 4.4.4 从测试固件启动

用户可以编写特殊固件用于生产环境中测试，并在需要的时候运行。此时需要在项目分区表中专门申请一块分区用于保存该测试固件，其类型为 app，子类型为 test（详情请参考分区表）。

实现该测试应用固件需要为测试应用创建一个完全独立的 ESP-IDF 项目（ESP-IDF 中的每个项目仅构建一个应用）。该测试应用可以独立于主项目进行开发和测试，然后在生成测试时作为一个预编译的 bin 文件集成到主项目的测试应用程序分区的地址。

为了使主项目的引导加载程序支持这个功能，请设置 CONFIG_BOOTLOADER_APP_TEST 并配置以下两个选项：

- **CONFIG_BOOTLOADER_NUM_PIN_APP_TEST** - 设置启动 TEST 分区的管脚编号。选中的管脚将被配置为启动了内部上拉的输入，要触发测试应用，必须在重置时将此管脚拉低。

  当管脚输入被释放（则被拉高）并将设备重新启动后，正常配置的应用程序将启动（工厂或任意 OTA 应用分区槽）。

- **CONFIG_BOOTLOADER_HOLD_TIME_GPIO** - 设置 GPIO 电平保持的时间（默认为5秒）。设备重置后，管脚在设定的时间内必须持续保持低电平，然后才会执行出厂重置或引导测试分区（如适用）。

### 4.4.5 回滚

回滚和反回滚功能也必须在引导程序中配置。

请参考 OTA API 参考文档 中的应用程序回滚 和防回滚 章节。

### 4.4.6 看门狗

默认情况下，硬件 RTC 看门狗定时器在引导加载程序运行时保持运行。如果9秒后没有应用程序成功启动，它将自动重置芯片。

- 可以通过设置 CONFIG_BOOTLOADER_WDT_TIME_MS 并重新编译引导加载程序来调整超时时间。
- 可以通过调整应用程序的行为使 RTC 看门狗在应用程序启动后保持启动。看门狗需要由应用程序显示地重置（即“喂狗”），以避免重置。为此，请设置 CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE 选项，根据需要修改应用程序，然后重新编译应用程序。
- 通过禁用 CONFIG_BOOTLOADER_WDT_ENABLE 设置并重新编译引导加载程序，可以在引导加载程序中禁用 RTC 看门狗，但并不建议这样做。
4.4.7 引导加载程序大小

当前需要启用额外的引导加载程序功能，包括 Flash 回密或安全启动，尤其是设置高级别的 CONFIG_BOOTLOADER_LOG_LEVEL 时，监控引导加载程序.bin 文件的大小变得非常重要。

当使用默认的 CONFIG_PARTITION_TABLE_OFFSET 值 0x8000 时，二进制文件最大可为 0x7000 (28672) 字节。

如果引导加载程序二进制文件过大，则引导加载程序会构建失败并显示“Bootloader binary size [...] is too large for partition table offset”的错误。如果此二进制文件已经被烧录，那么 ESP32 将无法启动 - 日志中将记录无效分区表或无效引导加载程序校验和的错误。

可以使用如下方法解决此问题:

- 将 bootloader 编译器优化 重新设置回默认值“Size”。
- 降低引导加载程序日志级别。将日志级别设置为 Warning, Error 或 None 都会显著减少最终二进制文件的大小（但也可能会让调试变得更加困难）。
- 将 CONFIG_PARTITION_TABLE_OFFSET 设置为高于 0x8000 的值，以便稍后将分区表放置在 flash 中，这样可以增加引导加载程序的可用空间。如果分区表的 CSV 文件包含明确的分区偏移量，则需要修改这些偏移量，从而保证没有分区的偏移量低于 CONFIG_PARTITION_TABLE_OFFSET + 0x1000。（这包括随 ESP-IDF 提供的默认分区 CSV 文件）

当启用 Secure Boot V2 时，由于引导加载程序最先加载到固定大小的缓冲区中进行验证，对二进制文件大小的绝对限制为 48KB（0xC000 bytes）（不包括 4 KB 签名）。

4.4.8 从深度睡眠中快速启动

引导加载程序有 CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP 选项，可以减少从深度睡眠中唤醒的时间（有利于降低功耗）。当 CONFIG_SECURE_BOOT 选项禁用时，该选项可用。由于无需镜像校验，唤醒时间减少。在第一次启动时，引导加载程序将启动的应用程序的地址存储在 RTC FAST 存储器中。而在唤醒过程中，这个地址用于启动而无需任何检查，从而实现了快速加载。

4.4.9 自定义引导加载程序

用户可以扩展或修改当前的引导加载程序，具体有两种方法：使用钩子实现或重写覆盖当前程序。这两种方法在 ESP-IDF 示例的 custom_bootloader 文件夹中都有呈现。

- bootloader_hooks 介绍了如何将钩子与引导加载程序初始化连接。
- bootloader_override 介绍了如何覆盖引导加载程序的实现。

在引导加载程序的代码中，用户不能使用其他组件提供的驱动和函数，如果确实需要，请将该功能的实现部分放在项目中的 bootloader_components 目录中（注意，这会增加引导加载程序的大小）。

如果引导加载程序过大，则可能与内存中的分区表重叠，分区表默认烧录在偏移量 0x8000 处。增加分区表偏移量，将分区表放在 flash 中靠后的区域，这样可以增加引导程序的可用空间。

4.5 构建系统

本文档主要介绍 ESP-IDF 构建系统的实现原理以及组件等相关概念。如您想了解如何组织和构建新的 ESP-IDF 项目或组件，请阅读本文档。

4.5.1 概述

一个 ESP-IDF 项目可以看作是多个不同组件的集合，例如一个显示当前湿度的网页服务器会包含以下组件：

- ESP-IDF 基础库，包括 libc、ROM bindings 等
• Wi-Fi 驱动
• TCP/IP 协议栈
• FreeRTOS 操作系统
• 网页服务器
• 湿度传感器的驱动
• 负责将上述组件整合到一起的主程序

ESP-IDF 可以显式地指定和配置每个组件。在构建项目的时候，构建系统会前往 ESP-IDF 目录，项目目录和用户自定义组件目录（可选）中查找所有组件，允许用户通过文本菜单系统配置 ESP-IDF 项目中用到的每个组件。在所有组件配置结束后，构建系统开始编译整个项目。

概念

• 项目特指一个目录，其中包含了构建可执行应用程序所需的全部文件和配置，以及其他支持型文件，例如分区表、数据/文件系统分区和引导程序。
• 项目配置保存在项目根目录下名为 sdkconfig 的文件中，可以通过 idf.py menuconfig 进行修改，且一个项目只能包含一个项目配置。
• 应用程序由 ESP-IDF 构建得到的可执行文件。一个项目通常会构建两个应用程序：项目应用程序（可执行的主文件，即用户自定义的固件）和引导程序（启动并初始化项目应用程序）。
• 组件是模块化且独立的代码，会被编译成静态库 (.a 文件) 并链接到应用程序。部分组件由 ESP-IDF 官方提供，其他组件则来源于其它开源项目。
• 目标特指运行构建后应用程序的硬件设备。运行 idf.py --list-targets 可以查看当前 ESP-IDF 版本中支持目标的完整列表。

请注意，以下内容并不属于项目的组成部分：

• ESP-IDF 并不是项目的一部分，它独立于项目。通过 IDF_PATH 环境变量（保存 esp-idf 目录的路径）链接到项目，从而将 IDF 框架与项目分离。
• 交叉编译工具链并不是项目的组成部分。它应该被安装在系统 PATH 环境变量中。

4.5.2 使用构建系统

idf.py

idf.py 命令行工具提供了一个前端，可以帮助您轻松管理项目的构建过程。它管理了以下工具：

• CMake，配置待构建的项目
• Ninja，用于构建项目
• esptool.py，烧录目标硬件设备

可通过 idf.py 配置构建系统，具体可参考相关文档。

直接使用 CMake

为了方便，idf.py 已经封装了 CMake 命令，但是您愿意，也可以直接调用 CMake。

当 idf.py 在执行某些操作时，它会打印出其运行的每条命令以便参考。例如运行 idf.py build 命令与在 bash shell（或者 Windows Command Prompt）中运行以下命令是相同的：

```
mkdir -p build
cd build
cmake .. -G Ninja  # 或者 'Unix Makefiles'
ninja
```

在上面的命令列表中，cmake 命令对项目进行配置，并生成用于最终构建工具的构建文件。在这个例子中，最终构建工具是 Ninja: 运行 ninja 来构建项目。

没有必要多次运行 cmake。第一次构建后，往后每次只需运行 ninja 即可。如果项目需要重新配置，ninja 会自动重新调用 cmake。
若在 CMake 中使用 ninja 或 make，则多数 idf.py 子命令也会有其对应的目标，例如在构建目录下运行 make menuconfig 或 ninja menuconfig 与运行 idf.py menuconfig 是相同的。

备注：如果您已经熟悉了 CMake，那么可能会发现 ESP-IDF 的 CMake 构建系统不同寻常，为了减少样板文件，该系统封装了 CMake 的许多功能。请参考编写 CMake 组件以编写更多 “CMake 风格” 的组件。

使用 Ninja/Make 来烧录 您可以直接使用 ninja 或 make 运行如下命令来构建项目并烧录:

<table>
<thead>
<tr>
<th>命令</th>
</tr>
</thead>
<tbody>
<tr>
<td>ninja flash</td>
</tr>
<tr>
<td>或：</td>
</tr>
<tr>
<td>make app-flash</td>
</tr>
</tbody>
</table>

可用的目的还包括：flash、app-flash（仅用于 app)、bootloader-flash（仅用于 bootloader)。以这种方式烧录时，可以通过设置 ESPPORT 和 ESPBAUD 环境变量来指定串口设备和波特率。您可以在操作系统或 IDE 项目中设置该环境变量，或者直接在命令行中进行设置:

<table>
<thead>
<tr>
<th>命令</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESPPORT=/dev/ttyUSB0 ninja flash</td>
</tr>
</tbody>
</table>

备注：在命令的开头为环境变量赋值属于 Bash shell 的语法，可在 Linux、macOS 和 Windows 的类 Bash shell 中运行，但在 Windows Command Prompt 中无法运行。

<table>
<thead>
<tr>
<th>命令</th>
</tr>
</thead>
<tbody>
<tr>
<td>或：</td>
</tr>
<tr>
<td>make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000</td>
</tr>
</tbody>
</table>

备注：在命令末尾为变量赋值属于 make 的语法，适用于所有平台的 make。

在 IDE 中使用 CMake

您还可以使用集成了 CMake 的 IDE，仅需将项目 CMakeLists.txt 文件的路径告诉 IDE 即可。集成 CMake 的 IDE 通常会有自己的构建工具 (CMake 称之为 “生成器”)，它是组成 IDE 的一部分，用来构建源文件。

向 IDE 中添加除 build 目标以外的自定义目标（如添加 “Flash” 目标到 IDE）时，建议调用 idf.py 命令来执行这些 “特殊” 的操作。

有关将 ESP-IDF 同 CMake 集成到 IDE 中的详细信息，请参阅构建系统的元数据。

设置 Python 解释器

ESP-IDF 适用于 Python 3.7 以上版本。

idf.py 和其他的 Python 脚本会使用默认的 Python 解释器运行。如 python。您可以通过 python3 $IDF_PATH/tools/idf.py ... 命令切换到别的 Python 解释器，或者您可以通过设置 shell 别名或其他脚本来简化该命令。

如果直接使用 CMake，运行 cmake -D PYTHON=python3 ...，CMake 会使用传入的值覆盖默认的 Python 解释器。

如果使用集成 CMake 的 IDE，可以在 IDE 的图形用户界面中给名为 PYTHON 的 CMake cache 变量设置新的值来覆盖默认的 Python 解释器。
如果想在命令行中更优雅地管理 Python 的各个版本，请查看 pyenv 或 virtualenv 工具，它们会帮助您更改默认的 python 版本。

4.5.3 示例项目

示例项目的目录树结构可能如下所示:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
    - Kconfig
      - src1.c
    - component2/
      - Kconfig
      - src1.c
      - include/
    - main/
      - CMakeLists.txt
      - src1.c
      - src2.c
    - build/
```

该示例项目“myProject”包含以下组成部分:

- 顶层项目 CMakeLists.txt 文件，这是 CMake 用于学习如何构建项目的主要文件，可以在这个文件中设置项目全局的 CMake 参数。顶层项目 CMakeLists.txt 文件会导入/tools/cmake/project.cmake 文件，由它负责实现构建系统的其余部分。该文件最后会设置项目的名称，并定义该项目。
- “sdkconfig”配置文件，执行 idf.py menuconfig 时会创建或更新此文件，文件中保存了项目中所有组件（包括 ESP-IDF 本身）的配置信息。sdkconfig 文件可能会也可能不会被添加到项目的源码管理系统中。
- 可选的“components”目录中包含了项目的各个自定义组件，并不是每个项目都需要这种自定义组件，但它有助于构建可复用的代码或者构建第三方（不属于 ESP-IDF）的组件。或者，您也可以在顶层 CMakeLists.txt 中设置 EXTRA_COMPONENT_DIRS 变量以查找其他自定义组件。
- “main”目录是一个特殊的组件，它包含项目本身的源代码。main 是默认名称。CMake 变量 COMPONENT_DIRS 默认包含此组件，但您可以修改此变量。有关详细信息，请参阅命名 main 组件。如果项目中源文件较多，建议将其归于组件中，而不是全部放在“main”中。
- “build”目录是存放构建输出的地方，如果没有此目录，idf.py 会自动创建。CMake 会配置项目，并在此目录下生成临时的构建文件。随后，在主构建过程的运行期间，该目录还会保存临时目标文件、库文件以及最后输出的二进制文件。此目录通常不会添加到项目的源码管理系统中，也不会随项目源码一同发布。

每个组件目录都包含一个 CMakeLists.txt 文件，里面会定义一些变量以控制该组件的构建过程，以及其与整个项目的集成。更多详细信息请参阅组件 CMakeLists 文件。

每个组件还可以包含一个 Kconfig 文件，它用于定义 menuconfig 时显示的组件配置选项。某些组件可能还会包含 Kconfig.projbuild 和 project_include.cmake 特殊文件，它们用于覆盖项目的其他部分。

4.5.4 项目 CMakeLists 文件

每个项目都有一个顶层 CMakeLists.txt 文件，包含整个项目的构建设置。默认情况下，项目 CMakeLists 文件会非常小。

最小 CMakeLists 文件示例

最小项目:
必要部分

每个项目都要按照上面显示的顺序添加上述三行代码:

- `cmake_minimum_required(VERSION 3.16)` 必须放在 CMakeLists.txt 文件的第一行，它会告诉 CMake 构建该项目所需的最小版本号。ESP-IDF 支持 CMake 3.16 或更高的版本。
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` 会导入 CMake 的其余功能来完成配置项目、检测组件等任务。
- `project(myProject)` 会创建项目本身，并指定项目名称。该名称会作为最终输出的二进制文件的名字，即 myProject.elf 和 myProject.bin。每个 CMakeLists 文件只能定义一个项目。

可选的项目变量

以下这些变量都有默认值，用户可以覆盖这些变量值以自定义构建行为。更多实现细节，请参阅 /tools/cmake/project.cmake 文件。

- `COMPONENT_DIRS`：组件的搜索目录，默认为 IDF_PATH/components、PROJECT_DIR/components、和 `EXTRA_COMPONENT_DIRS`。如果您不想在这些位置搜索组件，请覆盖此变量。
- `EXTRA_COMPONENT_DIRS`：用于搜索组件的其它可选目录列表。路径可以是相对于项目目录的相对路径，也可以是绝对路径。
- `COMPONENTS`：要构建项目中的组件名称列表，默认为 `COMPONENT_DIRS` 目录下搜索到的所有组件。使用此变量可以“精简”项目以缩短构建时间。请注意，如果一个组件通过 `COMPONENT_REQUIRES` 指定了它依赖的另一个组件，则会自动将其添加到 `COMPONENTS` 中，所以 `COMPONENTS` 列表可能会非常短。

以上变量中的路径可以是绝对路径，或者是相对于项目目录的相对路径。

请使用 cmake 中的 `set` 命令来设置这些变量，如 `set(VARIABLE "VALUE")`。请注意，`set()` 命令需放在 `include(...)` 之前，`cmake_minimum(...)` 之后。

重命名 main 组件

构建系统会对 main 组件进行特殊处理。假如 main 组件位于预期的位置（即 $PROJECT_PATH/main），那么它会被自动添加到构建系统中。其他组件也会作为其依赖项被添加到构建系统中，这使用户免于处理依赖关系，并提供即时可用的构建功能。重命名 main 组件会略微上述这些步骤。组件名称、重命名 main组件的步骤如下:

1. 重命名 main 目录。
2. 在项目 CMakeLists.txt 文件中设置 `EXTRA_COMPONENT_DIRS`，并添加重命名后的 main 目录。
3. 在组件的 CMakeLists.txt 文件中设置 `COMPONENT_REQUIRES` 或 `COMPONENT_PRIV_REQUIRES` 以指定依赖项。

覆盖默认的构建规范

构建系统设置了一些全局的构建规范（编译标志、定义等），这些规范可用于编译来自所有组件的所有源文件。

例如，其中一个默认的构建规范是编译选项 Wextra。假设一个用户想用 Wno-extra 来覆盖这个选项，应在 `project()` 之后进行:
这确保了用户设置的编译选项不会被默认的构建规范所覆盖，因为默认的构建规范是在 project() 内设置的。

4.5.5 组件 CMakeLists 文件

每个项目都包含一个或多个组件，这些组件可以是 ESP-IDF 的一部分，可以是项目自身组件目录的一部分，也可以从自定义组件目录添加（见上文）。

组件是 COMPONENT_DIRS 列表中包含 CMakeLists.txt 文件的任何目录。

搜索组件

搜索 COMPONENT_DIRS 中的目录列表以查找项目的组件，此列表中的目录可以是组件自身（即包含 CMakeLists.txt 文件的目录），也可以是子目录为组件的顶级目录。

当 CMake 运行项目配置时，它会记录本次构建包含的组件列表，它可用于调试某些组件的添加/排除。

同名组件

ESP-IDF 在搜索所有待构建的组件时，会按照 COMPONENT_DIRS 指定的顺序依次进行，这意味着在默认情况下，首先搜索 ESP-IDF 内部组件（IDF_PATH/components），然后是 EXTRA_COMPONENT_DIRS 中的组件。最后是项目组件（PROJECT_DIR/components）。如果这些目录中的两个或者多个包含具有相同名字的组件，则使用搜索到最后一个位置的组件。这就允许将组件复制到项目目录中再修改以覆盖 ESP-IDF 组件，如果使用这种方式，ESP-IDF 目录本身可以保持不变。

备注：如果在现有项目中通过将组件移动到一个新位置来覆盖它，项目不会自动看到新组件的路径。请运行 idf.py reconfigure 命令后（或删除项目构建文件夹）再重新构建。

最小组件 CMakeLists 文件

最小组件 CMakeLists 文件通过使用 idf_component_register 将组件添加到构建系统中。

```cmake
idf_component_register(SRCS "foo.c" "bar.c" INCLUDE_DIRS "include" REQUIRES mbedtls)
```

- SRCS 是源文件列表（*.c、*.cpp、*.cc、*.S），里面所有的源文件都将编译进组件库中。
- INCLUDE_DIRS 是目录列表，里面的路径会被添加到所有需要该组件的组件（包括 main 组件）全局 include 搜索路径中。
- REQUIRES 实际上并不是必需的，但通常需要它来声明该组件需要使用哪些其它组件，请参考组件依赖。

上述命令会构建生成与组件同名的库，并最终被链接到应用程序中。

上述目录通常设置为相对于 CMakeLists.txt 文件的相对路径。当然也可以设置为绝对路径。

还有其它参数可以传递给 idf_component_register，具体可参考 here。

有关更完整的 CMakeLists.txt 示例，请参阅组件依赖示例 和组件 CMakeLists 示例。
预设的组件变量

以下专用于组件的变量可以在组件 CMakeLists 中使用，但不建议修改：

- COMPONENT_DIR: 组件目录，即包含 CMakeLists.txt 文件的绝对路径，它与
  CMAKE_CURRENT_SOURCE_DIR 变量一致，路径中不能包含空格。
- COMPONENT_NAME: 组件名，与组件目录名相同。
- COMPONENT_ALIAS: 库别名，由构建系统在内部为组件创建。
- COMPONENT_LIB: 库名，由构建系统在内部为组件创建。

以下变量在配置级别中被设置，但可在组件 CMakeLists 中使用：

- CONFIG_*: 项目配置中的每个值在 cmake 中对应一个以 CONFIG_ 开头的变量，更多详细信息
  请参阅 Kconfig。
- ESP_PLATFORM: ESP-IDF 构建系统处理 CMake 文件时，其值设为 1。

构建/项目变量

以下是可作为构建属性的构建/项目变量，可通过组件 CMakeLists.txt 中的 idf_build_get_property
查询其变量值。

- PROJECT_NAME: 项目名，在项目 CMakeLists.txt 文件中设置。
- PROJECT_DIR: 项目目录（包含项目 CMakeLists 文件）的绝对路径，与
  CMAKE_SOURCE_DIR 变量相同。
- COMPONENTS: 此次构建中包含的所有组件的名称，具体格式为用分号隔开的 CMake 列表。
- IDF_VER: ESP-IDF 的 git 版本号，由 git describe 命令生成。
- IDF_VERSION_MAJOR、IDF_VERSION_MINOR、IDF_VERSION_PATCH: ESP-IDF 的组件版本，
  可用于条件表达式。请注意这些信息的精确度不如 IDF_VER 变量，版本号 v4.0-dev-*, v4.0-
  beta1, v4.0-rc1 和 v4.0 对应的 IDF_VERSION_* 变量值是相同的，但是 IDF_VER 的值是
  不同的。
- IDF_TARGET: 项目的硬件目标名称。
- PROJECT_VER: 项目版本号。
  - 如果设置 CONFIG_APP_PROJECT_VER_FROM_CONFIG 选项，将会使用
    CONFIG_APP_PROJECT_VER 的值。
  - 或者，如果在项目 CMakeLists.txt 文件中设置了 PROJECT_VER 变量，则该变量值可以使用。
  - 或者，如果 PROJECT_DIR/version.txt 文件存在，其内容会用作 PROJECT_VER 的值。
  - 或者，如果项目位于某个 Git 仓库中，则使用 git describe 命令的输出作为 PROJECT_VER
    的值。
  - 否则 PROJECT_VER 的值为 1。
- EXTRA_PARTITION_SUBTYPES: CMake 列表，用于创建额外的分区子类型。子类型的描述由字
  符串组成，以逗号为分隔，格式为 type_name, subtype_name, numeric_value。组件可通过
  此列表，添加新的子类型。
其它与构建属性有关的信息请参考这里。

组件编译控制

在编译特定组件的源文件时，可以使用 target_compile_options 函数来传递编译器选项:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

如果给单个源文件指定编译器标志，可以使用 CMake 的 set_source_files_properties 命令:

```cmake
set_source_files_properties(mysrc.c
  PROPERTIES COMPILE_FLAGS
  -Wno-unused-variable)
```

如果上游代码在编译的时候发出了警告，那么这样做可能会很有效。

请注意，上述两条命令只能在组件 CMakeLists 文件的 idf_component_register 命令之后调用。

Espressif Systems 2135 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
4.5.6 组件配置

每个组件都可以包含一个 Kconfig 文件，和 CMakeLists.txt 放在同一目录下。Kconfig 文件中包含要添加到该组件配置菜单中的一些配置设置信息。

运行 menuconfig 时，可以在 Component Settings 菜单栏下找到这些设置。

创建一个组件的 Kconfig 文件，最简单的方法就是使用 ESP-IDF 中现有的 Kconfig 文件作为模板，在这基础上进行修改。

有关示例请参阅添加条件配置。

4.5.7 预处理器定义

ESP-IDF 构建系统会在命令行中添加以下 C 预处理器定义:

- ESP_PLATFORM：可以用来检测在 ESP-IDF 内发生了构建行为。
- IDF_VER：定义 git 版本字符串，例如: v2.0 用于标记已发布的版本，v1.0-275-g0efaa4f 则用于标记任意某次的提交记录。

4.5.8 组件依赖

编译各个组件时，ESP-IDF 系统会递归评估其依赖项。这意味着每个组件都需要声明它所依赖的组件，即“requires”。

编译组件

```c
idf_component_register(...
    REQUIREES mbedtls
    PRIV_REQUIRES console spiffs)
```

- REQUIREES 需要包含所有在当前组件的公共头文件里 #include 的头文件所在的组件。
- PRIV_REQUIRES 需要包含被当前组件的源文件 #include 的头文件所在的组件 (除非已经被设置在了 REQUIREES 中)。以及是当前组件正常工作必须要链接的组件。
- REQUIREES 和 PRIV_REQUIRES 的值不能依赖于任何配置选项(CONFIG_xxx 宏)，这是因为在配置加载之前，依赖关系就已经被展开。其它组件变量 (比如包含路径或源文件) 可以依赖配置选择。
- 如果当前组件除了通用组件依赖项 中设置的通用组件（比如 RTOS, libc 等）外，并不依赖其它组件，那么对于上述两个 REQUIREES 变量，可以选择其中一个或是两个都不设置。

如果组件仅支持某些硬件目标（IDF_TARGET 的值），则可以在 idf_component_register 中指定 REQUIRED_IDF_TARGETS 来声明这个需求。在这种情况下，如果构建系统导入了不支持当前硬件目标的组件时就会报错。

备注：在 CMake 中，REQUIREES 和 PRIV_REQUIRES 是 CMake 函数 target_link_libraries(... PUBLIC ...) 和 target_link_libraries(... PRIVATE ...) 的近似包装。

组件依赖示例

假设现在有一个 car 组件，它需要使用 engine 组件，而 engine 组件需要使用 spark_plug 组件:

```bash
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
    - car.c
    - car.h
```

(下页继续)
**Car组件** car.h 头文件是 car 组件的公共接口。该头文件直接包含了 engine.h, 这是因为它需要使用 engine.h 中的一些声明:

```c
/* car.h */
#include "engine.h"

#ifndef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

同时 car.c 也包含了 car.h:

```c
/* car.c */
#include "car.h"
```

这代表文件 car/CMakeLists.txt 需要声明 car 需要 engine:

```c
idf_component_register(SRCS "car.c"
  INCLUDE_DIRS "."
  REQUIRES engine)
```

- SRCS 提供 car 组件中源文件列表。
- INCLUDE_DIRS 提供该组件公共头文件目录列表，由于 car.h 是公共接口，所以这里列出了所有包含了 car.h 的目录。
- REQUIRES 给出该组件的公共接口所需的组件列表。由于 car.h 是一个公共头文件并且包含了来自 engine 的头文件，所以我们这里包含 engine。这样可以确保任何包含 car.h 的其他组件也能递归地包含所需的 engine.h。

**Engine组件** engine 组件也有一个公共头文件 include/engine.h，但这个头文件更为简单:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start (void);
```

在 engine.c 中执行:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

在该组件中，engine 依赖于 spark_plug, 但这是私有依赖关系。编译 engine.c 需要 spark_plug.h 但不需要包含 engine.h。

这代表文件 engine/CMakeLists.txt 可以使用 PRIV_REQUIRES:

```c
idf_component_register(SRCS "engine.c"
  INCLUDE_DIRS "include"
  PRIV_REQUIRES spark_plug)
```
因此，car 组件中的源文件不需要在编译器搜索路径中添加 spark_plug include 目录。这可以加快编译速度，避免编译器命令行过多的冗长。

**Spark Plug 组件**
spark_plug 组件没有依赖项，它有一个公共头文件 spark_plug.h，但不包含其他组件的头文件。

这代表 spark_plug/CMakeLists.txt 文件不需要任何 REQUIRES 或 PRIV_REQUIRES:

```
idf_component_register(SRCS "spark_plug.c"
            INCLUDE_DIRS ".")
```

**源文件 Include 目录**
每个组件的源文件都是用这些 Include 路径目录编译的，这些路径在传递给 idf_component_register 的参数中指定:

```
idf_component_register(. .
            INCLUDE_DIRS "include"
            PRIV_INCLUDE_DIRS "other")
```

- 当前组件的 INCLUDE_DIRS 和 PRIV_INCLUDE_DIRS。
- REQUIRES 和 PRIV_REQUIRES 参数指定的所有其他组件（即当前组件的所有公共和私有依赖项）所设置的 INCLUDE_DIRS。
- 递归列出所有组件 REQUIRES 列表中 INCLUDE_DIRS 目录（如递归展开这个组件的所有公共依赖项）。

**主要组件依赖项**

main 组件比较特别，因为它在构建过程中自动依赖所有其他组件。所以不需要向这个组件传递 REQUIRE 或 PRIV_REQUIRE。有关不再使用 main 组件时需要更改哪些内容，请参考重命名 main 组件。

**通用组件依赖项**

为避免重复性工作，各组件都用自动依赖一些“通用”IDF 组件，即使它们没有被明确提及。这些组件的头文件会一直包含在构建系统中。

通用组件包括: cxx, newlib, freertos, esp_hw_support, heap, log, soc, hal, esp_rom, esp_common, esp_system。

**在构建中导入组件**

- 默认情况下，每个组件都会包含在构建系统中。
- 如果将 COMPONENTS 变量设置为项目直接使用的最小组件列表，那么构建系统会扩展到包含所有组件。完整的组件列表为:
  - COMPONENTS 中明确提及的组件。
  - 这些组件的依赖项（以及递归运算后的组件）。
  - 每个组件都依赖的通用组件。
- 将 COMPONENTS 设置为所需组件的最小列表，可以显著减少项目的构建时间。

**循环依赖**

一个项目中可能包含组件 A 和组件 B，而组件 A 依赖（REQUIRES 或 PRIV_REQUIRES）组件 B，组件 B 又依赖组件 A。这就是所谓的依赖循环或循环依赖。
Chapter 4. API

CMake 通常会在链接器命行上重复两次组件库名称来自动处理循环依赖。然而这种方法并不总是有效，还是可能构建失败并出现关于“Undefined reference to ...”的链接器错误。这通常是由引用了循环依赖中某一组件中定义的符号，或者存在较大的循环依赖关系，即 A -> B -> C -> D -> A。这种情况极有可能发生。

最好的解决办法是重构组件以消除循环依赖关系。在大多数情况下，没有循环依赖的软件架构具有模块化和分层清晰的特性，并且从长远来看更容易维护。然而，移除循环依赖关系并不容易做到。

要绕过由循环依赖引起的链接器错误，最简单的解决方法是增加其中一个组件库的 CMake

\texttt{LINK\_INTERFACE\_MULTIPICITY} 属性。这会让 CMake 在链接器命行上对此库及其依赖项重复

两次以上。

例如:

\begin{verbatim}
set_property(TARGET $\{COMPONENT\_LIB\} APPEND_PROPERTY LINK\_INTERFACE\_MULTIPICITY 3)
\end{verbatim}

- 这一行应该放在组件 CMakeLists.txt 文件 idf\_component\_register 之后。
- 可以的话，将此行放置在依稀其他组件而造成循环依赖的组件中。实际上，该行可以在循环内的任何一个组件中，但建议将其放置在拥有链接器错误提示信息中显示的源文件的组件中，或是放置在定义了链接器错误提示信息中所提及的符号的组件，先从这些组件开始是个不错的选择。
- 通常将值增加到 3（默认值是 2）就足够了，但如果不起作用，可以尝试逐步增加这个数字。
- 注意，增加这个选项会使链接器的命令行变长，链接阶段变慢。

高级解决方法：未定义符号 如果只有一两个符号导致循环依赖，而所有其他依赖都是线性的，那么有一种替代方法可以避免链接器错误：在链接时将“反向”依赖所需的特定符号指定为未定义符号。

例如，如果组件 A 依赖于组件 B，但组件 B 也需要引用组件 A 的 reverse\_ops。可以这样来添加如下一行，以在链接时避免这出现循环。

\begin{verbatim}
# 该符号是由“组件 A”在链接时提供
target_link_libraries($\{COMPONENT\_LIB\} INTERFACE "-u reverse_ops")
\end{verbatim}

- u 参数意味着链接器将始终在链接中包含此符号，而不管依赖项顺序如何。
- 该行应该放在组件 CMakeLists.txt 文件中的 idf\_component\_register 之后。
- 如果“组件 B”不需要访问“组件 A”的任何头文件，只需链接几个符号，那么这一行可以用来代替 B 对 A 的任何 REQUIRE。

请参考 target\_link\_libraries 文档以了解更多关于此 CMake 函数的信息。

构建系统中依赖处理的实现细节

- 在 CMake 配置进程的早期阶段会运行 expand\_requirements.cmake 脚本。该脚本会对所有组件的 CMakeLists.txt 文件进行局部的运算，得到一张组件依赖关系图（此图可能会有闭环）。此图用于在构建目录中生成 component\_depends.cmake 文件。
- CMake 主进程会导入该文件，并以此来确定要包含到构建系统中的组件列表（内部使用的 BUILD\_COMPONENTS 变量）。BUILD\_COMPONENTS 变量由排好序，依赖组件排在前面，由于组件依赖关系图中可能存在闭环，因此不能保证每个组件都满足该排序规则。如果给定相同的组件集和依赖关系，那么最终的排序结果应该是确定的。
- CMake 会将 BUILD\_COMPONENTS 的值以“Component names:”的形式打印出来。
- 然后执行构建系统中包含的每个组件的配置。
- 每个组件都被正常包含在构建系统中，然后再次执行 CMakeLists.txt 文件，将组件库加入构建系统。

组件依赖顺序 BUILD\_COMPONENTS 变量中组件的顺序决定了构建过程中的其它顺序，包括：

- 项目导入 project\_include\_cmake 文件的顺序。
- 生成用于编译（通过 -I 参数）的头文件路径列表的顺序。请注意，对于给定组件的源文件，仅需将该组件的依赖组件的头文件路径告知编译器。
4.5.9 覆盖项目的部分设置

project_include.cmake

如果组件的某些构建行为需要在组件 CMakeLists 文件之前被执行，您可以在组件目录下创建名为
project_include.cmake 的文件，project.cmake 在运行过程中会导入此 CMake 文件。

project_include.cmake 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能。比如 esptool.
py 的命令行参数和 bootloader 这个特殊的应用程序。

与组件 CMakeLists.txt 文件有所不同，在导入“project_include.cmake”文件的时候，当前源文件目录
（即 CMAKE_CURRENT_SOURCE_DIR `和工作目录）为项目目录。如果想获得当前组件的绝对路径，可
以使用 `\ COMPONENT_PATH 变量。

请注意，project_include.cmake 对于大多数常规的组件并不是必需的。例如给项目添加 include 搜
索目录，给最终的链接步骤添加 LDFLAGS 选项等等都可以通过 CMakeLists.txt 文件来自定义。详细
信息请参考可选的项目变量。

project_include.cmake 文件会按照 BUILD_COMPONENTS 变量中组件的顺序（由 CMake 记录）依
次导入，即只有在当前组件所有依赖组件的 project_include.cmake 文件都被导入后，当前组件
的 project_include.cmake 文件才会被导入，除非两个组件在同一个依赖闭环中。如果某个
project_include.cmake 文件依赖于另一组件设置的变量，则要特别注意上述情况。更多详情请参
阅构建系统中依赖处理的实现细节。

在 project_include.cmake 文件中设置变量或目标时要格外小心，这些值被包含在项目的顶层
CMake 文件中，因此他们会影响或破坏所有组件的功能。

KConfig.projbuild

与 project_include.cmake 类似，也可以为组件定义一个 KConfig 文件以实现全局的组件配置。如
果要在 menuconfig 的顶层添加配置选项，而不是在“Component Configuration”子菜单中，则可以在
CMakeLists.txt 文件所在目录的 KConfig.projbuild 文件中定义这些选项。

在此文件中添加配置时要小心，因为这些配置会包含在整个项目配置中。在可能的情况下，请为 组件配
置 创建 KConfig 文件。

project_include.cmake 文件在 ESP-IDF 内部使用，以定义项目范围内的构建功能，比如 esptool.
py 的命令行参数和 bootloader 这个特殊的应用程序。

通过封装现有函数进行重新定义或扩展

链接器具有封装功能，可以重新定义或扩展现有 ESP-IDF 函数的行为。如需封装函数，您需要在项目的
CMakeLists.txt 文件中提供以下 CMake 声明：

```
target_link_libraries($(COMPONENT_LIB) INTERFACE "-Wl,--wrap=function_to_redefine")
```

其中，function_to_redefine 为需要被重新定义或扩展的函数名称。启用此选项后，链接器将把二
进制库中所有对 function_to_redefine 函数的调用改为对 __wrap_function_to_redefine 函
数的调用。因此，您必须在应用程序中定义这一符号。

链接器会提供一个名为 __real_function_to_redefine 的新符号，指向将被重新定义的函数的原
有实现。由此，可以从新的实现中调用该函数，从而对原有实现进行扩展。

请参考 build_system/wrappers 示例，了解其详细原理。更多细节请参阅 examples/build_system/wrappers/README.md。

4.5.10 仅配置组件

仅配置组件是一类不包含源文件的特殊组件，仅包含 KConfig projbuild、
KConfig 和 CMakeLists.txt 文件，该 CMakeLists.txt 文件仅有一行代码，调用

CMake_CURRENT_SOURCE_DIR`
idf_component_register() 函数。此函数会将组件导入到项目构建中，但不会构建任何库，也不会将头文件添加到任何 include 搜索路径中。

### 4.5.11 CMake 调试

请查看 CMake v3.16 官方文档 获取更多关于 CMake 和 CMake 命令的信息。

调试 ESP-IDF CMake 构建系统的一些技巧：

- CMake 运行时，会打印大量诊断信息，包括组件列表和组件路径。
- 运行 `cmake -DDEBUG=1, IDF` 构建系统会生成更详细的诊断输出。
- 运行 `cmake` 时指定 `--trace` 或 `--trace-expand` 选项会提供大量有关控制流信息。详情请参考 CMake 命令行文档。

当从项目 CMakeLists 文件导入时，project.cmake 文件会定义工具模块和全局变量，并在系统环境中没有设置 `IDF_PATH` 时设置 `IDF_PATH`。

同时还定义了一个自定义版本的内置 CMake project 函数，这个函数被覆盖，以添加所有 ESP-IDF 特定的项目功能。

#### 警告未定义的变量

默认情况下，警告未定义的变量这一功能是关闭的。

可通过将 `--warn-uninitialized` 标志传递给 CMake 或通过将 `--cmake-warn-uninitialized` 传递给 idf.py 来使能这一功能。这样，如果在构建的过程中引用了未定义的变量，CMake 会打印警告。这对查找有错误的 CMake 文件非常有用。

更多信息，请参考文件 `/tools/cmake/project.cmake` 以及 `/tools/cmake/` 中支持的函数。

### 4.5.12 组件 CMakeLists 示例

因为构建环境试图设置大多数情况都能工作的合理默认值，所以组件 CMakeLists.txt 文件可能非常小，甚至是空的，请参考最小组件 CMakeLists 文件。但有些功能往往需要覆盖预设的组件变量 才能实现。

以下是组件 CMakeLists 文件的更高级的示例。

#### 添加条件配置

配置系统可用于根据项目配置中选择的选项有条件地编译某些文件。

Kconfig:

```
cfg FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
    list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...
```
上述示例使用了 CMake 的 if 函数和 list APPEND 函数。
也可用于选择或删除某一实现，如下所示:

Kconfig:

```cmake
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
    Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output debugging output to the lcd
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
    Select this to output temperature plots
```

CMakeLists.txt:

```cmake
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()

# 如果启用了控制台输出功能，则需要加入字体
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
  list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
  ...
)
```

硬件目标的条件判断

CMake 文件可以使用 IDF_TARGET 变量来获取当前的硬件目标。
此外，如果当前的硬件目标是 xyz（即 IDF_TARGET=xyz），那么 Kconfig 变量
CONFIG_IDF_TARGET_XYZ 同样也会被设置。
请注意，组件可以依赖 IDF_TARGET 变量，但不能依赖这个 Kconfig 变量。同样也不可在 CMake 文件的
include 语句中使用 Kconfig 变量。在这种上下文中可以使用 IDF_TARGET。

生成源代码

有些组件的源文件可能并不是由组件本身提供，而必须从另外的文件生成。假设组件需要一个头文件，该
文件由 BMP 文件转换后（使用 bmp2h 工具）的二进制数据组成，然后将头文件包含在名为 graphics_lib.c
的文件中:

```cmake
add_custom_command(OUTPUT logo.h
  COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
  DEPENDS ${COMPONENT_DIR}/logo.bmp
  VERBATIM)
add_custom_target(logo DEPENDS logo.h)
```

(下页继续)
add_dependencies(${COMPONENT_LIB} logo)

set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY ADDITIONAL_MAKE_CLEAN_FILES logo.h)

这个示例改编自 CMake 的一则 FAQ，其中还包含了一些同样适用于 ESP-IDF 构建系统的示例。

这个示例会在当前目录（构建目录）中生成 logo.h 文件，而 logo.bmp 会随组件一起提供在组件目录中。因为 logo.h 是一个新生成的文件，一旦项目需要清理，该文件也应该被清除。因此，要将该文件添加到 ADDITIONAL_MAKE_CLEAN_FILES 属性中。

备注：如果需要生成文件作为项目 CMakeLists.txt 的一部分，而不是作为组件 CMakeLists.txt 的一部分，此时需要使用 ${PROJECT_PATH} 替代 ${COMPONENT_DIR}，使用 ${PROJECT_NAME}.elf 替代 ${COMPONENT_LIB}。

如果某个源文件是从其他组件中生成，且包含 logo.h 文件，则需要调用 add_dependencies，在这两个组件之间添加一个依赖项，以确保组件源文件按照正确顺序进行编译。

嵌入二进制数据

有时您的组件希望使用一个二进制文件或者文本文件，但是您又不想将它们重新格式化为 C 源文件。这时，您可以在组件注册中指定 EMBED_FILES 参数，用空格分隔要嵌入的文件名称：

idf_component_register(...
  EMBED_FILES server_root_cert.der)

或者，如果文件是字符串，则可以使用 EMBED_TXTFILES 变量，把文件的内容转成以 null 结尾的字符串嵌入：

idf_component_register(...
  EMBED_TXTFILES server_root_cert.pem)

文件的内容会被添加到 Flash 的 .rodata 段，用户可以通过符号名来访问。如下所示：

extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_pem_end");

符号名会根据文件名全生成，如 EMBED_FILES 中所示，字符 /.. 等都会被下划线替代。符号名称中的 _binary 前缀由 objcopy 命令添加，对文本文件和二进制文件都是如此。

如果要将文件嵌入到项目中，而非组件中，可以调用 target_add_binary_data 函数：

target_add_binary_data(myproject.elf "main/data.bin" TEXT)

并将这行代码放在项目 CMakeLists.txt 的 project() 命令之后，修改 myproject.elf 为你自己的项目名。如果最后一个参数是 TEXT，那么构建系统会嵌入以 null 结尾的字符串，如果最后一个参数被设置为 BINARY，则将文件内容按照原样嵌入。

有关使用此技术的示例，请查看 file_serving 示例 protocols/http_server/file_serving/main/CMakeLists.txt 中的 main 组件，两个文件会在编译时加载并链接到固件中。

也可以嵌入生成的文件：

add_custom_command(OUTPUT my_processed_file.bin
  COMMAND my_process_file_cmd my_unprocessed_file.bin)

target_add_binary_data(my_target "my_processed_file.bin" BINARY)
上述示例中，`my_processed_file.bin` 是通过命令 `my_process_file_cmd` 从文件 `my_unprocessed_file.bin` 中生成，然后嵌入到目标中。

使用 `DEPENDS` 参数来指明对目标的依赖性:

```cpp
add_custom_target(my_process COMMAND ...) 
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

target_add_binary_data 的 `DEPENDS` 参数确保目标首先执行。

### 代码和数据的存放

ESP-IDF 还支持自动生成链接脚本，它允许组件通过链接片段文件定义其代码和数据在内存中的存放位置。构建系统会处理这些链接片段文件，并将处理后的结果扩充进链接脚本，从而指导应用程序二进制文件的链接过程。更多详细信息与快速上手指南，请参阅【链接脚本生成机制】。

### 完全覆盖组件的构建过程

当然，在有些情况下，上面提到的方法不一定够用。如果组件封装了另一个第三方组件，而这个第三方组件并不能直接在 ESP-IDF 的构建系统中工作。在这种情况下，就需要放弃 ESP-IDF 的构建系统，改为使用 CMake 的 `ExternalProject` 功能。组件 CMakeLists 示例如下:

```cpp
# 用于 quirc 的外部构建过程，在源目录中运行
# 并生成 libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}/quirc
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND "
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND "
)

# 将 libquirc.a 添加到构建系统中
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

（上述 CMakeLists.txt 可用于创建名为 quirc 的组件，该组件使用自己的 Makefile 构建 quirc 项目。）

- `externalproject_add` 定义了一个外部构建系统。
  - 设置 `SOURCE_DIR`、`CONFIGURE_COMMAND`、`BUILD_COMMAND` 和 `INSTALL_COMMAND`。如果外部构建系统没有配置这一步骤，可以将 `CONFIGURE_COMMAND` 设置为空字符串。在 ESP-IDF 的构建系统中，一般会将 `INSTALL_COMMAND` 变量设置为 `empty`。
  - 设置 `BUILD_IN_SOURCE`，即构建目录与源目录相同。否则，您也可以设置 `BUILD_DIR` 变量。
  - 有关 `externalproject_add()` 命令的详细信息，请参阅【ExternalProject】。
- 第二组命令添加了一个目标库，指向外部构建系统生成的库文件。为了添加 `include` 目录，并告知 CMake 该文件的位置，需要再设置一些属性。
- 最后，生成的库被添加到 `ADDITIONAL_MAKE_CLEAN_FILES` 中，即执行 `make clean` 后会删除该库。请注意，构建系统中的其他目标文件不会被删除。
Chapter 4. API 指南

备注：当外部构建系统使用 PSRAM 时，请记得将 `--mfix-esp32-psram-cache-issue` 添加到 C 编译器的参数中。关于该标志的更多详细信息，请参考 `CONFIG_SPIRAM_CACHE_WORKAROUND`。

ExternalProject 的依赖与构建清理 对于外部项目的构建，CMake 会有一些不同寻常的行为：

- **ADDITIONAL_MAKE_CLEAN_FILES** 仅在使用 Make 构建系统时有效。如果使用 Ninja 或 IDE 自带的构建系统，执行项目清理时，这些文件不会被删除。
- **ExternalProject** 会在 clean 运行后自动重新运行配置和构建命令。
- 可以采用以下两种方法来配置外部构建命令：
  1. 将外部 BUILD_COMMAND 命令设置为对所有源代码完整的重新编译。如果传递给 externalproject_add 命令的 DEFENDS 的依赖项发生了改变，或者当前执行的是项目清理操作（即运行了 ids.py clean, ninja clean 或者 make clean），那么就会执行该命令。
  2. 将外部 BUILD_COMMAND 命令设置为增量式构建命令，并给 externalproject_add 传递 BUILD_ALWAYS 1 参数。即不管实际的依赖情况，每次构建时，都会构建外部项目。这种方式仅当外部构建系统具有增量式构建的能力，且运行时间不会很长时才推荐。

构建外部项目的最佳方法取决于项目本身，其构建系统，以及是否需要频繁重新编译项目。

4.5.13 自定义 sdkconfig 的默认值

对于示例工程或者其他您不想指定完整 sdkconfig 配置的项目，但是您确实希望覆盖 ESP-IDF 默认值中的某些键值，则可以在项目中创建 sdkconfig.defaults 文件。重新创建新配置时将会用到此文件，另外在 sdkconfig 没有设置新配置值时，上述文件也会被用到。

如若需要覆盖此文件的名称或指定多个文件，请设置 **SDKCONFIG_DEFAULTS** 环境变量或在顶层 CMake-Lists.txt 文件中设置 **SDKCONFIG_DEFAULTS**。非绝对路径的文件名将以当前项目的相对路径来解析。

在指定多个文件时，使用分号作为分隔符。先列出的文件将会先应用。如果某个键值在多个文件里定义，后面文件的定义会覆盖前面文件的定义。

一些 IDF 示例中包含了 sdkconfig.ci 文件。该文件是 CI（持续集成）测试框架的一部分，在正常构建过程中会被忽略。

依赖于硬件目标的 sdkconfig 默认值

除了 sdkconfig.defaults 之外，构建系统还将从 sdkconfig.defaults.TARGET_NAME 文件加载默认值，其中 **IDF_TARGET** 的值为 TARGET_NAME。例如，对于 ESP32 这个硬件目标，sdkconfig 的默认值会首先从 sdkconfig.defaults 获取，然后再从 sdkconfig.defaults.esp32 获取。

如果使用 **SDKCONFIG_DEFAULTS** 覆盖默认文件的名称，则硬件目标的默认文件名也会从 **SDKCONFIG_DEFAULTS** 值中派生。如果 **SDKCONFIG_DEFAULTS** 中有多个文件，硬件目标文件会在引入该硬件目标文件的文件之后应用，而 **SDKCONFIG_DEFAULTS** 中所有其它后续文件则会在硬件目标文件之后应用。

例如，如果 **SDKCONFIG_DEFAULTS**="sdkconfig.defaults;sdkconfig_devkit1"，并且在同一文件夹中有一个 sdkconfig.defaults.esp32 文件，那么这些文件将按以下顺序应用：(1) sdkconfig.defaults (2) sdkconfig.defaults.esp32 (3) sdkconfig_devkit1。

4.5.14 Flash 参数

有些情况下，我们希望在没有 IDF 时也能烧写目标板，为此，我们希望可以保存已构建的二进制文件。esptool.py 和 esptool write flash 命令的参数。可以通过编写一段简单的脚本来保存二进制文件和 esptool.py。

运行项目构建之后，构建目录中包含项目二进制输出文件 (.bin 文件)，同时也包含以下烧录数据文件：

Espressif Systems 2145 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
• `flash_project_args` 包含烧录整个项目的参数，包括应用程序 (app)、引导程序 (bootloader)、分区表，如果设置了 PHY 数据，也会包含此数据。
• `flash_app_args` 只包含烧录应用程序的参数。
• `flash_bootloader_args` 只包含烧录引导程序的参数。

您可以参照如下命令将任意烧录参数文件传递给 esptool.py:

```sh
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

也可以手动复制参数文件中的数据到命令行中执行。

构建目录中还包含生成的 flasher_args.json 文件，此文件包含 JSON 格式的项目烧录信息，可用于 `idf.py` 和其它需要项目构建信息的工具。

### 4.5.15 构建 Bootloader

引导程序是 `/components/bootloader/subproject` 内部独特的“子项目”，它有自己的项目 CMakeLists.txt 文件，能够构建独立于主项目的 .ELF 和 .BIN 文件，同时它又与主项目共享配置和构建目录。

子项目通过 `/components/bootloader/project_include.cmake` 文件作为外部项目插入到项目的顶层，主构建进程会运行子项目的 CMake，包括查找组件（主项目使用的组件的子集），生成引导程序专用的配置文件（从主 `sdkconfig` 文件中派生）。

### 4.5.16 编写纯 CMake 组件

ESP-IDF 构建系统用“组件”的概念“封装”了 CMake，并提供了很多帮助函数来自动将这些组件集成到项目构建当中。

然而，“组件”概念的背后是一个完整的 CMake 构建系统，因此可以制作纯 CMake 组件。

下面是使用纯 CMake 语法为 `json` 组件编写的最小 CMakeLists 文件的示例:

```cmake
add_library(json STATIC cJSON/cJSON.c cJSON/cJSON_Utils.c) target_include_directories(json PUBLIC cJSON)
```

• 这实际上与 IDF 中的 json 组件 是等效的。
• 因为组件中的源文件不多，所以这个 CMakeLists 文件非常简单，对于具有大量源文件的组件而言，ESP-IDF 支持的组件通配符，可以简化组件 CMakeLists 的样式。
• 每当组件中新增一个与组件同名的库目标时，ESP-IDF 构建系统会自动将其添加到构建中，并公开公共的 include 目录，如果组件想要添加一个与组件不同名的库目标，就需要使用 CMake 命令手动添加依赖关系。

### 4.5.17 组件中使用第三方 CMake 项目

CMake 在许多开源的 C/C++ 项目中广泛使用。用户可以在自己的应用程序中使用开源代码。CMake 构建系统的一大好处就是可以导入这些第三方的项目，有时候甚至不用做任何改动。这就允许用户使用当前 ESP-IDF 组件尚未提供的功能，或者使用其它库来实现相同的功能。

假设 main 组件需要导入一个假设库 foo，相应的组件 CMakeLists 文件如下所示:

```cmake
# 注册组件
idf_component_register(...) 
# 设置 ‘foo’ 项目中的一些 CMake 变量，以控制 ‘foo’ 的构建过程
set(FOO_BUILD_STATIC OFF) 
set(FOO_BUILD_TESTS OFF) 
```

（下页继续）
实际的案例请参考 build_system/cmake/import_lib。请注意，导入第三方库所需要做的工作可能会因库的不同而有所差异。建议详细阅读第三方库的文档，了解如何将其导入到其它项目中。阅读第三方库的 CMakeLists.txt 文件以及结构也会有所帮助。

用这种方式还可以将第三方库封装成 ESP-IDF 的组件。例如 mbedls 组件就是封装了 mbedls 项目得到的。详情请参考 mbedls 组件的 CMakeLists.txt 文件。

每当使用 ESP-IDF 构建系统时，CMake 变量 ESP_PLATFORM 都会被设置为 1。如果要在通用的 CMake 代码加入 IDF 特定的代码时，可以采用 if (ESP_PLATFORM) 的形式加以分隔。

**外部库中使用 ESP-IDF 组件**

上述示例中假设的是外部库 foo（或 import_lib 示例中的 tinyxml 库）除了常见的 API 如 libc、libstdc++ 等外不需要使用其它 ESP-IDF API。如果外部库需要使用其它 ESP-IDF 组件提供的 API，则需要在外部 CMakeLists.txt 文件中通过添加对库目标 idf::<componentname> 的依赖关系。

例如，在 foo/CMakeLists.txt 文件:

```cmake
add_library(foo bar.c fizz.cpp buzz.cpp)
if (ESP_PLATFORM)
    # 在 ESP-IDF 中， bar.c 需要包含 spi_flash 组件中的 esp_flash.h
    target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

### 4.5.18 组件中使用预建库

还有一种情况是您有一个由其它构建过程生成预建静态库 (.a 文件)。

ESP-IDF 构建系统为用户提供了一个实用函数 add_prebuilt_library，能够轻松导入并使用预建库:

```cmake
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES _ req1 req2 ...])
```

其中:

- **target_name** - 用于引用导入库的名称，如链接到其它目标时
- **lib_path** - 预建库的路径，可以是绝对路径或是相对于组件目录的相对路径

可选参数 REQUIRES 和 PRIV_REQUIRES 指定对于其它组件的依赖性，这些参数与 idf_component_register 的参数的意义相同。

注意预建库的编译目标需与预编的项目相同。预建库的相关参数也要匹配。如果不特别注意，这两个因素可能会导致应用程序中出现 bug。

请查看示例 build_system/cmake/import_prebuilt。

### 4.5.19 在自定义 CMake 项目中使用 ESP-IDF

ESP-IDF 提供了一个模板 CMake 项目，可以基于此轻松创建应用程序。然而在有些情况下，用户可能已有一个现成的 CMake 项目，或者想自己创建一个 CMake 项目，此时就希望将 IDF 中的组件以库的形式链接到用户目标（库/可执行文件）。
可以通过 tools/cmake/idf.cmake 提供的build system APIs 实现该目标。例如:

```cmake
# 导入 ESP- IDF CMake 构建系统 API 的 CMake 文件
include($ENV{IDF_PATH}/tools/cmake/idf.cmake)

# 在构建中导入 ESP-IDF 组件，可以视作等同 add_subdirectory()
# 但为 ESP-IDF 构建增加额外的构建过程
# 具体构建过程
idf_build_process(esp32)

# 创建项目可执行文件
# 使用其别名 idf::newlib 将其链接到 newlib 组件
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# 让构建系统知道项目可执行文件是什么，从而添加更多的目标以及依赖关系等
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

build_system/cmake/idf_as_lib 中的示例演示了如何在自定义的 CMake 项目创建一个类似于 Hello World 的应用程序。

**备注:** IDF 构建系统只能为其构建的源文件设置编译器标志。当使用外部 CMakeLists.txt 文件并启用 PSRAM 时，记得在 C 编译器参数中添加 mfix-esp32-psram-cache-issue。参见 ref:CONFIG_SPIRAM_CACHE_WORKAROUND 了解更多信息。

### 4.5.20 ESP-IDF CMake 构建系统 API

**ESP-IDF 构建命令**

```cmake
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

该函数查找一个构建属性 property，并将其存储在当前作用域可视的 var 中。特定 GENERATOR_EXPRESSION 将检查该属性的生成器表达式字符串（不是实际值），它可与支持生成器表达式的 CMake 命令一起使用。

```cmake
idf_build_set_property(property val [APPEND])
```

该函数设置构建属性 property 的值为 val。特定 APPEND 将把指定的值附加到属性当前值之后。如果该属性之前不存在或当前为空，则指定的值将变为第一个元素/成员。

```cmake
idf_build_component(component_dir)
```

该函数向构建系统提交一个包含组件的 component_dir 目录。相对路径会被转换为相对于当前目录的绝对路径。所有对该命令的调用必须在 idf_build_process 之前执行。该命令并不保证组件在构建过程中会被处理（参见 idf_build_process 中 COMPONENTS 参数说明）

```cmake
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```
为了导人 ESP- IDF 组件执行大量的幕后工作，包括组件配置、库创建、依赖性扩展和解析。在这些功能中，对于用户最重要的可能是通过调用每个组件的 idf_component_register 来创建库。该命令为每个组件创建库；这些库可以使用别名来访问，其形式为 idf::component_name。这些别名可以用来将组件链接到用户自己的目标、库或可执行文件上。

该调用要求用 target 参数指定目标芯片。调用的可选参数包括：

- `PROJECT_DIR` - 项目目录，默认为 CMAKE_SOURCE_DIR。
- `PROJECT_NAME` - 项目名称，默认为 CMAKE_PROJECT_NAME。
- `PROJECT_VER` - 项目的版本/版本号，默认为“1”。
- `SDKCONFIG` - 生成的 sdkconfig 文件的输出路径。根据是否设置 PROJECT_DIR，默认为 PROJECT_DIR/sdkconfig 或 CMAKE_SOURCE_DIR/sdkconfig。
- `SDKCONFIG_DEFAULTS` - 包含默认配置的文件列表（列表中必须包含完整的路径）。默认为空；对于列表中的每一个值 filename，如果存在的话，也会加载文件 filename.target 中的配置。对于列表中的 filename 的每一个值，也会加载文件 filename.target（如果存在的话）中的配置。
- `BUILD_DIR` - 用于放置 ESP-IDF 构建相关工具的目录，如生成的二进制文件、文本文件、组件；默认为 CMAKE_BINARY_DIR。
- `COMPONENTS` - 从构建系统已知的组件中选择要处理的组件（通过 idf_build_component 添加）。这个参数用于精简构建过程。如果在依赖链中需要其它组件，则会自动添加，即自动添加这个列表中组件的公共和私有依赖项，进而添加这些依赖项的公共和私有依赖，以此类推。如果不指定，则会处理构建系统已知的所有组件。

```cpp
idf_build_executable(executable)
```

指定 ESP-IDF 构建的可执行文件 executable。这将添加额外的目标，如与 flash 相关的依赖关系，生成额外的二进制文件等。应在 idf_build_process 之后调用。

```cpp
idf_build_get_property(var config [GENERATOR_EXPRESSION])
```

获取指定配置的值。就像构建属性一样，特定 GENERATOR_EXPRESSION 将检索该配置的生成器表达式字符串，而不是实际值，可以与支持生成器表达式的 CMake 命令一起使用。然而，实际的配置值只有在调用 idf_build_process 后才能知道。

### ESP-IDF 构建属性

可以通过使用构建命令 idf_build_get_property 来获取构建属性的值。例如，以下命令可以获取构建过程中使用的 Python 解释器的相关信息。

```cpp
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: \$\{python\}"
```

- `BUILD_DIR` - 构建目录：由 idf_build_process 的 BUILD_DIR 参数设置。
- `BUILD_COMPONENTS` - 包含在构建中的组件列表：由 idf_build_process 设置。
- `BUILD_COMPONENT_ALIASES` - 包含在构建中的组件的库别名列表：由 idf_build_process 设置。
- `C_COMPILE_OPTIONS` - 适用于所有组件的 C 源代码文件的编译选项。
- `COMPILER_OPTIONS` - 适用于所有组件的源文件（无论是 C 或是 C++）的编译选项。
- `COMPILER_DEFINITIONS` - 适用于所有组件源文件的编译定义。
- `CXX_COMPILE_OPTIONS` - 适用于所有组件的 C++ 源文件的编译选项。
- `EXECUTABLE` - 项目可执行文件；通过调用 idf_build_executable 设置。
- `EXECUTABLE_NAME` - 不含扩展名的项目可执行文件的名称；通过调用 idf_build_executable 设置。
- `EXECUTABLE_DIR` - 输出的可执行文件的路径。
- `IDF_COMPONENT_MANAGER` - 默认启用组件管理器，但如果设置这个属性为 ‘0’，则会被 IDF_COMPONENT_MANAGER 环境变量禁用。
- `IDF_PATH` - ESP-IDF 路径：由 IDFF PATH 环境变量设置，或者从 idf cmake 的位置推断。
- `IDF_TARGET` - 构建的目标芯片：由 idf_build_process 的目标参数设置。
- `IDF_VER` - ESP-IDF 版本：由版本文件或 IDF_PATH 仓库的 Git 版本设置。
- `INCLUDE_DIRECTORIES` - 包含所有组件源文件的目录。
• KCONFIGS - 构建过程中组件里的 Kconfig 文件的列表，由 idf_build_process 设置。
• KCONFIG_PROJBUILDS - 构建过程中的 Kconfig.projbuild 文件的列表，由 idf_build_process 设置。
• PROJECT_NAME - 项目的名称，由 idf_build_process 的 PROJECT_NAME 参数设置。
• PROJECT_DIR - 项目的目录，由 idf_build_process 的 PROJECT_DIR 参数设置。
• PROJECT_VER - 项目的版本，由 idf_build_process 的 PROJECT_VER 参数设置。
• PYTHON - 用于构建的 Python 解释器；如果有则从 PYTHON 环境变量中设置，如果没有，则使用“python”。
• SDKCONFIG - 输出的配置文件的完整路径：由 idf_build_process SDKCONFIG 参数设置。
• SDKCONFIG_DEFAULTS - 包含默认配置的文件列表：由 idf_build_process SDKCONFIG_DEFAULTS 参数设置。
• SDKCONFIG_HEADER - 包含组件配置的 C/C++ 头文件的完整路径：由 idf_build_process 设置。
• SDKCONFIG_CMAKE - 包含组件配置的 CMake 文件的完整路径：由 idf_build_process 设置。
• SDKCONFIG_JSON - 包含组件配置的 JSON 文件的完整路径：由 idf_build_process 设置。
• SDKCONFIG_JSON_MENUS - 包含配置菜单的 JSON 文件的完整路径：由 idf_build_process 设置。

ESP-IDF 组件命令

```cpp
didf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

检索一个指定的 component 的组件属性 property，并将其存储在当前作用域可访问的 var 中。指定 GENERATOR_EXPRESSION 将检索该属性的生成器表达式字符串（不是实际值），它可以在支持生成器表达式的 CMake 命令中使用。

```cpp
didf_component_set_property(component property val [APPEND])
```

设置指定的 component 的组件属性，property 的值为 val。特APPEND 将把指定的值追加到属性的当前值后。如果该属性之前不存在或当前为空，指定的值将成为第一个元素/成员。

```cpp
didf_component_register([[[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...]] [EXCLUDE_\n ->SRCS src1 src2 ...]]
 [INCLUDE_DIRS dir1 dir2 ...]
 [PRIV_INCLUDE_DIRS dir1 dir2 ...]
 [REQUIRES component1 component2 ...]
 [PRIV_REQUIRES component1 component2 ...]
 [LDFRAGMENTS ldfragment1 ldfragment2 ...]
 [REQUIRED_IDF_TARGETS target1 target2 ...]
 [MBED_FILES file1 file2 ...]
 [MBED_TXTFILES file1 file2 ...]
 [CONFIG kconfig]
 [KCONFIG_PROJBUILD kconfigprojbuild]
 [WHOLE_ARCHIVE])
```

将一个组件注册到构建系统中，就像 project() CMake 命令一样，该命令应该直接从组件的 CMakeLists.txt 中调用（而不是通过函数或宏），且建议在其他命令之前调用该命令。下面是一些关于在 idf_component_register 之前不能调用哪些命令的指南：

- 在 CMake 脚本模式下无效的命令。
- 在 project() include.cmake 中定义的自定义命令。
- 除了 idf_build_get_property 之外，构建系统的 API 命令；但要考虑该属性是否有被设置。

对变量进行设置和操作的命令，一般可在 idf_component_register 之前调用。

idf_component_register 的参数包括：

- SRCS - 组件的源文件，用于为组件创建静态库；如果没有指定，组件将被视为仅配置组件，从而创建接口库。
Chapter 4. API

- **SRC_DIRS, EXCLUDE_SRCS** - 用于通过指定目录来 glob 源文件 (.c, .cpp, .S)。而不是通过 SRCS 手动指定源文件。请注意，这受 `CMake` 中指定配置的限制。在 `EXCLUDE_SRCS` 中指定的源文件会从被 glob 的文件中移除。
- **INCLUDE_DIRS** - 相对于组件目录的路径，该路径将被添加到需要当前组件的所有其他组件的 include 搜索路径中。
- **PRIV_INCLUDE_DIRS** - 必须是相对于组件目录的目录路径，它仅被添加到这个组件源文件的 include 搜索路径中。
- **REQUIRES** - 组件的公共组件依赖项。
- **PRIV_REQUIRES** - 组件的私有组件依赖项：在仅用于配置的组件上会被忽略。
- **LDFRAGMENTS** - 组件链接器片段文件。
- **REQUIRED_IDF_TARGETS** - 指定该组件唯一支持的目标。
- **KCONFIG** - 覆盖默认的 `Kconfig` 文件。
- **KCONFIG_PROJBUILD** - 覆盖默认的 `Kconfig.projbuild` 文件。
- **WHOLE_ARCHIVE** - 如果指定了此参数，链接时会在组件库的前后分别添加 `-Wl,--whole-archive` 和 `-Wl,--nowhole-archive`。这与设置 `WHOLE_ARCHIVE` 组件属性的效果一致。

以下内容用于将数据嵌入到组件中，并在确定组件是否仅用于配置时被视为源文件。这意味着，即使组件没有指定源文件，如果组件指定了以下其中之一，仍然会在内部为组件创建一个静态库。

- **EMBED_FILES** - 嵌入组件的二进制文件
- **EMBED_TXTFILES** - 嵌入组件的文本文件

**ESP-IDF 组件属性**

组件的属性值可以通过使用构建命令 `idf_component_get_property` 来获取。例如，以下命令可以获取 `freertos` 组件的目标。

```bash
idf_component_get_property(dir freertos COMPONENT_DIR)
message({
STATUS "The 'freertos' component directory is: \${dir}"}
```

- **COMPONENT_ALIAS** - `COMPONENT_LIB` 的别名，用于将组件链接到外部目标：由 `idf_build_component` 设置，别名库本身由 `idf_component_register` 创建。
- **COMPONENT_DIR** - 组件目录：由 `idf_build_component` 设置。
- **COMPONENT_OVERRIDEN_DIR** - 如果这个组件覆盖了另一个组件，则包含原组件的目录。
- **COMPONENT_LIB** - 所创建的组件静态/可执行的库名称：由 `idf_build_component` 设置，库本身由 `idf_component_register` 创建。
- **COMPONENT_NAME** - 组件的名称：由 `idf_build_component` 根据组件的目录名设置。
- **COMPONENT_TYPE** - 组件的类型（LIBRARY 或 CONFIG_ONLY）。如果一个组件指定了源文件或嵌入了一个文件，那么它的类型就是 LIBRARY。
- **EMBED_FILES** - 要嵌入组件的文件列表：由 `idf_component_register EMBED_FILES` 参数设置。
- **EMBED_TXTFILES** - 要嵌入组件的文本文件列表：由 `idf_component_register EMBED_TXTFILES` 参数设置。
- **INCLUDE_DIRS** - 组件 include 目录列表：由 `idf_component_register INCLUDE_DIRS` 参数设置。
- **KCONFIG** - 组件 Kconfig 文件：由 `idf_build_component` 设置。
- **KCONFIG_PROJBUILD** - 组件 Kconfig.projbuild：由 `idf_build_component` 设置。
- **LDFRAGMENTS** - 组件链接器片段文件列表：由 `idf_component_register LDFRAGMENTS` 参数设置。
- **MANAGED_PRIV_REQUIRES** - IDF 组件管理器从 `idf_component.yml` 清单文件中的依赖关系中添加的私有组件依赖关系列表。
- **MANAGED_REQUIRES** - IDF 组件管理器从 `idf_component.yml` 清单文件的依赖关系中添加的公共组件依赖关系列表。
- **PRIV_INCLUDE_DIRS** - 组件私有 include 目录列表：在 LIBRARY 类型的组件 `idf_component_register PRIV_INCLUDE_DIRS` 参数中设置。
- **PRIV_REQUIRES** - 私有组件依赖关系列表：根据 `idf_component_register PRIV_REQUIRES` 参数的值以及 `idf_component.yml` 清单文件中的依赖关系设置。
• REQUIRED_IDF_TARGETS - 组件支持的目标列表：由 `idf_component_register` EM-BED_TXTFILES 参数设置。
• REQUIREES - 公共组件依赖关系列表：根据 `idf_component_register` REQUIREES 参数的值以及 `idf_component.yaml` 清单文件中的依赖关系设置。
• SRCS - 组件源文件列表：由 `idf_component_register` 的 SRCS 或 SRC_DIRS/EXCLUDE_SRCS 参数设置。
• WHOLE_ARCHIVE - 如果该属性被设置为 TRUE (或是其他 CMake 布尔“真”值：1,ON,YES,Y 等),链接时会在组件库的前后分别添加-Wl,--whole-archive 和 -Wl,--no-whole-archive 选项。这可以强制链接器将每个目标文件包含到可执行文件中，即使该目标文件没有解析来自应用程序其余部分的任何引用。当组件中包含依赖链接时注册的插件或模块时，通常会使用该方法。默认情况下，此属性为 FALSE。可以从组件的 CMakeLists.txt 文件中将其设置为 TRUE。

### 4.5.21 文件遍历 & 增量构建

在 ESP-IDF 组件中添加源文件的首选方法是在 COMPONENT_SRCS 手动列出输出它们:

```bash
idf_component_register(SRCS library/a.c library/b.c platform/platform.c ...)
```

这是在 CMake 中手动列出源文件的 最佳实践。然而，当有许多源文件都需要添加到构建中时，这种方法就会很不方便。ESP-IDF 构建系统因此提供了另一种替代方法，即使用 SRC_DIRS 来指定源文件:

```bash
idf_component_register(SRC_DIRS library platform ...
```

后台会使用遍历在指定的目录中查找源文件。但是请注意，在使用这种方法的时候，如果组件中添加了一个新的源文件，CMake 并不知道重新运行配置，最终该文件也没有被加入构建中。

如果是自己添加的源文件，这种折衷还是可以接受的，因为用户可以触发一次干净的构建，或者运行 `idf.py reconfigure` 来手动重启 CMake。但是，如果你需要与其它使用 Git 等版本控制工具的开发人员共享项目时，问题就会变得非常困难，因为开发人员有可能会拉取新的版本。

ESP-IDF 中的组件使用了第三方的 Git CMake 集成模块（/tools/cmake/third_party/GetGitRevisionDescription.cmake），任何时候源码仓库的提交记录发生了改变，该模块就会自动重新运行 CMake。即只要拉取了新的 ESP-IDF 版本，CMake 就会重新运行。

对于不属于 ESP-IDF 的项目组件，有以下几个选项供参考:

- 如果项目文件保存在 Git 中，ESP-IDF 会自动跟踪 Git 修订版本，并在它发生变化时重新运行 CMake。
- 如果一些组件保存在第三方 Git 仓库中（不在项目仓库或 ESP-IDF 仓库），则可以在组件 CMakeLists 文件中调用 `git_describe` 函数，以便在 Git 修订版本发生变化时自动重启 CMake。
- 如果没有使用 Git，请记住在源文件发生变化时手动运行 `idf.py reconfigure`。
- 使用 `idf_component_register` 的 SRCS 参数来列出项目组件中的所有源文件则可以完全避免这一问题。

具体选择哪一方式，就要取决于项目本身，以及项目用户。

### 4.5.22 构建系统的元数据

为了将 ESP-IDF 集成到 IDE 或者其它构建系统中，CMake 构建过程中会在 build/ 目录下生成大量元数据文件。运行 `cmake` 或 `idf.py reconfigure` (或任何其它 `idf.py` 构建命令), 可以重新生成这些元数据文件。

- `compile_commands.json` 是标准格式的 JSON 文件，它描述了在项目中参与编译的每个源文件。
- `CMake` 其中的一个功能就是生成此文件，许多 IDE 都知道如何解析此文件。
- `project_description.json` 包含有关 ESP-IDF 项目、已配置路径等的一些常规信息。
- `flasher_args.json` 包含 `esptool.py` 工具用于烧录项目二进制文件的参数，此外还有 `flasherargs` 文件，可直接与 `esptool.py` 一起使用。更多详细信息请参阅 `Flash 参数`。
- `CMakeCache.txt` 是 CMake 的缓存文件，包含 CMake 进程、工具链等其它信息。
• config/sdkconfig.json 包含 JSON 格式的项目配置结果。
• config/kconfig_menus.json 是在 menuconfig 中显示菜单的 JSON 格式版本，用于外部 IDE 的 UI。

JSON 配置服务器

kconfserver 工具可以帮助 IDE 轻松地与配置系统的逻辑进行集成，它运行在后台，通过使用 stdin 和 stdout 读写 JSON 文件的方式与调用进程交互。

您可以通过 idf.py confserver 或 ninja kconfserver 从项目中运行 kconfserver，也可以使用不同的构建生成器来触发类似的目标。

有关 kconfserver 的更多信息，请参阅 esp-idf-kconfig documentation.

4.5.23 构建系统内部

构建脚本

ESP-IDF 构建系统的列表文件位于 /tools/cmake 中。实现构建系统核心功能的模块如下
• build.cmake - 构建相关命令，即构建初始化、检查/设置构建属性、构建处理。
• component.cmake - 组件相关的命令，如添加组件、检查/设置组件属性、注册组件。
• kconfig.cmake - 从 Kconfig 文件中生成配置文件（sdkconfig、sdkconfig.h、sdkconfig.cmake 等）。
• ldgen.cmake - 从链接器片段文件生成最终链接器脚本。
• target.cmake - 设置构建目标和工具链文件。
• utilities.cmake - 其它帮助命令。

除了这些文件，还有两个重要的 CMake 脚本在 /tools/cmake 中：
• idf.cmake - 设置构建参数并导入上面列出的核心模块。之所以包括在 CMake 项目中，是为了方便访问 ESP-IDF 构建系统功能。
• project.cmake - 导入 idf.cmake，并提供了一个自定义的 "project()" 命令，该命令负责处理建立可执行文件时所有的繁重工作。包含在标准 ESP-IDF 项目的顶层 CMakeLists.txt 中。

/tools/cmake 中的其它文件都是构建过程中的支持性文件或第三方脚本。

构建过程

本节介绍了标准的 ESP-IDF 应用构建过程。构建过程可以大致分为四个阶段：

图 3: ESP-IDF Build System Process

初始化

该阶段为构建设置必要的参数。
• 在将 idf.cmake 导入 project.cmake 后，将执行以下步骤：
  - 在环境变量中设置 IDF_PATH 或从顶层 CMakeLists.txt 中包含的 project.
cmake 路径推断相对路径。
将/Tools/cmake添加到CMAKE_MODULE_PATH中，并导入核心模块和各种辅助第三方脚本。
- 设置构建工具/可执行文件，如默认的Python解释器。
- 获取ESP-IDF git修订版，并存储为IDF_VER。
- 设置全局构建参数，即编译选项、编译定义，包括所有组件的include目录。
- 将components中的组件添加到构建中。

*自定义project()命令的初始部分执行以下步骤：*
- 在环境变量或CMake缓存中设置IDF_TARGET以及设置相应要使用的“CMAKE_TOOLCHAIN_FILE”。
- 添加EXTRA_COMPONENTS_DIRS中的组件至构建中。
- 从COMPONENTS/EXCLUDE_COMPONENTS、SDKCONFIG、SDKCONFIG_DEFAULTS等变量中为调用命令idf_build_process()准备参数。

调用idf_build_process()命令标志着这个阶段的结束。

**枚举**
这个阶段会建立一个需要在构建过程中处理的组件列表。该阶段在idf_build_process()的前半部分进行。
- 检索每个组件的公共和私有依赖。创建一个子进程，以脚本模式执行每个组件的CMakeLists.txt。idf_component_register.REQUIRES和PRIV_REQUIRES参数的值会返回给父进程。这就是所谓的早期扩展。在这一过程中定义变量CMAKE_BUILD_EARLY_EXPANSION。
- 根据公共和私有的依赖关系，递归地建立各个组件。

**处理**
该阶段处理构建中的组件，是idf_build_process()的后半部分。
- 从sdkconfig文件中加载项目配置，并生成sdkconfig.cmake和sdkconfig.h头文件。这两个文件分别定义了可以从中构建脚本和C/C++源文件/头文件中访问的配置变量宏。
- 导入各组件的project_include.cmake。
- 将每个组件添加为一个子目录，处理其CMakeLists.txt。组件CMakeLists.txt调用注册命令idf_component_register添加源文件、导入目录、构建组件库、链接依赖关系等。

**完成**
该阶段是idf_build_process()剩余的步骤。
- 创建可执行文件并将其链接到组件库中。
- 生成project_description.json等项目元数据文件并且显示所建项目等相关信息。

请参考/Tools/cmake/project.cmake获取更多信息。

### 4.5.24 从ESP-IDF GNU Make构建系统迁移到CMake构建系统

ESP-IDF CMake构建系统与旧版的GNU Make构建系统在某些方面非常相似，开发者都需要提供include目录、源文件等。然而，有一个语法上的区别，即对于ESP-IDF CMake构建系统，开发者需要将这些作为参数传递给注册命令idf_component_register。

**自动转换工具**

在ESP-IDF v4.x版本中，tools/cmake/convert_to_cmake.py提供了项目自动转换工具。由于该脚本依赖于make构建系统，所以v5.0版本中不包含该脚本。
Chapter 4. API

CMake 中不可用的功能

有些功能已从 CMake 构建系统中移除，或者已经发生很大改变。GNU Make 构建系统中的以下变量已从 CMake 构建系统中删除:

- COMPONENT_BUILD_DIR: 由 CMAKE_CURRENT_BINARY_DIR 替代。
- COMPONENT_LIBRARY: 默认为 $(COMPONENT_NAME).a 但是库名可以被组件覆盖。在 CMake 构建系统中，组件库名称不可再被组件覆盖。
- CC, LD, AR, OBJCOPY: gcc xtensa 交叉工具链中每个工具的完整路径。CMake 使用 CMAKE_C_COMPILER, CMAKE_C_LINK_EXECUTABLE 和 CMAKE_OBJCOPY 进行替代。完整列表请参阅 CMake 语言变量。
- HOSTCC, HOSTLD, HOSTAR: 宿主机本地工具链中每个工具的全名。CMake 系统不再提供此变量，外部项目需要手动检测所需的宿主机工具链。
- COMPONENT_ADD_LDFLAGS: 用于覆盖链接标志。CMake 中使用 target_link_link libraries 命令替代。
- COMPONENT_ADD_LINKER_DEPS: 链接过程依赖的文件列表。target_link_link libraries 通常会自动推断这些依赖。对于链接脚本，可以使用自定义的 CMake 函数 target_linker_scripts。
- COMPONENT_ADD_SUBMODULES: 不再使用。CMake 会自动枚举 ESP-IDF 仓库中所有的子模块。
- COMPONENT_EXTRA_INCLUDES: 曾是 COMPONENT_PRIV_INCLUDEDIRS 变量的替代版本，仅支持绝对路径。CMake 系统中统一使用 COMPONENT_PRIV_INCLUDEDIRS（可以是相对路径，也可以是绝对路径）。
- COMPONENT_OBJS: 以前，可以以目标文件列表的方式指定组件源。现在，可以通过 COMPONENT_SRCS 以源文件列表的形式指定组件源。
- COMPONENT_OBJEXCLUDE: 已被 COMPONENT_SRCEXCLUDE 替换。用于指定源文件（绝对路径或组件目录的相对路径）。
- COMPONENT_EXTRA_CLEAN: 已被 ADDITIONAL_MAKE_CLEAN_FILES 属性取代，注意，CMake 对此项功能有部分限制。
- COMPONENT_OWNBUILTARGET & COMPONENT_OWNCLEANTARGET: 已被 CMake 外部项目 <ExternalProject> 替代，详细内容请参阅完全覆盖组件的构建过程。
- COMPONENT_CONFIGONLY: 已被 register_config_only_component() 函数替代，请参阅配置组件。
- CFLAGS, CPPFLAGS, CXXFLAGS: 已被相应的 CMake 命令替代，请参阅组件编译控制。

无默认值的变量

以下变量不再具有默认值:

- 源目录（Make 中的 COMPONENT_SRCDIRS 变量，CMake 中 idf_component_register 的 SRC_DIRS 参数）
- include 目录（Make 中的 COMPONENT_ADD_INCLUDEDIRS 变量，CMake 中 idf_component_register 的 INCLUDE_DIRS 参数）

不再需要的变量

在 CMake 构建系统中，如果设置了 COMPONENT_SRCS，就不需要再设置 COMPONENT_SRCDIRS。实际上，CMake 构建系统中如果设置了 COMPONENT_SRCDIRS，那么 COMPONENT_SRCS 就会被忽略。

从 Make 中烧录

仍然可以使用 make flash 或者类似的目标来构建和烧录，但是项目 sdkconfig 再不能用来指定串口和波特率。可以使用环境变量来覆盖串口和波特率的设置，详情请参阅使用 Ninja/Make 来烧录。

4.6 Core Dump
4.6.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. It is also possible dumping variables content on demand if previously attributed accordingly. ESP-IDF provides special commands to help users to retrieve and analyse core dumps:

- `idf.py coredump-info` - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `idf.py coredump-debug` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful

For more information about core dump internals see the - Core dump internals

4.6.2 Configurations

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

**Core dump data destination (Components -> Core dump -> Data destination)**

- Save core dump to Flash (Flash)
- Print core dump to UART (UART)
- Disable core dump generation (None)

**Core dump data format (Components -> Core dump -> Core dump data format)**

- ELF format (Executable and Linkable Format file for core dump)
- Binary format (Basic binary format for core dump)

The ELF format contains extended features and allow to save more information about broken tasks and crashed software but it requires more space in the flash memory. This format of core dump is recommended for new software designs and is flexible enough to extend saved information for future revisions. The Binary format is kept for compatibility reasons, it uses less space in the memory to keep data and provides better performance.

**Core dump data integrity check (Components -> Core dump -> Core dump data integrity check)**

- Use CRC32 for core dump integrity verification
- Use SHA256 for core dump integrity verification (only work in ELF format)

The CRC32 option provides better calculation performance and consumes less memory for storage. The SHA256 hash algorithm provides greater probability of detecting corruption than a CRC32 with multiple bit errors.

**Maximum number of tasks snapshots in core dump (Components -> Core dump -> Maximum number of tasks)**

**Delay before core dump is printed to UART (Components -> Core dump -> Delay before print to UART)**

The value is in ms.

**Handling of UART core dumps in IDF Monitor (Components -> Core dump -> Delay before print to UART)**

The value is base64 encoded.

- Decode and show summary (info_corefile)
- Don’t decode
Reserved stack size (Components -> Core dump -> Reserved stack size)

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800.

4.6.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash. But if users want to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets...
→ to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is:

```
idf.py coredump-info
```

or

```
idf.py coredump-debug
```

4.6.4 Print core dump to UART

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case users should save core dump text body to some file manually and then run the following command:

```
idf.py coredump-info -c </path/to/saved/base64/text>
```

or

```
idf.py coredump-debug -c </path/to/saved/base64/text>
```

Base64-encoded body of core dump will be between the following header and footer:

```
== CORE DUMP START ==
<body of base64-encoded core dump, save it to file on disk>
== CORE DUMP END ==
```

The **CORE DUMP START** and **CORE DUMP END** lines must not be included in core dump text file.

4.6.5 ROM Functions in Backtraces

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be
broken with error message at the first ROM function. To overcome this issue, ROM ELF provided by Espressif is loaded automatically based on the target and its revision. More details about ROM ELFs can be found here.

### 4.6.6 Dumping variables on demand

Sometimes you want to read the last value of a variable to understand the root cause of a crash. Core dump supports retrieving variable data over GDB by attributing special notations declared variables.

**Supported notations and RAM regions**

- `COREDUMP_DRAM_ATTR` places variable into DRAM area which will be included into dump.
- `COREDUMP_RTC_ATTR` places variable into RTC area which will be included into dump.
- `COREDUMP_RTC_FAST_ATTR` places variable into RTC_FAST area which will be included into dump.

**Example**

1. In *Project Configuration Menu*, enable `COREDUMP TO FLASH`, then save and exit.
2. In your project, create a global variable in DRAM area as such as:

   ```
   // uint8_t global_var;
   COREDUMP_DRAM_ATTR uint8_t global_var;
   ```

3. In main application, set the variable to any value and `assert(0)` to cause a crash.

   ```
   global_var = 25;
   assert(0);
   ```

4. Build, flash and run the application on a target device and wait for the dumping information.
5. Run the command below to start core dumping in GDB, where `PORT` is the device USB port:

   ```
   idf.py coredump-debug
   ```

6. In GDB shell, type `p global_var` to get the variable content:

   ```
   (gdb) p global_var
   $1 = 25 '\031'
   ```

### 4.6.7 Running `idf.py coredump-info` and `idf.py coredump-debug`

`idf.py coredump-info --help` and `idf.py coredump-debug --help` commands can be used to get more details on usage.

**Related Documents**

Anatomy of core dump image  Core dump component can be configured to use old legacy binary format or the new ELF one. The ELF format is recommended for new designs. It provides more information about the CPU and memory state of a program at the moment when panic handler is entered. The memory state embeds a snapshot of all tasks mapped in the memory space of the program. The CPU state contains register values when the core dump has been generated. Core dump file uses a subset of the ELF structures to register these information. Loadable ELF segments are used for the memory state of the process while ELF notes (ELF.PT_NOTE) are used for process metadata (pid, registers, signal, …). Especially, the CPU status is stored in a note with a special name and type (CORE, NT_PRSTATUS type).

Here is an overview of coredump layout:
Chapter 4. API

4: Coredump ELF image format

- ELF formatted core dump image
  - Core dump image header: Contains information about core dump image such as image size, image version, number of tasks, etc.
  - ELF file header: Standard ELF header for core dump image.
  - ELF Segment Headers
    - Segment #1 Header: ELF headers for loadable and read segments showed in the data area.
    - Segment #2 ... Segment #N-1 Headers:

- ELF Segment Data (Tasks Data)
  - RT_PRSTATUS data for Task #1 ... Task #N
  - Task #1 TCB data, stack data
  - Task #2 ... Task #N-1 TCB data, stack data

- ESP core dump information segment data
  - Version control information
  - Extra information

- Core dump image checksum (CRC32 or SHA256)

图 4: Core dump ELF image format

5: Coredump binary image format

- Binary core dump image format
  - Core dump header: Describes basic information such as image size, image version, number of tasks, etc.
  - Task #1 image
  - Task #2 ... Task #N-1 image
  - Task #N image
  - Image checksum (CRC32)

- Represents task data for each task:
  - Task header: TCB address, stack start address, stack end address
  - Task data: Dumped TCB memory, dumped task stack

图 5: Core dump binary image format
Note: The format of image file showed on the above pictures represents current version of image and can be changed in future releases.

**Overview of implementation**

The figure below describes some basic aspects related to implementation of core dump:

![Diagram](image)

### 4.7 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

#### 4.7.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
• RTC memory must include any read-only data (.rodata) used by the stub.
• Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
• Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

4.7.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under components/esp32.

4.7.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

4.7.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count $d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```
The RTC memory area where this data will be placed can be configured via menuconfig option named CONFIG_ESP32_RTCDATA_IN_FAST_MEM. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with RTC_DATA_ATTR and RTC_RODATA_ATTR are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the CONFIG_FREERTOS_UNICORE because RTC fast memory can be accessed only by PRO_CPU.

The attributes RTC_FAST_ATTR and RTC_SLOW_ATTR can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with RTC_FAST_ATTR is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with RTC_RODATA_ATTR, as shown in the example above.

The second way is to place the data into any source file whose name starts with rtc_wake_stub.

For example, the equivalent example in rtc_wake_stub_counter.c:

```c
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count \%d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP Kconfig option, see more information in Fast boot from Deep Sleep.

### 4.7.5 CRC Check For Wake Stubs

During deep sleep, all RTC Fast memory areas will be validated with CRC. When ESP32 wakes up from deep sleep, the RTC fast memory will be validated with CRC again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader and esp-idf codes will be executed.

| 备注：When the CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP option is enabled, all the RTC fast memory except the wake stubs area is added to the heap. |

## 4.8 错误处理

### 4.8.1 概述

在应用程序开发中，及时发现并处理在运行时期的错误，对于保证应用程序的健壮性非常重要。常见的运行时错误有如下几种：

- 可恢复的错误：
  - 通过函数的返回值（错误码）表示的错误
  - 使用throw关键字抛出的C++异常
- 不可恢复（严重）的错误：
  - 断言失败（使用assert宏或者其它类似方法，可参考 Assertions）或者直接调用abort()函数造成的错误
  - CPU异常：访问受保护的内存区域、非法指令等
  - 系统级检查：看门狗超时、缓存访问错误、堆栈溢出、堆栈粉碎、堆栈损坏等
本文将介绍 ESP-IDF 中针对可恢复错误的错误处理机制，并提供一些常见错误的处理模式。
关于如何处理不可恢复的错误，请查阅 不可恢复错误。

### 4.8.2 错误码
ESP-IDF 中大多数函数会返回 esp_err_t 类型的错误码，esp_err_t 实质上是带符号的整型，ESP_OK 代表成功（没有错误），具体值定义为 0。
在 ESP-IDF 中，许多头文件都会使用预处理器，定义可能出现的错误代码。这些错误代码通常均以 ESP_ERR_ 前缀开头，一些常见错误（比如内存不足、超时、无效参数等）的错误代码则已经在 esp_err.h 文件中定义好了。此外，ESP-IDF 中的各种组件 (component) 也都可以针对具体情况，自行定义更多错误代码。
完整错误代码列表，请见 [错误代码参考](#) 中查看完整的错误列表。

### 4.8.3 错误码到错误消息
错误码并不直观，因此 ESP-IDF 还可以使用 esp_err_to_name() 或者 esp_err_to_name_r() 函数，将错误代码转换为具体的错误消息。例如，我们可以向 esp_err_to_name() 函数传递错误代码 0x101，可以得到返回字符串 “ESP_ERR_NO_MEM”。这样一来，我们可以在日志中输出更加直观的错误消息，而不是简单的错误码，从而帮助研发人员更快理解发生了何种错误。
此外，如果出现找不到匹配的 ESP_ERR_ 值的情况，函数 esp_err_to_name_r() 则会尝试将错误码作为一种 POSIX 错误码 进行解释。具体过程为：POSIX 错误代码（例如 ENOENT, ENOMEM）定义在 errno.h 文件中，可以通过 errno 变量获得。进而调用 strerror_r() 函数实现。在 ESP-IDF 中，errno 是一个基于线程的局部变量，即每个 FreeRTOS 任务都有自己的 errno 副本，通过函数修改 errno 也只会作用于当前任务中的 errno 变量值。
该功能（即在无法匹配 ESP_ERR_ 值时，尝试用标准 POSIX 解释错误码）默认启用。用户也可以禁用该功能，从而减小程序的二进制文件大小。详情可见 CONFIG_ESP_ERR_TO_NAME_LOOKUP 注意，该功能对禁用并不影响 esp_err_to_name() 和 esp_err_to_name_r() 函数的定义。用户仍可调用这两个函数转化错误码。在这种情况下，esp_err_to_name() 函数在遇到无法匹配错误码的情况会返回 UNKNOWN ERROR，而 esp_err_to_name_r() 函数会返回 Unknown error 0xXXXX(YYYYY)，其中 0xXXXX 和 YYYY 分别代表错误代码的十六进制和十进制表示。

### 4.8.4 ESP_ERROR_CHECK 宏
宏 ESP_ERROR_CHECK 的功能和 assert 类似，不同之处在于：这个宏会检查 esp_err_t 的值，而非判断 bool 条件。如果传给 ESP_ERROR_CHECK 的参数不等于 ESP_OK，则会在控制台上打印错误消息，然后调用 abort() 函数。
错误消息通常如下所示：

```plaintext
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf

file:  "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)
Backtrace: 0x40086e7c:0x3ffbf4ff0 0x40087328:0x3ffbf5010 0x400d1fdf:0x3ffbf5030_ ←0x400d0816:0x3ffbf5050
```

**备注**：如果使用 IDF 监视器，则最后一行回溯结果中的地址将会被自动解析为相应的文件名和行号。

- 第一行打印错误代码的十六进制表示，及该错误在源代码中的标识符。这个标识符取决于 CONFIG_ESP_ERR_TO_NAME_LOOKUP 选项的设定。最后，第一行还会打印程序中该错误发生的具体位置。
Chapter 4. API

- 下面几行显示了程序中调用ESP_ERROR_CHECK宏的具体位置，以及传递给该宏的参数。
- 最后一行打印回测结果。对于所有不可恢复错误，这里在应急处理程序中打印的内容都是一样的。
  更多有关回测结果的详细信息，请参阅不可恢复错误。

### 4.8.5 ESP_ERROR_CHECK_WITHOUT_ABORT宏

宏ESP_ERROR_CHECK_WITHOUT_ABORT的功能和ESP_ERROR_CHECK类似，不同之处在于它不会调用abort()。

### 4.8.6 ESP_RETURN_ON_ERROR宏

宏ESP_RETURN_ON_ERROR用于错误码检查，如果错误码不等于ESP_OK，该宏会打印错误信息，并使原函数立刻返回。

### 4.8.7 ESP_GOTO_ON_ERROR宏

宏ESP_GOTO_ON_ERROR用于错误码检查，如果错误码不等于ESP_OK，该宏会打印错误信息，将局部变量ret赋值为该错误码，并使原函数跳转至给定的goto_tag。

### 4.8.8 ESP_RETURN_ON_FALSE宏

宏ESP_RETURN_ON_FALSE用于条件检查，如果给定条件不等于true，该宏会打印错误信息，并使原函数立刻返回，返回值为给定的err_code。

### 4.8.9 ESP_GOTO_ON_FALSE宏

宏ESP_GOTO_ON_FALSE用于条件检查，如果给定条件不等于true，该宏会打印错误信息，将局部变量ret赋值为给定的err_code，并使原函数跳转至给定的goto_tag。

### 4.8.10 CHECK宏使用示例

示例:

```c
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message_
    // printed if `x` is not `ESP_OK`, and then `abort()`.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message_
    // printed if `x` is not `ESP_OK`, without `abort()`.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message_
    // printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message_
    // printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message_
    // printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message_
    // printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to `err`.

err:
```

(下页继续)
// clean up
return ret;

备份：如果 Kconfig 中的 CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT 选项被打开，CHECK 宏将不会打印错误信息，其他功能不变。

ESP_RETURN_xx 和 ESP_GOTO_xx 宏不可以在中断服务程序里被调用。如需要在中断中使用类似功能，请使用 xx_ISR 宏，如 ESP_RETURN_ON_ERROR_ISR 等。

4.8.11 错误处理模式

1. 尝试恢复。根据具体情况不同，我们具体可以:
   • 在一段时间后，重新调用该函数;
   • 尝试删除该驱动，然后重新进行“初始化”;
   • 采用其他外带机制，修改导致错误发生的条件（例如，对一直没有响应的外设进行复位等）。
   示例:

```c
esp_err_t err;
do {
   err = sdio_slave_send_queue(addr, len, arg , timeout);
   // 如果发送队列已满就不断重试
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
   // 处理其他错误
   free(card);
   return err;
}
```

2. 将错误传回调用程序。在某些中断件组件中，采用此类处理模式代表函数必须以相同的错误码退出，这样才能确保所有分配的资源都能得到释放。
   示例:

```c
sdmmc_card_t * card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
   return ESP_ERR_NO_MEM;
}

esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
   // 释放内存
   free(card);
   // 将错误码传给上层（例如通知用户）
   // 或者，应用程序可以自定义错误代码并返回
   return err;
}
```

3. 转为不可恢复错误，比如使用 ESP_ERROR_CHECK。详情请见 ESP_ERROR_CHECK 宏 章节。
   对于中断件组件而言，通常并不希望在发生错误时中止应用程序。不过，有时在应用程序级别，这种做法是可以接受的。
   在 ESP-IDF 的示例代码中，很多都会使用 ESP_ERROR_CHECK 来处理各种 API 引发的错误。虽然这不是应用程序的最佳做法，但可以让示例代码看起来更加简洁。
   示例:

```c
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

4.8.12 C++ 异常

请参考 Exception handling。
4.9 ESP-BLE-MESH

蓝牙 mesh 网络实现了无线设备的“多对多”通讯，其可用于建立包含大量设备的网络。

设备能将数据中继至不在初始设备无线电覆盖范围内的其他设备。这样，mesh 网络就能够覆盖非常大的物理区域，并且囊括大量设备。Mesh 网络非常适用于楼宇自动化，传感器网络和其他物联网解决方案，这些情景下数以十、百计，千计的设备需要与其他设备进行安全可靠的通信。

蓝牙 mesh 并非无线通信技术，而是一种网络技术。该技术基于一种无线通讯协议栈，即低功耗蓝牙。

ESP-BLE-MESH 基于 Zephyr 蓝牙 Mesh 协议栈的顶端，其实现支持设备配网和节点控制，同时也实现了代理、中继，低功耗和朋友等节点功能。

有关 ESP-BLE-MESH 架构实现的信息，请参见 ESP-BLE-MESH 架构；有关各自 API 的信息，请参见 ESP-BLE-MESH API Reference。

ESP-BLE-MESH 的实现和认证基于最新的 Mesh Profile v1.0.1。有关 ESP-BLE-MESH 认证的细节，请参考此处。

备注：如果您在寻找 ESP32 基于 Wi-Fi 的 mesh 方案，请查阅乐鑫的另一款产品 ESP-WIFI-MESH。更多相关信息及文档，请参见 ESP-WIFI-MESH。

4.9.1 ESP-BLE-MESH 快速入门

该章旨在帮助您基于乐鑫的 ESP32 开发板搭建 ESP-BLE-MESH 网络。

我们将展示如何搭建并运行一个包含 3 个节点的小型 ESP-BLE-MESH 网络，其中包含设备配网、节点配置，以及向特定节点上的 Generic OnOff Server Model 发送开关灯命令。

如果您是第一次接触 ESP-IDF，请参见 esp-idf 快速入门来设置开发环境，编译、烧写和运行示例应用程序。

硬件及软件准备

硬件:

- 3 块 ESP32 开发板，请参见 options。
- 连接开发板的 USB 线。
- ESP-IDF 开发环境。
- 运行 Android 或 iOS 的手机或平板。

软件:

- 下载至 ESP32 开发板的示例应用 bluetooth/esp_ble_mesh/ble_mesh_node。
- 手机 App: nRF Mesh Android 或 iOS 版本。除 nRF Mesh 的 App，以下 App 也支持 ESP-BLE-MESH:
  - EspBleMesh Android App
  - Silicon Labs Android 或 iOS App

安装

以下详细步骤可指导您完成安装过程。

步骤 1. 检查硬件 ESP32-DevKitC 和 ESP-WROVER-KIT 开发板均支持 ESP-BLE-MESH。您可以通过 menuconfig: idf.py menuconfig > Example Configuration > Board selection for ESP-BLE-MESH 选择特定的开发板。
备注：如果您打算使用 ESP32-DevKitC 开发板，请将 RGB 灯焊接至 GPIO 管脚 25、26 和 27。

步骤 2. 配置软件  进入 bluetooth/esp_ble_mesh/ble_mesh_node 示例文件夹，运行 idf.py menuconfig 选择所使用的开发板，然后运行 idf.py build 编译示例。

步骤 3. 下载应用  

进入 bluetooth/esp_ble_mesh/ble_mesh_node 示例编译成功后，用户可以运行 idf.py flash 将编译生成的二进制文件下载至 3 块开发板中。

当开发板上电后，RGB 灯会变为绿色。

步骤 4. 设备配网  在该章节中，我们将使用 NRF Mesh Android App 演示如何配网设备。用户也可以从 App Store 下载其 iOS 版本。

4.1 扫描 (scanner)  扫描 (Scanner) 是 NRF Mesh App 搜索蓝牙通信范围内未配网设备的功能。打开 App，点击底部的扫描按钮 Scanner。App 便会开始扫描设备，很快，我们便可在屏幕上看到 3 个未配网设备。

4.2 识别 用户可以选择任何一个未配网设备，此时 App 会尝试和该设备建立连接。连接成功（有时可能需要尝试多次），且发现相应的 ESP-BLE-MESH GATT 服务后，用户可以在屏幕上看到识别按钮 IDENTIFY。IDENTIFY 操作告诉用户哪个设备将被配网。

备注：IDENTIFY 需要设备侧的支持，然而才能用来识别当前正在配网的设备。当前如果点击识别按钮 IDENTIFY，除了串口输出的 log，在当前的 example 中设备侧不会有其他表现。
点击识别按钮 IDENTIFY 后，用户可以看到配网按钮 PROVISION。

4.3 配网 点击配网按钮 PROVISION，App 会开始配网设备。当设备配网成功后，开发板上的 RGB 灯会熄灭，此时 App 会执行以下几个步骤：

1. 和该节点（设备配网后成为节点）断开连接
2. 尝试和该节点重新建立连接
3. 连接成功并且发现了相应的 ESP-BLE-MESH GATT 服务
4. 获取节点的 Composition Data 并且给该节点添加 AppKey

当以上所有的步骤完成后，节点初始配置完成，此时点击 OK，用户可以看见节点的单播地址分配成功，并且其 Composition Data 也被成功解析。

有时在上述步骤 2 中，App 可能与节点连接失败。这种情况下，用户点击 OK 后可以看到，节点只有单播地址被成功分配，Composition data 并没有被成功获取。此时用户需要点击右上角的连接按钮 CONNECT，屏幕上会显示原先配网的节点，用户需要选择该节点并与其建立连接。

连接成功后，App 会显示获取 Composition Data 以及添加 AppKey 的按钮。

如果该设备是 App 配网的第二个或第三个节点，此时点击连接按钮 CONNECT 后，用户可以在屏幕中看到 2 个或 3 个节点。这种情况下，用户可以选择其中一个节点建立连接，连接成功后可以返回至主界面选择需要配置的节点。

这里给出了一个 3 个节点的示例。

- 左侧图片表示第三个设备成功配网，但是 App 没有和其成功建立连接。当 App 尝试去重新连接第三个节点时，界面上会出现 3 个节点。
- 右侧图片表示节点成功建立连接后，App 显示这 3 个节点的信息。用户可以看到 App 已经获取了第一个和第二个节点的 Composition Data，但是对于第三个节点，只有单播地址被成功分配而节点的 Composition Data 未知。

4.4 配置 当成功配网和初始配置完成后，用户可以配置节点的其余信息，例如将 AppKey 绑定至每个元素 (element) 的每个模型 (model) 中，设置模型的发布信息等。
图 9: nRF Mesh - 识别 - 配网

图 10: nRF Mesh - 配置完成
图 11: nRF Mesh - 初始化配置失败

图 12: nRF Mesh - 重新初始配置
下图展示了如何将 AppKey 绑定至 Primary Element 中的 Generic OnOff Server Model 上。用户不需要将 AppKey 绑定至 Configuration Server Model，因为该模型使用 DevKey 在 Upper Transport Layer 中对消息进行加密。

Step 5. 运行网络 当 3 个元素中的 Generic OnOff Server Models 均成功绑定 AppKey 后，用户可以使用 App 开关 RGB 灯。在 bluetooth/esp_ble_mesh/ble_mesh_node 示例中，第一个 Generic OnOff Server Model 用来控制 红色，第二个用来控制 绿色，同时第三个用来控制 蓝色。下图展示了打开了不同色灯的开发板。

备注：对于 nRF Mesh iOS App [version 1.0.4]，当节点包含超过一个元素时，App 表现不正确。如果用户尝试打开或者关闭第 2 个或第 3 个 Generic OnOff Server Model，App 会将相应的消息发送到第 1 个 Generic OnOff Server Model。

4.9.2 ESP-BLE-MESH 示例

- ESP-BLE-MESH 节点 - 展示了将 ESP-BLE-MESH 作为拥有 Configuration Server model 和 Generic OnOff Server model 的节点设备的用法。然后，ESP-BLE-MESH Provisioner 可以配网设备，控制表示开/关状态的 RGB 灯，示例请见 example code。
- ESP-BLE-MESH 客户端模型 - 展示了 Generic OnOff Client model 如何在节点内工作。节点拥有 Configuration Server model、Generic OnOff Server model 和 Generic OnOff Client model，示例请见 example code。
- ESP-BLE-MESH Provisioner - 展示了设备如何充当 ESP-BLE-MESH Provisioner 以配网设备。Provisioner 拥有 Configuration Server model、Configuration Client model 和 Generic OnOff Client model，示例请见 example code。

ESP-BLE-MESH Feature List

Supported Features

Mesh Core

- **Provisioning: Node Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Provisioning: Provisioner Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Networking**
  - Relay
  - Segmentation and Reassembly
  - Key Refresh Procedure
  - IV Update Procedure
  - Friend
  - Low Power
  - Proxy Server
  - Proxy Client
- **Multiple Client Models Run Simultaneously**
  - Support multiple client models send packets to different nodes simultaneously
  - No blocking between client model and server model
- **NVS Storing**
  - Store provisioning and configuration information of ESP-BLE-MESH Node

Mesh Models

- **Foundation models**
  - Configuration Server model
  - Configuration Client model
  - Health Server model
  - Health Client model
- **Generic client models**
  - Generic OnOff Client
  - Generic Level Client
  - Generic Default Transition Time Client
  - Generic Power OnOff Client
  - Generic Power Level Client
  - Generic Battery Client
  - Generic Location Client
  - Generic Property Client
- **Sensor client models**
  - Sensor Client
- **Time and Scenes client models**
  - Time Client
  - Scene Client
  - Scheduler Client
- **Lighting client models**
  - Light Lightness Client
  - Light CTL Client
  - Light HSL Client
  - Light xyL Client
  - Light LC Client
- **Generic server models**
  - Generic OnOff Server
  - Generic Level Server
– Generic Default Transition Time Server
– Generic Power OnOff Server
– Generic Power OnOff Setup Server
– Generic Power Level Server
– Generic Power Level Setup Server
– Generic Battery Server
– Generic Location Server
– Generic Location Setup Server
– Generic User Property Server
– Generic Admin Property Server
– Generic Manufacturer Property Server
– Generic Client Property Server

• Sensor server models
  – Sensor Server
  – Sensor Setup Server

• Time and Scenes server models
  – Time Server
  – Time Setup Server
  – Scene Server
  – Scene Setup Server
  – Scheduler Server
  – Scheduler Setup Server

• Lighting server models
  – Light Lightness Server
  – Light Lightness Setup Server
  – Light CTL Server
  – Light CTL Temperature Server
  – Light CTL Setup Server
  – Light HSL Server
  – Light HSL Hue Server
  – Light HSL Saturation Server
  – Light HSL Setup Server
  – Light xyl Server
  – Light xyl Setup Server
  – Light LC Server
  – Light LC Setup Server

ESP-BLE-MESH 架构

本文档将介绍 ESP-BLE-MESH 的架构概览、架构实现和辅助程序。

- ESP-BLE-MESH 架构概览
  - 描述了 ESP-BLE-MESH 架构的 5 大部分及每个部分的功能。
- ESP-BLE-MESH 架构实现
  - 描述了 ESP-BLE-MESH 文件的基本功能。文件与 ESP-BLE-MESH 架构的对应关系及文件间调用的接口。
- ESP-BLE-MESH 辅助程序
  - 描述了 ESP-BLE-MESH 的辅助程序，比如 Mesh 网络管理、Mesh 特性等。

1. ESP-BLE-MESH 架构概览 目前，ESP-BLE-MESH 已经实现了 Mesh Profile 的大多数功能及 Mesh Model 规范中定义的所有 Client Model。未支持的功能/模型尚在开发中，会尽快提供。ESP-BLE-MESH 已通过 Bluetooth SIG 蓝牙技术联盟的 认证。

ESP-BLE-MESH 架构主要由以下 5 大部分组成：

- Mesh 协议栈
  - Mesh Networking 负责 ESP-BLE-MESH 节点的网络消息处理等。
  - Mesh Provisioning 负责 ESP-BLE-MESH 设备的启动配置流程。
  - Mesh Models 负责实现 SIG 定义的模型。
- 网络管理
  - 负责实现网络管理程序，包括节点删除程序、网络索引 (IV Index) 恢复程序等。
- 特性
  - 包括 ESP-BLE-MESH 特性，如低功耗特性、好用特性、中继特性等。
- Mesh 承载层
  - 包括 广播承载层和 GATT 承载层。承载层对于 ESP-BLE-MESH 协议栈至关重要，因为协议栈基于蓝牙低功耗技术构建而成。其必须利用承载层通过 BLE 广播通道和连接通道进行数据传输。
- 应用程序
  - 基于 ESP-BLE-MESH 协议栈和 Mesh Models。
  - 通过调用 API 和处理事件，Applications 实现了与 ESP-BLE-MESH 协议栈中的 Mesh Networking 和 Mesh Provisioning 的交互，也实现了与 Mesh Models 中一系列模型的交互。

1.1 Mesh 协议栈

1.1.1 Mesh Networking 协议栈架构中的 Mesh Networking 实现了如下功能：

- Mesh 网络中节点间的通讯。
- Mesh 网络中消息的加解密。
- Mesh 网络资源的管理，如网络秘钥 (NetKey)、网络索引等。
- Mesh 网络消息的分包与重组。
图 17: 图 1.1 ESP-BLE-MESH 架构图
• 消息在不同模型间的模型映射。
• 更多功能，请参见 ESP-BLE-MESH Feature List。

Mesh Networking 功能的实现是基于层级结构的。每一层的功能如表 1.1 所示：

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>接入层</td>
<td>接入层定义应用程序数据的格式，还对上层传输层对数据包的加密和解密进行定义和控制。</td>
</tr>
<tr>
<td>上层传输层</td>
<td>上层传输层对接入层进的数据进行加解密，间接实现“传输控制消息”的特殊消息，这种消息包括了与“友谊”和心跳包相关的消息。</td>
</tr>
<tr>
<td>底层传输层</td>
<td>底层传输层处理 PDU 的分包和重组。</td>
</tr>
<tr>
<td>网络层</td>
<td>网络层定义网络消息的地址类型和格式，实现设备的中继功能。</td>
</tr>
</tbody>
</table>

1.1.2 Mesh Provisioning 协议栈架构中的 Mesh Provisioning 实现了如下功能：

• 对未配网设备的配网。
• Mesh 网络资源的分配(单播地址，网络索引和网络秘钥)。
• 配网期间对 4 种验证方法的支持。
• 更多功能，请参见 ESP-BLE-MESH Feature List。

Mesh Provisioning 功能的实现是基于层级结构的。每一层的功能如表 1.2 所示：

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>通过配网协议处理不同层级的 Provisioning PDUs。</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>使用 Generic Provisioning 层或代理协议层将 Provisioning PDU 传输到未配网的设备。</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT</td>
<td>这些层级定义了 Provisioning PDUs 作为可分包和重组的消息进行传输的方式。</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>Provisioning bearer 定义了会话建立的方式，该方式用来将 Generic Provisioning 层的传输包发送到设备。</td>
</tr>
</tbody>
</table>

1.1.3 Mesh Models 协议栈架构中的 Mesh Models 实现了如下功能：

• Configuration Client/Server Models
• Health Client/Server Models
• Generic Client/Server Models
• Sensor Client/Server Models
• Time and Scenes Client/Server Models
• Lighting Client/Server Models

每一层的功能如表 1.3 所示：

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>模型层</td>
<td>模型层实现用于标准化典型用户场景操作的模型，包括 Generic Client/Server Models，Sensor Client/Server Models，Time and Scenes Client/Server Models，Lighting Client/Server Models 和若干自定义模型。</td>
</tr>
<tr>
<td>基础模型层</td>
<td>基础模型层实现与 ESP-BLE-MESH 网络配置，管理和自我诊断等相关的模型。</td>
</tr>
</tbody>
</table>

1.2 Mesh 网络管理 网络管理实现了如下功能：

• 节点移除程序：用于将节点从网络中移除。
• 网络索引恢复程序：用于恢复节点的网络索引。
1.3 Mesh 特性
特性包括以下几项:
- 低功耗特性：用于降低节点的能耗。
- 好友特性：用于为低功耗节点存储消息。
- 中继特性：用于中继/转发节点通过广播承载层收到的网络 PDU。
- Proxy Server/Client 是代理协议中的两个节点角色，其使节点可以通过面向连接的承载层收发 Network PDUs、mesh beacons、代理配置消息和 Provisioning PDU。

1.4 Mesh 承载层
协议栈框架中的 承载层负责 ESP-BLE-MESH 协议栈和低功耗蓝牙核心协议间的数据传输。
承载层可视为是基于蓝牙低功耗核心协议的载体层，其实现了 ESP-BLE-MESH 协议栈数据的接收和传输。

<table>
<thead>
<tr>
<th>层级</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT 承载层</td>
<td>GATT 承载层使用代理协议通过 GATT 连接在两个设备之间发送和接收 Proxy PDUs。</td>
</tr>
<tr>
<td>广播承载层</td>
<td>使用广播承载层时，必须使用低功耗蓝牙广播通道来发送 mesh 数据包。数据包中的 AD Type 需要设置为 mesh 数据包的类型。</td>
</tr>
</tbody>
</table>

1.5 Mesh 应用层
协议栈框架图中的 应用层通过调用 ESP-BLE-MESH 协议栈提供的 API 并处理协议栈上报的事件来实现相应地功能，有一些常见应用，比如网关、照明等。

应用层和 API / 事件之间的交互
- 应用层调用 API
  - 调用配网相关的 API 进行配网。
  - 调用模型相关的 API 发送消息。
  - 调用设备属性相关的 API 获取设备的本地信息。
- 应用层处理事件
  - 应用层的设计基于事件设计，事件将参数传送给应用层。事件主要分为两大类。
    - 调用 API 完成的事件。
      - 比如接收消息的事件。
      - 协议栈主动上报给应用层的事件。
        - 协议栈主动上报的事件。
        - 模型主动上报的事件。
  - 事件通过应用层注册的回调函数进行上报，同时回调函数中也会包含对事件的响应处理。

API / 事件与 ESP-BLE-MESH 协议栈的交互
- 用户使用的 API 主要调用 “Mesh Networking”、Mesh Provisioning 和 Mesh Models 提供的函数。
- API / 事件和协议栈的交互不会跨越协议栈的层级进行操作。比如 API 不会调用 Network Layer 相关的函数。

2. ESP-BLE-MESH 架构实现
ESP-BLE-MESH 架构的设计和实现是基于层级和模块的。具体而言，第 2.1 节 (Mesh 网络的实现)、第 2.2 节 (Mesh 配网实现) 和第 2.3 节 (Mesh 层级实现) 基于层级思想，第 2.4 节 (网络模型的实现) 基于模块思想。
- 层级思想: 基于层级思想，网络架构根据 Mesh Profile Specification 中指定的层级设计而成。每层都有独特的文件，文件包括该层的 API 等。具体设计如图 2.1 所示。
- 模块思想: 每个文件实现一个独立的功能，供其它程序调用。
Chapter 4. API

ESP-BLE-MESH 架构采用分层的方式进行设计：数据包的处理所经过的层级顺序是固定的，也就是数据包的处理过程会形成一个消息流。因此，我们可以从图 2.1 的协议栈接口图中看到消息流。

2.1 Mesh 协议栈的实现

2.1.1 Mesh Networking 实现 Mesh Networking 中的文件列表和每个文件实现的功能如表 2.1 所示：

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>ESP-BLE-MESH 接入层</td>
</tr>
<tr>
<td>transport.c</td>
<td>ESP-BLE-MESH 底层/上层传输层</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH 网络层</td>
</tr>
<tr>
<td>adv.c</td>
<td>用于发送 ESP-BLE-MESH 广播包的任务，一个用于处理收到的广播包的回调以及用于分配 adv 缓冲区的 API</td>
</tr>
</tbody>
</table>

2.1.2 Mesh Provisioning 实现 由于 Node/Provisioner 共存的限制，Mesh Provisioning 的实现分为两大模块。实现 Node 启动配置的特定文件如表 2.2 所示：

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>ESP-BLE-MESH 节点配网 (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH 节点代理服务器相关功能</td>
</tr>
<tr>
<td>beacon.c</td>
<td>用于处理 ESP-BLE-MESH Beacon 的 API</td>
</tr>
</tbody>
</table>

实现 Provisioner 配置功能的特定文件如表 2.3 所示：

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>ESP-BLE-MESH Provisioner 配置入网 (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH 代理客户端相关功能</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>ESP-BLE-MESH Provisioner 网络相关功能</td>
</tr>
</tbody>
</table>

2.1.3 Mesh Models 实现 Mesh Models 用于实现节点中所包含的模型的具体功能。服务器模型主要用于维护节点状态。客户端模型主要用于获取和修改节点状态。

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg_cli.c</td>
<td>发送 Configuration Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>cfg_srv.c</td>
<td>接收 Configuration Client 消息，发送相应应答消息</td>
</tr>
<tr>
<td>health_cli.c</td>
<td>发送 Health Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>health_srv.c</td>
<td>接收 Health Client 消息，发送适当应答消息</td>
</tr>
<tr>
<td>client_common.c</td>
<td>ESP-BLE-MESH 模型相关操作</td>
</tr>
<tr>
<td>generic_client.c</td>
<td>发送 ESP-BLE-MESH Generic Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>lighting_client.c</td>
<td>发送 ESP-BLE-MESH Lighting Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>sensor_client.c</td>
<td>发送 ESP-BLE-MESH Sensor Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>time_scene_client.c</td>
<td>发送 ESP-BLE-MESH Time Scene Client 消息，接收相应应答消息</td>
</tr>
<tr>
<td>generic_server.c</td>
<td>发送 ESP-BLE-MESH Generic Client 消息，发送相应应答消息</td>
</tr>
<tr>
<td>lighting_server.c</td>
<td>接收 ESP-BLE-MESH Lighting Client 消息，发送相应应答消息</td>
</tr>
<tr>
<td>sensor_server.c</td>
<td>接收 ESP-BLE-MESH Sensor Client 消息，发送相应应答消息</td>
</tr>
<tr>
<td>time_scene_server.c</td>
<td>接收 ESP-BLE-MESH Time Scene Client 消息，发送相应应答消息</td>
</tr>
</tbody>
</table>
2.2 Mesh Bearers 实现  Mesh Bearers 在实现时充分考虑了可移植性。当 ESP-BLE-MESH 协议栈需要移植到其它平台时，用户只需要修改 mesh_bearer_adapt.c 就能移植成功。

表 9: 表 2.5 Mesh Bearers 文件描述

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh_bearer_adapt.c</td>
<td>ESP-BLE-MESH 承载层适配文件。此文件提供用于接收和发送 ESP-BLE-MESH ADV 和 GATT 相关数据包的接口。</td>
</tr>
</tbody>
</table>

备注：mesh_bearer_adapt.c 是对 Mesh 网络框架中 Advertising Bearer 和 GATT Bearer 的实现。

2.3 Mesh Applications 实现  我们提供了一系列用于客户开发的应用示例，用户可以基于 ESP-BLE-MESH 示例 开发产品。

1. ESP-BLE-MESH 辅助程序  辅助程序指的是 ESP-BLE-MESH 协议栈中可选的功能。辅助程序的设计通常通过 CONFIG_BLE_MESH 来实现代码的裁剪。

3.1 特性  
- 低功耗
- 好友
- 中继
- 代理客户端/代理服务器

3.2 网络管理  
- 节点移除程序
- 网络索引恢复程序
- 网络索引更新程序
- 秘钥更新程序
- 网络创建程序
- NVS 存储器

3.3 辅助程序实现  采用独立模块的设计主要考虑到两个因素：
- 该模块不具备分层实现的条件，其实现可以完全独立，不需要依赖其它模块。
- 模块中的函数会被反复使用到，因此最好设计成独立模块。独立模块如表 3.1 所示：

表 10: 表 3.1 模块文件描述

<table>
<thead>
<tr>
<th>文件</th>
<th>功能</th>
</tr>
</thead>

ESP-BLE-MESH 常见问题手册
本文汇总了 ESP-BLE-MESH 协议栈开发的常见问题及解答，全文分为 7 个章节。

1. Provisioner 开发
2. 节点开发
3. ESP-BLE-MESH 和 Wi-Fi 共存
4. 快速配网
5. Log 帮助
6. 示例帮助
7. 其他

用户可以参考这些章节，快速找到问题的答案。该文档会根据各种渠道收集的反馈进行更新。

1. Provisioner 开发 通常而言，Provisioner 用于配网未配网设备并形成 mesh 网络。组网后，设备的角色变成节点。

1.1 未配网设备加入 ESP-BLE-MESH 网络的流程是什么？
设备通过 Provisioner 加入 ESP-BLE-MESH 网络分为两个阶段，配网阶段和配置阶段。

- 部分阶段：为设备分配单播地址，添加网络密钥 (NetKey) 等。通过配网，设备加入 ESP-BLE-MESH 网络，身份从未配网设备变为节点。
- 配置阶段：为节点添加应用密钥 (AppKey)，并将应用密钥绑定到相应模块。配置期间，有些选项是可选的，比如为节点添加订阅地址、设置发布地址等。通过配置，该节点实际上可以向 Provisioner 发送消息，也可以接收来自 Provisioner 的消息。

1.2 如果 Provisioner 想要改变节点状态，其需满足什么条件？
- 需要有和节点的服务器模型相对应的客户端模型。
- 需要有节点存同的，可用于加密消息的网络密钥和应用密钥。
- 需要知道节点的地址，可以是单播地址，也可以是订阅地址。

1.3 如何使用网络密钥和应用密钥？
- 网络密钥用于加密网络层的消息。具有相同网络密钥的节点视作在同一网络中，具有不同网络密钥的节点无法进行通信。
- 应用密钥用于加密上层传输层中的消息。如果服务器模型和客户端模型绑定的应用密钥不同，则无法实现异步通信。

1.4 如何生成网络密钥或应用密钥？是否可以采用固定的网络密钥或应用密钥？
- API esp_ble_mesh_provisioner_add_local_net_key() 可以用来添加包含固定值或随机密钥的网络密钥。
- API esp_ble_mesh_provisioner_add_local_app_key() 可以用来添加包含固定值或随机密钥的应用密钥。

1.5 Provisioner 的单播地址是不是固定的？
esp_ble_mesh_prov_t 中 prov_unicast_addr 的值用于设置 Provisioner 的单播地址，只能在初始化期间设置一次，此后不能更改。

1.6 Provisioner 的地址是否可以作为节点上报状态消息的目的地址？
Provisioner 的单播地址只能在初始化期间设置一次，此后不能更改。理论而言，只要节点知道 Provisioner 的单播地址，此地址便可用作节点上报状态消息的目地地址。节点在网络配置的过程中可以知道 Provisioner 的单播地址，因为 Provisioner 在节点发送消息时，消息的源地址就是 Provisioner 的单播地址。

订阅地址也可使用。Provisioner 订阅组地址或者虚拟地址，节点向该订阅地址发送消息。
1.7 被 Provisioner 配网到 ESP-BLE-MESH 网络中的第一个节点的单播地址是不是固定的？

`esp_ble_mesh_prov_t` 中 `prov_start_address` 的值用于设置 Provisioner 配网未配网设备的起始地址，即其首先配网的节点的单播地址。单播地址只能在初始化期间设置一次，此后不能修改。

1.8 手机 App 首先配置的节点的单播地址是不是固定的？

该 App 将确定单播地址，目前大多数单播地址是固定的。

1.9 如何知道当前 Provisioner 正在配网哪个未配网设备？

`esp_ble_mesh_prov_t` 中 `prov_attention` 的值由 Provisioner 在配网过程中设置给未配网设备。该值只能在初始化期间设置一次，此后不能修改。未配网设备加入 mesh 网络后可以用特定的方式来显示自己正在配网，比如灯光闪烁，以告知 Provisioner 其正在配网。

1.10 配网过程中，认证设备共有多少种方法？提供的范例中 provided examples 使用了什么方法？

共有四种设备认证方法，即 No OOB、Static OOB、Output OOB 和 Input OOB。提供的范例使用了 No OOB 的方式。

1.11 配置入网前，未配网设备的广播包可以携带哪些信息？

- Device UUID
- OOB Info
- URL Hash (可选的)

1.12 这些信息可以用于设备识别吗？

是的。每个设备都有独一无二的 Device UUID，用户可以通过 Device UUID 识别设备。

1.13 当 Provisioner 配网的节点包含多个元素时，单播地址是如何分配的？

- Provisioner 会给设备的主元素分配一个单播地址，其余元素的单播地址在此基础上递增。
- 比如：如果一个未配网设备有三个元素，即主要元素、第二元素和第三元素。配网完成后，节点主元素的单播地址为 0x0002，节点第二元素的单播地址为 0x0003，节点第三元素的单播地址为 0x0004。

1.14 Provisioner 如何通过 Configuration Client Model 获取并且解析节点的构成数据？

- Provisioner 可以调用 `Configuration Client Model API esp_ble_mesh_config_client_set_state()` 设置参数，调用 `esp_ble_mesh_cfg_client_get_state_t` 中的 `comp_data_get` 获取节点的构成数据。
- 用户可以参考以下代码解析 Composition Data:

```c
#include <stdio.h>
#include <string.h>
#include <stdint.h>

// test date: 0C001A000100080003000001050100000080010000103103F002A00
// 0C00 1A00 0100 0800 0300 0001 05 01 0000 0080 0100 0010 0310 3F002A00

// CID is 0x000C
// PID is 0x001A
// VID is 0x0001
// CRPL is 0x0008
// Features is 0x0003 - Relay and Friend features.
// Loc is "front" - 0x0100
```

(下页继续)
// NumS is 5
// NumV is 1
// The Bluetooth SIG Models supported are: 0x0000, 0x8000, 0x0001, 0x1000, 0x1003
// The Vendor Models supported are: Company Identifier 0x003F and Model Identifier 0x002A

typedef struct {
  int16_t cid;
  int16_t pid;
  int16_t vid;
  int16_t crpl;
  int16_t features;
  int16_t all_models;
  uint8_t sig_models;
  uint8_t vnd_models;
} esp_ble_mesh_composition_head;

typedef struct {
  uint16_t model_id;
  uint16_t vendor_id;
} tsModel;

typedef struct {
  // reserve space for up to 20 SIG models
  uint16_t SIG_models[20];
  uint8_t numSIGModels;

  // reserve space for up to 4 vendor models
  tsModel Vendor_models[4];
  uint8_t numVendorModels;
} esp_ble_mesh_composition_decode;

int decode_comp_data(esp_ble_mesh_composition_head *head, esp_ble_mesh_composition_decode *data, uint8_t *mystr, int size) {
  int pos_sig_base;
  int pos_vnd_base;
  int i;

  memcpy(head, mystr, sizeof(*head));

  if (size < sizeof(*head) + head->sig_models * 2 + head->vnd_models * 4) {
    return -1;
  }

  pos_sig_base = sizeof(*head) - 1;

  for (i = 1; i < head->sig_models * 2; i++) {
    data->SIG_models[i / 2] = (mystr[i] + pos_sig_base + 1) << 8);
    printf("%d: %4.4x\n", i / 2, data->SIG_models[i / 2]);
  }

  pos_vnd_base = head->sig_models * 2 + pos_sig_base;

  for (i = 1; i < head->vnd_models * 2; i++) {
    data->Vendor_models[i / 2].model_id = (mystr[i] + pos_vnd_base + 1) << 8);
    printf("%d: %4.4x\n", i / 2, data->Vendor_models[i / 2].model_id);
  }
}
1.15 Provisioner 如何通过获取的 Composition Data 进一步配置节点？

Provisioner 通过调用 Configuration Client Model API esp_ble_mesh_config_client_set_state() 来进行如下配置。

- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 app_key_add，将应用密钥添加到节点中。
- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 model_sub_add，将订阅地址添加到节点的模型中。
- 正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 model_pub_set，将发布地址添加到节点的模型中。

1.16 节点可以自己添加相应的配置吗？

本法可用于特殊情况，如测试阶段。

- 此示例展示了节点如何为自己的模型添加新的组地址。

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t --group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;
    int i, j;
    
    if (ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
        return ESP_ERR_INVALID_ARG;
    }
    
    comp = esp_ble_mesh_get_composition_data();
    if (!comp) {
```

(接上页)
return ESP_FAIL;
}

for (i = 0; i < comp->element_count; i++) {
  element = comp->elements[i];
  model = esp_ble_mesh_find_sig_model(element, model_id);
  if (!model) {
    continue;
  }
  for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == group_addr) {
      break;
    }
  }
  if (j == ARRAY_SIZE(model->groups)) {
    ESP_LOGW(TAG, "%s: Group address already exists, element...index: %d", __func__, i);
    continue;
  }
  for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
    if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
      model->groups[j] = group_addr;
      break;
    }
  }
  if (j == ARRAY_SIZE(model->groups)) {
    ESP_LOGE(TAG, "%s: Model is full of group addresses, element...index: %d", __func__, i);
  }
  return ESP_OK;
}
此示例展示了如何通过 Provisioner 检测节点是否离线。

- 节点定期给 Provisioner 发送心跳包。如果 Provisioner 超过一定的时间未接收到心跳包，则视该节点离线。

备注：心跳包的设计应该采用单包（字节数小于 11 个字节）的方式，这样收发效率会更高。

1.20 Provisioner 删除网络中的节点时，需要进行哪些操作？

通常而言，Provisioner 从网络中移除节点主要涉及三个步骤：

- 首先，Provisioner 将需要移除的节点添加至“黑名单”。
- 其次，Provisioner 启动密钥更新程序。
- 最后，节点执行节点重置程序，切换自身身份为未配网设备。

1.21 在密钥更新的过程中，Provisioner 如何更新节点的网络密钥？

- 通过正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 net_key_update，使用 Configuration Client Model API esp_ble_mesh_config_client_set_state()，Provisioner 更新节点的网络密钥。
- 通过正确设置参数 esp_ble_mesh_cfg_client_set_state_t 中的 app_key_update，使用 Configuration Client Model API esp_ble_mesh_config_client_set_state()，Provisioner 更新节点的应用密钥。

1.22 Provisioner 如何管理 mesh 网络中的节点？

ESP-BLE-MESH 在示例中实现了一些基本的节点管理功能，比如 esp_ble_mesh_store_node_info()。ESP-BLE-MESH 还提供可用于设置节点本地名称的 API esp_ble_mesh_provisioner_set_node_name() 和可用于获取节点本地名称的 API esp_ble_mesh_provisioner_get_node_name()。

1.23 Provisioner 想要控制节点的服务器模型时需要什么？

Provisioner 在控制节点的服务器模型前，必须添加相应的客户端模型。

Provisioner 应当添加本地的网络密钥和应用密钥。

- Provisioner 调用 API esp_ble_mesh_provisioner_add_local_net_key() 以添加网络密钥。
- Provisioner 调用 API esp_ble_mesh_provisioner_add_local_app_key() 以添加应用密钥。

Provisioner 应当配置自己的客户端模型。

- Provisioner 调用 API esp_ble_mesh_provisioner_bind_app_key_to_local_model() 以绑定应用密钥至自己的客户端模型。

1.24 Provisioner 如何控制节点的服务器模型？

ESP-BLE-MESH 支持所有 SIG 定义的客户端模型。Provisioner 可以使用这些客户端模型控制节点的服务器模型。客户端模型分为 6 类，每类有相应的功能。

- Configuration Client Model
  - API esp_ble_mesh_config_client_get_state() 可用于获取 Configuration Server Model 的 esp_ble_mesh_cfg_client_get_state_t 值。
  - API esp_ble_mesh_config_client_set_state() 可用于设置 Configuration Server Model 的 esp_ble_mesh_cfg_client_set_state_t 值。
- Health Client Model
Chapter 4. API

- API `esp_ble_mesh_health_client_get_state()` 可用于获取 Health Server Model 的 `esp_ble_mesh_health_client_get_state_t` 值。
- API `esp_ble_mesh_health_client_set_state()` 可用于设置 Health Server Model 的 `esp_ble_mesh_health_client_set_state_t` 值。

  • **Generic Client Models**
    - API `esp_ble_mesh_generic_client_get_state()` 可用于获取 Generic Server Model 的 `esp_ble_mesh_generic_client_get_state_t` 值。
    - API `esp_ble_mesh_generic_client_set_state()` 可用于设置 Generic Server Model 的 `esp_ble_mesh_generic_client_set_state_t` 值。

  • **Lighting Client Models**
    - API `esp_ble_mesh_light_client_get_state()` 可用于获取 Lighting Server Model 的 `esp_ble_mesh_light_client_get_state_t` 值。
    - API `esp_ble_mesh_light_client_set_state()` 可用于设置 Lighting Server Model 的 `esp_ble_mesh_light_client_set_state_t` 值。

  • **Sensor Client Models**
    - API `esp_ble_mesh_sensor_client_get_state()` 可用于获取 Sensor Server Model 的 `esp_ble_mesh_sensor_client_get_state_t` 值。
    - API `esp_ble_mesh_sensor_client_set_state()` 可用于设置 Sensor Server Model 的 `esp_ble_mesh_sensor_client_set_state_t` 值。

  • **Time and Scenes Client Models**
    - API `esp_ble_mesh_time_scene_client_get_state()` 可用于获取 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_get_state_t` 值。
    - API `esp_ble_mesh_time_scene_client_set_state()` 可用于设置 Time and Scenes Server Model 的 `esp_ble_mesh_time_scene_client_set_state_t` 值。

2. 节点开发

2.1 节点包含什么样的模型？

  • ESP-BLE-MESH 中，节点由一系列的模型组成，每个模型实现节点的某些功能。
  • 模型分为两种，客户端模型和服务器模型。客户端模型可以获取并设置服务器模型的状态。
  • 模型也可以分为 SIG 模型和自定义模型。SIG 模型的所有行为都由官方定义，而自定义模型的行为
    均由用户定义。

2.2 每个模型对应的消息格式是不是固定的？

  • 消息由 opcode 和 payload 组成，通过 opcode 进行区分。
  • 与模型对应的消息的类型和格式都是固定的，这意味着模型之间传输的消息是固定的。

2.3 节点的模型可以使用哪些函数发送消息？

  • 对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` 发送消息。
  • 对于服务器模型，用户可以调用 API `esp_ble_mesh_server_model_send_msg()` 发送消息。
  • 对于发布，用户可以调用 API `esp_ble_mesh_model_publish()` 发布消息。

2.4 如何实现消息传输不丢包？

  如果用户要实现消息传输不丢包，则需有应答的消息。等待应答的默认时间在 `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT` 中设置。如果发送端等待应答超时，就会触发对应的超时事件。

备注：API `esp_ble_mesh_client_model_send_msg()` 中可以设置应答的超时时间。如果参数 `msg_timeout` 设为 0，那么超时时间便会采用默认值（4 秒）。
第 4 章 API

2.5 如何发送无应答的消息？
对于客户端模型，用户可以调用 API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` 发送无应答消息。

对于服务器模型，调用 API `esp_ble_mesh_server_model_send_msg()` 发送的消息总是无应答的消息。

2.6 如何为模型添加订阅地址？
通过 Configuration Client Model 添加订阅地址。

2.7 模型发送的消息和发布的消息有何不同？
调用 API `esp_ble_mesh_client_model_send_msg()` 或 `esp_ble_mesh_server_model_send_msg()` 发送的消息会在 Network Transmit 状态规定的期限内发送。

调用 API `esp_ble_mesh_model_publish()` 发布的消息将由模型发布状态决定是否发布。消息的发布一般是周期性的，或者有固定次数。发布周期和发布次数由模型发布状态控制，并且可以通过 Configuration Client Model 进行配置。

2.8 发送不分包消息时，最多可携带多少有效字节？
不分包消息的总有效载荷长度（可由用户设置）为 11 个八位组，因此，如果消息的 opcode 为 2 个八位组，则该消息可以携带 9 个八位组的有效信息。对于 vendor 消息，由于 opcode 是 3 个八位组，剩余的有效负载长度为 8 个八位组。

2.9 什么时候应该使用节点的 Relay 功能？
如果 mesh 网络中检测到的节点很稀疏，用户可以使能节点的 Relay 功能。

如果 mesh 网络中检测到的节点很密集，用户可以选择仅使能一些节点的 Relay 功能。

如果 mesh 网络大小未知，用户可以默认使能 Relay 功能。

2.10 什么时候应该使用节点的 Proxy 功能？
如果未配网设备将由电话配网，则未配网设备应该使能 Proxy 功能，因为当前几乎所有电话都不支持通过广播承载层发送 ESP-BLE-MESH 数据包，并且，未配网设备成功配网成为 Proxy 节点后，其会通过 GATT 承载层和广播承载层与 mesh 网络中的其他节点通信。

2.11 如何使用代理过滤器？
代理过滤器用于减少 Proxy Client（如手机）和 Proxy Server（如节点）之间交换的 Network PDU 的数量。另外，通过代理过滤器，Proxy Client 可以明确请求仅接收来自 Proxy Server 的某些目标地址的 mesh 消息。

2.12 Relay 节点什么时候可以中继消息？
如果要中继消息，消息需满足以下要求。

• 消息存在于 mesh 网络中。
• 消息的目的地址不是节点的单播地址。
• 消息的 TTL 值需大于 1。

2.13 如果一条消息分成几段，那么其他 Relay 节点是接收到一段消息就中继还是等接收到完整的数据包才中继？
Relay 节点收到其中一段消息时就中继，而非一直等到接收所有的消息。
2.14 使用 Low Power 功能降低功耗的原理是什么？

- 开启无线电进行收听时，设备消耗能量。使能节点的低功耗功能后，它将在大多数时间内关闭无线电功能。
- 低功耗节点和好友节点需要合作，因此低功耗节点可以以适当或较低的频率接收消息，而无需一直收听。
- 当低功耗节点有一些新消息时，好友节点将为其存储消息。低功耗节点可以间隔固定时间轮询好友节点，以查看是否有新的消息。

2.15 设备断电后上电，如何能继续在网络中进行通讯？

在 menuconfig 中启用配置 Store BLE Mesh Node configuration persistently。

2.16 如何实现将节点自检的信息发送出来？

推荐节点通过 Health Server Model 定期发布其自检结果。

2.17 节点间如何传输消息？

节点间传输信息的可能应用场景是，一旦烟雾报警检测到高浓度的烟雾，就会触发喷淋设备。有两种实现方法。
- 方法 1：喷淋设备订阅组地址。当烟雾报警器检测到高浓度的烟雾时，它会发布一条消息，该消息的目标地址是喷淋设备已订阅的组地址。
- 方法 2：Provisioner 可以配置喷淋设备的单播地址为烟雾报警器的地址。当检测到高浓度的烟雾时，烟雾报警器以喷淋设备的单播地址为目标地址，将消息发送到喷淋设备。

2.18 设备通信必须要网关吗？

- 情况 1：节点仅在 mesh 网络内通信。这种情况下，不需要网关。ESP-BLE-MESH 网络是一个泛洪的网络，网络中的消息没有固定的路径，节点与节点之间可以随意通信。
- 情况 2：如果用户想要远程控制网络，比如在到家之前打开某些节点，则需要网关。

2.19 何时使用 IV Update 更新程序？

一旦节点的底层检测到发送的消息的序列号达到临界值，IV Update 更新程序便会启用。

2.20 如何启用 IV Update 更新程序？

节点可以使用带有 Secure Network Beacon 的 IV Update 更新程序。

3. ESP-BLE-MESH 和 Wi-Fi 共存

3.1 Wi-Fi 和 ESP-BLE-MESH 共存时，支持哪些模式？

目前，只有 Wi-Fi STA 模式支持共存。

3.2 Wi-Fi 和 ESP-BLE-MESH 共存时，为什么 Wi-Fi 吞吐量很低？

未搭载 PSRAM 的 ESP32-DevKitC 开发板，Wi-Fi 和 ESP-BLE-MESH 共存可以正常运行，但是吞吐率较低。当 Wi-Fi 和 ESP-BLE-MESH 共存时，搭载 PSRAM 的 ESP32-DevKitC 速率可以在 1 Mbps 以上。

应使能 menuconfig 中的一些配置来支持 PSRAM。

- ESP32-specific --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
4. API

4.1 为什么需要快速配网？
通常而言，存在少量未配网设备时，用户可以逐个配置。但是如果有大量未配网设备（比如 100 个）时，逐个配置会耗费大量时间。通过快速配网，用户可以在约 50 秒内配网 100 个未配网设备。

4.2 为什么会出现 EspBleMesh App 在快速配网期间长时间等待的情况？
快速配网期间，代理节点在配置完一个节点后会断开与 APP 的连接，待所有节点配网完成后再与 APP 重新建立连接。

4.3 为什么 APP 中显示的节点地址的数量比现有的节点地址更多？
每完成一次快速配网后，开始新一次快速配网前，APP 会存有上次配网的数据，因此 APP 中显示的节点地址的数量比现有的节点地址更多。

4.4 在 EspBleMesh App 中输入的 ** count ** 值有什么用途？
此 count 值提供给 App 配置的代理节点，以决定何时提前开始 Proxy 广播信息。

4.5 运行以下示例 fast_prov_server 的节点的 Configuration Client Model 何时开始工作？
使能了 Temporary Provisioner 功能后，Configuration Client Model 会开始工作。

4.6 Temporary Provisioner 功能会一直处于使能的状态吗？
节点收到打开/关闭电灯的消息后，所有节点会禁用其 Temporary Provisioner 功能并且转化为一般节点。

5. Log 帮助 当 ESP-BLE-MESH 协议栈底层出现错误或者警告时，您可以在这儿找到这些错误和警告的含义。

5.1 ran out of retransmit attempts 代表什么？
节点发送分段消息时，由于某些原因，接收端未收到完整的消息。节点会重传消息。当重传次数达到最大重传数时，会出现该警告，当前最大重传数为 4。

5.2 Duplicate found in Network Message Cache 代表什么？
当节点收到一条消息时，它会把该消息与网络缓存中存储的消息进行比较。如果在缓存中找到相同的消息，这意味着之前已接受过该消息。则该消息会被丢弃。
5.3 Incomplete timer expired 代表什么？
当节点在一定时间段（比如 10 秒）内未收到分段消息的所有段时，则 Incomplete 计时器到时，并且出现该警告。

5.4 No matching TX context for ack 代表什么？
当节点收到一个分段 ack 且不能找到任何自己发送的与该 ack 相关的消息时，会出现该警告。

5.5 No free slots for new incoming segmented messages 代表什么？
当节点没有空间来接收新的分段消息时，会出现该警告。用户可以通过配置 CONFIG_BLE_MESH_RX_SEG_MSG_COUNT 扩大空间。

5.6 Model not bound to AppKey 0x0000 代表什么？
当节点发送带有模型的消息且该模型尚未绑定到索引为 0x0000 的应用密钥时，会出现该报警。

5.7 Busy sending message to DST xxxx 代表什么？
该错误表示节点的客户端模型已将消息发送给目标节点，并且正在等待响应。用户无法将消息发送到单播地址相同的同一节点。接收到相应的响应或计时器到时后，可以发送另一条消息。

6. 示例帮助

6.1 ESP-BLE-MESH 回调函数如何分类？
- API esp_ble_mesh_register_prov_callback() 用于注册处理配网和入网相关事件的回调函数。
- API esp_ble_mesh_register_config_client_callback() 用于注册处理 Configuration Client Model 相关事件的回调函数。
- API esp_ble_mesh_register_config_server_callback() 用于注册处理 Configuration Server Model 相关事件的回调函数。
- API esp_ble_mesh_register_health_client_callback() 用于注册处理 Health Client Model 相关事件的回调函数。
- API esp_ble_mesh_register_health_server_callback() 用于注册处理 Health Server Model 相关事件的回调函数。
- API esp_ble_mesh_register_generic_client_callback() 用于注册处理 Generic Client Models 相关事件的回调函数。
- API esp_ble_mesh_register_light_client_callback() 用于注册处理 Lighting Client Models 相关事件的回调函数。
- API esp_ble_mesh_register_sensor_client_callback() 用于注册处理 Sensor Client Model 相关事件的回调函数。
- API esp_ble_mesh_register_time_scene_client_callback() 用于注册处理 Time and Scenes Client Models 相关事件的回调函数。
- API esp_ble_mesh_register_custom_model_callback() 用于注册处理自定义模型和未实现服务器模型的相关事件的回调函数。

7. 其他

7.1 如何打印数据包？
示例使用如下函数 ESP_LOG_BUFFER_HEX() 打印信息语境，而 ESP-BLE-MESH 协议栈使用 bt_hex() 打印。
7.2 重启 ESP32 应使用哪个 API？
API `esp_restart()`。

7.3 如何监测任务栈的剩余空间？
API `vTaskList()` 可以用于定期打印任务栈的剩余空间。

7.4 如何在不更改 menuconfig 输出级别的情况下改变 log 级别？
无需使用 menuconfig，可以通过 API `esp_log_level_set()` 修改 log 的输出级别。

ESP-BLE-MESH Terminology
A device that is not a member of a mesh network is known as an unprovisioned device.

Anode is a provisioned device.

A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.

A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.

A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.

A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.

A node that is capable of adding a device to a mesh network.

</table>
| Configuration Server Model | “This model is used to represent a mesh network configuration of a device.” | 节点必须包含 Configuration Server Model。其负责维护配置相关的状态。Configuration Server Model 维护的状态包含：网络密钥名单 (NetKey List)、应用密钥名单 (AppKey List)、模型绑定的应用密钥名单 (Model to App-Key List)、节点身份 (Node Identity)、密钥刷新阶段 (Key Refresh Phase)、心跳消息发布 (Heartbeat Publish)、心跳消息订阅 (Heartbeat Subscription)、网络传输 (Network Transmit) 和中继转发 (Relay Retransmit) 等。

| Configuration Client Model | “The model is used to represent an element that can control and monitor the configuration of a node.” | Configuration Client Model 通过消息控制 Configuration Server Model 的状态。Provisioner 必须包含 Configuration Client Model。有了该模型才可发送 “Configuration Composition Data Get” 等配置消息。

| Health Server Model | “This model is used to represent a mesh network diagnostics of a device.” | Health Server Model 主要用于设备检查自身状态，查看自身是否发生错误。Health Server model 维护的状态包含：当前故障 (Current Fault)、已登记故障 (Registered Fault)、健康周期 (Health Period) 和关注时器 (Attention Timer)。 |

| Health Client Model | “The model is used to represent an element that can control and monitor the health of a node.” | Health Client Model 通过消息控制 Health Server Model 维护的状态。该模型可通过消息 “Health Fault Get” 获取其他节点的自检信息。 |
This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.

“IV 更新程序用于更新 ESP-BLE-MESH 网络的 IV Index 的值。这个值和消息加密时所需的随机数相关。为了保证随机数的值不重复，所以将这个值定期增加。IV Index 是一个 32 位的值，是一种共享网络资源。比如一个 mesh 网中的所有节点共享一个 IV Index 值。IV Index 从 0x00000000 开始，在 IV 更新过程中递增，并由特定的进程维护。以保证整个 Mesh 网内共享一个 IV Index。当节点认为它有耗尽其序列号的风险，或它确定另一个节点即将耗尽其序列号时，可以启动该程序。注意：每次的更新时间不得低于 96 小时。节点接收到 secure network beacon 或者确定自己的序列号大于特定值时，会触发 IV 更新程序。”

ESP-IDF FreeRTOS (SMP)

This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS (its features, behavior, and API usage). Refer to the Vanilla FreeRTOS documentation for more details.

This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS that were made in order to support Symmetric Multiprocessing (SMP). This document is split into the following parts.

Contents

- ESP-IDF FreeRTOS (SMP)
  - Overview
  - Symmetric Multiprocessing
    - Basic Concepts
    - SMP on an ESP Target
  - Tasks
    - Creation
    - Execution
    - Deletion
4.10.1 Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a small and efficient Real Time Operating System supported on many single-core MCUs and SoCs. However, numerous ESP targets (such as the ESP32 and ESP32-S3) are capable of dual core symmetric multiprocessing (SMP). Therefore, the version of FreeRTOS used in ESP-IDF (hereinafter referred to as ESP-IDF FreeRTOS) is a modified version of Vanilla FreeRTOS v10.4.3. These modifications allow ESP-IDF FreeRTOS to utilize the dual core SMP capabilities of ESP SoCs.

For information regarding features that have been added to ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS Additions.

For a detailed ESP-IDF FreeRTOS API Reference, see FreeRTOS API reference.

4.10.2 Symmetric Multiprocessing

Basic Concepts

SMP (Symmetric Multiprocessing) is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system ...

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus a piece of code that accesses a particular memory address will have the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single core or Asymmetric Multiprocessing systems are that...

- the presence of multiple CPUs allows for multiple hardware threads, thus increases overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This in general can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP systems will also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core will only be able to run on that core
- A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.
SMP on an ESP Target

ESP targets (such as the ESP32, ESP32-S3) are dual core SMP SoCs. These targets have the following hardware features that make them SMP capable:

- Two identical cores known as CPU0 (i.e., Protocol CPU or PRO_CPU) and CPU1 (i.e., Application CPU or APP_CPU). This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
  - If multiple cores access the same memory address, their access will be serialized at the memory bus level.
  - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger and interrupt on another CPU. This allows cores to signal each other.

注: The “PRO_CPU” and “APP_CPU” aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical IDF applications will utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., WiFi or Bluetooth) will be pinned to CPU0 (thus the name PRO_CPU), whereas the tasks handling the remainder of the application will be pinned to CPU1 (thus the name APP_CPU).

4.10.3 Tasks

Creation

Vanilla FreeRTOS provides the following functions to create a task:

- `xTaskCreate()` creates a task. The task’s memory is dynamically allocated.
- `xTaskCreateStatic()` creates a task. The task’s memory is statically allocated (i.e., provided by the user).

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a `PinnedToCore` version of Vanilla FreeRTOS’s task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task’s memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task’s memory is statically allocated (i.e., provided by the user).

The `PinnedToCore` versions of the task creation functions API differ from their vanilla counterparts by having an extra `xCOREID` parameter that is used to specify the created task’s core affinity. The valid values for core affinity are:

- 0 which pins the created task to CPU0
- 1 which pins the created task to CPU1
- `tskNO_AFFINITY` which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, they have been modified to simply call their `PinnedToCore` counterparts with `tskNO_AFFINITY`.

备注：ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

Execution

The anatomy of a task in ESP-IDF FreeRTOS is the same as Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:
• Can only be in one of following states: Running, Ready, Blocked, or Suspended.
• Task functions are typically implemented as an infinite loop
• Task functions should never return

Deletion

Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task (if the provided task handle is `NULL`). The actual freeing of the task’s memory is sometimes delegated to the idle task (if the task being deleted is the currently running task).

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

• When deleting a task that is pinned to the other core, that task’s memory is always freed by the idle task of the other core (due to the need to clear FPU registers).
• When deleting a task that is currently running on the other core, a yield is triggered on the other core and the task’s memory is freed by one of the idle tasks (depending on the task’s core affinity)
• A deleted task’s memory is freed immediately if:
  – The tasks is currently running on this core and is also pinned to this core
  – The task is not currently running and is not pinned to any core

Users should avoid calling `vTaskDelete()` on a task that is currently running on the other core. This is due to the fact that it is difficult to know what the task currently running on the other core is executing, thus can lead to unpredictable behavior such as:

• Deleting a task that is holding a mutex
• Deleting a task that has yet to free memory it previously allocated

Where possible, users should design their application such that `vTaskDelete()` is only ever called on tasks in a known state. For example:

• Tasks self deleting (via `vTaskDelete(NULL)`) when their execution is complete and have also cleaned up all resources used within the task.
• Tasks placing themselves in the suspend state (via `vTaskSuspend()`) before being deleted by another task.

4.10.4 SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a Fixed Priority Preemptive scheduler with Time Slicing meaning that:

• Each tasks is given a constant priority upon creation. The scheduler executes highest priority ready state task
• The scheduler can switch execution to another task without the cooperation of the currently running task
• The scheduler will periodically switch execution between ready state tasks of the same priority (in a round robin fashion). Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features (i.e., Fixed Priority, Preemption, and Time Slicing) albeit with some small behavioral differences.

Fixed Priority

In Vanilla FreeRTOS, when scheduler selects a new task to run, it will always select the current highest priority ready state task. In ESP-IDF FreeRTOS, each core will independently schedule tasks to run. When a particular core selects a task, the core will select the highest priority ready state task that can be run by the core. A task can be run by the core if:

• The task has a compatible affinity (i.e., is either pinned to that core or is unpinned)
• The task is not currently being run by another core

However, users should not assume that the two highest priority ready state tasks are always run by the scheduler as a task’s core affinity must also be accounted for. For example, given the following tasks:
Chapter 4. API

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second highest priority task.

Preemption

In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher priority task can run on that core.

However, there are some instances where a higher priority task that becomes ready can be run on multiple cores. In this case, the scheduler will only preempt one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing

The Vanilla FreeRTOS scheduler implements time slicing meaning that if current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready state tasks of the same priority AX, B0, C1, D1 where: - The priority is the current highest priority with ready state tasks - The first character represents the task’s names (i.e., A, B, C, D) - And the second character represents the tasks core pinning (and X means unpinned)
- The task list is always searched from the head

| Starting state. None of the ready state tasks have been selected to run |
| Head [ AX , B0 , C1 , D0 ] Tail |
| Core 0 has tick interrupt and searches for a task to run. |
| Task A is selected and is moved to the back of the list |
Chapter 4. API

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

Tick Interrupts

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook
In ESP-IDF FreeRTOS, each core will receive a periodic interrupt and independently run the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- CPU0 will execute all of the tick interrupt responsibilities listed above
- CPU1 will only check for time slicing and execute the application tick hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension

Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen (but the tick interrupt will still occur to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled.
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, those tasks will go into core A’s own pending ready task list
- If core A is CPU0, the tick count is frozen and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

- Any tasks added to core A’s pending ready task list will be resumed.
- If core A is CPU0, the pended tick count is unwound to catch up the lost ticks.

Disabling Interrupts

Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts will only disabled or enabled on the current core.
### 4. API

#### 7. Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

#### 8. Startup and Termination

ESP-IDF FreeRTOS does **not** require users to call `vTaskStartScheduler()` to start the scheduler. The startup flow of an ESP-IDF application will already call this automatically. The entry point for user code is a user defined `void app_main(void)` function. For more details regarding the startup of ESP-IDF FreeRTOS applications, see ESP-IDF FreeRTOS Applications.

ESP-IDF FreeRTOS does **not** support scheduler termination. Calling `vTaskEndScheduler()` will simply cause the application to abort.

#### 4.10.5 Critical Sections

##### API Changes

Vanilla FreeRTOS implements critical sections by disabling interrupts. This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&mux)` enters a critical from a task context
- `taskEXIT_CRITICAL(&mux)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&mux)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&mux)` exits a critical section from an interrupt context

**Note:** The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid dead locking when entering critical sections recursively.

##### Implementation

In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&mux)` (or `taskENTER_CRITICAL_ISR(&mux)`)
  1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock’s owner value to the core’s ID.
  3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.
- For `taskEXIT_CRITICAL(&mux)` (or `taskEXIT_CRITICAL_ISR(&mux)`)

---

Submit Document Feedback

Release v5.1-dev-2066-g7869f4e151

Espressif Systems 2207
1. The core releases the spinlock by clearing the spinlock’ s owner value
2. The core re-enables interrupts (or interrupt nesting)

Restrictions and Considerations

Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

4.10.6 Misc

Floating Point Usage

Usually, when a context switch occurs:

- the current state of a CPU’ s registers are saved to the stack of task being switch out
- the previously saved state of the CPU’ s registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core’ s FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU’ s registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that will save the FPU registers to Task A’ s stack.
- Task A gets scheduled to the same core and continues execution. Saving and restoring the FPU’ s registers is not necessary in this case.

However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU’ s registers across cores. Therefore, when a task utilizes the FPU (by using a float type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that use the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU’ s register state is tied to a particular task.

备注: ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (double). Instead double is implemented via software hence the behavioral restrictions regarding the float type do not apply to double. Note that due to the lack of hardware acceleration, double operations may consume significantly more CPU time in comparison to float.

ESP-IDF FreeRTOS Single Core

Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to 1 (i.e., the CONFIG_FREERTOS_UNICORE will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), CONFIG_FREERTOS_UNICORE can also be set. This will result in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.
Chapter 4. API

4.11 ESP-WIFI-MESH

Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is NOT equivalent to running Vanilla FreeRTOS. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS will incur a small amount of overhead even when compiled for only a single core.

4.11.1 概述

ESP-WIFI-MESH 是一套建立在 Wi-Fi 协议之上的网络协议。ESP-WIFI-MESH 允许分布在大范围区域内（室内和室外）的大量设备（下文简称节点）在同一个 WLAN（无线局域网）中相互连接。ESP-WIFI-MESH 具有自组网和自修复的特性，也就是说 mesh 网络可以自主地构建和维护。

本 ESP-WIFI-MESH 指南分为以下几个部分:

1. 简介
2. ESP-WIFI-MESH 概念
3. 建立网络
4. 管理网络
5. 数据传输
6. 信道切换
7. 性能
8. 更多注意事项

### 图 19: 传统 Wi-Fi 网络架构

传统基础设施 Wi-Fi 网络是一个 “单点对多点” 的网络。这种网络架构的中心节点为接入点 (AP)，其他节点 (station) 均与 AP 直接相连。其中，AP 负责各个 station 之间的仲裁和转发，一些 AP 还会通过路由
第4章 API

器与外部 IP 网络交换数据。在传统 Wi-Fi 网络架构中，1) 由于所有 station 均需与 AP 直接相连，不能距离 AP 太远，因此覆盖区域相对有限；2) 受到 AP 容量的限制，因此网络中允许的 station 数量相对有限，很容易超载。

图 20: ESP-WIFI-MESH 网络架构示意图

ESP-WIFI-MESH 与传统 Wi-Fi 网络的不同之处在于：网络中的节点不需要连接到中心节点，而是可以与相邻节点连接。各节点均负责相连节点的数据中继。由于无线受限于距离中心节点的位置，所有节点仍可互连。因此 ESP-WIFI-MESH 网络的覆盖区域更广。类似地，由于不再受限于中心节点的容量限制，ESP-WIFI-MESH 允许更多节点接入，也不易于超载。

### 树型拓扑

ESP-WIFI-MESH 建立在传统 Wi-Fi 协议之上，可被视为一种将多个独立 Wi-Fi 网络组合为一个单一WLAN 网络的组网协议。在 Wi-Fi 网络中，station 在任何时候都仅限于与 AP 建立单个连接（上行连接），而 AP 则可以同时连接到多个 station（下行连接）。然而，ESP-WIFI-MESH 网络则允许节点同时充当 station 和 AP。因此，ESP-WIFI-MESH 中的节点可以使用其 SoftAP 接口建立多个下行连接，同时使用其 station 接口建立一个上行连接。这将自然产生一个由多层父子结构组成的树型网络拓扑结构。

![ESP-WIFI-MESH Tree Topology](image)

**图 21: ESP-WIFI-MESH 树型拓扑**

ESP-WIFI-MESH 是一个多跳网络，也就是说网络中的节点可以通过单跳或多跳向网络中的其他节点传送数据包。因此，ESP-WIFI-MESH 中的节点不仅传输自己的数据包，而且同时充当其他节点的中继。假设 ESP-WIFI-MESH 网络中的任何两个节点存在物理层上连接（通过单跳或多跳），则这两个节点可以进行通信。

**备注**: ESP-WIFI-MESH 网络中的大小（节点总数）取决于网络中允许的最大层级，以及每个节点可以具有的最大下行连接数。因此，这两个变量可用于配置 ESP-WIFI-MESH 网络的大小。

### 节点类型

- **根节点**: 指网络顶部的节点，是 ESP-WIFI-MESH 网络和外部 IP 网络之间的唯一接口。根节点直接连接至传统的 Wi-Fi 路由器，并在 ESP-WIFI-MESH 网络的节点和外部 IP 网络之间中继数据包。ESP-WIFI-MESH 网络中只能有一个根节点，且根节点的上行连接只能是路由器。如上图所示，节点 A 即为该 ESP-WIFI-MESH 网络的根节点。

- **叶子节点**: 指不允许拥有任何子节点（即无下行连接）的节点。因此，叶子节点只能传输或接收自己的数据包，但不能转发其他节点的数据包。如果节点处于 ESP-WIFI-MESH 网络的最大允许层级，则该节点将成为叶子节点。叶子节点不回再产生下行连接，这可以防止节点继续生成下行连接，从而确保网络层级不会超出限制。由于建立下行连接必须使用 SoftAP 接口，因此一些没有 SoftAP 接口的节点（仅有 station 接口）也将被分配为叶子节点。如上图所示，位于网络最外层的 L/M/N 节点即为叶子节点。

- **中间父节点**: 既不是根节点也不属于叶子节点的节点即为中间父节点。中间父节点必须有且仅有一个上行连接（即一个父节点），但可以具有 0 个或多个下行连接（即 0 个或多个子节点）。因此，中间父节点可以发送和接收自己的数据包，也可以转发其上行和下行连接的数据包。如上图所示，节点 B 到 J 即为中间父节点。注意，E/F/G/I/J 等没有下行连接的中间父节点并不等同于叶子节点，原因在于这些节点仍允许形成下行连接。
图 22: ESP-WIFI-MESH 节点类型

空闲节点：尚未加入网络的节点即为空闲节点。空闲节点将尝试与中间父节点形成上行连接，或者在有条件的情况下（参见自动根节点选择）成为一个根节点。如上图所示，K 和 O 节点即为空闲节点。

信标帧和 RSSI 阈值

ESP-WIFI-MESH 中能够形成下行连接的每个节点（即具有 SoftAP 接口）都会定期传输 Wi-Fi 信标帧。节点可以通过信标帧让其他节点检测自己的存在和状态。空闲节点将侦听信标帧以生成一个潜在父节点列表，并与其中一个潜在父节点形成上行连接。ESP-WIFI-MESH 使用“供应商信息元素”来存储元数据，例如：

- 节点类型（根节点、中间父节点、叶子节点、空闲节点）
- 节点当前所处的层级
- 网络中允许的最大层级
- 当前子节点数量
- 可接受的最大下行连接数量

潜在上行连接的信号强度可由潜在父节点信标帧的 RSSI 表示。为了防止节点形成弱上行连接，ESP-WIFI-MESH 采用了针对信标帧的 RSSI 阈值控制机制。如果节点检测到某节点的信标帧 RSSI 过低（即低于预设阈值），则会在尝试形成上行连接时忽略该节点。

上图（A侧）展示了 RSSI 阈值将如何影响空闲节点的候选父节点数量。

上图（B侧）展示了 RF 屏蔽物将如何降低潜在父节点的 RSSI。由于存在 RF 屏蔽物，节点 X 的 RSSI 高于阈值的区域显著减小。这会导致空闲节点忽略节点 X，即使从地理位置上看 X 就在空闲节点附近。相反，该空闲节点将从更远的地方找到一个 RSSI 更强的节点 Y 形成上行连接。

备注：事实上，ESP-WIFI-MESH 网络中的节点在 MAC 层仍可以接收所有的信标帧，但 RSSI 阈值控制功能可以过滤掉所有 RSSI 低于预设阈值的信标帧。
首选父节点

当一个空闲节点有多个候选父节点（潜在父节点）时，空闲节点将与其中的首选父节点形成上行连接。首选父节点基于以下条件确定：

- 候选父节点所处的层级
- 候选父节点当前具有的下行连接（子节点）数量

在网络中所处层级较浅的候选父节点（包括根节点）将优先成为首选父节点。这有助于在形成上行连接时控制 ESP-WIFI-MESH 网络中的总层级使之最小。例如，在位于第二层和第三层的候选父节点中选择时，位于第二层的候选父节点将始终优先成为首选父节点。

如果同一层上存在多个候选父节点，子节点最少的候选父节点将优先成为首选父节点。这有助于平衡同一层节点的下行连接数量。

图 23: RSSI 阈值的影响

图 24: 首选父节点选择
上图（A侧）展示了空闲节点G如何在B/C/D/E/F五个候选父节点中选择首选父节点：首先，B/C节点优于D/E/F节点，因为这两个节点所处的层级更深。其次，C节点优于B节点，因为C节点的下行连接数量（子节点数量）更少。

上图（B侧）展示了空闲节点G如何在根节点A和其他候选父节点中选择首选父节点：此时根节点A处于空闲节点G范围内（即空闲节点G接收到的根节点A信标帧RSSI强度高于阈值）。由于根节点A处于网络中层的最层，因此将高为首选父节点。

备注：用户还可以自行定义首选父节点的选择规则，也可以直接指定某个节点为首选父节点（见Mesh手动配置示例）。

路由表

ESP-WIFI-MESH网络中的每个节点将维护自己的路由表，并按路由表将数据包（请见ESP-WIFI-MESH数据包）沿正确的路线发送至正确的目标节点。某个特定节点的路由表将包含该节点的子网中所有节点的MAC地址，也包括该节点自己的MAC地址。每个路由表会划分为多个子路由表，与每个子节点的子网对应。

图25: ESP-WIFI-MESH路由表示例

以上图为例，节点B的路由表中将包含节点B到节点I的MAC地址（即相当于节点B的子网）。节点B的路由表可划分为节点C和G的子路由表，分别包含节点C到节点F的MAC地址，节点G到节点I的MAC地址。

ESP-WIFI-MESH利用路由表来使用以下规则进行转发：确定ESP-WIFI-MESH数据包应根据向上传转发还是向下转发。

1. 如果数据包的目标MAC地址处于当前节点的路由表中且不等于当前节点的MAC地址，则选择包含目标MAC地址的子路由表，并将数据包向下转发给子路由表对应的子节点。

2. 如果数据包的目标MAC地址不在当前节点的路由表内，则将数据包向上转发给当前节点的父节点，并重复执行该操作直至数据包达到目标地址。此步骤可重复至根节点（根节点包含整个网络的全部节点）。

备注：用户可以通过调用esp_mesh_get_routing_table()获取一个节点的路由表，调用esp_mesh_get_routing_table_size()获取一个路由表的大小，也可
### 4.11.4 建立网络

一般过程

#### 警告：
ESP-WIFI-MESH 正式开始构建网络前，必须确保网络中所有节点具有相同的配置（见 mesh_cfg_t）。每个节点必须配置相同 MESH 网络 ID、路由器配置和 SoftAP 配置。

ESP-WIFI-MESH 网络将首先选择根节点，然后逐层形成下行连接，直到所有节点均加入网络。网络的布局可能取决于诸如根节点选择、父节点选择和异步上电复位等因素。但简单来说，一个 ESP-WIFI-MESH 网络的构建过程可以概括为以下步骤：

1. **根节点选择**  根节点直接进行指定（见用户指定根节点）或通过选举由信号强度最强的节点担任（见自动根节点选择）。一旦选定，根节点将与路由器连接，并开始允许下行连接形成。如上图所示，节点 A 被选为根节点，因此节点 A 上行连接到路由器。

2. **第二层形成**  一旦根节点连接到路由器，根节点范围内的空闲节点将开始与根节点连接，从而形成第二层网络。一旦连接，第二层节点成为中间父节点（假设最大允许层级大于 2 层），并进而形成下一层。如上图所示，节点 B 到节点 D 都在根节点的连接范围内。因此，节点 B 到节点 D 将与根节点形成上行连接，并成为中间父节点。

3. **其余层形成**  剩余的空闲节点将与所处范围内的中间父节点连接，并形成新的层。一旦连接，根据网络的最大允许层级，空闲节点成为中间父节点或叶子节点。之后重复该步骤，直到网络中的所有空闲节点均加入网络或达到网络最大允许层级。如上图所示，节点 E/F/G 分别与节点 B/C/D 连接，并成为中间父节点。

图 26: ESP-WIFI-MESH 网络构建过程
## API

### 4. 限制树深度

为了防止网络超过最大允许层级，最大允许层级上的节点将在完成连接后成为叶子节点。这样一来，其他空闲节点将无法与这些最大允许层级上的叶子节点形成连接，因此不会超过最大允许层级。然而，如果空闲节点无法找到其他潜在父节点，则将无限期地保持空闲状态。如上图所示，网络的最大允许层级为四。因此，节点 H 在完成连接后将成为叶子节点，以防止任何下行连接的形成。

### 自动根节点选择

在自动模式下，根节点的选择取决于相对于路由器的信号强度。每个空闲节点将通过 Wi-Fi 信标帧发送自己的 MAC 地址和路由器 RSSI 值。MAC 地址可以表示网络中的唯一节点，而路由器 RSSI 值代表相对于路由器的信号强度。

此后，每个节点将同时扫描来自其他空闲节点的信标帧。如果节点检测到具有更强的路由器 RSSI 的信标帧，则节点将开始传输该信标帧的内容（相当于为这个节点投票）。经过最小迭代次数（可预先设置，默认为 10 次），将选举出路由器 RSSI 值最强的信标帧。

在达到预设迭代次数后，每个节点将单独计算其得票百分比（得票数/总票数）以确定它是否应该成为根节点。如果节点的得票百分比大于预设的阈值（默认为 90%），则该节点将成为根节点。

下图展示了在 ESP-WIFI-MESH 网络中，根节点的自动选择过程。

![图 27: 根节点选举示例](image)

1. 上电复位时，每个节点开始传输自己的信标帧（包括 MAC 地址和路由器 RSSI 值）。
2. 在多次传输和扫描迭代中，路由器 RSSI 最强的信标帧将在整个网络中传播。节点 C 具有最强的路由器 RSSI 值 (-10 dB)，因此它的信标帧将在整个网络中传播。所有参与选举的节点都给节点 C 投票，因此节点 C 的得票百分比为 100%。因此，节点 C 成为根节点，并与路由器连接。
3. 一旦节点 C 与路由器连接，节点 C 将成为节点 A/B/D/E 的首选父节点（即最浅的节点），并与其他节点连接。节点 A/B/D/E 将形成网络的第二层。
4. 节点 F 和节点 G 分别连接节点 D 和节点 E，并完成网络构建过程。

备注：用户可以通过 esp_mesh_set_attempts() 配置选举的最小迭代次数。用户应根据网络内的节点数量配置迭代次数（即 mesh 网络越大，所需的迭代次数越高）。
警告：得票百分比阈值也可以使用 `esp_mesh_set_vote_percentage()` 进行配置。得票百分比阈值过低可能导致同一 mesh 网络中两个或多个节点成为根节点，进而分化为多个 mesh 网络。如果发生这种情况，ESP-WIFI-MESH 具有内部机制，可自主解决 根节点冲突。这些具有多个根节点的网络将围绕一个根节点形成一个网络。然而，两个或多个路由器 SSID 相同但路由器 BSSID 不同的根节点冲突无法解决。

用户指定根节点

根节点也可以由用户指定，即直接让指定的根节点与路由器连接，并放弃选举过程。当根节点指定后，网络内的所有其他节点也必须放弃选举过程，以防止根节点冲突的发生。下图展示了在 ESP-WIFI-MESH 网络中，根节点的手动选择过程。

![图 28: 根节点指定示例（根节点 = A，最大层级 = 4）](image)

1. 节点 A 是由用户指定的根节点，因此直接与路由器连接。此时，所有其他节点放弃选举过程。
2. 节点 C 和节点 D 将节点 A 选为自己的首选父节点，并与其形成连接。这两个节点将形成网络的第二层。
3. 类似地，节点 B 和节点 E 将与节点 C 连接，节点 F 将与节点 D 连接。这三个节点将形成网络的第三层。
4. 节点 G 将与节点 E 连接，形成网络的第四层。然而，由于该网络的最大允许层级已配置为 4，因此节点 G 将成为叶子节点，以防止形成任何新层。

备注：一旦指定根节点，该根节点应调用 `esp_mesh_set_parent()` 使其直接与路由器连接。类似地，所有其他节点都应该调用 `esp_mesh_fix_root()` 放弃选举过程。

选择父节点

默认情况下，ESP-WIFI-MESH 具有可以自组网的特点，也就是每个节点都可以自主选择与其形成上行连接的潜在父节点。自主选择出的父节点被称为首选父节点。用于选择首选父节点的标准旨在减少 ESP-WIFI-MESH 网络的层级，并平衡各个潜在父节点的下行连接数（参见 首选父节点）。
不过，ESP-WIFI-MESH 也允许用户禁用自组网功能，即允许用户自定义父节点选择标准，或直接指定某个节点为父节点（见：Mesh 手动组网示例）。

异步上电复位

ESP-WIFI-MESH 网络构建可能会受到节点上电顺序的影响。如果网络中的某些节点为异步上电（即相隔几分钟上电），网络的最终结构可能与所有节点同步上电时的理想情况不同。延迟上电的节点将遵循以下规则：

规则 1：如果网络中已存在根节点，则延迟节点不会尝试选举成为新的根节点。即使自身的路由器 RSSI 更强。反而，延迟节点与任何其他空闲节点无异，将通过与首选父节点连接来加入网络。如果该延迟节点为用户指定的根节点，则网络中的所有其他节点将保持空闲状态，直到延迟节点完成上电。

规则 2：如果延迟节点形成上行连接，并成为中间父节点，则后续也可能成为其他节点（即其他更浅的节点）的新首选父节点。此时，其他节点切换上行连接至该延迟节点（见

规则 3：如果空闲节点的指定父节点上电延迟了，则该空闲节点在没有找到指定父节点前不会尝试形成任何上行连接。空闲节点将无限制地保持空闲，直到其指定的父节点上电完成。

下方示例展示了异步上电对网络构建的影响。

图 29: 网络构建（异步电源）示例

1. 节点 A/C/D/F/G/H 同步上电，并通过广播其 MAC 地址和路由器 RSSI 开始选举根节点。节点 A 的 RSSI 最强，因此当选为根节点。
2. 一旦节点 A 成为根节点，其余的节点就开始与其首选父节点逐层形成上行连接，并最终形成一个具有五层的网络。
3. 节点 B/E 由于存在上电延迟，因此即使路由器 RSSI 比节点 A 更强（-20 dB 和 -10 dB）也不会尝试成为根节点。相反，这两个上电延迟节点均将与对应的首选父节点 A 和 C 形成上行连接。加入网络后，节
点 B/E 均将成为中间父节点。

4. 节点 B 由于所处层级变化（现为第二层）而成为新的首选父节点，因此节点 D/G 将切换其上行连接从而选择新的首选父节点。由于切换的发生，最终的网络层级从原来的五层减少至三层。

同步上电：如果所有节点均同步上电，节点 E (-10 dB) 由于路由器 RSSI 最强而成为根节点。此时形成的网络结构将与正常上电的情况截然不同。但是，如果用户手动切换根节点，则仍可以达到同步上电的网络结构（请见 esp_mesh_waive_root()）。

备注：从某种程度上，ESP-WIFI-MESH 可以自动修复部分因异常上电引起的父节点选择的偏差（请见父节点切换）

环路避免、检测与处理

环路是指特定节点与其后续节点（特定节点子网中的节点）形成上行连接的情况。因此产生的循环连接路径将打破 mesh 网络的拓扑结构。ESP-WIFI-MESH 的节点在选择父节点时将主动排除路由表（见路由表）中的节点，从而避免与其子网中的节点建立上行连接并形成环路。

在存在环路的情况下，ESP-WIFI-MESH 可利用链路验证机制和容量控制机制来检测环路的产生。因与子节点建立上行连接而导致环路形成的父节点将通知其子节点环路的存在，并主动断开连接。

4.11.5 管理网络

作为一个自修复网络，ESP-WIFI-MESH 可以检测并修正网络路由中的故障。当具有一个或多个子节点的父节点断开或父节点与其子节点之间的连接不时稳定时，会发生故障。ESP-WIFI-MESH 中的子节点将自主选择一个新的父节点，并与其形成上行连接，以维持网络连接。ESP-WIFI-MESH 可以处理根节点故障和中间父节点故障。

根节点故障

如果根节点断开，则与其连接的节点（第二层节点）将及时检测到该根节点故障。第二层节点将主动尝试与根节点重连，但在多次尝试失败后，第二层节点将启动新一轮的根节点选举。第二层中 RSSI 最强的节点将当选为新的根节点。而剩余的第二层节点将与新的根节点（如果不在范围内的话，也可与相邻父节点连接）形成上行连接。

如果根节点和下多层的节点（例如根节点、第二层节点和第三层节点）同时断开，则位于最底层的仍在正常工作的节点将发起根节点选举。下方示例展示了网络从根节点断开故障中进行自修复。

![图 30: 根节点故障的自修复示意](image)

1. 节点 C 是网络的根节点。节点 A/B/D/E 是连接到节点 C 的第二层节点。
2. 节点 C 断开。在多次重连尝试失败后，第二层节点开始通过广播其路由器 RSSI 开始新一轮的选举。此时，节点 B 的路由器 RSSI 最强。

3. 节点 B 被选为根节点，并开始接受下行连接。剩余的第二层节点 A/D/E 形成与节点 B 的上行连接，因此网络已经恢复，并且可以继续正常运行。

备注：如果是手动指定的根节点断开，则无法进行自动修复。任何节点不会在存在指定根节点的情况下开始选举过程。

中间父节点故障

如果中间父节点断开，则与之断开的子节点将主动尝试与该父节点重连。在多次重连尝试失败后，每个子节点开始扫描潜在父节点（请见标题和 RSSI 阈值）。

如果存在其他可用的潜在父节点，每个子节点将分别给予自己一个新的首选父节点（请见自动父节点），并与它形成上行连接。如果特定子节点没有其他潜在的父节点，则将无限期地保持空闲状态。

下方示例展示了网络中中间父节点断开故障中进行自修复。

![图31: 中间父节点故障的自修复](image)

1. 网络中存在节点 A 至 G。

2. 节点 C 断开。节点 F/G 检测到节点 C 的断开故障，并尝试与节点 C 重新连接。在多次重连尝试失败后，节点 F/G 将开始选择新的首选父节点。

3. 节点 G 因其区域内不存在父节点而暂时保持空闲。节点 F 的范围内有 B 和 E 两个节点，但节点 B 因为所处层级更浅而当选新的父节点。节点 F 将与节点 B 连接，并成为一个中间父节点，节点 G 将于节点 F 相连。这样一来，网络已经恢复了，但结构发生了变化（网络层级增加了 1 层）。

备注：如果子节点的父节点已被指定，则子节点不会尝试与其他潜在父节点连接。此时，该子节点将无限期地保持空闲状态。

根节点切换

除非根节点断开，否则 ESP-WIFI-MESH 不会自动切换根节点。即使根节点的路由器 RSSI 降低至必须断开的情况，根节点也将保持不变。根节点切换是指明确宣布新选举过程的行为，即具有更强路由器 RSSI 的节点选为新的根节点。这可以用于应对根节点性能降低的情况。

要触发根节点切换，当前根节点必须明确调用 esp_mesh_waive_root() 以触发新的选举。当下根节点将指示网络中的所有节点开始发送并扫描信标帧（见自动根节点选择），但与此同时一直保持联网（即...
不会变成空闲节点。如果另一个节点收到的票数超过当前根节点，则将启动根节点切换过程，否则根节点将保持不变。

新选出的根节点向当前的根节点发送切换请求，而原先的根节点将返回一个应答通知，表示已经准备好切换。一旦接收到来自新根节点的应答，新选出的根节点将与其父节点断开连接，并迅速与路由器形成上行连接，进而成为网络的新根节点。原先的根节点将断开与路由器的连接，并与此同时保持其所有下行连接并进入空闲状态。之前的根节点将开始扫描潜在的父节点并选择首选父节点。

下图说明了根节点切换的示例。

切换根节点示例

1. 节点 C 是当前的根节点，但路由器 RSSI 值 (-85 dB) 降低至较低水平。此时，新的选举过程被触发了。所有节点开始传输和扫描信号强度（此时仍保持连接）。

2. 经过多轮传输和扫描后，节点 B 被选为新的根节点。节点 B 向节点 C 发送了一个切换请求，节点 C 回复一个应答。

3. 节点 B 与其父节点断开连接，并与路由器连接，成为网络中的新根节点。节点 C 与路由器断开连接，进入空闲状态，并开始扫描并选择新的首选父节点。节点 C 在整个过程中仍保持其所有的下行连接。

4. 节点 C 选择节点 B 作为其的首选父节点，与之形成上行连接，并成为一个第二层节点。由于节点 C 仍保持相同的子网，因此根节点切换后的网络结构没有变化。然后，由于切换的发生，节点 C 子网中每个节点的所处层级均增加了一层。如果根节点切换过程中产生了新的根节点，则父节点切换可以随后调整网络结构。

备注：根节点切换必须要求选举，因此只有在使用自组网 ESP-WIFI-MESH 网络时才支持。换句话说，如果使用指定的根节点，则不能进行根节点切换。

父节点切换

父节点切换是指一个子节点将其上行连接切换到更浅一层的另一个父节点。父节点切换是自动的，这意味着如果较浅层出现了可用的潜在父节点（因“异步上电复位”产生），子节点将自动更改其上行连接。

所有潜在的父节点将定期发送信标帧（参见信标帧和 RSSI 阈值），从而允许子节点扫描较浅层的父节点的可用性。由于父节点切换，自组网 ESP-WIFI-MESH 网络可以动态调整其网络结构，以确保每个连接均具有良好的 RSSI 值，并且网络中的层级最小。
4.11.6 数据传输

ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 网络使用 ESP-WIFI-MESH 数据包传输数据。ESP-WIFI-MESH 数据包完全包含在 Wi-Fi 数据帧中。ESP-WIFI-MESH 网络中的数据传输将涉及通过不同 Wi-Fi 数据帧在每个无线跳上传输的单个 ESP-WIFI-MESH 数据包。

下图显示了 ESP-WIFI-MESH 数据包的结构及其与 Wi-Fi 数据帧的关系。

![ESP-WIFI-MESH 数据包结构图](image)

图 32: ESP-WIFI-MESH 数据包

ESP-WIFI-MESH 数据包的 报头 包含源节点和目标节点的 MAC 地址。 选项 (option) 字段包含有关特殊类型的 ESP-WIFI-MESH 数据包的信息，例如组传输或来自外部 IP 网络的数据包（请参阅 MESH_OPT_SEND_GROUP 和 MESH_OPT_RECV_DS_ADDR）。

ESP-WIFI-MESH 数据包的 有效载荷 包含实际的应用数据。该数据可以为原始二进制数据，也可以是使用 HTTP、MQTT 和 JSON 等应用层协议的编码数据（请见：mesh_proto_t）。

备注：当向外部 IP 网络发送 ESP-WIFI-MESH 数据包时，报头的目标地址字段将包含目标服务器的 IP 地址和端口号，而不是节点的 MAC 地址（请见：mesh_addr_t）。此外，根节点将处理外发 TCP/IP 数据包的形成。

组控制和组播

组播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的多个节点。ESP-WIFI-MESH 中的组播可以通过“指定一个目标节点列表”或“预配置一个节点组”来实现。这两种组播方式均需调用 esp_mesh_send() 实现。

如果通过“指定目标节点列表”实现组播，用户必须首先将 ESP-WIFI-MESH 数据包的目标地址设置为 组播组地址（例如 01:00:5E:xx:xx:xx）。这表明 ESP-WIFI-MESH 数据包是一个拥有一组地址的组播数据包，且该地址应该从报头选项中获得。然后，用户必须将目标节点的 MAC 地址列为选项（请见：mesh_opt_t 和 MESH_OPT_SEND_GROUP）。这种组播方法不需要进行提前设置，但由于每个目标节点的 MAC 地址均需列为报头的选项字段，因此会产生大量开销数据。

分组组播允许 ESP-WIFI-MESH 数据包被发送到一个预先配置的节点组。每个分组都有一个唯一的 ID 标识。用户可通过 esp_mesh_set_group_id() 将节点加入一个组。分组组播需要将 ESP-WIFI-MESH 数据包的目标地址设置为目标组的 ID，还必须设置 MESH_DATA_GROUP 标志位。分组组播产生的开销较小，但必须提前将节点加入分组中。

备注：在组播期间，网络中的所有节点在 MAC 层都会收到 ESP-WIFI-MESH 数据包。然而，不包括在 MAC 地址列表或目标组中的节点将简单地过滤掉这些数据包。
广播

广播功能允许将单个 ESP-WIFI-MESH 数据包同时发送给网络中的所有节点。每个节点可以将一个广播包转发至其所有上行和下行连接，使得数据包尽可能快地在整个网络中传播。但是，ESP-WIFI-MESH 利用以下方法来避免在广播期间浪费带宽。

1. 当中间父节点收到来自其父节点的广播包时，它会将该数据包转发给自己的各个子节点，同时为自己保存一份数据包的副本。
2. 当中间父节点是广播的源节点时，它会将该数据包向上发送至其父节点，并向下发送给自己的各个子节点。
3. 当中间父节点接收到一个来自其子节点的广播包时，它会将该数据包转发给其父节点和其余子节点，同时为自己保存一份数据包的副本。
4. 当叶子节点是广播的源节点时，它会直接将该数据包发送至其父节点。
5. 当根节点是广播的源节点时，它会将该数据包发送至自己的所有子节点。
6. 当根节点收到来自其子节点的广播包时，它会将该数据包转发给其余子节点，同时为自己保存一份数据包的副本。
7. 当节点接收到一个源地址与自身 MAC 地址匹配的广播包时，它会将该广播包丢弃。
8. 当中间父节点收到一个来自其父节点的广播包时（该数据包最初来自该父节点的一个子节点），它会将该广播包丢弃。

上行流量控制

ESP-WIFI-MESH 依赖父节点来控制其直接子节点的上行数据流。为了防止父节点的消息缓冲区上限情况下溢出，父节点将为每个子节点分配一个称为 接收窗口 的上行传输配额。每个子节点均必须申请接收窗口才允许进行上行传输。接收窗口的大小可以动态调整。完成从子节点到父节点的上行传输包括以下步骤：

1. 在每次传输之前，子节点向其父节点发送窗口请求。窗口请求中包括一个序号，与子节点的待传输数据包相对应。
2. 父节点接收窗口请求，并将序号与子节点发送的前一个数据包的序号进行比较，用于计算返回给子节点的接收窗口大小。
3. 子节点根据父节点指定的窗口大小发送数据包。如果子节点的接收窗口耗尽，它必须通过发送请求获得另一个接收窗口，然后才允许继续发送。

备注：ESP-WIFI-MESH 不支持任何下行流量控制。

警告：由于父节点切换，数据包可能会在上行传输期间丢失。

由于根节点是通信外部 IP 网络的唯一接口，因此下行节点必须了解根节点与外部 IP 网络的连接状态。否则，下节点可能会尝试向一个已经与 IP 网络断开连接的根节点发送数据，从而造成不必要的传输和数据包丢失。ESP-WIFI-MESH 可以基于监测根节点和外部 IP 网络的连接状态，提供一种稳定外发数据吞吐量的机制。根节点可以通过调用 esp_mesh_post_toDS_state() 将自身与外部 IP 网络的连接状态广播给所有其他节点。

双向数据流

下图展示了 ESP-WIFI-MESH 双向数据流涉及的各种网络层。

由于使用路由表，ESP-WIFI-MESH 能够在 mesh 层中完全处理数据包的转发。TCP/IP 层仅与 mesh 网络的根节点有关，可帮助根节点与外部 IP 网络的数据包传送。
4.11.7 信道切换

背景

在传统的 Wi-Fi 网络中，信道代表预设的频率范围。在基础设施基本服务集 (BSS) 中，工作 AP 及与之相连的 station 必须处于传输信标的网络信道（1到14）中。物理上相邻的 BSS 使用相同的工作信道会导致干扰产生和性能下降。

为了允许 BSS 适应不断变化的物理层条件并保持性能，Wi-Fi 网络中增加了网络信道切换的机制。网络信道切换是将 BSS 移至新的工作信道，并同时最大限度地减少期间对 BSS 的影响。然而，我们应该认识到，网络信道切换可能不会成功，无法将原信道中的所有 station 均移动至新的信道。

在基础设施 Wi-Fi 网络中，网络信道切换由 AP 触发，目的是将该 AP 及与之相连的所有 station 同步切换到新的信道。网络信道切换是通过在 AP 的周期性发送信标帧内嵌入一个信道切换宣告 (CSA) 元素来实现的。在网络信道切换前，该 CSA 元素用于向所有连接的 station 广播有关即将发生的网络信道切换，并且将包含在多个信标帧中。

一个 CSA 元素包含有关 新信道号 和 信道切换计数 的信息。其中，信道切换计数指示在网络信道切换之前剩余的信标帧间隔 (TBTT) 数量。因此，信道切换计数依每个信标帧递减，并且允许与之连接的 station 与 AP 同步进行信道切换。

ESP-WIFI-MESH 网络信道切换

ESP-WIFI-MESH 网络信道切换还利用包含 CSA 元素的信标帧。然而，ESP-WIFI-MESH 作为一个多跳网络，其信标帧可能无法到达网络中的所有节点（这与单跳网络不同）。因此信道切换过程更加复杂。因此，ESP-WIFI-MESH 网络依赖于通过节点转发 CSA 元素，从而实现在整个网络中的传播。

当具有一个或多个子节点的中间父节点接收到包含 CSA 元素的信标帧时，该节点会将该元素除在其下一个发送的信标帧（即具有相同的 新信道号 和 信道切换计数）中，从而实现该 CSA 元素的转发。鉴于 ESP-WIFI-MESH 网络中的所有节点都接收到相同的 CSA 元素，这些节点可以使用 信道切换计数 来同步其信道切换，但也会经历因 CSA 元素转发造成的延迟。

ESP-WIFI-MESH 网络信道切换可以由路由器或根节点触发。

根节点触发 由根节点触发的信道切换只能在 ESP-WIFI-MESH 网络未连接到路由器时才会发生。通过调用 esp_mesh_switch_channel() 函数，根节点将设置一个初始 信道切换计数值，并开始在其信标帧中包含 CSA 元素。接着，每个 CSA 元素将抵达第二层节点，并通过第二层节点自己的信标帧继续进行向下转发。
网络信道切换的影响

- 由于 ESP-WIFI-MESH 网络信道切换与路由器的信道切换不同步，ESP-WIFI-MESH 网络和路由器之间会出现临时信道切换。

  - ESP-WIFI-MESH 网络的信道切换时间取决于 ESP-WIFI-MESH 网络的信标间隔和根节点的自定义信道切换计数值。
  - 在 ESP-WIFI-MESH 网络切换期间，信道差异将阻止根节点和路由器之间的任何数据交换。
  - 在 ESP-WIFI-MESH 网络中，根节点和中间节点将请求与其连接的子节点停止传输，直至信道切换发生（通过将 CSA 元素的信道切换模式字段设置为 1）。
  - 频繁的路由器信道切换可能会降低 ESP-WIFI-MESH 网络的性能。请注意，这可能是由 ESP-WIFI-MESH 网络本身造成的（例如由于 ESP-WIFI-MESH 网络的无线介质争用等原因）。此时，用户应禁用路由器信道的自主信道切换，并直接指定一个信道。

- 当存在临时信道差异时，根节点从技术上来说仍保持连接至路由器。

  - 如果根节点经过一定数量信标间隔仍无法接收到信标帧或探测来自路由器的响应，则会断开连接。
  - 断开连接后，根节点将自动重新扫描所有信道以确定是否存在路由器。

- 如果根节点无法接收任何路由器的 CSA 信标帧（例如短暂的路由器切换时间），则路由器将在没有 ESP-WIFI-MESH 网络的情况下执行信道切换。

  - 在路由器切换信道后，根节点将不再能够接收路由器的信标帧和探测响应，并导致在一定数量的信标间隔后断开连接。
  - 在断开连接后，根节点将重新所有信道，寻找路由器。
  - 根节点将在整个过程中维护与之相连的下行连接。

备注：虽然 ESP-WIFI-MESH 网络信道切换的目的是将网络内的所有节点移动到新的工作信道，但也应该认识到，信道切换可能无法成功移动所有节点（比如由于节点故障等原因）。
存在根节点：根节点的存在也会影响是否允许信道或路由器切换。
下表说明了在不同参数/条件组合下是否允许信道切换和路由器切换。请注意，X 代表参数“不关心”。

4.11.8 性能

ESP-WIFI-MESH 网络的性能可以基于以下多个指标进行评估：

组网时长：从头开始构建 ESP-WIFI-MESH 网络所需的总时长。

修复时间：从网络检测到节点断开到执行适当操作（例如生成新的根节点或形成新的连接等）以修复网络所需的时间。

每跳延迟：数据每经过一次无线 hop 而经历的延迟，即从父节点向子节点（或从子节点向父节点）发送一个数据包所需的时间。

网络节点容量：ESP-WIFI-MESH 网络可以同时支持的节点总数。该指标取决于节点可以接受到的最大下行连接数和网络中允许的最大层级。

ESP-WIFI-MESH 网络的常见性能指标如下表所示：

- 组网时长：< 60 秒
- 修复时间
  - 根节点断开：< 10 秒
  - 子节点断开：< 5 秒
- 每条延迟：10 到 30 毫秒

备注：上述性能指标的测试条件见下。

- 测试设备数量：100
- 最大允许下行连接数量：6
- 最大允许层级：6

备注：吞吐量取决于数据包错误率和 hop 数量。

备注：根节点访问外部 IP 网络的吞吐量直接受到 ESP-WIFI-MESH 网络中节点数量和路由器带宽的影响。

备注：用户应注意，ESP-WIFI-MESH 网络的性能与网络配置和工作环境密切相关。
4.11.9 更多注意事项

- 数据传输使用 Wi-Fi WPA2-PSK 加密
- Mesh 网络 IE 使用 AES 加密

本文图片中使用的路由器与互联网图标来自 www.flaticon.com 的 Smashicons。

4.12 Event Handling

Several ESP-IDF components use events to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

4.12.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of esp_event library, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called legacy event loop. The following sections explain each of the methods.

esp_event Library Event Loop

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in system_event_id_t enumeration and system_event_info_t union, which made it impossible to send custom events to the event loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See esp_event library API reference for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the default event loop provided by this library.

Legacy Event Loop

This event loop implementation is started using esp_event_loop_init() function. Application typically supplies an event handler, a function with the following signature:

```c
esp_err_t event_handler(void *ctx, system_event_t *event)
{

}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to esp_event_loop_init().

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority event task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE and CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE options, respectively.

Event handler receives a pointer to the event structure (system_event_t) which describes current event. This structure follows a tagged union pattern: event_id member indicates the type of event, and event_info member is a union of description structures. Application event handler will typically use switch(event->event_id) to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

**4.12.2 Mesh Events**

ESP-WIFI-MESH uses a system similar to the Legacy Event Loop to deliver events to the application. See 系统事件 for details.
4.12.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type). The following list gives the registration API name, event enumeration type, and event parameter type.

- **BLE GAP**: esp_ble_gap_register_callback(), esp_gap_ble_cb_event_t, esp_ble_gap_cb_param_t.
- **BT GAP**: esp_bt_gap_register_callback(), esp_bt_gap_cb_event_t, esp_bt_gap_cb_param_t.
- **GATT**: esp_ble_gattc_register_callback(), esp_ble_gattc_cb_event_t, esp_ble_gattc_cb_param_t.
- **GATTS**: esp_ble_gatts_register_callback(), esp_ble_gatts_cb_event_t, esp_ble_gatts_cb_param_t.
- **SPP**: esp_spp_register_callback(), esp_spp_cb_event_t, esp_spp_cb_param_t.
- **Blufi**: esp_blufi_register_callbacks(), esp_blufi_cb_event_t, esp_blufi_cb_param_t.
- **A2DP**: esp_a2d_register_callback(), esp_a2d_cb_event_t, esp_a2d_cb_param_t.
- **AVRC**: esp_avrc_ct_register_callback(), esp_avrc_ct_cb_event_t, esp_avrc廖cb_param_t.
- **HFP Client**: esp_hf_client_register_callback(), esp_hf_client_cb_event_t, esp_hf_client_cb_param_t.
- **HFP AG**: esp_bt_hf_register_callback(), esp_hf_cb_event_t, esp_hf_cb_param_t.

4.13 严重错误

4.13.1 概述

在某些情况下，程序并不会按照我们的预期运行，在 ESP-IDF 中，这些情况包括：

- CPU 异常：非法指令，加载/存储时的内存对齐错误，加载/存储时的访问权限错误，双重异常。
- 系统级检查错误：
  - 中断看门狗 超时
  - 任务看门狗 超时（只有开启CONFIG_ESP_TASK_WDT_PANIC 后才会触发严重错误）
  - 高速缓存访问错误
  - 掉电检测事件
  - 堆栈溢出
  - 堆栈缓冲保护检查
  - 堆完整性检查
  - 未定义行为清理器 (UBSAN) 检查
- 使用 assert, configASSERT 等类似的宏断言失败。

本指南会介绍 ESP-IDF 中这类错误的处理流程，并给出对应的解决建议。

4.13.2 紧急处理程序

概述 中列举的所有错误都会由 紧急处理程序 (Panic Handler) 负责处理。

紧急处理程序首先会将出错原因打印到控制台，例如 CPU 异常的错误信息通常会类似于

Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was __unhandled.

对于一些系统级检查错误（如中断看门狗超时，高速缓存访问错误等），错误信息会类似于
Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory region accessed). Exception was unhandled.

不管哪种情况，错误原因都会被打印在括号中。请参阅Guru Meditation错误以查看所有可能的出错原因。紧急处理程序接下来的行为将取决于CONFIG_ESP_SYSTEM_PANIC的设置，支持的选项包括：

- 打印CPU寄存器，然后重启(CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT) - 默认选项
- 打印系统发生异常时CPU寄存器的值。打印回溯，最后重启芯片。
- 打印CPU寄存器，然后暂停(CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT)与上一个选项类似，但不会重启，而是选择暂停程序的运行。重启程序需要外部执行复位操作。
- 静默重启(CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT)不打印CPU寄存器的值，也不打印回溯，立即重启芯片。
- 调用GDB Stub (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)启动GDB服务器，通过控制台UART接口与GDB进行通信。该选项只提供只读调试或者事后调试，详细信息请参阅GDBStub。
- 调用动态GDB Stub (CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME)启动GDB服务器，通过控制台UART接口与GDB进行通信。该选项允许用户在程序运行时对其进行调试、设置断点和改变其执行方式等，详细信息请参阅GDBStub。

紧急处理程序的行为还受到另外两个配置项的影响：

- 如果使能了CONFIG_ESP_DEBUG_OCDWARE（默认），紧急处理程序会检测ESP32是否已经连接JTAG调试器。如果检测成功，程序会暂停运行，并将控制权交给调试器。在这种情况下，寄存器和回溯不会被打印到控制台，并且也不会使用GDB Stub和Core Dump的功能。
- 如果使能了内核转储功能，系统状态（任务堆栈和寄存器）会被转储到flash或者UART以供后续分析。
- 如果CONFIG_ESP_PANIC_HANDLER_IRAM被禁用（默认情况下禁用），紧急处理程序的代码会放置在flash而不是IRAM中。这意味着，如果ESP-IDF在flash高速缓存禁用时崩溃，在运行GDB Stub和内核转储之前紧急处理程序会自动重新使能flash高速缓存。如果flash高速缓存也崩溃了，这样做会增加一些小风险。
- 如果使能了该选项，紧急处理程序的代码（包括所有的UART函数）会放置在IRAM中，导致SRAM中的可用内存空间变小。当禁用flash高速缓存（如写入SPI flash时）或触发异常导致flash高速缓存崩溃时，可用此选项调试一些复杂的崩溃问题。

下图展示了紧急处理程序的行为：

### 4.13.3 寄存器转储与回溯

除非启用了CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT否则紧急处理程序会将CPU寄存器和回溯打印到控制台

</tbody>
</table>

仅会打印异常帧中CPU寄存器的值，即引发CPU异常或者其它严重错误时刻的值。
紧急处理程序如果因abort()而调用，则不会打印寄存器转储。
图 34: 紧急处理程序流程图（点击放大）
在某些情况下，例如中断看门狗超时，紧急处理程序会额外打印 CPU 寄存器（EPC1-EPC4）的值，以及另一个 CPU 的寄存器值和代码回溯。

回溯行包含了当前任务中每个堆栈帧的 PC:SP 对（PC 是程序计数器，SP 是堆栈指针）。如果在 ISR 中发生了严重错误，回溯会同时包括被中断任务的 PC:SP 对，以及 ISR 中的 PC:SP 对。

如果使用了 IDF 监视器，该工具会将程序计数器的值转换为对应的代码位置（函数名，文件名，行号），并加以注释。

若要查找发生严重错误的代码位置，请查看“Backtrace”的后面几行，发生严重错误的代码显示在顶行，后续几行显示的是调用堆栈。

### 4.13.4 GDB Stub

如果启用了 CONFIG_ESP_SYSTEM_PANIC_GDBSTUB 选项，在发生严重错误时，紧急处理程序不会复位芯片，相反，它将启动 GDB 远程协议服务器，通常称为 GDB Stub。发生这种情况时，可以让主机上运行的 GDB 实例通过 UART 端口连接到 ESP32。

如果使用了 IDF 监视器，该工具会在 UART 端口检测到 GDB Stub 提示符后自动启动 GDB，输出会类似于：

```
Entering gdb stub now.
$70b#6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa-
esp32-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:<http://www.gnu.org/software/gdb/bugs/>.
Find the GDB manual and other documentation resources online at:<http://www.gnu.org/software/gdb/documentation/>.
For help, type "help".
Type "apropos word" to search for commands related to "word"... Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
```
在 GDB 会话中，我们可以检查 CPU 寄存器，本地和静态变量以及内存中任意位置的值。但是不支持设置断点，改变 PC 值或者恢复程序的运行。若要复位程序，请退出 GDB 会话，在 IDF 监视器中连续输入 Ctrl-T Ctrl-R，或者按下开发板上的复位按键也可以重新运行程序。

### 4.13.5 RTC 看门狗超时

RTC 看门狗在启动代码中用于跟踪执行时间，也有助于防止由于电源不稳定引起的锁死。RTC 看门狗默认启用，参见 `CONFIG_BOOTLOADER_WDT_ENABLE`。如果执行时间超时，RTC 看门狗将自动重启系统。此时，ROM 引导加载程序将打印消息 RTC Watchdog Timeout 说明重启原因。

<table>
<thead>
<tr>
<th>rst:0x10 (RTCWDT_RTC_RESET)</th>
</tr>
</thead>
</table>

RTC 看门狗涵盖了从一级引导程序 (ROM 引导程序) 到应用程序启动的执行时间，最初在 ROM 引导程序中设置。在后台引导程序中使用 `CONFIG_BOOTLOADER_WDT_TIME_MS` 选项进行配置 (默认 9000 ms)。在应用初始化阶段，由于慢速时钟源可能已更改，RTC 看门狗将被重新配置，最后在调用 `app_main()`之前被禁用。可以使用选项 `CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE` 以保证 RTC 看门狗在调用 `app_main()` 之前不被禁用，而是保持运行状态，用户需要在应用代码中定期 “喂狗”。

### 4.13.6 Guru Meditation 错误

本节将对打印在 Guru Meditation Error: Core panic’ed 后面括号中的致错原因进行逐一解释。

**备注：** 想要了解 “Guru Meditation”的历史渊源，请参阅 维基百科。

**IllegalInstruction**

此 CPU 异常表示当前执行的指令不是有效指令，引起此错误的常见原因包括：

- FreeRTOS 中的任务函数已返回。在 FreeRTOS 中，如果想终止任务函数，需要调用 `vTaskDelete()` 函数释放当前任务的资源，而不是直接返回。
- 无法从 SPI flash 中读取下一条指令，这通常发生在：
  - 应用程序将 SPI flash 的管脚重新配置为其它功能 (如 GPIO、UART 等)。有关 SPI flash 管脚的详细信息，请参阅硬件设计指南和芯片/模组的数据手册。
  - 某些外部设备意外连接到 SPI flash 的管脚上，干扰了 ESP32 和 SPI flash 之间的通信。
- 在 C++ 代码中，退出 non-void 函数而无返回值被认为是未定义的行为。启用后编译器通常会忽略此类函数的结尾，导致 IllegalInstruction 异常。默认情况下，ESP-IDF 构建系统启用 `-Werror=return-type`，这意味着缺少返回语句会被视为编译时错误。但是，如果应用程序项目禁用了编译器警告，可能就无法检测到该问题，在运行时就会出现 IllegalInstruction 异常。

**InstrFetchProhibited**

此 CPU 异常表示 CPU 无法读取指令，因为指令的地址不在 IRAM 或者 IROM 中的有效区域中。

通常这意味着代码中调用了并不指向有效代码块的函数针。这种情况中，可以查看 PC (程序计数器) 寄存器的值并做出进一步判断：若为 0 或者其它非法值 (即只要不是 0x4xxxxxxx 的情况)，则证实确实是该原因。
LoadProhibited, StoreProhibited

当应用程序尝试读取或写入无效的内存位置时，会发生此类 CPU 异常。此类无效内存地址可以在寄存器转储的 EXCVADDR 中找到。如果该地址为零，通常意味着应用程序尝试访问一个 NULL 指针。如果该地址接近于零，则通常意味着应用程序尝试访问某个结构体的成员，但是该结构体的指针为 NULL。如果该地址是其它非法值（不在 0x3fxxxxxx - 0x6xxxxxxx 的范围内），则可能意味着用于访问数据的指针未初始化或者已经损坏。

IntegerDivideByZero

应用程序尝试将整数除以零。

LoadStoreAlignment

应用程序尝试读取/写入的内存位置不符合加载/存储指令对字节对齐大小的要求。例如，32 位读取指令只能访问 4 字节对齐的内存地址，而 16 位写入指令只能访问 2 字节对齐的内存地址。

LoadStoreError

这类异常通常发生于以下几种场合:

- 应用程序尝试从仅支持 32 位读取/写入的内存区域执行 8 位或 16 位加载/存储操作，例如，解引用一个指向指令内存区域（比如 IRAM 或者 IROM）的 char* 指针就会触发这个错误。
- 应用程序尝试写入数据到只读的内存区域（比如 IROM 或者 DROM）也会触发这个错误。

Unhandled debug exception

这后面通常会再跟一条消息:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

此错误表示应用程序写入的位置越过了 task_name 任务堆栈的末尾，请注意，并非每次堆栈溢出都会触发此错误。任务有可能会绕过堆栈栈底（stack canary）的位置访问内存，在这种情况下，监视点就不会被触发。

Interrupt wdt timeout on CPU0 / CPU1

这表示发生了中断看门狗超时，详细信息请查阅看门狗 文档。

Cache disabled but cached memory region accessed

在某些情况下，ESP-IDF 会暂时禁止通过高速缓存访问外部SPI flash 和 SPI RAM，例如在使用 spi_flash API 读取/写入/擦除/映射 SPI flash 的时候。在这些情况下，任务会被挂起，并且未使用 ESP_INTR_FLAG_IRAM 注册的中断处理程序会被禁用。请确保任何使用此标志注册的中断处理程序所访问的代码和数据分别位于 IRAM 和 DRAM 中。更多详细信息请参阅SPI flash API 文档。

4.13.7 其他严重错误

掉电

ESP32 内部集成掉电检测电路，并且会默认启用。如果电源电压低于安全值，掉电检测器可以触发系统复位。掉电检测器可以使用 CONFIG_ESP_BROWNOUT_DET 和 CONFIG_ESP_BROWNOUT_DET_LVL_SEL 这两个选项进行设置。
当电网检测器被触发时，会打印如下信息：

Brownout detector was triggered

芯片会在该打印信息结束后复位。
请注意，如果电源电压快速下降，则只能在控制台上看到部分打印信息。

堆不完整

ESP-IDF 堆的实现包含许多运行时的堆结构检查，可以在 menuconfig 中开启额外的检查（“Heap Poisoning”）。如果其中的某项检查失败，则会打印类似如下信息：

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbaac5678
assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

更多详细信息，请查阅堆内存调试文档。

堆栈粉碎

堆栈粉碎保护（基于 GCC -fstack-protector* 标志）可以通过 ESP-IDF 中的 CONFIG_COMPILER_STACK_CHECK_MODE 选项来开启。如果检测到堆栈粉碎，则会打印类似如下的信息：

```
Stack smashing protect failure!
abort() was called at PC 0x400d2138 on core 0
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffc17a0 0x400d2138:0x3ffc17c0...
  →0x400e79d5:0x3ffc17e0 0x400e79a7:0x3ffc1840 0x400e79df:0x3ffc18a0...
  →0x400e2235:0x3ffc18c0 0x400e1916:0x3ffc18f0 0x400e19cd:0x3ffc1910...
  →0x400e1a11:0x3ffc1930 0x400e1bb2:0x3ffc1950 0x400d2c44:0x3ffc1a80
```

回溯信息会指明发生堆栈粉碎的函数，建议检查函数中是否有代码访问局部数组时发生了越界。

未定义行为清理器 (UBSAN) 检查

未定义行为清理器 (UBSAN) 是一种编译器功能，它会为可能不正确的操作添加运行时检查，例如：

- 溢出（乘法溢出、有符号整数溢出）
- 移位基数或指数错误（如移位超过 32 位）
- 整数转换错误

请参考 GCC 文档中的 "-fsanitize=undefined" 选项，查看支持检查的完整列表。

使用 UBSAN 默认情况下未使用 UBSAN。可以通过在构建系统中添加编译器选项
- fsanitize=undefined 在文件、组件或项目级别上使用 UBSAN。

在对使用 SoC 硬件寄存器头文件（soc/xxx_reg.h）的代码使用 UBSAN 时，建议使用
- fno-sanitize=shift-base 选项禁用移位基数清理器。这是由于 ESP-IDF 寄存器头文件目前包含的模式会对这个特定的清理器选项造成误报。

要在项目级别使能 UBSAN，请在项目 CMakeLists.txt 文件的末尾添加以下内容：

```
idf_build_set_property(COMPILE_OPTIONS "-fsanitize=undefined" "-fno-sanitize=shift-base" APPEND)
```
或者，通过 EXTRA_CFLAGS 和 EXTRA_CXXFLAGS 环境变量来传递这些选项。
使能 UBSAN 会明显增加代码量和数据大小。当为整个应用程序使能 UBSAN 时，微控制器的可用 RAM 无法容纳大多数应用程序（除了一些微小程序）。因此，建议为特定的待测组件使能 UBSAN。
要为项目 CMakeLists.txt 文件中的特定组件（component_name）启用 UBSAN，请在文件末尾添加以下内容:

```cmake
idf_component_get_property(lib component_name COMPONENT_LIB)
target_compile_options(${lib} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

注意：关于构建属性 和 组件属性 的更多信息，请查看构建系统文档。

要为同一组件的 CMakeLists.txt 中的特定组件（component_name）使能 UBSAN，在文件末尾添加以下内容:

```cmake
target_compile_options(${COMPONENT_LIB} PRIVATE "-fsanitize=undefined" "-fno-sanitize=shift-base")
```

**UBSAN 输出** 当 UBSAN 检测到一个错误时，会打印一个信息和回溯，例如:

```
Undefined behavior of type out_of_bounds
Backtrace: 0x4008b383:0x3ffcd8b0 0x4008c791:0x3ffcd8d0 0x4008c587:0x3ffcd8f0... 0x4008c6be:0x3ffcd950 0x400db74f:0x3ffcd970 0x400db99c:0x3ffcd9a0
```

当使用 *IFD 监视器* 时，回溯会被解码为函数名以及源代码位置，并指向问题发生的位置（这里是 main.c:128）:

```
0x4008b383: panic_abort at /path/to/esp-idf/components/esp_system/panic.c:367
0x4008c791: esp_system_abort at /path/to/esp-idf/components/esp_system/system_api. →c:106
0x4008c587: __ubsan_default_handler at /path/to/esp-idf/components/esp_system/ →ubsan.c:152
0x4008c6be: __ubsan_handle_out_of_bounds at /path/to/esp-idf/components/esp_system/ →ubsan.c:223
0x400db74f: test_ub at main.c:128
0x400db99c: app_main at main.c:56 (discriminator 1)
```

UBSAN 报告的错误类型为以下几种:
4.14 Flash 加密

本文档旨在引导用户快速了解 ESP32 的 flash 加密功能，通过应用程序代码示例向用户演示如何在开发及生产过程中测试及验证 flash 加密的相关操作。

4.14.1 概述

flash 加密功能用于加密与 ESP32 搭载使用的片外 flash 中的内容。启用 flash 加密功能后，固件会以明文形式烧录，然后在首次启动时将数据进行加密。因此，物理读取 flash 将无法恢复大部分 flash 内容。

启用 flash 加密后，系统将默认加密下列类型的 flash 数据:

- 固件引导加载程序
- 分区表
- 所有“app”类型的分区

其他类型的数组将视情况加密处理:

- 任何在分区表中标有“加密”标志的分区。详情请见加密分区标志。
- 如果启用了安全启动，则可以加密安全启动引导程序摘要（见下文）。

安全启动 是一个独立的功能，可以与 flash 加密一起使用，从而创建更安全的环境。

重要: 对于生产用途，flash 加密仅应在“发布”模式下启用。

重要: 启用 flash 加密将限制后续 ESP32 更新。在使用 flash 加密功能前，请务必阅读本文档了解其影响。

4.14.2 相关 eFuses

Flash 加密操作由 ESP32 上的多个 eFuse 控制。以下是这些 eFuse 列表及其描述。下表中的各 eFuse 名称也在 espefuse.py 工具中使用，为了能在 eFuse API 中使用，而需在名称前加上 ESP_EFuse 模块，如: esp_efuse_read_field_bit(ESP_EFUSE_DISABLE_DL_ENCRYPT)。
表 20: Flash 加密过程中使用的 eFuses

<table>
<thead>
<tr>
<th>eFuse</th>

<tr>
<td>DISABLE_DL_DECRYPT</td>
<td>设置后，在 UART 固件下载模式运行时禁用 flash 解密操作。</td>
<td>1</td>
</tr>
<tr>
<td>FLASH_CRYPT_CNT</td>
<td>在启动时启用/禁用加密。如果设置了偶数个比特位 (0, 2, 4, 6), 则在启动时加密 flash。如果设置了奇数个比特位 (1, 3, 5, 7), 则在启动时不加密 flash。</td>
<td>7</td>
</tr>
</tbody>
</table>

备注:
- 上表中列出的所有 eFuse 位都提供读/写访问控制。
- 这些位的默认值是 0。

对上述 eFuse 位的读写访问由 WR_DIS 和 RD_DIS 寄存器中的相应字段控制。有关 ESP32 eFuse 的详细信息，请参考 eFuse 管理器。要使用 espefuse.py 更改 eFuse 字段的保护位，请使用以下两个命令: read_protect_efuse 和 write_protect_efuse。例如 espefuse.py write_protect_efuse DISABLE_DL_ENCRYPT。

4.14.3 Flash 的加密过程

假设 eFuse 值处于默认状态，且固件的引导加载程序编译为支持 flash 加密，则 flash 加密的具体过程如下:

1. 第一次开机复位时，flash 中的所有数据都是未加密的 (明文)。ROM 引导加载程序加载固件引导加载程序。
2. 固件的引导加载程序将读取 FLASH_CRYPT_CNT eFuse 值 (0b00000000)。因为该值为 0 (偶数位)，固件的引导加载程序将配置并启用 flash 加密块，同时将 FLASH_CRYPT_CONFIG eFuse 的值编程为 0xF。关于 flash 加密块的更多信息，请参考 ESP32 技术参考手册 > eFuse 控制器 (eFuse) > flash 加密块 [PDF]。
3. 固件的引导加载程序使用 RNG（随机数生成）模块生成 AES-256 位密钥，然后将其写入 flash_encryption eFuse 中。由于 flash_encryption eFuse 已设置密码和读/写保护位，将无法通过软件访问密钥。Flash 加密操作完全在硬件中完成，无法通过软件访问密钥。
4. Flash 加密块将加密 flash 的内容（固件的引导加载程序、应用程序以及标有“加密”标志的分区）。加密可能需要一些时间（对于大分区最多需要一分钟）。
5. 固件引导加载程序将在 FLASH_CRYPT_CNT (0b00000001) 中设置第一个可用位来对已加密的 flash 内容进行标记。设置奇数个比特位。
6. 对于开发模式，固件引导加载程序仅设置 DISABLE_DL_DECRYPT 和 DISABLE_DL_CACHE 的 eFuse 位，以便 UART 引导加载程序重新编译加密的二进制文件。此外，FLASH_CRYPT_CNT 的 eFuse 位不受写入保护。
7. 对于发布模式，固件引导加载程序设置 DISABLE_DL_ENCRYPT、DISABLE_DL_DECRYPT 和 DISABLE_DL_CACHE 的 eFuse 位为 1，以防止 UART 引导加载程序解密 flash 内容。它还写保护 FLASH_CRYPT_CNT eFuse 位。要修改此行为，请参阅启用 UART 引导加载程序加密/解密。
8. 重新启动设备以开始执行加密镜像。固件引导加载程序调用 flash 解密块来解密 flash 内容，然后将解密的内容加载到 IRAM 中。

在开发阶段常需编写不同的明文 flash 镜像并测试 flash 的加密过程。这要求固件下载模式能够根据需求不断加载新的明文镜像。但即使在制造和生产过程中，出于安全考虑，固件下载模式不应有权限访问 flash 内容。
因此需要有两种不同的 flash 加密配置：一种用于开发，另一种用于生产。详情请参考 Flash 加密设置 小节。

### 4.14.4 Flash 加密设置

提供以下 flash 加密模式：

- **开发模式** - 建议仅在开发过程中使用。因为在这种模式下，仍然可以将新的明文固件烧录到设备，并且引导加载程序将使用存储在硬件中的密钥对该固件进行透明加密。此操作间接允许从 flash 中读出固件密文。
- **发布模式** - 推荐用于制造和生产。因为在这种模式下，如果不知道加密密钥，则不可能将明文固件烧录到设备。

本节将详细介绍上述 flash 加密模式，并且逐步说明如何使用它们。

#### 开发模式

在开发过程中，可使用 ESP32 内部生成的密钥或外部主机生成的密钥进行 flash 加密。

**使用 ESP32 生成的密钥** 开发模式允许用户使用固件下载模式下载多个明文镜像。

测试 flash 加密过程需完成以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   请参考如何检查 ESP32 flash 加密状态。
2. 在项目配置菜单，执行以下操作：
   - 启动时使能 flash 加密。
   - 选择加密模式 （默认是 开发模式）。
   - 选择 UART ROM 下载模式 （默认是 启用）。请注意，对于 ESP32 芯片，该选项仅在 `CONFIG_ESP32_REV_MIN` 级别设置为 3 时 (ESP32 V3) 可用。
   - 选择适当详细程度的引导加载程序日志。
   - 保存配置并退出。

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建和烧录完整的镜像。

   ```
   idf.py flash monitor
   ```

**备注**：这个命令不包括任何应该写入 flash 分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为“加密”的分区。然后复位。就加密可能需要时间，对于大分区最多需要一分钟。之后，应用程序在运行时解密并执行命令。

下面是启用 flash 加密后 ESP32 首次启动时的样例输出：

```
--- idf_monitor on /dev/cu.SLAB_USBtoUART 115200 ---
--- Quit: Ctrl+| | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configskip: 0, SPIWP:0xee
```

(下页继续)
使用主机生成的密钥  可在主机中预生成 flash 加密密钥，并将其烧录到 eFuse 密钥烧录块中。这样，无需明文 flash 更新便可以在主机上预加密数据并将其烧录。该功能可在开发模式 和发布模式 两模式下使用。如果没有预生成的密钥，数据将使用 明文方式烧录，然后 ESP32 对数据进行就地加密。

备注：不建议在生产中使用该方法，除非为每个设备单独生成一个密钥。

使用主机生成的密钥需完成以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   请参考如何检查 ESP32 flash 加密状态。

2. 通过运行以下命令生成一个随机密钥：
   ```
   espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
   ```

3. 在第一次加密启动前，使用以下命令将该密钥烧录到设备上，这个操作只能执行 一次。
   ```
   espefuse.py --port PORT burn_key flash_encryption my_flash_encryption_key.bin
   ```

Sample program to check Flash Encryption
This is ESP32 chip with 2 CPU cores, WiFi/BT/BLE, silicon revision 1, 4MB external flash
Flash encryption feature is enabled
Flash encryption mode is DEVELOPMENT
Flash in encrypted mode with flash_encrypt_cnt = 1
Halting...
如果未烧录密钥并在启动 flash 加密后启动设备，ESP32 将生成一个软件无法访问或修改的随机密钥。

4. 在项目配置菜单中进行如下设置:
   - 启动时启用 flash 加密功能
   - 选择加密模式（默认为开发模式）
   - 选择适当详细程度的引导加载程序日志
   - 保存配置并退出

启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

5. 运行以下命令来构建并烧录完整的镜像:

   ```sh
   idf.py flash monitor
   ```

**备注:** 这个命令不包括任何应该被写入 flash 上的分区的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该指令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

如果使用开发模式，那么更新和重新烧录二进制文件最简单的方法是重新烧录更新后的分区。

如果使用发布模式，那么可以在主机上预先加密二进制文件，然后将其作为密文烧录。具体请参考手动加密文件。

**重新烧录更新后的分区** 如果用户用明文方式更新了应用程序代码并需要重新烧录，则需要在烧录前对其进行加密。请运行以下命令一次完成应用程序的加密与烧录：

```sh
idf.py encrypted-app-flash monitor
```

如果所有分区都需要加密形式更新，请运行：

```sh
idf.py encrypted-flash monitor
```

**发布模式**

在发布模式下，UART 引导加载程序无法执行 flash 加密操作。只能使用 OTA 方案下载新的明文镜像，该方案将在写入 flash 前加密明文镜像。

使用该模式需要执行以下步骤：

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。
   - 请参考如何检查 ESP32 flash 加密状态。
2. 在项目配置菜单，执行以下操作：

   - 启动时便能 flash 加密
   - 选择发布模式（注意一旦选择了发布模式，DISABLE_DL_ENCRYPT 和 DISABLE_DL_DECRYPT eFuse 位将被编程为在 ROM 下载模式下禁用 flash 加密硬件）
   - 选择 UART ROM 下载模式（推荐永久性禁用）（注意该选项仅在 CONFIG_ESP32_REV_MIN 级别设置为 3 时（ESP32 V3 可用。）默认选项是保持启用 UART ROM 下载模式，然而建议永久禁用该模式，以减少攻击者可用的选项。
   - 选择适当详细程度的引导加载程序日志
   - 保存配置并退出
启用 flash 加密将增大引导加载程序，因而可能需更新分区表偏移量。请参考引导加载程序大小。

3. 运行以下命令来构建并烧录完整的镜像:

```
idf.py flash monitor
```

**备注:** 这个命令不包括任何应该被写入 flash 区域的用户文件。请在运行此命令前手动写入这些文件，否则在写入前应单独对这些文件进行加密。

该命令将向 flash 写入未加密的镜像：固件引导加载程序、分区表和应用程序。烧录完成后，ESP32 将复位。在下一次启动时，固件引导加载程序会加密：固件引导加载程序、应用程序分区和标记为 加密的分区，然后复位。就地加密可能需要时间，对于大的分区来说可能耗时一分钟。之后，应用程序在运行时被解密并执行。

一旦在发布模式下启用 flash 加密，引导加载程序将写保护 FLASH_CRYPT_CNT eFuse。

请使用OTA 方案对字段中的明文进行后续更新。

**备注:** 如果用户已经预先生成了 flash 加密密钥并存储了一个副本，并且 UART 下载模式没有通过 CONFIG_SECURE_UART_ROM_DL_MODE (ESP32 V3 only) 永久禁用，那么可以通过使用 espsecure.py encrypt_flash_data 预加密文件，从而在本地更新 flash，然后烧录密文。请参看手动加密文件。  

**最佳实践**

在生产中使用 flash 加密时：

- 不要在多个设备之间重复使用同一个 flash 加密密钥，这样攻击者就无法从一台设备上复制加密数 据再将其转移到第二台设备上。
- 在使用 ESP32 V3 时，如果生产设备需要 UART ROM 下载模式，那么则该禁用该模式以增加设 备安全性。这可以通过在应用程序启动时调用esp_efuse_disable_rom_download_mode() 来实现。或者，可将项目 CONFIG_ESP32_REV_MIN 级别配置为 3 (仅针对 ESP32 V3)，然后选 择 CONFIG_SECURE_UART_ROM_DL_MODE 为“永久性的禁用 ROM 下载模式 (推荐)”。在早期的 ESP32 版本上无法禁用 ROM 下载模式。
- 启用安全启动 作为额外的保护层，防止攻击者在启动前有选择地破坏 flash 中某部分。

### 4.14.5 可能出现的错误

一旦启用 flash 加密，FLASH_CRYPT_CNT 的 eFuse 值将设置为奇数值。这意味着所有标有加密标志的分 区都会包含加密的密文。如果 ESP32 错误地加载了明文数据，则会出现以下三种典型的错误情况：

1. 如果通过 明文固件引导加载程序镜像重新烧录了引导加载程序分区，则 ROM 加载器将无法加载 固件引导加载程序，并会显示以下错误类型:

```
rst:0x3 (SW_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
flash read err, 1000
ets_main.c 371
ets Jun  8 2016 00:22:57
```

```
rst:0x7 (TG0WD_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
flash read err, 1000
ets_main.c 371
ets Jun  8 2016 00:22:57
```

```
rst:0x7 (TG0WD_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

(下页继续)
## 2. 如果固件的引导加载程序已加密，但通过明文分区表镜像重新烧录了分区表，引导加载程序将无法读取分区表，从而出现以下错误：

<table>
<thead>
<tr>
<th>原因</th>
<th>错误信息</th>
</tr>
</thead>
<tbody>
<tr>
<td>rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)</td>
<td>Boot: ESP-IDF v4.0-dev-763-g2c55fae6c-dirty 2nd stage bootloader</td>
</tr>
<tr>
<td>I (56) boot:</td>
<td>Compile time 15:37:14</td>
</tr>
<tr>
<td>I (58) boot:</td>
<td>Enabling RNG early entropy source...</td>
</tr>
<tr>
<td>I (64) boot:</td>
<td>SPI Speed : 40MHz</td>
</tr>
<tr>
<td>I (66) boot:</td>
<td>SPI Flash Size : 4MB</td>
</tr>
<tr>
<td>E (80) flash_parts: partition 0 invalid magic number 0x94f6</td>
<td></td>
</tr>
<tr>
<td>E (86) boot:</td>
<td>Failed to verify partition table</td>
</tr>
<tr>
<td>E (91) boot:</td>
<td>Load partition table error!</td>
</tr>
</tbody>
</table>

## 3. 如果引导加载程序和分区表已加密，但使用明文应用程序镜像重新烧录了应用程序，引导加载程序将无法加载应用程序，从而出现以下错误：

<table>
<thead>
<tr>
<th>原因</th>
<th>错误信息</th>
</tr>
</thead>
<tbody>
<tr>
<td>rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)</td>
<td>Boot: ESP-IDF v4.0-dev-850-gc4447462d-dirty 2nd stage bootloader</td>
</tr>
<tr>
<td>I (56) boot:</td>
<td>Compile time 15:37:14</td>
</tr>
<tr>
<td>I (58) boot:</td>
<td>Enabling RNG early entropy source...</td>
</tr>
<tr>
<td>I (64) boot:</td>
<td>SPI Speed : 40MHz</td>
</tr>
<tr>
<td>I (68) boot:</td>
<td>SPI Mode : DIO</td>
</tr>
<tr>
<td>I (72) boot:</td>
<td>SPI Flash Size : 4MB</td>
</tr>
<tr>
<td>I (74) boot:</td>
<td>Partition Table:</td>
</tr>
<tr>
<td>I (79) boot:</td>
<td># Label Usage Type ST Offset Length</td>
</tr>
</tbody>
</table>

(下页继续)
4.14.6 ESP32 flash 加密状态

1. 确保您的 ESP32 设备有相关 eFuses 中所示的 flash 加密 eFuse 的默认设置。

要检查您的 ESP32 设备上是否启用了 flash 加密，请执行以下操作之一:

- 将应用示例 security/flash_encryption 暂时重编译到您的设备上。此应用程序会打印 FLASH_CRYPT_CNT eFuse 值，以及是否启用了 flash 加密。
- 查询设备连接的串口名称，在以下命令中将 PORT 替换为串口号名称后运行:

```
espefuse.py -p PORT summary
```

4.14.7 在加密的 flash 中读写数据

ESP32 应用程序代码可以通过调用函数 `esp_flash_encryption_enabled()` 来检查当前是否启用了 flash 加密。此外，设备可以通过调用函数 `esp_get_flash_encryption_mode()` 来识别 flash 加密模式。

一旦启用 flash 加密，使用代码访问 flash 内容时要更加小心。

Flash 加密范围

当 FLASH_CRYPT_CNT eFuse 设置为奇数位的值，所有通过 MMU 的 flash 缓存访问的 flash 内容都将被透明加密，包括:

- Flash 中可执行的应用程序代码 (IROM)。
- 所有存储于 flash 中的只读数据 (DROM)。
- 通过函数 `spi_flash_mmap()` 访问的任意数据。
- ROM 引导加载程序读取的固件引导加载程序镜像。

**重要：** MMU flash 缓存将无条件解密所有数据。Flash 中未加密存储的数据通过 flash 缓存 “被透明解密”，并在软件中存储为随机垃圾数据。

读取加密的 flash

如果需要在不使用 flash 缓存 MMU 映射的情况下读取数据，推荐使用分区读取函数 `esp_partition_read()`，该函数只会解密从加密分区读取的数据。从未加密分区读取的数据不会被解密。这样，软件便能以相同的方式访问加密和未加密的 flash。

也可以使用以下 SPI flash API 函数:

- 通过函数 `esp_flash_read()` 读取不会被解密的原 (加密) 数据。
- 通过函数 `esp_flash_read_encrypted()` 读取和解密数据。

使用非易失性存储器 (NVS) API 存储的数据始终从 flash 加密的角度进行存储和读取解密。如有需要，则由库提供加密功能。详情可参考 NVS 加密。
写入加密的 flash

推荐使用分区写入函数 `esp_partition_write()`。此函数只会在将数据写入加密分区时加密数据，而写入未加密分区的数据不会被加密。通过这种方式，软件可以以相同的方式访问加密和非加密 flash。

也可以使用函数 `esp_flash_write_encrypted()` 加密和写入数据。

此外，esp-idf 应用程序中存在但不支持以下 ROM 函数：

- `esp_rom_spi_flash_write_encrypted` 预加密并将数据写入 flash
- `SPIWrite` 将未加密的数据写入 flash

由于数据是按块加密的，加密数据最小的写入大小为 16 字节，对齐也是 16 字节。

### 4.14.8 更新加密的 flash

**OTA 更新**

如果使用函数 `esp_partition_write()`，对加密分区的 OTA 更新将自动以加密形式写入。

在为已加密设备的 OTA 更新构建应用程序镜像之前，启用项目配置菜单中的 **启动时使能 flash 加密** 选项。请参考 [OTA](#) 获取更多关于 ESP-IDF OTA 更新的信息。

**通过串口更新加密 flash**

通过串行引导加载程序烧录加密设备，需要串行引导加载程序下载接口没有通过 eFuse 被永久禁用。

在开发模式下，推荐的方法是重新烧录更新后的分区。

在发布模式下，如果主机上有存储在 eFuse 中的相同密钥的副本，那么就可以在主机上对文件进行加密，然后进行烧录，具体请参考手动加密文件。

### 4.14.9 关闭 flash 加密

如果意外启用了 flash 加密，则明文数据的 flash 会使 ESP32 无法正常启动。设备将不断重启，并报警 flash read err, 1000 或 invalid header: 0xxxxxxx。

对于开发模式下的 flash 加密，可以通过烧录 FLASH_CRYPT_CNT efuse 来关闭加密。每个芯片仅有 3 次机会，请执行以下步骤：

1. 在项目配置菜单中，禁用 [启动时使能 flash 加密](#) 选项，然后保存并退出。
2. 再次打开项目配置菜单，再次检查你是否已经禁用了该选项，如果这个选项仍被启用，引导加载程序在启动时将立即重新启用加密功能。
3. 在禁用 flash 加密后，通过运行 idf.py flash 来构建和烧录新的引导加载程序和应用程序。
4. 使用 `espefuse.py`（在 `components/esptool_py/esptool` 中）以关闭 FLASH_CRYPT_CNT，运行：

   ```
   espefuse.py burn_efuse FLASH_CRYPT_CNT
   ```

重置 ESP32，flash 加密应处于关闭状态，引导加载程序将正常启动。

### 4.14.10 Flash 加密的要点

- 使用 AES-256 加密 flash。Flash 加密密钥存储于芯片内部的 `flash_encryption` eFuse 中，并（默认）受保护，防止软件访问。
• Flash 加密算法采用的是 AES-256，其中密钥随着 flash 的每个 32 字节块的偏移地址“调整”。这意味着，每个 32 字节块（2 个连续的 16 字节 AES 块）使用从 flash 加密密钥中产生的一个特殊密钥进行加密。

• 通过 ESP32 的 flash 缓存映射功能，flash 可支持透明访问——任何映射到地址空间的 flash 区域在读取时都被透明地解密。

为便于访问，某些数据分区最好保持未加密状态，或者也可使用对已加密数据无效的 flash 友好型更新算法。由于 NVS 库无法与 flash 加密直接兼容，因此无法加密非易失性存储器的 NVS 分区。详情可参见 NVS 加密。

• 如果以后可能需要启用 flash 加密，则编程人员在编写使用加密 flash 代码时需小心谨慎。

• 如果已启用安全启动，重新烧录加密设备的文字加载程序则需要“可重新烧录”的安全启动摘要（可参考 flash 加密与安全启动）。

启用 flash 加密将增大引导加载程序，因此可能需更新分区表偏移量。请参考引导加载程序大小。

重要：在首次启动加密过程中，请勿切断 ESP32 的电源。如果电源被切断，flash 的内容将被破坏，并需要重新烧录未加密数据。而这类重新烧录将不超过烧录限制次数。

4.14.11 Flash 加密的局限性

flash 加密可以保护固件，防止未经授权的读取与修改。了解 flash 加密系统的局限之处亦十分重要：

• Flash 加密功能与密钥同样稳固。因而，推荐您首次启动设备时在设备上生成密钥（默认行为）。如果在设备外生成密钥，请确保遵循正确的后续步骤，不要在所有生产设备之间使用相同的密钥。

• 并非所有数据都是加密存储。因而在 flash 上存储数据时，请检查您使用的存储方式（库、API 等）是否支持 flash 加密。

• Flash 加密无法防止攻击者获取 flash 的高层次布局信息。这是因为每对相邻的 16 字节 AES 块都使用相邻的 AES 密钥。当这些相邻的 16 字节块中包含相同内容时（如空白或填充区域），这些字节块将加密以产生匹配的加密块对。这让攻击者可在加密设备间进行高层次对比（例如，确认两设备是否可能是运行相同的固件版本）。

• 出于相同原因，攻击者始终可获取一对相邻的 16 字节块（32 字节对齐）时，包含相同的 16 字节序列。因此，在 flash 上存储敏感数据时应牢记这点，可进行相关设置避免该情况发生（可使用计数器字节或每 16 字节设置不同的值即可）。具体请参考 NVS 加密。

• 单独使用 flash 加密可能无法防止攻击者修改本设备的固件。为防止设备上运行未经授权的固件，可搭配 flash 加密使用安全启动。

4.14.12 Flash 加密与安全启动

推荐 flash 加密与安全启动搭配使用。但是，如果已启用安全启动，则重新烧录设备时会受到其他限制：

• 如果新的应用程序已使用安全启动签名密钥正确签名，则 OTA 更新 不受限制。

• 只有当选择可再次烧录 安全启动模式，且安全启动密钥已预生成并烧录至 ESP32 时（可参见 安全启动），明文串行 flash 更新 才可能实现。在该配置下，idf.py bootloader 将生成简化的引导加载程序和安全启动摘要文件，以偏移量 0x0 处进行烧录。当进行明文串行重新烧录步骤时，需在烧录其他明文数据前重新烧录此文件。

• 如果未重新烧录引导加载程序，则仍然可以使用预生成的 flash 加密密钥重新烧录。重新烧录引导加载程序时，需在安全启动配置中启用相同的可重新烧录 选项。

4.14.13 Flash 加密的高级功能

以下部分介绍了 flash 加密的高级功能。
加密分区标志

部分分区默认为已加密。通过在分区的标志字段中添加“encrypted”标志，可在分区表描述中将其他分区标记为需要加密。在这些标记分区中的数据会和应用程序分区一样视为加密数据。

<table>
<thead>
<tr>
<th>Name, Type, SubType, Offset, Size, Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs, data, nvs, 0x9000, 0x6000</td>
</tr>
<tr>
<td>phy_init, data, phy, 0xf000, 0x1000</td>
</tr>
<tr>
<td>factory, app, factory, 0x10000, 1M</td>
</tr>
<tr>
<td>secret_data, 0x40, 0x01, 0x20000, 256K, encrypted</td>
</tr>
</tbody>
</table>

请参考分区分表获取更多关于分区表描述的具体信息。

关于分区加密您还需要了解以下信息:

- 默认分区表都不包含任何加密数据分区。
- 启用 flash 加密后，“app”分区一般都视为加密分区，因此无需标记。
- 如果未启用 flash 加密，则“encrypted”标记无效。
- 将可选 phy 分区标记为“encrypted”，可以防止物理访问读取或修改 phy_init 数据。
- nvs 分区无法标记为“encrypted”因为NVS库与flash加密不直接兼容。

启用 UART 引导加载程序加密/解密

在第一次启动时，flash 加密过程默认会烧录以下 eFuse:

- DISABLE_DL_ENCRYPT 在 UART 引导加载程序启动模式下运行时，禁止 flash 加密操作。
- DISABLE_DL_DECRYPT 在 UART 引导加载程序模式下运行时，禁止透明 flash 解密 (即使 eFuse FLASH_CRYPT_CNT 已设置为在正常操作中启用 flash 解密)。
- DISABLE_DL_CACHE 在 UART 引导加载程序模式下运行时禁止整个 MMU flash 缓存。

为了能启用这些功能，可在首次启动前仅烧录部分 eFuse，并用未设置值 0 写保护其他部分。例如：

```bash
espefuse.py --port PORT burn_efuse DISABLE_DL_DECRYPT
espefuse.py --port PORT write_protect_efuse DISABLE_DL_ENCRYPT
```

重要：保持DISABLE_DL_DECRYPT 未设置 (0) 会使 flash 加密无效。

对芯片具有物理访问权限的攻击者会使用 UART 引导加载程序模式（使用自定义存根代码）读取 flash 的内容。

设置 FLASH_CRYPT_CONFIG

FLASH_CRYPT_CONFIG eFuse 决定 flash 加密密钥中密钥偏移“调整”的位数。详情可参考Flash 加密算法。

首次启动固件引导加载程序时，该值始终设置为最大值 0xF。

可手动写入这些 eFuse，并在首次启动前对其进行写保护，以便选择不同的调整值。但不推荐该操作。

强烈建议在FLASH_CRYPT_CONFIG 未设置时，不要对其进行写保护。否则，它的值将永久为零，而 flash 加密密钥中则无调整位。这导致 flash 加密算法等同于 AES ECB 模式。

JTAG 调试

默认情况下，当启用 flash 加密（开发或发布模式）时，将通过 eFuse 禁用 JTAG 调试。引导加载程序在首次启动时执行此操作，同时启用 flash 加密。

请参考JTAG 与闪存加密和安全引导 了解更多关于使用 JTAG 调试与 flash 加密的信息。
### 手动加密文件

手动加密或解密文件需要在 eFuse 中预烧录 flash 加密密钥（请参阅使用主机生成的密钥）并在主机上保留一份副本。如果 flash 加密配置在开发模式下，那么则不需要保留密钥的副本或遵循这些步骤，可以使用更简单的重新烧录更新后的分区步骤。

密钥文件应该是单个原始二进制文件（例如: key.bin）。

例如，以下是将文件 build/my-app.bin 进行加密，烧录到偏移量 0x10000 的步骤，运行 espsecure.py，如下所示:

```bash
espsecure.py encrypt_flash_data --keyfile /path/to/key.bin --address 0x10000 -- --output my-app-ciphertext.bin build/my-app.bin
```

然后可以使用 esptool.py 将文件 my-app-ciphertext.bin 写入偏移量 0x10000。关于为 esptool.py 推荐的所有命令行选项，请查看 idf.py build 成功时打印的输出。

### 备注:

如果 ESP32 在启动时无法识别烧录进去的密文文件，请检查密钥是否匹配以及命令行参数是否完全匹配，包括偏移量是否正确。

如果您的 ESP32 在 eFuse 中使用了非默认的 FLASH_CRYPT_CONFIG 值，那么则需要向 espsecure.py 传递 --flash_crypt_conf 参数以设置匹配的值。如果设备自己设置了 flash 加密就不会出现这种情况，但如果手动烧录 eFuse 来启用 flash 加密就可能发生这种情况。

```bash
espsecure.py decrypt_flash_data 命令可以使用同样的选项（和不同的输入/输出文件）来解密 flash 密文或之前加密的文件。
```

### 4.14.14 技术细节

以下章节将提供 flash 加密操作的相关信息。

#### Flash 加密算法

- AES-256 在 16 字节的数据块上运行。Flash 加密引擎在 32 字节的数据（2 个串行 AES 块）上加密或解密数据。
- Flash 加密的主密钥存储于 flash_encryption eFuse 中，默认受保护防止进一步写入或软件读取。
- AES-256 密钥大小为 256 位（32 字节），从 flash_encryption eFuse 中读取。与 flash_encryption 中的存储顺序相比，硬件 AES 引擎使用的是相反的字节顺序的密钥。
  - 如果 CODING_SCHEME eFuse 设置为 0（默认“无”编码方案），则 eFuse 密钥块为 256 位，且密钥按原方式存储（反字节序）。
  - 如果 CODING_SCHEME eFuse 设置为 1 (3/4 编码)，则 eFuse 密钥块为 192 位（反字节序），信息熵总量减少。硬件 flash 加密仍在 256 字节密钥上运行，在读取后（字节序未反向），密钥扩展为 key = key[0:255] + key[64:127]。
- Flash 加密中使用了逆向 AES 算法，因此 flash 加密的“加密”操作相当于 AES 解密，而其“解密”操作则相当于 AES 加密。这是为了优化性能，不会影响算法的有效性。
- 每个 32 字节块（2 个相邻的 16 字节 AES 块）都由一个特殊的密钥进行加密。该密钥由 flash_encryption 中 flash 加密的主密钥产生，并随 flash 中该字节块的偏移进行 XOR 运算（一次“密钥调整”）。
- 具体调整量取决于 FLASH_CRYPT_CONFIG eFuse 的设置。该 eFuse 共 4 位，每位可对特定范围的密钥位进行 XOR 运算：
  - Bit 1，对密钥的 0-66 位进行 XOR 运算。
  - Bit 2，对密钥的 67-131 位进行 XOR 运算。
  - Bit 3，对密钥的 132-194 位进行 XOR 运算。
  - Bit 4，对密钥的 195-256 位进行 XOR 运算。
4.15 Hardware Abstraction

Hardware abstraction in ESP-IDF are a group of API that allow users to control peripherals at differing levels of abstraction, as opposed to interfacing with hardware using only the ESP-IDF drivers. ESP-IDF Hardware abstraction will likely be useful for users writing high performance bare-metal drivers, or for those attempting to port an ESP chip to another platform.

This guide is split into the following sections:

1. Architecture
2. LL (Low Level) Layer
3. HAL (Hardware Abstraction Layer)

警告: Hardware abstraction API (excluding the driver and xxx_types.h) should be considered an experimental feature, thus cannot be considered public API. Hardware abstraction API do not adhere to the API name changing restrictions of ESP-IDF’s versioning scheme. In other words, it is possible that Hardware Abstraction API may change in between non-major release versions.

备注: Although this document mainly focuses on hardware abstraction of peripherals (e.g., UART, SPI, I2C), certain layers of hardware abstraction extend to other aspects of hardware as well (e.g., some of the CPU’s features are partially abstracted).

4.15.1 Architecture

Hardware abstraction in ESP-IDF is comprised of the following layers, ordered from low level (closer to hardware) to high level (further away from hardware) of abstraction.

- Low Level (LL) Layer
- Hardware Abstraction Layer (HAL)
- Driver Layers

The LL Layer, and HAL are entirely contained within the hal component. Each layer is dependent on the layer below it (i.e., driver depends on HAL, HAL depends on LL, LL depends on the register header files).

For a particular peripheral xxx, its hardware abstraction will generally consist of the header files described in the table below. Files that are Target Specific will have a separate implementation for each target (i.e., a separate copy for each chip). However, the #include directive will still be target-independent (i.e., will be the same for different targets) as the build system will automatically include the correct version of the header and source files.
## 4.15.2 LL (Low Level) Layer

The primary purpose of the LL Layer is to abstract away register field access into more easily understandable functions. LL functions essentially translate various in/out arguments into the register fields of a peripheral in the form of get/set functions. All the necessary bit shifting, masking, offsetting, and endianness of the register fields should be handled by the LL functions.

```c
//Inside xxx_ll.h

static inline void xxx_ll_set_baud_rate(xxx_dev_t *hw,
    xxx_ll_clk_src_t clock_source,
    uint32_t baud_rate) {
    uint32_t src_clk_freq = (source_clk == XXX_SCLK_APB) ? APB_CLK_FREQ : REF_CLK_FREQ;
    uint32_t clock_divider = src_clk_freq / baud;
    // Set clock select field
    hw->clk_div_reg.divider = clock_divider >> 4;
    // Set clock divider field
```
The code snippet above illustrates typical LL functions for a peripheral `xxx`. LL functions typically have the following characteristics:

- All LL functions are defined as `static inline` so that there is minimal overhead when calling these functions due to compiler optimization. These functions are not guaranteed to be inlined by the compiler, so any LL function that will be called when the cache is disabled (e.g. from an IRAM ISR context) should be marked with `__attribute__((always_inline)).`
- The first argument should be a pointer to a `xxx_dev_t` type. The `xxx_dev_t` type is a structure representing the peripheral’s registers, thus the first argument is always a pointer to the starting address of the peripheral’s registers. Note that in some cases where the peripheral has multiple channels with identical register layouts, `xxx_dev_t *hw` may point to the registers of a particular channel instead.
- LL functions should be short and in most cases are deterministic. In other words, the worst case runtime of the LL function can be determined at compile time. Thus, any loops in LL functions should be finite bounded; however, there are currently a few exceptions to this rule.
- LL functions are not thread safe, it is the responsibility of the upper layers (driver layer) to ensure that registers or register fields are not accessed concurrently.

### 4.15.3 HAL (Hardware Abstraction Layer)

The HAL layer models the operational process of a peripheral as a set of general steps, where each step has an associated function. For each step, the details of a peripheral’s register implementation (i.e., which registers need to be set/read) are hidden (abstracted away) by the HAL. By modeling peripheral operation as a set of functional steps, any minor hardware implementation differences of the peripheral between different targets or chip versions can be abstracted away by the HAL (i.e., handled transparently). In other words, the HAL API for a particular peripheral will remain mostly the same across multiple targets/chip versions.

The following HAL function examples are selected from the Watchdog Timer HAL as each function maps to one of the steps in a WDT’s operation life cycle, thus illustrating how a HAL abstracts a peripheral’s operation into functional steps.

```c
// Initialize one of the WDTs
void wdt_hal_init(wdt_hal_context_t *hal, wdt_inst_t wdt_inst, uint32_t prescaler, __bool enable_intr);

// Configure a particular timeout stage of the WDT
void wdt_hal_config_stage(wdt_hal_context_t *hal, wdt_stage_t stage, uint32_t timeout, wdt_stage_action_t behavior);

// Start the WDT
void wdt_hal_enable(wdt_hal_context_t *hal);

// Feed (i.e., reset) the WDT
void wdt_hal_feed(wdt_hal_context_t *hal);

// Handle a WDT timeout
void wdt_hal_handle_intr(wdt_hal_context_t *hal);

// Stop the WDT
void wdt_hal_disable(wdt_hal_context_t *hal);

// De-initialize the WDT
void wdt_hal_deinit(wdt_hal_context_t *hal);
```
HAL functions will generally have the following characteristics:

- The first argument to a HAL function has the `xxx_hal_context_t *` type. The HAL context type is used to store information about a particular instance of the peripheral (i.e., the context instance). A HAL context is initialized by the `xxx_hal_init()` function and can store information such as the following:
  - The channel number of this instance
  - Pointer to the peripheral’s (or channel’s) registers (i.e., a `xxx_dev_t *` type)
  - Information about an ongoing transaction (e.g., pointer to DMA descriptor list in use)
  - Some configuration values for the instance (e.g., channel configurations)
  - Variables to maintain state information regarding the instance (e.g., a flag to indicate if the instance is waiting for transaction to complete)

- HAL functions should not contain any OS primitives such as queues, semaphores, mutexes, etc. All synchronization/concurrency should be handled at higher layers (e.g., the driver).
- Some peripherals may have steps that cannot be further abstracted by the HAL, thus will end up being a direct wrapper (or macro) for an LL function.
- Some HAL functions may be placed in IRAM thus may carry an `IRAM_ATTR` or be placed in a separate `xxx_hal_iram.c` source file.

### 4.16 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 7 levels (levels 1 to 7, with 7 being an NMI), plus an assortment of exceptions. On the ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the interrupt allocator. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, resulting in very low interrupt latencies.

#### 4.16.1 Interrupt Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Symbol</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>Exception and level 0 interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>2-3</td>
<td>N/A</td>
<td>Medium level interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>4</td>
<td><code>xt_highint4</code></td>
<td>Free to use (See 1)</td>
</tr>
<tr>
<td>5</td>
<td><code>xt_highint5</code></td>
<td>Normally used by ESP-IDF debug logic (See 1)</td>
</tr>
<tr>
<td>NMI</td>
<td><code>xt_nmi</code></td>
<td>Free to use</td>
</tr>
<tr>
<td>dbg</td>
<td><code>xt_debugexception</code></td>
<td>Debug exception. Called on e.g. a BREAK instruction. (See 2)</td>
</tr>
</tbody>
</table>

The following notes give more information about the items in the tables above.

1. ESP-IDF debug logic can be configured to run on `xt_highint4` or `xt_highint5` in `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`. Bluetooth’s interrupt can be configured to run on level 4 by enabling `CONFIG_BTDM_CTRL_HLI`. If `CONFIG_BTDM_CTRL_HLI` is enabled, ESP-IDF debug logic must be running on level 5 interrupt.

2. If `CONFIG_BTDM_CTRL_HLI` is enabled, `xt_debugexception` is used to fix live lock issue in ESP32 ECO3.

Using these symbols is done by creating an assembly file (suffix `.S`) and defining the named symbols, like this:

```assembly
.section .iram1,"ax"
.global xt_highint5
.type xt_highint5, @function
.align 4
xt_highint5:
    ... your code here
rser a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the `esp_system/port/soc/esp32/highint_hdl.S` file; the panic handler interrupt is implemented there.
4.16.2 Notes

- Do not call C code from a high-level interrupt; as these interrupts are run from a critical section, this can cause the target to crash. Note that although the panic handler interrupt does call normal C code, this exception is allowed due to the fact that this handler never returns (i.e., the application will not continue to run after the panic handler). So breaking C code execution flow is not a problem.

  When `CONFIG_BTDM_CTRL_HLI` is enabled, C code is also called from a high-level interrupt, this is possible thanks to some additional protection added to it.

- Make sure your assembly code gets linked in. Indeed, as the free-to-use symbols are declared as weak, the linker may discard the file containing the symbol. This will happen if the only symbol defined, or used, from the user file is the `xt_*` free-to-use symbol. To avoid this, in the assembly file containing the `xt_*` symbol, define another symbol, like:

  ```
  .global ld_include_my_isr_file
  ld_include_my_isr_file:
  ```

  Here it is called `ld_include_my_isr_file` but can have any name, as long as it is not defined anywhere else in the project.

  Then, in the component `CMakeLists.txt`, add this name as an unresolved symbol to the ld command line arguments:

  ```
  target_link_libraries(${COMPONENT_TARGET} "-u ld_include_my_isr_file")
  ```

  This should cause the linker to always include the file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using `esp_intr_alloc()` and associated functions. The handler and handler arguments to `esp_intr_alloc()` must be NULL, however.

- In theory, medium priority interrupts could also be handled in this way. ESP-IDF does not support this yet.

- To check Xtensa instruction set architecture (ISA), please refer to Xtensa ISA Summary.

4.17 JTAG 调试

本文将介绍如何安装 ESP32 的 OpenOCD 调试环境，以及如何使用 GDB 来调试 ESP32 的应用程序。本文结构如下:

引言 介绍本指南主旨。
工作原理 介绍 ESP32、JTAG（Joint Test Action Group）接口、OpenOCD 和 GDB 如何相互连接，从而实现 ESP32 的调试功能。
选择 JTAG 适配器 介绍有关 JTAG 硬件适配器的选择及参照标准。
安装 OpenOCD 介绍如何安装官方预编译好的 OpenOCD 软件包并验证是否安装成功。
配置 ESP32 目标板 介绍如何设置 OpenOCD 软件并安装 JTAG 硬件，两项共同构成调试目标。
启动调试器 介绍如何从 Eclipse 集成开发环境 启动 GDB 调试时会话。
调试范例 如果您不熟悉 GDB，请查看此小节以获取 Eclipse 集成开发环境 提供的调试示例。
从源码构建 OpenOCD 介绍如何在 Windows、Linux 和 macOS 操作系统上从源码构建 OpenOCD。
注意事项和补充内容 介绍使用 OpenOCD 和 GDB 通过 JTAG 接口调试 ESP32 时的注意事项和补充内容。

4.17.1 引言

ESP32 具有两个强大的 Xtensa 内核，支持多种程序架构。ESP-IDF 自带的 FreeRTOS 操作系统支持多核抢占式调度，允许用户以更加直观的方式编写软件。与此相对地，由于缺乏合适的工具，简便的编程方式也会给程序的调试带来困难。
乐鑫已完成 OpenOCD 移植，以支持 ESP32 处理器和多核 FreeRTOS 架构（大多数 ESP32 应用程序的基础）。此外，乐鑫还提供了一些 OpenOCD 本身并不支持的工具，以进一步丰富调试功能。

本文将介绍如何在 Linux、Windows 和 macOS 环境下为 ESP32 安装 OpenOCD，并使用 GDB 进行软件调试。除部分安装流程有所不同外，所有操作系统的软件用户界面和使用流程都是相同的。

备注：本文使用的图片素材来自于 Ubuntu 16.04 LTS 上 Eclipse Neon 3 软件的截图，不同的操作系统（Windows、macOS 或 Linux）或不同的 Eclipse 软件版本在用户界面上可能会有细微差别。

4.17.2 工作原理

通过 JTAG（Joint Test Action Group）接口使用 OpenOCD 调试 ESP32 时所需要的关键软件和硬件包括 xtensa-esp32elf-gdb 调试器、OpenOCD 片上调试器和连接到 ESP32 目标的 JTAG 适配器，如下图“Application Loading and Monitoring”标志所示。

“Application Loading and Monitoring”标志显示一组关键的软件和硬件组件，可用于编译、构建和烧写应用程序到 ESP32 上，以及监视来自 ESP32 的运行诊断信息。

Eclipse 环境集成了 JTAG 调试和应用程序加载、监视的功能，使得软件从编写、编译、加载到调试的迭代过程变得更加快速简单。Eclipse IDE 及其集成的调试软件均适用于 Windows、Linux 和 macOS 平台。根据用户喜好，除了使用 Eclipse 集成开发环境，还可以直接在命令行终端运行 debugger 和 idf.py build。

若使用 ESP-WROOM-KIT 开发板，由于其板载 FT232H 芯片，仅需一根 USB 线即可连接 PC 与 ESP32。FT232H 提供了两路 USB 通道，一路连接到 JTAG，另一路连接到 UART。

4.17.3 选择 JTAG 适配器

上手 JTAG 最快速便捷的方式是使用 ESP-WROOM-KIT 开发板，因为它板载了 JTAG 调试接口，无需使用外部 JTAG 硬件适配器和额外线缆来连接 JTAG 与 ESP32。ESP-WROOM-KIT 采用 FT2232H 提供的 JTAG 接口，可以稳定运行在 20 MHz 的时钟频率，外接的适配器很难达到这个速度。

如果您想使用单独的 JTAG 适配器，请确保其与 ESP32 的电平电压和 OpenOCD 软件都兼容。ESP32 使用的是业界标准的 JTAG 接口，它未使用（实际上也并不需要）TRST 信号脚。JTAG 使用的 IO 管脚由
Chapter 4. API 指南

VDD_3P_RTC 电源管脚供电（通常连接到外部 3.3 V 的电源轨），因此 JTAG 硬件适配器的管脚需要能够在该电压范围内正常工作。

在软件方面，OpenOCD 支持相当多数量的 JTAG 适配器，请参阅 OpenOCD 支持的适配器列表（请注意这一列表并不完整），其中还列出了兼容 SWD 接口的适配器，但请注意，ESP32 目前并不支持 SWD。此外，硬编码为只支持特定产品线的 JTAG 适配器也无法在 ESP32 上工作，例如仅针对 STM32 系列产品的 ST-LINK 适配器。

保证 JTAG 正常工作需要连接的信号线包括：TDI、TDO、TCK、TMS 和 GND。一些 JTAG 适配器还需要 ESP32 提供一路电源到适配器的某个管脚上（比如 Vtar），用于设置适配器的工作电压。您也可以选择将 SRST 信号线连接到适配器的 CH_PD 管脚上，但请注意，目前 OpenOCD 对该信号线提供的支持相当有限。

ESP-Prog 中展示了使用外部电路板进行调试的实例，方法是将其连接到 ESP32 的 JTAG 管脚上。

4.17.4 安装 OpenOCD

如果您已经按照 快速入门 完成了 ESP-IDF 及其 CMake 构建系统的安装，那么 OpenOCD 已经被默认安装到了您的开发系统中。在 设置开发环境 结束后，您应该能够在终端中运行如下 OpenOCD 命令：

```
openocd --version
```

终端会输出以下信息（实际版本号可能会更新）：

```markdown
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read
https://openocd.org/doc/doxygen/bugs.html
```

您还可以检查 OPENOCD_SCRIPTS 环境变量的值，以确认 OpenOCD 配置文件的路径。Linux 和 macOS 用户可以在终端输入 `echo $OPENOCD_SCRIPTS`，Windows 用户需要输入 `echo %OPENOCD_SCRIPTS%`。如果终端输出了有效路径，则表明您已经正确安装 OpenOCD。

如果无法执行上述步骤，请再次阅读快速入门手册，参考 设置安装工具 章节。

备注：另外也可以从源代码编译 OpenOCD 工具，详细信息请参阅 源码构建 OpenOCD 章节。

4.17.5 配置 ESP32 目标板

OpenOCD 安装完成后就可以配置 ESP32 目标（即带 JTAG 接口的 ESP32 板），具体分为以下三个步骤：

- 配置并连接 JTAG 接口
- 运行 OpenOCD
- 上传待调试的应用程序

配置并连接 JTAG 接口

此步骤取决于使用的 JTAG 和 ESP32 板，参考以下两种情况。

配置 ESP-WROVER-KIT 上的 JTAG 接口

所有版本的 ESP-WROVER-KIT 板子都内置了 JTAG 调试功能，要使其正常工作，还需要设置相关跳线来启用 JTAG 功能，设置 SPI 闪存电压和配置 USB 驱动程序。具体步骤请参考以下说明。
配置硬件

- 根据ESP-WROVER-KIT V4.1入门指南文档中设置选项章节所描述的信息，设置JP8便可以启用JTAG功能。
- 检查ESP32上用于JTAG通信的引脚是否被接到了其它硬件上，这可能会影响JTAG的工作。

<table>
<thead>
<tr>
<th>ESP32管脚</th>
<th>JTAG信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO/GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI/GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK/GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS/GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

配置USB驱动 安装和配置USB驱动，这样OpenOCD才能够与ESP-WROVER-KIT板上的JTAG接口通信，并且使用UART接口上传待烧写的镜像文件。请根据你的操作系统按照以下步骤进行安装配置。

备注：ESP-WROVER-KIT使用了FT2232芯片实现了JTAG适配器，所以以下说明同样适用于其他基于FT2232的JTAG适配器。

Windows

1. 使用标准USB A / micro USB B线将ESP-WROVER-KIT与计算机相连接，并打开板子的电源。
2. 等待Windows识别出ESP-WROVER-KIT并且为其安装驱动。如果驱动没有被自动安装，请前往官网下载并手动安装。
3. 从Zadig官网下载Zadig工具（Zadig_X.X.exe）并运行。
4. 在Zadig工具中，进入“Options”菜单中选中“List All Devices”。
5. 检查设备列表，其中应该包含两条与ESP-WROVER-KIT相关的条目：“Dual RS232- HS (Interface 0)”和“Dual RS232- HS (Interface 1)”。驱动的名字应该是“FTDIBUS (vxxxx)”并且USB ID为：04036010。

图36: 在Zadig工具中配置JTAG USB驱动

6. 第一个设备“Dual RS232-HS (Interface 0)”连接到了ESP32的JTAG端口，此设备原来的“FTDIBUS (vxxxx)”驱动需要替换成“WinUSB (v6xxxxx)”。为此，请选择“Dual RS232-HS (Interface 0)”并将驱动重新安装为“WinUSB (v6xxxxx)”，具体可以参考上图。
Linux

1. 使用标准 USB A / micro USB B 线将 ESP-WROVER-KIT 与计算机相连接，并打开板子的电源。

2. 打开终端，输入 `ls -l /dev/ttyUSB*` 命令检查操作系统是否能够识别板子的 USB 端口。类似识别结果如下：

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
   crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
   crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
   ```

3. 根据 OpenOCD README 文档中“Permissions delegation”小节的介绍，设置这两个 USB 端口的访问权限。

4. 注销并重新登录 Linux 系统，然后重新插入板子的电源使之前的改动生效。在终端再次输入 `ls -l /dev/ttyUSB*` 命令进行验证，查看这两个设备的组所有是否已经从 dialout 更改为 plugdev：

   ```
   user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
   crw-rw---- 1 root plugdev 188, 0 Jul 10 19:07 /dev/ttyUSB0
   crw-rw---- 1 root plugdev 188, 1 Jul 10 19:07 /dev/ttyUSB1
   ```

如果看到类似的输出结果，并且你也是 plugdev 组的成员，那么设置工作就完成了。具有较低编号的 `/dev/ttyUSBn` 接口用于 JTAG 通信，另一路接口被连接到 ESP32 的串口 (UART)，用于上传应用程序映像给 ESP32 进行烧写。

现在，ESP-WROVER-KIT 的 JTAG 接口应该可以被 OpenOCD 使用了，想要进一步设置调试环境，请前往运行 OpenOCD 章节。

MacOS 在 macOS 上，同时使用 FT2232 的 JTAG 接口和串口还需另外进行其它操作。当操作系统加载 FTDI 串口驱动的时候，它会对 FT2232 芯片的两个通道做相同的操作。但是，这两个通道中只有一个是被用作串口，而另一个用于 JTAG，如果操作系统已经为用于 JTAG 的通道加载了 FTDI 串口驱动的话，OpenOCD 将无法连接到芯片。有两个方法可以解决这个问题：

1. 在启动 OpenOCD 之前手动卸载 FTDI 串口驱动程序，然后启动 OpenOCD，再加载串口驱动程序。
2. 修复 FTDI 驱动程序的配置，使其不会为 FT2232 芯片的通道 A 进行自我加载，该通道用于 ESP-WROVER-KIT 板上的 JTAG 通道。

手动卸载驱动程序

1. 从 FTDI 官网 安装驱动。
2. 使用 USB 线连接 ESP-WROVER-KIT。
3. 卸载串口驱动

   ```
   sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
   ```

有时，您可能还需要卸载苹果的 FTDI 驱动：

- macOS < 10.15:

   ```
   sudo kextunload -b com.apple.driver.AppleUSBFTDI
   ```

- macOS 10.15:

   ```
   sudo kextunload -b com.apple.DriverKit-AppleUSBFTDI
   ```
警告：对于 FTDI 驱动，如果使用串口的通道不正确，则可能会导致内核崩溃。ESP-WROVER-KIT 将通道 A 用于 JTAG，通道 B 用于串口。

4. 运行 OpenOCD:

```bash
.. include:: esp32.inc
:start-after: run-openocd
:end-before: ---
```

5. 在另一个终端窗口，再一次加载 FTDI 串口驱动:

```bash
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

备注：如果你需要重启 OpenOCD，则无需再次卸载 FTDI 驱动程序，只需停止 OpenOCD 并再次启动它。只有在重新连接 ESP-WROVER-KIT 或者切换了电源的情况下才需要再次卸载驱动。

你也可以根据自身需求，将此过程包装进 shell 脚本中。

修改 FTDI 驱动 简而言之，这种方法需要修改 FTDI 驱动程序的配置文件，这样可以防止为 FT2232H 的通道 B 自动加载串口驱动。

备注：其他板子可能将通道 A 用于 JTAG，因此请谨慎使用此选项。

警告：此方法还需要操作系统禁止对驱动进行签名验证，因此可能无法被所有的用户所接受。

1. 使用文本编辑器打开 FTDI 驱动的配置文件 (注意 sudo):

   ```bash
   sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
   ```

2. 找到并删除以下几行:

   ```xml
   <key>FT2232H_B</key>
   <dict>
   <key>CFBundleIdentifier</key>
   <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
   <key>IOClass</key>
   <string>FTDIUSBSerialDriver</string>
   <key>IOProviderClass</key>
   <string>IOUSBInterface</string>
   <key>bConfigurationValue</key>
   <integer>1</integer>
   <key>bInterfaceNumber</key>
   <integer>1</integer>
   <key>bcdDevice</key>
   <integer>1792</integer>
   <key>idProduct</key>
   <integer>24592</integer>
   <key>idVendor</key>
   <integer>1027</integer>
   </dict>
   ```

3. 保存并关闭文件

4. 禁用驱动的签名认证:
   1. 点击苹果的 logo，选择 “Restart…”
   2. 重启后当听到响铃时，立即按下键盘上的 CMD+R 组件键
   3. 进入恢复模式后，打开终端
   4. 运行命令:
第4章. API

```bash
csrutil enable --without kext
```

5. 再一次重启系统
完成这些步骤后，可以同时使用串口和 JTAG 接口了。
想要进一步设置调试环境，请前往运行 OpenOCD 章节。

### 配置其他 JTAG 接口
关于适配 OpenOCD 和 ESP32 的 JTAG 接口选择问题，请参考选择 JTAG 适配器 章节，确保 JTAG 适配器能够与 OpenOCD 和 ESP32 一同工作。然后按照以下三个步骤进行设置，使其正常工作。

### 配置硬件
1. 找到 JTAG 接口和 ESP32 板上需要相互连接并建立通信的所有管脚或信号。

<table>
<thead>
<tr>
<th>ESP32 管脚</th>
<th>JTAG 信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTMS / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

2. 检查 ESP32 上用于 JTAG 通信的管脚是否被连接到了其它硬件上，这可能会影响 JTAG 的工作。
3. 连接 ESP32 和 JTAG 接口上的管脚或信号。

### 配置驱动
您可能还需要安装软件驱动，才能使 JTAG 在计算机上正常工作，请参阅您所使用的 JTAG 适配器的有关文档，获取相关详细信息。

### 连接
将 JTAG 接口连接到计算机，打开 ESP32 和 JTAG 接口板上的电源，然后检查计算机是否可以识别到 JTAG 接口。
如需继续设置调试环境，请前往运行 OpenOCD 章节。

### 运行 OpenOCD
配置完目标并将其连接到电脑后，即可启动 OpenOCD。
打开终端，按照快速入门指南中的设置好开发环境 章节进行操作，然后运行如下命令，以启动 OpenOCD（该命令适用于 Windows、Linux 和 macOS）:

```bash
openocd -f board/esp32-wrover-kit-3.3v.cfg
```

### 备注：
上述命令中 -f 选项后跟的配置文件专用于板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板。基于具体使用的硬件，您可能需要选择不同的配置文件，具体内容请参阅根据目标芯片配置 OpenOCD。

例如，对于带有用于 JTAG 连接的 FT2232H 或 FT232H 芯片的定制板，或带有 ESP-Prog 的定制板，可使用 board/esp32c3-ftdi.cfg。

现在您应该可以看到如下输出（此日志来自板载 ESP32-WROOM-32 模组的 ESP-WROVER-KIT 开发板）:
• 如果出现提示权限问题的错误，请打开 ~/esp/openocd-esp32 目录，参阅 OpenOCD README 文件中关于“Permissions delegation”的说明。
• 如果遇到无法找到配置文件的错误，例如 Can't find board/esp32-wrover-kit-3.3v. cfg，请检查 OPENOCD_SCRIPTS 环境变量是否设置正确，OpenOCD 根据此变量来查找-f 指定的文件，详见 安装 OpenOCD。此外，还需要检查配置文件是否确实位于该路径下。
• 如果出现 JTAG 错误（例如输出为 ...all ones 或 ...all zeroes）,请检查硬件连接是否正确，除了 ESP32 的管脚之外是否还有其他信号连接到了 JTAG，并查看是否所有器件都已经上电。

上传待调试的的应用程序

按照正常步骤构建并上传 ESP32 应用程序，具体请参阅 第五步：开始使用 ESP-IDF 吧 章节。

除此之外，您还可以使用 OpenOCD 通过 JTAG 接口将应用程序镜像烧写到 flash 中，命令如下:

```
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "program_esp filename.bin 0x10000 ... verify exit"
```

其中 OpenOCD 的烧写命令 program_esp 格式如下:

```
program_esp <image_file> <offset> [verify] [reset] [exit]
```

• image_file - 程序镜像文件存放的路径
• offset - 镜像烧写到 flash 中的偏移地址
• verify - 烧写完成后校验 flash 中的内容（可选）
• reset - 烧写完成后重启目标（可选）
• exit - 烧写完成后退出 OpenOCD（可选）

现在可以调试应用程序了，请按照以下章节中的步骤进行操作。

### 4.17.6 启动调试器

ESP32 的工具链中带有 GNU 调试器（简称 GDB），它和其它工具链软件共同存放于 xtensa-esp32-elf-gdb 中。除了直接在命令行终端中调用并操作 GDB 外，也可以在 IDE（例如 Eclipse，Visual Studio Code 等）中进行调用。使用图形用户界面间接操作 GDB，这一方法无需在终端中输入任何命令。

关于以上两种调试器的使用方法，详见以下链接。

• 使用 Eclipse 调试
• 使用命令行调试

建议首先检查调试器能否在命令行终端下正常工作，然后再使用 Eclipse 集成开发环境 进行调试工作。
4.17.7 调试范例

本节适用于不熟悉 GDB 的用户，下文将使用 get-started/blink 下简单的应用程序来演示调试会话的工作流程，同时会介绍以下常用的调试操作:

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

此外还会提供在命令终端下使用 GDB 调试的例子。

备注：调试 FreeRTOS 对象目前仅适用于命令行调试。

在演示之前，请完成 ESP32 目标板设置并加载 get-started/blink 至 ESP32 中。

4.17.8 从源码构建 OpenOCD

以下文档分别介绍了如何在各操作系统平台上从源码构建 OpenOCD。

Windows 环境下从源码编译 OpenOCD

备注：本文介绍了如何从 OpenOCD 源文件构建二进制文件。如果您想要更快速地构建，也可以从乐鑫 GitHub 直接下载 OpenOCD 的预构建二进制文件，而无需自己编译（详细信息，请参阅安装 OpenOCD）。

备注：本文涉及的命令行操作均在装有 MINGW32 子系统的 MSYS2 shell 环境中进行了验证。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包：

```
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winthreads-git \
p7zip
```

下载 OpenOCD 源码 支持 ESP32 的 OpenOCD 源码可以从乐鑫官方 GitHub 获取，网址为 https://github.com/espressif/openocd-esp32。您可以在 Git 中使用以下命令来拉取源代码：

```
cd ~/esp

  git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码保存在 ~/esp/openocd-esp32 目录下。
Chapter 4. API 指南

下载 libusb 构建 OpenOCD 需使用 libusb 库。请执行以下命令来下载特定版本的 libusb，并将其解压至当前目录。

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
```

现在需要导入以下变量，以便将 libusb 库与 OpenOCD 构建相关联。

```
export CPPFLAGS="-I$(PWD)/libusb/include/libusb-1.0"
export LDLIBS="-L$(PWD)/libusb/MinGW32/.libs/dll"
```

构建 OpenOCD 配置和构建 OpenOCD，请参考以下命令：

```
cd ~/esp/openocd-esp32
export CPPFLAGS="-D__USE_MINGW_ANSI_STDIO=1 -Wno-error"
export CFLAGS="-Wno-error"
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build=i686-w64-mingw32 --host=i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

构建完成后，OpenOCD 的二进制文件将被保存于 ~/esp/openocd-esp32/src/ 目录下。

您可以使用 make install 将其复制到指定位置。

- 您可以在配置 OpenOCD 时指定这一位置，也可以在调用 make install 前设置 export DESTDIR="/custom/install/dir"。
- 如果您已经安装过其他开发平台的 OpenOCD，请跳过此步骤，否则原来的 OpenOCD 可能会被覆盖。

备注：

- 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
- 如果 OpenOCD 存在子模块问题，请 cd 到 openocd-esp32 目录，并输入 git submodule update --init 命令。
- 如果 ./configure 成功运行，JTAG 被使用的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 ./openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README.Windows。
- 请记得将 libusb-1.0.dll 和 libwinpthread-1.dll 从 ~/esp/openocd-esp32/src 复制到 OOCD_INSTALLDIR/bin。

一旦 make 过程完成，OpenOCD 的可执行文件会被保存到 ~/esp/openocd-esp32/src/openocd 目录下。

完整编译过程 OpenOCD 编译过程中所调用的所有命令都已包含在以下代码片段中，您可以将其复制到 shell 脚本中，以便快速执行：

```
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-cross-winpthreads-gcc p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
```

(下页继续)
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I$(PWD)/libusb/include/libusb-1.0"; export LDFLAGS="$LDFLAGS -L$(PWD)/libusb/MinGW32/.libs/dll"

export CPPFLAGS="SCPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="-Wno-error";

cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build-i686-w64-mingw32 --host-i686-w64-mingw32
make

cp .. /libusb/MinGW32/dll/libusb-1.0.dll ./src

cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src

# # optional
# export DESTDIR="$PWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin

下一步 想要进一步配置调试环境，请前往配置 ESP32 目标板 章节。

Linux 环境下从源码编译 OpenOCD

除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往 安装 OpenOCD 章节查阅。

下载 OpenOCD 源码 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获得，网址为 https://github.com/espressif/openocd-esp32，请使用以下命令来下载源代码：

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

安装依赖的软件包 安装编译 OpenOCD 所需的软件包。

备注：依次安装以下软件包，检查安装是否成功，然后继续下一个软件包的安装。在进行下一步操作之前，要先解决当前报告的问题。

```
sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
sudo apt-get install texinfo
sudo apt-get install libusb-1.0
```

备注：
- pkg-config 应为 0.2.3 或以上的版本。
- autoconf 应为 2.6.4 或以上的版本。
- automake 应为 1.9 或以上的版本。
Chapter 4. API

• 当使用 USB-Blaster，ASIX Presto，OpenJTAG 和 FT2232 作为适配器时，需要下载安装 libFTDI 和 FTD2XX 的驱动。
• 当使用 CMSIS-DAP 时，需要安装 HIDAPI。

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

你可以选择最后再执行 sudo make install，如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤，因为它可能会覆盖掉原来的 OpenOCD。

备注:
• 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
• 如果 OpenOCD 存在于模块问题，请 cd 到 openocd-esp32 目录，并输入 git submodule update --init 命令。
• 如果 ./configure 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
• 如果您的设备信息未显示在日志中，请根据 ..openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
• 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README。

一旦 make 过程成功结束，OpenOCD 的可执行文件会被保存到 ~/openocd-esp32/bin 目录中。

下一步 想要进一步配置调试环境，请前往配置 ESP32 目标板 章节。

MacOS 环境下从源码编译 OpenOCD

除了从 Espressif 官方 直接下载 OpenOCD 可执行文件，你还可以选择从源码编译得到 OpenOCD。如果想要快速设置 OpenOCD 而不是自行编译，请备份好当前文件，前往安装 OpenOCD 章节查阅。

下载 OpenOCD 源码 支持 ESP32 的 OpenOCD 源代码可以从乐鑫官方的 GitHub 获取。网址为 https://github.com/espressif/openocd-esp32。请使用以下命令来下载源代码:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

克隆后的源代码被保存在 ~/esp/openocd-esp32 目录中。

安装依赖的软件包 使用 Homebrew 安装编译 OpenOCD 所需的软件包:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

构建 OpenOCD 配置和构建 OpenOCD 的流程如下:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```
你可以选择最后再执行 `sudo make install`。如果你已经安装过别的开发平台的 OpenOCD，请跳过这个步骤。因为它可能会覆盖掉原来的 OpenOCD。

### 备注:
- 如果发生错误，请解决后再次尝试编译，直到 make 成功为止。
- 发生 `Unknown command 'raggedright'` 错误可能是因为安装的 texinfo 版本不对，或是由于没有将其添加到 PATH 路径。为了解决该问题，在运行 ./bootstrap 前，请先运行如下命令确保安装合适版本的 texinfo 并将其添加到 PATH 路径:

```bash
brew install texinfo
export PATH=/usr/local/opt/texinfo/bin:$PATH
```
- 如果 OpenOCD 存在子模块问题，请 cd 到 openocd-esp32 目录，并输人 git submodule update --init 命令。
- 如果 ./configure 成功运行，JTAG 被使能的信息会被打印在 OpenOCD configuration summary 下面。
- 如果您的设备信息未显示在日志中，请根据 ./openocd-esp32/doc/INSTALL.txt 文中的描述使用 ./configure 启用它。
- 有关编译 OpenOCD 的详细信息，请参阅 openocd-esp32/README.OSX。

一旦 make 过程成功结束，OpenOCD 的可执行文件会被保存到 ~/openocd-esp32/src/openocd 目录中。

#### 下一步
想要进一步配置调试环境，请前往 配置 ESP32 目标板 章节。

本文档在演示中所使用的 OpenOCD 是预编译好的。二进制文件的版本，安装 OpenOCD 章节中有所介绍。

如果要使用本地源代码编译的 OpenOCD 程序，需要将相应可执行文件的路径修改为 src/openocd，并设置 OPENOCD_SCRIPTS 环境变量，使得 OpenOCD 能够找到配置文件。Linux 和 macOS 用户可以执行:

```bash
cd ~/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

Windows 用户可以执行:

```bash
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

针对 Linux 和 macOS 用户，运行本地编译的 OpenOCD 的示例:

```bash
src/openocd -f board/esp32-wrover-kit-3.3v.cfg
```

Windows 用户的示例如下:

```bash
src\openocd -f board\esp32-wrover-kit-3.3v.cfg
```

### 4.17.9 注意事项和补充内容

本节列出了上文中提到的所有注意事项和补充内容的链接。

#### 注意事项和补充内容

本节提供了本指南中各部分提到的一些注意事项和补充内容。
关于断点的补充知识 使用常规的 GDB 命令 `hb myFunction` 给某个函数设置硬件断点时，如果该函数位于内存中，并且此时还有可用的硬件断点，那么 GDB 就会使用 32 个硬件断点，否则就会使用 32 个软件内存断点中的一个来模拟。这个规则同样适用于 b myFunction 之类的命令。在这种情况 GDB 会自己决定该使用哪种类型的断点。如果 myFunction 位于可写区域 (IRAM)，那就会使用软件 IRAM 断点，否则就会像处理 hb 命令一样使用硬件断点或者软件内存断点。

**闪光映射 vs 软件内存断点** 为了在内存中设置或者清除软件断点，OpenOCD 需要知道它们在内存中的地址。为了完成从 ESP32 的地址空间到内存地址的转换，OpenOCD 使用内存中程序代码区域的映射。这些映射被保存在程序映像的头部，位于二进制数据 (代码段和数据段) 之前，并且用于内存中程序的映射。为了支持软件内存断点，OpenOCD 需要知道程序映像在内存中的位置。默认情况下，OpenOCD 会在 0x8000 处读取内存映像并使用第一个找到的应用程序映像的映射，但是也可能会存在无法工作的代码，比如内存不在标准的内存位置，甚至可能有多个映像：一个出厂映像和一个 OTA 映像。你可能想要调试其中的任意一个。为了涵盖所有可能的调试情况，OpenOCD 支持特殊的命令，用于指定待调试的应用程序映像在内存中的具体位置。该命令具有以下格式：

```plain
esp appimage_offset <offset>
```

偏移量应为十六进制格式，如果要恢复默认行为，可以将偏移地址设置为 -1。

**备注**：由于 GDB 在连接 OpenOCD 时仅仅请求一次内存映射，所以可以在 TCL 配置文件中指定该命令，或者通过命令行传递给 OpenOCD。对于后者，命令行示例如下：

```bash
openocd -f board/esp32-wrover-kit-3.3v.cfg -c "init; halt; esp appimage_offset -0x210000"
```

另外还可以通过 OpenOCD 的 telnet 会话执行该命令，然后再连接 GDB，不过这种方式似乎没有那么便捷。

**“next” 命令无法跳过子程序的原因** 当使用 `next` 命令单步执行代码时，GDB 会在子程序的前面设置一个断点 (两个中可用的一个)，这样就可以跳过进入子程序内部的细节。如果这两个断点已经用在代码的其它位置，那么 `next` 命令将不起作用。在这种情况下，请删掉一个断点以使其中一个变得可用。当两个断点已经被使用时，`next` 命令会像 `step` 命令一样工作，调试器就会进入子程序内部。

**OpenOCD 支持的编译时的选项** ESP-IDF 有一些针对 OpenOCD 调试功能的选项可以在编译时进行设置：

- `CONFIG_ESP_DEBUG_OCDAWARE` 默认会被使能。如果程序抛出了不可修复或者未处理的异常，并且此时已经连接上了 JTAG 调试器 (即 OpenOCD 正在运行)，那么 ESP-IDF 将会进入调试器工作模式。
- `CONFIG_FREERTOSWATCHPOINT_END_OF_STACK` 默认没有使能。在所有任务堆栈的末尾设置观察点，从 1 号开始索引，这是调试任务堆栈溢出的最准确的方式。

更多有关设置编译时的选项的信息，请参阅 [项目配置菜单](#)。
支持 FreeRTOS OpenOCD 完全支持 ESP-IDF 自带的 FreeRTOS 操作系统，GDB 会将 FreeRTOS 中的任务当做线程。使用 GDB 命令 i threads 可以查看所有的线程，使用命令 thread n 可以切换到某个具体任务的堆栈，其中 n 是线程的编号。检测 FreeRTOS 的功能可以在配置目标时被禁用。更多详细信息，请参阅根据目标芯片配置 OpenOCD。

GDB 具有 FreeRTOS 支持的 Python 扩展模块。在系统要求满足的情况下，通过 idf.py gdb 命令，ESP-IDF 会将该模块自动加载到 GDB 中。详细信息请参考调用 FreeRTOS 对象。

在 OpenOCD 的配置文件中设置 SPI 闪存的工作电压 ESP32 的 MTD 管脚是用于 JTAG 通信的四个管脚之一，同时也是 ESP32 的 bootstrapping 管脚。上电时，ESP32 会在 MTD 管脚上采样二进制电平，据此来设置内部的稳压器，用于给外部的 SPI 闪存芯片供电。如果上电时 MTD 管脚上的二进制电平为低电平，则稳压器会被设置为 3.3 V。如果 MTD 管脚为高电平，则稳压器会被设置为 1.8 V。MTD 管脚通常需要一个上拉电阻或者直接使用内部的弱下拉电阻（详见 ESP32 系列芯片技术规格书），具体取决于所使用的 SPI 芯片的类型。但是一旦连接上 JTAG 后，原来用于实现 bootstrapping 功能的上拉或者下拉电阻都会被覆盖掉。

为了解决这个问题，OpenOCD 的板级配置文件（例如 ESP-WROVER-KIT 开发板的 board\exp32-wrover-kit-3.3v.cfg）提供了 ESP32_FLASH_VOLTAGE 参数来设置 TDO 信号线在空闲状态下的二进制电平，这样就可以减少由于闪存电压不正确而导致的应用程序启动不良的几率。

查看 JTAG 连接的 ESP32 模块的规格书，检查其 SPI 闪存芯片的供电电压值，然后再相应的设置 ESP32_FLASH_VOLTAGE。大多数 WROOM 模块使用 3.3 V 的闪存芯片。早于 ESP32-WROVER-B 的 WROVER 模块使用 1.8 V 闪存芯片，而 ESP32-WROVER-B 和 E 模块使用 3.3 V 闪存芯片。

优化 JTAG 的速度 为了实现更高的数据通信速率同时最小化丢包数，建议优化 JTAG 时钟频率的设置，使其达到 JTAG 能稳定运行的最大值。为此，请参考以下建议。

1. 如果 CPU 以 80 MHz 运行，则 JTAG 时钟频率的上限为 20 MHz；如果 CPU 以 160 MHz 或者 240 MHz 运行，则上限为 26 MHz。
2. 根据特定的 JTAG 适配器和连接线缆的长度，你可能需要将 JTAG 的工作频率降低至 20 / 26 MHz 以下。
3. 在某些特殊情况下，如果你看到 DSR/DIR 错误（并且它并不是由 OpenOCD 试图从一个没有物理存储器映射的地址空间读取数据而导致的），请降低 JTAG 的工作频率。
4. ESP-WROVER-KIT 能够稳定运行在 20 / 26 MHz 频率下。

调试器的启动命令的含义 在启动时，调试器发出一系列命令来复位芯片并使其在特定的代码行停止运行。这个命令序列（如下所示）支持自定义，用户可以选择在最方便合适的代码行开始调试工作。

- set remote hardware-watchpoint-limit 2 —限制 GDB 只使用 ESP32 支持的两个硬件观察点。更多详细信息，请查阅 GDB 配置远程目标。
- mon reset halt —复位芯片并使 CPU 停止运行。
- flushregs —mon 命令无法通知 GDB 目标状态已经更改，GDB 会假设在 mon reset halt 之前所有的任务堆栈仍然有效。实际上，复位后目标状态将发生变化。执行 flushreg 是一种强制 GDB 从目标获取最新状态的方法。
- thb app_main —在 app_main 处插入一个临时的硬件断点，如果有需要，可以将其替换为其他函数名。
- c —恢复程序运行，它将会在 app_main 的断点处停止运行。

根据目标芯片配置 OpenOCD OpenOCD 有很多种配置文件 (*.cfg)，它们位于 OpenOCD 安装目录的 share/openocd/scripts 子目录中（或者在 OpenOCD 源码目录的 tcl/scripts 目录中）。本文主要介绍 board, interface 和 target 这三个目录。

- interface 包含了例如 ESPProg、J-Link 这些 JTAG 适配器的配置文件。
- target 包含了目标芯片或者模组的配置文件。
- board 包含有关于 JTAG 适配器的开发板的配置文件，这些配置文件会根据实际的 JTAG 适配器和芯片/模组来导出某个具体的 interface 和 target 的配置。

ESP32 可以使用的配置文件如下表所示：

<table>
<thead>
<tr>
<th>ESP32-WROVER-B</th>
<th>20 / 26 MHz</th>
<th>3.3 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROVER-B</td>
<td>1.8 V</td>
<td></td>
</tr>
</tbody>
</table>

注意：ESP32-WROVER-B 模块使用 3.3 V 闪存芯片。早于 ESP32-WROVER-B 的 WROVER 模块使用 1.8 V 闪存芯片，而 ESP32-WROVER-B 和 E 模块使用 3.3 V 闪存芯片。
### 表 24: ESP32 相关的 OpenOCD 配置文件

<table>
<thead>
<tr>
<th>名字</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>board/esp32-wrover-kit-3.3v.cfg</td>
<td>板载 3.3 V 模组 (ESP32-WROOM-32, ESP32-WROVER-B, ESP32-WROVER-E) 的 ESP-WROVER-KIT 开发板配置文件</td>
</tr>
<tr>
<td>board/esp32-wrover-kit-1.8v.cfg</td>
<td>板载 1.8 V 模组 (ESP32-WROVER) 的 ESP-WROVER-KIT 开发板配置文件</td>
</tr>
<tr>
<td>board/esp32-ethernet-kit-3v.cfg</td>
<td>板载 3.3 V 模组 (ESP32-WROVER-B/ESP32-WROVER-E) 的 ESP-Ethernet-KIT 开发板配置文件</td>
</tr>
<tr>
<td>target/esp32.cfg</td>
<td>ESP32 的目标配置文件，可以和某个 interface/ 下的配置文件一同使用</td>
</tr>
<tr>
<td>target/esp32-solo-1.cfg</td>
<td>ESP32-SOLO-1 模组的目标配置文件，和 esp32.cfg 的差别在于它可以配置一个 CPU</td>
</tr>
<tr>
<td>interface/ftdi/esp32_devkitj_v1.cfg</td>
<td>适用于 ESP-WROVER-KIT 和 ESP-Prog 的 JTAG 适配器配置文件</td>
</tr>
</tbody>
</table>

如果你使用的开发板已经有一份预定义好的配置文件，你只需将该文件通过 -f 参数告诉 OpenOCD。如果你的开发板不在上述列表中，你需要使用多个 -f 参数来告诉 OpenOCD 你选择的 interface 和 target 配置文件。

#### 自定义配置文件
OpenOCD 的配置文件是用 TCL 语言编写的，包含了定制和编写脚本的各种选项。这在非标准调试的场景中非常有用，更多关于 TCL 脚本的内容请参考 OpenOCD 参考手册。

**OpenOCD 中的配置变量**
你还可以视情况在导入 target 配置文件之前，设定如下变量的值。可以在自定义配置文件中，或者通过命令行传递。

TCL 语言中为变量赋值的语法是:

```tcl
set VARIABLE_NAME value
```

在命令行中为变量赋值请参考如下示例（请把 .cfg 配置文件替换成你自己的开发板配置）:

```bash
openocd -c 'set VARIABLE_NAME value' -f board/esp-xxxxx-kit.cfg
```

请记住，一定要在导入配置文件之前设置这些变量，否则变量的值将不会生效。为多个变量赋值需要重复多次 -c 选项。

### 表 25: 通用的 ESP 相关的 OpenOCD 变量

<table>
<thead>
<tr>
<th>变量名</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_RTOS</td>
<td>设置成 none 可以关闭 OpenOCD 对 RTOS 的支持，这样的话，你将无法在 GDB 中查看到线程列表，这个功能在调试 FreeRTOS 本身的时候会很有用，可以单步调试调度器的代码。</td>
</tr>
<tr>
<td>ESP_FLASH_SIZE</td>
<td>设置成 0 可以关闭对 flash 断点的支持。</td>
</tr>
<tr>
<td>ESP_SEMIHOST_BASEDIR</td>
<td>设置 semihosting 在主机端的默认目录。</td>
</tr>
</tbody>
</table>

### 表 26: ESP32 相关的 OpenOCD 变量

<table>
<thead>
<tr>
<th>名字</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32_FLASH_VOLTAGE</td>
<td>如果 ESP32 模组集成的是 1.8 V 的 flash，将该变量设置为 1.8，详情请参考 OpenOCD 的配置文件中设置 SPI 闪存的工作电压</td>
</tr>
<tr>
<td>ESP32_ONLYCPU</td>
<td>对于多核芯片，将该值设置为 1 可以仅启用单核调试功能</td>
</tr>
</tbody>
</table>
复位 ESP32 通过在 GDB 中输入 `mon reset` 或者 `mon reset halt` 来复位板子。

不要将 JTAG 管脚用于其他功能 如果除了 ESP32 模组和 JTAG 适配器之外的其他硬件也连接到了 JTAG 管脚，那么 JTAG 的操作可能会受到干扰。ESP32 JTAG 使用以下管脚：

<table>
<thead>
<tr>
<th>ESP32 管脚</th>
<th>JTAG 信号</th>
</tr>
</thead>
<tbody>
<tr>
<td>MTD0/GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>MTD1/GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>MTCK/GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>MTMS/GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>GND</td>
<td>GND</td>
</tr>
</tbody>
</table>

如果用户应用程序更改了 JTAG 管脚的配置，JTAG 通信可能会失败。如果 OpenOCD 正确初始化（检测到两个 Tensilica 内核），但在程序运行期间失去了同步并报出大量 DTR/DIR 错误，则应用程序可能将 JTAG 管脚重新配置为其他功能或者用户忘记将 Vtsr 连接到 JTAG 适配器。

下面是 GDB 在应用程序进入重新配置 MTDO/GPIO15 作为输入代码后报告的一系列错误摘要:

```
cpu0: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
  an exception!
cpu0: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
  an overrun!
cpu1: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
  an exception!
cpu1: xtnsa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated.
  an overrun!
```

JTAG 与闪存加密和安全引导 默认情况下，开启了闪存加密和（或者）安全引导后，系统在首次启动时，引导程序会烧写 eFuse 的某个比特，从而将 JTAG 永久关闭。

Kconfig 配置项 `CONFIG_SECURE_BOOT_ALLOW_JTAG` 可以改变这个默认行为，使得用户即使开启了安全引导或者闪存加密，仍会保留 JTAG 的功能。

然而，因为设置软件断点的需要，OpenOCD 会尝试自动读取 flash 中的内容，这会带来两个问题:

- 软件断点和闪存加密是不兼容的，目前 OpenOCD 尚不支持对 flash 中的内容进行加密和解密。
- 如果开启了安全引导功能，设置软件断点会改变被签名的程序的摘要，从而使得签名失效。这也意味着，如果设置了软件断点，系统会在下次重启时的签名验证阶段失败，导致无法启动。

关闭 JTAG 的软件断点功能，可以在启动 OpenOCD 时在命令行额外加一项配置参数 `-c 'set ESP_FLASH_SIZE 0'`，请参考 `OpenOCD` 中的配置变量。

备注：同样地，当启用该选项，并且在调试过程中设置了软件断点，引导程序将无法校验通过应用程序的签名。

JTAG 和 ESP32-WROOM-32 AT 固件兼容性问题 ESP32-WROOM 系列模块预装了 AT 固件。该固件将 GPIO12 至 GPIO15 管脚配置为 SPI 从属接口，使得无法使用 JTAG。

要想使用 JTAG，需要编译新的固件，新的固件不能使用专门用于 JTAG 通信的管脚（GPIO12 至 GPIO15），然后将固件烧录到模组中，请参考不要将 JTAG 管脚用于其他功能。
报告 OpenOCD / GDB 的问题 如果你遇到 OpenOCD 或者 GDB 程序本身的问题，并且在网上没有找到可用的解决方案，请前往 https://github.com/espressif/openocd-esp32/issues 新建一个议题。

1. 请在问题报告中提供你使用的配置的详细信息:
   a. JTAG 适配器类型。
   b. 用于编译和加载正在调试的应用程序的 ESP-IDF 版本号。
   c. 用于调试的操作系统的详细信息。
   d. 操作系统是否在本地计算机运行还是在虚拟机上运行？
2. 创建一个能够演示问题的示例示例工程，描述复现该问题的步骤。且这个调试示例不能受到 Wi-Fi 协议栈引入的非确定性行为的影响，这样复现问题时，更容易复现。
3. 在启动命令中添加额外的参数来自定义调试日志。

   **OpenOCD 端**:
   ```
   openocd -l openocd_log.txt -d3 -f board/esp32-wrover-kit-3.3v.cfg
   ```

   这种方式会将日志输出到文件，但是它会阻止调试信息打印在终端上，当有大量信息需要输出的时候（比如调试等级提高到 -d3）这是个不错的选择。如果你仍然希望在屏幕上看到调试日志，请改用以下命令:
   ```
   openocd -d3 -f board/esp32-wrover-kit-3.3v.cfg 2>&1 | tee openocd.log
   ```

   **GDB 端**:
   ```
   xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other options>
   ```

   也可以将命令 remotelogfile gdb_log.txt 添加到 gdbinit 文件中。
4. 请将 openocd_log.txt 和 gdb_log.txt 文件附在你的问题报告中。

### 4.17.10 相关文档

**使用调试器**

本节介绍以下几种配置和运行调试器的方法:

- 使用 Eclipse 调试
- 使用命令行调试
- 使用 idf.py 进行调试

**使用 Eclipse 调试**

**备注**: 建议您首先通过 `idf.py` 或命令行 检查调试器是否正常工作，然后再转到使用 Eclipse 平台。

标准的 Eclipse 安装流程默认安装调试功能，另外您还可以使用插件来调试，比如“GDB Hardware Debugging”。这个插件用起来非常方便，本指南会详细介绍该插件的使用方法。

首先，打开 Eclipse 并转到“Help” > “Install New Software” 来安装“GDB Hardware Debugging”插件。

安装完成后，按照以下步骤配置调试会话。请注意，一些配置参数是通用的，有些则针对特定项目。我们会通过配置“blink”示例项目的调试环境来进行展示，请参照 Eclipse Plugin 介绍的方法将该示例项目添加到 Eclipse 的工作空间。示例项目 get-started/blink 的源代码可以在 ESP-IDF 仓库的 examples 目录下找到。

1. 在 Eclipse 中，进入 Run > Debug Configuration，会出现一个新的窗口。在窗口的左侧窗格中，双击“GDB Hardware Debugging”(或者选择“GDB Hardware Debugging”然后按下“New”按钮)来新建一个配置。
2. 在右边显示的表单中，“Name:”一栏中输入配置的名称，例如：“Blink checking”。
3. 在下面的“Main”选项卡中，点击“Project”边上的“Browse”按钮，然后选择当前的“blink”项目。
4. 在下一行的“C/C++ Application:”中，点击“Browse”按钮，选择“blink.elf”文件。如果“blink.elf”文件不存在，那么有可能该项目还没有编译，请参考 Eclipse Plugin 指南中的介绍。
5. 在“Build (if required) before launching”下面点击“Disable auto build”。

Espressif Systems 2272 Release v5.1-dev-2066-g7869f4e151

Submit Document Feedback
上述步骤 1 - 5 的示例输入如下图所示。

图 37: GDB 硬件调试的配置 - Main 选项卡

6. 点击 “Debugger” 选项卡，在 “GDB Command” 栏中输入 xtensa-esp32-elf-gdb 来调用调试器。
7. 更改 “Remote host”的默认配置，在 “Port number” 下面输入 3333。
   上述步骤 6 - 7 的示例输入如下图所示。
8. 最后一个需要更改默认配置的选项是 “Startup” 选项卡。在 “Initialization Commands” 下，取消选中 “Reset and Delay (seconds)” 和 “Halt”，然后在下面一栏中输入以下命令:

   ```
   mon reset halt
   flushregs
   set remote hardware-watchpoint-limit 2
   ```

备注: 如果您想在启动新的调试会话之前自动更新闪存中的镜像，请在 “Initialization Commands” 文本框的开头添加以下命令行:

   ```
   mon reset halt
   mon program_esp $\{workspace_loc:blink/build/blink.bin\} 0x10000 verify
   ```

有关 program_esp 命令的说明请参考上传待调试的应用程序 章节。
9. 在 “Load Image and Symbols” 下，取消选中 “Load image” 选项。
10. 在同一个选项卡中继续往下浏览，建立一个初始断点用来在调试器复位后暂停 CPU。插件会根据 “Set break point at:” 一栏中输入的函数名，在该函数的开头设置断点。选中这一选项，并在相应的字段中输入 app_main。
11. 选中 “Resume” 选项，这会使得程序在每次调用步骤 8 中的 mon reset halt 后恢复，然后在 app_main 的断点处停止。
   上述步骤 8 - 11 的示例输入如下图所示。
图 38: GDB 硬件调试的配置 - Debugger 选项卡
图 39: GDB 硬件调试的配置 - Startup 选项卡
上面的启动序列看起来有些复杂，如果您对其中的初始化命令不太熟悉，请查阅调试器的启动命令的含义章节获取更多说明。

12. 如果您前面已经完成配置 ESP32 目标板中介绍的步骤，那么目标正在运行并准备与调试器进行对话。按下“Debug”按钮就可以直接调试。否则请按下“Apply”按钮保存配置，返回配置 ESP32 目标板章节进行配置，最后再回到这里开始调试。

一旦所有 1-12 的配置步骤都已经完成，Eclipse 就会打开“Debug”视图，如下图所示。

![Eclipse 中的调试视图](image)

如果您不太了解 GDB 的常用方法，请查阅使用 Eclipse 的调试示例文章中的调试示例章节调试范例。

### 使用命令行调试

1. 为了能够启动调试会话，需要先启动并运行目标，如果还没有完成，请按照配置 ESP32 目标板中的介绍进行操作。
2. 打开一个新的终端会话并前往待调试的项目目录，比如:
   ```bash
cd ~/esp/blink
   ```
3. 当启动调试器时，通常需要提供几个配置参数和命令。为了避免每次都在命令行中逐行输入这些命令，您可以新建一个配置文件，并将其命名为 gdbinit:
   ```bash
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
flushregs
thb app_main
c
```

将此文件保存在当前目录中。
有关 gdbinit 文件内部的更多详细信息，请参阅调试器的启动命令的含义 章节。

4. 准备好启动 GDB，请在终端中输入以下内容:

```bash
tenxsa-esp32-elf-gdb -x gdbinit build/blink.elf
```

5. 如果前面的步骤已经正确完成，您会看到如下所示的输出日志，在日志的最后会出现 (gdb) 提示符:

```bash
user-name@computer-name:~/esp/blink$ xtensa-esp32-elf-gdb -x gdbinit build/blink.elf

--c:43
43 xTaskCreate(&blink_task, "blink_task", 512, NULL, 5, NULL);
(gdb)
```

注意上面日志的倒数第三行显示了调试器已经在 app_main() 函数的断点处停止，该断点在 gdbinit 文件中设定。由于处理器已经暂停运行，LED 也不会闪烁。如果这也是您看到的现象，您可以开始调试了。

如果您不太了解 GDB 的常用方法，请查阅使用命令行的调试示例 文章中的调试示例章节调试范例。
使用 idf.py 进行调试 您还可以使用 idf.py 更方便地执行上述提到的调试命令，可以使用以下命令：

1. idf.py openocd
   在终端中运行 OpenOCD，其配置信息来源于环境变量或者命令行，默认会使用 OPENOCD_SCRIPTS 环境变量中指定的脚本路径。如果你在 ESP-IDF 项目仓库中没有指定环境变量，那么命令中的路径会被覆盖这个变量的值。在启动开发板的 JTAG 配置，请使用环境变量 OPENOCD_COMMANDS 或命令行参数 --openocd-commands。如果这两者都没有被定义，那么 OpenOCD 会使用 --f board/esp32-wrover-kit-3.3v.config 参数来启动。
   2. idf.py gdb
      根据当前项目的 elf 文件自动导出 GDB 启动脚本，然后会按照使用命令行调试 中所描述的步骤启动 GDB。
   3. idf.py gdbtui
      启动 gdbtui，它在浏览器中打开调试器的前端界面。请在运行安装脚本时添加 “--enable-gdbtui” 参数，即运行 install.sh --enable-gdbtui。可以使用 gdbtui 参数来启动。
      如上这些命令也可以合并到一起使用。idf.py 会自动将后台进程（比如 openocd）最先运行，交互式进程中启动 GDB，gdbgui 最后运行。
      常用的组合命令如下所示：

```bash
idf.py openocd gdbgui monitor
```

上述命令会将 OpenOCD 运行至后台，然后启动 gdbgui 打开一个浏览器窗口，显示调试器的前端界面，最后在活动终端打开串口监视器。

调试示例

本节将介绍如何在 Eclipse 和命令行 中使用 GDB 进行调试的示例。

使用 Eclipse 的调试示例 请检查目标板是否已经准备好，并加载了 get-started/blink 示例代码。然后按照使用 Eclipse 调试 中介绍的步骤配置和启动调试器，最后选择让应用程序在 app_main() 建立的断点处停止。

本小节的示例

1. 浏览代码、查看堆栈和线程
2. 设置和清除断点
3. 手动暂停目标
4. 单步执行代码
5. 查看并设置内存
6. 观察和设置程序变量
7. 设置条件断点

浏览代码、查看堆栈和线程 当目标暂停时，调试器会在 “Debug” 窗口中显示线程的列表，程序暂停的代码行在下面的另一个窗口中被高亮显示，如下图所示。此时板子上的 LED 停止了闪烁。

暂停的程序所在线程也会被展开，显示函数调用的堆栈，它表示直到目标暂停所在代码行（下图高亮处）为止的所有函数的调用关系。1 号线程下函数调用堆栈的第一行包含了最后一个调用的函数 app_main()，根据下一行显示，它又是在函数 main_task() 中调用的。堆栈的每一行还包含调用函数的文件名和行号。通过单击每个堆栈的条目，在下面的窗口中，你将看到此文件的内容。

通过展开线程，你可以浏览整个应用程序。展开 5 号线程，它包含了更长的函数调用堆栈，你可以看到函数调用旁边的数字，比如 0x4000000c，它们代表未以源码形式提供的二进制代码所在的内存地址。

无论项目是以源代码还是仅以二进制形式提供，在右边一个窗口中，都可以看到反汇编后的机器代码。
图 41: Eclipse 中的 Debug 视图
图 42: 调试时目标停止
图 43: 浏览函数调用堆栈
回到1号线程中的`app_main()`函数所在的`blink.c`源文件。下面的示例将会以该文件为例介绍调试的常用功能。调试器可以轻松浏览整个应用程序的代码，这给单步调试代码和设置断点带来了很大的便利，下面将一一展开讨论。

### 设置和清除断点
在调试时，我们希望能够将关键的代码行停止应用程序，然后检查特定的变量、内存、寄存器和外设的状态。为此我们需要使用断点，以便在特定表行代码处快速访问和停止应用程序。

我们在控制LED状态发生变化的两处代码分别设置一个断点。基于以上代码列表，这两处分别为第33和36代码行。按住键盘上的“Control”键，双击`blink.c`文件中的行号33，并在弹出的对话框中点击“OK”按钮进行确定。如果不想想到此对话框，双击行号即可。执行同样操作，在第36行设置另外一个断点。

![设置和清除断点](image)

图44: 设置断点

断点的数量和位置信息会显示在右上角的“断点”窗口中。单击“Show Breakpoints Supported by Selected Target”图标可以刷新此列表。除了刚才设置的两个断点外，列表中可能还包含在调试器启动时设置在`app_main()`函数处的临时断点。由于最多只允许设置两个断点（详细信息请参阅可用的断点和观察点），你需要将其删除，否则调试会失败。

单击“Resume”（如果“Resume”按钮是灰色的，请先单击8号线程的`blink_task()`函数）后处理器将开始继续运行，并在断点处停止。再次单击“Resume”按钮，使程序再次运行，然后停在第二个断点处，依次类推。

每次单击“Resume”按钮恢复程序运行后，都会看到LED切换状态。

更多关于断点的信息，请参阅可用的断点和观察点和关于断点的补充知识。

### 手动暂停目标
在调试时，你可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。后者，如果想要返回调试模式，可以通过单击“Suspend”按钮来手动中断程序的运行。
图 45: 设置了三个断点 / 最多允许两个断点
在此之前，请删除所有的断点，然后单击“Resume”按钮。接着单击“Suspend”按钮，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器将展开线程并高亮显示停止的代码行。

图 46: 手动暂停目标

在上图所示的情况中，应用程序已经在 freertos_hooks.c 文件的第 52 行暂停运行，现在你可以通过单击“Resume”按钮再次将其恢复运行或者进行下面要介绍的调试工作。

单步执行代码 我们还可以使用“Step Into (F5)”和“Step Over (F6)”命令单步执行代码。这两者之间的区别是执行“Step Into (F5)”命令会进入调用的子程序，而执行“Step Over (F6)”命令则会直接跳过子程序看成单个源代码行，单步执行将其运行结束。

在继续演示此功能之前，请参照上文所述确保目前只在 blink.c 文件的第 36 行设置了一个断点。

按下 F8 键让程序继续运行然后在断点处停止运行，多次按下“Step Over (F6)”按钮，观察调试器是如何单步执行一行代码的。

如果你改用“Step Into (F5)”，那么调试器将会进入调用的子程序内部。

在上述例子中，调试器进入 gpio_set_level (BLINK_GPIO，0) 代码内部，同时代码窗口快速切换到 gpio.c 驱动文件。

请参阅“next”命令无法跳过子程序的原因 文档以了解 next 命令的潜在局限。

查看并设置内存 要显示或者设置内存的内容，请使用“调试”视图中位于底部的“Memory”选项卡。

在“Memory”选项卡下，我们在内存地址 0x3FF44004 处读取和写入内容。该地址也是 GPIO.OUT_REG 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 ESP32 技术参考手册 > IO_MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF] 章节。
图 47: 使用 “Step Over (F6)” 单步执行代码
图 48: 使用“Step Into (F5)”单步执行代码
同样在 blink.c 项目文件中，两个 gpio_set_level 语句的后面各设置一个断点，单击“Memory”选项卡，然后单击“Add Memory Monitor”按钮，在弹出的对话框中输入 0x3FF44004。

按下 F8 按键恢复程序运行，并观察“Monitor”选项卡。

图 49: 观察内存地址 0x3FF44004 处的某个比特被置高

每按一下 F8，你就会看见内存 0x3FF44004 地址处的一个比特位被翻转 (并且 LED 会改变状态)。

要修改内存的数据，请在“Monitor”选中卡找到待修改的内存地址，如前面观察的结果一样，输入特定比特翻转后的值。当按下回车键后，将即刻看到 LED 的状态发生了改变。

观察和设置程序变量 常见的调试任务是在程序运行期间检查程序中某个变量的值。为了演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明，int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。

退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32 中，接着重启调试器，注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，在代码 i++ 处添加一个断点。

下一步，在“Breakpoints”所在的窗口中，选择“Expressions”选项卡，如果该选项卡不存在，请在顶部菜单栏的 Window > Show View > Expressions 中添加这一选项卡。然后在该选项卡中单击“Add new expression”，并输入 i。

按下 F8 继续运行程序，每次程序停止时，都会看到变量 i 的值在递增。
图 51: 观察程序变量 “i”
如想更改 i 的值，可以在“Value”一栏中输入新的数值。按下 “Resume (F8)” 后，程序将从新输入的数字开始递增 i。

设置条件断点  接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点，然后让程序停止运行。右击断点打开上下文菜单，选择 “Breakpoint Properties”，将 “Type:” 改选为 “Hardware” 然后在 “Condition:” 一栏中输入条件表达式，例如 i == 2。

图 52: 设置条件断点

如果当前 i 的值小于 2（如果有需要也可以更改这个阈值）并且程序被恢复运行，那么 LED 就会循环闪烁，直到 i == 2 条件成立，最后程序停止在该处。

使用命令行的调试示例  请检查您的目标板是否已经准备好，并加载了 get-started/blink 示例代码，然后按照使用命令行调试 中介绍的步骤配置和启动调试器。最后选择让应用程序在 app_main() 建立的断点处停止运行

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,
        5, NULL);
```

本小节的示例

1. 浏览代码，查看堆栈和线程
2. 设置和清除断点
3. 暂停和恢复应用程序的运行
4. 单步执行代码
5. 查看并设置内存
第6章 API

6. 观察和设置程序变量
7. 设置条件断点
8. 调试FreeRTOS对象

浏览代码，查看堆栈和线程 当看到（gdb）提示符的时候，应用程序已停止运行，LED也停止闪烁。
要找到代码暂停的位置，输入 l 或者 list 命令，调试器会打印出暂停点（blink.c 代码文件的第 43 行）附近的几行代码

```
(gdb) l
38    }
39    }
40
41    void app_main()
42    {
43        xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL,
44            -5, NULL);
45    }
(gdb)
```

也可以通过输入 l 30, 40 等命令来查看特定行号范围内的代码。
使用 bt 或者 backtrace 来查看哪些函数最终导致了此代码被调用:

```
(gdb) bt
#0  app_main () at /home/user-name/esp/blink/main/.//blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
    --esp32/.//cpu_start.c:339
(gdb)
```

输出的第 0 行表示应用程序暂停之前调用的最后一个函数，即我们之前列出的 app_main ()。
app_main () 又被位于 cpu_start.c 文件第 339 行的 main_task 函数调用。
想查看 cpu_start.c 文件中 main_task 函数的上下文，需要输入 frame N，其中 N = 1，因为根据前面的输出，main_task 位于 #1 下:

```
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/
    --esp32/.//cpu_start.c:339
339    app_main();
(gdb)
```

输入 l 将显示一段名为 app_main() 的代码 (在第 339 行):

```
(gdb) l
334    }
335   
336   #endif
337   //Enable allocation in region where the startup stacks were located.
338   heap_caps_enable_nonos_stack_heaps();
339   app_main();
340   vTaskDelete(NULL);
341    }
342
(gdb)
```

通过打印前面的一些行，你会看到我们一直在寻找的 main_task 函数:

```
(gdb) l 326, 341
326    static void main_task(void* args)
327    {
328        // Now that the application is about to start, disable boot watchdogs
(gdb)
```

(下页继续)
如果要查看其他代码，可以输入 `i threads` 命令，则会输出目标板上运行的线程列表:

(gdb) i threads
  Id Target Id Frame
  8 Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
  "optimized out")
    at /home/user-name/esp/esp-idf/components/esp32./dport_access.c:170
  7 Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
  pvBuffer=0x0, xTicksToWait=1644638200,
  xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos./queue.
  "c:1452
  6 Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos./timers.c:445
  5 Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
  4 Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
    at /home/user-name/esp/esp-idf/components/esp32./dport_access.c:150
  3 Thread 1073431556 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos./tasks.c:3282
  2 Thread 1073412512 (IDLE) prvIdleTask (pvParameters=0x0)
    at /home/user-name/esp/esp-idf/components/freertos./tasks.c:3282
* 1 Thread 1073411772 (main : Running) app_main () at /home/user-name/esp/blink/
  main/../blink.c:43
(gdb)

线程列表显示了每个线程最后—个被调用的函数以及所在的 C 源文件名（如果存在的话）。
您可以通过输入 `thread N` 进入特定的线程。其中 N 是线程 ID。我们进入 5 号线程来看一下它是如何工作的:

(gdb) thread 5
[Switching to thread 5 (Thread 1073410208)]
#0 0x4000bfea in ?? ()
(gdb)

然后查看回溯:

(gdb) bt
#0 0x4000bfea in ?? ()
#1 0x40004a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
  "esp/esp-idf/components/freertos./port.c:415
#2 0x40004f3c8 in vTaskSwitchContext () at /home/user-name/esp/esp-idf/components/
  "freertos./tasks.c:2846
#3 0x4000532b in _frxt_dispatch ()
#4 0x4000393c in xPortStartScheduler () at /home/user-name/esp/esp-idf/components/
  "freertos./port.c:222

(下页继续)
如上所示，回溯可能会包含多个条目，方便查看直至目标停止运行的函数调用顺序。如果找不到某个函数的源码文件，将会使用问号 ?? 替代，这表示该函数是以二进制格式提供的。像 0x4000bfea 这样的值是被调用函数所在的内存地址。

使用诸如 bt, i threads, thread N 和 list 命令可以浏览整个应用程序的代码。这给单步调试代码和设置断点带来很大的便利，下面将一一展开来讨论。

### 设置和清除断点
在调试时，我们希望能够在关键的代码行停止应用程序，然后检查特定的变量，内存，寄存器和外设的状态。为此我们需要使用断点，以便在同一行代码处快速访问和停止应用程序。

我们在控制 LED 状态发生变化的两处代码行分别设置一个断点。基于以上代码列表，这两处分别为第 33 和 36 代码行。使用命令 break M 设置断点，其中 M 是具体的代码行:

```plaintext
(gdb) break 33
Breakpoint 2 at 0x400db6f6: file /home/user-name/esp/blink/main./blink.c, line 33.
(gdb) break 36
Breakpoint 3 at 0x400db704: file /home/user-name/esp/blink/main./blink.c, line 36.
```

输入命令 c，处理器将运行并在断点处停止。再次输入 c 将使其再次运行，并在第二个断点处停止。依此类推:

```plaintext
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB6F6 (active)  APP_CPU: PC=0x400D10D8
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./blink.c:33
   33 gpio_set_level(BLINK_GPIO, 0);
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB704 (active)  APP_CPU: PC=0x400D10D8
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main./blink.c:36
   36 gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

只有在输入命令 c 恢复程序运行后才能看到 LED 改变状态。

查看已设置断点的数量和位置，请使用命令 info break:

```plaintext
(gdb) info break
Num Type Disp Enb Address What
2 breakpoint keep y 0x400db6f6 in blink_task at /home/user-name/esp/blink/main./blink.c:33
   breakpoint already hit 1 time
3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/blink/main./blink.c:36
   breakpoint already hit 1 time
(gdb)
```

请注意，断点序号（在 Num 栏列出）从 2 开始，这是因为调试器启动时执行 thb app_main 命令已经在 app_main() 函数处建立了第一个断点。由于它是一个临时断点，已经被自动删除，所以没有被列出。
要删除一个断点，请输入 delete N 命令（或者简写成 d N），其中 N 代表断点序号:

```plaintext
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

更多关于断点的信息，请参阅可用的断点和观察点 和关于断点的补充知识。

**暂停和恢复应用程序的运行**  在调试时，可以恢复程序运行并输入代码等待某个事件发生或者保持无限循环而不设置任何断点。对于后者，想要返回调试模式，可以通过输入 Ctrl+C 手动中断程序的运行。

在之前，请删除所有的断点，然后输入 c 恢复程序运行。接着输入 Ctrl+C，应用程序会停止在某个随机的位置，此时 LED 也将停止闪烁。调试器会打印如下信息:

```plaintext
(gdb) c
Continuing.
^C
```

在上图所示的情况下，应用程序已经在 freertos_hooks.c 文件的第 52 行暂停运行，现在您可以通过输入 c 再次将其恢复运行或者进行如下所述的一些调试工作。

**单步执行代码** 我们还可以使用 step 和 next 命令（可以简写成 s 和 n）单步执行代码，这两者之间的区别是执行 “step” 命令进入调用的子程序内部，而执行 “next” 命令则会直接将子程序看成单个源码行，单步就能将其运行结束。

在继续演示此功能之前，请使用前面介绍的 break 和 delete 命令，确保目前只在 blink.c 文件的第 36 行设置了一个断点:

```plaintext
(gdb) info break
Num Type Disp Enb Address What
 3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/blink/main/./blink.c:36
breakpoint already hit 1 time
(gdb)
```

输入 c 恢复程序运行然后等它在断点处停止运行:

```plaintext
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB754 (active) APP_CPU: PC=0x400D1128
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./blink.c:36
36 gpio_set_level(BLINK_GPIO, 1);
(gdb)
```

然后输入 n 多次，观察调试器是如何单步执行一行代码的:

```plaintext
(gdb) n
Target halted. PRO_CPU: PC=0x400DB756 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400D04C (active) APP_CPU: PC=0x400D1128
```
如果你输入 \texttt{s}，那么调试器将进入子程序:

```
(gdb) s
```

```
Target halted. PRO_CPU: PC=0x400DB748 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active) APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/\rightarrow components/driver/./gpio.c:183
183 GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error", ESP_ERR_INVALID_ARG);
(gdb)
```

上述例子中，调试器进入 \texttt{gpio_set_level} (BLINK_GPIO, 0) 代码内部，同时代码窗口快速切换到 gpio.c 驱动文件。

请参阅 “next” 命令无法跳过子程序的原因 文档以了解 next 命令的潜在局限。

**查看并设置内存** 使用命令 \texttt{x} 可以显示内存的内容，配合其余参数还可以调整所显示内存位置的格式和数量。运行 \texttt{help x} 可以查看更多相关细节。与 \texttt{x} 命令配合使用的命令是 \texttt{set}，它允许你将值写入内存。

为了演示 \texttt{x} 和 \texttt{set} 的使用，我们将在内存地址 0x3FF44004 处读取和写入内容。该地址也是 GPIO_OUT_REG 寄存器的地址，可以用来控制（设置或者清除）某个 GPIO 的电平。

关于该寄存器的更多详细信息，请参阅 ESP32 技术参考手册 > IO_MUX 和 GPIO Matrix (GPIO, IO_MUX) [PDF] 章节。

同样在 blink.c 项目文件中，在两个 \texttt{gpio_set_level} 语句的后面各设置一个断点。输入两次 \texttt{c} 命令后停止在断点处，然后输入 \texttt{x} /1wx 0x3FF44004 来显示 GPIO_OUT_REG 寄存器的值:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./\rightarrow blink.c:34
34 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active) APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active) APP_CPU: PC=0x400D1128
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./\rightarrow blink.c:37
37 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000010
(gdb)
```
如果闪烁的 LED 连接到了 GPIO4，那么每次 LED 改变状态时你会看到第 4 比特被翻转:

<table>
<thead>
<tr>
<th>0x3ff44004: 0x00000000</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
</tr>
<tr>
<td>0x3ff44004: 0x00000010</td>
</tr>
</tbody>
</table>

现在，当 LED 熄灭时，与之对应地会显示 0x3ff44004: 0x00000000，尝试使用 set 命令向相同的内存地址写入 0x00000010 来将该比特置高:

```
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
```

在输入 set (unsigned int)0x3FF44004=0x00000010 命令后，你会立即看到 LED 亮起。

**观察和设置程序变量** 常见的调试任务是在程序运行期间检查程序中某个变量的值，为了能够演示这个功能，更新 blink.c 文件，在 blink_task 函数的上面添加一个全局变量的声明 int i，然后在 while(1) 里添加 i++，这样每次 LED 改变状态的时候，变量 i 都会增加 1。退出调试器，这样就不会与新代码混淆，然后重新构建并烧写代码到 ESP32 中，接着重启调试器。注意，这里不需要我们重启 OpenOCD。

一旦程序停止运行，输入命令 watch i:

```
(gdb) watch i
Hardware watchpoint 2: i
```

这会把所有变量 i 发生改变的代码处插入所谓的“观察点”。现在输入 continue 命令来恢复应用程序的运行并观察它停止:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)  APP_CPU: PC=0x400D0811
[New Thread 1073432196]
Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
   → blink.c:33
33   i++;
```

多次恢复程序运行后，变量 i 的值会增加，现在你可以输入 print i (简写 p i) 来查看当前 i 的值:

```
(gdb) p i
$1 = 3
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出来查看是否已修改）:

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
```

最多可以使用两个观察点，详细信息请参阅可用的断点和观察点。

**设置条件断点** 接下来的内容更为有趣，你可能想在一定条件满足的情况下设置断点。请先删除已有的断点，然后尝试如下命令:

```
(gdb) continue
(gdb) break i = 3
(gdb) continue
```

```
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)  APP_CPU: PC=0x400D0811
[New Thread 1073432196]
Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
   → blink.c:33
33   i++;
```

当前 i 的值是 3，现在你可以输入 print i 来查看当前 i 的值:

```
(gdb) p i
$1 = 3
```

要修改 i 的值，请使用 set 命令，如下所示（可以将其打印输出来查看是否已修改）:

```
(gdb) set var i = 0
(gdb) p i
$3 = 0
```
(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main././blink.c, line 34.
(gdb)

以上命令在 blink.c 文件的 34 处设置了一个条件断点，当 i == 2 条件满足时，程序会停止运行。
如果当前 i 的值小于 2 并且程序被恢复运行，那么 LED 就会循环闪烁，直到 i == 2 条件成立，最后程序停止在该处:

(gdb) set var i = 0
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C
Target halted. PRO_CPU: PC=0x400DB755 (active) APP_CPU: PC=0x400D112C

(gdb) break blink.c:34 if (i == 2)
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main././blink.c, line 34.
(gdb)

调试 FreeRTOS 对象：该部分内容或许可以帮助您调试 FreeRTOS 任务交互。需要调试 FreeRTOS 任务交互的用户可使用 GDB 命令 freertos。该命令非 GDB 原生命令，而是来自于 Python 扩展模块 freertos-gdb，其包含一系列子命令:

(gdb) freertos
"freertos" 后面必须紧跟子命令的名称
freertos 子命令如下:
freertos queue -- 打印当前队列信息
freertos semaphore -- 打印当前信号量信息
freertos task -- 打印当前任务及其状态
freertos timer -- 打印当前定时器信息

点击 https://pypi.org/project/freertos-gdb 链接了解此扩展模块的详细信息。

备注: ESP-IDF 在安装 Python 包时会自动安装 freertos-gdb Python 模块，详情请参考第三步: 设置工具。
如果使用 idf.py gdb 命令运行 GDB，FreeRTOS 扩展会自动加载。也可以使用 GDB 内部命令 python import freertos_gdb 使能该模块。
请保证使用 Python 3.6 及以上版本，该版本具有 Python 共享库。

命令的帮助信息：目前所介绍的都是些非常基础的命令，目的在于让您快速上手 JTAG 调试。如果想获得特定命令的语法和功能相关的信息，请在 (gdb) 提示符下输入 help 和命令名:

(gdb) help next
Step program, proceeding through subroutine calls.
Usage: next [N]
Unlike "step", if the current source line calls a subroutine, this command does not enter the subroutine, but instead steps over the call, in effect treating it as a single source line.
(gdb)

只需输入 help 命令，即可获得高级命令列表，帮助你了解更多详细信息。此外，还可以参考一些 GDB 命令速查表，比如 https://darkdust.net/files/GDB%20Cheat%20Sheet.pdf。虽然不是所有命令都适用于嵌入式环境，但还是会有所帮助。
结束调试会话 输入命令 `q` 可以退出调试器:

```
(gdb) q
A debugging session is active.

Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$
```

### 4.18 链接器脚本生成机制

#### 4.18.1 概述

ESP32 中有多个用于存放代码和数据的内存区域。代码和只读数据默认存放在 flash 中，可写数据存放在 RAM 中。不过有时，用户必须更改默认存放区域。

例如:

- 将关键代码存放到 RAM 中以提高性能;
- 将可执行代码存放到 IRAM 中，以便在缓存被禁用时运行这些代码;
- 将代码存放到 RTC 存储器中，以便在 wake stub 中使用;
- 将代码存放到 RTC 内存中，以便 ULP 协处理器使用。

链接器脚本生成机制可以让用户指定代码和数据在 ESP-IDF 组件中的存放区域。组件包含如何存放符号、目标或完整库的信息。在构建应用程序时，组件中的这些信息会被收集、解析并处理，生成的存放规则用于链接应用程序。

#### 4.18.2 快速上手

本段将指导如何使用 ESP-IDF 的即用方案，快速将代码和数据放入 RAM 和 RTC 存储器中。

假设用户有:

```
components
└── my_component
    ├── CMakeLists.txt
    ├── Kconfig
    └── src/
        ├── my_src1.c
        │ └── my_src1.o
        ├── my_src2.c
        │ └── my_src2.o
        └── my_src3.c
            └── my_src3.o
```

- 名为 `my_component` 的组件，在构建过程中存储为 `libmy_component.a` 库文件
- 库文件包含的三个源文件: `my_src1.c`、`my_src2.c` 和 `my_src3.c`。编译后分别为 `my_src1.o`、`my_src2.o` 和 `my_src3.o`
• 在 my_src1.o 中定义 my_function1 功能；在 my_src2.o 中定义 my_function2 功能
• 在 my_component 下 Kconfig 中存在布尔类型配置 PERFORMANCE_MODE (y/n) 和整数类型配置 PERFORMANCE_LEVEL（范围是 0-3）

创建和指定链接器片段文件

首先，用户需要创建链接器片段文件。链接器片段文件是一个扩展名为 .lf 的文本文件，想要存放的位置信息会写入该文件内。文件创建成功后，需要将其呈现构建系统中。ESP-IDF 支持的构建系统指南如下：

在组件目录的 CMakeLists.txt 文件中，指定 idf_component_register 调用引数 LDFRAGMENTS 的值。LDFRAGMENTS 可以为绝对路径，也可为组件目录的相对路径，指向已创建的链接器片段文件。

```cpp
# 相对于组件的 CMakeLists.txt 的文件路径
idf_component_register([...)
  LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
               another_linker_fragment_file.lf"
  ...
]
```

指定存放区域

可以按照下列粒度指定存放区域：
• 目标文件 (.obj 或 .o 文件)
• 符号（函数/变量）
• 库 (.a 文件)

存放目标文件 假设整个 my_src1.o 目标文件对性能至关重要，所以最好把该文件放在 RAM 中。另外，my_src2.o 目标文件包含从睡眠唤醒所需的符号，因此需要将其存放到 RTC 存储器中。

在链接器片段文件中可以写入以下内容：

```cpp
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1 (noflash)  # 将所有 my_src1 代码和只读数据存放在 IRAM 和 DRAM 中
  my_src2 (rtc)     # 将所有 my_src2 代码、数据和只读数据存放在 RTC 快速 RAM 中
```

那么 my_src3.o 放在哪里呢？由于未指定存放区域，my_src3.o 会存放到默认区域。更多关于默认存放区域的信息，请查看这里。

存放符号 继续上文的例子，假设 object1.o 目标文件定义的功能中，只有 my_function1 影响到性能：object2.o 目标文件中只有 my_function2 需要在芯片从深度睡眠中唤醒后运行。要实现该目的，可在链接器片段文件中写入以下内容：

```cpp
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1:my_function1 (noflash)
  my_src2:my_function2 (rtc)
```

my_src1.o 和 my_src2.o 中的其他函数以及整个 object3.o 目标文件会存放到默认区域。要指定数据的存放区域，仅需将上文的函数名替换为变量名即可，如:

```cpp
my_src1:my_variable (noflash)
```
**存放整个库** 在这个例子中，假设整个组件库需存放到 RAM 中，可以写入以下内容存放整个库：

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (noflash)
```

类似的，写入以下内容可以将整个组件存放到 RTC 存储器中：

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (rtc)
```

**根据具体配置存放** 假设只有在某个条件为真时，比如 `CONFIG_PERFORMANCE_MODE == y` 时，整个组件库才有特定存放区域，可以写入以下内容实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_MODE == y:
    * (noflash)
  else:
    * (default)
```

来看一种更复杂的情况。假设 “`CONFIG_PERFORMANCE_LEVEL == 1“ 时，只有 object1.o 存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 2` 时，object1.o 和 object2.o 会存放到 RAM 中；`CONFIG_PERFORMANCE_LEVEL == 3` 时，库中的所有目标文件都会存放到 RAM 中，以上三个条件为假时，整个库会存放到 RTC 存储器中。虽然这种使用场景很罕见，不过，还是可以通过以下方式实现：

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_LEVEL == 1:
    my_src1 (noflash)
  elif PERFORMANCE_LEVEL == 2:
    my_src1 (noflash)
    my_src2 (noflash)
  elif PERFORMANCE_LEVEL == 3:
    my_src1 (noflash)
    my_src2 (noflash)
    my_src3 (noflash)
  else:
    * (rtc)
```

也可以嵌套条件检查。以下内容与上述片段等效：

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
    if PERFORMANCE_LEVEL >= 1:
      object1 (noflash)
    if PERFORMANCE_LEVEL >= 2:
      object2 (noflash)
```

(下页继续)
默认存放区域

到目前为止，“默认存放区域”在未指定 rtc 和 noflash 存放规则时才会作为备选方案使用。需要注意的是，noflash 或者 rtc 标记不仅仅是关键字，实际上还是被称作片段的实体，确切地说是协议。

与 rtc 和 noflash 类似，还有一个默认协议，定义了默认存放规则。顾名思义，该协议规定了代码和数据通过存放的区域，即代码和变量存放在 flash 中，变量存放在 RAM 中。更多关于默认协议的信息，请见这里。

备注：使用链接器脚本生成机制的 IDF 组件示例，请参阅 freertos/CMakeLists.txt。为了提高性能，freertos 使用链接器脚本生成机制，将其目标文件存放到 RAM 中。

4.18.3 链接器脚本生成机制内核

链接是将 C/C++ 源文件转换或可执行文件的最后一步。链接由工具链的链接器完成，接受指定代码和数据存放区域等信息的链接脚本。链接器脚本生成机制的转换过程类似，区别在于传输给链接器的链接脚本根据 (1) 收集的链接器片段文件 和 (2) 链接器脚本模板 动态生成。

备注：执行链接器脚本生成机制的工具存放在 tools/ldgen 之下。

链接器片段文件

如快速入门指南所述，片段文件是扩展名为 .lf 的简单文本文件，内含存放可存放区域的信息。不过，这是对片段文件所包含内容的简化版描述。实际上，片段文件内包含的是“片段”。片段是实体，包含多条信息，这些信息放在一起组成了存放规则，说明目标文件各个段在二进制输出文件中的存放位置。片段一共有三种，分别是 段、协议 和 映射。

语法 三种片段类型使用同一种语法：

```
[type:name]
key: value
key:
  value
  value
  value
...
```

- 类型：片段类型，可以为 段、协议 或 映射。
- 名称：片段名称，指定片段类型的片段名称应唯一。
- 键值：片段内容。每个片段类型可支持不同的键值和不同的键值语法。
  - 在 段 和 协议 中，仅支持 entries 键。
  - 在 映射 中，支持 archive 和 entries 键。

备注：多个片段的类型和名称相同时会引发异常。
条件检查

条件检查使得链接器脚本生成机制可以感知配置。含有配置值的表达式是否为真，决定了使用哪些特定键值。检查使用的是 kconfiglib 脚本的 eval_string，遵循该脚本要求的语法和局限性，支持：

- **比较**
  - 小于 <
  - 小于等于 <=
  - 大于 >
  - 大于等于 >=
  - 等于 =
  - 不等于 !=

- **逻辑**
  - 或 ||
  - 和 &&
  - 取反 ~

- **分组**
  - 圆括号 ()

条件检查和其他语言中的 if...elseif/elif...else 块作用一样。键值和完整片段都可以进行条件检查。以下两个示例效果相同：

```python
# 配置决定键值
[type:name]
key_1:
  if CONDITION = y:
    value_1
  else:
    value_2
key_2:
  if CONDITION = y:
    value_a
  else:
    value_b

# 完整片段的定义决定键值
if CONDITION = y:
  [type:name]
  key_1:
    value_1
  key_2:
    value_a
else:
  [type:name]
  key_1:
    value_2
  key_2:
    value_b
```

**注释**

链接器片段文件中的注释以 # 开头。和在其他语言中一样，注释提供了有用的描述和资料，在处理过程中会被忽略。

**类型段**

段定义了 GCC 编译器输出的一系列目标文件段，可以是默认段（如 .text, .data），也可以是用户通过 __attribute__ 关键字定义的段。
Chapter 4. API 指南

`*` 表示段列表开始，且当前段为列表中的第一个段，这种表达方式更加推荐。

```plaintext
[sections:name]
entries:
  .section+
  .section
  ...
```

示例：

```plaintext
# 不推荐的方式
[sections:text]
entries:
  .text
  .text.*
  .literal
  .literal.*

# 推荐的方式，效果与上面等同
[sections:text]
entries:
  .text+     # 即 .text 和 .text.*
  .literal+  # 即 .literal 和 .literal.*
```

协议

协议定义了每个段对应的 目标。

```plaintext
[scheme:name]
entries:
  sections -> target
  sections -> target
  ...
```

示例：

```plaintext
[scheme:noflash]
entries:
  text -> iram0_text       # text 段下的所有条目均归入 iram0_text
  rodata -> dram0_data     # rodata 段下的所有条目均归入 dram0_data
```

默认协议

注意，有一个默认的协议很特殊，特殊在于包罗存放规则都是根据这个协议中的条目生成的。这意味着，如果该协议有一条条目是 text -> flash_text，则将为目标 flash_text 生成如下的存放规则：

```plaintext
* (.literal .literal.* .text .text.*)
```

这些生成的包罗规则将用于未指定映射规则的情况。

默认协议在 esp_system/app.lf 文件中定义。快速上手指南中提到的内置noflash 协议和 rtc 协议也在该文件中定义。

映射

映射定义了可映射实体（即目标文件、函数名、变量名和库）对应的协议。

```plaintext
[mapping]
archive: archive                      # 构建后输出的库文件名称（即 libxxx.a)
entries:
  object:symbol (scheme)               # 符号
  object (scheme)                      # 目标
  * (scheme)                           # 库
```

有三种存放粒度：
Chapter 4. API 指南

- 符号：指定了目标文件名称和符号名称。符号名称可以是函数名或变量名。
- 目标：只指定目标文件名称。
- 库：指定 *，即某个库下面所有目标文件的简写表达法。

为了更好地理解条目的含义，请看一个按目标存放的例子。

```object (scheme)
```

根据条目定义，将这个协议展开：

```object (sections -> target,
sections -> target,
...)
```

再根据条目定义，将这个段展开：

```object (.section,
.section,
... -> target, # 根据目标文件将这里所列出的所有段放在该目标位置
.section,
.section,
... -> target, # 同样的方法指定其他段
...)
```
# 直至所有段均已展开

示例：

```[mapping:map]
archive: libfreertos.a
entries:
  * (noflash)
```

除了实体和协议，条目中也支持指定如下符号：（注：<> = 参数名称，[] = 可选参数）

1. **ALIGN(<alignment>[, pre, post])**
   根据 alignment 中指定的数字对齐存放区域。根据是否指定 pre 和 post，或两者都指
   定，在输入段描述（生成于映射条目）的前面和/或后面生成。

2. **SORT([<sort_by_first>, <sort_by_second>])**
   在输入段描述中输出 SORT_BY_NAME, SORT_BY_ALIGNMENT, SORT_BY_INIT_PRIORITY 或 SORT.
   sort_by_first 和 sort_by_second 的值可以是 name, alignment, init_priority。
   如果既没指定 sort_by_first 也没指定 sort_by_second，则输入段会按照名称
   排序，如果两者都指定了，那么按套排序会遵循 https://sourceware.org/binutils/docs/ld/
   Input-Section-Wildcards.html 中的规则。

3. **KEEP()**
   用 KEEP 命令包围输入段描述，从而防止链接器丢弃存放区域。更多细节请参考 https:
   //sourceware.org/binutils/docs/ld/Input-Section-Keep.html

4. **SURROUND(<name>)**

在存放区域的前面和后面生成符号，生成的符号遵循_<name>_start 和_<name>_end 的
命名方式，例如，如果 name == sym1

在添加标志时，协议中需要指定具体的 section -> target。对于多个 section -> target，使
用逗号作为分隔符，例如：

```# 注意
# A. entity-scheme 后使用分号
# B. section2 -> target2 前使用逗号
# C. 在 scheme1 条目中定义 section1 -> target1 和 section2 -> target2
entity1 (scheme1);
```
合并后，如下的映射:

```
[mapping:name]
archive: lib1.a
entries:
  obj1 (noflash);
  rodata -> dram0_data KEEP() SORT() ALIGN(8) SURROUND(my_sym)
```

会在链接器脚本上生成如下输出:

```
._ = ALIGN(8)
__my_sym_start = ABSOLUTE(.)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.* ) ))
__my_sym_end = ABSOLUTE(.)
```

注意，正如在 `flag` 描述中提到的，ALIGN 和 SURROUND 的使用对顺序敏感，因此如果将两者顺序调换后用到相同的映射片段，则会生成:

```
__my_sym_start = ABSOLUTE(.)
._ = ALIGN(8)
KEEP(lib1.a:obj1.*( SORT(.rodata) SORT(.rodata.* ) ))
__my_sym_end = ABSOLUTE(.)
```

**按符号存放** 按符号存放可通过编译器标志 `-ffunction-sections` 和 `-ffdata-sections` 实现。ESP-IDF 默认用这些标志编译，用户若选择移除标志，便不能按符号存放。另外，即便有标志，也会其他限制，具体取决于编译器输出的段。

比如，使用 `-ffunction-sections`，针对每个函数会输出单独的段。段的名称可以预测，即 `.text.{func_name}` 和 `.data.{func_name}`。但是功能内的字符串并非如此，因为字符串会进入字符串池，或者使用生成的段名称。

使用 `-ffdata-sections`，对全局数据来说编译器可输出 `.data.{var_name}`、`.rodata.{var_name}` 或 `.bss.{var_name}`；因此类型 I 映射词条可以适用。但是，功能中声明的静态数据并非如此，生成的段名称是将变量名称和其他信息混合。

**链接器脚本模板**

链接器脚本模板是指定存放规则的存放位置的框架，与其他链接器脚本没有本质区别，但带有特定的标记语法，可以指示存放生成的存放规则的位置。

如需引用一个目标标记下的所有存放规则，请使用以下语法:

```
mapping[target]
```

示例:

以下示例是某个链接器脚本模板的摘录，定义了输出段 `.iram0.text`，该输出段包含一个引用目标 `.iram0_text` 的标记。

```
.iram0.text :
{
  /* 标记 IRAM 空间不足 */
  __iram_text_start = ABSOLUTE(.);

  /* 引用 iram0_text */
  mapping[iram0_text]
```

(下页继续)
假设链接器脚本生成器收集到了以下片段定义:

```c
[sections:text]
 .text+
 .literal+
[sections:iram]
 .iram1+
[scheme:default]
 entries:
   text -> flash_text
   iram -> iram0_text
[scheme:noflash]
 entries:
   text -> iram0_text

[mapping:freertos]
 archive: libfreertos.a
 entries:
   * (noflash)

然后生成的链接器脚本的相应摘录如下:

```c
.iram0.text :
{
   /* 标记 IRAM 空间不足 */
   _iram_text_start = ABSOLUTE(.);

   /* 处理片段生成的存放规则，存放于模板标记的位置处 */
   "libfreertos.a:(.literal .text .literal.* .text.*)"
   _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

*libfreertos.a:(.literal .text .literal.* .text.*)

这是根据 freertos 映射的 * (noflash) 条目生成的规则。libfreertos.a 库下所有目标文件的所有 text 段会收集到 iram0_text 目标下 (按照 noflash 协议), 并放在模板中被 iram0_text 标记的地方。

* (.iram1 .iram1.*)

这是根据默认协议条目 iram -> iram0_text 生成的规则。默认协议指定了 iram -> iram0_text 条目。因此生成的规则同样也放在被 iram0_text 标记的地方。由于该规则是根据默认协议生成的，因此在同一目标下收集的所有规则下排在第一位。

目前使用的链接器脚本模板是 esp_system/ld/esp32/sections.ld.in，生成的脚本存放在构建目录下。

**将链接器脚本片段文件语法迁移至 ESP-IDF v5.0 适应版本**

ESP-IDF v5.0 中将不再支持 ESP-IDF v3.x 中链接器脚本片段文件的旧式语法。在迁移的过程中需注意以下几点:
4.19 lwIP

ESP-IDF uses the open source lwIP lightweight TCP/IP stack. The ESP-IDF version of lwIP (esp-lwip) has some modifications and additions compared to the upstream project.

4.19.1 Supported APIs

ESP-IDF supports the following lwIP TCP/IP stack functions:

- BSD Sockets API
- Netconn API is enabled but not officially supported for ESP-IDF applications

Adapted APIs

Some common lwIP “app” APIs are supported indirectly by ESP-IDF:

- DHCP Server & Client are supported indirectly via the ESP-NETIF functionality
- Simple Network Time Protocol (SNTP) is supported via the lwip/include/apps/sntp/sntp.h lwip/lwip/src/include/lwip/apps/sntp.h functions (see also SNTP 時間同步)
- ICMP Ping is supported using a variation on the lwIP ping API. See ICMP Echo.
- NetBIOS lookup is available using the standard lwIP API, protocols/http_server/restful_server has an option to demonstrate using NetBIOS to look up a host on the LAN.
- mDNS uses a different implementation to the lwIP default mDNS (see mDNS 服務), but lwIP can look up mDNS hosts using standard APIs such as gethostbyname() and the convention hostname.local, provided the CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES setting is enabled.

4.19.2 BSD Sockets API

The BSD Sockets API is a common cross-platform TCP/IP sockets API that originated in the Berkeley Standard Distribution of UNIX but is now standardized in a section of the POSIX specification. BSD Sockets are sometimes called POSIX Sockets or Berkeley Sockets.

As implemented in ESP-IDF, lwIP supports all of the common usages of the BSD Sockets API.

References

A wide range of BSD Sockets reference material is available, including:

- Single UNIX Specification BSD Sockets page
- Berkeley Sockets Wikipedia page

Examples

A number of ESP-IDF examples show how to use the BSD Sockets APIs:

- protocols/sockets/tcp_server
- protocols/sockets/tcp_client
- protocols/sockets/udp_server
- protocols/sockets/udp_client
- protocols/sockets/udp_multicast
• **protocols/http_request** (Note: this is a simplified example of using a TCP socket to send an HTTP request. The *ESP HTTP Client* is a much better option for sending HTTP requests.)

**Supported functions**

The following BSD socket API functions are supported. For full details see `lwip/lwip/src/include/lwip/sockets.h`.

- `socket()`  
- `bind()`  
- `accept()`  
- `shutdown()`  
- `getpeername()`  
- `getsockopt()` & `setsockopt()` (see *Socket Options*)  
- `close()` (via 虚拟文件系统组件)  
- `read()`, `readv()`, `write()`, `writev()` (via 虚拟文件系统组件)  
- `recv()`, `recvmsg()`, `recvfrom()`  
- `send()`, `sendmsg()`, `sendto()`  
- `select()` (via 虚拟文件系统组件)  
- `poll()` (Note: on ESP-IDF, `poll()` is implemented by calling `select` internally, so using `select()` directly is recommended if a choice of methods is available.)  
- `fcntl()` (see *fcntl*)

Non-standard functions:

- `ioctl()` (see *ioctl*)

`备注`: Some lwIP application sample code uses prefixed versions of BSD APIs, for example `lwip_socket()` instead of the standard `socket()`. Both forms can be used with ESP-IDF, but using standard names is recommended.

**Socket Error Handling**

BSD Socket error handling code is very important for robust socket applications. Normally the socket error handling involves the following aspects:

- Detecting the error.  
- Getting the error reason code.  
- Handle the error according to the reason code.

In lwIP, we have two different scenarios of handling socket errors:

- Socket API returns an error. For more information, see *Socket API Errors*.  
- `select(int maxfdp1, fd_set *readset, fd_set *writeset, fd_set *exceptset, struct timeval *timeout)` has exception descriptor indicating that the socket has an error. For more information, see *select() Errors*.

**Socket API Errors**

**The error detection**

- We can know that the socket API fails according to its return value.

**Get the error reason code**

- When socket API fails, the return value doesn’ t contain the failure reason and the application can get the error reason code by accessing `errno`. Different values indicate different meanings. For more information, see `<Socket Error Reason Code>`.

Example:
int err;
int sockfd;

if (sockfd = socket(AF_INET, SOCK_STREAM, 0) < 0) {
    // the error code is obtained from errno
    err = errno;
    return err;
}

select() Errors

The error detection

- Socket error when select() has exception descriptor

Get the error reason code

- If the select indicates that the socket fails, we can’t get the error reason code by accessing errno, instead we should call getsockopt() to get the failure reason code. Because select() has exception descriptor, the error code will not be given to errno.

备注: getsockopt function prototype int getsockopt(int s, int level, int optname, void *optval, socklen_t *optlen). Its function is to get the current value of the option of any type, any state socket, and store the result in optval. For example, when you get the error code on a socket, you can get it by getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen).

Example:

```c
int err;
if (select(sockfd + 1, NULL, NULL, &exfds, &tval) <= 0) {
    err = errno;
    return err;
} else {
    if (FD_ISSET(sockfd, &exfds)) {
        // select() exception set using getsockopt()
        int optlen = sizeof(int);
        getsockopt(sockfd, SOL_SOCKET, SO_ERROR, &err, &optlen);
        return err;
    }
}
```

Socket Error Reason Code Below is a list of common error codes. For more detailed list of standard POSIX/C error codes, please see newlib/errno.h <https://github.com/espressif/newlib-esp32/blob/master/newlib/libc/include/sys/errno.h> and the platform-specific extensions newlib/platform_include/errno.h
## Error codes

<table>
<thead>
<tr>
<th>Error code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECONNREFUSED</td>
<td>Connection refused</td>
</tr>
<tr>
<td>EADDRINUSE</td>
<td>Address already in use</td>
</tr>
<tr>
<td>ECONNABORTED</td>
<td>Software caused connection abort</td>
</tr>
<tr>
<td>ENETUNREACH</td>
<td>Network is unreachable</td>
</tr>
<tr>
<td>ENETDOWN</td>
<td>Network interface is not configured</td>
</tr>
<tr>
<td>ETimedout</td>
<td>Connection timed out</td>
</tr>
<tr>

<td>Socket already connected</td>
</tr>
<tr>
<td>EDESTADDRREQ</td>
<td>Destination address required</td>
</tr>
<tr>
<td>EPROTONOSUPPORT</td>
<td>Unknown protocol</td>
</tr>
</tbody>
</table>

### Socket Options

The `getsockopt()` and `setsockopt()` functions allow getting/setting per-socket options.

Not all standard socket options are supported by lwIP in ESP-IDF. The following socket options are supported:

#### Common options

Used with level argument `SOL_SOCKET`.

- `SO_REUSEADDR` (available if `CONFIG_LWIP_SO_REUSE` is set, behavior can be customized by setting `CONFIG_LWIP_SO_REUSE_RTOALL`)
- `SO_KEEPALIVE`
- `SO_BROADCAST`
- `SO_ACCEPTCONN`
- `SO_RCVBUF` (available if `CONFIG_LWIP_SO_RCVBUF` is set)
- `SO_SNDBUF`, `SO_RCVTIMEO`
- `SO_ERROR` (this option is only used with `select()`, see `Socket Error Handling`)
- `SO_TYPE`
- `SO_NO_CHECK` (for UDP sockets only)

#### IP options

Used with level argument `IPPROTO_IP`.

- `IP_TOS`
- `IP_TTL`
- `IP_PKTINFO` (available if `CONFIG_LWIP_NETBUF_RECVINFO` is set)

For multicast UDP sockets:

- `IP_MULTICAST_IF`
- `IP_MULTICAST_LOOP`
- `IP_MULTICAST_TTL`
- `IP_ADD_MEMBERSHIP`
- `IP_DROP_MEMBERSHIP`

#### TCP options

TCP sockets only. Used with level argument `IPPROTO_TCP`.

- `TCP_NODELAY`

Options relating to TCP keepalive probes:

- `TCP_KEEPALIVE` (int value, TCP keepalive period in milliseconds)
- `TCP_KEEPIDLE` (same as `TCP_KEEPALIVE`, but the value is in seconds)
- `TCP_KEEPINTVL` (int value, interval between keepalive probes in seconds)
- `TCP_KEEPCNT` (int value, number of keepalive probes before timing out)
IPv6 options
IPv6 sockets only. Used with level argument IPPROTO_IPV6
- IPV6_CHECKSUM
- IPV6_V6ONLY

For multicast IPv6 UDP sockets:
- IPV6_JOIN_GROUP / IPV6_ADD_MEMBERSHIP
- IPV6_LEAVE_GROUP / IPV6_DROP_MEMBERSHIP
- IPV6_MULTICAST_IF
- IPV6_MULTICAST_HOPS
- IPV6_MULTICAST_LOOP

fcntl

The fcntl() function is a standard API for manipulating options related to a file descriptor. In ESP-IDF, the virtual file system layer is used to implement this function.

When the file descriptor is a socket, only the following fcntl() values are supported:
- O_NONBLOCK to set/clear non-blocking I/O mode. Also supports O_NDELAY, which is identical to O_NONBLOCK.
- O_RDONLY, O_WRONLY, O_RDWR flags for different read/write modes. These can read via F_GETFL only, they cannot be set using F_SETFL. A TCP socket will return a different mode depending on whether the connection has been closed at either end or is still open at both ends. UDP sockets always return O_RDWR.

ioctl

The ioctl() function provides a semi-standard way to access some internal features of the TCP/IP stack. In ESP-IDF, the virtual file system layer is used to implement this function.

When the file descriptor is a socket, only the following ioctl() values are supported:
- FIONREAD returns the number of bytes of pending data already received in the socket’s network buffer.
- FIONBIO is an alternative way to set/clear non-blocking I/O status for a socket, equivalent to fcntl(fd, F_SETFL, O_NONBLOCK, ...).

4.19.3 Netconn API

lwIP supports two lower level APIs as well as the BSD Sockets API: the Netconn API and the Raw API.

The lwIP Raw API is designed for single threaded devices and is not supported in ESP-IDF.

The Netconn API is used to implement the BSD Sockets API inside lwIP, and it can also be called directly from ESP-IDF apps. This API has lower resource usage than the BSD Sockets API, in particular it can send and receive data without needing to first copy it into internal lwIP buffers.

Important: Espressif does not test the Netconn API in ESP-IDF. As such, this functionality is enabled but not supported. Some functionality may only work correctly when used from the BSD Sockets API.

For more information about the Netconn API, consult lwip/lwip/src/include/lwip/api.h and this wiki page which is part of the unofficial lwIP Application Developers Manual.

4.19.4 lwIP FreeRTOS Task

lwIP creates a dedicated TCP/IP FreeRTOS task to handle socket API requests from other tasks.

A number of configuration items are available to modify the task and the queues (“mailboxes”) used to send data to/from the TCP/IP task.
4.19.5 IPv6 Support

Both IPv4 and IPv6 are supported as dual stack and enabled by default (IPv6 may be disabled if it’s not needed, see Minimum RAM usage). IPv6 support is limited to Stateless Autoconfiguration only. Stateful configuration is not supported in ESP-IDF (not in upstream lwip). IPv6 Address configuration is defined by means of these protocols or services:

- SLAAC IPv6 Stateless Address Autoconfiguration (RFC-2462)
- DHCPv6 Dynamic Host Configuration Protocol for IPv6 (RFC-8415)

None of these two types of address configuration is enabled by default, so the device uses only Link Local addresses or statically defined addresses.

Stateless Autoconfiguration Process

To enable address autoconfiguration using Router Advertisement protocol please enable:

- `CONFIG_LWIP_IPV6_AUTOCONFIG`

This configuration option enables IPv6 autoconfiguration for all network interfaces (in contrast to the upstream lwIP, where the autoconfiguration needs to be explicitly enabled for each netif with `netif->ip6_autoconfig_enabled=1`).

DHCPv6

DHCPv6 in lwIP is very simple and support only stateless configuration. It could be enabled using:

- `CONFIG_LWIP_IPV6_DHCP6`

Since the DHCPv6 works only in its stateless configuration, the Stateless Autoconfiguration Process has to be enabled, too, by means of `CONFIG_LWIP_IPV6_AUTOCONFIG`. Moreover, the DHCPv6 needs to be explicitly enabled form the application code using

```c
dhcp6_enable_stateless(netif);
```

DNS servers in IPv6 autoconfiguration

In order to autoconfigure DNS server(s), especially in IPv6 only networks, we have these two options

- Recursive domain name system – this belongs to the Neighbor Discovery Protocol (NDP), uses Stateless Autoconfiguration Process. Number of servers must be set `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`, this is option is disabled (set to 0) by default.
- DHCPv6 stateless configuration – uses `DHCPv6` to configure DNS servers. Note that the this configuration assumes IPv6 Router Advertisement Flags (RFC-5175) to be set to
  - Managed Address Configuration Flag = 0
  - Other Configuration Flag = 1

4.19.6 esp-lwip custom modifications

Additions

The following code is added which is not present in the upstream lwIP release:
Thread-safe sockets  It is possible to close() a socket from a different thread to the one that created it. The close() call will block until any function calls currently using that socket from other tasks have returned.

It is, however, not possible to delete a task while it is actively waiting on select() or poll() APIs. It is always necessary that these APIs exit before destroying the task, as this might corrupt internal structures and cause subsequent crashes of the lwIP. (These APIs allocate globally referenced callback pointers on stack, so that when the task gets destroyed before unrolling the stack, the lwIP would still hold pointers to the deleted stack)

On demand timers  lwIP IGMP and MLD6 features both initialize a timer in order to trigger timeout events at certain times.

The default lwIP implementation is to have these timers enabled all the time, even if no timeout events are active. This increases CPU usage and power consumption when using automatic light sleep mode. esp-lwip default behaviour is to set each timer “on demand” so it is only enabled when an event is pending.

To return to the default lwIP behaviour (always-on timers), disable CONFIG_LWIP_TIMERS_ONDEMAND.

Lwip timers API  When users are not using WiFi, these APIs provide users with the ability to turn off LwIP timer to reduce power consumption.

The following API functions are supported. For full details see lwip/lwip/src/include/lwip/timeouts.h.

• sys_timeouts_init()
• sys_timeouts_deinit()

Additional Socket Options

• Some standard IPV4 and IPV6 multicast socket options are implemented (see Socket Options).
• Possible to set IPV6-only UDP and TCP sockets with IPV6_V6ONLY socket option (normal lwIP is TCP only).

IP layer features

• IPV4 source based routing implementation is different.
• IPV4 mapped IPV6 addresses are supported.

Customized lwIP hooks  The original lwIP supports implementing custom compile-time modifications via LWIP_HOOK_FILENAME. This file is already used by the IDF port layer, but IDF users could still include and implement any custom additions via a header file defined by the macro ESP_IDF_LWIP_HOOK_FILENAME. Here is an example of adding a custom hook file to the build process (the hook is called my_hook.h and located in the project’s main folder):

```c
idf_component_get_property(lwip lwip COMPONENT_LIB)
target_compile_options({lwip} PRIVATE "-I{PROJECT_DIR}/main")
target_compile_definitions({lwip} PRIVATE "-DESP_IDF_LWIP_HOOK_FILENAME="my_hook_.h")
```

Limitations

Calling send() or sendto() repeatedly on a UDP socket may eventually fail with errno equal to ENOMEM. This is a limitation of buffer sizes in the lower layer network interface drivers. If all driver transmit buffers are full then UDP transmission will fail. Applications sending a high volume of UDP datagrams who don’t wish for any to be dropped by the sender should check for this error code and re-send the datagram after a short delay.

Increasing the number of TX buffers in the Wi-Fi or Ethernet project configuration (as applicable) may also help.
4.19.7 Performance Optimization

TCP/IP performance is a complex subject, and performance can be optimized towards multiple goals. The default settings of ESP-IDF are tuned for a compromise between throughput, latency, and moderate memory usage.

Maximum throughput

Espressif tests ESP-IDF TCP/IP throughput using the wifi/iperf example in an RF sealed enclosure. The wifi/iperf/sdkconfig.defaults file for the iperf example contains settings known to maximize TCP/IP throughput, usually at the expense of higher RAM usage. To get maximum TCP/IP throughput in an application at the expense of other factors then suggest applying settings from this file into the project sdkconfig.

 AVC: Suggest applying changes a few at a time and checking the performance each time with a particular application workload.

- If a lot of tasks are competing for CPU time on the system, consider that the lwIP task has configurable CPU affinity (CONFIG_LWIP_TCP_TASK_AFFINITY) and runs at fixed priority ESP_TASK_TCP_IP_Prio (18). Configure competing tasks to be pinned to a different core, or to run at a lower priority. See also Built-In Task Priorities.
- If using select() function with socket arguments only, disabling CONFIG_VFS_SUPPORT_SELECT will make select() calls faster.
- If there is enough free IRAM, select CONFIG_LWIP_IRAM_OPTIMIZATION to improve TX/RX throughput.

If using a Wi-Fi network interface, please also refer to Wi-Fi缓冲区使用情况.

Minimum latency

Except for increasing buffer sizes, most changes which increase throughput will also decrease latency by reducing the amount of CPU time spent in lwIP functions.

- For TCP sockets, lwIP supports setting the standard TCP_NODELAY flag to disable Nagle’s algorithm.

Minimum RAM usage

Most lwIP RAM usage is on-demand, as RAM is allocated from the heap as needed. Therefore, changing lwIP settings to reduce RAM usage may not change RAM usage at idle but can change it at peak.

- Reducing CONFIG_LWIP_MAX_SOCKETS reduces the maximum number of sockets in the system. This will also cause TCP sockets in the WAIT_CLOSE state to be closed and recycled more rapidly (if needed to open a new socket), further reducing peak RAM usage.
- Reducing CONFIG_LWIP_TCP_RB_RECVMBX_SIZE, CONFIG_LWIP_TCP_RECVMBX_SIZE and CONFIG_LWIP_UDP_RECVMBX_SIZE reduce memory usage at the expense of throughput, depending on usage.
- Reducing CONFIG_LWIP_TCP_MSL, CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT reduces the maximum segment lifetime in the system. This will also cause TCP sockets in the TIME_WAIT, FIN_WAIT_2 state to be closed and recycled more rapidly.
- Disable CONFIG_LWIP_IPV6 can save about 39 KB for firmware size and 2KB RAM when system power up and 7KB RAM when TCP/IP stack running. If there is no requirement for supporting IPV6 then it can be disabled to save flash and RAM footprint.

If using Wi-Fi, please also refer to Wi-Fi缓冲区使用情況.

Peak Buffer Usage  The peak heap memory that lwIP consumes is the theoretically-maximum memory that the lwIP driver consumes. Generally, the peak heap memory that lwIP consumes depends on:

- the memory required to create a UDP connection: lwip_udp_conn
- the memory required to create a TCP connection: lwip_tcp_conn
Chapter 4. API

- the number of UDP connections that the application has: lwip_udp_con_num
- the number of TCP connections that the application has: lwip_tcp_con_num
- the TCP TX window size: lwip_tcp_tx_win_size
- the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

\[
\text{lwip_dynamic_peak_memory} = (\text{lwip_udp_con_num} \times \text{lwip_udp_conn}) + (\text{lwip_tcp_con_num} \times (\text{lwip_tcp_tx_win_size} + \text{lwip_tcp_rx_win_size} + \text{lwip_tcp_conn}))
\]

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

4.20 存储器类型

ESP32 芯片具有不同类型的存储器和灵活的存储器映射特性，本小节将介绍 ESP-IDF 默认如何使用这些功能。

ESP-IDF 区分了指令总线（IRAM、IROM、RTC FAST memory）和数据总线 (DRAM、DROM)。指令存储器是可执行的，只能通过 4 字节对齐字读取或写入。数据存储器不可执行，可以通过单独的字节操作访问。有关总线的更多信息，请参阅 ESP32 技术参考手册 > 系统和存储器 [PDF]。

4.20.1 DRAM（数据 RAM）

非常量静态数据 (.data 段) 和零初始化数据 (.bss 段) 由链接器放入内部 SRAM 作为数据存储。此区域中的剩余空间可在程序运行时用作堆。

通过应用 EXTRAM_BSS_ATTR 宏，零初始化数据也可以放入外部 RAM，使用这个宏需要启用 CONFIG_SPIRAM_ALLOW_BSS_EXTERNAL_MEMORY，详情请见允许 .bss 段放入片外存储器。

如果使用蓝牙堆栈，内存 DRAM 区域的可用大小将减少 64 KB (由于起始地址移动到 0x3FFC0000)。如果使用内存跟踪功能，该区域的长度还会减少 16 KB 或 32 KB。由于 ROM 引起的一些内存碎片问题，不可能将所有可用的 DRAM 用于静态分配，但是剩余的 DRAM 在运行时仍可用作堆。

常量数据也可能被放人 DRAM，例如当它被用于 non-flash-safe ISR 时（具体请参考如何将代码放入 IRAM）。

“noinit” DRAM

可以将 __NOINIT_ATTR 宏用作属性，从而将数据放入 .noinit 部分。放入该部分的值在启动时不会被初始化，在软件重启后也会保持值不变。

通过使用 EXT_RAM_NOINIT_ATTR 宏，noinit 数据也可以放入外部 RAM 中。为此，需要启用 CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY，可参考允许 .noinit 段放入片外存储器。如果没有启用 CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY，EXT_RAM_NOINIT_ATTR 会和 __NOINIT_ATTR 一样，将数据放入内部 RAM 的 .noinit 部分。

示例:

```c
__NOINIT_ATTR uint32_t noinit_data;
```
4.20.2 IRAM（指令 RAM）

ESP-IDF 将内部 SRAM0 的部分区域分配为指令 RAM。可在 ESP32 技术参考手册 > 系统和存储器 > 内部存储器 [PDF] 中查看 IRAM 区域的定义。该内存中第一个 64 KB 块用于 PRO 和 APP MMU 缓存，其余部分（从 0x40080000 到 0x400A0000）用于存储需要从 RAM 运行的应用程序部分。

何时需要将代码放入 IRAM

以下情况时应将部分应用程序放入 IRAM:
- 如果在注册中断处理程序时使用了 ESP_INTR_FLAG_IRAM，则中断处理程序必须要放入 IRAM。更多信息可参考 IRAM 定义中断处理程序。
- 可将一些时序关键代码放入 IRAM，以减少从 flash 中加载代码造成的相关损失。ESP32 通过 MMU 缓存从 flash 中读取代码和数据。在某些情况下，将函数放入 IRAM 可以减少由缓存未命中造成的延迟，从而显著提高函数的性能。

如何将代码放入 IRAM

借助链接器脚本，一些代码会被自动放入 IRAM 区域中。

如果需要将某些特定的应用程序代码放入 IRAM，可以使用链接器脚本生成机制 功能。在组件中添加链接器脚本片段文件，该片段文件中，可以为输出目标源文件或其中的个别函数打上 noflash 标签。更多信息可参考链接器脚本生成机制。

或者，也可以通过使用 IRAM_ATTR 宏在源代码中指定需要放入 IRAM 的代码:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg) {
    // ...
}
```

放于 IRAM 后可能会导致 IRAM 安全中断处理程序出现问题：
- IRAM_ATTR 函数中的字符串或常量可能没有自动放入 RAM 中。这时可以使用 DRAM_ATTR 属性进行标记，或者也可以使用链接器脚本方法将它们放入 RAM 中。

```c
void IRAM_ATTR gpio_isr_handler(void* arg) {
    const static DRAM_ATTR uint8_t INDEX_DATA[] = { 45, 33, 12, 0 };
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

注意，具体哪些数据需要被标记为 DRAM_ATTR 可能很难确定。如果没有被标记为 DRAM_ATTR，某些变量或表达式有时会被编译器视为常量（即使它们没有被标记为 const）并将其放入 flash 中。

4.20.3 IROM（代码从 flash 中运行）

如果一个函数没有被显式地声明放在 IRAM 或者 RTC 存储器中，则它会放在 flash 中。由于 IRAM 空间有限，应用程序的大部二进制代码都需要放入 IROM 中。

允许从 flash 中执行代码的 Flash MMU 机制可参考 ESP32 技术参考手册 > 存储器管理和保护单元 (MMU, MPU) [PDF]。
在启动过程中，从 IRAM 中运行的引导加载程序配置 MMU flash 缓存，将应用程序的指令代码区域映射到指令空间。通过 MMU 访问的 flash 使用一些内部 SRAM 进行缓存，访问缓存的 flash 数据与访问其它类型的内部存储器一样快。

### 4.20.4 DROM（数据存储在 flash 中）

默认情况下，链接器将常量数据放入一个映射到 MMU flash 缓存的区域中。这与 IROM（代码从 flash 中运行）部分相同，但此处用于只读数据而不是可执行代码。

唯一没有默认放入 DROM 的常量数据是被编译器嵌入到应用程序代码中的字面常量。这些被放置在周围函数的可执行指令中。

DRAM_ATTR 属性可以用来强制将常量从 DRAM 放入 DRAM（数据 RAM）部分（见上文）。

### 4.20.5 RTC Slow memory（RTC 慢速存储器）

从 RTC 存储器运行的代码使用的全局和静态变量必须放入 RTC Slow memory 中。例如深度睡眠变量可以在放在 RTC Slow memory 中，而不是 RTC FAST memory，或者也可以放入由 ULP 协处理器编程访问的代码和变量。

RTC_NOINIT_ATTR 属性宏可以用来将数据放入 RTC Slow memory。放入此类型存储器的值从深度睡眠模式中醒来后会保持值不变。

示例:

```c
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

### 4.20.6 RTC FAST memory（RTC 快速存储器）

RTC FAST memory 的同一区域既可以作为指令存储器也可以作为数据存储器进行访问。从深度睡眠模式唤醒后必须要运行的代码要放在 RTC 存储器中，更多信息请查阅文档深度睡眠。

RTC FAST memory 只可以被 PRO CPU 访问。

在单核模式下，除非禁用 CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP 选项，否则剩余的 RTC FAST memory 会被添加到堆中。该部分内存可以和 DRAM（数据 RAM）互换使用，但是访问速度稍慢，且不具备 DMA 功能。

### 4.20.7 具备 DMA 功能

大多数的 DMA 控制器（比如 SPI，sdmmc 等）都要求发送/接收缓冲区放在 DRAM 中，并且按字对齐。我们建议将 DMA 缓冲区放在静态变量而不是堆栈中。使用 DMA_ATTR 宏可以声明该全局/本地的静态变量具备 DMA 功能，例如:

```c
DMA_ATTR uint8_t buffer[] = "I want to send something";

void app_main()
{
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, temp);
    // 其它程序
}
```

或者:
void app_main()
{
    DMA_ATTR static uint8_t buffer[] = "I want to send something";
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}

也可以通过使用 MALLOC_CAP_DMA 标志来动态分配具备 DMA 能力的内存缓冲区。

### 4.20.8 在堆栈中放置 DMA 缓冲区

可以在堆栈中放置 DMA 缓冲区，但建议尽量避免。如果实在有需要的话，请注意以下几点：

- 如果堆栈在 PSRAM 中，则不建议将 DRAM 缓冲区放在堆栈上。如果任务堆栈在 PSRAM 中，则必须执行**例外 RAM** 中描述的几个步骤。
- 在函数中使用 **WORD_ALIGNED_ATTR** 宏来修饰变量，将其放在适当的位置上，比如:

```c
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[] = "I want to send something";  // 声明...
    // 初始化代码
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8 * sizeof(buffer),
    };
    spi_device_transmit(spi, &temp);
    // 其它程序
}
```

### 4.21 OpenThread

OpenThread is a IP stack running on the 802.15.4 MAC layer which features mesh network and low power consumption.

#### 4.21.1 Mode of the OpenThread stack

OpenThread can run under the following modes on Espressif chips:

**Standalone node**

The full OpenThread stack and the application layer runs on the same chip. This mode is available on chips with 15.4 radio such as ESP32-H4.
Radio Co-Processor (RCP)

The chip will be connected to another host running the OpenThread IP stack. It will send and received 15.4 packets on behalf of the host. This mode is available on chips with 15.4 radio such as ESP32-H4. The underlying transport between the chip and the host can be SPI or UART. For sake of latency, we recommend to use SPI as the underlying transport.

OpenThread host

For chips without 15.4 radio, it can be connected to an RCP and run OpenThread under host mode. This mode enables OpenThread on Wi-Fi chips such as ESP32, ESP32-S2, ESP32-S3 and ESP32-C3. The following diagram shows how devices work under different modes:

![Diagram showing OpenThread device modes](image)

**4.21.2 How To Write an OpenThread Application**

The OpenThread openthread/ot_cli example will be a good place to start at. It demonstrates basic OpenThread initialization and simple socket-based server and client.

**Before OpenThread initialization**

- s1.1 The main task calls `esp_vfs_eventfd_register()` to initialize the eventfd virtual filesystem. The eventfd file system is used for task notification in the OpenThread driver.
- s1.2 The main task calls `nvs_flash_init()` to initialize the NVS where the Thread network data is stored.
- s1.3 Optional. The main task calls `esp_netif_init()` only when it wants to create the network interface for Thread.
- s1.4: The main task calls `esp_event_loop_create()` to create the system Event task and initialize an application event’s callback function.

**OpenThread stack initialization**

- s2.1: Call `esp_openthread_init()` to initialize the OpenThread stack.
OpenThread network interface initialization

The whole stage is optional and only required if the application wants to create the network interface for Thread.
- s3.1: Call `esp_netif_new()` with `ESP_NETIF_DEFAULT_OPENTHREAD` to create the interface.
- s3.2: Call `esp_openthread_netif_glue_init()` to create the OpenThread interface handlers.
- s3.3: Call `esp_netif_attach()` to attach the handlers to the interface.

The OpenThread main loop

- s4.3: Call `esp_openthread_launch_mainloop()` to launch the OpenThread main loop. Note that this is a busy loop and will not return until the OpenThread stack is terminated.

Calling OpenThread APIs

The OpenThread APIs are not thread-safe. When calling OpenThread APIs from other tasks, make sure to hold the lock with `esp_openthread_lock_acquire()` and release the lock with `esp_openthread_lock_release()` afterwards.

Deinitialization

The following steps are required to deinitialize the OpenThread stack: - Call `esp_netif_destroy()` and `esp_openthread_netif_glue_deinit()` to deinitialize the OpenThread network interface if you have created one. - Call `esp_openthread_deinit()` to deinitialize the OpenThread stack.

4.21.3 The OpenThread border router

The OpenThread border router connects the Thread network with other IP networks. It will provide IPv6 connectivity, service registration and commission functionality. To launch an OpenThread border router on an ESP chip, you need to connect an RCP to a Wi-Fi capable chip such as ESP32. Call `esp_openthread_border_router_init()` during the initialization will launch all the border routing functionalities.

You may refer to the `openthread/ot_br` example and the README for further border router details.

4.22 分区表

4.22.1 概述

每片 ESP32 的 flash 可以包含多个应用程序，以及多种不同类型的数 (例如校准数据、文件系统数据、参数存储数据等)。因此，我们在 flash 的默认偏移地址 0x8000 处烧写一张分区表。

分区表的长度为 0x0C00 字节（最多可以保存 95 条分区表条目）。分区表数据后还保存着该表的 MD5 校验和，用于验证分区表的完整性。此外，如果芯片使能了安全启动功能，则该分区表后还会保存签名信息。分区表中的每个条目都包括以下几个部分：Name（标签）、Type（app, data 等）、SubType 以及在 flash 中的偏移量（分区的加载地址）。

在使用分区表时，最简单的方法就是打开项目配置菜单（idf.py menuconfig），并在 `CONFIG_PARTITION_TABLE_TYPE` 下选择一个预定义的分区表：
- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

在以上两种选项中，出厂应用程序均将被烧录至 flash 的 0x10000 偏移地址处。这时，运行 `idf.py partition-table`，即可打印当前使用分区表的信息摘要。
4.22.2 内置分区表

以下是“Single factory app, no OTA”选项的分区表信息摘要:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>
<td>0x6000</td>
<td></td>
</tr>
<tr>
<td>phy_init</td>
<td>data</td>
<td>phy</td>
<td>0xf000</td>
<td>0x1000</td>
<td></td>
</tr>
<tr>
<td>factory</td>
<td>app</td>
<td>factory</td>
<td>0x10000</td>
<td>1M</td>
<td></td>
</tr>
</tbody>
</table>

- flash 的 0x10000 (64 KB) 偏移地址处存放一个标记为“factory”的二进制应用程序，且启动加载器将默认加载这个应用程序。
- 分区表中定义了两个数据区域，分别用于存储 NVS 库专用分区和 PHY 初始化数据。

以下是“Factory app, two OTA definitions”选项的分区表信息摘要:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>
<td>0x4000</td>
<td></td>
</tr>
<tr>
<td>otsdata</td>
<td>data</td>
<td>ots</td>
<td>0xd000</td>
<td>0x2000</td>
<td></td>
</tr>
<tr>
<td>phy_init</td>
<td>data</td>
<td>phy</td>
<td>0xf000</td>
<td>0x1000</td>
<td></td>
</tr>
<tr>
<td>factory</td>
<td>app</td>
<td>factory</td>
<td>0x10000</td>
<td>1M</td>
<td></td>
</tr>
<tr>
<td>ota_0</td>
<td>app</td>
<td>ota_0</td>
<td>0x110000</td>
<td>1M</td>
<td></td>
</tr>
<tr>
<td>ota_1</td>
<td>app</td>
<td>ota_1</td>
<td>0x210000</td>
<td>1M</td>
<td></td>
</tr>
</tbody>
</table>

- 分区表中定义了三个应用程序分区，这三个分区的类型都被设置为“app”，但具体 app 类型不同。其中，位于 0x10000 偏移地址处的为出厂应用程序（factory），其余两个为 OTA 应用程序（ota_0, ota_1）。
- 新增了一个名为“otadata”的数据分区，用于保存 OTA 升级时需要的数据。启动加载器会查询该分区的数据，以判断该从哪个 OTA 应用程序分区加载程序。如果“otadata”分区为空，则会执行出厂程序。

4.22.3 创建自定义分区表

如果在 menuconfig 中选择了“Custom partition table CSV”，则还需要输入该分区表的 CSV 文件在项目中的路径。CSV 文件可以根据需要，描述任意数量的分区信息。

CSV 文件的格式与上面摘要中打印的格式相同，但是 CSV 文件中并非所有字段都是必需的。例如下面是一个自定义的 OTA 分区表的 CSV 文件:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>SubType</th>
<th>Offset</th>
<th>Size</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs</td>
<td>data</td>
<td>nvs</td>
<td>0x9000</td>
<td>0x4000</td>
<td></td>
</tr>
<tr>
<td>otsdata</td>
<td>data</td>
<td>ots</td>
<td>0xd000</td>
<td>0x2000</td>
<td></td>
</tr>
<tr>
<td>phy_init</td>
<td>data</td>
<td>phy</td>
<td>0xf000</td>
<td>0x1000</td>
<td></td>
</tr>
<tr>
<td>factory</td>
<td>app</td>
<td>factory</td>
<td>0x10000</td>
<td>1M</td>
<td></td>
</tr>
<tr>
<td>ota_0</td>
<td>app</td>
<td>ota_0</td>
<td></td>
<td></td>
<td>1M</td>
</tr>
<tr>
<td>ota_1</td>
<td>app</td>
<td>ota_1</td>
<td></td>
<td></td>
<td>1M</td>
</tr>
<tr>
<td>nvs_key</td>
<td>data</td>
<td>nvs_keys</td>
<td></td>
<td></td>
<td>0x1000</td>
</tr>
</tbody>
</table>

- 字段之间的空格会被忽略，任何以 # 开头的行（注释）也会被忽略。
- CSV 文件中的每个非注释行均为一个分区定义。
- 每个分区的 Offset 字段可以为空，gen_esp32part.py 工具会从分区表位置的后面开始自动计算并填充该分区的偏移地址，同时确保每个分区的偏移地址正确对齐。

Name 字段

Name 字段可以是任何有意义的名称，但不能超过 16 个字节，其中包括一个空字节（之后的内容将被截断）。该字段对 ESP32 并不是特别重要。
Chapter 4. API 指南

**Type 字段**

Type 字段可以指定为 app (0x00) 或者 data (0x01)，也可以直接使用数字 0-254（或者十六进制 0x00-0xFE)。注意，0x00-0x3F 不得使用（留给 esp-idf 的核心功能）。

如果您的应用程序需要以 ESP-IDF 尚未支持的格式存储数据，请在 0x40-0xFE 内添加一个自定义分区类型。

参考 esp_partition_type_t 关于 app 和 data 分区的枚举定义。

如果用 C++ 编写，那么指定一个应用程序定义的分区类型，需要在 esp_partition_type_t 中使用整数，从而与函数 API 一起使用。例如:

```c
static const esp_partition_type_t APP_PARTITION_TYPE_A = {esp_partition_type_t...
```

注意，启动加载器将忽略 app (0x00) 和 data (0x01) 以外的其他分区类型。

**SubType 字段**

SubType 字段长度为 8 bit，内容与具体分区 Type 有关。目前，esp-idf 仅仅规定了“app”和“data”两种分区类型的子类型含义。

参考 esp_partition_subtype_t，以了解 ESP-IDF 定义的全部子类型列表，包括:

- 当 Type 定义为 app 时，SubType 字段可以指定为 factory (0x00)、ota_0 (0x10) ... ota_15 (0x1F) 或者 test (0x20)。
  - factory (0x00) 是默认的 app 分区。启动加载器将默认加载该应用程序。但如果存在类型为 data/ota 分区，则启动加载器将加载 data/ota 分区中的数据，进而启动该各个OTA镜像文件。
  - OTA 升级永远都不会更新 factory 分区中的内容。
  - 如果您希望在 OTA 项目中预留更多 flash，可以删除 factory 分区，转而使用 ota_0 分区。
  - ota_0 (0x10) ... ota_15 (0x1F) 为 OTA 应用程序分区。启动加载器将根据 OTA 数据分区中的数据来决定加载哪个 OTA 应用程序分区中的程序。在使用 OTA 功能时，应用程序应至少拥有 2 个 OTA 应用程序分区 (ota_0 和 ota_1)。更多详细信息，请参考 OTA 文档。
  - test (0x20) 为预留的子类型，用于工厂测试流程。如果没有其他有效 app 分区，test 将作为选启动分区使用。也可以配置启动加载器在每次启动时读取 GPIO，如果 GPIO 被拉低则启动该分区。详细信息请查阅从测试固件启动。
- 当 Type 定义为 data 时，SubType 字段可以指定为 ota (0x00)、phy (0x01)、nvs (0x02)、nvs_keys (0x04) 或者其他组件特定的子类型（请参考子类型枚举）。
  - ota (0) 即 OTA 数据分区，用于存储当前所选的 OTA 应用程序的信息。这个分区的大小需要设定为 0x2000，更多详细信息，请参考 OTA 文档。
  - phy (1) 分区用于存放 PHY 初始化数据，从而保证可以为每个设备单独配置 PHY，而非必须采用固件中的统一 PHY 初始化数据。
    - 默认配置下，phy 分区并不启用，而是直接将 phy 初始化数据编译至应用程序中，从而节省分区表空间（直接将此分区删除）。
    - 如果需要从此分区加载 phy 初始化数据，请打开项目配置菜单 (idf.py menuconfig)，并且使能 CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION 选项。此时，您还需要手动将 phy 初始化数据烧至 flash (esp-idf 编译系统并不会自动完成该操作)。
  - nvs (2) 是专门给非易失性存储 (NVS API) 使用的分区。
    - 用于存储每台设备的 PHY 校准数据（注意，并不是 PHY 初始化数据）。
    - 用于存储 Wi-Fi 数据（如果使用了 esp_wifi_set_storage(WIFI_STORAGE_FLASH) 初始化函数）。
    - NVS API 还可以用于其他应用程序数据。
    - 强烈建议您应为 NVS 分区分配至少 0x3000 字节空间。
    - 如果使用 NVS API 存储大量数据，请增加 NVS 分区的大小（默认是 0x6000 字节）。
  - nvs_keys (4) 是 NVS 秘钥分区。详细信息，请参考非易失性存储 (NVS API) 文档。
    - 用于存储加密密钥（如果启用了 NVS 加密功能）。
    - 此分区应至少设定为 0x0006 字节。
Chapter 4. API 指南

- ESP-IDF 还支持其它预定义的子类型用于数据存储，包括 FAT 文件系统 (ESP_PARTITION_SUBTYPE_DATA_FAT), SPIFFS (ESP_PARTITION_SUBTYPE_DATA_SPIFFS) 等。

包含的数据子类型已预留给 esp-idf 未来使用。
- 如果分区类型是由应用程序定义的任意值（0x40-0xFE），那么 subtype 字段可以是由应用程序选择的任何值（0x00-0xFE）。

请注意如果用 C++ 编写，应用程序定义的子类型值需要转换为 esp_partition_type_t，从而与分区 API 一起使用。

额外分区 SubType 字段

组件可以通过设置 EXTRA_PARTITION_SUBTYPES 属性来定义额外的分区子类型。EXTRA_PARTITION_SUBTYPES 是一个 CMake 列表，其中的每个条目由字符串组成，以逗号为分隔，格式为 <type>, <subtype>, <value>。构建系统通过该属性会自动添加额外的子类型，并在 esp_partition_subtype_t 中插入名为 ESP_PARTITION_SUBTYPE_<type>_<subtype> 的字段。项目可以使用这个子类型来定义分区表 CSV 文件中的分区，并使用 esp_partition_subtype_t 中的新字段。

Offset 和 Size 字段

分区若偏移地址为空，则会紧跟着前一个分区之后开始；若为首个分区，则将紧跟着分区表开始。

app 分区的偏移地址必须要与 0x10000 (64K) 对齐。如果将偏移字段留空。gen.esp32part.py 工具会自动计算得到一个满足对齐要求的偏移地址。如果 app 分区的偏移地址没有与 0x10000 (64K) 对齐，则该工具会报错。

app 分区的大小和偏移地址可以采用十进制数，以 0x 为前缀的十六进制数，且支持 K 或 M 的倍数单位（分别代表 1024 和 1024*1024 字节）。

如果您希望允许分区表中的分区采用任意起始偏移量 (CONFIG_PARTITION_TABLE_OFFSET)，请将分区表（CSV 文件）中所有分区的偏移字段都留空。注意，此时，如果您更改了分区表中任意分区的偏移地址，其他分区的偏移地址也会跟着改变。这种情况下，如果您之前还曾设定某个分区采用固定偏移地址，则可能造成分区表冲突，从而导致报错。

Flags 字段

当前仅支持 encrypted 标记。如果 Flags 字段设置为 encrypted，且已启用 Flash 功能，则该分区将会被加密。

备注：app 分区始终会被加密，不管 Flags 字段是否设置。

### 4.22.4 生成二进制分区表

编译到 ESP32 中的分区表采用二进制格式，而不是 CSV 文件本身。此时，partition_table/gen.esp32part.py 工具可以实现 CSV 和二进制文件之间的转换。

如果您在配置菜单（idf.py menuconfig）中设置了分区表 CSV 文件的名称，然后构建项目或执行 idf.py partition-table，这时，转换将在编译过程中自动完成。

手动将 CSV 文件转换为二进制文件:

```
python gen.esp32part.py input_partitions.csv binary_partitions.bin
```

手动将二进制文件转换为 CSV 文件:
Chapter 4. API 指南

```python gen_esp32part.py binary_partitions.bin input_partitions.csv```

在标准输出 (stdout) 上，打印二进制分区表的内容（运行 idf.py partition-table 时展示的信息摘要也是这样生成的）:

```python gen_esp32part.py binary_partitions.bin```

### 4.22.5 分区大小检查

ESP-IDF 构建系统将自动检查生成的二进制文件大小与可用的分区大小是否匹配，如果二进制文件太大，则会构建失败并报错。

目前会对以下二进制文件进行检查:

- 引导加载程序的二进制文件的大小要适合分区表前的区域大小（分区表前的区域都分配给了引导加载程序），具体请参考引导加载程序大小。
- 应用程序二进制文件应至少适合一个“app”类型的分区。如果不适合任何应用程序分区，则会构建失败。如果只适合某些应用程序分区，则会打印相关警告。

**备注**: 即使分区大小检查返回错误并导致构建失败，仍然会生成可以烧录的二进制文件（它们对于可用空间来说过大，因此无法正常工作）。

### MD5 校验和

二进制格式的分区表中含有一个 MD5 校验和。这个 MD5 校验和是根据分区表内容计算的，可在设备启动阶段，用于验证分区表的完整性。

用户可通过 gen_esp32part.py 的 --disable-md5sum 选项或者 CONFIG_PARTITION_TABLE_MD5 选项关闭 MD5 校验。对于 ESP-IDF v3.1 版本前的引导加载程序, 因为它不支持 MD5 校验, 所以无法正常启动并报告 invalid magic number 0xebeb, 此时用户可以使用此选项关闭 MD5 校验。

### 4.22.6 烧写分区表

- idf.py partition-table-flash: 使用 esptool.py 工具烧写分区表。
- idf.py flash: 会烧写所有内容，包括分区表。

在执行 idf.py partition-table 命令时，手动烧写分区表的命令也将打印在终端上。

**备注**: 分区表的更新并不会擦除根据旧分区表存储的数据。此时，您可以使用 idf.py erase-flash 命令或者 esptool.py erase_flash 命令来擦除 flash 中的所有内容。

### 4.22.7 分区工具 (parttool.py)

parttion_table 组件中有分区工具 parttool.py，可以在目标设备上完成分区相关操作。该工具具有如下用途:

- 读取分区，将内存存储到文件中 (read_partition)
- 将文件中的内容写入分区 (write_partition)
- 擦除分区 (erase_partition)
- 检索特定分区的名称、偏移、大小和 flag（“加密”）标志等信息 (get_partition_info)

用户若想通过编程方式完成相关操作，可从另一个 Python 脚本导入并使用分区工具，或者从 Shell 脚本调用分区工具。前者可使用工具的 Python API，后者可使用命令行界面。
Python API

首先请确保已导入 `parttool` 模块。

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # 从环境中获取 IDF_PATH 的值
parttool_dir = os.path.join(idf_path, "components", "partition_table")  # parttool.py 位于 $IDF_PATH/components/partition_table 下

sys.path.append(parttool_dir)  # 使能 Python 寻找 parttool 模块
from parttool import *  # 导入 parttool 模块内的所有名称
```

要使用分区工具的 Python API，第一步是创建 `ParttoolTarget`:

```python
# 创建 parttool.py 的目标设备，并将目标设备连接到串行端口 /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

现在，可使用创建的 `ParttoolTarget` 在目标设备上完成操作:

```python
# 擦除名为 ‘storage’ 的分区
target.erase_partition(PartitionName("storage"))

# 读取类型为 ‘data’、子类型为 ‘spiffs’ 的分区，保存至文件 ‘spiffs.bin’
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# 将 ‘factory.bin’ 文件的内容写入 ‘factory’ 分区
target.write_partition(PartitionName("factory"), "factory.bin")

# 打印默认启动分区的大小
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

使用 `PartitionName`、`PartitionType` 或 `PARTITION_BOOT_DEFAULT` 指定要操作的分区。顾名思义，这三个参数可以指向拥有特定名称的分区、特定类型和子类型的分区或默认启动分区。

更多关于 Python API 的信息，请查看分区工具的代码注释。

命令行界面

`parttool.py` 的命令行界面具有如下结构:

```
parttool.py [command-args] [subcommand] [subcommand-args]
```

- `command-args` - 执行主命令（parttool.py）所需的实际参数，多与目标设备有关
- `subcommand` - 要执行的操作
- `subcommand-args` - 所选操作的实际参数

```bash
# 擦除名为 ‘storage’ 的分区
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# 读取类型为 ‘data’、子类型为 ‘spiffs’ 的分区，保存到 ‘spiffs.bin’ 文件
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-
 subtype=spiffs --output "spiffs.bin"

# 将 ‘factory.bin’ 文件中的内容写入到 ‘factory’ 分区
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory --input
 "factory.bin"
```

(下页继续)
Chapter 4. API

4.23 Performance

ESP-IDF ships with default settings that are designed for a trade-off between performance, resource usage, and available functionality.

These guides describe how to optimize a firmware application for a particular aspect of performance. Usually this involves some trade-off in terms of limiting available functions, or swapping one aspect of performance (such as execution speed) for another (such as RAM usage).

4.23.1 How to Optimize Performance

1. Decide what the performance-critical aspects of your application are (for example: a particular response time to a certain network operation, a particular startup time limit, particular peripheral data throughput, etc.).
2. Find a way to measure this performance (some methods are outlined in the guides below).
3. Modify the code and project configuration and compare the new measurement to the old measurement.
4. Repeat step 3 until the performance meets the requirements set out in step 1.

4.23.2 Guides

Maximizing Execution Speed

Overview Optimizing execution speed is a key element of software performance. Code that executes faster can also have other positive effects, like reducing overall power consumption. However, improving execution speed may have trade-offs with other aspects of performance such as Minimizing Binary Size.

Choose What To Optimize If a function in the application firmware is executed once per week in the background, it may not matter if that function takes 10 ms or 100 ms to execute. If a function is executed constantly at 10 Hz, it matters greatly if it takes 10 ms or 100 ms to execute.

Most application firmwares will only have a small set of functions which require optimal performance. Perhaps those functions are executed very often, or have to meet some application requirements for latency or throughput. Optimization efforts should be targeted at these particular functions.

Measuring Performance The first step to improving something is to measure it.

Basic Performance Measurements If measuring performance relative to an external interaction with the world, you may be able to measure this directly (for example see the examples wifi/iperf and ethernet/iperf for measuring general network performance, or you can use an oscilloscope or logic analyzer to measure timing of an interaction with a device peripheral.)

Otherwise, one way to measure performance is to augment the code to take timing measurements:

```bash
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --info size
```

更多信息可用 -help 指令查看：

```bash
parttool.py --help
```

```bash
parttool.py [subcommand] --help
```
#include "esp_timer.h"

void measure_important_function(void) {
    const unsigned MEASUREMENTS = 5000;
    uint64_t start = esp_timer_get_time();
    for (int retries = 0; retries < MEASUREMENTS; retries++) {
        important_function(); // This is the thing you need to measure
    }
    uint64_t end = esp_timer_get_time();
    printf("%u iterations took %llu milliseconds (%llu microseconds per...
        invocation), MEASUREMENTS, (end - start)/1000, (end - start)/MEASUREMENTS);
}

Executing the target multiple times can help average out factors like RTOS context switches, overhead of measurements, etc.

- Using `esp_timer_get_time()` generates “wall clock” timestamps with microsecond precision, but has moderate overhead each time the timing functions are called.
- It’s also possible to use the standard Unix `gettimeofday()` and `utime()` functions, although the overhead is slightly higher.
- Otherwise, including `hal/cpu_hal.h` and calling the HAL function `cpu_hal_get_cycle_count()` will return the number of CPU cycles executed. This function has lower overhead than the others. It is good for measuring very short execution times with high precision.
- The CPU cycles are counted per-core, so only use this method from an interrupt handler, or a task that is pinned to a single core.
- If making “microbenchmarks” (i.e. benchmarking only a very small routine of code that runs in less than 1-2 milliseconds) then flash cache performance can sometimes cause big variations in timing measurements depending on the binary. This happens because binary layout can cause different patterns of cache misses in a particular sequence of execution. If the test code is larger then this effect usually averages out. Executing a small function multiple times when benchmarking can help reduce the impact of flash cache misses. Alternatively, move this code to IRAM (see Targeted Optimizations).

**External Tracing**  
The 应用层跟踪库 allows measuring code execution with minimal impact on the code itself.

**Tasks**  
If the option `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS` is enabled then the FreeRTOS API `vTaskGetRunTimeStats()` can be used to retrieve runtime information about the processor time used by each FreeRTOS task.

**SEGGER SystemView** is an excellent tool for visualizing task execution and looking for performance issues or improvements in the system as a whole.

**Improving Overall Speed**  
The following optimizations will improve the execution of nearly all code - including boot times, throughput, latency, etc:

- Set `CONFIG_ESPTOOLPY_FLASHFREQ` to 80 MHz. This is double the 40 MHz default value and will double the speed at which code is loaded or executed from flash. You should verify that the board or module that connects the ESP32 to the flash chip is rated for 80 MHz operation at the relevant temperature ranges, before changing this setting. The hardware datasheet(s) will have this information.
- Set `CONFIG_ESPTOOLPY_FLASHMODE` to QIO or QOUT mode (Quad I/O). Both will almost double the speed at which code is loaded or executed from flash compared to the default DIO mode. QIO is slightly faster than QOUT if both are supported. Note that both the flash chip model and the electrical connections between the ESP32 and the flash chip must support quad I/O modes or the SoC will not work correctly.
• Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for performance (-O2)”. This may slightly increase binary size compared to the default setting, but will almost certainly increase performance of some code. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise are not seen.

• If the application uses PSRAM and is based on ESP32 rev. 3 (ECO3), setting `CONFIG_ESP32_REV_MIN` to 3 will disable PSRAM bug workarounds, reducing the code size and improving overall performance.

• Avoid using floating point arithmetic (`float`). Even though ESP32 has a single precision hardware floating point unit, floating point calculations are always slower than integer calculations. If possible then use fixed point representations, a different method of integer representation, or convert part of the calculation to be integer only before switching to floating point.

• Avoid using double precision floating point arithmetic (`double`). These calculations are emulated in software and are very slow. If possible then use an integer-based representation, or single-precision floating point.

Reduce Logging Overhead  Although standard output is buffered, it’s possible for an application to be limited by the rate at which it can print data to log output once buffers are full. This is particularly relevant for startup time if a lot of output is logged, but can happen at other times as well. There are multiple ways to solve this problem:

• Reduce the volume of log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL` (the equivalent bootloader setting is `CONFIG_BOOTLOADER_LOG_LEVEL`). This also reduces the binary size, and saves some CPU time spent on string formatting.

• Increase the speed of logging output by increasing the `CONFIG_ESP_CONSOLE_UART_BAUDRATE`.

Not Recommended  The following options will also increase execution speed, but are not recommended as they also reduce the debuggability of the firmware application and may increase the severity of any bugs.

• Set `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to disabled. This also reduces firmware binary size by a small amount. However, it may increase the severity of bugs in the firmware including security-related bugs. If necessary to do this to optimize a particular function, consider adding `#define NDEBUG` in the top of that single source file instead.

Targeted Optimizations  The following changes will increase the speed of a chosen part of the firmware application:

• Move frequently executed code to IRAM. By default, all code in the app is executed from flash cache. This means that it’s possible for the CPU to have to wait on a “cache miss” while the next instructions are loaded from flash. Functions which are copied into IRAM are loaded once at boot time, and then will always execute at full speed.

IRAM is a limited resource, and using more IRAM may reduce available DRAM, so a strategic approach is needed when moving code to IRAM. See IRAM（指令 RAM） for more information.

• Jump table optimizations can be re-enabled for individual source files that don’t need to be placed in IRAM. For hot paths in large switch cases this will improve performance. For instructions on how to add the `-fjump-tables -ftree-switch-conversion` options when compiling individual source files, see 算法编辑控制

Improving Startup Time  In addition to the overall performance improvements shown above, the following options can be tweaked to specifically reduce startup time:

• Minimizing the `CONFIG_LOG_DEFAULT_LEVEL` and `CONFIG_BOOTLOADER_LOG_LEVEL` has a large impact on startup time. To enable more logging after the app starts up, set the `CONFIG_LOG_MAXIMUM_LEVEL` as well and then call `esp_log_level_set()` to restore higher level logs. The `system/startup_time` main function shows how to do this.
• If using deep sleep, setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` allows a faster wake from sleep. Note that if using Secure Boot this represents a security compromise, as Secure Boot validation will not be performed on wake.

• Setting `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON` will skip verifying the binary on every boot from power-on reset. How much time this saves depends on the binary size and the flash settings. Note that this setting carries some risk if the flash becomes corrupt unexpectedly. Read the help text of the `config item` for an explanation and recommendations if using this option.

• It’s possible to save a small amount of time during boot by disabling RTC slow clock calibration. To do so, set `CONFIG_RTC_CLK_CAL_CYCLES` to 0. Any part of the firmware that uses RTC slow clock as a timing source will be less accurate as a result.

The example project `system/startup_time` is pre-configured to optimize startup time. The file `system/startup_time/sdkconfig.defaults` contain all of these settings. You can append these to the end of your project’s own `sdkconfig` file to merge the settings, but please read the documentation for each setting first.

**Task Priorities** As ESP-IDF FreeRTOS is a real-time operating system, it’s necessary to ensure that high throughput or low latency tasks are granted a high priority in order to run immediately. Priority is set when calling `xTaskCreate()` or `xTaskCreatePinnedToCore()` and can be changed at runtime by calling `vTaskPrioritySet()`.

It’s also necessary to ensure that tasks yield CPU (by calling `vTaskDelay()`, `sleep()`, or by blocking on semaphores, queues, task notifications, etc) in order to not starve lower priority tasks and cause problems for the overall system. The Task Watchdog Timer (TWDT) provides a mechanism to automatically detect if task starvation happens, however note that a Task WDT timeout does not always indicate a problem (sometimes the correct operation of the firmware requires some long-running computation). In these cases tweaking the Task WDT timeout or even disabling the Task WDT may be necessary.

**Built-In Task Priorities** ESP-IDF starts a number of system tasks at fixed priority levels. Some are automatically started during the boot process, some are started only if the application firmware initializes a particular feature. To optimize performance, structure application task priorities so that they are not delayed by system tasks, while also not starving system tasks and impacting other functions of the system.

This may require splitting up a particular task. For example, perform a time-critical operation in a high priority task or an interrupt handler and do the non-time-critical part in a lower priority task.

Header `components/esp_system/include/esp_task.h` contains macros for the priority levels used for built-in ESP-IDF tasks system.

Common priorities are:

- **Main task that executes `app_main` function** has minimum priority (1). This task is pinned to Core 0 by default (configurable).
- **High Resolution Timer (ESP Timer)** system task to manage high precision timer events and execute callbacks has high priority (22, `ESP_TASK_TIMER_PRIO`). This task is pinned to Core 0.
- FreeRTOS Timer Task to handle FreeRTOS timer callbacks is created when the scheduler initializes and has minimum task priority (1, configurable). This task is pinned to Core 0.
- **Event Handling** system task to manage the default system event loop and execute callbacks has high priority (20, `ESP_TASK_EVENT_PRIO`) and pinned to Core 0. This configuration is only used if the application calls `esp_event_loop_create_default()`, it’s possible to call `esp_event_loop_create()` with a custom task configuration instead.
- **lwIP TCP/IP** task has high priority (18, `ESP_TASK_TCPIP_PRIO`) and is not pinned to any core (configurable).
- **Wi-Fi Driver** task has high priority (23) and is pinned to Core 0 by default (configurable).
- Wi-Fi `wpa_supplicant` component may create dedicated tasks while the Wi-Fi Protected Setup (WPS), WPA2 EAP-TLS, Device Provisioning Protocol (DPP) or BSS Transition Management (BTM) features are in use. These tasks all have low priority (2) and are not pinned to any core.
• Bluetooth Controller task has high priority (23, ESP_TASK_BT_CONTROLLER_PRIO) and is pinned to Core 0 by default (configurable). The Bluetooth Controller needs to respond to requests with low latency, so it should always be close to the highest priority task assigned to a single CPU.

• NmBLE Bluetooth Host task has high priority (21) and is pinned to Core 0 by default (configurable).

• Bluedroid Bluetooth Host creates multiple tasks when used:
  – Stack event callback task ("BTC") has high priority (19).
  – Stack BTU layer task has high priority (20).
  – Host HCI host task has high priority (22).

  All Bluedroid Tasks are pinned to the same core, which is Core 0 by default (configurable).

• The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config ETH_MAC_DEFAULT_CONFIG then the priority is medium-high (15) and the task is not pinned to any core. These settings can be changed by passing a custom eth_mac_config_t struct when initializing the Ethernet MAC.

• If using the MQTT component, it creates a task with default priority 5 (configurable, depends on CONFIG_MQTT_USE_CUSTOM_CONFIG) and not pinned to any core (configurable).

• To see what is the task priority for mDNS service, please check Performance Optimization.

Choosing application task priorities

With a few exceptions (most importantly the lwIP TCP/IP task), in the default configuration most built-in tasks are pinned to Core 0. This makes it quite easy for the application to place high priority tasks on Core 1. Using priority 19 or higher will guarantee an application task can run on Core 1 without being preempted by any built-in task. To further isolate the tasks running on each CPU, configure the lwIP task to only run on Core 0 instead of either core (this may reduce total TCP/IP throughput depending on what other tasks are running).

In general, it’s not recommended to set task priorities on Core 0 higher than the built-in Wi-Fi/BT operations as starving them of CPU may make the system unstable. Choosing priority 19 and Core 0 will allow lower layer Wi-Fi/BT functionality to run without delays, but still pre-empts the lwIP TCP/IP stack and other less time-critical internal functionality - this is an option for time-critical tasks that don’t perform network operations. Any task that does TCP/IP network operations should run at lower priority than the lwIP TCP/IP task (18) to avoid priority inversion issues.

备注：Setting a task to always run in preference to built-in ESP-IDF tasks does not require pinning to Core 1. The task can be left unpinned - at priority 17 or lower - to optionally run on Core 0 as well, if no higher priority built-in task is running there. Using unpinned tasks can improve the overall CPU utilization, however it makes reasoning about task scheduling more complex.

备注：Task execution is always completely suspended when writing to the built-in SPI flash chip. Only IRAM 安全中断处理程序 will continue executing.

Improving Interrupt Performance

ESP-IDF supports dynamic Interrupt allocation with interrupt preemption. Each interrupt in the system has a priority, and higher priority interrupts will preempt lower priority ones.

Interrupt handlers will execute in preference to any task (provided the task is not inside a critical section). For this reason, it’s important to minimize the amount of time spent executing in an interrupt handler.

To obtain the best performance for a particular interrupt handler:

• Assign more important interrupts a higher priority using a flag such as ESP_INTR_FLAG_LEVEL2 or ESP_INTR_FLAG_LEVEL3 when calling esp_intr_alloc().

• Assign the interrupt on a CPU where built-in Wi-Fi/BT tasks are not configured to run (this means assigning on Core 1 by default, see Built-In Task Priorities). Interrupts are assigned on the same CPU where the esp_intr_alloc() function call is made.
• If you’re sure the entire interrupt handler can run from IRAM (see IRAM 安全中断处理程序) then set the ESP_INTR_FLAG_IRAM flag when calling esp_intr_alloc() to assign the interrupt. This prevents it being temporarily disabled if the application firmware writes to the internal SPI flash.

• Even if the interrupt handler is not IRAM safe, if it is going to be executed frequently then consider moving the handler function to IRAM anyhow. This minimizes the chance of a flash cache miss when the interrupt code is executed (see Targeted Optimizations). It’s possible to do this without adding the ESP_INTR_FLAG_IRAM flag to mark the interrupt as IRAM-safe, if only part of the handler is guaranteed to be in IRAM.

### Improving Network Speed

• For Wi-Fi, see 如何提高 Wi-Fi 性能 and Wi-Fi 缓冲区使用情况

• For lwIP TCP/IP (Wi-Fi and Ethernet), see Performance Optimization

• The wifi/iperf example contains a configuration that is heavily optimized for Wi-Fi TCP/IP throughput. Append the contents of the files wifi/iperf/sdkconfig.defaults, wifi/iperf/sdkconfig.defaults.esp32 and wifi/iperf/sdkconfig.ci.99 to your project sdkconfig file in order to add all of these options. Note that some of these options may have trade-offs in terms of reduced debuggability, increased firmware size, increased memory usage, or reduced performance of other features. To get the best result, read the documentation pages linked above and use this information to determine exactly which options are best suited for your app.

### Minimizing Binary Size

The ESP-IDF build system compiles all source files in the project and ESP-IDF, but only functions and variables that are actually referenced by the program are linked into the final binary. In some cases, it is necessary to reduce the total size of the firmware binary (for example, in order to fit it into the available flash partition size).

The first step to reducing the total firmware binary size is measuring what is causing the size to increase.

#### Measuring Static Sizes

To optimize both firmware binary size and memory usage it’s necessary to measure statically allocated RAM ("data", "bss"), code ("text") and read-only data ("rodata") in your project.

Using the idf.py sub-commands size, size-components and size-files provides a summary of memory used by the project:

```
$ idf.py size
[...]
Total sizes:
  DRAM .data size: 14956 bytes
  DRAM .bss size: 15808 bytes
  Used static DRAM: 30764 bytes (149972 available, 17.0% used)
  Used static IRAM: 83918 bytes (47154 available, 64.0% used)
  Flash code: 559943 bytes
  Flash rodata: 176736 bytes
  Total image size: 835553 bytes (.bin may be padded larger)
```

This output breaks down the size of all static memory regions in the firmware binary:

• DRAM .data size is statically allocated RAM that is assigned to non-zero values at startup. This uses RAM (DRAM) at runtime and also uses space in the binary file.

• DRAM .bss size is statically allocated RAM that is assigned zero at startup. This uses RAM (DRAM) at runtime but doesn’t use any space in the binary file.
Chapter 4. API

- **Used static DRAM** is the total DRAM used by `.data + .bss`. The available size is the estimated amount of DRAM which will be available as heap memory at runtime (due to metadata overhead and implementation constraints, and heap allocations done by ESP-IDF during startup, the actual free heap at startup will be lower than this).

- **Used static IRAM** is the total size of executable code executed from IRAM. This uses space in the binary file and also reduces IRAM and/or DRAM (depending on sizes) available as heap memory at runtime. See **Optimizing IRAM Usage**.

- **Flash code** is the total size of executable code executed from flash cache (IROM). This uses space in the binary file.

- **Flash rodata** is the total size of read-only data loaded from flash cache (DROM). This uses space in the binary file.

- **Total image size** is the estimated total binary file size, which is the total of all the used memory types except for .bss.

**Component Usage Summary (idf.py size-components)** The summary output provided by idf.py size does not give enough detail to find the main contributor to excessive binary size. To analyze in more detail, use idf.py size-components

```
$ idf.py size-components
[...]
Total sizes:
DRAM .data size: 14956 bytes
DRAM .bss size: 15808 bytes
Used static DRAM: 30764 bytes (149972 available, 17.0% used)
Used static IRAM: 83918 bytes (47154 available, 64.0% used)
Flash code: 559943 bytes
Flash rodata: 176736 bytes
Total image size: 835553 bytes (.bin may be padded larger)
Per-archive contributions to ELF file:

Espressif Systems 2331 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
Chapter 4. API

The first lines of output from `idf.py size-components` are the same as `idf.py size`. After this a table is printed of “per-archive contributions to ELF file”. This means how much each static library archive has contributed to the final binary size.

Generally, one static library archive is built per component, although some are binary libraries included by a particular component (for example, `libnet80211.a` is included by `esp_wifi` component). There are also toolchain libraries such as `libc.a` and `libgcc.a` listed here, these provide Standard C/C++ Library and toolchain built-in functionality.

If your project is simple and only has a “main” component, then all of the project’s code will be shown under `libmain.a`. If your project includes its own components (see 枚建系統), then they will each be shown on a separate line.

The table is sorted in descending order of the total contribution to the binary size.

The columns are as follows:

- **DRAM .data & .bss & other**: .data and .bss are the same as for the totals shown above (static variables, these both reduce total available RAM at runtime but .bss doesn’t contribute to the binary file size). “other” is a column for any custom section types that also contribute to RAM size (usually this value is 0).
- **IRAM**: is the same as for the totals shown above (code linked to execute from IRAM, uses space in the binary file and also reduces IRAM that can be dynamically allocated at runtime using `HEAP_CAP_32BIT`.
- **D/IRAM**: Shows IRAM space which, due to occupying D/IRAM space, is also reducing available DRAM available as heap at runtime.
- **Flash code & rodata**: these are the same as the totals above, IROM and DROM space accessed from flash cache that contribute to the binary size.

### Source File Usage Summary (idf.py size-files)

For even more detail, run `idf.py size-files` to get a summary of the contribution each object file has made to the final binary size. Each object file corresponds to a single source file.

```
$ idf.py size-files
[...]
Total sizes:
  DRAM .data size:  14956 bytes
  DRAM .bss size:  15808 bytes
  Used static DRAM:  30764 bytes ( 149972 available, 17.0% used)
  Used static IRAM:  83918 bytes ( 47154 available, 64.0% used)
  Flash code:  559943 bytes
  Flash rodata:  176736 bytes
Total image size:~ 835553 bytes (.bin may be padded larger)
Per-file contributions to ELF file:
  x509_crt_bundle.S.o  0  0  0  0  0  64212
  wl_cnx.o  2  3183  0  221  0  13119
```

(续上页)
After the summary of total sizes, a table of “Per-file contributions to ELF file” is printed.
The columns are the same as shown above for \texttt{idy.py size-components}, but this time the granularity is the contribution of each individual object file to the binary size.

For example, we can see that the file \texttt{x509.crt_bundle.S.o} contributed 64212 bytes to the total firmware size, all as \texttt{.rodata} in flash. Therefore we can guess that this application is using the \textit{ESP x509 Certificate Bundle} feature and not using this feature would save at last this many bytes from the firmware size.

Some of the object files are linked from binary libraries and therefore you won’t find a corresponding source file. To locate which component a source file belongs to, it’s generally possible to search in the ESP-IDF source tree or look in the \textit{Linker Map File} for the full path.

\textbf{Comparing Two Binaries} If making some changes that affect binary size, it’s possible to use an ESP-IDF tool to break down the exact differences in size.

This operation isn’t part of \texttt{idf.py}, it’s necessary to run the \texttt{idf_size.py} Python tool directly.

To do so, first locate the linker map file in the build directory. It will have the name \texttt{PROJECTNAME.map}. The \texttt{idf_size.py} tool performs its analysis based on the output of the linker map file.

To compare with another binary, you will also need its corresponding \texttt{.map} file saved from the build directory.

For example, to compare two builds: one with the default \texttt{CONFIG_COMPILER_OPTIMIZATION} setting “Debug (-Og)” configuration and one with “Optimize for size (-Os)”:

\begin{verbatim}
$ $IDF_PATH/tools/idf_size.py --diff build_Og/https_request.map build_Os/https_request.map
<CURRENT> MAP file: build_Os/https_request.map
<REFERENCE> MAP file: build_Og/https_request.map
Difference is counted as <CURRENT> - <REFERENCE>, i.e. a positive number means that <CURRENT> is larger.
Total sizes of <CURRENT>:

<table>
<thead>
<tr>
<th>Component</th>
<th>Size</th>
<th>Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>DRAM .data</td>
<td>14516 bytes</td>
<td>-440 bytes</td>
</tr>
<tr>
<td>DRAM .bss</td>
<td>15792 bytes</td>
<td>-16 bytes</td>
</tr>
<tr>
<td>Used static DRAM</td>
<td>30308 bytes</td>
<td>-5420 bytes</td>
</tr>
<tr>
<td>Used static IRAM</td>
<td>78498 bytes</td>
<td>+5420 bytes</td>
</tr>
<tr>
<td>Flash code</td>
<td>509183 bytes</td>
<td>-62764 bytes</td>
</tr>
<tr>
<td>Flash rodata</td>
<td>170592 bytes</td>
<td>-6144 bytes</td>
</tr>
<tr>
<td>Total image size</td>
<td>772789 bytes</td>
<td>-62764 bytes</td>
</tr>
</tbody>
</table>

We can see from the “Difference” column that changing this one setting caused the whole binary to be over 60 KB smaller and over 5 KB more RAM is available.

It’s also possible to use the “diff” mode to output a table of component-level (static library archive) differences:

\textbf{备注：} To get the output in JSON or CSV format using \texttt{idf_size.py} it is possible to use the \texttt{--format} option.

\begin{verbatim}
$ $IDF_PATH/tools/idf_size.py --archives --diff build_Og/https_request.map build_Os/https_request.map
Also at the individual source file level:

\end{verbatim}
Other options (like writing the output to a file) are available, pass --help to see the full list.

**Showing Size When Linker Fails**  If too much static memory is used, then the linker will fail with an error such as DRAM segment data does not fit, region `iram0_0_seg' overflowed by 44 bytes, or similar.

In these cases, idf.py size will not succeed either. However it is possible to run idf_size.py manually in order to view the partial static memory usage (the memory usage will miss the variables which could not be linked, so there still appears to be some free space.)

The map file argument is `<projectname>.map` in the build directory

```
$IDF_PATH/tools/idf_size.py build/project_name.map
```

It is also possible to view the equivalent of `size-components` or `size-files` output:

```
$IDF_PATH/tools/idf_size.py --archives build/project_name.map
$IDF_PATH/tools/idf_size.py --files build/project_name.map
```

**Linker Map File**  *This is an advanced analysis method, but it can be very useful. Feel free to skip ahead to :ref:`reducing-overall-size` and possibly come back to this later.*

The idf.py size analysis tools all work by parsing the GNU binutils “linker map file”, which is a summary of everything the linker did when it created ( “linked”) the final firmware binary file

Linker map files themselves are plain text files, so it’s possible to read them and find out exactly what the linker did. However, they are also very complex and long - often 100,000 or more lines!

The map file itself is broken into parts and each part has a heading. The parts are:

- **Archive member included to satisfy reference by file (symbol).** This shows you: for each object file included in the link, what symbol (function or variable) was the linker searching for when it included that object file. If you’re wondering why some object file in particular was included in the binary, this part may give a clue. This part can be used in conjunction with the Cross Reference Table at the end of the file. Note that not every object file shown in this list ends up included in the final binary, some end up in the Discarded input sections list instead.
- **Allocating common symbols** - This is a list of (some) global variables along with their sizes. Common symbols have a particular meaning in ELF binary files, but ESP-IDF doesn’t make much use of them.
- **Discarded input sections** - These sections were read by the linker as part of an object file to be linked into the final binary, but then nothing else referred to them so they were discarded from the final binary. For ESP-IDF this list can be very long, as we compile each function and static variable to a unique section in order to minimize the final binary size (specifically ESP-IDF uses compiler options -ffunction-sections -fdata-sections and linker option --gc-sections). Items mentioned in this list do not contribute to the final binary.
- **Memory Configuration, Linker script and memory map** These two parts go together. Some of the output comes directly from the linker command line and the Linker Script, both provided by the 构建系统. The linker script is partially generated from the ESP-IDF project using the 链接器脚本生成机制 feature. As the output of the Linker script and memory map part of the map unfolds, you can see each symbol (function or static variable) linked into the final binary along with its address (as a 16 digit hex number), its length (also in hex), and the library and object file it was linked from (which can be used to determine the component and source file).
  
  Following all of the output sections that take up space in the final .bin file, the memory map also includes some sections in the ELF file that are only used for debugging (ELF sections .debug_*.*, etc.). These don’t contribute to the final binary size. You’ll notice the address of these symbols is a very low number (starting from 0x0000000000000000 and counting up).
- **Cross Reference Table.** This table shows for each symbol (function or static variable), the list of object file(s) that referred to it. If you’re wondering why a particular thing is included in the binary, this will help determine what included it.
Unfortunately, the Cross Reference Table doesn’t only include symbols that made it into the final binary. It also includes symbols in discarded sections. Therefore, just because something is shown here doesn’t mean that it was included in the final binary - this needs to be checked separately.

Linker map files are generated by the GNU binutils linker “ld”, not ESP-IDF. You can find additional information online about the linker map file format. This quick summary is written from the perspective of ESP-IDF build system in particular.

### Reducing Overall Size

The following configuration options will reduce the final binary size of almost any ESP-IDF project:

- Set `CONFIG_COMPILER_OPTIMIZATION` to “Optimize for size (-Os)” . In some cases, “Optimize for performance (-O2)” will also reduce the binary size compared to the default. Note that if your code contains C or C++ Undefined Behaviour then increasing the compiler optimization level may expose bugs that otherwise don’t happen.
- Reduce the compiled-in log output by lowering the app `CONFIG_LOG_DEFAULT_LEVEL`. If the `CONFIG_LOG_MAXIMUM_LEVEL` is changed from the default then this setting controls the binary size instead. Reducing compiled-in logging reduces the number of strings in the binary, and also the code size of the calls to logging functions.
- Set the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL` to “Silent”. This avoids compiling in a dedicated assertion string and source file name for each assert that may fail. It’s still possible to find the failed assert in the code by looking at the memory address where the assertion failed.
- Besides the `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`, you can disable or silent the assertion for HAL component separately by setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL`. It is to notice that ESP-IDF lowers HAL assertion level in bootloader to be silent even if `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` is set to full-assertion level. This is to reduce the bootloader size.
- Set `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`. This removes specific error messages for particular internal ESP-IDF error check macros. This may make it harder to debug some error conditions by reading the log output.
- If the binary needs to run on only certain revision(s) of ESP32, increasing `CONFIG_ESP32_REV_MIN` to match can result in a reduced binary size. This will make a large difference if setting ESP32 minimum revision 3, and PSRAM is enabled.
- Don’t enable `CONFIG_COMPILER_CXX.Exceptions, CONFIG_COMPILER_CXX.RTTI`, or set the `CONFIG_COMPILER_STACK_CHECK_MODE` to Overall. All of these options are already disabled by default, but they have a large impact on binary size.
- Disabling `CONFIG_ESP_ERR_TO_NAME_LOOKUP` will remove the lookup table to translate user-friendly names for error values (see 错误处理) in error logs, etc. This saves some binary size, but error values will be printed as integers only.
- Setting `CONFIG_ESP_SYSTEM_PANIC` to “Silent reboot” will save a small amount of binary size, however this is only recommended if no one will use UART output to debug the device.
- If the application binary uses only one of the security versions of the protocomm component, then the support for others can be disabled to save some code size. The support can be disabled through `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1` or `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2` respectively.

In addition to the many configuration items shown here, there are a number of configuration options where changing the option from the default will increase binary size. These are not noted here. Where the increase is significant, this is usually noted in the configuration item help text.

### Targeted Optimizations

The following binary size optimizations apply to a particular component or a function:
Wi-Fi

- Disabling `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE` will save some Wi-Fi binary size if WPA3 support is not needed. (Note that WPA3 is mandatory for new Wi-Fi device certifications.)
- Disabling `CONFIG_ESP_WIFI_SOFTAP_SUPPORT` will save some Wi-Fi binary size if soft-AP support is not needed.

ADC

- Disabling ADC calibration features `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`, `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`, `CONFIG_ADC_CAL_LUT_ENABLE` will save a small amount of binary size if ADC driver is used, at expense of accuracy.

Bluetooth NimBLE

If using NimBLE Bluetooth Host then the following modifications can reduce binary size:

- Set `CONFIG_BTDM_CTRL_BLE_MAX_CONN` to 1 if only one BLE connection is needed.
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS` to 1 if only one BLE connection is needed.
- Disable either `CONFIG_BT_NIMBLE_ROLE_CENTRAL` or `CONFIG_BT_NIMBLE_ROLE_OBSERVER` if these roles are not needed.
- Reducing `CONFIG_BT_NIMBLE_LOG_LEVEL` can reduce binary size. Note that if the overall log level has been reduced as described above in Reducing Overall Size then this also reduces the NimBLE log level.

lwIP IPv6

- Setting `CONFIG_LWIP_IPV6` to false will reduce the size of the lwIP TCP/IP stack, at the cost of only supporting IPv4.

备注：IPv6 is required by some components such as coap and ASIO port, These components will not be available if IPV6 is disabled.

Newlib nano formatting

By default, ESP-IDF uses newlib “full” formatting for I/O (printf, scanf, etc.)

Enabling the config option `CONFIG_NEWLIB_NANO_FORMAT` will switch newlib to the “nano” formatting mode. This both smaller in code size and a large part of the implementation is compiled into the ESP32 ROM, so it doesn’t need to be included in the binary at all.

The exact difference in binary size depends on which features the firmware uses, but 25 KB ~ 50 KB is typical.

Enabling Nano formatting also reduces the stack usage of each function that calls printf() or another string formatting function, see Reducing Stack Sizes.

“Nano” formatting doesn’t support 64-bit integers, or C99 formatting features. For a full list of restrictions, search for `--enable-newlib-nano-formatted-io` in the Newlib README file.

mbedTLS features

Under Component Config -> mbedTLS there are multiple mbedTLS features which are enabled by default but can be disabled if not needed to save code size.

These include:

- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SSL_CONTEXT.Serialization`
- `CONFIG_MBEDTLS_SSL_ALPN`
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
• CONFIG_MBEDTLS_CCM_C
• CONFIG_MBEDTLS_GCM_C
• CONFIG_MBEDTLS_ECP_C (Alternatively: Leave this option enabled but disable some of the elliptic curves listed in the sub-menu.)
• Change CONFIG_MBEDTLS_TLS_MODE if both server & client functionalities are not needed
• Consider disabling some ciphersuites listed in the “TLS Key Exchange Methods” sub-menu (i.e. CONFIG_MBEDTLS_KEY_EXCHANGE_RSA)

The help text for each option has some more information.

**Important:** It is strongly not recommended to disable all these mbedTLS options. Only disable options where you understand the functionality and are certain that it is not needed in the application. In particular:

- Ensure that any TLS server(s) the device connects to can still be used. If the server is controlled by a third party or a cloud service, recommend ensuring that the firmware supports at least two of the supported cipher suites in case one is disabled in a future update.
- Ensure that any TLS client(s) that connect to the device can still connect with supported/recommended cipher suites. Note that future versions of client operating systems may remove support for some features, so it is recommended to enable multiple supported cipher suites or algorithms for redundancy.

If depending on third party clients or servers, always pay attention to announcements about future changes to supported TLS features. If not, the ESP32 device may become inaccessible if support changes.

**Note:** Not every combination of mbedTLS compile-time config is tested in ESP-IDF. If you find a combination that fails to compile or function as expected, please report the details on GitHub.

**VFS** Virtual filesystem feature in ESP-IDF allows multiple filesystem drivers and file-like peripheral drivers to be accessed using standard I/O functions (`open`, `read`, `write`, etc.) and C library functions (`fopen`, `fread`, `fwrite`, etc.). When filesystem or file-like peripheral driver functionality is not used in the application this feature can be fully or partially disabled. VFS component provides the following configuration options:

- **CONFIG_VFS_SUPPORT_TERMIOS** — can be disabled if the application doesn’t use `termios` family of functions. Currently, these functions are implemented only for UART VFS driver. Most applications can disable this option. Disabling this option reduces the code size by about 1.8 kB.
- **CONFIG_VFS_SUPPORT_SELECT** — can be disabled if the application doesn’t use `select` function with file descriptors. Currently, only the UART and eventfd VFS drivers implement `select` support. Note that when this option is disabled, `select` can still be used for socket file descriptors. Disabling this option reduces the code size by about 2.7 kB.
- **CONFIG_VFS_SUPPORT_DIR** — can be disabled if the application doesn’t use directory related functions, such as `readdir` (see the description of this option for the complete list). Applications which only open, read and write specific files and don’t need to enumerate or create directories can disable this option, reducing the code size by 0.5 kB or more, depending on the filesystem drivers in use.
- **CONFIG_VFS_SUPPORT_IO** — can be disabled if the application doesn’t use filesystems or file-like peripheral drivers. This disables all VFS functionality, including the three options mentioned above. When this option is disabled, `console` can’t be used. Note that the application can still use standard I/O functions with socket file descriptors when this option is disabled. Compared to the default configuration, disabling this option reduces code size by about 9.4 kB.

**Bootloader Size** This document deals with the size of an ESP-IDF app binary only, and not the ESP-IDF 二级引导程序.

For a discussion of ESP-IDF bootloader binary size, see 引导加载程序大小.

**IRAM Binary Size** If the IRAM section of a binary is too large, this issue can be resolved by reducing IRAM memory usage. See Optimizing IRAM Usage.
Minimizing RAM Usage

In some cases, a firmware application’s available RAM may run low or run out entirely. In these cases, it’s necessary to tune the memory usage of the firmware application.

In general, firmware should aim to leave some “headroom” of free internal RAM in order to deal with extraordinary situations or changes in RAM usage in future updates.

Background  Before optimizing ESP-IDF RAM usage, it’s necessary to understand the basics of ESP32 memory types, the difference between static and dynamic memory usage in C, and the way ESP-IDF uses stack and heap. This information can all be found in Heap Memory Allocation.

Measuring Static Memory Usage  The idf.py tool can be used to generate reports about the static memory usage of an application. Refer to the Binary Size chapter for more information.

Measuring Dynamic Memory Usage  ESP-IDF contains a range of heap APIs for measuring free heap at runtime. See Heap Memory Debugging.

备注： In embedded systems, heap fragmentation can be a significant issue alongside total RAM usage. The heap measurement APIs provide ways to measure the “largest free block”. Monitoring this value along with the total number of free bytes can give a quick indication of whether heap fragmentation is becoming an issue.

Reducing Static Memory Usage

• Reducing the static memory usage of the application increases the amount of RAM available for heap at runtime, and vice versa.
• Generally speaking, minimizing static memory usage requires monitoring the .data and .bss sizes. For tools to do this, see Measuring Static Sizes.
• Internal ESP-IDF functions do not make heavy use of static RAM allocation in C. In many instances (including: Wi-Fi library, Bluetooth controller) “static” buffers are still allocated from heap, but the allocation is done once when the feature is initialized and will be freed if the feature is deinitialized. This is done in order to maximize the amount of free memory at different points in the application life-cycle.

To minimize static memory use:

• Declare structures, buffers, or other variables const whenever possible. Constant data can be stored in flash not RAM. This may require changing functions in the firmware to take const * arguments instead of mutable pointer arguments. These changes can also reduce the stack usage of some functions.
• If using Bluedroid, setting the option CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY will cause Bluedroid to allocate memory on initialization and free it on deinitialization. This doesn’t necessarily reduce the peak memory usage, but changes it from static memory usage to runtime memory usage.

Reducing Stack Sizes  In FreeRTOS, task stacks are usually allocated from the heap. The stack size for each task is fixed (passed as an argument to xTaskCreate()). Each task can use up to its allocated stack size, but using more than this will cause an otherwise valid program to crash with a stack overflow or heap corruption.

Therefore, determining the optimum sizes of each task stack can substantially reduce RAM usage.

To determine optimum task stack sizes:

• Combine tasks. The best task stack size is 0 bytes, achieved by combining a task with another existing task. Anywhere that the firmware can be structured to perform multiple functions sequentially in a single task will increase free memory. In some cases, using a “worker task” pattern where jobs are serialized into a FreeRTOS queue (or similar) and then processed by generic worker tasks may help.
• Consolidate task functions. String formatting functions (like printf) are particularly heavy users of stack, so any task which doesn’t ever call these can usually have its stack size reduced.

• Enabling Newlib nano formatting will reduce the stack usage of any task that calls printf() or other C string formatting functions.

• Avoid allocating large variables on the stack. In C, any large struct or array allocated as an “automatic” variable (i.e. default scope of a C declaration) will use space on the stack. Minimize the sizes of these, allocate them statically and/or see if you can save memory by allocating them from the heap only when they are needed.

• Avoid deep recursive function calls. Individual recursive function calls don’t always add a lot of stack usage each time they are called, but if each function includes large stack-based variables then the overhead can get quite high.

• At runtime, call the function uxTaskGetStackHighWaterMark() with the handle of any task where you think there is unused stack memory. This function returns the minimum lifetime free stack memory in bytes. The easiest time to call this is from the task itself: call uxTaskGetStackHighWaterMark(NULL) to get the current task’s high water mark after the time that the task has achieved its peak stack usage (i.e. if there is a main loop, execute the main loop a number of times with all possible states and then call uxTaskGetStackHighWaterMark()). Often, it’s possible to subtract almost the entire value returned here from the total stack size of a task, but allow some safety margin to account for unexpected small increases in stack usage at runtime.

• Call uxTaskGetSystemState() at runtime to get a summary of all tasks in the system. This includes their individual stack “high watermark” values.

• When debugger watchpoints are not being used, set the CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK option to trigger an immediate panic if a task writes the word at the end of its assigned stack. This is slightly more reliable than the default CONFIG_FREERTOS_CHECK_STACKOVERFLOW option of “Check using canary bytes”, because the panic happens immediately, not on the next RTOS context switch. Neither option is perfect, it’s possible in some cases for stack pointer to skip the watchpoint or canary bytes and corrupt another region of RAM, instead.

**Internal Stack Sizes**

ESP-IDF allocates a number of internal tasks for housekeeping purposes or operating system functions. Some are created during the startup process, and some are created at runtime when particular features are initialized.

The default stack sizes for these tasks are usually set conservatively high, to allow all common usage patterns. Many of the stack sizes are configurable, and it may be possible to reduce them to match the real runtime stack usage of the task.

重 要：If internal task stack sizes are set too small, ESP-IDF will crash unpredictably. Even if the root cause is task stack overflow, this is not always clear when debugging. It is recommended that internal stack sizes are only reduced carefully (if at all), with close attention to “high water mark” free space under load. If reporting an issue that occurs when internal task stack sizes have been reduced, please always include this information and the specific configuration that is being used.

• **Main task that executes app_main function** has stack size CONFIG_ESP_MAIN_TASK_STACK_SIZE.

• **High Resolution Timer (ESP Timer) system task which executes callbacks** has stack size CONFIG_ESP_TIMER_TASK_STACK_SIZE.

• FreeRTOS Timer Task to handle FreeRTOS timer callbacks has stack size CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH.

• **Event Handling** system task to execute callbacks for the default system event loop has stack size CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE.

• lwIP TCP/IP task has stack size CONFIG_LWIP_TCP_IP_TASK_STACK_SIZE.

• BlueDroid Bluetooth Host have task stack sizes CONFIG_BT_BTC_TASK_STACK_SIZE, CONFIG_BT_BTU_TASK_STACK_SIZE.

• NimBLE Bluetooth Host has task stack size CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE.

• The Ethernet driver creates a task for the MAC to receive Ethernet frames. If using the default config ETH_MAC_DEFAULT_CONFIG then the task stack size is 4 KB. This setting can be changed by passing a custom eth_mac_config_t struct when initializing the Ethernet MAC.
Chapter 4. API

- FreeRTOS idle task stack size is configured by `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`.
- If using the MQTT component, it creates a task with stack size configured by `CONFIG_MQTT_TASK_STACK_SIZE`. MQTT stack size can also be configured using `task_stack` field of `esp_mqtt_client_config_t`.
- To see how to optimize RAM usage when using mDNS, please check Performance Optimization.

备注：Aside from built-in system features such as esp-timer, if an ESP-IDF feature is not initialized by the firmware then no associated task is created. In those cases, the stack usage is zero and the stack size configuration for the task is not relevant.

Reducing Heap Usage  For functions that assist in analyzing heap usage at runtime, see Heap Memory Debugging.

Normally, optimizing heap usage consists of analyzing the usage and removing calls to `malloc()` that aren’t being used, reducing the corresponding sizes, or freeing previously allocated buffers earlier.

There are some ESP-IDF configuration options that can reduce heap usage at runtime:

- lwIP documentation has a section to configure Minimum RAM usage.
- Wi-Fi缓冲区使用情况 describes options to either reduce numbers of “static” buffers or reduce the maximum number of “dynamic” buffers in use, in order to minimize memory usage at possible cost of performance. Note that “static” Wi-Fi buffers are still allocated from heap when Wi-Fi is initialized and will be freed if Wi-Fi is deinitialized.
- The Ethernet driver allocates DMA buffers for the internal Ethernet MAC when it is initialized - configuration options are `CONFIG_ETH_DMA_BUFFER_SIZE`, `CONFIG_ETH_DMA_RX_BUFFER_NUM`, `CONFIG_ETH_DMA_TX_BUFFER_NUM`.
- Several Mbed TLS configuration options can be used to reduce heap memory usage. See the Mbed TLS docs for details.
- In single core mode only, it’s possible to use IRAM as byte accessible memory (added to the regular heap) by enabling `CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY`. Note that this option carries a performance penalty and the risk of security issues caused by executable data. If this option is enabled then it’s possible to set other options to prefer certain buffers be allocated from this memory: mbedTLS, NimBLE.
- Reduce `CONFIG_BTDM_CTRL_BLE_MAX_CONN` if using BLE.
- Reduce `CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN` if using Bluetooth Classic.

备注：There are other configuration options that will increase heap usage at runtime if changed from the defaults. These are not listed here, but the help text for the configuration item will mention if there is some memory impact.

Optimizing IRAM Usage  If the app allocates more static IRAM than is available then the app will fail to build and linker errors such as section `.iram0.text` will not fit in region `.iram0_0_seg`. IRAM0 segment data does not fit and region `.iram0_0_seg` overflowed by 84 bytes will be seen. If this happens, it is necessary to find ways to reduce static IRAM usage in order to link the application.

To analyze the IRAM usage in the firmware binary, use Measuring Static Sizes. If the firmware failed to link, steps to analyze are shown at Showing Size When Linker Fails.

The following options will reduce IRAM usage of some ESP-IDF features:

- Enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
- Enable `CONFIG_FREERTOSPLACE_SNAPSHOT_FUNS_INTO_FLASH`. Enabling this option will place snapshot-related functions, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, in flash.
- Enable `CONFIG_RINGBUFPPLACE_FUNCTIONS_INTO_FLASH`. Provided these functions are not (incorrectly) used from ISRs, this option is safe to enable in all configurations.
Chapter 4. API 指南

- Enable `CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH`. This option is not safe to use if the ISR ringbuf functions are used from an IRAM interrupt context, e.g. if `CONFIG_UART_ISR_IN_IRAM` is enabled. For the IDF drivers where this is the case you will get an error at run-time when installing the driver in question.
- Disable Wi-Fi options `CONFIG_ESP32_WIFI_IRAM_OPT` and/or `CONFIG_ESP32_WIFI_RX_IRAM_OPT`. Disabling these options will free available IRAM at the cost of Wi-Fi performance.
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH` disabling this option will free some IRAM but is only available in some flash configurations (see the configuration item help text).
- If the application uses PSRAM and is based on ESP32 rev. 3 (ECO3), setting `CONFIG_ESP32_REV_MIN` to 3 will disable PSRAM bug workarounds, saving ~10kB or more of IRAM.
- Disabling `CONFIG_ESP32_WIFI_IRAM_OPT` prevents posting `esp_event` events from IRAM 安全中断处理程序 but will save some IRAM.
- Disabling `CONFIG_SPI_MASTER_ISR_IN_IRAM` prevents `spi_master` interrupts from being serviced while writing to flash, and may otherwise reduce `spi_master` performance, but will save some IRAM.
- Setting `CONFIG_HAL_DEFAULT_ASSERTION_LEVEL` to disable assertion for HAL component will save some IRAM especially for HAL code who calls `HAL_ASSERT` a lot and resides in IRAM.

Putting C Library in Flash When compiling for ESP32 revisions older than ECO3 (`CONFIG_ESP32_REV_MIN`), PSRAM cache bug workaround (`CONFIG_SPIRAM_CACHE_WORKAROUND`) option is enabled, and the C library functions normally located in ROM are recompiled with the workaround and placed into IRAM instead. For most applications, it is safe to move many of the C library functions into Flash, claiming some IRAM. Corresponding options include:

- `CONFIG_SPIRAM_CACHE_LIBIMP_IN_IRAM`: affects the functions `longjmp` and `setjmp`.
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`: affects the functions `abs`, `div`, `labs`, `ldiv`, `quorem`, `fpclassify` and `nan`.
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`: affects the functions `utoa`, `itoa`, `atoi`, ` atol`, `strtol`, and `strtoul`.
- `CONFIG_SPIRAM_CACHE_LIBBIO_IN_IRAM`: affects the functions `wctomb`, `fwrite`, `wbuf`, `wsetup`, `fpwrite`, `wctomb_r`, `ungetc`, `makebuf`, `fllush`, `refill`, and `sccl`.
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`: affects the functions `asctime`, `asctime_r`, `ctime`, `ctime_r`, `lcltime`, `lcltime_r`, `gmtime`, `gmtime_r`, `strftime`, `mktime`, `tzset`, `time`, `gettinfo`, `system`, `month_lengths`, `timelocal`, `tzvars`, `tzlock`, `tzcalc_limits`, and `strptime`.
- `CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM`: affects the functions `ctype_r`, `toupper`, `tolower`, `toascii`, `strupr`, `bzero`, `isalnum`, `isalpha`, `isascii`, `isblank`, `iscntrl`, `isdigit`, `isgraph`, `islower`, `ispunct`, `isspace`, and `isupper`.
- `CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM`: affects the functions `memcpy`, `memchr`, `memmove`, and `memchr`.
- `CONFIG_SPIRAM_CACHE Libstrr_IN_IRAM`: affects the functions `stristr`, `strncmp`, `strndup`, `strdup`, `strndup_r`, `strftime`, `strleq`, `strleqr`, `strchr`, `strcoll`, `strncpy`, `strncpy_r`, `strlen`, `strlwr`, `strncasecmp`, `strncat`, `strncpy`, `strndup`, `strndup_r`, `strchr`, `strsep`, `strspn`, `strstr`, `strtok`, and `strupr`.
- `CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM`: affects the functions `rand`, `rand`, and `rand_r`.
- `CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM`: affects the functions `environ`, `environlock`, and `getenv_r`.
- `CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM`: affects the functions `lock_t`, `isatty`, `fclose`, `open`, `close`, `creat`, ` creat`, `read`, `rshift`, `sbrk`, `st dio`, `syssbrk`, `sysclose`, `sysopen`, `creat`, `sysread`, `syswrite`, `impure`, `fwrite`, and `findfp`.
- `CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM`: affects the functions `raise` and `system`.

The exact amount of IRAM saved will depend on how much C library code is actually used by the application. In addition to these, the following options may be used to move more of the C library code into Flash, however note that this may result in reduced performance. Also take care to not use corresponding C library functions from interrupts which may be called while cache is disabled (allocated with `ESP_INTR_FLAG_IRAM` flag), refer to IRAM 安全中断处理程序 for more details. For these reasons, the functions `itoa`, `memcmp`, `memcpy`, `memset`, `strcat`, `strcp y`, and `strlen` are always put in IRAM.
Moving frequently-called functions from IRAM to flash may increase their execution time.

Other configuration options exist that will increase IRAM usage by moving some functionality into IRAM, usually for performance, but the default option is not to do this. These are not listed here. The IRAM size impact of enabling these options is usually noted in the configuration item help text.

### 4.24 RF calibration

ESP32 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

#### 4.24.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to `menuconfig` and enable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`.

#### 4.24.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to `menuconfig` and disable `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don’t mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g., an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

#### 4.24.3 No calibration

No calibration method is only used when the device wakes up from deep sleep.

#### 4.24.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_phy/esp32/include/phy_init_data.h`. 
It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to menuconfig and disable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to menuconfig and enable `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`.

### 4.24.5 API Reference

#### Header File

- `components/esp_phy/include/esp_phy_init.h`

#### Functions

**const esp_phy_init_data_t** `*esp_phy_get_init_data (void)`

Get PHY init data.

If “Use a partition to store PHY init data” option is set in menuconfig, this function will load PHY init data from a partition. Otherwise, PHY init data will be compiled into the application itself, and this function will return a pointer to PHY init data located in read-only memory (DROM).

If “Use a partition to store PHY init data” option is enabled, this function may return NULL if the data loaded from flash is not valid.

备注: Call `esp_phy_release_init_data` to release the pointer obtained using this function after the call to `esp_wifi_init`.

返回 pointer to PHY init data structure

**void** `esp_phy_release_init_data (const esp_phy_init_data_t *data)`

Release PHY init data.

参数 data - pointer to PHY init data structure obtained from `esp_phy_get_init_data` function

**esp_err_t** `esp_phy_load_cal_data_from_nvs (esp_phy_calibration_data_t *out_cal_data)`

Function called by `esp_phy_init` to load PHY calibration data.

This is a convenience function which can be used to load PHY calibration data from NVS. Data can be stored to NVS using `esp_phy_store_cal_data_to_nvs` function.

If calibration data is not present in the NVS, or data is not valid (was obtained for a chip with a different MAC address, or obtained for a different version of software), this function will return an error.

If “Initialize PHY in startup code” option is set in menuconfig, this function will be used to load calibration data. To provide a different mechanism for loading calibration data, disable “Initialize PHY in startup code” option in menuconfig and call `esp_phy_init` function from the application. For an example usage of `esp_phy_init` and this function, see `esp_phy_store_cal_data_to_nvs` function in `cpu_start.c`.

参数 out_cal_data - pointer to calibration data structure to be filled with loaded data.

返回 ESP_OK on success

**esp_err_t** `esp_phy_store_cal_data_to_nvs (const esp_phy_calibration_data_t *cal_data)`

Function called by `esp_phy_init` to store PHY calibration data.

This is a convenience function which can be used to store PHY calibration data to the NVS. Calibration data is returned by `esp_phy_init` function. Data saved using this function to the NVS can later be loaded using `esp_phy_store_cal_data_to_nvs` function.
If “Initialize PHY in startup code” option is set in menuconfig, this function will be used to store calibration
data. To provide a different mechanism for storing calibration data, disable “Initialize PHY in startup code”
option in menuconfig and call esp_phy_init function from the application.

参数 cal_data - pointer to calibration data which has to be saved.

返回 ESP_OK on success

**esp_err_t esp_phy_erase_cal_data_in_nvs (void)**

Erase PHY calibration data which is stored in the NVS.

This is a function which can be used to trigger full calibration as a last-resort remedy if partial calibration is
used. It can be called in the application based on some conditions (e.g. an option provided in some diagnostic
mode).

返回 ESP_OK on success

返回 others on fail. Please refer to NVS API return value error number.

void esp_phy_enable (void)

Enable PHY and RF module.

PHY and RF module should be enabled in order to use WiFi or BT. Now PHY and RF enabling job is done
automatically when start WiFi or BT. Users should not call this API in their application.

void esp_phy_disable (void)

Disable PHY and RF module.

PHY module should be disabled in order to shutdown WiFi or BT. Now PHY and RF disabling job is done
automatically when stop WiFi or BT. Users should not call this API in their application.

void esp_phy_load_cal_and_init (void)

Load calibration data from NVS and initialize PHY and RF module.

void esp_phy_pd_mem_init (void)

Initialize backup memory for Phy power up/down.

void esp_phy_pd_mem_deinit (void)

Deinitialize backup memory for Phy power up/down.

void esp_phy_common_clock_enable (void)

Enable WiFi/BT common clock.

void esp_phy_common_clock_disable (void)

Disable WiFi/BT common clock.

int64_t esp_phy_rf_get_on_ts (void)

Get the timestamp when PHY/RF was switched on.

返回 return 0 if PHY/RF is never switched on. Otherwise return time in microsecond since boot
when phy/rf was last switched on

**esp_err_t esp_phy_update_country_info (const char *country)**

Update the corresponding PHY init type according to the country code of Wi-Fi.

参数 country – country code

返回 ESP_OK on success.

返回 esp_err_t code describing the error on fail

char *get_phy_version_str (void)

Get PHY lib version.

返回 PHY lib version.
Structures

struct esp_phy_init_data_t
  Structure holding PHY init parameters.

  **Public Members**

  uint8_t params[128]
  opaque PHY initialization parameters

struct esp_phy_calibration_data_t
  Opaque PHY calibration data.

  **Public Members**

  uint8_t version[4]
  PHY version

  uint8_t mac[6]
  The MAC address of the station

  uint8_t opaque[1894]
  calibration data

Enumerations

enum esp_phy_calibration_mode_t
  PHY calibration mode.

  **Values:**

  enumerator PHY_RF_CAL_PARTIAL
  Do part of RF calibration. This should be used after power-on reset.

  enumerator PHY_RF_CAL_NONE
  Don’t do any RF calibration. This mode is only suggested to be used after deep sleep reset.

  enumerator PHY_RF_CAL_FULL
  Do full RF calibration. Produces best results, but also consumes a lot of time and current. Suggested to be used once.

4.25 Security

This guide provides an overview of the overall security features available in Espressif solutions. It is highly recommended to consider this guide while designing the products with Espressif platform and ESP-IDF software stack from the “security” perspective.
4.25.1 Goals

High level security goals are as follows:

1. Preventing untrusted code execution
2. Protecting the identity and integrity of the code stored in the off-chip flash memory
3. Securing device identity
4. Secure storage for confidential data
5. Authenticated and encrypted communication from the device

4.25.2 Platform Security

Secure Boot

Secure Boot feature ensures that only authenticated software can execute on the device. Secure boot process forms chain of trust by verifying all mutable software entities involved in the ESP-IDF boot process. Signature verification happens during both boot-up as well as OTA updates.

Please refer to the Secure Boot (v2) Guide for detailed documentation about this feature.

For ESP32 before ECO3, please refer to Secure Boot (v1) Guide.

It is highly recommended that a secure boot feature be enabled on all production devices.

Secure Boot Best Practices

• Generate the signing key on a system with a quality source of entropy.
• Always keep the signing key private. A leak of this key will compromise the Secure Boot system.
• Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
• Ensure that all security eFuses have been correctly programmed, includes disabling of the debug interfaces, non-required boot mediums (e.g., UART DL mode) etc.

Flash Encryption

Flash Encryption feature helps to encrypt the contents on the off-chip flash memory and thus provides the confidentiality aspect to the software or data stored in the flash memory.

Please refer to the Flash Encryption Guide for detailed documentation about this feature.

Flash Encryption Best Practices

• It is recommended to use Flash Encryption release mode for the production use-cases.
• It is recommended to have a unique flash encryption key per device.
• Enable Secure Boot as an extra layer of protection, and to prevent an attacker from selectively corrupting any part of the flash before boot.

Debug Interfaces

JTAG

• JTAG interfaces stays disabled if any of the security features are enabled, please refer to JTAG 与闪存加密和安全引导 for more information.
• JTAG interface can also be disabled in the absence of any other security features using eFuse API.
Chapter 4. API 指南

UART DL Mode  For ESP32 ECO3 case, UART Download mode stays disabled if any of the security features are enabled in their release configuration. Alternatively, it can also be disabled by calling `esp_efuse_disable_rom_download_mode()` at runtime.

重要：If UART Download mode is disabled then `esptool` cannot work on the device.

4.25.3  Network Security

Wi-Fi

In addition to the traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), Wi-Fi driver in ESP-IDF also supports additional state-of-the-art security protocols. Please refer to the Wi-Fi Security for detailed documentation.

TLS (Transport Layer Security)

It is recommended to use TLS (Transport Layer Security) in all external communications, e.g., cloud communication, OTA updates etc. from the ESP device. ESP-IDF supports mbedTLS as the official TLS stack.

TLS is default integrated in ESP HTTP Client, ESP HTTPS Server and several other components that ship with ESP-IDF.

备注：It is recommended to use ESP-IDF protocol components in their default configuration which has been ensured to be secure. Disabling HTTPS and similar security critical configurations should be avoided.

ESP-TLS Abstraction  ESP-IDF provides an abstraction layer for most used TLS functionalities and hence it is recommended that an application makes use of the API exposed by ESP-TLS.

TLS Server verification section highlights diverse ways in which the identity of server could be established on the device side.

ESP Certificate Bundle  The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. The certificate bundle is the easiest way to verify the identity of almost all standard TLS servers.

重要：It is highly recommended to verify the identity of the server (based on X.509 certificates) to avoid establishing communication with the fake server.

4.25.4  Product Security

Secure Provisioning

Secure Provisioning refers to a process of secure on-boarding of the ESP device on to the Wi-Fi network. This mechanism also allows provision of additional custom configuration data during the initial provisioning phase from the provisioning entity (e.g., Smartphone).

ESP-IDF provides various security schemes to establish a secure session between ESP and the provisioning entity, they are highlighted at Security Schemes.

Please refer to the Wi-Fi Provisioning documentation for details and example code for this feature.
Secure OTA (Over-the-air) Updates

- OTA Updates must happen over secure transport, e.g., HTTPS.
- ESP-IDF provides a simplified abstraction layer ESP HTTPS OTA for this.
- If Secure Boot is enabled then server should host the signed application image.
- If Flash Encryption is enabled then no additional steps are required on the server side, encryption shall be taken care on the device itself during flash write.
- OTA update 回滚过程 can help to switch the application as active only after its functionality has been verified.

Anti-Rollback Protection  Anti-roll back protection feature ensures that device only executes application that meets the security version criteria as stored in its eFuse. So even though the application is trusted and signed by legitimate key it may contain some revoked security feature or credential and hence device must reject any such application.

ESP-IDF allows this feature for the application only and it’s managed through 2nd stage bootloader. The security version is stored in the device eFuse and it’s compared against the application image header during both bootup and over-the-air updates.

Please see more information to enable this feature in the 回滚 guide.

Encrypted Firmware Distribution  Encrypted firmware distribution during over-the-air updates ensure that the application stays encrypted in transit from server to the device. This can act as an additional layer of protection on top of the TLS communication during OTA updates and protect the identity of the application.

Please see working example for this documented in OTA Upgrades with Pre-Encrypted Firmware section.

Secure Storage

Secure storage refers to the application specific data that can be stored in a secure manner on the device (off-chip flash memory). This is typically read-write flash partition and holds device specific configuration data e.g., Wi-Fi credentials.

ESP-IDF provides “NVS (Non-volatile Storage)” management component which allows encrypted data partitions. This feature is tied with the platform Flash Encryption feature described earlier.

Please refer to the NVS Encryption for detailed documentation on the working and instructions to enable this feature.

Secure Device Control

ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTP or BLE in a secure manner using ESP Local Control component.

Please refer to the ESP Local Control for detailed documentation about this feature.

4.25.5 Security Policy

ESP-IDF GitHub repository has attached Security Policy Brief.
Adviseories

- Espressif publishes critical Security Advisories on the website, this includes both hardware and software related.
- ESP-IDF software components specific advisories are published through the GitHub repository.

Software Updates

Critical security issues in the ESP-IDF components, 3rd party libraries are fixed as and when we find them or when they are reported to us. Gradually, we make the fixes available in all applicable release branches in ESP-IDF.

Applicable security issues and CVEs for the ESP-IDF components, 3rd party libraries are mentioned in the ESP-IDF release notes.

We recommend periodically updating to the latest bugfix version of the ESP-IDF release to have all critical security fixes available.

4.26 Secure Boot

All references in this document are related to Secure Boot V1 (The AES based Secure Boot Scheme). ESP32 Revision 3 onwards, the preferred secure boot scheme is Secure Boot V2. Please refer to Secure Boot V2 document for ESP32 Revision 3 or ESP32-S2.

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each reset.

Secure Boot is separate from the Flash Encryption feature, and you can use secure boot without encrypting the flash contents. However, for a secure environment both should be used simultaneously. See Secure Boot & Flash Encryption for more details.

Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document throughly and understand the implications of enabling secure boot.

4.26.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (ABS_DONE_0) is burned (written to 1) to permanently enable secure boot on the chip. For more details on Efuses, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF].
- To understand the secure boot process, first familiarise yourself with the standard ESP-IDF boot process.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.

4.26.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under How To Enable Secure Boot. Further in-depth details are supplied under Technical Details:

1. The options to enable secure boot are provided in the Project Configuration Menu, under “Secure Boot Configuration”.
2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.
3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.
4. On first boot, the software bootloader follows the following process to enable secure boot:
   - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
   - The secure digest is flashed at offset 0x0 in the flash.
   - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
   - Bootloader permanently enables secure boot by burning the ABS_DONE_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)
5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see Secure Boot Hardware Support.

4.26.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see Re-Flashable Software Bootloader). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
- By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING_SCHEME efuse has value 1) and a 192 bit key must be stored in this block.

For more details, see ESP32 Technical Reference Manual > eFuse Controller (eFuse) > System Parameter coding_scheme [PDF].

The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits (details).

- “secure boot signing key” is a standard ECDSA public/private key pair (see Image Signing Algorithm) in PEM format.
- The public key from this key pair (for signature verification but not signature creation) is compiled into the software bootloader and used to verify the second stage of booting (partition table, app image) before booting continues. The public key can be freely distributed, it does not need to be kept secret.
- The private key from this key pair must be securely kept private, as anyone who has this key can authenticate to any bootloader that is configured with secure boot and the matching public key.

4.26.4 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See 引导加载程序大小.

4.26.5 How To Enable Secure Boot

1. Open the Project Configuration Menu, navigate to “Secure Boot Configuration” and select the option “One-time Flash”. (To understand the alternative “Reflashable” choice, see Re-Flashable Software Bootloader.)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.

4. The first time you run `make`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (`/dev/urandom` on OSX/Linux and `CryptGenRandom()` on Windows). If this random number source is weak, then the private key will be weak.

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See *Generating Secure Boot Signing Key* for more details.

5. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.

6. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by make) and then wait for flashing to complete. **Remember this is a one time flash, you can’t change the bootloader after this!**

7. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

备注：`idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

备注：Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注：If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).

### 4.26.6 Re-Flashable Software Bootloader

Configuration “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode *Secure Boot: Reflashable* is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digests for them.

In the esp-idf build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the *Generating Secure Boot Signing Key* step below). This private key’s SHA-256 digest is used as the secure bootloader key in eFuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.
Chapter 4. API

Although it’s possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

To enable a reflashable bootloader:

1. In the Project Configuration Menu, select “Bootloader Config” -> CONFIG_SECURE_BOOT -> CONFIG_SECURE_BOOT_V1_ENABLED -> CONFIG_SECURE_BOOTLOADER_MODE -> Reflashable.
2. If necessary, set the CONFIG_SECURE_BOOTLOADER_KEY_ENCODING based on the coding scheme used by the device. The coding scheme is shown in the Features line when esptool.py connects to the chip, or in the espefuse.py summary output.
3. Please follow the steps shown in Generating Secure Boot Signing Key to generate signing key. Path of the generated key file must be specified in “Secure Boot Configuration” menu.
4. Run idf.py bootloader. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an espefuse.py burn_key secure_boot_v1 path_to/secure-bootloader-key-xxx.bin command which is used to write the bootloader key to efuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).
5. Resume from Step 6 of the one-time flashing process, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

4.26.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via espsecure.py generate_signing_key. This uses the python-ecdsa library, which in turn uses Python’s os.urandom() as a random number source.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the openssl command line:

```
`openssl ecparam -name prime256v1 -genkey -noout -out my_secure_bootSigning_key.pem`
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

4.26.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates.

To extract the public key from the private key:

```
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_KEY
```

The path to the public signature verification key needs to be specified in the menuconfig under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:
4.26.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

4.26.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

Secure Boot Hardware Support

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32’s Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see Secure Bootloader Digest Algorithm. The digest can only be read back by software if Efuse ABS_DONE_0 is not burned (ie still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse ABS_DONE_0 is burned.

Secure Bootloader Digest Algorithm

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the espsecure.py tool in the components/esptool_py directory (specifically, the digest_secure_bootloader command).

Items marked with (^) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.

1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in Flash加密算法. (^)
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (^) 4. For each 16 byte plaintext block of the input image: - Reverse the byte order of the plaintext input block (^) - Apply AES256 in ECB mode to the plaintext block. - Reverse the byte order of the ciphertext output block. (^) - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (^)
6. Calculate SHA-512 of the ciphertext.
Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.

**Image Signing Algorithm**

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
  - In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

**Manual Commands**

Secure boot is integrated into the esp-idf build system, so make will automatically sign an app image if secure boot is enabled. `idf.py bootloader` will produce a bootloader digest if menuconfig is configured for it.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./image_signed.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```
espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./bootloader-digest.bin build/bootloader/bootloader.bin
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the `espsecure.py digest_secure_bootloader` command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:

```
esptool.py write_flash 0x0 bootloader-digest.bin
```

### 4.26.11 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

### 4.26.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See [How To Enable Signed App Verification](#) for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features -> Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you’ll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key”. In this case, private signing key should be generated by following instructions in Generating Secure Boot Signing Key; public verification key and signed images should be generated by following instructions in Remote Signing of Images.

4.26.13 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG 与闪存安全和安全引导 for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.27 Secure Boot V2

Important: This document is about Secure Boot V2, supported on the following chips: ESP32 (ECO3 onwards), ESP32-S2, ESP32-S3, ESP32-C3 (ECO3 onwards), and ESP32-C2. Except for ESP32, it is the only supported Secure Boot scheme.

For ESP32 before ECO3, refer to Secure Boot. It is recommended that users use Secure Boot V2 if they have a chip version that supports it. Secure Boot V2 is safer and more flexible than Secure Boot V1.

Secure Boot V2 uses RSA-PSS based app and bootloader verification. This document can also be used as a reference for signing apps using the RSA-PSS scheme without signing the bootloader.

Secure Boot V2 and RSA scheme (App Signing Scheme) options are available for ESP32 from ECO3 onwards. To use these options in menuconfig, set CONFIG_ESP32_REV_MIN greater than or equal to Rev 3.

4.27.1 Background

Secure Boot protects a device from running any unauthorized (i.e., unsigned) code by checking that each piece of software that is being booted is signed. On an ESP32, these pieces of software include the second stage bootloader and each application binary. Note that the first stage bootloader does not require signing as it is ROM code thus cannot be changed.

The Secure Boot process on the ESP32 involves the following steps:

1. When the first stage bootloader loads the second stage bootloader, the second stage bootloader’s RSA-PSS signature is verified. If the verification is successful, the second stage bootloader is executed.
2. When the second stage bootloader loads a particular application image, the application’s RSA-PSS signature is verified. If the verification is successful, the application image is executed.

### 4.27.2 Advantages

- The RSA-PSS public key is stored on the device. The corresponding RSA-PSS private key is kept at a secret place and is never accessed by the device.
- Only one public key can be generated and stored in the chip during manufacturing.
- Same image format and signature verification method is applied for applications and software bootloader.
- No secrets are stored on the device. Therefore, it is immune to passive side-channel attacks (timing or power analysis, etc.)

### 4.27.3 Secure Boot V2 Process

This is an overview of the Secure Boot V2 Process. Instructions how to enable Secure Boot are supplied in section *How To Enable Secure Boot V2*.

Secure Boot V2 verifies the bootloader image and application binary images using a dedicated *signature block*.

Each image has a separately generated signature block which is appended to the end of the image.

Only one signature block can be appended to the bootloader or application image in ESP32 ECO3.

Each signature block contains a signature of the preceding image as well as the corresponding RSA-3072 public key.

For more details about the format, refer to *Signature Block Format*. A digest of the RSA-3072 public key is stored in the eFuse.

The application image is not only verified on every boot but also on each over the air (OTA) update. If the currently selected OTA app image cannot be verified, the bootloader will fall back and look for another correctly signed application image.

The Secure Boot V2 process follows these steps:

1. On startup, the ROM code checks the Secure Boot V2 bit in the eFuse. If Secure Boot is disabled, a normal boot will be executed. If Secure Boot is enabled, the boot will proceed according to the following steps.
2. The ROM code verifies the bootloader’s signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
3. The ROM code verifies the bootloader image using the raw image data, its corresponding signature block(s), and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted.
4. The ROM code executes the bootloader.
5. The bootloader verifies the application image’s signature block (*Verifying a Signature Block*). If this fails, the boot process will be aborted.
6. The bootloader verifies the application image using the raw image data, its corresponding signature blocks and the eFuse (*Verifying an Image*). If this fails, the boot process will be aborted. If the verification fails but another application image is found, the bootloader will then try to verify that other image using steps 5 to 7. This repeats until a valid image is found or no other images are found.
7. The bootloader executes the verified application image.

### 4.27.4 Signature Block Format

The bootloader and application images are padded to the next 4096 byte boundary, thus the signature has a flash sector of its own. The signature is calculated over all bytes in the image including the padding bytes.

The content of each signature block is shown in the following table:
### Table 28: Content of a Signature Block

<table>
<thead>
<tr>
<th>Offset</th>
<th>Size (bytes)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>Magic byte</td>
</tr>
<tr>

</table>

备注：R和M’是用于硬件辅助蒙哥蒙特Montgomery乘法。

The remainder of the signature sector is erased flash (0xFF) which allows writing other signature blocks after previous signature block.

#### 4.27.5 Verifying a Signature Block

A signature block is “valid” if the first byte is 0xe7 and a valid CRC32 is stored at offset 1196. Otherwise it’s invalid.

#### 4.27.6 Verifying an Image

An image is “verified” if the public key stored in any signature block is valid for this device, and if the stored signature is valid for the image data read from flash.

1. Compare the SHA-256 hash digest of the public key embedded in the bootloader’s signature block with the digest(s) saved in the eFuses. If public key’s hash doesn’t match any of the hashes from the eFuses, the verification fails.
2. Generate the application image digest and match it with the image digest in the signature block. If the digests don’t match, the verification fails.
3. Use the public key to verify the signature of the bootloader image, using RSA-PSS (section 8.1.2 of RFC8017) with the image digest calculated in step (2) for comparison.

#### 4.27.7 Bootloader Size

Enabling Secure boot and/or flash encryption will increase the size of bootloader, which might require updating partition table offset. See 阅读加载程序大小.

#### 4.27.8 eFuse usage

ESP32-ECO3:

- ABS_DONE_1 - Enables Secure Boot protection on boot.
Chapter 4. API

- BLK2 - Stores the SHA-256 digest of the public key. SHA-256 hash of public key modulus, exponent, pre-calculated R & M’ values (represented as 776 bytes - offsets 36 to 812 - as per the Signature Block Format) is written to an eFuse key block. The write-protection bit must be set, but the read-protection bit must not.

The key(s) must be readable in order to give software access to it. If the key(s) is read-protected then the software reads the key(s) as all zeros and the signature verification process will fail, and the boot process will be aborted.

4.27.9 How To Enable Secure Boot V2

1. Open the Project Configuration Menu, in “Security features” set “Enable hardware Secure Boot in bootloader” to enable Secure Boot.

2. For ESP32, Secure Boot V2 is available only ESP32 ECO3 onwards. To view the “Secure Boot V2” option the chip revision should be changed to revision 3 (ESP32- ECO3). To change the chip revision, set “Minimum Supported ESP32 Revision” to Rev 3 in “Component Config” -> “ESP32- Specific”.

3. Specify the path to Secure Boot signing key, relative to the project directory.

4. Select the desired UART ROM download mode in “UART ROM download mode”. By default the UART ROM download mode has been kept enabled in order to prevent permanently disabling it in the development phase, this option is a potentially insecure option. It is recommended to disable the UART download mode for better security.

5. Set other menuconfig options (as desired). Then exit menuconfig and save your configuration.

6. The first time you run idf.py build, if the signing key is not found then an error message will be printed with a command to generate a signing key via espsecure.py generate_signing_key.

重要: A signing key generated this way will use the best random number source available to the OS and its Python installation (/dev/urandom on OSX/Linux and CryptGenRandom() on Windows). If this random number source is weak, then the private key will be weak.

重要: For production environments, we recommend generating the key pair using openssl or another industry standard encryption program. See Generating Secure Boot Signing Key for more details.

7. Run idf.py bootloader to build a Secure Boot enabled bootloader. The build output will include a prompt for a flashing command, using esptool.py write_flash.

8. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by the build system) and then wait for flashing to complete.

9. Run idf.py flash to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 6.

备注: idf.py flash doesn’t flash the bootloader if Secure Boot is enabled.

10. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable Secure Boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that Secure Boot is enabled and no errors have occurred due to the build configuration.

备注: Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

备注: If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.
11. On subsequent boots, the Secure Boot hardware will verify the software bootloader has not changed and the software bootloader will verify the signed app image (using the validated public key portion of its appended signature block).

### 4.27.10 Restrictions after Secure Boot is enabled

- Any updated bootloader or app will need to be signed with a key matching the digest already stored in eFuse.
- After Secure Boot is enabled, no further eFuses can be read protected. (If Flash encryption is enabled then the bootloader will ensure that any flash encryption key generated on first boot will already be read protected.) If `CONFIG_SECURE_BOOT_INSECURE` is enabled then this behavior can be disabled, but this is not recommended.

### 4.27.11 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via `espsecure.py generate_signing_key`.

The `--version 2` parameter will generate the RSA 3072 private key for Secure Boot V2.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available RSA-PSS key generation utilities.

For example, to generate a signing key using the openssl command line:

```
openssl genrsa -out my_secure_boot_signing_key.pem 3072
```

Remember that the strength of the Secure Boot system depends on keeping the signing key private.

### 4.27.12 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf Secure Boot configuration). The `espsecure.py` command line program can be used to sign app images & partition table data for Secure Boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system.

After the app image and partition table are built, the build system will print signing steps using `espsecure.py`:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `--output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --version 2 --keyfile PRIVATE_SIGNING_KEY --output SIGNED_--BINARY_FILE BINARY_FILE
```

### 4.27.13 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the Secure Boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using `espsecure.py`. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all Secure Boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use Secure Boot in combination with flash encryption to prevent local readout of the flash contents.
4.27.14 Technical Details

The following sections contain low-level reference descriptions of various Secure Boot elements:

Manual Commands

Secure boot is integrated into the esp-idf build system, so `idf.py build` will sign an app image and `idf.py bootloader` will produce a signed bootloader if secure signed binaries on build is enabled.

However, it is possible to use the `espsecure.py` tool to make standalone signatures and digests.

To sign a binary image:

```
espsecure.py sign_data --version 2 --keyfile ./my_signing_key.pem --output ./image_\n\n\nimage_signed.bin image_unsigned.bin
```

Keyfile is the PEM file containing an RSA-3072 private signing key.

4.27.15 Secure Boot & Flash Encryption

If Secure Boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.

4.27.16 Signed App Verification Without Hardware Secure Boot

The Secure Boot V2 signature of apps can be checked on OTA update, without enabling the hardware Secure Boot option. This option uses the same app signature scheme as Secure Boot V2, but unlike hardware Secure Boot it does not prevent an attacker who can write to flash from bypassing the signature protection.

This may be desirable in cases where the delay of Secure Boot verification on startup is unacceptable, and/or where the threat model does not include physical access or attackers writing to bootloader or app partitions in flash.

In this mode, the public key which is present in the signature block of the currently running app will be used to verify the signature of a newly updated app. (The signature on the running app isn’t verified during the update process, it’s assumed to be valid.) In this way the system creates a chain of trust from the running app to the newly updated app.

For this reason, it’s essential that the initial app flashed to the device is also signed. A check is run on app startup and the app will abort if no signatures are found. This is to try and prevent a situation where no update is possible. The app should have only one valid signature block in the first position. Note again that, unlike hardware Secure Boot V2, the signature of the running app isn’t verified on boot. The system only verifies a signature block in the first position and ignores any other appended signatures.

备注： In general, it’s recommended to use full hardware Secure Boot unless certain that this option is sufficient for application security needs.

How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features
2. Ensure App Signing Scheme is RSA. For ESP32 ECO3 chip, select `CONFIG_ESP32_REV_MIN` to Rev 3 to get RSA option available
3. Enable `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
4. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
5. If you disable “Sign binaries during build” option then all app binaries must be manually signed by following instructions in *Remote Signing of Images*.

警告: It is very important that all apps flashed have been signed, either during the build or after the build.

### 4.27.17 Advanced Features

**JTAG Debugging**

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See *JTAG与闪存加密和安全引导* for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

### 4.28 片外 RAM

#### 4.28.1 简介

ESP32 提供了好几 KB 的片上 RAM，可以满足大部分需求。但有些场景可能需要更多 RAM，因此 ESP32 另外提供了高达 4 MB 的片外 SPI RAM 存储器供用户使用。片外 RAM 已经集成到内存映射中，在某些范围内与片上 RAM 使用方式相同。

#### 4.28.2 硬件

ESP32 支持与 SPI flash 芯片并联的 SPI PSRAM（伪静态随机存储器）。虽然 ESP32 支持多种类型的 RAM 芯片，但 ESP-IDF 当前仅支持乐鑫品牌的 PSRAM 芯片，如 ESP-PSRAM32、ESP-PSRAM64 等。

**备注**: PSRAM 芯片的工作电压分为 1.8 V 和 3.3 V。其工作电压必须与 flash 的工作电压匹配。请查询您 PSRAM 芯片以及 ESP32 的技术规格书获取准确的工作电压。对于 1.8 V 的 PSRAM 芯片，请确保在启动时将 MTDI 管脚设置为高电平，或者将 ESP32 中的 eFuses 设置为始终使用 1.8 V 的 VDD_SIO 电平，否则有可能会损坏 PSRAM 和/或 flash 芯片。

**备注**: 乐鑫同时提供模组和系统级封装芯片，集成了兼容的 PSRAM 和 flash，可直接用于终端产品 PCB 中。如需了解更多信息，请前往乐鑫官网。

有关将 SoC 或模组管脚连接到片外 PSRAM 芯片的具体细节，请查阅 SoC 或模组技术规格书。

#### 4.28.3 配置片外 RAM

ESP-IDF 完全支持将片外 RAM 集成到您的应用程序中。在启动并完成片外 RAM 初始化后，可以将 ESP-IDF 配置为用多种方式处理片外 RAM:

- 集成片外 RAM 到 ESP32 内存映射
- 添加片外 RAM 到堆内存分配器
- 调用 malloc() 分配片外 RAM (default)
集成片外 RAM 到 ESP32 内存映射

在 CONFIG_SPIRAM_USE 中选择 “Integrate RAM into memory map (集成片外 RAM 到 ESP32 内存映射)” 选项。

这是集成片外 RAM 最基础的设置选项，大多数用户需要用到其他更高级的选项。

ESP-IDF 启动过程中，片外 RAM 被映射到 0x3F800000 起始的数据地址空间（字节可寻址），空间大小正好为 SPI RAM 的大小 (4 MB)。

应用程序可以通过创建指向该区域的指针手动将数据放入片外存储器，同时应用程序全程负责管理片外 SPI RAM，包括调用 Buffe 的使用，防止发生损坏等。

添加片外 RAM 到内存分配器

在 CONFIG_SPIRAM_USE 中选择 “Make RAM allocatable using heap_caps_malloc(...)” 选项。

启用上述选项后，片外 RAM 被映射到地址 0x3F800000，并将这个区域添加到携带 MALLOC_CAP_SPIRAM 标志的内存分配器。

程序如果想从片外存储器分配存储空间，则需要调用 heap_caps_malloc(size, MALLOC_CAP_SPIRAM)，之后可以调用 free() 函数释放这部分存储空间。

调用 malloc() 分配片外 RAM

在 CONFIG_SPIRAM_USE 中选择 “Make RAM allocatable using malloc() as well” 选项，该选项为默认选项。

启用此选项后，片外存储器将被添加到内存分配程序（与上一选项相同），同时也将被添加到由标准 malloc() 函数返回的 RAM 中。

应用程序因此可以使用片外 RAM，无需重写代码就能使用 heap_caps_malloc(..., MALLOC_CAP_SPIRAM)。

如果某次内存分配偏向于片外存储器，您也可以使用 CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL 设置分配空间的大小阈值，控制分配结果：

- 如果分配的空间小于阈值，分配程序将首先选择内部存储器。
- 如果分配的空间等于或大于阈值，分配程序将首先选择外部存储器。

如果优先考虑的内部或外部存储器中没有可用的存储块，分配程序则会选择其他类型存储。

由于有些内存缓冲器仅可在内部存储器中分配，因此需要使用第二个配置项 CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL 定义一个内存内核池，仅限显式的内部存储器分配使用（例如用于 DMA 的存储器）。常规 malloc() 将不会从该池中分配，但可以使用 MALLOC_CAP_DMA 和 MALLOC_CAP_INTERNAL 标志从该池中分配存储器。

允许.bss 段放入片外存储器

通过勾选 CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY 启用该选项。

启用该选项后，从 0x3F800000 起始的地址空间将用于存储来自 lwip, net80211, libpp 和 bluedroid ESP-IDF 库中初始化的数据（BSS 段）。

通过将宏 EXT_RAM_BSS_ATTR 应用于任何静态声明（初始化为非零值），可以将附加数据从内部 BSS 段移到片外 RAM。

也可以使用链接器片段方案 extram_bss 将组件即库的 BSS 段放到片外 RAM 中。

启用此选项可以减少 BSS 段占用的内部静态存储。

Espressif Systems 2363 Release v5.1-dev-2066-g7869f4e151
剩余的片外 RAM 也可以通过上述方法添加到堆分配器中。

允许`noinit`段放入片外存储器

通过勾选`CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`启用该选项。启用该选项后，外部 RAM 中提供的地址空间区域将用于存储未初始化的数据。即使在启动或重新启动期间，放置在该段中的值也不会被初始化或修改。

通过应用`EXT_RAM_NOINIT_ATTR`宏，可以将数据从内部 NOINIT 段移到片外 RAM。剩余的片外 RAM 也可以通过上述方法添加到堆分配器中，具体请参考添加片外 RAM 到堆内存分配器。

### 4.28.4 片外 RAM 使用限制

使用片外 RAM 有下面一些限制：

- flash cache 禁用时（比如，正在写入 flash），片外 RAM 将无法访问；同样，对片外 RAM 的读写操作也将导致 cache 访问异常。出于这个原因，ESP-IDF 不会在片外 RAM 中分配任务堆栈（详见下文）。
- 片外 RAM 不能用于储存 DMA 事务描述符，也不能用作 DMA 读写操作的缓冲区（Buffer）。因此，当片外 RAM 启用时，与 DMA 搭配使用的 Buffer 必须先使用 `heap_caps_malloc(size, MALLOC_CAP_DMA | MALLOC_CAP_INTERNAL)` 进行分配，之后可以调用标准 `free()` 回调释放 Buffer。
- 片外 RAM 与片外 flash 使用相同的 cache 区域，这意味着频繁在片外 RAM 访问的变量可以像在片上 RAM 中一样快速读取和修改。但访问大块数据时（大于 32 KB），cache 空间可能会不足，访问速度将回落到片外 RAM 访问速度。此外，访问大块数据会挤出 flash cache，可能降低代码执行速度。
- 一般来说，片外 RAM 不会用作任务堆栈存储器。`xTaskCreate()` 及类似函数始终会为堆栈和任务 TCB 分配片上储存器。

可以使用`CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY`选将任务堆栈放入片外存储器。这时，必须使用`xTaskCreateStatic()` 指定从片外存储器分配的任务堆栈缓冲区，否则任务堆栈将会从片上存储器分配。

### 4.28.5 初始化失败

默认情况下，片外 RAM 初始化失败将终止 ESP-IDF 启动。如果想禁用此功能，可启用`CONFIG_SPIRAM_IGNORE_NOTFOUND`配置选项。

如果启用`CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`，忽略失败的选项将无法使用，这是因为当链接时，链接器已经向片外存储器分配标志符。

- Regarding stacks in PSRAM: For tasks not calling on code in ROM in any way, directly or indirectly, the menuconfig option `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` will eliminate the check in `xTaskCreateStatic`, allowing a task’s stack to be in external RAM. Using this is not advised, however.

### 4.28.6 Chip revisions

There are some issues with certain revisions of ESP32 that have repercussions for use with external RAM. The issues are documented in the ESP32 ECO document. In particular, ESP-IDF handles the bugs mentioned in the following ways:

ESP32 rev v0

ESP-IDF has no workaround for the bugs in this revision of silicon, and it cannot be used to map external PSRAM into ESP32’s main memory map.
Chapter 4. API

ESP32 rev v1

The bugs in this revision of silicon cause issues if certain sequences of machine instructions operate on external memory. (ESP32 ECO 3.2). As a workaround, the GCC compiler received the flag `-mfix-esp32-psram-cache-issue` to filter these sequences and only output the code that can safely be executed. Enable this flag by checking `CONFIG_SPIRAM_CACHE_WORKAROUND`.

Aside from linking to a recompiled version of Newlib with the additional flag, ESP-IDF also does the following:

- Avoids using some ROM functions
- Allocates static memory for the WiFi stack

ESP32 rev v3

ESP32 revision 3 (“ECO V3”) fixes the PSRAM cache issue found in rev. 1. When `CONFIG_ESP32_REV_MIN` option is set to rev. 3, compiler workarounds related to PSRAM will be disabled. For more information about ESP32 ECO V3, see ESP32 ECO V3 User Guide.

4.29 Thread Local Storage

4.29.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- **FreeRTOS Native API**: ESP-IDF FreeRTOS native API.
- **Pthread API**: ESP-IDF’s pthread API.
- **C11 Standard**: C11 standard introduces special keyword to declare variables as thread local.

4.29.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS` configuration value. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses.

Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables.

If size of the variable is more then 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

4.29.3 Pthread API

The ESP-IDF provides the following pthread API to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`
This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

### 4.29.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see [https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local](https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local). Storage for that kind of variables is allocated on the task’s stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such variables at all. For example ESP-IDF system tasks (like `ipc.timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using minimal CPU instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

### 4.30 工具

#### 4.30.1 IDF Frontend - `idf.py`

The `idf.py` command-line tool provides a front-end for easily managing your project builds, deployment and debugging, and more. It manages several tools, for example:

- **CMake**, which configures the project to be built
- **Ninja** which builds the project
- **esptool.py** for flashing the target.

The [getting started guide](https://docs.espressif.com/projects/idf/en/latest/ Getting Started.html) contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

**重要**: `idf.py` should be run in an ESP-IDF “project” directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a `Makefile` will not work with `idf.py`.

**Commands**

**Start a new project: create-project**

```
idf.py create-project <project name>
```

This will create a new ESP-IDF project, additionally folder where the project will be created can be specified by the `--path` option.

**Create a new component: create-component**

```
idf.py create-component <component name>
```

This command creates a new component, which will have a minimum set of files necessary for building.

The `-C` option can be used to specify the directory the component will be created in. For more information about components see the [build system page](https://docs.espressif.com/projects/idf/en/latest/ Build System.html).

**Select the Target Chip: set-target**

ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py --list-targets`.

This sets the current project target:
**Chapter 4. API 指南**

```python
idf.py set-target <target>
```

**重要：** `idf.py set-target` 将清除构建目录并重新生成 `sdkconfig` 文件。旧的 `sdkconfig` 文件将保存为 `sdkconfig.old`。

**备注：** `idf.py set-target` 命令等同于以下操作：

1. 清除构建目录 (`idf.py fullclean`)
2. 移动 `sdkconfig` 文件到 `sdkconfig.old` (`mv sdkconfig sdkconfig.old`)
3. 配置新目标的项目 (`idf.py -DIDF_TARGET=esp32 reconfigure`)

也可以通过将所需的 `IDF_TARGET` 作为环境变量（例如 `export IDF_TARGET=esp32s2`）或作为 CMake 变量（例如 `IDF_TARGET=esp32s2`）传递给 CMake 或 `idf.py` 来指定。在大多数情况下，您可以将环境变量设置为一个方便的方法，如果您主要使用一种类型的芯片。

如果未由任何这些方法设置目标，则构建系统将默认设置为 `esp32` 目标。

**Start the graphical configuration tool: menuconfig**

```python
idf.py menuconfig
```

**Build the project: build**

```python
idf.py build
```

运行此命令将构建当前目录中找到的项目。这可能涉及多个步骤：

- 创建构建目录（`-B` 选项）。
- 运行必需的 CMake 配置整个项目，并为构建工具生成构建文件。
- 运行主构建工具（`Ninja` 或 `GNU Make`）。默认情况下，构建工具将自动检测到它，但可以使用 `-G` 选项显式设置。

构建是增量的，如果自上次构建以来没有更改源文件或配置，则没有任何操作。

另外，命令可以使用 `app`、`bootloader` 和 `partition-table` 参数仅构建这些应用程序、固件或分区表。

**Remove the build output: clean** 通过使用以下命令可以删除构建输出文件：

```python
idf.py clean
```

项目将被完全重建。使用此方法不会从构建目录中删除 CMake 配置输出。

**Delete the entire build contents: fullclean**

```python
idf.py fullclean
```
Running this command will delete the entire "build" directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes all files in the build directory, so use with care. Project configuration is not deleted.

**Flash the project: flash**

Running the following command:

```
idf.py flash
```

will automatically build the project if necessary, and then flash it to the target. You can use `-p` and `-b` options to set serial port name and flasher baud rate, respectively.

**备注:** The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

Similarly to the `build` command, the command can be run with `app`, `bootloader` and `partition-table` arguments to flash only the app, bootloader or partition table as applicable.

**Hints on how to resolve errors**

`idf.py` will try to suggest hints on how to resolve errors. It works with a database of hints stored in `tools/idf_py_actions/hints.yml` and the hints will be printed if a match is found for the given error. The monitor, menuconfig, gdb and openocd targets are not supported at the moment by automatic hints on resolving errors.

The `--no-hints` argument of `idf.py` can be used to turn the hints off in case they are not desired.

**Important notes**

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (i.e. building before flashing, erasing before flashing, etc.).

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports **shell autocompletion** for bash, zsh and fish shells.

In order to make **shell autocompletion** supported, please make sure you have at least Python 3.5 and **click** 7.1 or newer (**see also**).

To enable autocompletion for `idf.py` use the `export` command (**see this**). Autocompletion is initiated by pressing the TAB key. Type `idf.py` - and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

**Advanced Commands**

**Open the documentation: docs**

Using the following command the documentation for the projects target and version will be opened in the browser:

```
idf.py docs
```

**Show size: size**

```
idf.py size
```

Will print app size information including occupied RAM and FLASH and section sizes.
idf.py `size-components`

Similarly, this will print the same information for each component used in the project.

idf.py `size-files`

Will print size information per source file in the project.

**Options**

- `--format` specifies the output format with available options: `text`, `csv`, `json`, default being `text`.
- `--output-file` optionally specifies the name of the file to print the command output to instead of the standard output.

**Reconfigure the project: reconfigure**

idf.py `reconfigure`

This command re-runs `CMake` even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.

**Clean the python byte code: python-clean**

Generated python byte code can be deleted from the IDF directory using:

idf.py `python-clean`

The byte code may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

**Global Options**

To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `--C <dir>` allows overriding the project directory from the default current working directory.
- `--B <dir>` allows overriding the build directory from the default build subdirectory of the project directory.
- `--ccache` flag can be used to enable CCache when compiling source files, if the CCache tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling CCache and build again. CCache can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `--v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings found in the project directory only. This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.
- `--no-hints` flag to disable hints on resolving errors and disable capturing output.
4.30.2 IDF Docker Image

IDF Docker image (espressif/idf) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.7 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). IDF_PATH environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up PATH environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

Tags

Multiple tags of this image are maintained:

- latest: tracks master branch of ESP-IDF
- vX.Y: corresponds to ESP-IDF release vX.Y
- release-vX.Y: tracks release/vX.Y branch of ESP-IDF

This feature was introduced before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Usage

Setting up Docker Before using the espressif/idf Docker image locally, make sure you have Docker installed. Follow the instructions at https://docs.docker.com/install/, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

Building a project with CMake In the project directory, run:

```shell
docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build
```

The above command explained:

- docker run: runs a Docker image. It is a shorter form of the command docker container run.
- --rm: removes the container when the build is finished
- -v $PWD:/project: mounts the current directory on the host ($PWD) as /project directory in the container
- espressif/idf: uses Docker image espressif/idf with tag latest (implicitly added by Docker when no tag is specified)
- idf.py build: runs this command inside the container

To build with a specific docker image tag, specify it as espressif/idf:TAG, for example:

```shell
docker run --rm -v $PWD:/project -w /project espressif/idf:release-v4.4 idf.py --build
```

You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.
Using the image interactively  It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with `-i -t` flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use idf.py as usual:

```
idf.py menuconfig
idf.py build
```

备注: Commands which communicate with the development board, such as idf.py flash and idf.py monitor will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows (https://github.com/docker/for-win/issues/1018) and Docker for Mac (https://github.com/docker/for-mac/issues/900).

Building custom images

The Dockerfile in ESP-IDF repository provides several build arguments which can be used to customize the Docker image:

- **IDF_CLONE_URL**: URL of the repository to clone ESP-IDF from. Can be set to a custom URL when working with a fork of ESP-IDF. Default is https://github.com/espressif/esp-idf.git.
- **IDF_CLONE_BRANCH_OR_TAG**: Name of a git branch or tag use when cloning ESP-IDF. This value is passed to git clone command using the `--branch` argument. Default is master.
- **IDF_CHECKOUT_REF**: If this argument is set to a non-empty value, git checkout $IDF_CHECKOUT_REF command will be performed after cloning. This argument can be set to the SHA of the specific commit to check out, for example if some specific commit on a release branch is desired.
- **IDF_CLONE_SHALLOW**: If this argument is set to a non-empty value, `--depth=1 --shallow-submodules` arguments will be used when performing git clone. This significantly reduces the amount of data downloaded and the size of the resulting Docker image. However, if switching to a different branch in such a “shallow” repository is necessary, an additional git fetch origin <branch> command must be executed first.
- **IDF_INSTALL_TARGETS**: Comma-separated list of IDF targets to install toolchains for, or all to install toolchains for all targets. Selecting specific targets reduces the amount of data downloaded and the size of the resulting Docker image. Default is all.

To use these arguments, pass them via the `--build-arg` command line option. For example, the following command will build a Docker image with a shallow clone of ESP-IDF v4.4.1 and tools for ESP32-C3, only:

```
docker build -t idf-custom:v4.4.1-esp32c3
  --build-arg IDF_CLONE_BRANCH_OR_TAG=v4.4.1
  --build-arg IDF_CLONE_SHA=1
  --build-arg IDF_INSTALL_TARGETS=esp32c3
tools/docker
```

4.30.3 IDF Windows Installer

Command-line parameters

Windows Installer esp-idf-tools-setup provides the following command-line parameters:

- `/CONFIG=[PATH]` - Path to ini configuration file to override default configuration of the installer. Default: config.ini.
- `/GITRECURSIVE=[yes|no]` - Clone recursively all git repository submodules. Default: yes
Chapter 4. API

Unattended installation

The unattended installation of IDF can be achieved by following command-line parameters:

```
esp-idf-tools-setup-x.x.exe /VERYSILENT /SUPPRESSMSGBOXES /SP- /NOCANCEL
```

The installer detaches its process from the command-line. Waiting for installation to finish could be achieved by following PowerShell script:

```
$InstallerProcess = Get-Process esp-idf-tools-setup
Wait-Process -Id $InstallerProcess.id
```

Custom Python and custom location of Python wheels

The IDF installer is using by default embedded Python with reference to Python Wheel mirror. Following parameters allows to select custom Python and custom location of Python wheels:

```
esp-idf-tools-setup-x.x.exe /USEEMBEDDEDPYTHON=no /PYTHONWHEELSURL=https://pypi.org/simple/
```

4.30.4 IDF Component Manager

The IDF Component manager is a tool that downloads dependencies for any ESP-IDF CMake project. The download happens automatically during a run of CMake. It can source components either from the component registry or from a git repository.

A list of components can be found on https://components.espressif.com/

Using with a project

Dependencies for each component in the project are defined in a separate manifest file named idf_component.yml placed in the root of the component. The manifest file template can be created for a component by running
idf.py create-manifest --component=my_component. When a new manifest is added to one of the components in the project it’s necessary to reconfigure it manually by running idf.py reconfigure. Then build will track changes in idf_component.yml manifests and automatically triggers CMake when necessary.

There is an example application: example/build_system/cmake/component_manager that uses components installed by the component manager.

It’s not necessary to have a manifest for components that don’t need any managed dependencies.

When CMake configures the project (e.g. idf.py reconfigure) component manager does a few things:

- Processes idf_component.yml manifests for every component in the project and recursively solves dependencies
- Creates a dependencies.lock file in the root of the project with a full list of dependencies
- Downloads all dependencies to the managed_components directory

The lock-file dependencies.lock and content of managed_components directory is not supposed to be modified by a user. When the component manager runs it always make sure they are up to date. If these files were accidentally modified it’s possible to re-run the component manager by triggering CMake with idf.py reconfigure

**Defining dependencies in the manifest**

```yaml
dependencies:
  # Required IDF version
  idf: ">=4.1"
  # Defining a dependency from the registry:
  # https://components.espressif.com/component/example/cmp
  example/cmp: ">=1.0.0"

  # # Other ways to define dependencies
  # # For components maintained by Espressif only name can be used.
  # # Same as `espressif/cmp`
  # component: "~1.0.0"
  # # Or in a longer form with extra parameters
  # component2:
  # version: ">=2.0.0"
  # # For transient dependencies `public` flag can be set.
  # # `public` flag doesn't affect the `main` component.
  # # All dependencies of `main` are public by default.
  # public: true
  # # For components hosted on non-default registry:
  # service_url: "https://componentregistry.company.com"
  # # For components in git repository:
  # test_component:
  # path: test_component
  # git: ssh://git@gitlab.com/user/components.git
  # # For test projects during component development
  # # components can be used from a local directory
  # # with relative or absolute path
  # some_local_component:
  # path: ../../projects/component
```
Disabling the Component Manager

The component manager can be explicitly disabled by setting `IDF_COMPONENT_MANAGER` environment variable to 0.

4.30.5 IDF Clang Tidy

The IDF Clang Tidy is a tool that uses `clang-tidy` to run static analysis on your current app.

| Warning: | This functionality and the toolchain it relies on are still under development. There may be breaking changes before a final release. |

Prerequisites

If you have never run this tool before, take the following steps to get this tool prepared.

1. Run the export scripts (`export.sh`/`export.bat`/...) to set up the environment variables.
2. Run `pip install --upgrade pyclang` to install this plugin. The extra commands would be activated in `idf.py` automatically.
3. Run `idf_tools.py install esp-clang` to install the clang-tidy required binaries

| Note: | This toolchain is still under development. After the final release, you don’t have to install them manually. |

4. Get file from the llvm repository and add the folder of this script to the $PATH. Or you could pass an optional argument `--run-clang-tidy-py` later when you call `idf.py clang-check`. Please don’t forget to make the script executable.

| Note: | This file would be bundled in future toolchain releases. This is a temporary workaround. |

5. Run the export scripts (`export.sh`/`export.bat`/...) again to refresh the environment variables.

Extra Commands

- **clang-check** Run `idf.py clang-check` to re-generate the compilation database and run clang-tidy under your current project folder. The output would be written to `<project_dir>/warnings.txt`.

Run `idf.py clang-check --help` to see the full documentation.

- **clang-html-report**

  1. Run `pip install codereport` to install the additional dependency.

  2. Run `idf.py clang-html-report` to generate an HTML report in folder `<project_dir>/html_report` according to the `warnings.txt`. Please open the `<project_dir>/html_report/index.html` in your browser to check the report.

Bug Report

This tool is hosted in espressif/clang-tidy-runner. If you faced any bugs or have any feature request, please report them via github issues.
4.30.6 Downloadable Tools

ESP-IDF build process relies on a number of tools: cross-compiler toolchains, CMake build system, and others. Installing the tools using an OS-specific package manager (like apt, yum, brew, etc.) is the preferred method when the required version of the tool is available. This recommendation is reflected in the Getting Started guide. For example, on Linux and macOS it is recommended to install CMake using an OS package manager.

However, some of the tools are IDF-specific and are not available in OS package repositories. Furthermore, different versions of ESP-IDF require different versions of the tools to operate correctly. To solve these two problems, ESP-IDF provides a set of scripts for downloading and installing the correct versions of tools, and exposing them in the environment.

The rest of the document refers to these downloadable tools simply as “tools”. Other kinds of tools used in ESP-IDF are:

- Python scripts bundled with ESP-IDF (such as idf.py)
- Python packages installed from PyPI.

The following sections explain the installation method, and provide the list of tools installed on each platform.

Tools metadata file

The list of tools and tool versions required for each platform is located in tools/tools.json. The schema of this file is defined by tools/tools_schema.json. This file is used by tools/idf_tools.py script when installing the tools or setting up the environment variables.

Tools installation directory

IDF_TOOLS_PATH environment variable specifies the location where the tools are to be downloaded and installed. If not set, IDF_TOOLS_PATH defaults to HOME/.espressif on Linux and macOS, and %USER_PROFILE%\espressif on Windows.

Inside IDF_TOOLS_PATH, the scripts performing tools installation create the following directories and files:

- dist — where the archives of the tools are downloaded.
- tools — where the tools are extracted. The tools are extracted into subdirectories: tools/TOOL_NAME/VERSION/. This arrangement allows different versions of tools to be installed side by side.
- idf-env.json — user install options (targets, features) are stored in this file. Targets are selected chip targets for which tools are installed and kept up-to-date. Features determine the Python package set which should be installed. These options will be discussed later.
- python_env — not tools related; virtual Python environments are installed in the sub-directories.
- espidf.constraints.*.txt — one constraint file for each ESP-IDF release containing Python package version requirements.

GitHub Assets Mirror

Most of the tools downloaded by the tools installer are GitHub Release Assets, which are files attached to a software release on GitHub.

If GitHub downloads are inaccessible or slow to access, it’s possible to configure a GitHub assets mirror.
To use Espressif’s download server, set the environment variable `IDF_GITHUB_ASSETS` to `dl.espressif.com/github_assets`. When the install process is downloading a tool from `github.com`, the URL will be rewritten to use this server instead.

Any mirror server can be used provided the URL matches the `github.com` download URL format: the install process will replace `https://github.com` with `https://${IDF_GITHUB_ASSETS}` for any GitHub asset URL that it downloads.

**Note:** The Espressif download server doesn’t currently mirror everything from GitHub, it only mirrors files attached as Assets to some releases as well as source archives for some releases.

### `idf_tools.py` script

`tools/idf_tools.py` script bundled with ESP-IDF performs several functions:

- **install:** Download the tool into `${IDF_TOOLS_PATH}/dist` directory, extract it into `${IDF_TOOLS_PATH}/tools/TOOL_NAME/VERSION`. The `install` command accepts the list of tools to install, in `TOOL_NAME` or `TOOL_NAME@VERSION` format. If all is given, all the tools (required and optional ones) are installed. If no argument or required is given, only the required tools are installed.
- **download:** Similar to `install` but doesn’t extract the tools. An optional `--platform` argument may be used to download the tools for the specific platform.
- **export:** Lists the environment variables which need to be set to use the installed tools. For most of the tools, setting `PATH` environment variable is sufficient, but some tools require extra environment variables. The environment variables can be listed in either of `shell` or `key-value` formats, set by `--format` parameter:
  - `shell` produces output suitable for evaluation in the shell. For example,
    ```bash
    export PATH="/home/user/.espressif/tools/tool/v1.0.0/bin:$PATH"
    ```
on Linux and macOS, and
    ```bash
    set "PATH=C:\Users\user\.espressif\tools\v1.0.0\bin;%PATH%"
    ```
on Windows.

**Note:** Exporting environment variables in Powershell format is not supported at the moment. The `key-value` format may be used instead.

The output of this command may be used to update the environment variables, if the shell supports this. For example:

```bash
eval $(IDF_PATH/tools/idf_tools.py export)
```

- **key-value** produces output in `VARIABLE=VALUE` format, suitable for parsing by other scripts:

  ```bash
  PATH=/home/user/.espressif/tools/tool/v1.0.0:$PATH
  ```

  Note that the script consuming this output has to perform expansion of `$VAR` or `%VAR%` patterns found in the output.

- **list:** Lists the known versions of the tools, and indicates which ones are installed.
- **check:** For each tool, checks whether the tool is available in the system path and in `IDF_TOOLS_PATH`. 
• install-python-env: Create a Python virtual environment in the \${IDF_TOOLS_PATH}/python_env directory and install there the required Python packages. An optional --features argument allows one to specify a comma-separated list of features to be added or removed. Feature that begins with - will be removed and features with + or without any sign will be added. Example syntax for removing feature XY is --features=-XY and for adding --features=+XY or --features=XY. If both removing and adding options are provided with the same feature, no operation is performed. For each feature a requirements file must exist. For example, feature XY is a valid feature if \${IDF_PATH}/tools/requirements/requirements.XY.txt is an existing file with a list of Python packages to be installed. There is one mandatory core feature ensuring core functionality of ESP-IDF (build, flash, monitor, debug in console). There can be an arbitrary number of optional features. The selected list of features is stored in idf-env.json. The requirement files contain a list of the desired Python packages to be installed and espidf.constraints.*.txt downloaded from https://dl.espressif.com and stored in \${IDF_TOOLS_PATH} the package version requirements for a given ESP-IDF version. Although it is not recommended, the download and use of constraint files can be disabled with the --no-constraints argument or setting the IDF_PYTHON_CHECK_CONSTRAINTS environment variable to no.

• check-python-dependencies: Checks if all required Python packages are installed. Packages from \${IDF_PATH}/tools/requirements/requirements.*.txt files selected by the feature list of idf-env.json are checked with the package versions specified in the espidf.constraints.*.txt file. The constraint file is downloaded with install-python-env command. The use of constraints files can be disabled similarly to the install-python-env command.

• uninstall: Print and remove tools, that are currently not used by active ESP-IDF version.
  – --dry-run Print installed unused tools.
  – --remove-archives Additionally remove all older versions of previously downloaded installation packages.

Install scripts

Shell-specific user-facing scripts are provided in the root of ESP-IDF repository to facilitate tools installation. These are:

• install.bat for Windows Command Prompt
• install.ps1 for Powershell
• install.sh for Bash
• install.fish for Fish

Aside from downloading and installing the tools into IDF_TOOLS_PATH, these scripts prepare a Python virtual environment, and install the required packages into that environment.

These scripts accept optionally a comma separated list of chip targets and --enable-* arguments for enabling features. These arguments are passed to the idf_tools.py script which stores them in idf-env.json. Therefore, chip targets and features can be enabled incrementally.

Running the scripts without any optional arguments will install tools for all chip targets (by running idf_tools.py install --targets=all) and Python packages for core ESP-IDF functionality (by running idf_tools.py install-python-env --features=core).

Or for example, install.sh esp32 will install tools only for ESP32. See the Getting Started Guide for more examples.

install.sh --enable-XY will enable feature XY (by running idf_tools.py install-python-env --features=core,XY).

Export scripts

Since the installed tools are not permanently added into the user or system PATH environment variable, an extra step is required to use them in the command line. The following scripts modify the environment variables in the current shell to make the correct versions of the tools available:

• export.bat for Windows Command Prompt
• export.ps1 for Powershell
export.sh for Bash  
export.fish for Fish

备注：To modify the shell environment in Bash, `export.sh` must be “sourced”: `. ./export.sh` (note the leading dot and space). `export.sh` may be used with shells other than Bash (such as zsh). However in this case the IDF_PATH environment variable must be set before running the script. When used in Bash, the script will guess the IDF_PATH value from its own location.

In addition to calling `idf_tools.py`, these scripts list the directories which have been added to the PATH.

Other installation methods

Depending on the environment, more user-friendly wrappers for `idf_tools.py` are provided:

- **IDF Tools installer for Windows** can download and install the tools. Internally the installer uses `idf_tools.py`.
- **Eclipse Plugin** includes a menu item to set up the tools. Internally the plugin calls `idf_tools.py`.
- **VSCode Extension** for ESP-IDF includes an onboarding flow. This flow helps setting up the tools. Although the extension does not rely on `idf_tools.py`, the same installation method is used.

Custom installation

Although the methods above are recommended for ESP-IDF users, they are not a must for building ESP-IDF applications. ESP-IDF build system expects that all the necessary tools are installed somewhere, and made available in the PATH.

dfu-util  dfu-util (Device Firmware Upgrade Utilities)

License: GPL-2.0-only

More info: http://dfu-util.sourceforge.net/
### 4.31 ESP32 中的单元测试

ESP-IDF 提供以下方法测试软件。

- 一种是基于目标的测试, 该测试使用运行在 esp32 上的中央单元测试应用程序。这些测试使用的是基于 Unity 的单元测试框架。通过把测试用例放在组件的 test 子目录，可以将其集成到 ESP-IDF 组件中。本文档主要介绍这种方法的目标测试方法。
- 另一种是基于 Linux 主机的单元测试, 其中所有硬件行为都通过 Mock 组件进行模拟。此测试方法目前仍在开发中，暂且只有一小部分 IDF 组件支持 Mock，具体请参考基于 Linux 主机的单元测试。

#### 4.31.1 添加常规测试用例

单元测试被添加在相应组件的 test 子目录中。测试用例写在 C 文件中，一个 C 文件可以包含多个测试用例。测试文件的名字要以 “test” 开头。

测试文件需要包含 unity.h 头文件，此外还需要包含待测试 C 模块需要的头文件。

测试用例需要通过 C 文件中特定的函数来添加。如下所示:

```c
TEST_CASE("test name", "[module name]"
{
   // 在这里添加测试用例
}
```

- 第一个参数是此测试的描述性名称。
- 第二个参数是用方括号括起来的标识符。标识符用来对相关测试或具有特定属性的测试进行分组。

**备注：** 没有必要在每个测试用例中使用 UNITY_BEGIN() 和 UNITY_END() 来声明主函数的区域, unity_platform.c 会自动调用 UNITY_BEGIN(), 然后运行测试用例, 最后调用 UNITY_END()。

test 子目录应包含组件 CMakeLists.txt，因为他们本身就是一种组件（即测试组件）。ESP-IDF 使用了 Unity 测试框架, 基于 unity 组件里。因此, 每个测试组件都需要通过 REQUIRES 参数将 unity 组件设为依赖项。通常, 组件需要手动指定待编译的源文件, 但是, 对于测试组件来说, 这个要求被放宽为仅建议将参数 SRC_DIRS 用于 idf_component_register。

总的来说, test 子目录下最小的 CMakeLists.txt 文件可能如下所示:

```cmake
idf_component_register(SRC_DIRS "."
   INCLUDE_DIRS "."
   REQUIRES unity)
```

更多关于如何在 Unity 下编写测试用例的信息，请查阅 [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity)。
4.31.2 添加多设备测试用例

常规测试用例会在一个在试设备 (Device Under Test, DUT) 上执行。但是，由于要求互相通信的组件（比如 GPIO、SPI）需要与其他设备进行通信，因此不能使用常规测试用例进行测试。多设备测试用例包括写入多个测试函数，并在多个 DUT 运行测试。

以下是一个多设备测试用例：

```c
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    };
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}
void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    };
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}
TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", "[driver]", gpio_<master_test, gpio_slave_test>);
```

宏 TEST_CASE_MULTIPLE_DEVICES 用来声明多设备测试用例。

- 第一个参数指定测试用例的名字。
- 第二个参数是测试用例的描述。
- 从第三个参数开始，可以指定最多 5 个测试函数，每个函数都是单独运行在一个 DUT 上的测试入口点。

在不同的 DUT 上运行的测试用例需要相互之间进行同步。可以通过 unity_wait_for_signal 和 unity_send_signal 这两个函数使用 UART 进行同步操作。上例的场景中，slave 应该在 master 设置好 GPIO 电平时再读取 GPIO 电平，DUT 的 UART 终端会打印提示信息，并要求用户进行交互。

DUT1 (master) 终端:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) 终端:

```
Send signal: [output high level]!
```

一旦 DUT2 发送了该信号，您需要在 DUT1 的终端按回车键，然后 DUT1 会从 unity_wait_for_signal 函数中解除阻塞，并开始更改 GPIO 的电平。

4.31.3 添加多阶段测试用例

常规的测试用例无需重启就会结束（或者仅需要检查是否发生了重启），可有些时候我们想在某些特定类型的重启事件后运行指定的测试代码。例如，在深度睡眠唤醒后检查复位的原因是否正确。首先我们需要触发深度睡眠复位事件，然后检查复位的原因。为了实现这一点，可以通过定义多阶段测试用例来将这些测试函数组合在一起。
多阶段测试用例向用户呈现了一组测试函数，它需要用户进行交互（选择用例并选择不同的阶段）来运行。

### 4.31.4 应用于不同芯片的单元测试

某些测试（尤其与硬件相关的）不支持在所有的芯片上执行。请参照本节，让您的单元测试只在其中一部分芯片上执行。

1. 使用宏！(TEMPORARY_DISABLED_FOR_TARGETS()) 包装您的测试代码，并将其放于原始的测试文件中，或将代码分成按功能分组的文件。但请确保所有这些文件都会由编译器处理。例:

```c
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
TEST_CASE("a test that is not ready for esp32 and esp8266 yet", "]")
{
}
#endif //TEMPORARY_DISABLED_FOR_TARGETS(ESP32, ESP8266)
```

如果您需要将其中某个测试在特定芯片上编译，只需要修改禁止的芯片列表。推荐使用一些能在 soc_caps.h 中被清楚描述的通用概念来禁止某些单元测试。如果您已经进行上述操作，但一些测试在芯片中的调整未通过，请同时使用上述两种方法，当测试完成后再移除！(TEMPORARY_DISABLED_FOR_TARGETS())。例:

```c
#if SOC_SDIO_SLAVE_SUPPORTED
#if !TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
TEST_CASE("a sdio slave tests that is not ready for esp64 yet", "][sdio_slave]"
{
    //available for esp32 now, and will be available for esp64 in the future
}
#endif //TEMPORARY_DISABLED_FOR_TARGETS(ESP64)
#endif //SOC_SDIO_SLAVE_SUPPORTED
```

2. 对于某些您确定不会支持的测试 (例如，芯片根本没有该外设)，使用 DISABLED_FORTARGETS 来禁止该测试；对于其他只是临时性需要关闭的（例如，没有 runner 资源等）使用 TEMPORARY_DISABLED_FORTARGETS 来暂时关闭该测试。

一些禁用目标芯片测试用例的旧方法，由于它们具有明显的缺陷，已经被废弃，请勿继续使用：

- 请勿将测试代码放在 test/target 目录下并用 CMakeLists.txt 来选择其中一个进行编译。这是因为测试代码比实现代码更容易被复用。如果您将一些代码放在 test/esp32 目录下，您将无法执行它，一旦您需要在新的芯片（比如 esp32s3）中启用该测试，这种结构将变得难以保持代码整洁。
- 请勿继续使用 CONFIG_IDF_TARGET_xxx 宏来禁用测试。这种方法会导致被禁用的测试被忽略，功能可能会被忽略。并且，相比于自定义的 #if CONFIG_IDF_TARGET xxx，黑名单式的 #if !disabled 不会导致在新芯片上插入这些测试被自动禁用。但对于测试实现，仍然可以使用 #if CONFIG_IDF_TARGET xxx 给不同芯片版本选择实现代码。在测试项目中使用这种功能时，请自行判断如下:
  - 测试项目：那些会在一些芯片上执行，而在另外一些芯片上跳过的项目，例如:
有三个测试项目 SD 1-bit，SD 4-bit 和 SDSPI。对于不支持 SD Host 外设的 ESP32-S2 芯片，只有 SDSPI 一个项目需要被执行。

测试实现：一些始终会发生的代码，但采取的实现方式不同。例如：ESP3260 的 SDIO_PKT_LEN 寄存器。如果在测试过程中需要从 slave 设备的数据长度，您可以不同方式读取的 #if CONFIG_IDF_TARGET_宏来保护不同的实现代码。但请注意避免使用 #else 宏。这样当新芯片被引入时，测试就会在编译阶段失败，提示维护者去显示选择一个正确的测试实现。

### 4.31.5 编辑单元测试程序

按照 esp-idf 顶层目录的 README 文件中的说明进行操作，确保 IDF_PATH 环境变量已经被设置指向了 esp-idf 的顶层目录。

切换到 tools/unit-test-app 目录下进行配置和编译：

- `idf.py menuconfig` 配置单元测试程序。
- `idf.py -T all build` 编译单元测试程序，测试每个组件 test 子目录下的用例。
- `idf.py -T "xxx yyy" build` 编译单元测试程序，对已空格分隔的特定组件进行测试（如 `idf.py -T heap build` 仅对 heap 组件目录下的单元测试程序进行编译）。
- `idf.py -T all -E "xxx yyy" build` 编译单元测试程序，测试除指定组件之外的所有组件（例如 `idf.py -T all -E "ulp mbedtls" build` 编译所有的单元测试，不包括 ulp 和 mbedtls 组件）。

**备注：** 由于 Windows 命令提示符有限制，需使用以下语法来编译多个组件的单元测试程序：`idf.py -T xxx -T yyy build` 或者在 PowerShell 中使用 `idf.py -T "xxx yyy" build`。在 Windows 命令提示符下使用 `idf.py -T "ssd1306 hts221" build`。

当编译完成时，它会打印出烧写芯片的指令。您只需要运行 `idf.py flash` 即可烧写所有编译输出的文件。

您还可以运行 `idf.py -T all flash` 或者 `idf.py -T xxx flash` 来编译并烧写，所有需要的文件都会在烧写之前自动重新编译。

使用 `menuconfig` 可以设置烧写测试程序所使用的串口。更多信息，见 `tools/unit-test-app/README.md`。

### 4.31.6 运行单元测试

烧写完成后重启 ESP32，它将启动单元测试程序。

当单元测试应用程序空闲时，输入回车键，它会打印出测试菜单，其中包含所有的测试项目：

Here's the test menu, pick your combo:

1. "esp_ota_begin() verifies arguments" [ota]
2. "esp_ota_get_next_update_partition logic" [ota]
3. "Verify bootloader image in flash" [bootloader_support]
4. "Verify unit test app image" [bootloader_support]
5. "can use new and delete" [cxx]
6. "can call virtual functions" [cxx]
7. "can use static initializers for non-POD types" [cxx]
8. "can use std::vector" [cxx]
9. "static initialization guards work as expected" [cxx]
10. "global initializers run in the correct order" [cxx]
11. "before scheduler has started, static initializers work correctly" [cxx]
12. "adc2 work with wifi" [adc]
13. "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_device]
   1. "gpio_master_test"
   2. "gpio_slave_test"
14. "SPI Master clockdiv calculation routines" [spi]
常规测试用例会打印用例名字和描述，主从测试用例还会打印子菜单（已注册的测试函数的名字）。

可以输入以下任意一项来运行测试用例：
- 引号中写入测试用例的名字，运行单个测试用例。
- 测试用例的序号，运行单个测试用例。
- 方括号中的模块名字，运行指定模块所有的测试用例。
- 星号，运行所有测试用例。

`[multi_device]` 和 `[multi_stage]`` 标签告诉测试运行者该用例是多设备测试还是多阶段测试。这些标签由 `TEST_CASE_MULTIPLE_DEVICES` 和 `TEST_CASE_MULTIPLE_STAGES` 宏自动生成。

一旦选择了多设备测试用例，它会打印一个子菜单：

```plaintext
Running gpio master/slave test example...
gpio master/slave test example
   (1)  "gpio_master_test"
   (2)  "gpio_slave_test"
```

您需要输入数字以选择在 DUT 上运行的测试。

与多设备测试用例相似，多阶段测试用例也会打印子菜单：

```plaintext
Running reset reason check for deepsleep...
reset reason check for deepsleep
   (1)  "trigger_deepsleep"
   (2)  "check_deepsleep_reset_reason"
```

第一次执行此用例时，输入 1 运行第一阶段（触发深度睡眠）。在重启 DUT 并再次选择运行此用例后，输入 2 运行第二阶段。只有在最后一个阶段通过并且之前的阶段都成功触发了复位的情况下，该测试才算通过。

### 4.31.7 带缓冲补偿定时器的定时期代码

存储在外部存储器（如 SPI Flash 和 SPI RAM）中的指令和数据是通过 CPU 的统一指令和数据缓存来访问的。当代码或数据在缓存中时，访问速度会非常快（即缓存命中）。然而，如果指令或数据不在缓存中，则需要从外部存储器中获取（即缓存缺失）。访问外部存储器的速度明显较慢，因为 CPU 在等待从外部存储器获取指令或数据时会陷入停滞，从而导致整体代码执行速度会依据缓存命中或缓存缺失的次数而变化。

在不同的编译中，代码和数据的位置可能会有所不同，一些可能会更有利于缓存访问（即最大限度地减少缓存缺失）。理论上，这会影响执行速度，但这些因素通常无关紧要，因为它们的影响会在设备的运行过程中“平均化”。

然而，高速缓存对执行速度的影响可能与基准测试场景（尤其是微基准测试）有关。每次运行时间和构建时的测量时间可能会有所差异。减少差异的方法之一是将代码和数据分别放在指令或数据 RAM (IRAM/DRAM) 中。CPU 可以直接访问 IRAM 和 DRAM，从而消除了高速缓存的影响。然而，由于 IRAM 和 DRAM 容量有限，该方法并不总是可行。

缓存补偿定时器是上述方法的替代方法，该计时器使用处理器的内部事件计数器来确定在发生高速缓存未命中时等待代码/数据所花费的时间，然后从记录的实时时间中减去该时间。
缓存补偿定时器的限制之一是基准功能必须固定在一个内核上。这是由于每个内核都有自己的事件计数器，这些事件计数器彼此独立。例如，如果在一个内核上调用 ccomp_timer_start，使调度器进入睡眠状态，唤醒并再在另一个内核上重新调度，那么对应的 ccomp_timer_stop 将无效。

### 4.31.8 Mocks

**备注**：目前，只有一些特定的组件在 Linux 主机上运行时才能 Mock。未来我们计划，无论是在 Linux 主机上运行还是在目标芯片 ESP32 上运行，IDF 所有重要的组件都可以实现 Mock。

嵌入式系统中单元测试的最大问题之一是对硬件依赖性极强。直接在 ESP32 上运行单元测试对于上层组件来说存在极大的困难，原因如下：

- 受下层组件和/或硬件设置的影响，测试可复性降低。
- 由于下层组件和/或硬件设置的限制，测试边缘案例的难度提高。
- 由于数量庞大的依赖关系影响了行为，识别根本原因的难度提高。

当测试一个特定的组件（即被测组件）时，通过软件进行 Mock 能让所有被测组件的依赖在软件中被完全替换（即 Mock）。为了实现此功能，ESP-IDF 集成了 CMock 的 Mock 框架作为组件，通过在 ESP-IDF 的构建系统中添加一些 CMake 函数，可以方便地 Mock 整个（或部分）IDF 组件。

理想情况下，被测组件所依赖的所有组件都应该被 Mock，从而让测试环境完全控制与被测组件之间的所有交互。然而，如果 Mock 所有的组件过于复杂或冗长（例如需要模拟过多的函数调用），以下做法可能会有帮助：

- 在测试代码中包含更多“真正”（非模拟）代码。这样做可能有效，但同时也会增加对“真正”代码行为的依赖。此外，一旦测试失败，很难判断失败原因是因为实际测试代码还是“真正”地 IDF 代码。
- 重新评估被测代码的设计，尝试将被测代码划分为更易于管理的组件来减少其依赖性。这可能看起来很麻烦，但众所周知，单元测试经常暴露软件设计的弱点。修复设计上的弱点不仅在短期内有助于进行单元测试，而且还有助于长期的代码维护。

请参考 cmock/CMock/docs/CMock_Summary.md 了解 CMock 工作原理以及如何创建和使用 Mock。

**要求**

目前 Mock 只支持基于 Linux 主机的单元测试。生成 Mock 需要满足如下要求：

- Installed IDF including all IDF requirements
- CMock requirements (Ruby)
- System package requirements (libbsd, libbsd-dev)

**对组件进行 Mock**

要创建组件的 Mock 版本（也称为“组件模拟”），需要以特定方式覆盖组件。覆盖组件时需要创建一个与原始组件名称完全相同的组件，然后让构建系统先发现原始组件再发现这个具有相同名称的新组件。具体可参考同名组件。
在组件模拟中需要指定如下部分：

- 头文件，头文件中提供了需要生成模拟的函数
- 上述头文件的路径
- 模拟组件的依赖（如果头文件中包含有其他组件的文件，那么这点非常必要）

以上这些部分都需要使用 IDF 构建系统函数 `idf_component_mock` 指定。您可以使用 IDF 构建系统函数 `idf_component_get_property`，并加上标签 `COMPONENT_OVERRIDEN_DIR` 访问原始组件的组件目录，然后使用 `idf_component_mock` 注册模拟组件。

组件模拟还需要一个单独的 mock 目录，里面包含一个 mock_config.yaml 文件用于配置 CMock。以下是一份简单的 mock_config.yaml 文件：

```yaml
:cmock:
:plugins:
  - expect
  - expect_any_args
```

更多关于 CMock yaml 类型配置文件的详细信息，请查看 cmock/CMock/docs/CMock_Summary.md。

请注意，组件模拟不一定要对原始组件进行整体模拟。只要组件模拟满足测试项目的依赖以及其他代码对原始组件的依赖，部分模拟就足够了。事实上，IDF 中 `tools/mocks` 中的大多数组件模拟都只是部分地模拟了原始组件。

可在 IDF 目录的 `tools/mocks` 下找到组件模拟的示例。有关如何覆盖 IDF 组件，可查看同名组件。

### 修改单元测试文件

单元测试需要通知 `cmake` 构建系统对依赖的组件进行模拟（即用模拟组件来覆盖原始组件）。这可以通过将组件模拟放到项目的 components 目录，或者在项目的根目录 `CMakeLists.txt` 文件中使用以下代码来添加模拟组件的目录来实现：

```cmake
list(APPEND EXTRA_COMPONENT_DIRS "<mock_component_dir>")
```

这两种方法都会让组件模拟覆盖 ESP-IDF 中的现有组件。如果使用的是 IDF 提供的组件模拟，则第二个方法更加方便。

您可参考 esp_event 基于主机的单元测试及其 esp_event/host_test/esp_event_unit_test/CMakeLists.txt 作为组件模拟的示例。

### 4.32 Unit Testing on Linux

**备注：** Host testing with IDF is experimental for now. We try our best to keep interfaces stable but can’t guarantee it for now. Feedback via github or the forum on esp32.com is highly welcome, though and may influence the future design of the host-based tests.

This article provides an overview of unit tests with IDF on Linux. For using unit tests on the target, please refer to target based unit testing.
4.32.1 Embedded Software Tests

Embedded software tests are challenging due to the following factors:

- Difficulties running tests efficiently.
- Lack of many operating system abstractions when interfacing with hardware, making it difficult to isolate code under test.

To solve these two problems, Linux host-based tests with CMock are introduced. Linux host-based tests are more efficient than unit tests on the target since they:

- Compile the necessary code only
- Don’t need time to upload to a target
- Run much faster on a host-computer, compared to an ESP

Using the CMock framework also solves the problem of hardware dependencies. Through mocking, hardware details are emulated and specified at run time, but only if necessary.

Of course, using code on the host and using mocks does not fully represent the target device. Thus, two kinds of tests are recommended:

1. Unit tests which test program logic on a Linux machine, isolated through mocks.
2. System/Integration tests which test the interaction of components and the whole system. They run on the target, where irrelevant components and code may as well be emulated via mocks.

This documentation is about the first kind of tests. Refer to target based unit testing for more information on target tests (the second kind of tests).

4.32.2 IDF Unit Tests on Linux Host

The current focus of the Linux host tests is on creating isolated unit tests of components, while mocking the component’s dependencies with CMock.

A complete implementation of IDF to run on Linux does not exist currently.

Examples for running IDF-built code on Linux host include (non-exhaustive list):

- unit test for the NVS Page class.
- unit test for esp_event.
- unit test for mqtt.

Inside the component which should be tested, there is a separate directory host_test, besides the “traditional” test directory or the test_apps directory. It has one or more subdirectories:

- host_test/
  - fixtures/
    contains test fixtures (structs/functions to do test case setup and tear-down).
    If there are no fixtures, this can be omitted.
  - <test_name>/
    IDF applications which run the tests
  - <test_name2>/
    Further tests are possible.

The IDF applications inside host_test set the mocking configuration as described in the IDF unit test documentation.

The NVS page unit test provides some illustration of how to control the mocks.

Requirements

- Installed IDF including all IDF requirements
• CMock requirements (Ruby)
• System package requirements (libbsd, libbsd-dev)

The host tests have been tested on Ubuntu 20.04 with GCC version 9 and 10.

4.33 Wi-Fi 驱动程序

4.33.1 ESP32 Wi-Fi 功能列表

ESP32 支持以下 Wi-Fi 功能:
• 支持 4 个虚拟接口，即 STA、AP、Sniffer 和 reserved。
• 支持仅 station 模式、仅 AP 模式、station/AP 共存模式
• 支持使用 IEEE 802.11b、IEEE 802.11g、IEEE 802.11n 和 AP 配置协议模式
• 支持 WPA/WPA2/WPA3/WPA2-企业版/WPA3-企业版/WAPI/WPS 和 DPP
• 支持 AMSDU、AMPDU、HT40、QoS 以及其它主要功能
• 支持 Modem-sleep
• 支持乐鑫专属协议，可实现 1 km 数据通信量
• 空中数据传输最高可达 20 MBit/s TCP 吞吐量和 30 MBit/s UDP 吞吐量
• 支持 Sniffer
• 支持快速扫描和全信道扫描
• 支持多个天线
• 支持获取信道状态信息

4.33.2 如何编写 Wi-Fi 应用程序

准备工作

一般来说，要编写自己的 Wi-Fi 应用程序，最高效的方式是先选择一个相似的应用程序示例，然后将其中可用的部分移植到自己的项目中。如果您希望编写一个强健的 Wi-Fi 应用程序，强烈建议您在开始之前先阅读本文。非强制要求，请依个人情况而定。

本文将补充说明 Wi-Fi API 和 Wi-Fi 示例的相关信息，重点描述使用 Wi-Fi API 的原则、当前 Wi-Fi API 实现的限制以及使用 Wi-Fi 时的常见错误。同时，本文还介绍了 Wi-Fi 驱动程序的一些设计细节。建议您选择一个示例 example 进行参考。

设置 Wi-Fi 编译时选项

请参阅 Wi-Fi menuconfig。

Wi-Fi 初始化

请参阅 ESP32 Wi-Fi station 一般情况、ESP32 Wi-Fi AP 一般情况。

启动/连接 Wi-Fi

请参阅 ESP32 Wi-Fi station 一般情况、ESP32 Wi-Fi AP 一般情况。
第4章 API

事件处理

通常，在理想环境下编写代码难度并不大，如 WIFI_EVENT_STA_START、WIFI_EVENT_STA_CONNECTED 中所述。难度在于如何在现实的困难环境下编写代码，如 WIFI_EVENT_STA_DISCONNECTED 中所述。能否在后者情况下完美地解决各类事件冲突，是编写一个强健的 Wi-Fi 应用程序的根本。请参阅 ESP32 Wi-Fi 事件描述，ESP32 Wi-Fi Station 一般情况，ESP32 Wi-Fi AP 一般情况。另可参阅 ESP-IDF 中的事件处理概述。

编写错误恢复程序

除了在能在比较差的环境下工作，错误恢复能力也对一个强健的 Wi-Fi 应用程序至关重要。请参阅 ESP32 Wi-Fi API 错误代码。

4.33.3 ESP32 Wi-Fi API 错误代码

所有 ESP32 Wi-Fi API 都有定义好的返回值，即错误代码。这些错误代码可分类为:

- 无错误，例如：返回值 ESP_OK 代表 API 成功返回
- 可恢复错误，例如：ESP_ERR_NO_MEM
- 不可恢复的非关键性错误
- 不可恢复的关键性错误

一个错误是否为关键性取决于其 API 和应用场景，并且由 API 用户定义。

要使用 Wi-Fi API 编写一个强健的应用程序，根本原则便是要时刻检查错误代码并编写相应的错误处理代码。一般来说，错误处理代码可用于解决:

- 可恢复错误，您可以编写一个可恢复错误处理代码解决该类错误。例如，当 esp_wifi_start() 返回 ESP_ERR_NO_MEM 时，调用 esp_wifi_set_mode() 以获取几秒的重试时间。
- 不可恢复非关键性错误，打印错误代码可以帮助您更好地处理该类错误。
- 不可恢复关键性错误，可使用 “assert” 语句处理该类错误。例如，如果 esp_wifi_set_mode() 返回 ESP_ERR_WIFI_NOT_INIT，该值意为 esp_wifi_init() 未成功初始化 Wi-Fi 驱动程序。您可以在应用程序开发阶段非常快速地检测到此类错误。

在 esp_err.h 中，ESP_ERROR_CHECK 负责检查返回值。这是一个较为常见的错误处理代码，可在应用程序开发阶段作为默认的错误处理代码。但是，我们强烈建议 API 的使用者编写自己的错误处理代码。

4.33.4 初始化 ESP32 Wi-Fi API 参数

初始化 API 的结构参数时，应遵循以下两种方式之一:

- 设置该参数的所有字段
- 先使用 get API 获取当前配置，然后只设置特定于应用程序的字段

初始化或获取整个结构这一步至关重要，因为在大多数情况下，返回值 0 意味着程序使用了默认值。未来，我们将会在该结构中加入更多字段，并将这些字段初始化为 0，确保即便 IDF 版本升级后您的应用程序依然能够正常运行。

4.33.5 ESP32 Wi-Fi 编程模型

ESP32 Wi-Fi 编程模型如下图所示：

Wi-Fi 驱动程序可以看作是一个无法感知上层代码（如 TCP/IP 堆栈，应用程序任务，事件任务等）的黑匣子。通常，应用程序任务（使用 Wi-Fi 驱动程序 API 来初始化 Wi-Fi，并在必要时处理 Wi-Fi 事件。然后，Wi-Fi 驱动程序接收并处理 API 数据，并在应用程序中插入事件。

Wi-Fi 事件处理是在 esp_event 库的基础上进行的。Wi-Fi 驱动程序将事件发送至默认事件循环，应用程序便可以使用 esp_event_handler_register() 中的回调函数处理这些事件。除此之外，esp_netif 接
图 54: Wi-Fi 编程模型

也负责处理 Wi-Fi 事件，并产生一系列默认行为。例如，当 Wi-Fi station 连接至一个 AP 时，esp_netif 将自动开启 DHCP 客户端服务（系统默认）。

4.33.6 ESP32 Wi-Fi 事件描述

WIFI_EVENT_WIFI_READY

Wi-Fi 驱动程序永远不会生成此事件，因此，应用程序的事件回调函数可忽略此事件。在未来的版本中，此事件可能会被移除。

WIFI_EVENT_SCAN_DONE

扫描完成事件，由 esp_wifi_scan_start() 函数触发，将在以下情况下产生：

- 扫描已完成，例如：Wi-Fi 已成功找到目标 AP 或已扫描所有信道。
- 当前扫描因函数 esp_wifi_scan_stop() 而终止。
- 在当前扫描完成之前调用了函数 esp_wifi_scan_start()。此时，新的扫描将覆盖当前扫描过程，并生成一个扫描完成事件。

以下情况下将不会产生扫描完成事件：

- 当前扫描被阻止。
- 当前扫描是由函数 esp_wifi_connect() 触发的。

接收此事件后，事件任务暂不做任何响应。首先，应用程序的事件回调函数需调用 esp_wifi_scan_get_ap_num() 和 esp_wifi_scan_get_ap_records() 获取已扫描的 AP 列表，然后触发 Wi-Fi 驱动程序释放扫描过程中占用的内存空间（切记该步骤）。更多详细信息，请参阅 ESP32 Wi-Fi 扫描。

WIFI_EVENT_STA_START

如果调用函数 esp_wifi_start() 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将初始化 LwIP 网络接口 (netif)。通常，应用程序的事件回调函数需调用 esp_wifi_connect() 来连接已配置的 AP。
Chapter 4. API 指南

WIFI_EVENT_STA_STOP

如果调用函数 esp_wifi_stop() 后接收到返回值 ESP_OK，且当前 Wi-Fi 处于 station 或 station/AP 共存模式，则将产生此事件。接收到此事件后，事件任务将进行释放 station IP 地址，终止 DHCP 客户端服务、移除 TCP/UDP 相关连接并清除 LwIP station netif 等动作。此时，应用程序的事件回调函数通常不需做任何响应。

WIFI_EVENT_STA_CONNECTED

如果调用函数 esp_wifi_connect() 后接收到返回值 ESP_OK，且 station 已成功连接目标 AP，则将产生此连接事件。接收到此事件后，事件任务将启动 DHCP 客户端服务并开始获取 IP 地址。此时，Wi-Fi 驱动程序已准备就绪，可发送和接收数据。如果您的应用程序不依赖于 LwIP（即 IP 地址），则此刻便可以开始应用程序开发工作。但是，如果您的应用程序需基于 LwIP 进行，则还需等待 got ip 事件发生后才可开始。

WIFI_EVENT_STA_DISCONNECTED

此事件将在以下情况下产生:

- 调用了函数 esp_wifi_disconnect() 或 esp_wifi_stop()，且 Wi-Fi station 已成功连接至 AP。
- 调用了函数 esp_wifi_connect()，但 Wi-Fi 驱动程序因为某些原因未能成功连接至 AP，例如:未扫描到目标 AP、验证超时等。或存在多个 SSID 相同的 AP，station 无法连接所有已找到的 AP，也将产生该事件。
- Wi-Fi 连接因为某些原因而中断，例如: station 连续多次丢失 N beacon、AP 踢掉 station、AP 认证模式改变等。

接收到此事件后，事件任务的默认动作作为:

- 关闭 station 的 LwIP netif。
- 通知 LwIP 任务清除导致所有套接字状态错误的 UDP/TCP 连接。针对基于套接字编写的应用程序，其回调函数可以在接收到此事件时（如有必要）关闭并重新创建所有套接字。

应用程序处理此事件最常用的方法为: 调用函数 esp_wifi_disconnect() 重新连接 Wi-Fi，但是，如果此次事件是由函数 esp_wifi_disconnect() 引发的，则应用程序不应调用 esp_wifi_connect() 来重新上线。应用程序须明确区分此事件的引发原因，因某些情况下使用其它更好的方式进行重新连接。请参阅 Wi-Fi 重新连接 和连接 Wi-Fi 时扫描。

需要注意的另一点是: 接收到此事件后，LwIP 的默认动作是终止所有 TCP 套接字连接。大多数情况下，该动作不会造成影响。但对某些特殊应用程序可能例外。例如:

- 应用程序创建一个了 TCP 连接，以维护每 60 秒发送一次的应用程序级、保持活动状态的数据。
- 由于某些原因，Wi-Fi 连接被中断并引发了 WIFI_EVENT_STA_DISCONNECTED 事件。根据当前实现，此时所有 TCP 连接都将被移除，且保持活动的套接字将处于错误的状态中。但是，由于应用程序设计者认为网络层不应考虑这个 Wi-Fi 层的错误，因此应用程序不会关闭套接字。
- 5 秒后，因为在应用程序的事件回调函数中调用了 esp_wifi_connect()，Wi-Fi 连接恢复，同时，station 连接至同一个 AP 并获得与之前相同的 IPV4 地址。
- 60 秒后，当应用程序发送具有保持活动状态的套接字的数据时，套接字将返回错误，应用程序将关闭套接字并在必要时重新创建。

在上述场景中，理想状态下应用层套接字和网络层将不会受到影响，因为在此过程中 Wi-Fi 连接只是短暂地断开然后快速恢复。应用程序可通过 LwIP menuconfig 启动“IP 改变时保持 TCP 连接”的功能。

IP_EVENT_STA_GOT_IP

当 DHCP 客户端成功从 DHCP 服务器获得 IPV4 地址或 IPV4 地址发生改变时，将引发此事件。此事件意味着应用程序一切就绪，可以开始任务（如：创建套接字）。

IPV4 地址可能由于以下原因而发生改变:

- DHCP 客户端无法重新获取/绑定 IPV4 地址，且 station 的 IPV4 重置为 0。
Chapter 4. API

- DHCP 客户端重新绑定新地址。
- 静态配置的 IPv4 地址已发生改变。

函数 ip_event_got_ip 中的字段 ip_change 说明了 IPv4 地址是否发生改变。

套接字的状态是基于 IPv4 地址的，这意味着，如果 IPv4 地址发生改变，则所有与此 IPv4 相关的套接字都将变为异常。接收到此事件后，应用程序需关闭所有套接字，并在 IPv4 变为有效地址时重新创建应用程序。

**IP_EVENT_GOT_IP6**

当 IPv6 SLAAC 支持自动为 ESP32 配置一个地址，或 ESP32 地址发生改变时，将引发此事件。此事件意味着应用程序必须重新启动，可以开始任务（如：创建套接字）。

**IP_EVENT_STA_LOST_IP**

当 IPv4 地址失效时，将引发此事件。

此事件不会在 Wi-Fi 断连后立刻出现。Wi-Fi 连接断开后，首先将启动一个 IPv4 地址丢失计时器。如果 station 在该计时器超时之前成功获取了 IPv4 地址，则不会发生此事件。否则，此事件将在计时器超时后发生。

一般来说，应用程序可忽略此事件。这只是一个调试事件，主要使应用程序获知 IPv4 地址已丢失。

**WIFI_EVENT_AP_START**

与 WIFI_EVENT_STA_START 事件相似。

**WIFI_EVENT_AP_STOP**

与 WIFI_EVENT_STA_STOP 事件相似。

**WIFI_EVENT_AP_STACONNECTED**

每当有一个 station 成功连接 ESP32 AP 时，将引发此事件。接收到此事件后，事件任务将不做任何响应。应用程序的回调函数也可忽略这一事件。但是，您可以在此时进行一些操作，例如：获取已连接 station 的信息等。

**WIFI_EVENT_AP_STATADISCONNECTED**

此事件将在以下情况下发生：

- 应用程序通过调用函数 esp_wifi_disconnect() 或 esp_wifi_deauth_sta() 手动断开 station 连接。
- Wi-Fi 驱动程序由于某些原因断开 station 连接，例如：AP 在过去 5 分钟（可改通过函数 esp_wifi_set_inactive_time() 修改该时间）内未接收到任何数据包等。
- station 断开与 AP 之间的连接。

发生此事件时，事件任务将不做任何响应，但应用程序的事件回调函数需执行一些操作，例如：关闭与此 station 相关的套接字等。

**WIFI_EVENT_AP_PROBEREQRECVED**

默认情况下，此事件处于禁用状态，应用程序可以通过调用 API esp_wifi_set_event_mask() 启用。启用后，每当 AP 接收到 probe request 时都将引发此事件。
**Chapter 4. API 指南**

**WIFI_EVENT_STA_BEACON_TIMEOUT**

如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时，将引发此事件。inactive 时间通过调用函数 `esp_wifi_set_inactive_time()` 设置。

**WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START**

非连接模块在 Interval 开始时触发此事件。请参考非连接模块功耗管理。

**4.3.3 ESP32 Wi-Fi station 一般情况**

下图为 station 模式下的宏观场景，其中包含不同阶段的具体描述：

1. Wi-Fi/LwIP 初始化阶段

   • s1.1：主任务通过调用函数 `esp_netif_init()` 创建一个 LwIP 核心任务，并初始化 LwIP 相关工作。
   • s1.2：主任务通过调用函数 `esp_event_loop_create()` 创建一个系统事件任务，并初始化应用程序事件的回调函数。在此情况下，该回调函数唯一的作用就是将事件中继到应用程序任务中。
   • s1.3：主任务通过调用函数 `esp_netif_create_default_wifi_ap()` 或 `esp_netif_create_default_wifi_sta()` 创建有 TCP/IP 堆栈的默认网络接口实例绑定 station 或 AP。
   • s1.4：主任务通过调用函数 `esp_wifi_init()` 创建 Wi-Fi 驱动程序任务，并初始化 Wi-Fi 驱动程序。
   • s1.5：主任务通过调用 OS API 创建应用程序任务。

推荐按照 s1.1 ~ s1.5 的步骤顺序基于 Wi-Fi/LwIP 的应用程序进行初始化。但这一顺序 并非 强制，您可以在第 s1.1 步创建应用程序任务，然后在该应用程序任务中进行所有其它初始化操作。不过，如果您应用程序任务依赖套接字，那么在初始化阶段创建应用程序任务可能并不适用。此时，您可以在接收到 IP 后再进行任务创建。

2. Wi-Fi 配置阶段

Wi-Fi 驱动程序初始化成功后，可以进入到配置阶段。该场景下，Wi-Fi 驱动程序处于 station 模式。因此，首先您需要调用函数 `esp_wifi_set_mode()` (WIFI_MODE_STA) 将 Wi-Fi 模式配置为 station 模式。可通过调用其它 `esp_wifi_set_xxx` API 进行更多设置，例如：协议模式、国家代码、带宽等。请参阅 ESP32 Wi-Fi 配置。

一般情况下，我们会在建立 Wi-Fi 连接之前配置 Wi-Fi 驱动程序，但这 并非 强制要求，也就是说，只要 Wi-Fi 驱动程序已成功初始化，您可以在任意阶段进行配置。但是，如果您的 Wi-Fi 在建立连接后不需要更改配置，则应先在该阶段完成配置。因为调用配置 API (例如 `esp_wifi_set_protocol()` ) 将会导致 Wi-Fi 连接断开，为您的操作带来不便。

如果 menuconfig 已使能 Wi-Fi NVS flash，刚不论当前阶段还是后续的 Wi-Fi 配置信息都将被存储至该 flash 中。那么，当主板上电/重新启动时，就不需从头开始配置 Wi-Fi 驱动程序。您只需调用函数 `esp_wifi_get_xxx` API 获取之前存储的配置信息。当然，如果不想使用之前的配置，您依然可以重新配置 Wi-Fi 驱动程序。

3. Wi-Fi 启动阶段

   • s3.1：调用函数 `esp_wifi_start()` 启动 Wi-Fi 驱动程序。
   • s3.2：Wi-Fi 驱动程序将事件 `WIFI_EVENT_STA_START` 发布到事件任务中，然后，事件任务将执行一些正常操作并调用应用程序的事件回调函数。
   • s3.3：应用程序的事件回调函数将事件 `WIFI_EVENT_STA_START` 发布到应用程序任务中。您此时调用函数 `esp_wifi_connect()` 进行 Wi-Fi 连接。当然，您也可以等待在 `WIFI_EVENT_STA_START` 事件发生后的其它阶段再调用此函数。
图 5.5: station 模式下 Wi-Fi 事件场景示例
4. Wi-Fi 连接阶段

- s4.1: 调用函数 `esp_wifi_connect()` 后，Wi-Fi 驱动程序将启动内部扫描/连接过程。
- s4.2: 如果内部扫描/连接过程成功，将产生 `WIFI_EVENT_STA_CONNECTED` 事件。然后，事件任务将启动 DHCP 客户端服务，最终触发 DHCP 程序。
- s4.3: 在此情况下，应用程序的事件回调函数将收到 `WIFI_EVENT_STA_CONNECTED` 事件中继到应用程序任务中。通常，应用程序不需进行操作，而您可以执行任何动作，例如：打印日志等。

步骤 s4.2 中 Wi-Fi 连接可能会由于某些原因而失败，例如：密码错误、未找到 AP 等。这种情况下，将引发 `WIFI_EVENT_STA_DISCONNECTED` 事件并提示连接错误原因。有关如何处理中断 Wi-Fi 连接的事件，请参阅第6章 6 的描述。

5. Wi-Fi 获取 IP 阶段

- s5.1: 一旦步骤 4.2 中的 DHCP 客户端初始化完成，Wi-Fi 驱动程序将进入获取 IP 阶段。
- s5.2: 如果 Wi-Fi 成功从 DHCP 服务器接收到 IP 地址，则将引发 `IP_EVENT_STA_GOT_IP` 事件，事件任务将执行正常处理。
- s5.3: 应用程序的事件回调函数将事件 `IP_EVENT_STA_GOT_IP` 中继到应用程序任务中。对于那些基于 LwIP 构建的应用程序，此事件较为特殊，因为它意味着应用程序已准备好，可以开始任务，例如：创建 TCP/UDP 套接字。此时较为容易犯的一个错误就是在接收到 `IP_EVENT_STA_GOT_IP` 事件之前就初始化套接字。切记在接收到 IP 之前启动任何套接字相关操作。

6. Wi-Fi 断开阶段

- s6.1: 当 Wi-Fi 因为某些原因（例如：AP 掉电、RSSI 较弱等）连接中断时，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。此事件也可能在上文步骤 3 中发生。在这里，事件任务将通知 LwIP 任务清除/移除所有 UDP/TCP 连接。然后，所有应用程序套接字都将处于错误状态。也就是说，`WIFI_EVENT_STA_DISCONNECTED` 事件发生时，所有套接字都无法正常工作。
- s6.2: 上述情况下，应用程序的事件回调函数将将 `WIFI_EVENT_STA_DISCONNECTED` 事件中继到应用程序任务中。推荐您调用函数 `esp_wifi_connect()` 重新连接 Wi-Fi，关闭所有套接字，并在必要时重新创建套接字。请参阅 `WIFI_EVENT_STA_DISCONNECTED`。

7. Wi-Fi IP 更改阶段

- s7.1: 如果 IP 地址发生更改，将引发 `IP_EVENT_STA_GOT_IP` 事件，其中 “ip_change” 被置为 “true”。
- s7.2: 此事件对应用程序至关重要。这一事件发生时，适合关闭所有已创建的套接字并进行重新创建。

8. Wi-Fi 清理阶段

- s8.1: 调用函数 `esp_wifi_disconnect()` 断开 Wi-Fi 连接。
- s8.2: 调用函数 `esp_wifi_stop()` 终止 Wi-Fi 驱动程序。
- s8.3: 调用函数 `esp_wifi_deinit()` 清理 Wi-Fi 驱动程序。

4.33.8 ESP32 Wi-Fi AP 一般情况

下图为 AP 模式下的宏观场景，其中包含不同阶段的具体描述：

4.33.9 ESP32 Wi-Fi 扫描

目前，仅 station 或 station/AP 共存模式支持 `esp_wifi_scan_start()` API。
图 56: AP 模式下 Wi-Fi 事件场景示例
### 扫描类型

<table>
<thead>
<tr>
<th>模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>主动扫描</td>
<td>通过发送 probe request 进行扫描。该模式为默认的扫描模式。</td>
</tr>
<tr>
<td>被动扫描</td>
<td>不发送 probe request。跳至某一特定信道并等待 beacon。应用程序可通过 wifi_scan_config_t 中的 scan_type 字段使能被动扫描。</td>
</tr>
<tr>
<td>前端扫描</td>
<td>在 station 模式下 Wi-Fi 未连接时，可进行前端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。</td>
</tr>
<tr>
<td>后端扫描</td>
<td>在 station 模式或 station/AP 共存模式下 Wi-Fi 已连接时，可进行后端扫描。Wi-Fi 驱动程序决定进行前端扫描还是后端扫描，应用程序无法配置这两种模式。</td>
</tr>
<tr>
<td>全信道扫描</td>
<td>扫描所有信道。wifi_scan_config_t 中的 channel 字段为 0 时，当前模式为全信道扫描。</td>
</tr>
<tr>
<td>特定信道扫描</td>
<td>只扫描特定的信道。wifi_scan_config_t 中的 channel 字段为 1-14 时，当前模式为特定信道扫描。</td>
</tr>
</tbody>
</table>

上表中的扫描模式可以任意组合，因此共有 8 种不同扫描方式:

- 全信道后端主动扫描
- 全信道后端被动扫描
- 全信道前端主动扫描
- 全信道前端被动扫描
- 特定信道后端主动扫描
- 特定信道后端被动扫描
- 特定信道前端主动扫描
- 特定信道前端被动扫描

### 扫描配置

扫描类型与其他扫描属性通过函数 esp_wifi_scan_start() 进行配置。下表详细描述了函数 wifi_scan_config_t 各字段信息。

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>如果该字段的值不为 NULL，则仅可扫描到具有相同 SSID 值的 AP。</td>
</tr>
<tr>
<td>bssid</td>
<td>如果该字段的值不为 NULL，则仅可扫描到具有相同 BSSID 值的 AP。</td>
</tr>
<tr>
<td>channel</td>
<td>如果该字段值为 0，将进行全信道扫描；反之，将针对特定信道进行扫描。</td>
</tr>
<tr>
<td>show_hidden</td>
<td>如果该字段值为 0，本次扫描将忽略具有隐藏 SSID 的 AP；反之，这些 AP 也会在扫描时被视为正常 AP。</td>
</tr>
<tr>
<td>scan_type</td>
<td>如果该字段值为 WIFI_SCAN_TYPE_ACTIVE，则本次扫描为自动扫描；反之，将被视为被动扫描。</td>
</tr>
<tr>
<td>scan_time</td>
<td>该字段用于控制每个信道的扫描时间。被扫描时，scan_time.active 字段负责为每个信道指定扫描时间。主扫描时，每个信道的扫描时间如下所示。其中，min 代表 scan_time.active_min，max 代表 scan_time.active_max。</td>
</tr>
</tbody>
</table>

- min=0, max=0：每个信道的扫描时间为 120 ms。
- min>0, max=0：每个信道的扫描时间为 120 ms。
- min=0, max>0：每个信道的扫描时间为 max ms。
- min>0, max>0：每个信道扫描的最短时间为 min ms。如果在这段时间内未找到 AP，将跳转至下一个信道。如这时间内找到 AP，则该信道的扫描时间为 max ms。

如希望提升 Wi-Fi 扫描性能，则可修改上述两个参数。

调用 API esp_wifi_set_config() 可全局配置一些扫描属性，请参阅 station 基本配置。
在所有信道中扫描全部 AP（前端）

场景:

![图57: 所有Wi-Fi信道的前端扫描](image)

上述场景中描述了全信道前端扫描过程。仅 station 模式支持前端扫描，该模式下 station 未连接任何 AP。前端扫描还是后端扫描完全由 Wi-Fi 驱动程序决定，应用程序无法配置这一模式。

详细描述:

扫描配置阶段

- s1.1: 如果默认的国家信息有误，调用函数 `esp_wifi_set_country()` 进行配置。请参阅 Wi-Fi 国家/地区代码。
- s1.2: 调用函数 `esp_wifi_scan_start()` 配置扫描信息，可参阅扫描配置。该场景为全信道扫描，将 SSID/BSSID/channel 设置为 0 即可。

Wi-Fi 驱动程序内部扫描阶段
扫描完成后事件处理阶段

s.3.1: 当所有信道扫描全部完成后，将产生 WIFI_EVENT_SCAN_DONE 事件。
s.3.2: 应用程序的事件回调函数告知应用程序任务已接收 WIFI_EVENT_SCAN_DONE 事件。调用
函数 esp_wifi_scan_get_ap_num() 获取在本次扫描中找到的 AP 数量，然后，分配出足够
的事物槽，并调用函数 esp_wifi_scan_get_ap_records() 获取 AP 记录。请注意，一旦调
用 esp_wifi_scan_get_ap_records()，Wi-Fi 驱动程序中的 AP 记录将被释放。但是，请不要
在单个扫描完成事件中重复调用 esp_wifi_scan_get_ap_records()。反之，如果扫描完
成事件发生后未调用 esp_wifi_scan_get_ap_records()，则 Wi-Fi 驱动程序中的 AP 记录不
会被释放。因此，请务必确保调用函数 esp_wifi_scan_get_ap_records()，且仅调用一次。

在所有信道上扫描全部 AP（后端）

场景：
上述场景为一次信道后端扫描。与在所有信道中扫描全部 AP（前端）相比，信道后端扫描的不同
之处在于：在跳至下一个信道之前，Wi-Fi 驱动程序会先返回主信道停留 30 ms，以便 Wi-Fi 连接有一定的
时间发送/接收数据。

在所有信道中扫描特定 AP

场景：
该扫描过程与在所有信道中扫描全部 AP（前端）相似。区别在于：
- s.1.1: 在步骤 1.2 中，目标 AP 将配置为 SSID/BSSID。
- s.2.1 ~ s.2.N: 每当 Wi-Fi 驱动程序扫描某个 AP 时，它将检查该 AP 是否为目标 AP。如果本次扫描
类型为 WIFI_FAST_SCAN，且已确认没有找到目标 AP，则将产生扫描完成事件，同时结束本次扫描；
反之，扫描将继续。请注意，第一个扫描的信道可能不是信道 1，因为 Wi-Fi 驱动程序会优化扫描
顺序。

如果有多个匹配目标 AP 信息的 AP，例如：碰到扫描到两个 SSID 为 “ap” 的 AP。如果本
次扫描类型为 WIFI_FAST_SCAN，则仅可扫描到第一个扫描到的“ap”；如果本次扫描类型为
WIFI_ALL_CHANNEL_SCAN，则两个“ap”都将被找到，且 station 将根据配置规则连接至其需要连接
的“ap”，请参阅 station 基本配置。

您可以在任意信道中扫描某个特定的 AP，或扫描该信道中的所有 AP，这两种扫描过程也较为相似。

在 Wi-Fi 连接模式下扫描

调用函数 esp_wifi_connect() 后，Wi-Fi 驱动程序将首先尝试扫描已配置的 AP，Wi-Fi 连接模式下的
扫描过程与在所有信道中扫描特定 AP 过程相同，但连接模式下扫描结束后将不会产生扫描完成事件。如
果已找到目标 AP，则 Wi-Fi 驱动程序将开始 Wi-Fi 连接；反之，将产生 WIFI_EVENT_STA_DISCONNECTED
事件。请参阅在所有信道中扫描特定 AP。

在禁用模式下扫描

如果函数 esp_wifi_scan_start() 中的禁用参数为 “true”，则本次扫描为禁用模式下的扫描。在该
次扫描完成之前，应用程序任务都将被禁用。禁用模式下的扫描和正常扫描相似，不同之处在于，禁用
模式下扫描完成之后将不会出现扫描完成事件。
图 58: 所有 Wi-Fi 信道的后端扫描
图 59: 扫描特定的 Wi-Fi 信道
并行扫描

有时，可能会有两个应用程序任务同时调用函数 `esp_wifi_scan_start()`，或者某个应用程序任务在获取扫描完成事件之前再次调用了函数 `esp_wifi_scan_start()`。这两种情况都可能会发生。但是，Wi-Fi 驱动程序并不足以支持多个并行的扫描。因此，应避免上述并行扫描。随着 ESP32 的 Wi-Fi 功能不断提升，未来的版本中可能会增加并行扫描支持。

连接 Wi-Fi 时扫描

如果 Wi-Fi 正在连接，则调用函数 `esp_wifi_scan_start()` 后扫描将立即失败，因为 Wi-Fi 连接优先级高于扫描。如果扫描是因为 Wi-Fi 连接而失败的，此时推荐采取的策略为：等待一段时间后重试。因为一旦 Wi-Fi 连接完成后，扫描将立即成功。

但是，延时重试策略并非万无一失。试想以下场景：

- 如果 `station` 正在连接一个不存在的 AP，或正在使用错误的密码，错误一个 AP，此时将产生事件 `WIFI_EVENT_STA_DISCONNECTED`。
- 接收到断开连接事件后，应用程序调用函数 `esp_wifi_connect()` 进行重新连接。
- 而另一个应用程序任务（如控制任务）调用了函数 `esp_wifi_scan_start()` 进行扫描。这种情况下，每次扫描都会立即失败，因为 `station` 一直处于正在连接状态。
- 扫描失败后，应用程序将等待一段时间后进行重新扫描。

上述场景中的扫描永远不会成功，因为 Wi-Fi 一直处于连接过程中。因此，如果您的应用程序也可以发生相似的场景，那么就需要为其配置一个更佳的重新连接策略。例如；

- 应用程序可以定义一个连续重新连接次数的最大值，当重新连接的次数达到这个最大值时，立刻停止重新连接。
- 应用程序可以在首轮连续重新连接 N 次后立即进行重新连接，然后延迟一段时间后进行下一次重新连接。

可以给应用程序定义其特殊的重新连接策略，以防止扫描无法成功。请参阅 Wi-Fi 重新连接。

4.33.10 ESP32 Wi-Fi station 连接场景

该场景仅针对在扫描阶段只找到一个目标 AP 的情况，对于多个相同 SSID AP 的情况，请参阅找到多个 AP 时的 ESP32 Wi-Fi station 连接。

通常，应用程序无需关心这一连接过程。如感兴趣，可参看下述简介。

场景：

扫描阶段

- s1.1: Wi-Fi 驱动程序开始在 “Wi-Fi 连接” 模式下扫描。详细信息请参阅在 Wi-Fi 连接模式下扫描。
- s1.2: 如果未找到目标 AP，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_NO_AP_FOUND`。请参阅 Wi-Fi 原因代码。

认证阶段

- s2.1: 发送认证请求数据包并使能认证计时器。
- s2.2: 如果在认证计时器超时之前未接收到认证响应数据包，将产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，且原因代码为 `WIFI_REASON_AUTH_EXPIRE`。请参阅 Wi-Fi 原因代码。
- s2.3: 接收到认证响应数据包，且认证计时器终止。
- s2.4: AP 在响应中拒绝认证且产生 `WIFI_EVENT_STA_DISCONNECTED` 事件，原因代码为 `WIFI_REASON_AUTH_FAIL` 或为 AP 指定的其它原因。请参阅 Wi-Fi 原因代码。
Chapter 4. API 指南

图 60. Wi-Fi Station 连接过程
关联阶段

- s3.1: 发送关联请求并使能关联计时器。
- s3.2: 如果在关联计时器超时之前未接收到关联响应，将产生 WIFI_EVENT_STA_DISCONNECTED 事件，且原因代码为 WIFI_REASON_ASSOC_EXPIRE。请参阅 Wi-Fi 原因代码。
- s3.3: 接收到关联响应，且关联计时器终止。
- s3.4: AP 在响应中拒绝关联且产生 WIFI_EVENT_STA_DISCONNECTED 事件，原因代码将在关联响应中指定。请参阅 Wi-Fi 原因代码。

四次握手阶段

- s4.1: 使能握手定时器，定时器终止之前未接收到 1/4 EAPOL，此时将产生 WIFI_EVENT_STA_DISCONNECTED 事件，且原因代码为 WIFI_REASON_HANDSHAKE_TIMEOUT。请参阅 Wi-Fi 原因代码。
- s4.2: 接收到 1/4 EAPOL。
- s4.3: station 回复 2/4 EAPOL。
- s4.4: 如果在握手定时器终止之前未接收到 3/4 EAPOL，将产生 WIFI_EVENT_STA_DISCONNECTED 事件，且原因代码为 WIFI_REASON_HANDSHAKE_TIMEOUT，请参阅 Wi-Fi 原因代码。
- s4.5: 接收到 3/4 EAPOL。
- s4.6: station 回复 4/4 EAPOL。
- s4.7: station 产生 WIFI_EVENT_STA_CONNECTED 事件。

Wi-Fi 原因代码

下表罗列了 ESP32 中定义的原因代码，其中，第一列为 esp_wifi_types.h 中定义的宏名称，名称中省去了前缀 WIFI_REASON，也就是说，名称 UNSPECIFIED 实际应为 WIFI_REASON_UNSPECIFIED，以此类推。第二列为原因代码的相应数值。第三列为该原因映射到 IEEE 802.11-2020 中 9.4.1.7 段的标准值。（更多详细信息，请参阅前文描述。）最后一列为此原因的描述。

<table>
<thead>

<td>UNSPECIFIED</td>
<td>1</td>
<td>1</td>
<td>出现内部错误，例如：内存已满，内部发送失败，或该原因已被远端接收等。</td>
</tr>
</tbody>
</table>
| AUTH_EXPIRE | 2 | | 先前的 authentication 已失效。对于 ESP station，出现以下情况时将报告该代码：
- authentication 超时；
- 从 AP 接收到该代码。
对于 ESP AP，出现以下情况时将报告该代码：
- 在过去五分钟之内，AP 未从 station 接收到任何数据包；
- 由于调用了函数 esp_wifi_stop() 导致 AP 终止；
- 由于调用了函数 esp_wifi_deauth_sta() 导致 station 的 authentication 取消。 |
| AUTH_LEAVE | 3 | | authentication 取消，因为发送 station 正在离开（或已经离开）。
对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。 |

</tr>
</thead>
</table>
| AS-SOC_EXPIRE | 4 | 4 | 因为 AP 无法同时处理所有当前已关联的 STA。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 对于 ESP AP，出现以下情况时将报告该代码：
  - 经过五分钟，AP 未从 station 接收到任何数据包；
  - 由于调用了函数 esp_wifi_stop() 导致 AP 终止；
- 由于调用了函数 esp_wifi_deauth_sta() 导致 station 的 authentication 取消。 |
| AS-SOC_TOOMANY | 5 | 5 | association 取消，因为 AP 无法同时处理所有当前已关联的 STA。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 对于 ESP AP，出现以下情况时将报告该代码：
  - 与 AP 相关联的 station 数量已到达 AP 可支持的最大值。 |
| NOT_AUTHED | 6 | 6 | 从一个未认证 station 接收到 class-2 frame。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 对于 ESP AP，出现以下情况时将报告该代码：
  - AP 从一个未认证 station 接收到数据包。 |
| NOT_ASSOCED | 7 | 7 | 从一个未关联 station 接收到的 class-3 frame。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 对于 ESP AP，出现以下情况时将报告该代码：
  - AP 从未关联 station 接收到数据包。 |
| AS-SOC_LEAVE | 8 | 8 | association 取消，因为发送 station 正在离开（或已经离开）BSS。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 由于调用 esp_wifi_disconnect() 和其它 API，station 断开连接。 |
| AS-SOC_NOT_AUTHED | 9 | 9 | station 的 reassociation 请求未被响应 station 认证。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。
- 对于 ESP AP，出现以下情况时将报告该代码：
  - AP 从一个已关联、但未认证的 station 接收到数据包。 |
| DIS-AS-SOC_PWRCAP_BAD | 10 | 10 | association 取消，因为无法接收功率能力（Power Capability）元素中的信息。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。 |
| DIS-AS-SOC_SUPCHAN_BAD | 11 | 11 | association 取消，因为无法接收支持的信道（Supported Channels）元素中的信息。对于 ESP station，出现以下情况时报告该代码：
- 从 AP 接收到该代码。 |
<table>
<thead>
<tr>
<th>原因代码</th>
<th>数值</th>

| IE_INVALID | 13 | | 无效元素或内容不符合Wi-Fi协议帧格式(Frame formats)章节所描述的标准的元素。对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。
对于ESP AP，出现以下情况时将报告该代码：
- AP解析了一个错误的WPA或RSN IE。 |
| MIC_FAILURE | 14 | | 消息完整性代码(MIC)出错。对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| 4WAY_HANDSHAKE_TIMEOUT | | | 四次握手超时。由于某些历史原因，在ESP中该原因代码实为WIFI_REASON_HANDSHAKE_TIMEOUT。
对于ESP station，出现以下情况时报告该代码：
- 握手超时。
- 从AP接收到该代码。 |
| GROUP_CIPHER_INVALID | | | 组密钥(Group-Key)握手超时。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| IE_IN_4WAY_DIFFERS17 | | | 四次握手中产生的元素与(re-)association后的request/probe以及response/beacon frame中的信息不同。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。
- station发现四次握手的IE与(re-)association后的request/probe以及response/beacon frame中的IE不同。 |
| GROUP_CIPHER_INVALID | | | 无效组密钥。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| PAIRWISE_CIPHER_INVALID | 19 | 19 | 无效或对密钥。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| AKMP_INVALID | 20 | | 无效AKMP。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| UN-SUPP_RSN_IE_VERSION | 21 | 21 | 不支持的RSNE版本。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| IN-VALID_RSN_IE_CAP | 22 | 22 | 无效的RSNE性能。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。 |
| 802_1X_2AUTH_FAILURE | 23 | | IEEE 802.1X authentication失败。
对于ESP station，出现以下情况时报告该代码：
- 从AP接收到该代码。
对于ESP AP，出现以下情况时将报告该代码：
- IEEE 802.1X authentication失败。 |
<table>

4.33.11 找到多个 AP 时的 ESP32 Wi-Fi station 连接

该场景与 ESP32 Wi-Fi station 连接场景相似，不同之处在于该场景中不会产生 WIFI_EVENT_STA_DISCONNECTED 事件，除非 station 无法连接到所有找到的 AP。

4.33.12 Wi-Fi 重新连接

出于多种原因，station 可能会断开连接，例如：连接的 AP 重新启动等。应用程序应负责重新连接。推荐使用的方法为：在接收到 WIFI_EVENT_STA_DISCONNECTED 事件后调用函数 esp_wifi_disconnect()。但有时，应用程序需要更复杂的方式进行重新连接：

- 如果断开连接事件是由调用函数 esp_wifi_disconnect() 引发的，那么应用程序可能不需要进行重新连接。
- 如果 station 随时可能调用函数 esp_wifi_scan_start() 开始扫描，此时就需要一个更佳的重新连接方法，请参阅连接 Wi-Fi 时扫描。
另一点需要注意的是，如果存在多个具有相同 SSID 的 AP，那么重新连接后可能不会连接到之前的同一个 AP。重新连接时，station 将永远选择最佳的 AP 进行连接。

4.33.13 Wi-Fi beacon 超时

ESP32 使用 beacon 超时机制检测 AP 是否活跃。如果 station 在 inactive 时间内未收到所连接 AP 的 beacon，将发生 beacon 超时。 inactive 通过调用函数 `esp_wifi_set_inactive_time()` 设置。

beacon 超时发生后，station 将向 AP 发送 5 个 probe request。如果仍未从 AP 接收到 probe response 或 beacon，station 将与 AP 断开连接并产生 `WIFI_EVENT_STA_DISCONNECTED` 事件。

需要注意的是，扫描过程中会重置 beacon 超时使用的定时器，即扫描过程会影响 `WIFI_EVENT_STA_BEACON_TIMEOUT` 事件的触发。

4.33.14 ESP32 Wi-Fi 配置

使能 Wi-Fi NVS 时，所有配置都将存储到 flash 中；反之，请参阅 Wi-Fi NVS Flash。

Wi-Fi 模式

调用函数 `esp_wifi_set_mode()` 设置 Wi-Fi 模式。

<table>
<thead>
<tr>
<th>模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIFI_MODE_NULL</td>
<td>NULL 模式：此模式下，内部数据结构不分配给 station 和 AP，同时，station 和 AP 接口不会为发送/接收 Wi-Fi 数据进行初始化。通常，此模式用于 Sniffer，或者您不想通过调用函数 <code>esp_wifi_deinit()</code> 卸载整个 Wi-Fi 驱动程序来同时停止 station 和 AP。</td>
</tr>
<tr>
<td>WIFI_MODE_STA</td>
<td>station 模式：此模式下，<code>esp_wifi_start()</code> 将初始化内部 station 数据，同时 station 接口准备发送/接收 Wi-Fi 数据。调用函数 <code>esp_wifi_connect()</code> 后，station 将连接到目标 AP。</td>
</tr>
<tr>
<td>WIFI_MODE_AP</td>
<td>AP 模式：在此模式下，<code>esp_wifi_start()</code> 将初始化内部 AP 数据，同时 AP 接口准备发送/接收 Wi-Fi 数据。随后，Wi-Fi 驱动程序开始广播 beacon，AP 即可与其它 station 连接。</td>
</tr>
<tr>
<td>WIFI_MODE_APSTA</td>
<td>station/AP 共存模式：在此模式下，<code>esp_wifi_start()</code> 将同时初始化 station 和 AP。该步骤在 station 模式和 AP 模式下完成。请注意 ESP station 所连外部 AP 的信道优先于 ESP AP 信道。</td>
</tr>
</tbody>
</table>

station 基本配置

API `esp_wifi_set_config()` 可用于配置 station。配置的参数信息会保存到 NVS 中。下表详细介绍各个字段。
### Chapter 4. API 指南

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>station 想要连接的目标 AP 的 SSID。</td>
</tr>
<tr>
<td>password</td>
<td>目标 AP 的密码。</td>
</tr>
<tr>
<td>scan_method</td>
<td>WIFI_FAST_SCAN 模式下，扫描到一个匹配的 AP 时即结束。WIFI_ALL_CHANNEL_SCAN 模式下，在所有信道扫描所有匹配的 AP。默认扫描模式是 WIFI_FAST_SCAN。</td>
</tr>
<tr>
<td>bssid_set</td>
<td>如果 bssid_set 为 0，station 连接 SSID 与 “ssid” 字段相同的 AP，同时忽略字段 “bssid”。其他情况下，station 连接 SSID 与 “ssid” 字段相同，BSSID 与 “bssid” 字段也相同的 AP。</td>
</tr>
<tr>
<td>bssid</td>
<td>只有当 bssid_set 为 1 时有效。见字段 “bssid_set”。</td>
</tr>
<tr>
<td>channel</td>
<td>该字段为 0 时，station 扫描信道 1 ~ N 寻找目标 AP；否则，station 首先扫描 SSID 与 channel 字段相同的信道，再扫描其他信道。如果您不知道目标 AP 在哪个信道，请将该字段设置为 0。</td>
</tr>
<tr>
<td>sort_method</td>
<td>该字段仅用于 WIFI_ALL_CHANNEL_SCAN 模式。如果设置为 WIFI_CONNECT_AP_BY_SIGNAL，所有匹配的 AP 将会按照信号强度排序，信号最好的 AP 会被首选。如果 station 想要连接 ssid 为 “apxx” 的 AP，并扫描到两个这样的 AP。第一个 AP 的信号为 -90 dBm，第二个 AP 的信号为 -100 dBm，station 首先选择连接第二个 AP。除非失败，才会选择第一个。如果设置为 WIFI_CONNECT_AP_BY_SECURITY，所有匹配的 AP 会按照安全性排序。比如，如果 station 想要连接 ssid 为 “apxx” 的 AP，并扫描到两个这样的 AP。第一个 AP 为开放式，第二个 AP 为 WPA2 加密，station 首先选择连接第二个 AP。除非失败，才会选择第一个。</td>
</tr>
<tr>
<td>threshold</td>
<td>该字段用来筛选找到的 AP，如果 AP 的 RSSI 或安全模式小于配置的阈值，则不会被连接。如果 RSSI 设置为 0，则表示默认阈值，默认 RSSI 阈值为 -127 dBm。如果 authmode 阈值设置为 0，则表示默认阈值，默认 authmode 阈值无授权。</td>
</tr>
</tbody>
</table>

**注意：** WEP/WPA 安全模式在 IEEE802.11-2016 协议中已弃用，建议不要使用。可使用 authmode 阈值代替，通过将 threshold.authmode 设置为 WIFI_AUTH_WPA2_PSK 使用 WPA2 模式

### AP 基本配置

API esp_wifi_set_config() 可用于配置 AP。配置的参数信息会保存在 NVS 中。下表详细介绍了各个字段。

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>指 AP 的 SSID。如果 ssid[0] 和 ssid[1] 均为 0xFF，AP 默认 SSID 为 ESP_aabbcc，”aabbcc” 是 AP MAC 的最后三个字节。</td>
</tr>
<tr>
<td>password</td>
<td>AP 的密码。如果身份验证模式为 WIFI_AUTH_OPEN，此字段将被忽略。</td>
</tr>
<tr>
<td>ssid_len</td>
<td>SSID 的长度。如果 ssid_len 为 0，则检查 SSID 直至出现终止字符。如果 ssid_len 大于 32，请更改为 32，或者根据 ssid_len 设置 SSID 长度。</td>
</tr>
<tr>
<td>channel</td>
<td>AP 的信道。如果信道超出范围，Wi-Fi 驱动程序将默认该信道为信道 1。所以，请确保信道在要求的范围内。有关详细信息，请参阅 Wi-Fi 协议/信道代码。</td>
</tr>
<tr>
<td>authmode</td>
<td>ESP AP 的身份验证模式。目前，ESP Wi-Fi 不支持 AUTH_WEP。如果 authmode 是一个无效值，AP 默认该值为 WIFI_AUTH_OPEN。</td>
</tr>
<tr>
<td>ssid_hidden</td>
<td>如果 ssid_hidden 为 1，AP 不广播 SSID，若为其他值，则广播。</td>
</tr>
<tr>
<td>max_connection</td>
<td>目前，ESP Wi-Fi 支持 10 个 Wi-Fi 连接。如果 max_connection 大于 10，AP 默认该值为 10。</td>
</tr>
<tr>
<td>beacon_interval</td>
<td>beacon 隔离。值为 100 ~ 60000 ms，默认值为 100 ms。如果该值不在上述范围，AP 默认取 100 ms。</td>
</tr>
</tbody>
</table>
Wi-Fi 协议模式

目前，IDF 支持以下协议模式：

<table>
<thead>
<tr>
<th>协议模式</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11b</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B)，将 station/AP 设置为仅 802.11b 模式。</td>
</tr>
<tr>
<td>802.11bg</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11g</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11bgn</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11gn</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGNLR</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 LR</td>
<td>调用函数 esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR) 和 esp_wifi_config_11b_rate(ifx, true)，将 station/AP 设置为 LR 模式。 此模式是乐鑫的专利模式，可以达到 1 公里视线范围。请确保 station 和 AP 同时连接至 ESP 设备。</td>
</tr>
</tbody>
</table>

长距离 (LR)

长距离 (LR) 模式是乐鑫的一项专利 Wi-Fi 模式，可达到 1 公里视线范围。与传统 802.11b 模式相比，接收灵敏度更高，抗干扰能力更强，传输距离更长。

**LR 兼容性** 由于 LR 是乐鑫的独有 Wi-Fi 模式，只有 ESP32 设备才能传输和接收 LR 数据。也就是说，如果连接的设备不支持 LR，ESP32 设备则不会以 LR 数据速率传输数据。可通过配置适当的 Wi-Fi 模式使您的应用程序实现这一功能。如果协商的模式支持 LR，ESP32 可能会以 LR 速率传输数据，否则，ESP32 将以传统 Wi-Fi 数据速率传输所有数据。

下表是 Wi-Fi 模式协商：

<table>
<thead>
<tr>
<th>APSTA</th>
<th>BGN</th>
<th>BG</th>
<th>B</th>
<th>BGNLR</th>
<th>BGLR</th>
<th>BLR</th>
<th>LR</th>
</tr>
</thead>
<tbody>
<tr>
<td>BGN</td>
<td>BGN</td>
<td>BG</td>
<td>B</td>
<td>BGN</td>
<td>BG</td>
<td>B</td>
<td>*</td>
</tr>
<tr>
<td>BG</td>
<td>BG</td>
<td>BG</td>

</tr>
<tr>
<td>LR</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
</tr>
</tbody>
</table>

上表中，行是 AP 的 Wi-Fi 模式，列是 station 的 Wi-Fi 模式。”-” 表示 AP 和 station 的 Wi-Fi 模式不兼容。 根据上表，得出以下结论：
对于已能使 LR 的 ESP32 AP，由于以 LR 模式发送 beacon，因此与传统的 802.11 模式不兼容。
对于已能使 LR 且并非仅 LR 模式的 ESP32 station，与传统 802.11 模式兼容。
如果 station 和 AP 都是 ESP32 设备，并且两者都使用 LR 模式，则协商的模式支持 LR。

如果协商的 Wi-Fi 模式同时支持传统的 802.11 模式和 LR 模式，则 Wi-Fi 驱动程序会在不同的 Wi-Fi 模式下自动选择最佳数据速率，应用程序无需任何操作。

**LR 对传统 Wi-Fi 设备的影响** 以 LR 速率进行的数据传输不会影响传统 Wi-Fi 设备。因为：
- LR 模式的 CCA 和回退过程符合 802.11 协议。
- 传统的 Wi-Fi 设备可以通过 CCA 检测 LR 信号并进行回退。

也就是说，LR 模式下传输效果与 802.11b 模式相似。

**LR 传输距离** LR 的接收灵敏度比传统的 802.11b 模式高 4 dB，理论上，传输距离约为 802.11b 的 2 至 2.5 倍。

**LR 吞吐量** 因为原始 PHY 数据传输速率为 1/2 Mbps 和 1/4 Mbps，LR 的吞吐量有限。

**何时使用 LR** 通常使用 LR 的场景包括：
- AP 和 station 都是乐鑫设备。
- 需要长距离 Wi-Fi 连接和数据传输。
- 数据吞吐量要求非常小，例如远程设备控制等。

**Wi-Fi 国家/地区代码**

调用 `esp_wifi_set_country()`，设置国家/地区信息。下表详细介绍了各个字段，请在配置这些字段之前参考当地的 2.4 GHz RF 操作规定。

<table>
<thead>
<tr>
<th>字段</th>
<th>描述</th>
</tr>
</thead>
</table>
- ASCII 码空格字符，代表 station/AP 所处国家/地区的规定允许当前频段所需的所有环境。  
- ASCII 码‘O’字符，代表 station/AP 所处国家/地区的规定仅允许室外环境。  
- ASCII 码‘I’字符，代表 station/AP 所处国家/地区的规定仅允许室内环境。  
- ASCII 码‘X’字符，代表 station/AP 所处国家/地区的规定允许在室外环境。  
- ASCII 码‘XX’字符，代表 station/AP 所处国家/地区的规定允许在室内环境。  
- ASCII 码 ‘O’字符，代表 station/AP 所处国家/地区的规定允许在室外环境。  |
| schan | 起始信道，station/AP 所处国家/地区规定的最小信道值。 |
| nchan | 规定的总信道数，比如，如果 schan=1, nchan=13, 那么 station/AP 可以从信道 1 至 13 发送数据。 |
| policy | 国家/地区策略。当配置的国家/地区信息与所选 AP 的国家/地区信息冲突时，该字段决定使用哪一信息。更多策略相关信息，可参见下文。 |

默认国家/地区信息为：

```c
wifi_country_t config = {  
  .cc = "01",  
  .schan = 1,  
  .nchan = 11,  
}  
```

(下页继续)
如果 Wi-Fi 模式为 station/AP 共存模式，则它们配置的国家/地区信息相同。有时，station 所连 AP 的国家/地区信息与配置的不同。例如，配置的 station 国家/地区信息为:

```c
wifi_country_t config = {
  .cc = "JP",
  .schan = 1,
  .nchan = 14,
  .policy = WIFI_COUNTRY_POLICY_AUTO,
};
```

但所连 AP 的国家/地区信息为:

```c
wifi_country_t config = {
  .cc = "CN",
  .schan = 1,
  .nchan = 13,
};
```

此时，使用所连 AP 的国家/地区信息。

下表描述了在不同 Wi-Fi 模式和不同国家/地区策略下使用的国家/地区信息，并描述了对主动扫描的影响。

<table>
<thead>
<tr>
<th>Wi-Fi 模式</th>
<th>策略</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>station 模式</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>AP 的 beacon 中有国家/地区的 IE，使用国家/地区信息为 beacon 中的信息，否则，使用默认信息。扫描时：主动扫描信道 1 至信道 11，被动扫描信道 12 至信道 14。请记住，如果带有隐藏 SSID 的 AP 和 station 被设置在被动扫描信道上，被动扫描将无法找到该 AP。也就是说，如果应用程序希望在每个信道中找到带有隐藏 SSID 的 AP，国家/地区信息应该配置为 WIFI_COUNTRY_POLICY_MANUAL。</td>
</tr>
<tr>
<td>station 模式</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>扫描时：主动扫描信道 schan 至信道 schan+nchan-1。国家/地区信息。</td>
</tr>
<tr>
<td>AP 模式</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>配置的国家/地区信息。</td>
</tr>
<tr>
<td>AP 模式</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>国家/地区信息。</td>
</tr>
<tr>
<td>station/AP 共存模式</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>station 模式与 station 模式下使用的国家/地区信息相同。如果 station 不连接任何外部 AP，AP 使用配置的国家/地区信息。如果 station 连接一个外部 AP，该 AP 的国家/地区信息与该 station 相同。</td>
</tr>
<tr>
<td>station/AP 共存模式</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>station 模式与 station 模式下使用的国家/地区信息相同。该 AP 与 AP 模式、WIFI_COUNTRY_POLICY_MANUAL 策略下使用的国家/地区信息相同。</td>
</tr>
</tbody>
</table>

**主信道** AP 模式下，AP 的信道定义为主信道。station 模式下，station 所连 AP 的信道定义为主信道。station/AP 共存模式下，AP 和 station 的主信道必须相同。如果不同，station 的主信道始终优先。例如，初
Wi-Fi 供应商 IE 配置

默认情况下，所有 Wi-Fi 管理帧都由 Wi-Fi 驱动程序处理，应用程序不需要任何操作。但是，某些应用程序可能需要处理 beacon、probe request、probe response 和其他管理帧。例如，如果在管理帧中插入一些只针对供应商的 IE，则只有包含此 IE 的管理帧才能得到处理。ESP32 中，esp_wifi_set_vendor_ie() 和 esp_wifi_set_vendor_ie_cb() 负责此类任务。

4.33.15 Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™（也称为设备配置协议）是一个安全且标准化的配置协议，用于配置 Wi-Fi 设备。更多信息请参考 esp_dpp。

WPA2-Enterprise

WPA2-Enterprise 是企业无线网络的安全认证机制。在连接到接入点之前，它使用 RADIUS 服务器对网络用户进行身份验证。身份验证过程基于 802.1X 标准，并有不同的扩展身份验证协议 (EAP) 方法，如 TLS、TTLS、PEAP 等。RADIUS 服务器根据用户的凭据（用户名和密码）、数字证书或两者对用户进行身份验证。当处于 station 模式的 ESP32 尝试连接到企业模式的 AP 时，它会向 AP 发送身份验证请求。AP 将该请求发送到 RADIUS 服务器以对 station 进行身份验证。根据不同的 EAP 方法，可以通过 idf.py menuconfig 打开配置，并在配置中设置参数。ESP32 仅在 station 模式下支持 WPA2 Enterprise。

为了建立安全连接，AP 和 station 协商并使用最佳密码套件达成一致。ESP32 支持 AKM 的 802.1X/EAP (WPA) 方法和 AES-CCM（高级加密标准-密码块链消息验证码协议的计数器模式）支持的密码套件，设置了 USE_MBEDTLS_CRYPTO 标志，ESP32 也支持 mbedts 支持的密码套件。

目前，ESP32 支持以下 EAP 方法：
- EAP-TLS: 这是基于证书的方法，只需要 SSID 和 EAP-IDF。
- PEAP: PEAP: 这是受保护的 EAP 方法，用户名和密码是必填项。
- EAP-TTLS: 这是基于凭据的方法。只有服务器支持验证是强制性的，而用户身份验证是可选的。用户名和密码

- PAP: 密码认证协议
- CHAP: 询问握手身份验证协议
- MSCHAP 和 MSCHAP-V2
- EAP-FAST: 这是一种基于受保护的访问凭据 (PAC) 的认证方法，使用身份验证和密码。目前使用此功能时需要禁用 USE_MBEDTLS_CRYPTO 标志。

请查看 wifi/wifienterprise 获取关于证书创建以及如何在 ESP32 上运行 wpa2enterprise 示例的详细信息。

4.33.16 无线网络管理

无线网络管理让客户端设备能够交换有关网络拓扑结构的信息，包括与射频环境相关的信息。这使每个客户端都能感知到网络状况，从而促进无线网络性能的整体改进。这是 802.11v 规范的一部分。它还使客户端能够支持网络辅助漫游。网络辅助漫游让 WLAN 能够向关联的客户端发送消息，从而使客户端与具有更好链路指标的 AP 关联。这对于促进负载平衡以及引导连接不良的客户端很有用。

目前 802.11v 的实现支持 BSS 过渡管理帧。

4.33.17 无线资源管理

无线电资源测量（802.11k）旨在改善网络内流量的分配方式。在无线局域网中，一般情况下，无线设备会连接发射信号最强的接入点 (AP)。根据用户的数量和地理位置，这种分配方式有时会导致某个接入点超负荷而其它接入点利用不足，从而导致整体网络性能下降。在符合 802.11k 规范的网络中，如果信号
4.33.18  ESP32 Wi-Fi 节能模式

station 睡眠

目前，ESP32 Wi-Fi 支持 Modem-sleep 模式，该模式是 IEEE 802.11 协议中的传统节能模式。仅 station 模式支持该模式，station 必须先连接到 AP。如果使能了 Modem-sleep 模式，station 将定期在活动状态和睡眠状态之间切换。在睡眠状态下，RF、PHY 和 BB 处于关闭状态，以减少功耗。Modem-sleep 模式下，station 可以与 AP 保持连接。

Modem-sleep 模式包括最小和最大节能模式。在最小节能模式下，每个 DTIM 间隔，station 都将唤醒以接收 beacon，广播数据在 DTIM 之后传输，因此不会丢失。但是，由于 DTIM 间隔短由 AP 决定，如果该间隔时间设置较短，则省电效果不大。

在最大节能模式下，每个监听间隔，station 都将唤醒以接收 beacon。可以设置该监听间隔长于 AP 的 DTIM 周期。在 DTIM 间隔内，station 可能处于睡眠状态，广播数据会丢失。如果监听间隔较长，则可以节省更多电量，但广播数据更容易丢失。连接 AP 前，可以通过调用 API esp_wifi_set_config() 配置监听间隔。

调用 esp_wifi_init() 后，调用 esp_wifi_set_ps(WIFI_PS_MIN_MODEM) 可使能 Modem-sleep 最小节能模式。调用 esp_wifi_set_ps(WIFI_PS_MAX_MODEM) 可使能 Modem-sleep 最大节能模式。station 连接到 AP 时，Modem-sleep 模式将启动。station 与 AP 断开连接时，Modem-sleep 模式将停止。

调用 esp_wifi_set_ps(WIFI_PS_NONE) 可以完全禁用 Modem-sleep 模式。禁用会增大功耗，但可以最大限度减少实时接收 Wi-Fi 数据的延迟。使能 Modem-sleep 时，接收 Wi-Fi 数据的延迟时间可能与 DTIM 周期（最小节能模式）或监听间隔（最大节能模式）相同。在 Wi-Fi 与 Bluetooth LE 共存模式下，无法完全禁用 modem-sleep 模式。

默认的 Modem-sleep 模式是 WIFI_PS_MIN_MODEM。

AP 睡眠

目前，ESP32 AP 不支持 Wi-Fi 协议中定义的所有节能功能。具体来说，AP 只缓存所连 station 单播数据，不缓存组播数据。如果 ESP32 AP 所连的 station 已使能节能功能，可能发生组播数据包丢失。

未来，ESP32 AP 将支持所有节能功能。

非连接状态下的休眠

非连接状态指的是 esp_wifi_start() 至 esp_wifi_stop() 期间内，没有建立 Wi-Fi 连接的阶段。

目前，ESP32 Wi-Fi 支持以 station 模式运行时，在非连接状态 下休眠。可以通过选项 CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE 配置该功能。

如果打开配置选项 CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE，则在该阶段内，RF、PHY 和 BB 将在空闲时被关闭，电流将会等同于 Modem-sleep 模式下的休眠电流。

配置选项 CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE 默认情况下将会被打开，共存模式下被 Menuconfig 强制打开。
非连接模块功耗管理

非连接模块指的是一些不依赖于 Wi-Fi 连接的 Wi-Fi 模块，例如 ESP-NOW，DPP，FTM。这些模块从esp_wifi_start() 开始工作至esp_wifi_stop() 结束。

目前，ESP-NOW 以 station 模式工作时，既支持在连接状态下休眠，也支持在非连接状态下休眠。

非连接模块发包 对于任何非连接模块，在开启了休眠的任何时间点都可以发包，不需要进行任何额外的配置。

此外，esp_wifi_80211_tx() 也在休眠时被支持。

非连接模块收包 对于非连接模块，在开启休眠时如果需要进行收包，需要配置两个参数，分别为 Window 和 Interval。

在每个 Interval 开始时，RF, PHY 和 BB 将会被打开并保持 Window 的时间。非连接模块可以在此时间内收包。

Interval

• 全局只有一个 Interval 参数，所有非连接模块共享它。其数值由 API esp_wifi_set_connectionless_interval() 设置，单位为毫秒。
• Interval 的默认值为ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE。
• 在 Interval 开始时，将会给 WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START 事件，由于 Window 将在此时开始，可以在此事件内配置发包动作。
• 在连接状态下，Interval 开始的时间点将会与 TBTT 时间对齐。

Window

• 每个非连接模块在启动后都有其自身的 Window 参数，休眠模块将取所有模块 Window 的最大值运算。
• 其数值由 API module_name_set_wake_window() 设置，单位为毫秒。
• 模块 Window 的默认值为最大值。

<table>
<thead>
<tr>
<th>Interval</th>
<th>Esp_wifi_connectionless_interval_default_mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>Window</td>
<td>0: not used</td>
</tr>
<tr>
<td></td>
<td>1 - maximum: default mode</td>
</tr>
<tr>
<td></td>
<td>used periodically (Window &lt; Interval) / used all time (Window = Interval)</td>
</tr>
</tbody>
</table>

默认模式 当 Interval 参数被配置为 ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE，且有非零的 Window 参数时，非连接模块功耗管理将会按照默认模式运行。

在没有与非 Wi-Fi 协议共存时，RF, PHY 和 BB 将会在默认模式下被一直打开。

在与非 Wi-Fi 协议共存时，RF, PHY 和 BB 资源被共存模块分时划给 Wi-Fi 非连接模块和非 Wi-Fi 协议使用。在默认模式下，Wi-Fi 非连接模块被允许周期性使用 RF, PHY 和 BB，并且具有稳定性能。

推荐在与非 Wi-Fi 协议共存时将非连接模块功耗管理配置为默认模式。

4.33.19 ESP32 Wi-Fi 吞吐量

下表是我们在 Espressif 实验室和屏蔽箱中获得的最佳吞吐量结果。
### 4.33.20 Wi-Fi 802.11 数据包发送

`esp_wifi_80211_tx()` API 可用于：

- 发送 beacon、probe request、probe response 和 action 帧。
- 发送非 QoS 数据帧。

不能用于发送加密或 QoS 帧。

#### 使用 `esp_wifi_80211_tx()` 的前提条件

- Wi-Fi 模式为 station 模式、AP 模式，或 station/AP 共存模式。
- API esp_wifi_set_promiscuous(true) 或 esp_wifi_start()，或者二者都返回 ESP_OK，这是为了确保在调用函数`esp_wifi_80211_tx()` 前，Wi-Fi 硬件已经初始化。对于 ESP32，esp_wifi_set_promiscuous(true) 和 esp_wifi_start() 都可以触发 Wi-Fi 硬件初始化。
- 提供正确的`esp_wifi_80211_tx()` 参数。

#### 传输速率

- 默认传输速率为 1 Mbps。
- 可以通过函数`esp_wifi_config_80211_tx_rate()` 设置任意速率。
- 可以通过函数`esp_wifi_set_bandwidth()` 设置任意带宽。

#### 在不同情况下需要避免的副作用

理论上，如果不考虑 API 对 Wi-Fi 驱动程序或其他 station 或 AP 的副作用，可以通过空中发送一个原始的 802.11 数据包，包括任何目的地址的 MAC、任何源地址的 MAC、任何 BSSID、或任何其他类型的数据包。但是，一个具有强健、有用的应用程序应该避免这种副作用。下表针对如何避免`esp_wifi_80211_tx()` 的副作用提供了一些提示或建议。

<table>
<thead>
<tr>
<th>类型/吞吐量</th>
<th>实验室空气状态</th>

<td>75 MBit/s</td>
<td>iperf example</td>
<td>15575346</td>
</tr>
</tbody>
</table>

使用 iperf example 测试吞吐量时，sdkconfig 是 `examples/wifi/iperf/sdkconfig.defaults.esp32`。
### 场景  |  描述
--- | ---
无 Wi-Fi 连接 | 在这种情况下，因为没有 Wi-Fi 连接，Wi-Fi 驱动程序不会受到副作用影响。如果 en_sys_seq=true，则 Wi-Fi 驱动程序负责序列控制。如果 en_sys_seq=false，应用程序需要确保缓存区序列的正确。理论上，MAC 地址可以是任何地址，但是这样可能会影响其他使用相同 MAC/BSSID 的 station/AP。例如，AP 模式下，应用程序调用函数 esp_wifi_80211_tx() 发送带有 BSSID == mac_x 的 beacon，但是 mac_x 并非 AP 接口的 MAC。而且，还有另一个 AP（我们称之为“other-AP”）的 bssid 是 mac_x。因此，连接到“other-AP”的 station 无法分辨 beacon 来自“other-AP”还是 esp_wifi_80211_tx()，就会出现“意外行为”。为了避免上述副作用，我们建议：如果在 station 模式下调用函数 esp_wifi_80211_tx()，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 station 接口的 MAC。如果在 AP 模式下调用函数 esp_wifi_80211_tx()，第一个 MAC 应该是组播 MAC 或是目标设备的 MAC，第二个 MAC 应该是 AP 接口的 MAC。上述建议仅供参考，有充分理由的情况下可以忽略。
有 Wi-Fi 连接 | 当 Wi-Fi 已连接，且序列由应用程序控制，应用序程序可能会影响整个 Wi-Fi 连接的序列控制。因此，en_sys_seq 要为 true，否则将返回 ESP_ERR_WIFI_ARG。“无 Wi-Fi 连接”情况下的 MAC 地址选择也适用于此情况。如果 Wi-Fi 模式是 station 模式，MAC 的地址 1 是 station 所连 AP 的 MAC，地址 2 是 station 接口的 MAC。那么就称数据包是从 station 发送到 AP，另一方面，如果 Wi-Fi 模式是 AP 模式，且 MAC 地址 1 是该 AP 所连 station 的 MAC，地址 2 是 AP 接口的 MAC。那么就称数据包是从 AP 发送到 station。为避免与 Wi-Fi 连接冲突，可采用以下检查方法：如果数据包类型是数据，且是从 station 发送到 AP，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 1，FromDS 位为 0，否则，Wi-Fi 驱动程序不接受该数据包。如果数据包类型是数据，且是从 AP 发送到 station，IEEE 802.11 Frame control 字段中的 ToDS 位应该为 0，FromDS 位为 1，否则，Wi-Fi 驱动程序不接受该数据包。如果数据包是从 station 发送到 AP，或从 AP 到 station，Power Management、More Data 和 Re-Transmission 位应该为 0，否则，Wi-Fi 驱动程序不接受该数据包。如果任何检查失败，将返回 ESP_ERR_WIFI_ARG。

#### 4.33.21 Wi-Fi Sniffer 模式

Wi-Fi Sniffer 模式可以通过 esp_wifi_set_promiscuous() 使能，如果使能 Sniffer 模式，可以向应用程序转储以下数据包。

- 802.11 管理帧
- 802.11 数据帧，包括 MPDU、AMPDU、AMSDU 等
- 802.11 MIMO 帧，Sniffer 模式仅转储 MIMO 帧的长度。
- 802.11 控制帧
- 802.11 CRC 错误帧

不可以向应用程序转储以下数据包。

- 802.11 其它错误帧

对于 Sniffer 模式可以转储的帧，应用程序可以另外使用 esp_wifi_set_promiscuous_filter() 和 esp_wifi_set_promiscuous_ctrl_filter() 决定筛选哪些特定类型的数据包。应用程序默认筛选所有 802.11 数据和管理帧。

可以在 WIFI_MODE_NULL、WIFI_MODE_STA、WIFI_MODE_AP、WIFI_MODE_APSTA 等 Wi-Fi 模式下使能 Wi-Fi Sniffer 模式，也就是说，当 station 连接到 AP，或者 AP 有 Wi-Fi 连接时，就可以使能。请注意，Sniffer 模式对 station/AP Wi-Fi 连接的吞吐量有很大影响。通常，除非有特别原因，当 station/AP Wi-Fi 连接出现大量流量，不应使能。

该模式下还应注意回调函数 wifi_promiscuous_cb 的使用。该回调将直接在 Wi-Fi 驱动程序任务中进行。
所以如果应用程序需处理大量过滤的数据包，建议在回调中向应用程序任务发布一个事件，把真正的工作推延到应用程序任务中完成。

### 4.33.22 Wi-Fi 多根天线

下图描述 Wi-Fi 多根天线的选择过程:

```plaintext
<table>
<thead>
<tr>
<th>Enabled</th>
<th>Antenna 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
```

ESP32 通过外部天线开关，最多支持 16 根天线。天线开关最多可由四个地址管脚控制 - antenna_select[0:3]，向 antenna_select[0:3] 输入不同的值，以选择不同的天线。例如，输入值 ‘0b1011’ 表示选中天线 11。antenna_select[3:0] 的默认值为 “00000”，表示默认选择了天线 0。

四个高电平有效 antenna_select 管脚有多达四个 GPIO 连接。ESP32 可以通过控制 GPIO[0:3] 选择天线。API esp_wifi_set_ant_gpio() 用于配置 antenna_select 连接哪些 GPIO。如果 GPIO[x] 连接到 antenna_select[x], gpio_config->gpio_cfg[x].gpio_select 应设置为 1，其导提供 gpio_config->gpio_cfg[x].gpio_num 的值。

天线开关的具体实现不同，antenna_select[0:3] 的输入值中可能存在非法值，即 ESP32 通过外部天线开关支持的天线数可能小于 16 根。例如，ESP32-WROOM-DA 使用 RTC6603P 作为天线开关，仅支持 2 根天线。两个天线选择输入管脚为高电平有效，连接到两个 GPIO。’0b11’ 表示选中天线 0，’0b01’ 表示选中天线 1，输入值 ‘0b00’ 和 ‘0b11’ 为非法值。

尽管最多支持 16 根天线，发送和接收数据时，最多只能同时使用两根天线。API esp_wifi_set_ant() 用于配置使能哪些天线。

使能天线后，选择算法的过程同样可由 esp_wifi_set_ant() 配置。接收/发送数据的天线模式可以是 WIFI_ANT_MODE_ANT0、WIFI_ANT_MODE_ANT1 或 WIFI_ANT_MODE_AUTO。如果天线模式为 WIFI_ANT_MODE_ANT0，使能的天线 0 用于接收/发送数据。如果天线模式为 WIFI_ANT_MODE_ANT1，使能的天线 1 用于接收/发送数据。否则，Wi-Fi 会自动选择使能天线中信号较好的天线。

如果接收数据的天线模式为 WIFI_ANT_MODE_AUTO，还需要设置默认天线模式。只有在满足某些条件时，接收数据天线才切换，例如，如果 RSSI 低于 -65 dBm，或另一根天线信号更好。如果条件不满足，接收数据使用默认天线。如果默认天线模式为 WIFI_ANT_MODE_ANT1，则使能的天线 1 是默认接收数据天线，否则是使能的天线 0。

有一些限制情况需要考虑:

- 因为发送数据天线基于 WIFI_ANT_MODE_AUTO 类型的接收数据天线选择算法，只有接收数据的天线模式为 WIFI_ANT_MODE_AUTO 时，发送数据天线才能设置为 WIFI_ANT_MODE_AUTO。
- 目前，Bluetooth® 不支持多根天线功能，请不要使用与多根天线有关的 API。

推荐在以下场景中使用多根天线:

- Wi-Fi 模式 WIFI_MODE_STA 下，接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_AUTO。Wi-Fi 驱动程序自动选择更好的接收/发送天线。
- 接收数据天线模式配置为 WIFI_ANT_MODE_AUTO, 发送数据的天线模式配置为 WIFI_ANT_MODE_ANT1 或 WIFI_ANT_MODE_ANT1，应用程序可以始终选择指定的天线用于发送数据，也可以执行自身发送数据天线选择算法，如根据信号切换信息选择发送数据的天线模式等。
• 接收/发送数据的天线模式均配置为 WIFI_ANT_MODE_ANT0 或 WIFI_ANT_MODE_ANT1。

**Wi-Fi 多根天线配置**

通常，可以执行以下步骤来配置多根天线：

- 配置 antenna_selects 连接哪些 GPIOs，例如，如果支持四根天线，且 GPIO20/GPIO21 连接到 antenna[0]/antenna_select[1]，配置如下所示：

```c
wifi_ant_gpio_config_t config = {
    .gpio_select = 1, .gpio_num = 20,
    .gpio_select = 1, .gpio_num = 21
};
```

- 配置使能哪些天线，以及接收/发送数据如何使用使能的天线，例如，如果使能了天线 1 和天线 3，接收数据需要自动选择较好的天线，并将天线 1 作为默认天线，发送数据最终选择天线 3。配置如下所示：

```c
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    enabled_ant0 = 1,
    enabled_ant1 = 3
};
```

### 4.33.23 Wi-Fi 信道状态信息

信道状态信息 (CSI) 是指 Wi-Fi 连接的信道信息。ESP32 中，CSI 由子载波的信道频率响应组成。CSI 从发送端接收数据包时开始估计，每个子载波信道频率响应由两个字节的有符号字符记录。第一个字节是虚部，第二个字节是实部。根据接收数据包的类型，信道频率响应最多有三个字段。分别是 LLTF、HT-LTF 和 STBC-HT-LTF。对于在不同状态的信道上接收到的不同类型的信包、CSI 的子载波索引和总字节数如下表所示。

<table>
<thead>
<tr>
<th>信道</th>

<td>-21,-7,+7,+21</td>
<td>52 total, 48 usable</td>
</tr>
<tr>
<td>802.11n, 20MHz</td>
<td>-28到+28</td>
<td>-21,-7,+7,+21</td>
<td>56 total, 52 usable</td>
</tr>
<tr>
<td>802.11n, 40MHz</td>
<td>-57到+57</td>
<td>-53,-25,-11,+11,+25,+53</td>
<td>114 total, 108 usable</td>
</tr>
</tbody>
</table>

备注：
- 对于 STBC 数据包，每个时隙都提供了 CSI，不会出现 CSD（循环移位延迟）。由于附带链上的
  每一次循环移位为 -200 ns，因为子载波 0 中没有信道频率响应，在 HT-LTF 和 STBC-HT-LTF
  中只记录第一时隙的 CSD 角度。CSD[10] 是 11 位，范围从 -pi 到 pi。
- 如果调用 API esp_wifi_set_csi_config() 没有使能 LLTF、HT-LTF 或 STBC-HT-LTF，则 CSI
  数据的总字节数量会比表中的少。例如，如果没有使能 LLTF 和 HT-LTF，而使能 STBC-HT-LTF，当
  接收到上述条件、HT、40 MHz 或 STBC 的数据包时，CSI 数据的总字节数为 244 ((61+60)*2+2=244，
  结果对齐为四个字节，最后两个字节无效)。

### 4.33.24 Wi-Fi 信道状态信息配置

要使用 Wi-Fi CSI，需要执行以下步骤。
- 在菜单配置中选择 Wi-Fi CSI，方法是“菜单配置 -> 组件配置 -> Wi-Fi -> Wi-Fi CSI (信道状态信息)”。
- 调用 API esp_wifi_set_csi_rx_cb() 设置 CSI 接收回调函数。
- 调用 API esp_wifi_set_csi_config() 配置 CSI。
- 调用 API esp_wifi_set_csi() 使能 CSI。

CSI 接收回调函数从 Wi-Fi 任务中运行。因此，不要在回调函数中进行冗长的操作。可以将需要的数据
发送到队列中，并从一个较低优先级的任务中处理。由于 station 在断开连接时不会收到任何数据包，只
有在连接时才会收到来自 AP 的数据包，因此建议通过调用函数 esp_wifi_set_promiscuous() 使
能 Sniffer 模式接收更多 CSI 数据。

### 4.33.25 Wi-Fi HT20/40

ESP32 支持 Wi-Fi 带宽 HT20 或 HT40，不支持 HT20/40 共存。调用函数 esp_wifi_set_bandwidth() 可改变
station/AP 的默认带宽。ESP32 station 和 AP 的默认带宽为 HT40。

station 模式下，实际带宽首先在 Wi-Fi 连接时协商。只有当 station 和所连 AP 都支持 HT40 时，带宽才为
HT40，否则为 HT20。如果所连的 AP 的带宽发生变化，则在不断开 Wi-Fi 连接的情况下再次协商实际带
宽。

同样，在 AP 模式下，在 AP 与所连 station 协商实际带宽。如果 AP 和其中一个 station 支持 HT40，则为
HT40，否则为 HT20。

在 station/AP 共存模式下，station 和 AP 都可独立配置为 HT20/40。如果 station 和 AP 都协商为 HT40，由
于 ESP32 中，station 的优先级总高于 AP，HT40 信道是 station 的信道。例如，AP 的配置带宽为 HT40，
配置的主信道为 6，配置的辅助信道为 10。如果，station 所连路由器的主信道为 6，辅助信道为 2，AP 的
实际信道将自动更改为主 6 和辅 2。
理论上，HT40 可以获得更大的吞吐量。因为 HT40 的最大原始 PHY 数据速率为 150 Mbps，而 HT20 为 72 Mbps。但是，如果设备在某些特殊环境中使用，例如，ESP32 周围其他 Wi-Fi 设备过多，HT40 的性能可能会降低。因此，如果应用程序需要支持相同或类似的情况，建议始终将带宽配置为 HT20。

4.33.26 Wi-Fi QoS

ESP32 支持 WFA Wi-Fi QoS 认证所要求的所有必备功能。

Wi-Fi 协议中定义了四个 AC（访问类别），每个 AC 有各自的优先级访问 Wi-Fi 信道。此外，还定义了映射规则以映射其他协议的 QoS 优先级，例如 802.11D 或 TCP/IP 到 Wi-Fi AC。

下表描述 ESP32 中 IP 优先级如何映射到 Wi-Fi AC，还指明此 AC 是否支持 AMPDU。该表按优先级降序排列，即 AC_VO 拥有最高优先级。

<table>
<thead>
<tr>
<th>IP 优先级</th>
<th>Wi-Fi AC</th>
<th>是否支持 AMPDU</th>
</tr>
</thead>
<tbody>
<tr>
<td>6, 7</td>
<td>AC_VO (Voice)</td>
<td>否</td>
</tr>
<tr>
<td>4, 5</td>
<td>AC_VI (Video)</td>
<td>是</td>
</tr>
<tr>
<td>3, 0</td>
<td>AC_BE (Best Effort)</td>
<td>是</td>
</tr>
<tr>
<td>1, 2</td>
<td>AC_BK (Background)</td>
<td>是</td>
</tr>
</tbody>
</table>

应用程序可以通过套接字选项 IP_TOS 配置 IP 优先级使用 QoS 功能。下面是使套接字使用 VI 队列的示例:

```c
const int ip_precedence_vii = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vii << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

理论上，高优先级的 AC 比低优先级 AC 具有更好的性能，但并非总是如此，下面是一些关于如何使用 Wi-Fi QoS 的建议:

- 可以把一些真正重要的应用程序流量放到 AC_VO 队列中。避免通过 AC_VO 队列发送大流量。一方面，AC_VO 队列不支持 AMPDU，如果流量很大，性能不会优于其他队列。另一方面，可能会严重影响同样使用 AC_VO 队列的管理帧。
- 避免使用 AMPDU 支持的，两个以上的不同优先级，比如 socket A 使用优先级 0，socket B 使用优先级 1，socket C 使用优先级 2。因为可能需要更多的内存，不是好的设计。具体来说，Wi-Fi 驱动程序可能会为每个优先级生成一个 Block Ack 会话，如果设置了 Block Ack 会话，则需要更多内存。

4.33.27 Wi-Fi AMSDU

ESP32 支持接收和发送 AMSDU。

4.33.28 Wi-Fi 分片

支持 Wi-Fi 接收分片，但不支持 Wi-Fi 发送分片。

4.33.29 WPS 注册

在 Wi-Fi 模式 WIFI_MODE_STA 或 WIFI_MODE_APSTA 下，ESP32 支持 WPS 注册功能。目前，ESP32 支持的 WPS enrollee 类型有 PBC 和 PIN。

4.33.30 Wi-Fi 缓冲区使用情况

本节只介绍动态缓冲区配置。
Chapter 4. API 指南

缓冲区配置的重要性

为了获得一个具有强健、高性能的系统，我们需要非常谨慎地考虑内存的使用或配置情况，因为：

- ESP32 的可用内存有限。
- 目前，LwIP 和 Wi-Fi 驱动程序中默认的缓冲区类型是“动态”，意味着 LwIP 和 Wi-Fi 都与应用程序共享内存。程序员应该时刻牢记这一点，否则将面临如“堆内存耗尽”等的内存问题。
- “堆耗尽”情况非常危险，会导致 ESP32 出现“未定义行为”。因此，应该为应用程序预留足够的堆内存，防止耗尽。
- Wi-Fi 的吞吐量很大程度上取决于与内存相关的配置，如 TCP 窗口大小、Wi-Fi 接收/发送数据动态缓冲区数量等。
- ESP32 LwIP/Wi-Fi 可能使用的堆内存峰值取决于许多因素，例如应用程序可能拥有的最大 TCP/UDP 连接等。
- 在考虑内存配置时，应用程序所需的总内存也是一个重要因素。

由于这些原因，不存在一个适合所有应用程序的配置。相反，我们必须为每个不同的应用程序考虑不同的内存配置。

动态与静态缓冲区

Wi-Fi 驱动程序中默认的缓存类型是 “动态”。大多数情况下，动态缓冲区可以极大地节省内存。但是因为应用程序需要考虑 Wi-Fi 的内存使用情况，会给应用程序编程造成一定的难度。

LwIP 还在 TCP/IP 层分配缓冲区，这种缓冲区分配也是动态的。具体内容，见 LwIP 文档内存使用和性能部分。

Wi-Fi 动态缓冲区峰值

Wi-Fi 驱动程序支持多种类型的缓冲区（参考 Wi-Fi 缓冲区配置）。但本节只介绍 Wi-Fi 动态缓冲的使用方法 Wi-Fi 使用的堆内存峰值是 Wi-Fi 驱动程序理论上消耗的最大内存。通常，该内存峰值取决于：

- 配置的动态接收数据缓冲区数：wifi_rx_dynamic_buf_num
- 配置的动态发送数据缓冲区数：wifi_tx_dynamic_buf_num
- Wi-Fi 驱动程序可以接收的最大数据包：wifi_rx_pkt_size_max
- Wi-Fi 驱动程序可以发送的最大数据包：wifi_tx_pkt_size_max

因此，Wi-Fi 驱动程序消耗的内存峰值可以用下面的公式计算：

$$\text{wifi\_dynamic\_peek\_memory} = (\text{wifi\_rx\_dynamic\_buf\_num} \times \text{wifi\_rx\_pkt\_size\_max}) + (\text{wifi\_tx\_dynamic\_buf\_num} \times \text{wifi\_tx\_pkt\_size\_max})$$

一般情况下，不需要关心动态发送数据长缓冲区和超长缓冲区，因为它们是管理帧，对系统的影响很小。

4.3.31 如何提高 Wi-Fi 性能

ESP32 Wi-Fi 的性能受许多参数的影响，各参数之间存在相互制约。如果配置得合理，不仅可以提高性能，还可以增加应用程序的可用内存，提高稳定性。

在本节中，我们将简单介绍 Wi-Fi/LWIP 协议栈的工作模式，并说明各个参数的作用。我们将推荐几种配置等级，您可以根据使用场景选择合适的等级。

协议栈工作模式

ESP32 协议栈分为四层，分别为应用层、LWIP 层、Wi-Fi 层和硬件层。

- 在接收过程中，硬件将接收到的数据包放入 DMA 缓冲区，然后依次传送到 Wi-Fi 的接收数据缓冲区、LWIP 的接收数据缓冲区进行相关协议处理，最后传送到应用层。Wi-Fi 的接收数据缓冲区和 LWIP 的接收数据缓冲区默认共享同一个缓冲区。也就是说，Wi-Fi 默认将数据包转发到 LWIP 作为参考。
在发送过程中，应用程序首先将要发送的消息复制到LWIP层的发送数据缓冲区，进行TCP/IP封装。然后将消息发送到Wi-Fi层的发送数据缓冲区进行MAC封装，最后等待发送。

### 参数

适当增加上述缓冲区的大小或数量，可以提高Wi-Fi性能，但同时会减少应用程序的可用内存。下面我们将介绍您需要配置的参数：

#### 接收数据方向：

- **CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM** 该参数表示硬件层的DMA缓冲区数量。提高该参数将增加发送方的一次性接收吞吐量，从而提高Wi-Fi协议栈处理突发流量的能力。
- **CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM** 该参数表示Wi-Fi层中接收数据缓冲区的数量。提高该参数可以增强数据包的接收性能。该参数需要与LWIP层的接收数据缓冲区大小相匹配。
- **CONFIG_ESP32_WIFI_RX_BA_WIN** 该参数表示接收端AMPU BA窗口的大小。应配置为**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**和**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**的二倍数值中较小的数值。
- **CONFIG_LWIP_TCP_WND_DEFAULT** 该参数表示LWIP层用于每个TCP流的接收数据缓冲区大小，应配置为**WIFI_DYNAMIC_RX_BUFFER_NUM**（KB）的值，从而实现高稳定性。同时，在有多个流的情况下，应相应降低该参数值。

#### 发送数据方向：

- **CONFIG_ESP32_WIFI_TX_BUFFER** 该参数表示发送数据缓存区的类型，建议配置为动态缓存区，该配置可以充分利用内存。
- **CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM** 该参数表示Wi-Fi层发送数据缓冲区数量。提高该参数可以增强数据包发送的性能。该参数值需要与LWIP层的发送数据缓冲区大小相匹配。
- **CONFIG_LWIP_TCP_SND_BUF_DEFAULT** 该参数表示LWIP层用于每个TCP流的发送数据缓冲区大小，应配置为**WIFI_DYNAMIC_TX_BUFFER_NUM**（KB）的值，从而实现高稳定性。在有多个流的情况下，应相应降低该参数值。

#### 通过在IRAM中放置代码优化吞吐量：

- **CONFIG_ESP32_WIFI_IRAM_OPT** 如果能使该选项，一些Wi-Fi功能将被移至IRAM，从而提高吞吐量，IRAM使用量将增加15 KB。
- **CONFIG_ESP32_WIFI_RX_IRAM_OPT** 如果能使该选项，一些Wi-Fi接收数据功能将被移至IRAM，从而提高吞吐量，IRAM使用量将增加16 KB。
• **CONFIG_LWIP_IRAM_OPTIMIZATION** 如果使能该选项，一些 LWIP 功能将被移至 IRAM，从而提高吞吐量。IRAM 使用量将增加 13 KB。

备注：上述的缓冲区大小固定为 1.6 KB。

### 如何配置参数

ESP32 的内存由协议栈和应用程序共享。

在这里，我们给出了几种配置等级。在大多数情况下，您应根据应用程序所占用内存的大小，选择合适的等级进行参数配置。

下表中未提及的参数应设置为默认值。

<table>

备注：以上结果使用华硕 RT-N66U 路由器，在屏蔽箱中进行单流测试得出。ESP32 的 CPU 为双核，频率为 240 MHz，flash 为 QIO 模式，频率为 80 MHz。

等级：

- **Iperf 级别** ESP32 的极端性能等级，用于测试极端性能。
- **高性能级别** ESP32 的高性能配置等级，适用于应用程序占用内存较少但有高性能要求的场合。在该等级中，您可以根据使用场景选择使用接收数据优先等级或发送数据优先等级。
- **默认级别** ESP32 的默认配置等级，兼顾可用内存和性能。
- **节省内存级别** 该级别适用于应用程序需要大量内存的场景。在这一等级下，收发器的性能会有所降低。
- **最小级别** ESP32 的最小配置等级。协议栈只使用运行所需的内存。适用于对性能没有要求，而应用程序需要大量内存的场景。
使用 PSRAM

PSRAM 一般在应用程序占用大量内存时使用。在该模式下，CONFIG_ESP32_WIFI_TX_BUFFER 被强制为静态。CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM 表示硬件层 DMA 缓冲区数量，提高这一参数可以增强性能。以下是使用 PSRAM 时的推荐等级。

4.33.32 Wi-Fi Menuconfig

Wi-Fi 缓冲区配置

如果您要修改默认的缓冲区数量或类型，最好也了解缓冲区在数据路径中是如何分配或释放的。下图显示了发送数据方向的这一过程。

- 应用程序分配需要发送的数据。
- 应用程序调用 TCP/IP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。

下图展示了如何在接收数据方向分配或释放缓冲区：

图 62: TX Buffer Allocation

描述：

- 应用程序分配需要发送的数据。
- 应用程序调用 TCP/IP 或套接字相关的 API 发送用户数据。这些 API 会分配一个在 LwIP 中使用的 PBUF，并复制用户数据。
- 当 LwIP 调用 Wi-Fi API 发送 PBUF 时，Wi-Fi API 会分配一个“动态发送数据缓冲区”或“静态发送数据缓冲区”，并复制 LwIP PBUF，最后发送数据。
图 63: 接收数据缓冲区分配

描述:

- Wi-Fi 硬件在空中接收到数据包后，将数据包内容放到“静态接收数据缓冲区”，也就是“接收数据 DMA 缓冲区”。
- Wi-Fi 驱动程序分配一个“动态接收数据缓冲区”，复制“静态接收数据缓冲区”，并将“静态接收数据缓冲区”返回给硬件。
- Wi-Fi 驱动程序将数据包传送到上层 (LwIP)，并分配一个 PBUF 用于存放“动态接收数据缓冲区”。
- 应用程序从 LwIP 接收数据。

下表是 Wi-Fi 内部缓冲区的配置情况。
<table>
<thead>
<tr>
<th>缓冲区类型</th>
<th>分配类型</th>
<th>默认</th>
<th>是否可配置</th>
<th>描述</th>
</tr>
</thead>
<tbody>
<tr>
<td>静态接收数据缓冲区（硬件接收数据缓冲区）</td>
<td>静态</td>
<td>10 * 1600 Bytes</td>
<td>是</td>
<td>这是一种 DMA 内存，在函数 esp_wifi_init() 中初始化，在函数 esp_wifi_deinit() 中释放。该缓冲区形成硬件接收列表。当通过空中接收到一个帧时，硬件将该帧写入缓冲区，并向 CPU 发起一个中断。然后，Wi-Fi 驱动程序从缓冲区中读取内容，并将缓冲区返回到列表中。如果应用程序希望减少 Wi-Fi 静态分配的内存，可以将该值从 10 减少到 6，从而节省 6400 Bytes 的内存。除非禁用 AMPDU 功能，否则不建议将该值降低到 6 以下。</td>
</tr>
<tr>
<td>动态接收数据缓冲区</td>
<td>动态</td>
<td>32</td>
<td>是</td>
<td>缓冲区的长度可变，取决于所接收帧的长度。当 Wi-Fi 驱动程序从“硬件接收数据缓冲区”接收到一帧时，需要从堆中分配“动态接收数据缓冲区”。在 Menuconfig 中配置的“动态接收数据缓冲区”数量用来限制未释放的“动态接收数据缓冲区”总数量。</td>
</tr>
<tr>
<td>动态发送数据缓冲区</td>
<td>动态</td>
<td>32</td>
<td>是</td>
<td>这是一种 DMA 内存，位于堆内存中。当上层（LwIP）向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“动态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。</td>
</tr>
<tr>
<td>静态发送数据缓冲区</td>
<td>静态</td>
<td>16 * 1600 Bytes</td>
<td>是</td>
<td>这是一种 DMA 内存，在函数 esp_wifi_init() 中初始化，在函数 esp_wifi_deinit() 中释放。当上层（LwIP）向 Wi-Fi 驱动程序发送数据包时，该缓冲区首先分配一个“静态发送数据缓冲区”，并复制上层缓冲区。动态发送数据缓冲区和静态发送数据缓冲区相互排斥。由于发送数据缓冲区必须是 DMA 缓冲区，所以当使用 PSRAM 时，发送数据缓冲区必须是静态的。</td>

<td>Wi-Fi 驱动程序的内部缓冲区。</td>
</tr>
</tbody>
</table>

**Wi-Fi NVS Flash**

如果使能 Wi-Fi NVS flash，所有通过 Wi-Fi API 设置的 Wi-Fi 配置都会被存储到 flash 中，Wi-Fi 驱动程序在下次开机或重启时将自动加载这些配置。但是，应用程序可视情况禁用 Wi-Fi NVS flash，例如：其配置信息不需要存储在非易失性内存中，其配置信息已安全备份，或仅出于某些调试原因等。
Wi-Fi AMPDU

ESP32 同时支持接收和发送 AMPDU，AMPDU 可以大大提高 Wi-Fi 的吞吐量。
通常，应使能 AMPDU。禁用 AMPDU 通常用于调试目的。

4.33.33 故障排除

请见乐鑫 Wireshark 使用指南。

乐鑫 Wireshark 使用指南

1. 概述

1.1 什么是 Wireshark？ Wireshark（原称 Ethereal）是一个网络封包分析软件。网络封包分析软件的功能是撷取网络封包，并尽可能显示出最为详细的网络封包资料。Wireshark 使用 WinPCAP 作为接口，直接与网卡进行数据报文交换。
网络封包分析软件的功能可想像成“电工技师使用电表来量测电流、电压、电阻”的工作，只是将场景移植到网络上，并将电线替换成网线。
在过去，网络封包分析软件是非常昂贵，或是专门属于军利用的软件。Wireshark 的出现改变了这一切。
在 GNU GPL 通用许可证的保障范围内，使用者可以以免费的代价取得软件与其源代码，并拥有针对其源代码修改及客制化的权利。
Wireshark 是目前全世界最广泛的网络封包分析软件之一。

1.2 Wireshark 的主要应用 下面是 Wireshark 一些应用的举例：

- 网络管理员用来解决网络问题
- 网络安全工程师用来检测安全隐患
- 开发人员用来测试协议执行情况
- 用来学习网络协议

除了上面提到的，Wireshark 还可以用在其它许多场合。

1.3 Wireshark 的特性

- 支持 UNIX 和 Windows 平台
- 在接口实时捕捉包
- 能详细显示包的详细协议信息
- 可以打开/保存捕捉的包
- 可以导入导出其他捕捉程序支持的包数据格式
- 可以通过多种方式过滤包
- 多种方式查找包
- 通过过滤以多种色彩显示包
- 创建多种统计分析
- 等等
1.4 Wireshark 的“能”与“不能”？

- 捕获多种网络接口
  Wireshark 可以捕获多种网络接口类型的包，哪怕是无线局域网接口。
- 支持多种其它程序捕获的文件
  Wireshark 可以打开多种网络分析软件捕获的包。
- 支持多格式输出
  Wireshark 可以将捕获文件输出为多种其他捕获软件支持的格式。
- 对多种协议解码提供支持
  Wireshark 可以支持许多协议的解码。
- Wireshark 不是入侵检测系统
  如果您的网络中存在任何可疑活动，Wireshark 并不会主动发出警告。不过，当您希望对这些可疑活动一探究竟时，Wireshark 可以发挥作用。
- Wireshark 不会处理网络事务，它仅仅是“测量”（监视）网络
  Wireshark 不会发送网络包或做其它交互性的事情（名称解析除外，但您也可以禁止解析）。

2. 如何获取 Wireshark 官网链接：https://www.wireshark.org/download.html

Wireshark 支持多种操作系统，请在下载安装文件时，注意选择与您所用操作系统匹配的安装文件。

3. 使用步骤 本文档仅以 Linux 系统下的 Wireshark（版本号：2.2.6）为例。

1) 启动 Wireshark

Linux 下，可编辑一个 Shell 脚本，运行该文件即可开启 Wireshark 配置抓包网卡和信道。Shell 脚本如下：

```bash
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark
```

脚本中有两个参数：$1 和 $2，分别表示网卡和信道，例如，./xxx.sh wlan0 6 （此处，wlan0 即为抓包使用的网卡，后面的数字 6 即为 AP 或 soft-AP 所在的 channel）。

2) 运行 Shell 脚本开启 Wireshark，会出现 Wireshark 抓包开始界面

![Wireshark界面](image)

图 64: Wireshark 抓包界面

3) 选择接口，开始抓包

从上图红色框中可以看到有多个接口，第一个为本地网卡，第二个为无线网络。
可根据自己的需求选取相应的网卡，本文是以利用无线网卡抓取空中包为例进行简单说明。
双击 `wlan0` 即可开始抓包。

4) 设置过滤条件

抓包过程中会抓取到同信道所有的空包，但其实很多都是我们不需要的，因此很多时候我们会设置抓包的过滤条件从而得到我们想要的包。

下图中红色框内即为设置 `filter` 的位置。

![Wireshark Filter](image)

图 65: 设置 Wireshark 过滤条件

点击 `Filter` 按钮（下图的左上角蓝色按钮）会弹出 `display filter` 对话框。

![Display Filter](image)

图 66: Display Filter 对话框

点击 `Expression` 按钮，会出现 `Filter Expression` 对话框，在此你可以根据需求进行 `filter` 的设置。

最直接的方法：直接在工具栏上输入过滤条件。

点击在此区域输入或修改显示的过滤字符。在输入过程中会进行语法检查，如果输入的格式不正确，或者未输入完成，则背景显示为红色。直到您输入合法的表达式，背景变为绿色。你可以点击下拉列表选择您先前键入的过滤字符，列表会一直保留，即使你重新启动程序。

例如：下图所示，直接输入 2 个 MAC 作为过滤条件，点击 `Apply`（即图中的蓝色箭头），则表示只抓取 2 个此 MAC 地址之间的交互的包。

5) 封包列表

若想查看包的具体的信息只需要选中要查看的包，在界面的下方会显示出包的具体的格式和包的内容。如上图所示，我要查看第 1 个包，选中此包，图中红色框中即为包的具体内容。

6) 停止/开始包的捕捉

若要停止当前抓包，点击下图的红色按钮即可。
图 67: Filter Expression 对话框

图 68: 过滤条件工具栏

图 69: 在过滤条件工具栏中运用 MAC 地址过滤示例
图 70: 封包列表具体信息示例

图 71: 停止包的捕捉

图 72: 开始或继续包的捕捉
若要重新开始抓包，点击下图左上角的蓝色按钮即可。

7) 保存当前捕捉包

Linux下，可以通过依次点击“File”->“Export Packet Dissections”->“As Plain Text File”进行保存。

图73: 保存捕捉包

上图中，需要注意的是，选择All packets、Displayed以及All expanded三项。

Wireshark捕捉的包可以保存为其原生格式文件（libpcap），也可以保存为其他格式（如.txt文件）供其他工具进行读取分析。

4.34 Wi-Fi Security

4.34.1 ESP32 Wi-Fi Security Features

- Support for Protected Management Frames (PMF)
- Support for WPA3-Personal

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks on traditional modes.

4.34.2 Protected Management Frames (PMF)

Introduction

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to the following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
• Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

There are 3 types of PMF configuration modes on both station and AP side -

• PMF Optional
• PMF Required
• PMF Disabled

Depending on PMF configurations on Station and AP side, the resulting connection will behave differently. The table below summarises all possible outcomes -

<table>
<thead>
<tr>
<th>STA Setting</th>
<th>AP Setting</th>
<th>Outcome</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMF Optional</td>
<td>PMF Optional/Required</td>
<td>Mgmt Frames Protected</td>
</tr>
<tr>
<td>PMF Optional</td>
<td>PMF Disabled</td>
<td>Mgmt Frames Not Protected</td>
</tr>
<tr>
<td>PMF Required</td>
<td>PMF Optional/Required</td>
<td>Mgmt Frames Protected</td>
</tr>
<tr>
<td>PMF Required</td>
<td>PMF Disabled</td>
<td>STA refuses Connection</td>
</tr>
<tr>
<td>PMF Disabled</td>
<td>PMF Optional/Disabled</td>
<td>Mgmt Frames Not Protected</td>
</tr>
<tr>
<td>PMF Disabled</td>
<td>PMF Required</td>
<td>AP refuses Connection</td>
</tr>
</tbody>
</table>

API & Usage

ESP32 supports PMF in both Station and SoftAP mode. For both, the default mode is PMF Optional and disabling PMF is not possible. For even higher security, PMF required mode can be enabled by setting the required flag in pmf_cfg while using the esp_wifi_set_config() API. This will result in the device only connecting to a PMF enabled device and rejecting others.

注意: capable flag in pmf_cfg is deprecated and set to true internally. This is to take the additional security benefit of PMF whenever possible.

4.34.3 WPA3-Personal

Introduction

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. It includes new features and capabilities that offer significantly better protection against different types of attacks. It improves upon WPA2-Personal in following ways:

• WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction.
• Disallows outdated protocols such as TKIP, which is susceptible to simple attacks like MIC key recovery attack.
• Mandates Protected Management Frames (PMF), which provides protection for unicast and multicast robust management frames which include Disassoc and Deauth frames. This means that the attacker cannot disrupt an established WPA3 session by sending forged Assoc frames to the AP or Deauth/Disassoc frames to the Station.
• Provides forward secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission.

Please refer to Security section of Wi-Fi Alliance’s official website for further details.
### Setting up WPA3 with ESP32

In IDF Menuconfig under Wi-Fi component, a config option “Enable WPA3-Personal” is provided to Enable/Disable WPA3. By default it is kept enabled, if disabled ESP32 will not be able to establish a WPA3 connection. Currently, WPA3 is supported only in the Station mode. Additionally, since PMF is mandated by WPA3 protocol, PMF Mode should be set to either Optional or Required while setting WiFi config.

Refer to *Protected Management Frames (PMF)* on how to set this mode.

After these settings are done, Station is ready to use WPA3-Personal. Application developers need not worry about the underlying security mode of the AP. WPA3-Personal is now the highest supported protocol in terms of security, so it will be automatically selected for the connection whenever available. For example, if an AP is configured to be in WPA3 Transition Mode, where it will advertise as both WPA2 and WPA3 capable, Station will choose WPA3 for the connection with above settings. Note that Wi-Fi stack size requirement will increase 3kB when WPA3 is used.

### 4.35 RF 共存

#### 4.35.1 概览

ESP32 只支持一路 RF, Bluetooth (BT 和 BLE) 和 Wi-Fi 共享这一路 RF，无法同时收发数据，因此采用时分复用的方法进行收发数据包。

#### 4.35.2 ESP32 支持的共存场景

4.35.3 共存机制与策略

### 共存机制

基于优先级抢占的 RF 资源分配机制，如下图所示。Bluetooth 模块和 Wi-Fi 模块向共存模块申请 RF 资源，共存模块根据二者的优先级高低裁决 RF 归谁使用。

![共存机制示意图](image)

图 74: 共存机制

### 共存策略

**共存周期和时间片**  Wi-Fi、BT、BLE 三者对于 RF 的使用，主要是按照时间片来划分的。在一个共存周期内，按照 Wi-Fi、BT、BLE 的顺序划分时间片。在 Wi-Fi 的时间片内，Wi-Fi 会向共存仲裁模块发出较高优先级的请求，同理，BT/BLE 在自己的时间片内会具有较高优先级。共存周期大小和各个时间片占比根据 Wi-Fi 的状态分成四类：

1. **IDLE** 状态：BT 和 BLE 共存由 Bluetooth 模块控制。
2. **CONNECTED** 状态：共存周期以目标信标传输时间 (Target Beacon Transmission Time, TBTT) 为起点，周期大于 100 ms。
3. **SCAN** 状态：Wi-Fi 时间片以及共存周期都比在 CONNECTED 状态下的长，为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。
4. **CONNECTING** 状态：Wi-Fi 时间片在 CONNECTED 状态下的长。为了确保蓝牙的性能，蓝牙的时间片也会做相应的调整。

共存逻辑会根据当前 Wi-Fi 和 Bluetooth 的使用场景来选取不同的共存周期和共存时间片的划分策略。对应一个使用场景的共存策略，我们称之为 “共存模板”。比如，Wi-Fi CONNECTED 与 BLE CONNECTED 的场景，就对应有一个共存模板。在这个共存模板中，一个共存周期内 Wi-Fi 和 BLE 的时间片各占 50%，时间分配如下图所示：

**动态优先级** 共存模块对 Wi-Fi 和 Bluetooth 不同的状态赋予其不同的优先级。每种状态下的优先级并不是一成不变的，例如每次广播事件 (Advertising event) 中会有一个广播事件使用高优先级。如果高优先级的广播事件发生在 Wi-Fi 时间片内，RF 的使用权可能会被 BLE 抢占。

备注：Y：支持且性能稳定。C1：不能保证性能处于稳定状态。X：不支持。S：在 STA 模式下支持且性能稳定，否则不支持。
Wi-Fi 非连接模块的共存 在一定程度上，某些 Wi-Fi 非连接模块功耗参数 Window 与 Interval 的组合会导致共存模块在 Wi-Fi 时间片外申请共存优先级。这是为了使设定的功耗参数在共存时获取 RF 资源。但这也会影响剩余的蓝牙性能。

如果 Wi-Fi 非连接模块功耗参数为默认值时，上述动作不会发生。共存模块会按照性能稳定的模式运行。因此，除非您对特定非连接功耗参数下的共存性能有足够的测试，请在共存场景下将 Wi-Fi 非连接模块功耗参数配置为默认参数。

请参考 非连接模块功耗管理 获取更多信息。

### 4.35.4 如何使用共存功能

**共存 API 的使用**

在大多数共存情况下，ESP32 会自动进行共存状态切换，无需调用 API 对其进行干预。但是对于 BLE MESH 和 Wi-Fi 的共存，ESP32 对其提供了两个 API。当 BLE MESH 的状态发生变化时，应先调用 esp_coex_status_bit_clear 对上一个状态进行清除，然后调用 esp_coex_status_bit_set 设置当前状态。

**BLE MESH 共存状态描述** 由于 Wi-Fi 和 Bluetooth 固件无法获取当前的上层应用的场景，一些共存模块需要应用代码调用共存的 API 才能生效。BLE MESH 工作状态就需要由应用层通知给共存模块，用于选择共存模块。

- ESP_COEX_BLE_ST_MESH_CONFIG：正在组网。
- ESP_COEX_BLE_ST_MESH_TRAFFIC：正在传输数据。
- ESP_COEX_BLE_ST_MESH_STANDBY：处于空闲状态，无大量数据交互。

**共存 API 错误代码**

所有共存 API 都有自定义的返回值，即错误代码。这些代码可分类为：

- 无错误，例如：返回值为 ESP_OK 代表 API 成功返回。
- 可恢复错误，例如：返回值为 ESP_ERR_INVALID_ARG 代表 API 参数错误。

**设置共存编译时选项**

- 在完成共存程序编写的时候，您必须通过 menuconfig 选择 CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE 打开软件共存配置选项，否则就无法使用上文提到的共存功能。
- 为了在共存情况下获得更好的 Wi-Fi 和蓝牙的通信性能，建议将 Wi-Fi 协议栈的 task 和蓝牙 Controller 以及 Host 协议栈的 task 运行在不同的 CPU 上。您可以通过 CONFIG_BT_DM_CTRL_PINNED_TO_CORE_CHOICE 和 CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE（或者 CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE）选择将蓝牙 controller 以及 host 协议栈的 task 放在同一个 CPU 上，再通过 CONFIG_ESP32_WIFI_TASK_CORE_ID 选择将 Wi-Fi 协议栈 task 放在另一个 CPU 上。
Chapter 4. API 指南

• 在 共 存 情 况 下 BLE SCAN 可 能 会 被 Wi-Fi 打 断 且 Wi-Fi 在 当 前 的 BLE scan window 结 束
前 释 放 了 RF 资 源。 为 了 使 BLE 在 当 前 的 scan window 内 再 次 获 取 RF 资 源， 您 可 以 通
过CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED 选择打开 FULL SCAN 配置选项。
• 您可以通过修改以下 menuconfig 选项，以减小内存开销：
1) CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY 选择打开蓝牙协议栈动态内存配置选项。
2) CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM 选择减少 Wi-Fi 静态接收数据缓冲区的数量。
3) CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM 选择减少 Wi-Fi 动态接收数据缓冲区的数
量。
4) CONFIG_ESP32_WIFI_TX_BUFFER 选择使用动态分配发送数据缓冲区配置选项。
5) CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM 选择减少 Wi-Fi 动态发送数据缓冲区的数
量。
6) CONFIG_ESP32_WIFI_TX_BA_WIN 选择减少 Wi-Fi Block Ack TX 窗口的数量。
7) CONFIG_ESP32_WIFI_RX_BA_WIN 选择减少 Wi-Fi Block Ack RX 窗口的数量。
8) CONFIG_ESP32_WIFI_MGMT_SBUF_NUM 选择减少 Wi-Fi 管理短缓冲区的数量。
9) CONFIG_ESP32_WIFI_RX_IRAM_OPT 选择关闭此配置选项，关闭此配置选项将会减少大约 17
KB 的 IRAM 内存。
10) CONFIG_LWIP_TCP_SND_BUF_DEFAULT 选择减小 TCP 套接字默认发送缓存区大小。
11) CONFIG_LWIP_TCP_WND_DEFAULT 选择减小 TCP 套接字默认接收窗口的大小。
12) CONFIG_LWIP_TCP_RECVMBOX_SIZE 选择减小 TCP 接收邮箱的大小。
13) CONFIG_LWIP_UDP_RECVMBOX_SIZE 选择减小 UDP 接收邮箱的大小。
14) CONFIG_LWIP_TCPIP_RECVMBOX_SIZE 选择减小 TCPIP 任务接收邮箱大小。
备注: 由于共存配置选项依赖于蓝牙配置选项，所以请先打开蓝牙配置选项，然后在 Wi-Fi 配置选项中
打开共存配置选项。

4.36

Reproducible Builds

4.36.1

Introduction

ESP-IDF build system has support for reproducible builds.
When reproducible builds are enabled, the application built with ESP-IDF doesn’t depend on the build environment.
Both the .elf file and .bin files of the application remains exactly the same, even if the following variables change:
• Directory where the project is located
• Directory where ESP-IDF is located (IDF_PATH)
• Build time

4.36.2

Reasons for non-reproducible builds

There are several reasons why an application may depend on the build environment, even when the same source code
and tools versions are used.
• In C code, __FILE__ preprocessor macro is expanded to the full path of the source file.
• __DATE__ and __TIME__ preprocessor macros are expanded to compilation date and time.
• When the compiler generates object files, it adds sections with debug information. These sections help debuggers, like GDB, to locate the source code which corresponds to a particular location in the machine code.
These sections typically contain paths of relevant source files. These paths may be absolute, and will include
the path to ESP-IDF or to the project.
There are also other possible reasons, such as unstable order of inputs and non-determinism in the build system.

4.36.3

Enabling reproducible builds in ESP-IDF

Reproducible builds can be enabled in ESP-IDF using CONFIG_APP_REPRODUCIBLE_BUILD option.
Espressif Systems

2447
Submit Document Feedback

Release v5.1-dev-2066-g7869f4e151


This option is disabled by default. It can be enabled in menuconfig.
The option may also be added into `sdkconfig.defaults`. If adding the option into `sdkconfig.defaults`, delete the `sdkconfig` file and run the build again. See self-defined `sdkconfig` defaults for more information.

### 4.36.4 How reproducible builds are achieved

ESP-IDF achieves reproducible builds using the following measures:

- In ESP-IDF source code, `__DATE__` and `__TIME__` macros are not used when reproducible builds are enabled. Note, if the application source code uses these macros, the build will not be reproducible.
- ESP-IDF build system passes a set of `-fmacro-prefix-map` and `-fdebug-prefix-map` flags to replace base paths with placeholders:
  - Path to ESP-IDF is replaced with `/IDF`
  - Path to the project is replaced with `/IDF_PROJECT`
  - Path to the build directory is replaced with `/IDF_BUILD`
  - Paths to components are replaced with `/COMPONENT_NAME_DIR` (where `NAME` is the name of the component)
- Build date and time are not included into the application metadata structure if `CONFIG_APP_REPRODUCIBLE_BUILD` is enabled.
- ESP-IDF build system ensures that source file lists, component lists and other sequences are sorted before passing them to CMake. Various other parts of the build system, such as the linker script generator also perform sorting to ensure that same output is produced regardless of the environment.

### 4.36.5 Reproducible builds and debugging

When reproducible builds are enabled, file names included in debug information sections are altered as shown in the previous section. Due to this fact, the debugger (GDB) is not able to locate the source files for the given code location.

This issue can be solved using GDB `set substitute-path` command. For example, by adding the following command to GDB init script, the altered paths can be reverted to the original ones:

```plaintext
set substitute-path /COMPONENT_FREERTOS_DIR /home/user/esp/esp-idf/components/
```

ESP-IDF build system generates a file with the list of such `set substitute-path` commands automatically during the build process. The file is called `prefix_map_gdbinit` and is located in the project build directory.

When `idf.py gdb` is used to start debugging, this additional gdbinit file is automatically passed to GDB. When launching GDB manually or from and IDE, please pass this additional gdbinit script to GDB using `-x build/prefix_map_gdbinit` argument.

### 4.36.6 Factors which still affect reproducible builds

Note that the built application still depends on:

- ESP-IDF version
- Versions of the build tools (CMake, Ninja) and the cross-compiler

`IDF Docker Image` can be used to ensure that these factors do not affect the build.

### 4.37 C++ Support

ESP-IDF is primarily written in C and provides C APIs. However, ESP-IDF supports development of applications in C++. This document covers various topics relevant to C++ development.

The following C++ features are supported:
Chapter 4. API

- Exception handling
- C++ language standard
- Runtime Type Information (RTTI)
- Thread Local Storage (thread_local keyword)
- All C++ features implemented by GCC, except for some limitations. See GCC documentation for details on features implemented by GCC.

4.37.1 esp-idf-cxx Component

esp-idf-cxx component provides higher-level C++ APIs for some of the ESP-IDF features. This component is available from the IDF Component Registry.

4.37.2 C++ language standard

By default, ESP-IDF compiles C++ code with C++20 language standard with GNU extensions (-std=gnu++20).

To compile the source code of a certain component using a different language standard, set the desired compiler flag in the component CMakeLists.txt file:

```cpp
idf_component_register(...) target_compile_options(${COMPONENT_LIB} PRIVATE -std=gnu++2b)
```

Use PUBLIC instead of PRIVATE if the public header files of the component also need to be compiled with the same language standard.

4.37.3 Multithreading

C++ threads, mutexes, and condition variables are supported. C++ threads are built on top of pthreads, which in turn wrap FreeRTOS tasks.

See cxx/pthread for an example of creating threads in C++.

4.37.4 Exception handling

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using the CONFIG_COMPILER_CXX.Exceptions option.

If an exception is thrown, but there is no catch block, the program will be terminated by the abort function, and the backtrace will be printed. See Fatal Errors for more information about backtraces.

C++ Exceptions should only be used for exceptional cases, something happening unexpectedly and that is quite rare, e.g. an event that happens less frequently than 1 every 100 times. Do not use them for control flow (see also the section about resource usage below)! For more information on how to use C++ Exceptions, see the ISO C++ FAQ and CPP Core Guidelines.

See cxx/exceptions for an example of C++ exception handling.

### C++ Exception Handling and Resource Usage

Enabling exception handling normally increases application binary size by a few KB.

Additionally, it may be necessary to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible to allocate exception object from the heap. The amount of memory in the emergency pool can be set using the CONFIG_COMPILER_CXX.Exceptions.EMG_POOL_SIZE variable. Some additional stack memory (around 200 bytes) will also be used if and only if a C++ Exception is actually thrown, because it requires calling some functions from the top of the stack to initiate exception handling.
The run time of code using C++ exceptions depends on what actually happens at run time. If no exception is thrown, the code tends to be somewhat faster since there is no need to check error codes. If an exception is thrown, the run time of the code that handles exceptions will be orders of magnitude slower than code returning an error code. This increase may or may not be significant, however, in the entire application, in particular if the error handling requires additional action, such as a user input or messaging to a cloud. But exception-throwing code should never be used in real-time critical code paths.

### 4.37.5 Runtime Type Information (RTTI)

Support for RTTI is disabled by default, but can be enabled using `CONFIG_COMPILER_CXX_RTTI` option. Enabling this option compiles all C++ files with RTTI support enabled, which allows using `dynamic_cast` conversion and `typeid` operator. Enabling this option typically increases the binary size by tens of kB.

See `cxx/rtti` for an example of using RTTI in ESP-IDF.

### 4.37.6 Developing in C++

The following sections provide tips on developing ESP-IDF applications in C++.

**Combining C and C++ code**

When part of the application is developed in C and part in C++, it is important to understand the concept of language linkage.

In order for a C++ function to be callable from C code, it has to be both declared and defined with C linkage (`extern "C"`):

```c
// declaration in the header file:
#ifdef __cplusplus
extern "C" {    
#endif
void my_cpp_func(void);
#ifdef __cplusplus}
#endif
// definition in a .cpp file:
extern "C" void my_cpp_func(void) {
  // ...
}
```

In order for a C function to be callable from C++, it has to be declared with C linkage:

```c
// declaration in the header file:
#ifdef __cplusplus
extern "C" {    
#endif
void my_c_func(void);
#ifdef __cplusplus}
#endif
// definition in a .c file:
void my_c_func(void) {
```

(下页继续)
// ...

```cpp
extern "C" void app_main()
{
}
```

### Defining `app_main` in C++

ESP-IDF expects the application entry point, `app_main`, to be defined with C linkage. When `app_main` is defined in a .cpp source file, it has to be designated as `extern "C"`:

```cpp
extern "C" void app_main()
{
}
```

### Designated initializers

Many of the ESP-IDF components use `configuration structures` as arguments to the initialization functions. ESP-IDF examples written in C routinely use designated initializers to fill these structures in a readable and maintainable way.

C and C++ languages have different rules with regards to the designated initializers. For example, C++ language version C++20, currently the default in ESP-IDF, does not support out-of-order designated initialization, nested designated initialization, mixing of designated initializers and regular initializers, and designated initialization of arrays. Therefore, when porting ESP-IDF C examples to C++, some changes to the structure initializers may be necessary. See the C++ aggregate initialization reference for more details.

### `iostream`

`iostream` functionality is supported in ESP-IDF, with a couple of caveats:

1. Normally ESP-IDF build process eliminates the unused code. However in the case of `iostreams`, simply including `<iostream>` header in one of the source files significantly increases the binary size (by about 200 kB).
2. By default, ESP-IDF uses a simple non-blocking implementation of the standard input stream (stdin). To get the usual behavior of `std::cin`, the application has to initialize the UART driver and enable the blocking mode as shown in `common_components/protocol_examples_common/stdin_out.c`.

### 4.37.7 Limitations

- Linker script generator doesn’t support function level placements for functions with C++ linkage.
- Various section attributes (such as `IRAM_ATTR`) are ignored when used with template functions.
- Vtables are placed into Flash and are not accessible when the flash cache is disabled. Therefore, virtual function calls should be avoided in `IRAM-safe interrupt handlers`. Placement of Vtables cannot be adjusted using the linker script generator, yet.
- `C++ filesystem` features are not supported.

### 4.37.8 What to Avoid

Do not use `setjmp/longjmp` in C++! `longjmp` blindly jumps up the stack without calling any destructors, easily introducing undefined behavior and memory leaks. Use C++ exceptions instead, they will guarantee correctly calling destructors. If you cannot use C++ exceptions, use alternatives (except `setjmp/longjmp` themselves) such as simple return codes.
Chapter 5

迁移指南

5.1 迁移到 ESP-IDF 5.x

5.1.1 从 4.4 迁移到 5.0

经典蓝牙

Bluedroid

- bt/host/bluedroid/api/include/api/esp_hf_defs.h
  - 在 esp_hf_cme_err_t 中
    * ESP_HF_CME_MEMORY_FULL 改名为 ESP_HF_CME_MEMORY_FULL
    * ESP_HF_CME_MEMORY_FAILURE 改名为 ESP_HF_CME_MEMORY_FAILURE
- bt/host/bluedroid/api/include/api/esp_hf_api.h
  - esp_bt_hf_init(esp_bd_addr_t remote_addr) 改为 esp_hf_ag_init(void)
  - esp_bt_hf_deinit(esp_bd_addr_t remote_addr) 改为 esp_hf_ag_deinit(void)
  - esp_bt_hf_register_callback 改为 esp_hf_ag_register_callback
  - esp_bt_hf_connect 改为 esp_hf_ag_slc_connect
  - esp_bt_hf_disconnect 改为 esp_hf_ag_slc_disconnect
  - esp_bt_hf_connect_audio 改为 esp_hf_ag_audio_connect
  - esp_bt_hf_disconnect_audio 改为 esp_hf_ag_audio_disconnect
  - esp_bt_hf_vra 改为 esp_hf_ag_vra_control
  - esp_bt_hf_volume_control 改为 esp_hf_ag_volume_control
  - esp_hf_unat_response 改为 esp_hf_ag_unknown_at_send
  - esp_hf_cme_response 改为 esp_hf_ag_cme_send
  - esp_bt_hf_indchange_notification 改为 esp_hf_ag_devices_status_indchange
  - esp_bt_hf_cind_response 改为 esp_hf_ag_cind_response
  - esp_bt_hf_cops_response 改为 esp_hf_ag_cops_response
  - esp_bt_hf_clcc_response 改为 esp_hf_ag_clcc_response
  - esp_bt_hf_cnum_response 改为 esp_hf_ag_cnum_response
  - esp_bt_hf_bsir 改为 esp_hf_ag_bsir
  - esp_bt_hf_answer_call 改为 esp_hf_ag_answer_call
低功耗蓝牙

Bluedroid

以下 Bluedroid 宏、类型和函数已被重命名：

- bt/host/bluedroid/api/include/api/esp_gap_ble_api.h
  - esp_gap_ble_cb_event_t 中:
    - ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT 改名 为 ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT
    - ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT 改名 为 ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT
    - ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT 改名 为 ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT
- esp_ble_wpoperation_t 改名为 esp_ble_wpoperation_t
- esp_ble_gap_cb_param_t.pkt_data_lenth_cmpl 改名 为 pkt_data_length_cmpl
- esp_ble_gap_cb_param_t.update_whitelist_cmpl.wl_operation 改名 为 wl_operation
- esp_ble_gap_set_preferred_default_phy 改名为 esp_ble_gap_set_preferred_default_phy()

Nimble

以下 Nimble API 已被移除：

- bt/host/nimble-esp-hci/include/esp_nimble_hci.h
  - 移除 esp_err_t esp_nimble_hci_and_controller_init(void)
    - 控制器初始化，使能以及 HCI 初始化的调用已经被移至 nimble_port_init 中。可直接删除该函数。
  - 移除 esp_err_t esp_nimble_hci_and_controller_deinit(void)
    - 控制器去初始化，禁用以及 HCI 去初始化的调用已经被移至 nimble_port_deinit 中。可直接删除该函数。

ESP-BLE-MESH

以下 ESP-BLE-MESH 宏已被重命名：

- bt/esp_ble_mesh/api/esp_ble_mesh_defs.h
  - esp_ble_mesh_prov_cb_event_t 中:
    - ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT 改名为 ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT
迁移构建系统至 ESP-IDF v5.0

从 GNU Make 构建系统迁移至 ESP-IDF v5.0 ESP-IDF v5.0 已不再支持基于 Make 的工程，请参考从 ESP-IDF GNU Make 构建系统迁移至 CMake 构建系统 进行迁移。

更新片段文件语法 请参考 将链接器脚本片段文件语法迁移至 ESP-IDF v5.0 适用版本 对 v3.x 的语法进行更新。

明确指定组件依赖 在之前的 ESP-IDF 版本中，除了通用组件依赖外，还有一些组件总是作为公共依赖项在构建中被添加至每个组件中，如：

- driver
- efuse
- esp_timer
- lwip
- vfs
- esp_wifi
- esp_event
- esp_netif
- esp_eth
- esp_phy

这意味着可以直接包含这些组件的头文件，而无需在 idf_component_register 中将它们指定为依赖。此行为是由各种常见组件的传递依赖关系引起的。

在 ESP-IDF v5.0 中，此行为已修复，这些组件不再默认作为公共依赖项添加。

如果组件所依赖的某个组件不属于通用组件依赖项，则必须显式地声明此依赖关系。可以通过在组件的 CMakeLists.txt 中的 idf_component_register 调用中添加 REQUIRES <component_name> 或 PRIV_REQUIRES <component_name> 来完成。有关指定组件依赖的更多信息，请参阅组件依赖。

设置 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量 为了实现构建项目时的路径能够包含空格，ESP-IDF v5.0 做了一系列改进，其中包括改进了 CMakeLists.txt 文件中的 COMPONENT_DIRS 和 EXTRA_COMPONENT_DIRS 变量。

ESP-IDF v5.0 版本中，不再支持添加不存在的目录到变量 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 中，否则会出错。

同时，ESP-IDF v5.0 中也不再支持使用字符串拼接的方式定义 COMPONENT_DIRS 或 EXTRA_COMPONENT_DIRS 变量。这些变量应该定义为 CMake 列表。例如：

```cmake
set(EXTRA_COMPONENT_DIRS path1 path2)
lst(APPEND EXTRA_COMPONENT_DIRS path3)
```

不支持：

```cmake
set(EXTRA_COMPONENT_DIRS "path1 path2")
set(EXTRA_COMPONENT_DIRS "$\{EXTRA_COMPONENT_DIRS\} path3")
```

将这些变量定义为 CMake 列表的方式兼容之前的 ESP-IDF 版本。

更新 target_link_libraries 用法 ESP-IDF v5.0 修复了组件的 CMake 变量传播问题。此问题导致本应该只应用于某一组件的编译器标志和定义应用到了项目中的每个组件。

该修复也带来一定的副作用，从 ESP-IDF v5.0 开始，用户项目在使用 target_link_libraries 时必须明确指定 project_elf，同时自定义 CMake 项目必须指定 PRIVATE, PUBLIC 或 INTERFACE 参数。这是一项重大变更，不兼容以前的 ESP-IDF 版本。

例如：
更新 CMake 版本 在 ESP-IDF v5.0 中，最低 CMake 版本已更新到 3.16，并且不再支持低于 3.16 的版本。如果您的操作系统没有安装 CMake，请运行 tools/idf_tools.py install cmake 来安装合适的版本。

该变更会影响到使用系统提供的 CMake 以及自定义 CMake 的 ESP-IDF 用户。

重新定义特定目标配置文件的应用顺序 ESP-IDF v5.0 重新安排了特定目标配置文件和 SDKCONFIG_DEFAULTS 中所有其他文件的应用顺序。现在，特定目标的配置文件将在引入它的文件之后，在 SDKCONFIG_DEFAULTS 中后续的其他文件之前应用。

例如:

```bash
如果 `''SDKCONFIG_DEFAULTS="sdkconfig.defaults;sdkconfig_devkit1
"'`，且同一文件夹内有 `''sdkconfig.defaults.esp32`` 文件，那么文件的应用顺序为: (1) sdkconfig.defaults (2) sdkconfig.defaults.esp32 (3) sdkconfig_devkit1
```

如果某个键在不同的特定目标配置文件中有不同的值，那么后者的值会覆盖前者。例如在以上案例中，如果某个键在 sdkconfig.defaults.esp32 和 sdkconfig_devkit1 中的值不同，则在 sdkconfig_devkit1 中的值会覆盖在 sdkconfig.defaults.esp32 中的值。

如果确实需要设置特定目标的配置值，请将其放到后应用的特定目标文件中，如 sdkconfig_devkit1.esp32。

GCC

GCC 版本 ESP-IDF 之前使用的 GCC 版本为 8.4.0，现已针对所有芯片目标升级至 GCC 11.2.0。若需要将您的代码从 GCC 8.4.0 迁移到 GCC 11.2.0，请参考以下官方 GCC 迁移指南。

- 迁移至 GCC 9
- 迁移至 GCC 10
- 迁移至 GCC 11

警告 升级至 GCC 11.2.0 后会触发新警告，或是导致原有警告内容发生变化。所有 GCC 警告的详细内容，请参考 GCC 警告选项。建议用户仔细检查代码，并设法解决这些警告。但由某些警告的特殊性及用户代码的复杂性，有些警告可能为误报，需要进行关键修复。在这种情况下，用户可以采取多种方式来抑制这些警告。本节介绍了用户可能遇到的常见警告及如何抑制这些警告。

注意：建议用户在抑制警告之前仔细确认该警告是否确实为误报。

-Wstringop-overflow、-Wstringop-overread、-Wstringop-truncation 和 -Warray-bounds 如果编译器不能准确判断内存或字符串的大小，使用 memory/string copy/compare 函数的用户会遇到某种 -Wstringop 警告。下文展示了触发这些警告的代码，并介绍了如何抑制这些警告。
Chapter 5. 迁移指南

```c
#pragma GCC diagnostic push
#pragma GCC diagnostic ignored "-Wstringop-overflow"
#pragma GCC diagnostic ignored "-Warray-bounds"
memset(RTC_SLOW_MEM, 0, CONFIG_ULP_COPROC_RESERVE_MEM); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

```c
#pragma GCC diagnostic push
#if __GNUC__ >= 11
#pragma GCC diagnostic ignored "-Wstringop-overread" // <<-- 此键从 GCC 11 开始引入
#endif
#pragma GCC diagnostic ignored "-Warray-bounds"
memcpy(backup_write_data, (void*)EFUSE_PGM_DATA0_REG, sizeof(backup_write_data)); // <<-- 此行触发了警告
#pragma GCC diagnostic pop
```

-Waddress-of-packed-member 当访问打包 struct 中的某个未对齐成员时，由于非对齐内存访问会对性能产生影响，GCC 会触发-Waddress-of-packed-member 警告。然而，所有基于 Xtensa 或 RISC-V 架构的 ESP 芯片都允许非对齐内存访问，并且不会产生额外的性能影响。因此，在大多数情况下，可以忽略此问题。

```c
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c: In function btc_to_bta_gatt_id:
components/bt/host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c:105:21: warning:
   taking address of packed member of 'struct <anonymous>' may result in an
   unaligned pointer value [-Waddress-of-packed-member]
105 | btc_to_bta_uuid(&p_dest->uuid, &p_src->uuid);
    | ^~~~~~~~~~~~~
```

如果该警告在多个源文件中多次出现，可以在 CMake 级别抑制该警告，如下所示。

```cmake
set_source_files_properties(
    "host/bluedroid/bta/gatt/bta_gatcc_act.c"
    "host/bluedroid/bta/gatt/bta_gatcc_cache.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatt_util.c"
    "host/bluedroid/btc/profile/std/gatt/btc_gatts.c"
    PROPERTIES COMPILE_FLAGS "-Wno-address-of-packed-member"
)
```

但如果只有一或两处警告，可以直接在源代码中进行抑制，如下所示。

```c
#pragma GCC diagnostic push
#if __GNUC__ >= 9
#pragma GCC diagnostic ignored "-Waddress-of-packed-member" // <<-- 此键从 GCC 11 开始引入
#endif
#pragma GCC diagnostic ignored "-Warray-bounds"
uint32_t* reg_ptr = (uint32_t*)src;
#pragma GCC diagnostic pop
```

llabs() 用于 64 位整数 stdlib.h 中的函数 abs() 需要使用 int 参数。请在计划为 64 位的类型中使用 llabs()，尤其是 time_t。乐鑫工具链更新

Xtensa 编译器中的 int32_t 和 uint32_t 在 Xtensa 编译器中，int32_t 和 uint32_t 类型已分别从 int 和 unsigned int 更新为 long 和 unsigned long。此更新应与上游 GCC 相匹配，上游 GCC 在 Xtensa、RISC-V 和其他架构上使用 long 整数来表示 int32_t 和 uint32_t。
<table>
<thead>
<tr>
<th>Xtensa</th>
<th>2021r2 及以上版本，GCC 8</th>
<th>2022r1，GCC 11</th>
</tr>
</thead>
<tbody>
<tr>
<td>riscv32</td>
<td>(unsigned) int</td>
<td>(unsigned) long</td>
</tr>
<tr>
<td></td>
<td>(unsigned) long</td>
<td>(unsigned) long</td>
</tr>
</tbody>
</table>

上述变化主要影响到使用 `<inttypes.h>` 提供的类型来格式化字符串的代码。请使用 PRIi32、PRIxx 等占位符来分别替换 %i、%x 等。

在其他情况下，请注意枚举支持 int 类型。

通常，int32_t 和 int 为不同的类型。同样，uint32_t 和 unsigned int 也为不同的类型。

如果用户在其应用中对格式化字符串进行上述更新，程序会报错，如下所示：

```c
#include/esp_diagnostics.h:238:29: error: format '%u' expects argument of type 'unsigned int', but argument 3 has type 'uint32_t' (aka 'long unsigned int') [-Werror=format=
```

移除构建选项 CONFIG_COMPILER_DISABLE_GCC8_WARNINGS 原有的 CONFIG_COMPILER_DISABLE_GCC8_WARNINGS 选项用于构建使用现已弃用的 GCC 5 工具链编写的陈旧代码。但由于已经过去较长时间，现在可以对警告进行修复，因此该选项已被移除。

目前，在 GCC 11 中，建议用户仔细检查代码，尽量解决编译器警告。

### 网络

**esp_eth_ioctl() API** 此前，`esp_eth_ioctl()` API 存在以下问题：

- 在某些情况下，第三个参数 (数据类型为 void /*) 可以接受 int/bool 类型实参 (而非指针) 作为输入。然而，文档中未描述这些情况。
- 为了将 int/bool 类型实参作为第三个参数传递，实参将被强制转换为 void * 类型，以防出现如下所示的编译器警告。此等转换可能引发 `esp_eth_ioctl()` 函数的滥用。

```c
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, (void *)true);
```

因此，我们统一了 `esp_eth_ioctl()` 的用法。现在，该结构体的第三个参数在传递时必须作为指向特定数据类型的指针，表示 `esp_eth_ioctl()` 调用/存储数据的位置。`esp_eth_ioctl()` 的用法如下列代码所示。

设置以太网配置的用例如下：

```c
eth_duplex_t new_duplex_mode = ETH_DUPLEX_HALF;
esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```

获取以太网配置的用例如下：

```c
void esp_eth_ioctl(eth_handle, ETH_CMD_S_DUPLEX_MODE, &new_duplex_mode);
```
KSZ8041/81 和 LAN8720 驱动更新

KSZ8041/81 和 LAN8720 驱动现已更新，以支持相关产品系列中的更多设备（如新一代设备）。上述驱动能够识别特定芯片编号及驱动提供的潜在支持。

更新之后，通用函数将替代特定“芯片编号”函数得以调用：
- 删除 esp_eth_phy_new_ksz8041() 以及 esp_eth_phy_new_ksz8081()，转而使用esp_eth_phy_new_ksz80xx()
- 删除 esp_eth_phy_new_lan8720()，转而使用esp_eth_phy_new_lan87xx()

ESP NETIF Glue 事件处理程序 esp_eth_set_default_handlers() 和 esp_eth_clear_default_handlers() 函数现已删除。现在可以自动处理以太网默认 IP 层处理程序的注册。如您在注册以太网/IP 事件处理程序之前已经按照建议完全初始化以太网驱动和网络接口，则无需执行任何操作（除了删除受影响的函数）。否则，在注册用户事件处理程序后，应随即启动以太网驱动。

PHY 地址自动检测 以太网 PHY 地址自动检测函数 esp_eth_detect_phy_addr() 已重命名为esp_eth_phy_802_3_detect_phy_addr()，其声明移至 esp_eth/include/esp_eth_phy_802_3.h。

SPI 以太网模块初始化 以太网模块的初始化过程已经简化。此前，您需要在实例化 SPI 以太网 MAC 之前，使用spi_bus_add_device() 手动分配 SPI 设备。

现在，由于 SPI 设备已在内部分配，您无需再调用spi_bus_add_device()。eth_dm9051_config_t, eth_w5500_config_t 和 eth_ksz8851snl_config_t 配置结构体现已包含 SPI 设备配置成员（例如，可以微调可能依赖 PCB 设计的 SPI 时序）。ETH_DM9051_DEFAULT_CONFIG, ETH_W5500_DEFAULT_CONFIG 和 ETH_KSZ8851SNL_DEFAULT_CONFIG 配置初始化宏也已接受新的参数输入。了解 SPI 以太网模块初始化示例，请查看以太网 API 参考指南。

TCP/IP 适配器 TCP/IP 适配器是在 ESP-IDF v4.1 之前使用的网络接口抽象组件。本文档概述了从 tcpip_adapter API 移迁至ESP-NETIF 的过程。

更新网络连接代码

网络软件栈初始化
- 您只需用 esp_netif_init() 替换 tcpip_adapter_init()，注意 esp_netif_init() 函数现将返回标准错误代码。了解详细信息，请参考ESP-NETIF。
- esp_netif_deinit() 函数用于反初始化网络软件栈。
- 您还需用 #include "esp_netif.h" 替换 #include "tcpip_adapter.h"。

创建网络接口 更新之前，TCP/IP 适配器静态定义了以下三个接口：
- Wi-Fi Station
- Wi-Fi AP
- 以太网

接口定义现已更新，网络接口的设计应严格参考ESP-NETIF，使其能够连接至 TCP/IP 软件栈。例如，在 TCP/IP 软件栈和事件循环初始化完成后，Wi-Fi 的初始化代码必须显示调用esp_netif_create_default_wifi_sta(); 或 esp_netif_create_default_wifi_ap();。

请参考上述三个接口的初始化代码示例：
- Wi-Fi Station：wifi/getting_started/station/main/station_example_main.c
• Wi-Fi AP：wif/learning/softAP/main/softap_example_main.c
• 以太网：ethernet/basic/main/ethernet_example_main.c

其他 tcpip_adapter API 更换 所有 tcpip_adapter 函数都有对应的 esp-netif，请参考以下章节中的 esp_netif.h 部分，了解更多信息：
  • Setters/Getters
  • DHCP
  • DNS
  • IP address

默认事件处理程序 事件处理程序已从 tcpip_adapter 移至相应驱动程序代码。从应用程序的角度来看，这一变更不会产生任何影响，所有事件仍将以相同的方式处理。请注意，在与 IP 相关的事件处理程序中，应用代码通常以 esp-netif 结构体而非 LwIP 结构体的形式接收 IP 地址。两种结构体兼兼容二进制格式。

打印地址的首选方式如下所示：
```c
ESP_LOGI(TAG, "got ip:\n", IP2STR(&event->ip_info.ip));
```

不建议使用下述方式：
```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

ip4addr_ntoa() 为 LwIP API，因此 esp-netif 还提供了替代函数 esp_ip4addr_ntoa()，然而总得来说仍推荐使用 IP2STR() 这一方法。

IP 地址 推荐使用 esp-netif 定义的 IP 结构。请注意，在启用默认兼容性时，LwIP 结构体仍然可以工作。
  • esp-netif IP address definitions

外设

外设时钟门控 与更新之前相同，外设的时钟仍由驱动处理，用户无需对外设模块的时钟门控进行设置。但是，如果用户想基于组件 hal 和 soc 开发自己的驱动，请注意时钟门控的头文件引用路径已由 driver/periph_ctrl.h 更新为 esp_private/periph_ctrl.h。

RTC 子系统控制 RTC 控制 API 已经从 driver/rtc_ctrl.h 移动到了 esp_private/rtc_ctrl.h。

ADC

ADC 单次模式及连续模式驱动 ADC 单次模式的驱动已更新。
  • 新的驱动位于组件 esp_adc 中，头文件引用路径为 esp_adc/adc_oneshot.h。
  • 旧版驱动仍然可用，其头文件引用路径为 driver/adc.h。

对于 ADC 连续模式驱动，其位置已由组件 driver 更新为 esp_adc。
  • 头文件引用路径由 driver/adc.h 更新为 esp_adc/adc_continuous.h。

但是，引用两种模式的旧版路径 driver/adc.h 会默认触发如下编译警告，可通过配置 Kconfig 选项 CONFIG_ADC_SUPPRESS_DEPRECATED_WARN 关闭该警告。
ADC 校准驱动

- 新的驱动位于组件 esp_adc 中，头文件引用路径为 esp_adc/adc_cali.h 和 esp_adc/adc_cali_scheme.h。
- 旧版驱动仍然可用，其头文件引用路径为 esp_adc_cal.h。如果用户要使用旧版路径，需要将组件 esp_adc 添加到文件 CMakeLists.txt 的组件需求表中。
- 默认情况下，引用路径 esp_adc_cal.h 会默认触发如下编译警告，可通过配置 Kconfig 选项 CONFIG_ADC_CALI.Suppress_Deprecate_Warn 关闭该警告。

### API 更新

- ADC 电源管理 API adc_power_acquire 和 adc_power_release 已被移至 esp_private/adc_share_hw_ctrl.h，用于内部功能。
  - 更新前，由于硬件延迟的工作原理，这两个 API 可以被用户调用。
  - 更新后，ADC 电源管理完全由驱动在内部实现。
  - 如果用户仍需调用这个 API，可以通过引用路径 esp_private/adc_share_hw_ctrl.h 来调用它。
- 更新后，driver/adc2_wifi_private.h 已被移至 esp_private/adc_share_hw_ctrl.h。
- esp_unit_t 中的枚举 ADC_UNIT_BOTH, ADC_UNIT_ALTER 及 ADC_UNIT_MAX 已被删除。
- 由于只有部分芯片支持下列枚举的某些取值，因此将下列枚举删除。如果用户使用了不支持的取值，会造成驱动运行错误。
  - 枚举 ADC_CHANNEL_MAX
  - 枚举 ADC_ATTEN_MAX
  - 枚举 ADC_CONV_UNIT_MAX
- ESP32 中的 API hall_sensor_read 已被删除，因此 ESP32 不再支持霍尔传感器。
- API adc_set_i2s_data_source 和 adc_i2s_mode_init 已被弃用，相关的枚举 adc_i2s_source_t 也被弃用，请使用 esp_adc/adc_continuous.h 进行迁移。

GPIO

- 之前的 Kconfig 选项 RTCIO_SUPPORT_RTC_GPIO_DESC 已被删除，因此数组 rtc_gpio_desc 已不可用，请使用替代数组 rtc_io_desc。
- 更新后，用户调用函数无法再通过读取 GPIO 中断的状态寄存器来获取用于触发中断的 GPIO 管脚的编号。但是，用户可以通过使用回调函数变量来确定该管脚编号。
  - 更新前，GPIO 中断发生时，GPIO 中断状态寄存器调用用户回调函数之后，会被清空。因此，用户可以在回调函数中读取 GPIO 中断状态寄存器，以便确定触发中断的 GPIO 管脚。
  - 但是，在调用回调函数后清空中断状态寄存器可能会导致边缘触发的中断丢失。例如，在调用用户回调函数时，如果某个边缘触发的中断 (re) 被触发，该中断会被清除，并且其注册的用户回调函数还未被处理。
  - 更新后，GPIO 的中断状态寄存器在调用用户回调函数之前被清空。因此，用户无法读取 GPIO 中断状态寄存器来确定哪个管脚触发了中断。但是，用户可以通过回调函数变量来传递被触发的管脚编号。

Sigma-Delta 调制器

- 新驱动中实现了工厂模式，SDM 通道都位于内部通道池中，因此用户无需手动将 SDM 通道配置到 GPIO 管脚。
- SDM 通道会被自动分配。
尽管我们推荐用户使用新的驱动 API，旧版驱动仍然可用，位于头文件引用路径 driver/sigmadelta.h 中。但是，引用 driver/sigmadelta.h 会默认触发如下编译警告，可通过配置 Kconfig 选项 CONFIG_SDM_SUPPRESS_DEPRECATED_WARN 关闭该警告。

The legacy sigma-delta driver is deprecated, please use driver/sdm.h

概念与使用方法上的主要更新如下所示：

**主要概念更新**

- SDM 通道名称已由 sigmadelta_channel_t 更新为 sdm_channel_handle_t，后者为一个不透明指针。
- SDM 通道配置原来存放于 sigmadelta_config_t，现存放于 sdm_config_t。
- 旧版驱动中，用户无需为 SDM 通道设置时钟源。但是在新驱动中，用户需要在 sdm_config_t::clk_src 为 SDM 通道设置合适的时钟源，soc_periph_sdm_clk_src_t 中列出了可用的时钟源。
- 旧版驱动中，用户需要为通道设置 prescale，该参数会影响调制器输出脉冲的频率。在新的驱动中，用户需要使用 sdm_config_t::sample_rate_hz 实现该功能。

**主要使用方法更新**

- 更新前，通道配置由通道分配器 sdm_new_channel() 完成。在新驱动中，只有 duty 可在运行时由 sdm_channel_set_duty() 更新。其他参数如 gpio number, prescale 只能在通道分配时进行设置。
- 在进行下一步通道操作前，用户应通过调用 sdm_channel_enable() 提前使能该通道。该函数有助于管理一些系统级服务，如电源管理。

定时器组驱动 为统一和简化通用定时器的使用，定时器组驱动已更新为 GPTimer。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，其头文件引用路径为 driver/timer.h。但是，引用 driver/timer.h 会默认触发如下编译警告，可通过配置 Kconfig 选项 CONFIG_GPTIMER_SUPPRESS_DEPRECATED_WARN 关闭该警告。

legacy timer group driver is deprecated, please migrate to driver/gptimer.h

概念和使用方法上的主要更新如下所示：

**主要概念更新**

- 用于识别定时器的 timer_group_t 和 timer_idx_t 已被删除。在新驱动中，定时器用参数 gptimer_handle_t 表示。
- 更新后，定时器的时钟源由 gptimer_clock_source_t 定义，之前的时钟源参数 timer_src_clk_t 不再使用。
- 更新后，定时器计数方向由 gptimer_count_direction_t 定义，之前的计数方向参数 timer_count_dir_t 不再使用。
- 更新后，仅支持电平触发的中断，timer_intr_t 和 timer_intr_mode_t 不再使用。
- 更新后，通过设置标志位 gptimer_alarm_config_t::auto_reload_on_alarm，可以使能自动生成加裁。timer_autoreload_t 不再使用。

**主要使用方法更新**

- 更新后，通过从 gptimer_new_timer() 创建定时器示例可以初始化定时器。用户可以在 gptimer_config_t 进行一些基本设置，如时钟源，分辨率和计数方向。请注意，无需在驱动安装阶段进行报警事件的特殊设置。
- 更新后，报警事件在 gptimer_set_alarm_action() 中进行设置，参数在 gptimer_alarm_config_t 中进行设置。
• 更新后，通过`gptimer_get_raw_count()`设置计数值，通过`gptimer_set_raw_count()`获取计数值，驱动不会自动将原始数据同步到UTC时间戳。由于时钟器的分辨率已知，用户可以自行转换数据。

• 更新后，如果`gptimer_event_callbacks_t::on_alarm`被设置为有 效的回调函数，驱动程序也会安装中断服务。在回调函数中，用户无需配置底层寄存器，如用于“清除中断状态”、“重新使能事件”的寄存器等。因此，`timer_group_get_intr_status_in_isr`与`timer_group_get_auto_reload_in_isr`这些函数不再使用。

• 更新后，当报警事件发生时，为更新报警配置，用户可以在中断回调中调用`gptimer_set_alarm_action()`，这样报警事件会被重新使能。

• 更新后，如果用户将`gptimer_alarm_config_t::auto_reload_on_alarm`设置为true，报警事件将会被驱动程序使能。

脉冲计数器 (PCNT) 驱动 为统一和简化 PCNT 外设，PCNT 驱动已更新，详见 PCNT。

尽管我们推荐使用新的驱动 API，旧版驱动仍然可用，保留在头文件引用路径 `driver/pcnt.h` 中。但是，引用路径 `driver/pcnt.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项`CONFIG_PCNT.Suppress.Deprecate.Warn` 来关闭该警告。
主要概念和使用方法上的更新如下所示:

主要概念更新

- 更新后，pcnt_port_t，pcnt_unit_t 和 pcnt_channel_t 这些用于识别 PCNT 单元和通道的参数已被删除。在新的驱动中，PCNT 单元由参数 pcnt_unit_handle_t 表示，PCNT 通道由参数 pcnt_channel_handle_t 表示，这两个参数都是不透明指针。
- 更新后，不再使用 pcnt_evt_type_t，它们由统一的 观察点事件 表示。在事件回调函数 pcnt_watch_cb_t 中，通过 pcnt_watch_event_data_t 可以分辨不同观察点。
- pcnt_count_mode_t 更名为 pcnt_channel_edge_action_t，pcnt_ctrl_mode_t 更名为 pcnt_channel_level_action_t。

主要使用方法更新

- 更新前，PCNT 的单元配置和通道配置都通过函数 pcnt_unit_config 实现。更新后，PCNT 的单元配置通过工厂 API pcnt_new_unit() 完成，通道配置通过工厂 API pcnt_new_channel() 完成。
  - 只需配置计数范围即可初始化一个 PCNT 单元。更新后，GPIO 管脚分配通过 pcnt_new_channel() 完成。
  - 高低电平控制模式和上升沿/下降沿计数模式分别通过函数 pcnt_channel_set_edge_action() 和 pcnt_channel_set_level_action() 进行设置。
- pcnt_get_counter_value 更新为 pcnt_unit_get_count()。
- pcnt_counter_start 更新为 pcnt_unit_start()。
- pcnt_counter_clear 更新为 pcnt_unit_clear_count()。
- 更新后，pcnt_intr_enable 与 pcnt_intr_disable 已被删除。新的驱动中，通过注册时间回调函数 pcnt_unit_register_event_callbacks() 来使能中断。
- 更新后，pcnt_event_enable 与 pcnt_event_disable 已被删除。新的驱动中，可通过 pcnt_unit_add_watch_point() 和 pcnt_unit_remove_watch_point() 来增加/删除观察点，以使能/停用 PCNT 事件。
- 更新后，pcnt_set_event_value 已被删除。新的驱动中，通过 pcnt_unit_add_watch_point() 增加观察点时，也同时设置了事件的数值。
- 更新后，pcnt_get_event_value 与 pcnt_get_event_status 已被删除。新的驱动中，这些信息存储在 pcnt_watch_event_data_t 的回调函数 pcnt_watch_cb_t 中。
- 更新后，pcnt_isr_register 与 pcnt_isr_unregister 已被删除。不允许注册 ISR 句柄。用户可以通过调用 cpp:func:pcnt_unit_register_event_callbacks 来注册事件回调函数。
- 更新后，pcnt_set_pin 已被删除。新的驱动不再允许在运行时切换 GPIO 管脚。如果用户想切换为其他 GPIO 管脚，可通过 cpp:func:pcnt_del_channel 删除当前的 PCNT 通道，然后通过 cpp:func:pcnt_new_channel 安装新的 GPIO 管脚。
- pcnt_filter_enable, pcnt_filter_disable 与 pcnt_set_filter_value 更新为 pcnt_unit_set_glitch_filter()，同时，pcnt_get_filter_value 已被删除。
- pcnt_set_mode 更新为 pcnt_channel_set_edge_action() 与 pcnt_channel_set_level_action()。
- pcnt_isr_service_install, pcnt_isr_service_unregister, pcnt_isr_handler_add 与 pcnt_isr_handler_remove 更新为 pcnt_unit_register_event_callbacks()。默认的 ISR 句柄已安装在新的驱动中。

**RMT 驱动** 为统一和扩展 RMT 外设的使用，RMT 驱动已更新，详见 RMT transceiver。

尽管我们建议使用新的驱动 API，旧版驱动仍然可用。保留在头文件引用路径 driver/rmt.h 中。但是，引用路径 `driver/rmt.h` 会默认触发如下编译警告，可通过配置 Kconfig 选项 CONFIG_RMT_SUPPRESS_DEPRECATED_WARN 来关闭该警告。
The legacy RMT driver is deprecated, please use driver/rmt_tx.h and/or driver/rmt_
rx.h

主要概念和使用方法更新如下所示：

主要概念更新

- 更新后，用于识别硬件通道的 rmt_channel_t 已删除。在新的驱动中，RMT 通道用参数
  rmt_channel_handle_t 表示，该通道由驱动程序动态分配，而不是由用户指定。
- rmt_item32_t 更新为 rmt_symbol_word_t，以避免在结构体中出现嵌套的共用体。
- 更新后，rmt_mem_t 已被删除，因为我们不只允许用户直接访问 RMT 内存块（即 RMTMEM）。直接
  访问 RMTMEM 没有意义，反而会引发错误，特别是当 RMT 通道与 DMA 通道相连时。
- 更新后，由 rmt_mem_owner_t 由驱动控制，而不是用户，因此 rmt_mem_owner_t 已被删除。
- rmt_source_clk_t 更新为 rmt_clock_source_t，后者不支持二进制兼容。
- 更新后，rmt_data_mode_t 已被删除，RMT 内存访问模式配置为始终使用 Non-FIFO 和 DMA 模式。
- 更新后，由于驱动有独立的发送和接收通道装术函数，因此 rmt_mode_t 已被删除。
- 更新后，rmt_idle_level_t 已被删除，在 rmt_transmit_config_t::eot_level 中可为发送
  通道设置空闲状态电平。
- 更新后，rmt_carrier_level_t 被删除，可在 rmt_carrier_config_t::polarity_active_low
  设置载波极性。
- 更新后，rmt_channel_status_t 与 rmt_channel_status_result_t 已被删除，不再使用。
- 通过 RMT 通道发送并不需要用户提供 RMT 符号，但是用户需要提供一个 RMT 编码器用来告知驱
  动如何将用户数据转换成 RMT 符号。

主要使用方法更新

- 更新后，分别通过 rmt_new_tx_channel() 和 rmt_new_rx_channel() 安装发送通道和接收
  通道。
- 更新后，rmt_set_clk_div 和 rmt_get_clk_div 已被删除。通道时钟配置只能在通道安装时
  完成。
- 更新后，rmt_set_rx_idle_thresh 和 rmt_get_rx_idle_thresh 已被删除。新驱动中，接
  收通道的空闲状态阈值定义为 rmt_receive_config_t::signal_range_max_ns。
- 新 驱 动 中， 内 存 块 的 数 量 由 rmt_tx_channel_config_t::mem_block_symbols
  与 rmt_rx_channel_config_t::mem_block_symbols 决定。
- 更新后，rmt_set_tx_carrier 已被删除。新驱动使用 rmt_apply_carrier() 来设置载波波
  动。
- 更新后，rmt_set_mem_pd 和 rmt_get_mem_pd 已被删除，驱动程序自动调整内存的功率。
- 更新后，rmt_memory_rx_rst, rmt_tx_memory_reset 和 rmt_rx_memory_reset 已被删
  除，驱动程序自动进行内存重置。
- 更新后，rmt_tx_start 和 rmt_rx_start 被合并为函数 rmt_enable()，该函数同时适用于
  发射通道和接收通道。
- 更新后，rmt_tx_stop 和 rmt_rx_stop 被合并为函数 rmt_disable()，该函数同时适用于发
  射通道和接收通道。
- 更新后，rmt_set_memory_owner 和 rmt_get_memory_owner 已被删除，驱动程序自动添加
  RMT 内存保护。
- 更新后，rmt_set_tx_loop_mode 和 rmt_get_tx_loop_mode 已被删除。新驱动在，
  rmt_transmit_config_t::loop_count 中设置循环模式。
- 更新后，rmt_set_source_clk 和 rmt_get_source_clk 已被删除。仅能在通道安装时通过
  rmt_tx_channel_config_t::clk_src 和 rmt_rx_channel_config_t::clk_src 设置时钟源。
- 更新后，rmt_set_rx_filter 已被删除。新驱动中，过滤阈值定义为
  rmt_receive_config_t::signal_range_min_ns。
- 更新后，rmt_set_idle_level 和 rmt_get_idle_level 已被删除，可在
  rmt_transmit_config_t::eot_level 中设置发送通道的空闲状态电平。
Chapter 5. 迁移指南

- 更新后，rmt_set_rx_intr_en, rmt_set_err_intr_en, rmt_set_tx_intr_en, rmt_set_tx_thr_intr_en 和 rmt_set_rx_thr_intr_en 已被删除。新驱动不允许用户在用户端开启/关闭中断，而是提供了回调函数。
- 更新后，rmt_set_gpio 和 rmt_set_pin 已被删除。新驱动不支持运行时动态切换 GPIO 管脚。
- 更新后，rmt_config 已被删除。新驱动中，基础配置在通道安装阶段完成。
- 更新后，rmt_isr_register 和 rmt_isr_deregister 已被删除，驱动程序负责分配中断。
- rmt_driver_install 更新为 rmt_new_tx_channel() 中 rmt_new_rx_channel()。
- rmt_driver_uninstall 更新为 rmt_del_channel()。
- 更新后，rmt_fill_tx_items, rmt_write_items 和 rmt_write_sample 已被删除。新驱动中，用户需要提供一个编码器用来将用户数据“翻译”为 RMT 码。
- 更新后，由于用户可以通过 rmt_tx_channel_config_t::resolution_hz 配置通道的时钟分辨率，rmt_get_counter_clock 已被删除。
- rmt_wait_tx_done 更新为 rmt_tx_channel_config_t::resolution_hz 和 rmt_set_pin 重复。
- 更新后，rmt_set_gpio 和 rmt_set_pin 已被删除。新驱动中，rmt_set_tx_intr_en 已被删除，用户需提供一个编码器用来将用户数据“翻译”为 RMT 码。
- 更新后，由于用户可以通过 rmt_tx_channel_config_t::resolution_hz 配置通道的时钟分辨率，rmt_get_counter_clock 已被删除。
- rmt_wait_tx_done 更新为 rmt_tx_channel_config_t::resolution_hz 和 rmt_set_pin 重复。

LCD

- LCD 面板的初始化流程也有一些更新。更新后，esp_lcd_panel_init() 不再会自动打开显示器。用户需要调用 esp_lcd_panel_disp_on_off() 手动打开显示器，请注意，打开显示器与打开背光是不同的。更新后，打开屏幕前，用户可以烧录一个预定义的图案，这可以避免开机复位后屏幕上的随机噪音。
- 更新后，esp_lcd_panel_disp_off() 已被弃用，请使用 esp_lcd_panel_disp_on_off() 作为替代。
- 更新后，dc_as_cmd_phase 已被删除，SPI LCD 驱动不再支持 9-bit 的 SPI LCD，请使用专用的 GPIO 管脚来控制 LCD D/C 线。
- 更新后，用于注册 RGB 面板的事件回调函数已从 esp_lcd_rgb_panel_config_t 更新为单独的 API esp_lcd_rgb_panel_register_event_callbacks()。但是，事件回调签名仍保持不变。
- 更新后，esp_lcd_rgb_panel_config_t 中的标志位 relax_on_idle 被重命名为 esp_lcd_rgb_panel_config_t::refresh_on_demand，后者虽表达了同样的含义，但是其命名更有意义。
- 更新后，如果创建 RGB LCD 时，标志位 refresh_on_demand 使能，驱动不会在 esp_lcd_panel_draw_bitmap() 中进行刷新，用户需要调用 esp_lcd_rgb_panel_refresh() 来刷新屏幕。
- 更新后，esp_lcd_color_space_t 已被弃用，请使用 lcd_color_space_t 来描述色彩空间，使用 lcd_color_rgb_endian_t 来描述 RGB 颜色的排列顺序。

MCPWM

MCPWM 支持的功能旨在方便用户使用。同时，旧版驱动已被弃用。

新驱动中，每个 MCPWM 子模块相互独立，用户可以自由进行资源选择。

尽管我们推荐使用新的驱动，API 和旧版驱动仍然可用，其包含路径为 driver/mcpwm.h。但是，使用旧版驱动会默认触发如下编译警告，可以通过配置 Kconfig 选项 CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN 来关闭该警告。
Chapter 5. 迁移指南

主要概念和使用方法上的更新如下所示:

主要概念更新  更新后，MCPWM 驱动是面向对象的，大多数 MCPWM 子模块都有一个与之相关的驱动对象。驱动对象是由工厂函数创建的，如 `mcpwm_new_timer()`。IO 控制函数总是需要对象句柄。

旧版驱动有一个不恰当的假设，即 MCPWM 运算器应连接到不同的 MCPWM 定时器上，但是，硬件上并没有这样的限制。新驱动中，同一个 MCPWM 定时器可以连接多个运算器，这样运算器可以获得最佳的同步性能。

更新前，驱动将生成 PWM 波形的方法预设为所谓的 `mcpwm_duty_type_t`，但是，列出的占空比模式远远不够。类似的，旧版驱动有一些预设的 `mcpwm_deadtime_type_t` 也没有包含所有的使用场景。更重要的是，用户通常会被占空比模式和死区时间模式的名称所迷惑。更新后，驱动没有这些限制，但是用户必须从头开始构建发生器的行为。

在旧版驱动中，通过 GPIO 管脚，软件和其他定时器模块同步 MCPWM 定时器的方法并不统一。这增加了用户的学习成本，因此新驱动统一了同步 API。

旧版驱动混淆了“故障检测器”和“故障处理器”的概念。这让用户对 API 感到非常困惑。新驱动中，故障对象只代表一个故障源，而我们引入了一个新概念，制动器，来表示故障处理器。而且，新驱动支持软件故障。

旧版驱动只为获取子模块提供了回调函数，而新驱动为 MCPWM 子模块提供多种回调函数，如停止定时器，比较匹配，故障进入，紧急停止等。

- 更新后，不再使用 `mcpwm_io_signals_t` 和 `mcpwm_pin_config_t`，GPIO 管脚配置被移至子模块的配置结构中。
- 更新后，不再使用 `mcpwm_timer_t` 和 `mcpwm_generator_t`，定时器和发生器分别用 `mcpwm_timer_handle_t` 和 `cpp: type=mcpwm_gen_handle_t` 表示。
- 更新后，不再使用 `mcpwm_fault_signal_t` 和 `mcpwm_sync_signal_t`，故障和同步源分别用 `mcpwm_fault_handle_t` 和 `cpp: type=mcpwm_sync_handle_t` 表示。
- 更新后，不再使用 `mcpwm_capture_signal_t`，获取通道用 `mcpwm_cap_channel_handle_t` 表示。

主要使用方法更新

- `mcpwm_gpio_init` 和 `mcpwm_set_pin`：GPIO 管脚配置在子模块配置中完成，例如在 `mcpwm_generator_config_t::gen_gpio_num` 中设置 PWM GPIO 管脚。
- `mcpwm_init`：为得到预期的 PWM 波形，用户需要至少分配一个 MCPWM 定时器和 MCPWM 运算器，然后通过调用 `mcpwm_operator_connect_timer()` 将二者连接起来。然后，用户需要调用如 `cpp: func=mcpwm_generator_set_actions_on_timer_event`，`mcpwm_generator_set_actions_on_compare_event()` 来设置发生器对不同事件的动作。
- `mcpwm_group_set_resolution`：新驱动中，群组分辨率固定为最大值。通常为 80 MHz。
- `mcpwm_timer_set_resolution`：MCPWM 定时器的分辨率在 `mcpwm_timer_config_t::resolution_hz` 中进行设置。
- `mcpwm_set_frequency`：PWM 频率由 `mcpwm_timer_config_t::resolution_hz` 和 `mcpwm_timer_config_t::count_mode` 和 `cpp: member=mcpwm_timer_config_t::period_ticks` 决定。
- `mcpwm_set_duty`：为设置 PWM 占空比，用户应调用 `mcpwm_comparator_set_compare_value()` 来改变比较器的阈值。
- `mcpwm_set_duty_type`：新驱动中没有预设的占空比模式，通过设置不同的发生器行为，如 `mcpwm_generator_set_actions_on_timer_event()`，来配置占空比模式。
- `mcpwm_set_signal_high` 和 `mcpwm_set_signal_low` 更新为 `mcpwm_generator_set_signal_high` 和 `mcpwm_generator_set_signal_low`，新驱动中，这是通过为发生器设置力作用来实现的，而不是在后台将占空比改为 0% 或 100%。
- `mcpwm_start` 和 `mcpwm_stop` 更新为 `mcpwm_timer_start_stop()`。用户可以用更多的模式来启动和停止 MCPWM 定时器，详见 `mcpwm_timer_start_stop_cmd_t`。
- `mcpwm_carrier_init` 更新为 `mcpwm_operator_apply_carrier()`。

legacy MCPWM driver is deprecated, please migrate to the new driver (include_driver/mcpwm_prelude.h)
Chapter 5. 迁移指南

- mcpwm_carrier_enable 与 mcpwm_carrier_disable：通过检查载波设置结构 mcpwm_carrier_config_t 是否为空来决定使能和禁止载波输出。
- mcpwm_carrier_set_period 更新为 mcpwm_carrier_config_t::frequency_hz。
- mcpwm_carrier_set_duty_cycle 更新为 mcpwm_carrier_config_t::duty_cycle。
- mcpwm_carrier_oneshot_mode_enable 更新为 mcpwm_carrier_config_t::first_pulse_duration_us。
- 更新后，mcpwm_carrier_oneshot_mode_disable 被删除。硬件不支持停用第一个载波脉冲（即一次性脉冲）。
- mcpwm_carrier_output_invert 更新为 mcpwm_carrier_config_t::invert_before_modulate 和 mcpwm_carrier_config_t::invert_after_modulate。
- mcpwm_deadtime_enable 与 mcpwm_deadtime_disable 更新为 mcpwm_generator_set_dead_time()。
- mcpwm_fault_init 更新为 mcpwm_new_gpio_fault()。
- mcpwm_fault_set_cyc_mode 与 mcpwm_fault_set_cyc_mode 更新为 mcpwm_operator_set_brake_on_fault() 与 mcpwm_generator_set_actions_on_brake_event()。
- 由于 mcpwm_capture_enable 与 mcpwm_capture_enable_channel() 重复，因此在更新后被删除。
- 由于 mcpwm_capture_disable 与 mcpwm_capture_disable_channel() 重复，因此在更新后被删除。
- mcpwm_capture_enable_channel 与 mcpwm_capture_disable_channel 重复为 mcpwm_capture_enable_channel() 与 mcpwm_capture_disable_channel()。
- mcpwm_capture_signal_get_value 与 mcpwm_capture_signal_get_edge：通过 mcpwm_capture_event_data_t，获取事件回调函数中提供了计时器的数值和边缘电平。只有获取事件发生时，获取数据才有意义，提供单一的 API 来获取捕获数据是没有意义的。
- 由于 mcpwm_sync_enable 与 mcpwm_sync_disable 重复，因此更新后被删除。
- mcpwm_sync_config 更新为 mcpwm_timer_set_sync_phase_config_t::sync_src 设置为 NULL。
- mcpwm_set_timer_sync_output 更新为 mcpwm_new_timer_sync_src()。
- mcpwm_timer_trigger_soft_sync 更新为 mcpwm_soft_sync_activate()。
- mcpwm_syncinvert_gpio_synchro 与设置 mcpwm_gpio_sync_config_t::active_neg 功能相同。
- 更新后，mcpwm_isr_register 已被删除。用户可以注册不同的事件回调函数来替换其功能，例如，可以使用 mcpwm_capture_channel_register_event_callbacks() 注册获取事件注册函数。

I2S 驱动 旧版 I2S 驱动在支持 ESP32-C3 和 ESP32-S3 新功能时暴露了很多缺点，为解决这些缺点，I2S 驱动已更新（请参考 doc/I2S Driver <.../api-reference/ peripherals/i2s>)。用户可以通过引用不同 I2S 模式对应的头文件来使用新版驱动的 API，如 driver/include/driver/i2s_std.h, driver/include/driver/i2s_pdm.h 以及 driver/include/driver/i2s_tdm.h。

为保证前向兼容，旧版驱动的 API 仍然在 driver/deprecated/driver/i2s.h 中可用。但使用旧版 API 会触发编译警告，该警告可通过配置 Kconfig 选项 CONFIG_I2S_SUPPRESS_DEPRECATED_WARN 来关闭。

以下是更新后的 I2S 文件概况。

主要概念更新

独立的发送通道和接收通道 更新后，I2S 驱动的最小控制单元是发送/接收通道，而不是整个 I2S 控制器（控制器包括多个通道）。
- 用户可以分别控制同一个 I2S 控制器的发送通道和接收通道，即可以通过配置实现分别开启和关闭发送通道和接收通道。
- i2s-chan_handle_t 句柄类型用于唯一地识别 I2S 通道。所有的 API 都需要该通道句柄，用户需要对这些通道句柄进行维护。
- 对于 ESP32-C3 和 ESP32-S3，同一个控制器中的发送通道和接收通道可以配置为不同的时钟或不同的模式。
- 但是对于 ESP32 和 ESP32-S2，同一个控制器中的发送通道和接收通道共享某些硬件资源。因此，配置可能会造成一个通道影响同一个控制器中的另一个通道。
通过将 `i2s_port_t::I2S_NUM_AUTO` 设置为 I2S 端口 ID，驱动会搜索可用的发送/接收通道，之后通道会被自动注册到可用的 I2S 控制器上。但是，驱动仍然支持将通道注册到一个特定的端口上。

为区分发送/接收通道和声音通道，在更新后的驱动中，“通道 (channel)”一词仅代表发送/接收通道，用“声道 (slot)”来表示声音通道。

I2S 模式分类 I2S 通信模式包括以下三种模式，请注意：

- **标准模式**：标准模式通常包括两个声道，支持 Philips，MSB 和 PCM（短帧同步）格式，详见 `driver/include/driver/i2s_std.h`。
- **PDM 模式**：PDM 模式仅支持两个声道，16 bit 数据位宽，但是 PDM TX 和 PDM RX 的配置略有不同。对于 PDM TX，采样率可通过 `i2s_pdm_rx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于上采样的配置。对于 PDM RX，采样率可通过 `i2s_pdm_rx_clk_config_t::sample_rate` 进行设置，其时钟频率取决于下采样的配置，详见 `driver/include/driver/i2s_pdm.h`。
- **TDM 模式**：TDM 模式可支持高达 16 声道，该模式可在 Philips，MSB，PCM（短帧同步）和 PCM（长帧同步）格式下，详见 `driver/include/driver/i2s_tdm.h`。

在某个模式下分配新通道时，必须通过相应的函数初始化这个通道。我们强烈建议使用辅助宏来生成默认配置，以避免默认值被改动。

独立的声道配置和时钟配置 可以单独进行声道配置和时钟配置。

- 通过调用 `i2s_channel_init_std_mode()`，`i2s_channel_init_pdm_rx_mode()`，`i2s_channel_init_pdm_tx_mode()` 或 `cppfunc::i2s_channel_init_tdm_mode` 初始化声道/时钟/GPIO 管脚配置。
- 通过调用 `i2s_channel_reconfig_std_slot()`，`i2s_channel_reconfig_pdm_rx_slot()` 或 `i2s_channel_reconfig_pdm_rx_slot()` 可以在初始化之后改变声道配置。
- 通过调用 `i2s_channel_reconfig_std_slot()`，`i2s_channel_reconfig_pdm_rx_slot()` 或 `i2s_channel_reconfig_tdm_slot()` 可以在初始化之后改变时钟配置。
- 通过调用 `i2s_channel_reconfig_std_gpio()`，`i2s_channel_reconfig_pdm_rx_gpio()`，`i2s_channel_reconfig_pdm_rx_gpio()` 或 `i2s_channel_reconfig_tdm_gpio()` 可以在初始化之后改变 GPIO 管脚配置。
更新后，I2S 驱动利用状态和状态机避免在错误状态下调用 API。
更新后，ADC 和 DAC 模式已被删除，只有它们各自专用的驱动及 I2S 旧版驱动还支持这两种模式。

**主要使用方法更新** 请参考以下步骤使用更新后的 I2S 驱动:

1. 通过调用 `i2s_new_channel()` 来获取通道句柄。我们应在这个步骤中指定外设为主机还是从机以及 I2S 端口。此外，驱动负责生成发送通道或接收通道的句柄。不需要同时输入发送通道和接收通道句柄，但需要输入至少一个句柄。输入两个句柄时，驱动会工作在双工模式。在同一端口上，发送通道和接收通道同时可用，并且共享 MCLK，BCLK 和 WS 信号。如果只输入了发送通道句柄或接收通道句柄，该通道只能工作在单工模式。
2. 通过调用 `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()` 或 `i2s_channel_init_tdm_mode()` 将通道初始化为指定模式。进行相应的声道、时钟和 GPIO 管脚配置。
3. （可选）通过调用 `i2s_channel_register_event_callback()` 注册 ISR 事件回调函数。I2S 事件由回调函数同步接收，而不是从事件队列中异步接收。
4. 通过调用 `i2s_channel_enable()` 来开启 I2S 通道的硬件资源。在更新后的驱动中，I2S 在安装后不会再自动开启。用户需要确定通道是否已经开启。
5. 分别通过 `i2s_channel_read()` 和 `i2s_channel_write()` 来读取和写入数据。当然，在 `i2s_channel_read()` 中只能输入接收通道句柄，在 `i2s_channel_write()` 中只能输入发送通道句柄。
6. （可选）通过相应的 ‘reconfig’ 函数可以更改声道、时钟和 GPIO 管脚配置，但是更改配置前必须调用 `i2s_channel_disable()`。
7. 通过调用 `i2s_channel_disable()` 可以停止使用 I2S 通道的硬件资源。
8. 不再使用某通道时，通过调用 `i2s_del_channel()` 可以删除和释放该通道资源，但是删除之前必须先停用该通道。

### 用于访问寄存器的宏
更新后，所有用于访问寄存器的宏都可以作为表达式来使用，所以以下命令是允许的:

```c
uint32_t val = REG_SET_BITS(reg, mask);
```

在 ESP-IDF v5.0 中，用于写入或读取-修改-写入寄存器的宏不能再作为表达式使用，而只能作为语句使用。这适用于以下宏: `REG_WRITE`, `REG_SET_BIT`, `REG_CLR_BIT`, `REG_SET_BITS`, `REG_SET_FIELD`, `WRITE_PERI_REG`, `CLEAR_PERI_REG_MASK`, `SET_PERI_REG_MASK`, `SET_PERI_REG_BITS`。

为存储要写入寄存器的值，请按以下步骤完成操作:

```c
uint32_t new_val = REG_READ(reg) | mask;
REG_WRITE(reg, new_val);  
```

要获得修改后的寄存器的值（该值可能与写入的值不同），要增加一个显示的读取命令:

```c
REG_SET_BITS(reg, mask);
uint32_t new_val = REG_READ(reg);  
```

### 协议

**Mbed TLS** 在 ESP-IDF v5.0 版本中，Mbed TLS 已从 v2.x 版本更新到 v3.1.0 版本。

更多有关 Mbed TLS 从 v2.x 版本迁移到 v3.0 或更高版本的详细信息，请参考 官方指南。

### 重大更新（概述）
Chapter 5. 迁移指南

增加私有结构体字段数量

- 不再支持直接访问公共头文件中声明的结构体（struct 类型）字段。
- 当前版本下，访问公共头文件中声明的结构体字段需要使用特定的访问函数（getter/setter）。另外，也可以用 MBEDTLS_PRIVATE 宏暂时代替，但不建议使用此种方法。
- 更多详细信息，请参考 官方指南。

SSL

- 不再支持 TLS 1.0、TLS 1.1 和 DTLS 1.0
- 不再支持 SSL 3.0

移除密钥模块中的废弃函数

- 更新了 MD、SHA、RIPEMD、RNG、HMAC 模块相关的函数 mbedtls_* _ret() 的返回值，并将其重新命名，以取代未附加 chaired 的相关函数。
- 更多详细信息，请参考 官方指南。

废弃配置选项

以下为在此次更新中废弃的重要配置选项。与以下配置有关或是依赖于下表配置的相关配置也已相应废弃。

- MBEDTLS_SSL_PROTO_SSL3: 原用于支持 SSL 3.0
- MBEDTLS_SSL_PROTO_TLS1: 原用于支持 TLS 1.0
- MBEDTLS_SSL_PROTO_TLS1_1: 原用于支持 TLS 1.1
- MBEDTLS_SSL_PROTO_DTLS: 原用于支持 DTLS 1.1（当前版本仅支持 DTLS 1.2）
- MBEDTLS_DES_C: 原用于支持 3DES 密码套件
- MBEDTLS_RC4_MODE: 原用于支持基于 RC4 的密码套件

备注：上述仅列出了可通过 idf.py menuconfig 配置的主要选项。更多有关废弃选项的信息，请参考 官方指南。

其他更新

禁用 Diffie-Hellman 密码交换模式

为避免 安全风险，当前版本已默认禁用 Diffie-Hellman 密码交换模式。以下为相应的禁用配置项：

- MBEDTLS_DH_C: 原用于支持 Diffie-Hellman-Merkle 模块
- MBEDTLS_KEY_EXCHANGE_DHE_PSK: 原用于支持 Diffie-Hellman 预共享密钥 (PSK) TLS 认证模式
- MBEDTLS_KEY_EXCHANGE_DHE_RSA: 原用于支持有前缀的密码套件 TLS-DHE-RSA-WITH-

备注：在信号交换的初始步骤（即 client_hello）中，服务器会在客户端提供的列表中选择一个密码。由于 DHE_PSK/DHE_RSA 密码已在本次更新中禁用，服务器将退回到一个替代密码。在特别情况下，服务器按不支持任何其他的代码，此时，初始步骤将失败。若要检索服务器所支持的密码列表，需要首先在客户端使用特定的密码连接服务器，可以使用 sslscan 等工具完成连接。

从 X509 库中移除 certs 模块

- mbeds 3.1 不再支持 mbedts/certs.h 头文件。大多数应用程序支持从包含列表中安全删除该头文件。

对 esp_crt_bundle_set API 的重大更新

- 更新后，调用 esp_crt_bundle_set() API 需要一个额外的参数 bundle_size。该 API 的返回类型也从 void 变为了 esp_err_t.
对 esp_ds_rsa_sign API 的重大更新

- 更新后，调用 esp_ds_rsa_sign() API 无需再使用参数 mode。

HTTPS 服务器

重大更新（概述） 更新 httpd_ssl_config_t 结构体中持有不同证书的变量名。

- httpd_ssl_config::servercert: 原 cacert_pem
- httpd_ssl_config::servercert_len: 原 cacert_len
- httpd_ssl_config::cacert_pem: 原 client_verify_cert_pem
- httpd_ssl_config::cacert_len: 原 client_verify_cert_len

httpd_ssl_stop() API 的返回类型从 void 变为了 esp_err_t。

ESP HTTPS OTA

重大更新（概述）

- 函数 esp_https_ota() 现需以指向 esp_https_ota_config_t 的指针作为参数，而非之前的指向 esp_http_client_config_t 的指针。

ESP-TLS

重大更新（概述）

私有化 esp_tls_t 结构体 更新后，esp_tls_t 已完全私有化，用户无法直接访问其内部结构。之前需要通过 ESP-TLS 句柄获得的必要数据，现在可由对应的 getter/setter 函数获取。如需特定功能的 getter/setter 函数，请在 ESP-IDF 的 Issue 板块 提出。

下列为新增的 getter/setter 函数：

- esp_tls_get_ssl_context(): 从 ESP-TLS 句柄获取底层 ssl 栈的 ssl 上下文。

废弃函数及推荐的替代函数 下表总结了在 ESP-IDF v5.0 中废弃的函数以及相应的替代函数。

<table>
<thead>
<tr>
<th>废弃函数</th>
<th>替代函数</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_tls_conn_new()</td>
<td>esp_tls_conn_new_sync()</td>
</tr>
<tr>
<td>esp_tls_conn_delete()</td>
<td>esp_tls_conn_destroy()</td>
</tr>
</tbody>
</table>

- 函数 esp_tls_conn_http_new() 现已废弃，已使用替代函数 esp_tls_conn_http_new_sync() (或其异步函数 esp_tls_conn_http_new_async())。请注意，使用替代函数时，需要额外的参数 esp_tls_t，此参数必须首先通过 esp_tls_init() 函数进行初始化。

HTTP 服务器

重大更新（概述）

- esp_http_server 现不再支持 http_server.h 头文件。请使用 esp_http_server.h。
ESP HTTP 客户端

重大更新（概述）

- 函数 esp_http_client_read() 和 esp_http_client_fetch_headers() 现在会返回额外的返回值 -ESP_ERR_HTTP_EAGAIN 用于处理超时错误。即数据准备好前就已调用超时的情况。

TCP 传输

重大更新（概述）

- 更新后，出现连接超时的情况时，函数 esp_transport_read() 将返回 0，对其他错误则返回 < 0。请参阅 esp_tcp_transport_err_t，查看所有可能的返回值。

MQTT 客户端

重大更新（概述）

- esp_mqtt_client_config_t 的所有字段都分组存放在子结构体中。以下为较为常用的配置选项：
  - 通过 esp_mqtt_client_config_t::broker::address::uri 配置 MQTT Broker
  - 通过 esp_mqtt_client_config_t::broker::verification 配置 MQTT Broker 身份验证的相关安全问题
  - 通过 esp_mqtt_client_config_t::credentials::username 配置客户端用户名

ESP-Modbus

重大更新（概述） 本次更新从 ESP-IDF 中移除了组件 freemodbus，该组件已作为一个独立组件受到支持。可前往如下的独立仓库，查看更多有关 ESP-Modbus 的信息：

- GitHub 中的 ESP-Modbus 组件

在新版应用程序中，main 组件文件夹应包括组件管理器清单文件 idf.component.yml，如下所示：

```
dependencies:
espressif/esp-modbus:
  version: "^1.0"
```

可以前往 组件管理器注册表 找到 ESP-Modbus 组件。更多有关如何设置组件管理器的信息，请参考 组件管理器文档。

对于使用 ESP-IDF v4.x 及以后版本的应用程序，需要通过添加组件管理器清单文件 idf.component.yml 拉取新版 ESP-Modbus 组件。同时，在编译时，应去掉已过时的 freemodbus 组件。此项操作可通过项目 CMakeLists.txt 中的以下语句实现：

```
set(EXCLUDE_COMPONENTS freemodbus)
```

配置
Protocomm  protocomm_set_security() API 中的 pop 字段现已弃用。请使用 sec_params 字段来代替 pop。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，sec_params 参数应包含指向protocomm_security2_params_t 类型结构的指针。

Wi-Fi 配置

- wifi_prov_mgr_start_provisioning() API 中的 pop 字段现已弃用。为了向后兼容，在使用安全版本 1 时，pop 仍可以作为字符串传递。但在使用安全版本 2 时，请使用wifi_prov_sec_params 字段来代替 pop。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。例如，当使用安全版本 2 时，wifi_prov_sec_params 参数应包含指向wifi_prov_security2_params_t 结构体类型的指针。对于安全版本 1，该 API 的行为和使用方式保持不变。

ESP 本地控制 esp_local_ctrl_proto_sec_cfg_t API 中的 pop 字段现已弃用。请使用sec_params 字段来代替 pop。此参数应包含所使用的协议版本所要求的结构（包括安全参数）。

例如，当使用安全版本 2 时，sec_params 字段应包含指向esp_local_ctrl_security2_params_t 类型结构的指针。

从 ESP-IDF 中移出或弃用的组件

移至 IDF Component Registry 的组件 以下组件已经从 ESP-IDF 中迁出至 IDF Component Registry：

- libsodium
- cbor
- jsmn
- esp_modem
- nghttp
- mdns
- esp_websocket_client
- asio
- freemodbus
- sh2lib
- expat
- coap
- esp-cryptoauthlib
- qrcode
- tjpgd
- esp_serial_slave_link
- tinyusb

备注：请注意，http 解析功能以前属于 nghttp 组件一部分，但现在属于 http_parser 组件。

可使用 idf.py add-dependency 命令安装以上组件。

例如，要安装 X.Y 版本的 libsodium 组件，请运行: idf.py add-dependency libsodium==X.Y。

根据 semver 规则安装与 X.Y 兼容的最新版本 libsodium 组件，请运行 idf.py add-dependency

libodium=X.Y。

可前往 https://components.espressif.com 查询每个组件有哪些版本，按名称搜索该组件，组件页面上会列出所有版本。
弃用的组件  IDF v4.x 版本中已不再使用以下组件，这些组件已弃用：

- tcpip_adapter，可使用 ESP-NETIF 组件代替，具体可参考 TCP/IP 配置。

备注：不再支持 OpenSSL-API 组件，IDF Component Registry 中也没有该组件。请直接使用 ESP-TLS 或 mbedtls API。

备注：不再支持 esp_adc_cal 组件，新的 adc 校准驱动在 esp_adc 组件中。旧版 adc 校准驱动已被迁移进 esp_adc 组件中。要使用旧版 esp_adc_cal 驱动接口，你应该在 CMakeLists.txt 文件的组件依赖列表中增加 esp_adc。更多细节请查看 Peripherals Migration Guide。

版本更新后无需目标组件，因此以下目标组件也已经从 ESP-IDF 中删除：

- esp32
- esp32s2
- esp32s3
- esp32c2
- esp32c3
- esp32h4

存储

分区 API 的新组件 非兼容性更新：所有的分区 API 代码都已迁移到新组件 esp_partition 中。如需查看所有受影响的函数及数据类型，请参见头文件 esp_partition.h。

在以前，这些 API 函数和数据类型属于 spi_flash 组件，因此，在现有的应用程序中或将依赖 spi_flash，这也意味着在直接使用 esp_partition_* API/数据类型时，可能会导致构建过程失败（比如，在出现 #include "esp_partition.h" 的行中报错 fatal error: esp_partition.h: No such file or directory）。如果遇到类似问题，请按以下步骤更新项目中的 CMakeLists.txt 文件：

原有的依赖性设置:

```c
idf_component_register(...
    REQUIRES spi_flash)
```

更新后的依赖性设置:

```c
idf_component_register(...
    REQUIRES spi_flash esp_partition)
```

备注：请根据项目的实际情况，更新相应的 REQUIRES 或是 PRIV_REQUIRES 部分。上述代码片段仅为范例。

如果问题仍未解决，请联系我们，我们将协助您进行代码迁移。

SDMMC/SDSPI 用户现可通过 sdmmc_host.t_max_freq_khz 将 SDMMC/SDSPI 接口上的 SD 卡频率配置为特定值，不再局限于之前的 SDMMC_FREQ_PROBING (400 kHz)、SDMMC_FREQ_DEFAULT (20 MHz) 或是 SDMMC_FREQ_HIGHSPEED (40 MHz)。此前，如果用户配置了上述三个给定频率之外的值，用户所选频率将自动调整为与其最为接近的给定值。

更新后，底层驱动将计算与用户配置的特定值最为接近的合适频率。相对于枚举项选择，该频率现由可用的分频器提供。不过，如果尚未更新现有的应用代码，可能会导致与 SD 卡的通信过程出现问题。如发现上述问题，请尝试配置与期望值接近的不同频率，直到找到合适的频率。如需查看底层驱动的计算结果以及实际应用的频率，请使用 void sdmmc_card_print_info(FILE* stream, const sdmmc_card_t* card) 函数。
FatFs

FatFs 已更新至 v0.14，f_mkfs() 函数签名也已变更。新签名为 FRESULT f_mkfs (const TCHAR* path, const MKFS_PARM* opt, void* work, UINT len);，使用 MKFS_PARM 结构体作为第二个实参。

分区表
分区表生成器不再支持未对齐的分区。生成分区表时，ESP-IDF 将只接受偏移量与 4 KB 对齐的分区。此变更仅影响新生成的分区表，不影响读写现有分区。

VFS
esp_vfs_semihost_register() 函数签名有所更改:

- 新签名为了 esp_err_t esp_vfs_semihost_register(const char* base_path);
- 旧签名的 host_path 参数不再存在，请使用 OpenOCD 命令 ESP_SEMIHOST_BASEDIR 设置主机上的完整路径。

函数签名更改
以下函数现将返回 esp_err_t，而非 void 或 nvs_iterator_t。此前，当参数无效或内部出现问题时，这些函数将 assert() 反回 nullptr，通过返回 esp_err_t，您将获得更加实用的错误报告。

- nvs_entry_find()
- nvs_entry_next()
- nvs_entry_info()

由于 esp_err_t 返回类型的更改，nvs_entry_find() 和 nvs_entry_next() 的使用模式也发生了变化。上述函数现均通过参数修改迭代器，而非返回一个迭代器。

迭代 NVS 区分的旧编程模式如下所示:

```c
nvs_iterator_t it = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    printf("key '%s', type '%d'", info.key, info.type);
    it = nvs_entry_next(it);
}
```

现在，迭代 NVS 分区的编程模式已更新为:

```c
nvs_iterator_t it = nullptr;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_ANY, &it);
while (res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are
guaranteed to be non-NULL
    printf("key '%s', type '%d'", info.key, info.type);
    res = nvs_entry_next(&it);
}
```

迭代器有效性
请注意，由于函数签名的改动，如果存在参数错误，则可能从 nvs_entry_find() 获得无效迭代器。因此，请务必在使用 nvs_entry_find() 之前将迭代器初始化为 NULL，以免在调用 nvs_release_iterator() 之前进行复杂的错误检查。上述编程模式便是一个很好的例子。

删除 SD SPI 弃用的 API 结构体 sdspi_slot_config_t 和函数 sdspi_host_init_slot() 现已删除，并由结构体 sdspi_device_config_t 和函数 sdspi_host_init_device() 替代。
ROM SPI flash 在 v5.0 之前的版本中，ROM SPI flash 函数一般通过 esp32**/rom/spi_flash.h 得以体现。因此，为支持不同 ESP 芯片而编写的代码可能会充满不同目标的 ROM 头文件。此外，并非所有 API 都可以在全部的 ESP 芯片上使用。

现在，常用 API 被提取至 esp_rom_spiflash.h。尽管这不能算作重大变更，我们强烈建议您仅使用此头文件中的函数（即以 esp_rom_spiflash 为前缀并包含在 esp_rom_spiflash.h 中），以获得不同 ESP 芯片之间更佳的交叉兼容性。

为了提高 ROM SPI flash API 的可读性，以下函数也被重命名:

- esp_rom_spiflash_lock() 更名为 esp_rom_spiflash_set_bp()
- esp_rom_spiflash_unlock() 更名为 esp_rom_spiflash_clear_bp()

S PI flash 驱动 esp flash_speed_t enum 类型现已弃用。现在，您可以直接将实际时钟频率值传递给 flash 配置结构。下为配置 80MHz flash 频率的示例:

```
esp_flash_spi_device_config_t dev_cfg = {
    // Other members
    .freq_mhz = 80,
    // Other members
};
```

旧版 SPI flash 驱动 为了使 SPI flash 驱动更为稳定，v5.0 已经删除旧版 SPI flash 驱动。旧版 SPI flash 驱动程序是指自 v3.0 以来的默认 SPI flash 驱动程序，以及自 v4.0 以来启用配置选项 CONFIG_SPI_FLASH_USE_LEGACY_IMPL 的 SPI flash 驱动。从 v5.0 开始，我们将不再支持旧版 SPI flash 驱动程序。因此，旧版驱动 API 和 CONFIG_SPI_FLASH_USE_LEGACY_IMPL 配置选项均被删除，替换为新 SPI flash 驱动的 API。

<table>
<thead>
<tr>
<th>删除项目</th>
<th>替代项目</th>
</tr>
</thead>
<tbody>
<tr>
<td>spi_flash_erase_sector()</td>
<td>esp_flash_erase_region()</td>
</tr>
<tr>
<td>spi_flash_erase_range()</td>
<td>esp_flash_erase_region()</td>
</tr>
<tr>
<td>spi_flash_write()</td>
<td>esp_flash_write()</td>
</tr>
<tr>
<td>spi_flash_read()</td>
<td>esp_flash_read()</td>
</tr>
<tr>
<td>spi_flash_write_encrypted()</td>
<td>esp_flash_write_encrypted()</td>
</tr>
<tr>
<td>spi_flash_read_encrypted()</td>
<td>esp_flash_read_encrypted()</td>
</tr>
</tbody>
</table>

备注：带有前缀 esp_flash 的新函数接受额外的 esp_flash_t* 参数。您可以直接将其设置为 NULL，从而使函数运行主 flash(esp_flash_default_chip)。

由于系统函数不再是公共函数，esp_spi_flash.h 头文件已停止使用。若要使用 flash 映射 API，请使用 spi_flash_mmap.h。

系统

跨核执行 跨核执行 (Inter-Processor Call, IPC) 不再是一个独立组件，现已被包含至 esp_system。因此，若项目的 CMakeLists.txt 文件中出现 PRIVQUIRES esp_ipc 或 REQUIRES esp_ipc，应删除这些选项，因为项目中已默认包含 esp_system 组件。
ESP 时钟  ESP 时钟 API（即以 esp_clk 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "ESP32/clk.h" 和 #include "esp_clk.h" 已被移除。如仍需使用 ESP 时钟 API（并不推荐），请使用 #include "esp_private/esp_clk.h" 来包含。

注意：私有 API 不属于稳定的 API，不会遵循 ESP-IDF 的版本演进规则，因此不推荐用户在应用中使用。

缓存错误中断 缓存错误中断 API（即以 esp_cache_err 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "ESP32/cache_err_int.h" 已被移除。如仍需使用缓存错误中断 API（并不推荐），请使用 #include "esp_private/cache_err_int.h" 来包含。

bootloader_support

- 函数 bootloader_common_get_reset_reason() 已被移除。请使用 ROM 组件中的函数 esp_rom_get_reset_reason()。
- 函数 esp_secure_boot_verify_sbv2_signature_block() 和 esp_secure_boot_verify_rsa_signature_block() 已被移除，无新的替换函数。不推荐用户直接使用以上函数。如需使用，请在 GitHub 上对该功能提交请求，并解释您需要此函数的原因。

断电 断电 API（即以 esp_brownout 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "brownout.h" 已被移除。如仍需使用断电 API（并不推荐），请使用 #include "esp_private/brownout.h" 来包含。

Trax Trax API（即以 trax_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "trax.h" 已被移除。如仍需使用 Trax API（并不推荐），请使用 #include "esp_private/trax.h" 来包含。

ROM components/esp32/rom/ 路径下存放的已弃用的 ROM 相关头文件已被移除（原包含路径为rom/*.h）。请使用新的特定目标的路径 components/esp_rom/include/ESP32/" (新的包含路径为"ESP32/rom/*.h")。

esp_hw_support

- 头文件 soc/cpu.h 及弃用的 CPU util 函数都已被移除。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 hal/cpu_ll.h, hal/cpu_hal.h, hal/soc_ll.h, hal/soc_hal.h 和 interrupt_controller_hal.h 的 CPU API 函数已弃用。请包含 esp_cpu.h 来代替相同功能的函数。
- 头文件 compare_set.h 已被移除。请使用 esp_cpu.h 中提供的 esp_cpu_compare_and_set() 函数来代替。
- esp_cpu_get_ccount()、esp_cpu_set_ccount() 和 esp_cpu_in_ocd_debug_mode() 已从 esp_cpu.h 中移除。请分别使用 esp_cpu_get_cycle_count()、esp_cpu_set_cycle_count() 和 esp_cpu_dbgr_is_attached() 代替。
- 头文件 esp_intr.h 已被移除。请包含 esp_intr_alloc.h 以分配和操作中断。
- Panic API（即以 esp_panic 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "esp_panic.h" 已被移除。如仍需使用 Panic API（并不推荐），请使用 #include "esp_private/panic_reason.h" 来包含。此外，请包含 esp_debug_helpers.h 以使用与调试有关的任意辅助函数，如打印回溯。
- 头文件 soc/log.h 现更名为 esp_hw_log.h，并已更新为私有。建议用户使用 esp_log.h 头文件下的日志 API。
- 包含头文件 spinlock.h, clk_ctrl_os.h 和 rtc_wdt.h 时不应使用 soc 前缀，如 #include "spinlock.h"。
Chapter 5. 移植指南

- esp_chip_info() 命令返回芯片版本，格式为 \( \text{major} \times \text{revision} + \text{minor} \)。因此，为适应新格式，esp_chip_info_t 结构体中的 revision 被扩展为 uint16_t。

**PSRAM**

- 针对特定目标的头文件 spiram.h 及头文件 esp_spiram.h 已被移除，创建新组件 esp_psram。对于与 PSRAM 或 SPIRAM 相关的函数，请包含 esp_psram.h，并在 CMakeLists.txt 项目文件中将 esp_psram 设置为必需组件。
- esp_spiram_get_chip_size 和 esp_spiram_get_size 已被移除，请使用 esp_psram_get_size。

**eFuse**

- 函数 esp_secure_boot_read_key_digests() 的参数类型从 ets_secure_boot_key_digests_t* 更新为 esp_secure_boot_key_digests_t*。新类型与旧类型相同，仅移除了 allow_key_revoke 标志。在当前代码中，后者总是被设置为 true，并未提供额外信息。
- 针对 eFuse 晶圆增加主要修订版和次要修订版本。API esp_efuse_get_chip_ver() 与新修订不兼容，因此已被移除。请使用 API efuse_hal_get_major_chip_version()、efuse_hal_get_minor_chip_version() 或 efuse_hal_chip_revision() 来代替原有 API。

**esp_common** EXT_RAM_ATTR 已被弃用。请使用新的宏 EXT_RAM_BSS_ATTR 以将 bss 放在 PSRAM 上。

**esp_system**

- 头文件 esp_random.h, esp_mac.h 和 esp_chip_info.h 以往都通过头文件 esp_system.h 间接包含，更新后必须直接包含。已移除从 esp_system.h 中的间接包含功能。
- 回溯解析器 API（即以 esp_eh_frame_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "eh_frame_parser.h" 已被移除。如仍需使用回溯解析器 API（并不推荐），请使用 #include "esp_private/eh_frame_parser.h" 来包含。
- 中断看门狗定时器 API（即以 esp_int_wdt_ 为前缀的函数、类型或宏）已被更新为私有 API。因此，原先的包含路径 #include "esp_int_wdt.h" 已被移除。如仍需使用中断看门狗定时器 API（并不推荐），请使用 #include "esp_private/esp_int_wdt.h" 来包含。

**SOC 依赖性**

- Doxygen 中列出的公共 API 头文件中不会显示不稳定和非必要的 SOC 头文件，如 soc/soc.h 和 soc/rtc.h。这意味着，如果用户仍然需要这些“缺失”的头文件，就必须在代码中明确包含这些文件。
- Kconfig 选项 LEGACYINCLUDE_COMMON_HEADERS 也已被移除。
- 头文件 soc/soc_memory_types.h 已被弃用。请使用 esp_memory_utils.h。包含 soc/soc_memory_types.h 将触发构建警告，如 soc_memory_types.h is deprecated, please migrate to esp_memory_utils.h。

**应用跟踪** 其中一个时间截源已从定时器组驱动改为新的 GPTimer。Kconfig 选项已重新命名，例如 APPTRACE_SV_TS_SOURCE_TIMER00 已更改为 APPTRACE_SV_TS_SOURCE_GPTIMER。用户已无需选择组和定时器 ID。

**esp_timer** 基于 FRC2 的 esp_timer 过去可用于 ESP32，现在已被移除，更新后仅可使用更简单有效的 LAC 定时器。
ESP 镜像  ESP 镜像中关于 SPI 速度的枚举成员已重新更名。
- ESP_IMAGE_SPI_SPEED_80M 已被重新命名为 ESP_IMAGE_SPI_SPEED_DIV_1。
- ESP_IMAGE_SPI_SPEED_40M 已被重新命名为 ESP_IMAGE_SPI_SPEED_DIV_2。
- ESP_IMAGE_SPI_SPEED_26M 已被重新命名为 ESP_IMAGE_SPI_SPEED_DIV_3。
- ESP_IMAGE_SPI_SPEED_20M 已被重新命名为 ESP_IMAGE_SPI_SPEED_DIV_4。

任务看门狗定时器
- API esp_task_wdt_init() 更新后有如下变化：
  - 以结构体的形式传递配置。
  - 可将该函数配置为订阅空闲任务。
- 原先的配置选项 CONFIG_ESP_TASK_WDT 被重新命名为 CONFIG_ESP_TASK_WDT_INIT 并引入了一个新选项 CONFIG_ESP_TASK_WDT_EN。

FreeRTOS

遗留 API 及数据类型 在以往版本中, ESP-IDF 默认设置 configENABLE_BACKWARD_COMPATIBILITY 选项，因此可使用 FreeRTOS v8.0.0 之前的函数名称和数据类型。该选项现已默认禁用。因此默认情况下不再支持以往的 FreeRTOS 名称或类型。用户可以选择以下一种解决方式：
- 更新代码，删除以往的 FreeRTOS 名称或类型。
- 启用 CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY 以显式调用这些名称或类型。

任务快照 头文件 task_snapshot.h 已从 freertos/task.h 中移除。如需使用任务快照 API，请包含 freertos/task_snapshot.h。
函数 vTaskGetSnapshot() 现返回 BaseType_t，成功时返回值为 pdTRUE，失败则返回 pdFALSE。

FreeRTOS 断言 在以往版本中，FreeRTOS 断言通过 FREERTOS_ASSERT kconfig 选项独立配置，不同于系统的其他部分。该选项已被移除，现在需要通过 COMPILER_OPTIMIZATION_ASSERTION_LEVEL 来完成配置。

FreeRTOS 移植相关的宏 已移除以保证弃用 API 向后兼容性的 portmacro_deprecated.h 文件。建议使用下列函数来代替弃用 API。
- portENTER_CRITICAL_NESTED() 已被移除，请使用 portSET_INTERRUPT_MASK_FROM_ISR() 宏。
- portEXIT_CRITICAL_NESTED() 已被移除，请使用 portCLEAR_INTERRUPT_MASK_FROM_ISR() 宏。
- vPortCPUInitializeMutex() 已被移除，请使用 spinlock_initialize() 函数。
- vPortCPUAcquireMutex() 已被移除，请使用 spinlock_acquire() 函数。
- vPortCPUAcquireMutexTimeout() 已被移除，请使用 spinlock_acquire() 函数。
- vPortCPUReleaseMutex() 已被移除，请使用 spinlock_release() 函数。

应用程序更新
- 函数 esp_ota_get_app_description() 和 esp_ota_get_app_elf_sha256() 已被弃用，请分别使用 esp_app_get_description() 和 esp_app_get_elf_sha256() 函数来代替。这些函数已被移至新组件 esp_app_format。请参考头文件 esp_app_desc.h。
引邬加載程序支持

- esp_app_desc_t 结构体此前在 esp_app_format.h 中声明，现在在 esp_app_desc.h 中声明。
- 函数 bootloader_common_get_partition_description() 已更新为私有函数，请使用代替函数 esp_ota_get_partition_description()。注意，此函数的第一个参数为 esp_partition_t，而非 esp_partition_pos_t。

芯片版本 在应用程序开始加载时，引导加载程序会检查芯片版本。只有当版本为 >= CONFIG_ESP32_REV_MIN 和 <= CONFIG_ESP32_REV_MAX 全时，应用程序才能成功加载。

在 OTA 升级时，会检查应用程序头部中的版本需求和芯片版本是否符合条件。只有当版本为 >= CONFIG_ESP32_REV_MIN 和 <= CONFIG_ESP32_REV_MAX 全时，应用程序才能成功更新。

工具

IDF 监视器 IDF 监视器在波特率方面的改动如下：

- 目前，IDF 监视器需遵循自定义的控制台波特率 (CONFIG_ESP_CONSOLE_UART_BAUDRATE)，而非 115200。
- ESP-IDF v5.0 不再支持通过 menuconfig 自定义波特率。
- 支持通过设置环境变量或在命令行中使用 idf.py monitor -b <baud> 命令自定义波特率。
- 注意，为了与全局波特率 idf.py -b <baud> 保持一致，波特率参数已从 -B 改名为 -b。请运行 idf.py monitor --help 获取更多信息。

废弃指令 ESP-IDF v5.0 已将 idf.py 子命令和 cmake 目标名中的下划线 (_) 统一为连字符 (-)。使用废弃的子命令及目标名将会触发警告，建议使用更新后的版本。具体改动如下：

表 1: 废弃子命令及目标名

<table>

</tbody>
</table>

Esptool CONFIG_ESPTOOLPY_FLASHSIZE_DETECT 选项已重命名为 CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE，且默认禁用。迁移到 ESP-IDF v5.0 的新项目和现有项目必须设置 CONFIG_ESPTOOLPY_FLASHSIZE。若因编译时 flash 大小未知而无法设置，可启用 CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE。但需注意的是，启用该项后，为在烧录期间使用 flash 大小更新二进制时不会导致摘要无效，映像后将不再附加 SHA256 摘要。

Windows 环境 基于 MSYS/MinGW 的 Windows 环境支持已在 ESP-IDF v4.0 中弃用，v5.0 则完全移除了该项服务。请使用 ESP-IDF 工具安装器设置 Windows 兼容环境。目前支持 Windows 命令行、Power Shell 和基于 Eclipse IDE 的图形用户界面等选项。此外，还可以使用支持的软件 <https://github.com/espressif/vscode-esp-idf-extension>，设置基于 VSCode 的环境。

Espressif Systems 2481 Release v5.1-dev-2066-g7869f4e151
5.1.2 从 5.0 迁移到 5.1

外设
Chapter 6

Libraries and Frameworks

6.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks’ agents and examples:

6.1.1 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. ESP RainMaker on GitHub.

6.1.2 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32 based on Amazon Web Services’ aws-iot-device-sdk-embedded-C.

6.1.3 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32 based on Microsoft Azure’s azure-iot-sdk-c SDK.

6.1.4 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32 based on Google’s iot-device-sdk-embedded-c SDK.

6.1.5 Aliyun IoT

https://github.com/espressif/esp-aliyun is an open source repository for ESP32 based on Aliyun’s iotkit-embedded SDK.

6.1.6 Joylink IoT

https://github.com/espressif/esp-joylink is an open source repository for ESP32 based on Joylink’s joylink_dev_sdk SDK.
6.1.7 Tencent IoT

https://github.com/espressif/esp-welink is an open source repository for ESP32 based on Tencent’s welink SDK.

6.1.8 Tencent Yun IoT

https://github.com/espressif/esp-qcloud is an open source repository for ESP32 based on Tencent Yun’s qcloud-iot-sdk-embedded-c SDK.

6.1.9 Baidu IoT

https://github.com/espressif/esp-baidu-iot is an open source repository for ESP32 based on Baidu’s iot-sdk-c SDK.

6.2 Espressif’s Frameworks

Here you will find a collection of the official Espressif libraries and frameworks.

6.2.1 Espressif Audio Development Framework

The ESP-ADF is a comprehensive framework for audio applications including:

• CODEC’s HAL
• Music Players and Recorders
• Audio Processing
• Bluetooth Speakers
• Internet Radios
• Hands-free devices
• Speech Recognition

This framework is available at GitHub: ESP-ADF.

6.2.2 ESP-CSI

ESP-CSI is an experimental implementation that uses the Wi-Fi Channel State Information to detect the presence of a human body.

See ESP-CSI project for more information about it.

6.2.3 Espressif DSP Library

The library provides algorithms optimized specifically for digital signal processing applications. This library supports:

• Matrix multiplication
• Dot product
• FFT (Fast Fourier Transform)
• IIR (Infinite Impulse Response)
• FIR (Finite Impulse Response)
• Vector math operations

This library is available here: ESP-DSP library.
6.2.4 ESP-WIFI-MESH Development Framework

This framework is based on the ESP-WIFI-MESH protocol with the following features:

- Fast network configuration
- Stable upgrade
- Efficient debugging
- LAN control
- Various application demos

ESP-MDF.

6.2.5 ESP-WHO

The ESP-WHO is a face detection and recognition framework using the ESP32 and camera. To know more about the project, see ESP-WHO on GitHub.

6.2.6 ESP RainMaker

ESP RainMaker is a complete solution for accelerated AIoT development. Using ESP RainMaker, you can create AIoT devices from the firmware to the integration with voice-assistant, phone apps and cloud backend.

ESP RainMaker on GitHub.

6.2.7 ESP-IoT-Solution

ESP-IoT-Solution contains commonly used device drivers and code frameworks when developing IoT systems. The device drivers and code frameworks within the ESP-IoT-Solution are organized as separate components, allowing them to be easily integrated into an ESP-IDF project.

ESP-IoT-Solution includes:

- Device drivers for sensors, display, audio, GUI, input, actuators, etc.
- Framework and documentation for low power, security, storage, etc.
- Guide for Espressif open source solutions from practical application point.

ESP-IoT-Solution on GitHub.

6.2.8 ESP-Protocols

ESP-Protocols repository contains collection of protocol components for ESP-IDF. The code within the ESP-Protocols is organized into separate components, allowing them to be easily integrated into an ESP-IDF project. In addition to that, each component is available in IDF Component Registry.

ESP-Protocols components:

- `esp_modem` enables connectivity with GSM/LTE modems using AT commands or PPP protocol, see the `esp_modem documentation`.
- `mdns` (mDNS) is a multicast UDP service that is used to provide local network service and host discovery, see the `mdns documentation`.
- `esp_websocket_client` is a managed component for `esp-idf` that contains implementation of [WebSocket protocol client](https://datatracker.ietf.org/doc/html/rfc6455) for ESP32, see the `esp_websocket_client documentation`.
- `asio` is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach., see the `asio documentation`. 
6.2.9 ESP-BSP

ESP-BSP repository contains Board Support Packages (BSPs) for various Espressif’s and 3rd party development boards. BSPs are useful for quick start on a supported board. Usually they contain pinout definition and helper functions, that will initialize peripherals for the specific board. Additionally, the BSP would contain drivers for external chips populated on the development board, such as sensors, displays, audio codecs etc.

6.2.10 ESP-IDF-CXX

ESP-IDF-CXX contains C++ wrappers for part of ESP-IDF. The focus is on ease of use, safety, automatic resource management and shifting checks to compile time instead of failing at run time. There are C++ classes for ESP-Timer, I2C, SPI, GPIO and other peripherals or features of ESP-IDF. ESP-IDF-CXX is available as a component from the component registry. Please check the project’s README.md for more information.
Chapter 7

Contributions Guide

We welcome contributions to the esp-idf project!

7.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

7.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it. Please check the Copyright Header Guide for additional information.
- Does any new code conform to the esp-idf Style Guide?
- Have you installed the pre-commit hook for esp-idf project?
- Does the code documentation follow requirements in Documenting Code?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the 创建示例项目 guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” squashed into previous commits?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

7.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself. Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.
Chapter 7. Contributions Guide

7.4 Legal Part

Before a contribution can be accepted, you will need to sign our Contributor Agreement. You will be prompted for this automatically as part of the Pull Request process.

7.5 Related Documents

7.5.1 Espressif IoT Development Framework Style Guide

About This Guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF. Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C Code Formatting

Naming

- Any variable or function which is only used in a single source file should be declared static.
- Public names (non-static variables and functions) should be namedpaced with a per-component or per-unit prefix, to avoid naming collisions. i.e esp_vfs_register() or esp_console_run(). Starting the prefix with esp_ for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with s_ for easy identification. For example, static bool s_invert.
- Avoid unnecessary abbreviations (i.e shortening data to dat), unless the resulting name would otherwise be very long.

Indentation

Use 4 spaces for each indentation level. Don’t use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical Space

Place one empty line between functions. Don’t begin or end a function with an empty line.
The maximum line length is 120 characters as long as it doesn’t seriously affect the readability.

**Horizontal Space** Always add single space after conditional and loop keywords:

```c
if (condition) {  // correct
  // ...
}
switch (n) {      // correct
  case 0:
    // ...
}
for (int i = 0; i < CONST; ++i) {  // INCORRECT
  // ...
}
```

Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```c
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);    // correct
const int y = y0 + (x - x0)*(y1 - y0)/(x1 - x0);      // also okay
int y_cur = -y;
  ++y_cur;
const int y = y0+(x-x0)*(y1-y0)/(x1-x0);              // INCORRECT
```

No space is necessary around . and -> operators.
Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```c
esp_rom_gpio_connect_in_signal(PIN_CAM_D6, I2S0I_DATA_IN14_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_D7, I2S0I_DATA_IN15_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX, false);
esp_rom_gpio_connect_in_signal(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. PIN_CAM_VSYNC), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.
Never add trailing whitespace at the end of the line.

**Braces**

- Function definition should have a brace on a separate line:

  ```c
  // This is correct:
  void function(int arg)
  {
  }
  ```
• Within a function, place opening brace on the same line with conditional and loop statements:

```c
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

**Comments**  Use `//` for single line comments. For multi-line comments it is okay to use either `//` on each line or a `/* */` block.

Although not directly related to formatting, here are a few notes about using comments effectively.

• Don’t use single comments to disable some functionality:

```c
void init_something()
{
    setup_dma();
    // load_resources();  // WHY is this thing commented, asks...
    --the reader?
    start_timer();
}
```

• If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```c
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated...
    --yet.
    // load_resources();
    start_timer();
}
```

• Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don’t use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.

• Don’t add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```c
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

**Line Endings**  Commits should only contain files with LF (Unix style) endings.
Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. Github has a document about setting this option <github-line-endings>.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs --dos2unix & & git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebases on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it’s possible to run `dos2unix FILENAME` and then run `git commit --amend`

**Formatting Your Code** You can use `astyle` program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don’t re-format the code you didn’t change. This will help others when they review your changes.

To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**Type Definitions** Should be snake_case, ending with _t suffix:

```c
typedef int signed_32_bit_t;
```

**Enum** Enums should be defined through the `typedef` and be namespaced:

```c
typedef enum
{
    MODULE_FOO_ONE,
    MODULE_FOO_TWO,
    MODULE_FOO_THREE
} module_foo_t;
```

**Assertions** The standard C `assert()` function, defined in `assert.h` should be used to check conditions that should be true in source code. In the default configuration, an assert condition that returns false or 0 will call `abort()` and trigger a **Fatal Error**.

`assert()` should only be used to detect unrecoverable errors due to a serious internal logic bug or corruption, where it’s not possible for the program to continue. For recoverable errors, including errors that are possible due to invalid external input, an error value should be returned.

**备注:** When asserting a value of type `esp_err_t` is equal to `ESP_OK`, use the `ESP_ERROR_CHECK` macro instead of an `assert()`.

It’s possible to configure ESP-IDF projects with assertions disabled (see `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`). Therefore, functions called in an `assert()` statement should not have side-effects.

It’s also necessary to use particular techniques to avoid “variable set but not used” warnings when assertions are disabled, due to code patterns such as:
```cpp
int res = do_something();
assert(res == 0);
```

Once the `assert` is optimized out, the `res` value is unused and the compiler will warn about this. However the function `do_something()` must still be called, even if assertions are disabled.

When the variable is declared and initialized in a single statement, a good strategy is to cast it to `void` on a new line. The compiler will not produce a warning, and the variable can still be optimized out of the final binary:

```cpp
int res = do_something();
assert(res == 0);
(void) res;
```

If the variable is declared separately, for example if it is used for multiple assertions, then it can be declared with the GCC attribute `__attribute__((unused))`. The compiler will not produce any unused variable warnings, but the variable can still be optimized out:

```cpp
int res __attribute__((unused));
res = do_something();
assert(res == 0);
res = do_something_else();
assert(res != 0);
```

### Header file guards

All public facing header files should have preprocessor guards. A pragma is preferred:

```cpp
#pragma once
```

over the following pattern:

```
ifndef FILE_NAME_H
#define FILE_NAME_H
...
#endif // FILE_NAME_H
```

In addition to guard macros, all C header files should have `extern "C"` guards to allow the header to be used from C++ code. Note that the following order should be used: `pragma once`, then any `#include` statements, then `extern "C"` guards:

```cpp
#pragma once
#include <stdint.h>
#ifndef __cplusplus
extern "Cplusplus"
extern "C" {
#endif
/* declarations go here */
#ifndef __cplusplus
}
#endif
```

### Include statements

When writing `#include` statements, try to maintain the following order:
Chapter 7. Contributions Guide

- C standard library headers.
- Other POSIX standard headers and common extensions to them (such as sys/queue.h.)
- Common IDF headers (esp_log.h, esp_system.h, esp_timer.h, esp_sleep.h, etc.)
- Headers of other components, such as FreeRTOS.
- Public headers of the current component.
- Private headers.

Use angle brackets for C standard library headers and other POSIX headers (#include <stdio.h>.

Use double quotes for all other headers (#include "esp_log.h").

C++ Code Formatting

The same rules as for C apply. Where they are not enough, apply the following rules.

File Naming  C++ Header files have the extension .hpp. C++ source files have the extension .cpp. The latter is important for the compiler to distinguish them from normal C source files.

Naming

- **Class and struct** names shall be written in CamelCase with a capital letter as beginning. Member variables and methods shall be in snake_case.
- **Namespaces** shall be in lower snake_case.
- **Templates** are specified in the line above the function declaration.
- Interfaces in terms of Object-Oriented Programming shall be named without the suffix ...Interface. Later, this makes it easier to extract interfaces from normal classes and vice versa without making a breaking change.

Member Order in Classes  In order of precedence:

- First put the public members, then the protected, then private ones. Omit public, protected or private sections without any members.
- First put constructors/destructors, then member functions, then member variables.

For example:

```cpp
class ForExample {
public:
  // first constructors, then default constructor, then destructor
  ForExample(double example_factor_arg);
  ForExample();
  ~ForExample();

  // then remaining public methods
  set_example_factor(double example_factor_arg);

  // then public member variables
  uint32_t public_data_member;

private:
  // first private methods
  void internal_method();

  // then private member variables
  double example_factor;
};
```
Spacing

- Don’t indent inside namespaces.
- Put public, protected and private labels at the same indentation level as the corresponding class label.

Simple Example

```c++
// file spaceship.h
#ifndef SPACESHIP_H_
#define SPACESHIP_H_
#include <cstdlib>
namespace spaceships {
    class SpaceShip {
    public:
        SpaceShip(size_t crew);
        size_t get_crew_size() const;
    private:
        const size_t crew;
    };
    class SpaceShuttle : public SpaceShip {
    public:
        SpaceShuttle();
    };
    class Sojuz : public SpaceShip {
    public:
        Sojuz();
    };
    template<typename T>
    class CargoShip {
    public:
        CargoShip(const T &cargo);
    private:
        T cargo;
    };
} // namespace spaceships
#endif // SPACESHIP_H_

// file spaceship.cpp
#include "spaceship.h"
namespace spaceships {
    // Putting the curly braces in the same line for constructors is OK if it only initializes
    // values in the initializer list
    SpaceShip::SpaceShip(size_t crew) : crew(crew) { }
    size_t SpaceShip::get_crew_size() const {
        return crew;
    }
} // namespace spaceships
```
CMake Code Style

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don’t put anything in the optional parentheses after endforeach(), endif(), etc.
- Use lowercase (with_underscores) for command, function, and macro names.
- For locally scoped variables, use lowercase (with_underscores).
- For globally scoped variables, use uppercase (WITH_UNDERSCORES).
- Otherwise follow the defaults of the cmake-lint project.

Configuring the Code Style for a Project Using EditorConfig

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

Third Party Component Code Styles

ESP-IDF integrates a number of third party components where these components may have differing code styles.

FreeRTOS The code style adopted by FreeRTOS is described in the FreeRTOS style guide. Formatting of FreeRTOS source code is automated using Uncrustify, thus a copy of the FreeRTOS code style’s Uncrustify configuration (uncrustify.cfg) is stored within ESP-IDF FreeRTOS component.

If a FreeRTOS source file is modified, the updated file can be formatted again by following the steps below:

1. Ensure that Uncrustify (v0.69.0) is installed on your system
2. Run the following command on the update FreeRTOS source file (where source.c is the path to the source file that requires formatting).

   uncrustify -c "$IDF_PATH/components/freertos/FreeRTOS-Kernel/uncrustify.cfg" --replace source.c --no-backup

Documenting Code

Please see the guide here: Documenting Code.
Chapter 7. Contributions Guide

Structure
To be written.

Language Features
To be written.

7.5.2 Install pre-commit Hook for ESP-IDF Project

Required Dependency
Python 3.7.* or above. This is our recommended python version for IDF developers.
If you still have python versions not compatible, update your python versions before installing the pre-commit hook.

Install pre-commit

Run `pip install pre-commit`

Install pre-commit hook

1. Go to the IDF Project Directory
2. Run `pre-commit install --allow-missing-config`. Install hook by this approach will let you commit successfully even in branches without the `.pre-commit-config.yaml`
3. pre-commit hook will run automatically when you’re running `git commit` command

Uninstall pre-commit

Run `pre-commit uninstall`

What’s More?

For detailed usage, please refer to the documentation of pre-commit.

Common Problems For Windows Users

`/usr/bin/env: python: Permission denied`. If you’re in Git Bash, please check the python executable location by run `which python`
If the executable is under `~/.AppData/Local/Microsoft/WindowsApps/`, then it’s a link to Windows AppStore, not a real one.
Please install python manually and update this in your PATH environment variable.

Your `%USERPROFILE%` contains non-ASCII characters
pre-commit may fail when initializing an environment for a particular hook when the path of pre-commit’s cache contains non-ASCII characters. The solution is to set `PRE_COMMIT_HOME` to a path containing only standard characters before running pre-commit.

- **CMD:** `set PRE_COMMIT_HOME=C:\somepath\pre-commit`
- **PowerShell:** `$Env:PRE_COMMIT_HOME = "C:\somepath\pre-commit"`
- **git bash:** `export PRE_COMMIT_HOME="/c/somepath/pre-commit"`
7.5.3 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in espresif/esp-idf repository and how to add new documentation.

Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance @param, into standard comments blocks, for example:

```c
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:
Chapter 7. Contributions Guide

Go for it!

When writing code for this repository, please follow guidelines below.

1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information about purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.

2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.

3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

4. If function has void input or does not return any value, then skip @param or @return
5. When documenting a `define` as well as members of a `struct` or `enum`, place specific comment like below after each member.

6. To provide well formatted lists, break the line after command (like `@return` in example below).

```
* @return
  * - ESP_OK if erase operation was successful
  * - ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
  * - ESP_ERR_NVS_READ_ONLY if handle was opened as read only
  * - ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
  * - other error codes from the underlying storage driver
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in a separate README.rst file of the same directory. If this directory contains header files for different APIs, then the file name should be apiname-readme.rst.

---

**Go one extra mile**

Here are a couple of tips on how you can make your documentation even better and more useful to the reader and writer.

When writing codes, please follow the guidelines below:

1. Add code snippets to illustrate implementation. To do so, enclose snippet using `@code{c}` and `@endcode` commands.

```
* @code{c}
* // Example of using nvs_get_i32:
* int32_t max_buffer_size = 4096; // default value
* esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
* assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
* // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
* // have its default value.
```
Chapter 7. Contributions Guide

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command `@attention` or `@note`.

```
@attention
1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using `/**@{*/` and `/**}@*/` markup commands:

```
/**@{*/
/**
* @brief common description of similar functions
*/
void first_similar_function (void);
void second_similar_function (void);
/**}@*/
```

For practical example see `nvs_flash/include/nvs.h`.

4. You may want to go even further and skip some code like repetitive defines or enumerations. In such case, enclose the code within `/** @cond */` and `/** @endcond */` commands. Example of such implementation is provided in `driver/include/driver/gpio.h`.

5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

```
```

6. Prepare one or more complete code examples together with description. Place description to a separate file `README.md` in specific folder of `examples` directory.

**Standardize Document Format**

When it comes to text, please follow guidelines below to provide well formatted Markdown (.md) or reST (.rst) documents.

1. Please ensure that one paragraph is written in one line. Don’t break lines like below. Breaking lines to enhance readability is only suitable for writing codes. To make the text easier to read, it is recommended to place an empty line to separate the paragraph.

2. Please make the line number of CN and EN documents consistent like below. The benefit of this approach is that it can save time for both writers and translators. When non-bilingual writers need to update text, they only need to update the same line in the corresponding CN or EN document. For translators, if documents are updated in English, then translators can quickly locate where to update in the corresponding CN document later. Besides, by comparing the total number of lines in EN and CN documents, you can quickly find out whether the CN version lags behind the EN version.
Recommend: one line for one paragraph like below

To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI2 is allowed using ISR (it's meaningless for the task to yield to other tasks when the cache is disabled).

Don't need to break lines here

To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI2 is allowed using ISR (it's meaningless for the task to yield to other tasks when the cache is disabled).

Keep the line number for EN and CN documents consistent
Building Documentation

The documentation is built with the esp-docs Python package, which is a wrapper around Sphinx.

To install it simply do:

```
pip install esp-docs
```

After a successful install then the documentation can be built from the docs folder with:

```
built-docs build
```

or for specific target and language with:

```
built-docs -t esp32 -l en build
```

For more in-depth documentation about esp-docs features please see the documentation at esp-docs.

Wrap up

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

- API Documentation Template

7.5.4 创建示例项目

每个 ESP-IDF 的示例都是一个完整的项目，其他人可以将示例复制至本地，并根据实际情况进行一定修改。请注意，示例项目主要是为了展示 ESP-IDF 的功能。

示例项目结构

- main 目录需要包含一个名为 (something)_example_main.c 的源文件，里面包含示例项目的主功能。
- 如果该示例项目的子任务比较多，请根据逻辑将其拆分为 main 目录下的多个 C 或者 C++ 源文件，并将对应的头文件也放在同一目录下。
- 如果该示例项目具有多种功能，可以考虑在项目中增加一个 components 子目录，通过库功能，将示例项目的不同功能划分为不同的组件。注意，如果该组件提供的功能相对完整，且具有一定的通用性，则应该将它们添加到 ESP-IDF 的 components 目录中，使其成为 ESP-IDF 的一部分。
- 示例项目需要包含一个 README.md 文件，建议使用示例项目 README 模板，并根据项目实际情况进行修改。
- 示例项目需要包含一个 example_test.py 文件，用于进行自动化测试。如果在 GitHub 上初次提交 Pull Request 时，可以先不包含这个脚本文件。具体细节，请见有关 Pull Request 的相关内容。

一般准则

示例代码需要遵循《乐鑫物联网开发框架风格指南》。
检查清单

提交一个新的示例项目之前，需要检查以下内容：

- 示例项目的名字（包括 README.md 中）应使用 example，而不要写“demo”、“test”等词汇。
- 每个示例项目只能有一个主要功能。如果某个示例项目有多个主要功能，请将其拆分为两个或更多示例项目。
- 每个示例项目应包含一个 README.md 文件。建议使用 示例项目 README 模板。
- 示例项目中的函数和变量的命名要遵循命名规范中的要求。对于仅在示例项目源文件中使用的非静态变量/函数，请使用 example 或其他类似的前缀。
- 示例项目中的所有代码结构良好，关键代码要有详细注释。
- 示例项目中所有不必要的代码（旧的调试日志，注释掉的代码等）都必须清除掉。
- 示例项目中使用的选项（比如网络名称，地址等）不得直接硬编码，应尽可能地使用配置项，或者定义为宏或变量。
- 配置项可见 KConfig.projbuild 文件，该文件中包含一个名为“Example Configuration”的菜单。
- 具体情况，请查看现有示例项目。
- 所有的源代码都需要在文件开头指定许可信息（表示该代码是 in the public domain CC0）和免责声明。或者，源代码也可以应用 Apache License 2.0 许可条款。请查看现有示例项目中的许可信息和免责声明，并根据实际情况进行修改。
- 任何第三方代码（无论是直接使用，还是进行了一些改进）均应保留原始代码中的许可信息，且这些代码的许可必须兼容 Apache License 2.0 协议。

7.5.5 API Documentation Template

备注：INSTRUCTIONS

1. Use this file (docs/en/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using ..include::
   - README.rst
   - example.rst
   - ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

备注：INSTRUCTIONS

1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.
3. To distinguish between sections, use the following heading levels:
   - # with overline, for parts
   - * with overline, for chapters
   - =, for sections
   - -, for subsections
   - ^, for subsubsections
   - "", for paragraphs

Application Example

备注：INSTRUCTIONS
1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
3. Place example in this folder complete with `README.md` file.
4. Provide overview of demonstrated functionality in `README.md`.
5. With good overview reader should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.

**API Reference**

**INSTRUCTIONS**

1. This repository provides for automatic update of API reference documentation using code markup retrieved by Doxygen from header files.
2. Update is done on each documentation build by invoking Sphinx extension `esp_extensions/run_doxygen.py` for all header files listed in the `INPUT` statement of `docs/doxygen/Doxyfile`.
3. Each line of the `INPUT` statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```
## Wi-Fi - API Reference
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

4. When the headers are expanded, any macros defined by default in `sdkconfig.h` as well as any macros defined in SOC-specific `include/soc/*.caps.h` headers will be expanded. This allows the headers to include/exclude material based on the `IDF_TARGET` value.
5. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
6. To show contents of `*.inc` file in documentation, include it as follows:

```
.. include-build-file:: inc/esp_wifi.inc
```

For example see `docs/en/api-reference/network/esp_wifi.rst`

Below is the list of common .. doxygen...:: directives:

- Functions ... doxygenfunction:: name_of_function
- Unions ... doxygenuinion:: name_of_union
- Structures ... doxygenstruct:: name_of_structure together with :members:
- Macros ... doxygendefine:: name_of_define
- Type Definitions ... doxygentypedef:: name_of_type
- Enumerations ... doxygenenum:: name_of Enumeration

See Breathe documentation for additional information.

To provide a link to header file, use the `link custom role` directive as follows:

```
*:component_file:`path_to/header_file.h`
```

8. In any case, to generate API reference, the file `docs/doxygen/Doxyfile` should be updated with paths to `*.h` headers that are being documented.
9. When changes are committed and documentation is build, check how this section has been rendered. Correct annotations in respective header files, if required.
7.5.6 Contributor Agreement

**Individual Contributor Non-Exclusive License Agreement including the Traditional Patent License OPTION**

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ("We" or "Us").

The purpose of this contributor agreement ("Agreement") is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions in the Contributions Guide.

1. **DEFINITIONS**

   "You" means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

   "Contribution" means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at marius.vikhammer@espressif.com.

   "Copyright" means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

   "Material" means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

   "Submit" means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as "Not a Contribution."

   "Submission Date" means the date You Submit a Contribution to Us.

   "Documentation" means any non-software portion of a Contribution.

2. **LICENSE GRANT**

   2.1 Copyright License to Us

   Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

   • to publish the Contribution,
   • to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
   • to reproduce the Contribution in original or modified form,
   • to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.

3. **PATENTS**

   3.1 Patent License

   Subject to the terms and conditions of this Agreement You hereby grant to Us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable license (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License
You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER  THE CONTRIBUTION IS PROVIDED “AS IS”. MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver  TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver  IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term  7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous  8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

You

Espressif Systems  2506 Release v5.1-dev-2066-g7869f4e151
Submit Document Feedback
7.5.7 Copyright Header Guide

ESP-IDF is released under the Apache License 2.0 with some additional third-party copyrighted code released under various licenses. For further information please refer to the list of copyrights and licenses.

This page explains how the source code should be properly marked with a copyright header. ESP-IDF uses The Software Package Data Exchange (SPDX) format which is short and can be easily read by humans or processed by automated tools for copyright checks.

How to Check the Copyright Headers

Please make sure you have installed the pre-commit hooks which contain a copyright header checker as well. The checker can suggest a header if it is not able to detect a properly formatted SPDX header.

What if the Checker’s Suggestion is Incorrect?

No automated checker (no matter how good is) can replace humans. So the developer’s responsibility is to modify the offered header to be in line with the law and the license restrictions of the original code on which the work is based on. Certain licenses are not compatible between each other. Such corner cases will be covered by the following examples.

The checker can be configured with the tools/ci/check_copyright_config.yaml configuration file. Please check the options it offers and consider updating it in order to match the headers correctly.

Common Examples of Copyright Headers

The simplest case is when the code is not based on any licensed previous work, e.g. it was written completely from scratch. Such code can be decorated with the following copyright header and put under the license of ESP-IDF:

```c
/*
 * SPDX-License-Identifier: Apache-2.0
 */
```

Less restrictive parts of ESP-IDF Some parts of ESP-IDF are deliberately under less restrictive licenses in order to ease their re-use in commercial closed source projects. This is the case for ESP-IDF examples which are in Public domain or under the Creative Commons Zero Universal (CC0) license. The following header can be used in such source files:

```c
/*
 * SPDX-License-Identifier: Unlicense OR CC0-1.0
 */
```
The option allowing multiple licenses joined with the `OR` keyword from the above example can be achieved with the definition of multiple allowed licenses in the `tools/ci/check_copyright_config.yaml` configuration file. Please use this option with care and only selectively for a limited part of ESP-IDF.

**Third party licenses** Code licensed under different licenses, modified by Espressif Systems and included in ESP-IDF cannot be licensed under Apache License 2.0 even if the checker suggests it. It is advised to keep the original copyright header and add an SPDX before it.

The following example is a suitable header for a code licensed under the “GNU General Public License v2.0 or later” held by John Doe with some additional modifications done by Espressif Systems:

```plaintext
/*
 * SPDX-FileCopyrightText: 1991 John Doe
 * SPDX-License-Identifier: GPL-2.0-or-later
 * SPDX-FileContributor: 2019-2022 Espressif Systems (Shanghai) CO LTD
 */
```

The licenses can be identified and the short SPDX identifiers can be found in the official SPDX license list. Other very common licenses are the GPL-2.0-only, the BSD-3-Clause, and the BSD-2-Clause.

The configuration stored in `tools/ci/check_copyright_config.yaml` offers features useful for third party licenses:

- A different license can be defined for the files part of a third party library.
- The check for a selected set of files can be permanently disabled. Please use this option with care and only in cases when none of the other options are suitable.

### 7.5.8 ESP-IDF Tests with Pytest Guide

This documentation is a guide that introduces the following aspects:

1. The basic idea of different test types in ESP-IDF
2. How to apply the pytest framework to the test python scripts to make sure the apps are working as expected.
3. ESP-IDF CI target test process
4. Run ESP-IDF tests with pytest locally
5. Tips and tricks on pytest

**Disclaimer**

In ESP-IDF, we use the following plugins by default:

- `pytest-embedded` with default services `esp, idf`
- `pytest-rerunfailures`

All the introduced concepts and usages are based on the default behavior in ESP-IDF. Not all of them are available in vanilla pytest.

**Installation**

All dependencies could be installed by running the install script with the `--enable-pytest` argument, e.g. `$ install.sh --enable-pytest`.

**Common Issues During Installation**
No Package ‘dbus-1’ found  If you’re facing an error message like:

```
configure: error: Package requirements (dbus-1 >= 1.8) were not met:
No package 'dbus-1' found
```

Consider adjusting the PKG_CONFIG_PATH environment variable if you installed software in a non-standard prefix.

If you’re running a ubuntu system, you may need to run:

```
sudo apt-get install libdbus-glib-1-dev
```

or

```
sudo apt-get install libdbus-1-dev
```

For other linux distros, you may Google the error message and find the solution. This issue could be solved by installing the related header files.

Invalid command ‘bdist_wheel’  If you’re facing an error message like:

```
error: invalid command 'bdist_wheel'
```

You may need to run:

```
python -m pip install -U pip
```

Or

```
python -m pip install wheel
```

Before running the pip commands, please make sure you’re using the IDF python virtual environment.

Basic Concepts

Component-based Unit Tests  Component-based unit tests are our recommended way to test your component. All the test apps should be located under `${IDF_PATH}/components/<COMPONENT_NAME>/test_apps`.

For example:

```
components/
  └── my_component/
      └── include/
      └── test_apps/
          ├── test_app_1
              └── main/
                  └── pytest_my_component_app_1.py
          ├── test_app_2
              └── pytest_my_component_app_2.py
          └── parent_folder
                  └── test_app_3
                      └── pytest_my_component_app_3.py
          └── ...  
      └── my_component.c
          └── CMakeLists.txt
```
Chapter 7. Contributions Guide

Example Tests  Example Tests are tests for examples that are intended to demonstrate parts of the ESP-IDF functionality to our customers.

All the test apps should be located under `${IDF_PATH}/examples`. For more information please refer to the Examples Readme.

For example:

```
examples/
└── parent_folder/
    └── example_1/
        └── main/
            ├── ...
            └── CMakeLists.txt
            └── pytest_example_1.py
```

Custom Tests  Custom Tests are tests that aim to run some arbitrary test internally. They are not intended to demonstrate the ESP-IDF functionality to our customers in any way.

All the test apps should be located under `${IDF_PATH}/tools/test_apps`. For more information please refer to the Custom Test Readme.

Pytest in ESP-IDF

Pytest Execution Process

1. Bootstrapping Phase
   Create session-scoped caches:
   - port-target cache
   - port-app cache

2. Collection Phase
   1. Get all the python files with the prefix `pytest_`
   2. Get all the test functions with the prefix `test_`
   3. Apply the `params`, and duplicate the test functions.
   4. Filter the test cases with CLI options. Introduced detailed usages here

3. Test Running Phase
   1. Construct the fixtures. In ESP-IDF, the common fixtures are initialized in this order:
      1. `pexpect_proc`: pexpect instance
      2. `app`: `IdfApp` instance
         The information of the app, like sdkconfig, flash_files, partition_table, etc., would be parsed at this phase.
      3. `serial`: `IdfSerial` instance
         The port of the host which connected to the target type parsed from the app would be auto-detected.
         The flash files would be auto flashed.
      4. `dut`: `IdfDut` instance
   2. Run the real test function
   3. Deconstruct the fixtures in this order:
      1. `dut`
         1. close the `serial` port
      2. (Only for apps with `unity test framework`) generate junit report of the unity test cases
      3. `serial`
      4. `app`
      4. `pexpect_proc`: Close the file descriptor
   4. (Only for apps with `unity test framework`) Raise `AssertionError` when detected unity test failed if you call `dut.expect_from_unity_output()` in the test function.

4. Reporting Phase
   1. Generate junit report of the test functions
2. Modify the junit report test case name into ESP-IDF test case ID format: `<target>.<config>.<test function name>`.

5. Finalizing Phase (Only for apps with unity test framework)
Combine the junit reports if the junit reports of the unity test cases are generated.

Example Code  This code example is taken from `pytest_console_basic.py`.

```python
@ pytest.mark.esp32
@ pytest.mark.esp32c3
@ pytest.mark.generic
@ pytest.mark.parametrize('config', ['history', 'nohistory'], indirect=True)
def test_console_advanced(config: str, dut: Dut) -> None:
    if config == 'history':
        dut.expect('Command history enabled')
    elif config == 'nohistory':
        dut.expect('Command history disabled')
```

**Note:** Using `expect_exact` is better here. For further reading about the different types of `expect` functions, please refer to the `pytest-embedded Expecting documentation`.

Use Markers to Specify the Supported Targets  You can use markers to specify the supported targets and the test env in CI. You can run `pytest --markers` to get more details about different markers.

```python
@ pytest.mark.esp32  # <-- support esp32
@ pytest.mark.esp32c3  # <-- support esp32c3
@ pytest.mark.generic  # <-- test env 'generic, would assign to runner with tag...
```

Besides, if the test case supports all officially ESP-IDF-supported targets, like esp32, esp32s2, esp32s3, esp32c3 for now (2022.2), you can use a special marker `supported_targets` to apply them all in one line.

This code example is taken from `pytest_gptimer_example.py`.

```python
@ pytest.mark.supported_targets
@ pytest.mark.generic
def test_gptimer_example(dut: Dut) -> None:
    ...
```

Use Params to Specify the sdkconfig Files  You can use `pytest.mark.parametrize` with “config” to apply the same test to different apps with different sdkconfig files. For more information about `sdkconfig.ci.xxx` files, please refer to the Configuration Files section under this readme.

```python
@ pytest.mark.parametrize('config', ['history', 'nohistory'], indirect=True)  # <-- 'indirect=True' is required
```

Overall, this test function would be replicated to 4 test cases:
- esp32.history.test_console_advanced
- esp32.nohistory.test_console_advanced
- esp32c3.history.test_console_advanced
- esp32c3.nohistory.test_console_advanced
**Advanced Examples**

**Multi Dut Tests with the Same App**

```python
@pytest.mark.esp32s2
@ pytest.mark.esp32s3
@ pytest.mark.usb_host
@ pytest.mark.parametrize('count', [2], indirect=True)
def test_usb_host(dut: Tuple[IdfDut, IdfDut]) -> None:
    device = dut[0]  # <-- assume the first dut is the device
    host = dut[1]    # <-- and the second dut is the host
    ...
```

After setting the param `count` to 2, all these fixtures are changed into tuples.

**Multi Dut Tests with Different Apps**  
This code example is taken from `pytest_wifi_getting_started.py`.

```python
@ pytest.mark.esp32
@ pytest.mark.multi_dut_generic
@ pytest.mark.parametrize(
    'count, app_path', [
        (2,  
        f'os.path.join(os.path.dirname(__file__), "softAP") || os.path.join(os.          path.dirname(__file__), "station"))',
    ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```

Here the first dut was flashed with the app `softap`, and the second dut was flashed with the app `station`.

**Multi Dut Tests with Different Apps, and Targets**  
This code example is taken from `pytest_wifi_getting_started.py`. As the comment says, for now it’s not running in the ESP-IDF CI.

```python
@ pytest.mark.parametrize(
    'count, app_path, target', [
        (2,  
        f'os.path.join(os.path.dirname(__file__), "softAP") || os.path.join(os.          path.dirname(__file__), "station"))',
        [esp32|esp32s2],
        (2,  
        f'os.path.join(os.path.dirname(__file__), "softAP") || os.path.join(os.          pathdirname(__file__), "station"))',
        [esp32s2|esp32],
    ], indirect=True
)
def test_wifi_getting_started(dut: Tuple[IdfDut, IdfDut]) -> None:
    softap = dut[0]
    station = dut[1]
    ...
```
Overall, this test function would be replicated to 2 test cases:

- softap with esp32 target, and station with esp32s2 target
- softap with esp32s2 target, and station with esp32 target

Support different targets with different sdkconfig files

This code example is taken from `pytest_panic.py` as an advanced example.

```python
CONFIGS = [
    pytest.param('coredump_flash_bin_crc', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('coredump_flash_elf_sha', marks=[pytest.mark.esp32]),  # sha256 only supported on esp32
    pytest.param('coredump_uart_bin_crc', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('coredump_uart_elf_crc', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('gdbstub', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
    pytest.param('panic', marks=[pytest.mark.esp32, pytest.mark.esp32s2]),
]
@pytest.mark.parametrize('config', CONFIGS, indirect=True)
...
```

Use Custom Class

Usually, you can write a custom class in these conditions:

1. Add more reusable functions for a certain number of DUTs
2. Add custom setup and teardown functions in different phases described here

This code example is taken from `panic/conftest.py`

```python
class PanicTestDut(IdfDut):
    ...

@ pytest.fixture(scope='module')
def monkeypatch_module(request: FixtureRequest) -> MonkeyPatch:
    mp = MonkeyPatch()
    request.addfinalizer(mp.undo)
    return mp

@ pytest.fixture(scope='module', autouse=True)
def replace_dut_class(monkeypatch_module: MonkeyPatch) -> None:
    monkeypatch_modulesetattr('pytest_embedded_idf.dut.IdfDut', PanicTestDut)
```

monkeypatch_module provide a module-scoped monkeypatch fixture.
replace_dut_class is a module-scoped autouse fixture. This function replaces the IdfDut class with your custom class.

Mark Flaky Tests

Sometimes, our test is based on ethernet or wifi. The network may cause the test flaky. We could mark the single test case within the code repo.

This code example is taken from `pytest_esp_eth.py`

```python
@ pytest.mark.flaky(reruns=3, reruns_delay=5)
def test_esp_eth_ip101(dut: Dut) -> None:
    ...
```

This flaky marker means that if the test function failed, the test case would rerun for a maximum of 3 times with 5 seconds delay.
Mark Known Failure Cases  Sometimes a test couldn’t pass for the following reasons:

- Has a bug
- The success ratio is too low because of environment issue, such as network issue. Retry couldn’t help

Now you may mark this test case with marker xfail with a user-friendly readable reason.

This code example is taken from pytest_panic.py

```python
@ pytest.mark.xfail('config.getvalue("target") == "esp32s2"', reason='raised_→IllegalInstruction instead')
def test_cache_error(dut: PanicTestDut, config: str, test_func_name: str) -> None:

# This marker means that if the test would be a known failure one on esp32s2.
```

Mark Nightly Run Test Cases  Some tests cases are only triggered in nightly run pipelines due to a lack of runners.

```python
@ pytest.mark.nightly_run
```

This marker means that the test case would only be run with env var NIGHTLY_RUN or INCLUDE_NIGHTLY_RUN.

Run the Tests in CI

The workflow in CI is simple, build jobs -> target test jobs.

Build Jobs

Build Job Names

- Component-based Unit Tests: build_pytest_components_<target>
- Example Tests: build_pytest_examples_<target>
- Custom Tests: build_pytest_test_apps_<target>

Build Job Command  The command used by CI to build all the relevant tests is:

```
python $IDF_PATH/tools/ci/ci_build_apps.py <parent_dir> --target <target> -vv --pytest-apps
```

All apps which supported the specified target would be built with all supported sdkconfig files under build_<target>_<config>.

For example, If you run

```
python $IDF_PATH/tools/ci/ci_build_apps.py $IDF_PATH/examples/system/console/basic --target esp32 --pytest-apps
```

the folder structure would be like this:

```
basic
├── build_esp32_history/
│   ├── ...
├── build_esp32_nohistory/
│   └── ...
├── main/
│   └── CMakeLists.txt
├── pytest_console_basic.py
└── ...
```

All the binaries folders would be uploaded as artifacts under the same directories.

Target Test Jobs
Target Test Job Names

- Component-based Unit Tests: component_ut_pytest_<target>_<test_env>
- Example Tests: example_test_pytest_<target>_<test_env>
- Custom Tests: test_app_test_pytest_<target>_<test_env>

Target Test Job Command

The command used by CI to run all the relevant tests is: `pytest <parent_dir> --target <target> -m <test_env_marker>`

All test cases with the specified target marker and the test env marker under the parent folder would be executed. The binaries in the target test jobs are downloaded from build jobs, the artifacts would be placed under the same directories.

Run the Tests Locally

The local executing process is the same as the CI process.

For example, if you want to run all the esp32 tests under the `$IDF_PATH/examples/system/console/basic` folder, you may:

```
$ pip install pytest-embedded-serial-esp pytest-embedded-idf
$ cd $IDF_PATH
$ . ./export.sh
$ cd examples/system/console/basic
$ python $IDF_PATH/tools/ci/ci_build_apps.py . --target esp32 -vv --pytest-apps
$ pytest --target esp32
```

Tips and Tricks

Filter the Test Cases

- filter by target with `pytest --target <target>`
  pytest would run all the test cases that support specified target.
- filter by sdkconfig file with `pytest --sdkconfig <sdkconfig>`
  if `<sdkconfig>` is default, pytest would run all the test cases with the sdkconfig file `sdkconfig`. defaults.
  In other cases, pytest would run all the test cases with `sdkconfig file` `sdkconfig.ci.<sdkconfig>`.

Add New Markers

We’re using two types of custom markers, target markers which indicate that the test cases should support this target, and env markers which indicate that the test case should be assigned to runners with these tags in CI.

You can add new markers by adding one line under the `${IDF_PATH}/pytest.ini markers =` section. The grammar should be: `<marker_name>: <marker_description>`

Generate JUnit Report

You can call pytest with `--junitxml <filepath>` to generate the JUnit report. In ESP-IDF, the test case name would be unified as “<target>.<config>.<function_name>”.

Skip Auto Flash Binary

Skipping auto-flash binary every time would be useful when you’re debugging your test script.

You can call pytest with `--skip-autoflash y` to achieve it.
**Record Statistics**  Sometimes you may need to record some statistics while running the tests, like the performance test statistics.

You can use `record_xml_attribute` fixture in your test script, and the statistics would be recorded as attributes in the JUnit report.

**Logging System**  Sometimes you may need to add some extra logging lines while running the test cases.

You can use `python logging module` to achieve this.

**Known Limitations and Workarounds**

**Avoid Using Thread for Performance Test**  `pytest-embedded` is using some threads internally to help gather all stdout to the pexpect process. Due to the limitation of Global Interpreter Lock, if you’re using threads to do performance tests, these threads would block each other and there would be great performance loss.

**workaround**

Use `Process` instead, the APIs should be almost the same as Thread.

**Further Readings**

- pytest documentation: https://docs.pytest.org/en/latest/contents.html
- pytest-embedded documentation: https://docs.espressif.com/projects/pytest-embedded/en/latest/
Chapter 8

ESP-IDF 版本简介

ESP-IDF 的 GitHub 仓库时常更新，特别是用于开发新特性的 master 分支。如有量产需求，请使用稳定版本。

8.1 发布版本

您可以通过以下链接访问各个版本的配套文档:

ESP-IDF 在 GitHub 平台上的完整发布历史请见 发布说明页面。您可以在该页面查看各个版本的发布说明、配套文档及相应获取方式。

8.2 我该选择哪个版本？

- 如有量产需求，请使用 最新稳定版本。稳定版本已通过人工测试，后续更新仅修复 bug。主要特性不受影响（更多详情，请见版本管理）。请访问 发布说明页面 界面查看每一个稳定发布版本。
- 如需尝试/测试 ESP-IDF 的最新特性，请使用 最新版本 (在 master 分支上)。最新版本包含 ESP-IDF 的所有新特性，已通过自动化测试，但尚未全部完成人工测试 (因此存在一定风险)。
- 如需使用稳定版本中没有的新特性，但同时又不希望受到 master 分支更新的影响，您可以将一个最适合您的稳定版本更新至一个预发布版本 或更新至一个发布分支。
- 如需使用其他基于 ESP-IDF 的项目，请先查看该项目的文档，以确定其兼容的 ESP-IDF 版本。

有关如何更新 ESP-IDF 本地副本的内容，请参考 更新 ESP-IDF 章节。

8.3 版本管理

ESP-IDF 采用了 语义版本管理方法，即您可以从字面含义理解每个版本的差异。其中

- 主要版本 (例 v3.0) 代表有重大更新，包括增加新特性、改变现有特性及移除已弃用的特性。升级至一个新的主要版本 (例 v2.1 升级至 v3.0) 意味着您可能需要更新工程代码，并重新测试工程，具体可参考 发布说明页面 的重大变更 (Breaking Change) 部分。
- 次要版本 (例 v3.1) 代表有新增特性和 bug 修复，但现有特性不受影响，公开 API 的使用也不受影响。
  升级至一个新的次要版本 (例 v3.0 升级至 v3.1) 意味着您可能不需要更新您的工程代码，但需重新测试您的工程，特别是 发布说明页面 中专门提到的部分。
- Bugfix 版本 (例 v3.0.1) 仅修复 bug，并不增加任何新特性。

2517
8.4 支持期限

ESP-IDF 的每个主要版本和次要版本都有相应的支持期限。支持期限满后，版本停止更新维护，将不再提供支持。

支持期限政策 对此有具体描述，并介绍了每个版本的支持期限是如何界定的。

发布说明页面 界面上的每一个发布版本都提供了该版本的支持期限信息。

一般而言：

- 如您刚开始一个新项目，建议使用最新稳定版本。
- 如您有 GitHub 账号，请点击 发布说明页面 界面右上角的“Watch”按键，并选中“Releases only”选项。GitHub 将会在新版本发布的时候通知您。当您所使用的版本有 Bugfix 版本发布时，请做好升级至该 Bugfix 版本的规划。
- 如可能，请定期（如每年一次）将项目的 IDF 版本升级至一个新的主要版本或次要版本。对于次要版本更新，更新过程应该比较简单，但对于主要版本更新，可能需要细致查看发布说明并做对应的更新规划。
- 请确保您所使用的版本停止更新维护前，已做好升级至新版本的规划。

ESP-IDF 的每个主要版本和次要版本（V4.1、V4.2 等）的支持期限为 30 个月，从最初的稳定版发布日算起。

在支持期限内意味着 ESP-IDF 团队将继续在 GitHub 的分支上进行 bug 修复，安全修复等，并根据需要定期发布新的 Bugfix 版本。

支持期限分为“服务期”和“维护期”：

<table>
<thead>
<tr>
<th>周期</th>
<th>时长</th>
<th>是否推荐新工程使用</th>
</tr>
</thead>
<tbody>
<tr>
<td>服务期</td>
<td>12 个月</td>
<td>是</td>
</tr>
<tr>
<td>维护期</td>
<td>18 个月</td>
<td>否</td>
</tr>
</tbody>
</table>

在服务期内，Bugfix 版本的发布更为频繁。某些情况下，在服务期内会增加新特性，这些特性主要是为了满足新产品特定监管要求或标准，并且回归风险非常低。

在维护期内，该版本仍受支持，但只会对严重性较高的问题或安全问题进行 bug 修复。

当开始一个新项目时，建议使用在服务期内的版本。

鼓励用户在您所用的版本支持期限结束之前，将所有的工程升级到最新的 ESP-IDF 版本。在版本支持期限满后，我们将不再继续进行 bug 修复。

支持期限包括预发布版本（betas，预览版，-rc 和 -dev 版等），有时会将某个特性在发布版中标记为“预览版”，这意味着该特性不在支持期限内。

关于 不同版本的 ESP-IDF （主要版本、次要版本、Bugfix 版本等）的更多信息，请参考 ESP-IDF 编程指南。
8.5 查看当前版本

查看 ESP-IDF 本地副本的版本，请使用 idf.py 命令:

```
idf.py --version
```

此外，由于 ESP-IDF 的版本也已编译至固件中，因此您也可以使用宏 IDF_VER 查看 ESP-IDF 的版本 (以字符串的格式)。ESP-IDF 默认引导程序会在设备启动时打印 ESP-IDF 的版本，请注意，在 GitHub 仓库中的代码更新时，代码中的版本信息仅会在源代码重新编译或在清除编译时才会更新，因此打印出来的版本可能并不是最新的。

如果编写的代码需要支持多个 ESP-IDF 版本，可以在编译时使用 compile-time macros 检查版本。

几个 ESP-IDF 版本的例子:

<table>
<thead>
<tr>
<th>版本字符串</th>
<th>含义</th>
</tr>
</thead>
<tbody>
<tr>
<td>v3.2-dev-306-gbeb3611ca</td>
<td>master 分支上的预发布版本。</td>
</tr>
<tr>
<td></td>
<td>- v3.2-dev: 为 v3.2 进行的开发。</td>
</tr>
<tr>
<td></td>
<td>- 306: v3.2 开发启动后的 commit 数量。</td>
</tr>
<tr>
<td></td>
<td>- geb3611ca: commit 标识符。</td>
</tr>
<tr>
<td>v3.0.2</td>
<td>稳定版本，标签为 v3.0.2。</td>
</tr>
<tr>
<td>v3.1-beta1-75-g346d6b0ea</td>
<td>v3.1 的 beta 测试版本 (可参考更新至一个发布分支)。</td>
</tr>
<tr>
<td></td>
<td>- v3.1-beta1: 预发布标签。</td>
</tr>
<tr>
<td></td>
<td>- 75: 添加预发布 beta 标签后的 commit 数量。</td>
</tr>
<tr>
<td></td>
<td>- g346d6b0ea: commit 标识符。</td>
</tr>
<tr>
<td>v3.0.1-dirty</td>
<td>稳定版本，标签为 v3.0.1。</td>
</tr>
<tr>
<td></td>
<td>- dirty 代表 ESP-IDF 的本地副本有修改。</td>
</tr>
</tbody>
</table>
8.6 Git 工作流

乐鑫 ESP-IDF 团队的 (Git) 开发工作流程如下:

- 新的改动总是在 master 分支（最新版本）进行。master 分支上的 ESP-IDF 版本总带有 -dev 标签，表示“正在开发中”。例如 v3.1-dev。
- 这些改动将首先在乐鑫的内部 Git 仓库进行代码审阅与测试，而后在自动化测试完成后推至 GitHub。
- 新版本一旦完成特性开发（在 master 分支上进行）并达到进入 Beta 测试的标准，则将该版本切换至一个新分支（例如 release/v3.1）。此外，该分支还打上预发布标签（例如 v3.1-beta1）。您可以在 GitHub 平台上查看 ESP-IDF 的完整分支列表和标签列表。Beta 预发布版本可能仍存在大量“已知问题”（Known Issue）。
- 随着对 Beta 版本的不断测试，bug 修复将同时增加至该发布分支和 master 分支。而且，master 分支可能也已经开始为下个版本开发新特性了。
- 当测试结束时，该发布分支上将增加一个 `rc` 标签，代表候选发布（Release Candidate），如 `v3.1-rc1`。此时，该分支仍属于预发布版本。
- 如果一直未发现或报告重大 bug，则该预发布版本将最终增加“主要版本”（例 v4.0）或“次要版本”标记（例 v3.1），成为正式发布版本，并体现在发布说明页面。
- 后续，发布版本中发现的 bug 都将在该发布分支上进行修复。
- 发布分支上会定期进行 bug 修复，人工测试完成后，该分支将增加一个 Bugfix 版本标签（例如 v3.1.1），并体现在发布说明页面。

8.7 更新 ESP-IDF

请根据您的实际情况，对 ESP-IDF 进行更新。

- 如有量产用途，建议参考更新至一个稳定发布版本。
- 如需测试/研发/尝试最新特性，建议参考更新至 master 分支。
- 两者折衷建议参考更新至一个发布分支。

备注：在参考本指南时，请首先获得 ESP-IDF 的本地副本，具体步骤请参考入门指南中的介绍。

8.7.1 更新至一个稳定发布版本

对于量产用户，推荐更新至一个新的 ESP-IDF 发布版本，请参考以下步骤：

- 请定期查看 发布说明页面，了解最新发布情况。
- 如有新发布的 Bugfix 版本（如 v3.0.1 或 v3.0.2）时，请将新的 Bugfix 版本更新至您的 ESP-IDF 目录。
- 在 Linux 或 macOS 系统中，请运行如下命令将分支更新至 vX.Y.Z:

```
cd $IDF_PATH
git fetch

git checkout vX.Y.Z

git submodule update --init --recursive
```

- 在 Windows 系统中，需要将 cd $IDF_PATH 替换为 cd %IDF_PATH%。
- 在主要版本或次要版本新发布时，请查看发布说明中的具体描述，并决定是否升级您的版本。具体命令与上述描述一致。

备注：如果您之前在安装 ESP-IDF 时使用了 zip 文件包，而非通过 Git 命令，则您将无法使用 Git 命令进行版本升级，此属正常情况。这种情况下，请重新下载最新 zip 文件包，并替换掉之前 IDF_PATH 下的全部内容。
8.7.2 更新至一个预发布版本

您可以将您的本地副本切换（命令git checkout）至一个预发布版本或rc版本，具体方法请参考更新至一个稳定发布版本中的描述。

预发布版本通常不体现在发布说明页面。更多详情，请查看完整标签列表。使用预发布版本的注意事项，请参考更新至一个发布分支中的描述。

8.7.3 更新至master分支

备注：ESP-IDF中master分支上的代码会时时更新，因此使用master分支相当在“流血的边缘试探”，存在一定风险。

如需使用ESP-IDF的master分支，请参考以下步骤：

- 在Linux或macOS系统中，使用如下命令在本地切换至master分支：

```bash
cd $IDF_PATH
git checkout master
git pull
git submodule update --init --recursive
```

- 在Windows系统中，需要将cd $IDF_PATH替换为cd %IDF_PATH%。

此外，您还需要在后续工作中不时使用git pull命令，将远端master上的更新同步到本地。注意，在更新master分支后，您可能需要更改工程代码，也可能遇到新的bug。
- 如需从master分支切换至一个发布分支或稳定版本，请使用git checkout命令。

重要：强烈建议您定期使用git pull和git submodule update --init --recursive命令，确保本地副本得到及时更新。旧的master分支相当于一个“快照”，可能存在未记录的问题，且无法获得支持。对于半稳定版本，请参考更新至一个发布分支。

8.7.4 更新至一个发布分支

从稳定性来说，使用“发布分支”相当于在使用master分支和稳定版本之间进行折衷，包含一些master分支上的新特性，但也同时保证可通过beta测试且基本完成了bug修复。

更多详情，请前往GitHub查看完整标签列表。

例如，在Linux或macOS系统中，您可以运行以下命令更新至ESP-IDF v3.1，随时关注该分支上的Bugfix版本发布（如v3.1.1等）：

```bash
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

在Windows系统中，需要将cd $IDF_PATH替换为cd %IDF_PATH%。

您每次在该分支上使用git pull时都相当于把最新的Bugfix版本发布更新至您的本地副本中。

备注：发布分支并不会有专门的配套文档，建议您使用与本分支最接近版本的文档。

9.1 PlatformIO

• What is PlatformIO?
• Installation
• Configuration
• Tutorials
• Project Examples
• Next Steps

9.1.1 What is PlatformIO?

PlatformIO is a cross-platform embedded development environment with out-of-the-box support for ESP-IDF.

Since ESP-IDF support within PlatformIO is not maintained by the Espressif team, please report any issues with PlatformIO directly to its developers in the official PlatformIO repositories.

A detailed overview of the PlatformIO ecosystem and its philosophy can be found in the official PlatformIO documentation.

9.1.2 Installation

• PlatformIO IDE is a toolset for embedded C/C++ development available on Windows, macOS and Linux platforms
• PlatformIO Core (CLI) is a command-line tool that consists of multi-platform build system, platform and library managers and other integration components. It can be used with a variety of code development environments and allows integration with cloud platforms and web services
Chapter 9. 资源

9.1.3 Configuration

Please go through the official PlatformIO configuration guide for ESP-IDF.

9.1.4 Tutorials

- ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

9.1.5 Project Examples

Please check ESP-IDF page in the official PlatformIO documentation

9.1.6 Next Steps

Here are some useful links for exploring the PlatformIO ecosystem:

- Learn more about integrations with other IDEs/Text Editors
- Get help from PlatformIO community

9.2 有用的链接

- 您可以在 ESP32 论坛 中提出您的问题，访问社区资源。
- 您可以通过 GitHub 的 Issues 版块提交 bug 或功能请求。在提交新 Issue 之前，请先查看现有的 Issues。
- 您可以在 ESP IoT Solution 库中找到基于 ESP-IDF 的解决方案、应用实例、组件和驱动等内容。多数文档均提供中英文版本。
- 通过 Arduino 平台开发应用，请参考 ESP32、ESP32-S2 和 ESP32-C3 芯片的 Arduino 内核。
- 关于 ESP32 的书籍列表，请查看 乐鑫 网站。
- 如果您有兴趣参与到 ESP-IDF 的开发，请查阅 Contributions Guide。
- 关于 ESP32 的其它信息，请查看官网 文档 版块。
- 关于本文档的 PDF 和 HTML 格式下载（最新版本和早期版本），请点击 下载。
Chapter 10

Copyrights and Licenses

10.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2022 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

Some examples use external components which are not Apache licensed, please check the copyright description in each example source code.

10.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- **Newlib** is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensa header files** are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of **FreeRTOS** (components/freertos) are Copyright (C) 2017 Amazon.com, Inc. or its affiliates are licensed under the MIT License, as described in license.txt.
- Original parts of **LWIP** (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.
- **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- **FreeBSD net80211** Copyright (c) 2004-2008 Sam Leffler, Erno Consulting and licensed under the BSD license.
- **argtable3** argument parsing library Copyright (C) 1998-2001,2003-2011,2013 Stewart Heitmann and licensed under 3-clause BSD license. argtable3 also includes the following software components. For details, please see argtable3 LICENSE file.
  - C Hash Table library, Copyright (c) 2002, Christopher Clark and licensed under 3-clause BSD license.
  - The Better String library, Copyright (c) 2014, Paul Hsieh and licensed under 3-clause BSD license.
  - TCL library, Copyright the Regents of the University of California, Sun Microsystems, Inc., Scriptics Corporation, ActiveState Corporation and other parties, and licensed under TCL/TK License.
- **linenoise** line editing library Copyright (c) 2010-2014 Salvatore Sanfilippo, Copyright (c) 2010-2013 Pieter Noordhuis, licensed under 2-clause BSD license.
- **FatFS** library, Copyright (C) 2017 ChaN, is licensed under a BSD-style license.
- ** cJSON** library, Copyright (c) 2009-2017 Dave Gamble and cJSON contributors, is licensed under MIT license as described in LICENSE file.
- **micro-ecc** library, Copyright (c) 2014 Kenneth MacKay, is licensed under 2-clause BSD license.
• **Mbed TLS library**, Copyright (C) 2006-2018 ARM Limited, is licensed under Apache License 2.0 as described in LICENSE file.
• **SPIFFS library**, Copyright (c) 2013-2017 Peter Andersson, is licensed under MIT license as described in LICENSE file.
• **SD/MMC driver** is derived from OpenBSD SD/MMC driver, Copyright (c) 2006 Uwe Stuehler, and is licensed under BSD license.
• **ESP-MQTT** MQTT Package (contiki-mqtt) - Copyright (c) 2014, Stephen Robinson, MQTT-ESP - Tuan PM (<tuanpm at live dot com>) is licensed under Apache License 2.0 as described in LICENSE file.
• **BLE Mesh** is adapted from Zephyr Project, Copyright (c) 2017-2018 Intel Corporation and licensed under Apache License 2.0
• **mynewt-nimble** Apache Mynewt NimBLE, Copyright 2015-2018, The Apache Software Foundation, is licensed under Apache License 2.0 as described in LICENSE file.
• **TLSF allocator** <https://github.com/espressif/tlsf> Two Level Segregated Fit memory allocator, Copyright (c) 2006-2016, Matthew Conte, and licensed under the BSD 3-clause license.
• **openthread** Copyright (c) The OpenThread Authors, is licensed under BSD License as described in LICENSE file.
• **UBSAN runtime** — Copyright (c) 2016, Linaro Limited and Jiří Zárevůcký, licensed under the BSD 2-clause license.
• **HTTP Parser** Based on src/http/ngx_http_parse.c from NGINX copyright Igor Sysoev. Additional changes are licensed under the same terms as NGINX and Joyent, Inc. and other Node contributors. For details please check LICENSE file.
• **SEGGER SystemView** target-side library, Copyright (c) 2015-2017 SEGGER Microcontroller GmbH & Co. KG, is licensed under BSD 3-clause license.

### 10.1.2 Documentation

• HTML version of the ESP-IDF Programming Guide uses the Sphinx theme sphinx_idf_theme, which is Copyright (c) 2013-2020 Dave Snider, Read the Docs, Inc. & contributors, and Espressif Systems (Shanghai) CO., LTD. It is based on sphinx_rtd_theme. Both are licensed under MIT license.

### 10.2 ROM Source Code Copyrights

ESP32, ESP32-S and ESP32-C Series SoCs mask ROM hardware includes binaries compiled from portions of the following third party software:

• **Newlib** , licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
• **Xtensa libhal**, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
• **TinyBasic** Plus, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
• **miniz**, by Rich Geldreich - placed into the public domain.
• **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
• **TJpgDec** Copyright (C) 2011, ChaN, all right reserved. See below for license.

### 10.3 Xtensa libhal MIT License

Copyright (c) 2003, 2006, 2010 Tensilica Inc.

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.
Chapter 10. Copyrights and Licenses

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.4 TinyBasic Plus MIT License

Copyright (c) 2012-2013

Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the “Software”), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions:

The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software.

THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM, OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN THE SOFTWARE.

10.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.

关于本指南

本指南为乐鑫公司 ESP32 官方应用开发框架 ESP-IDF 的配套文档。

ESP32 芯片是一款 2.4 GHz Wi-Fi 和蓝牙双模芯片，内置 1 或 2 个 Xtensa® 32 位 LX6 处理器，运算能力最高可达 600 DMIPS。

ESP-IDF 即乐鑫物联网开发框架，可为在 Windows、Linux 和 macOS 系统平台上开发 ESP32 应用程序工具链、API、组件和工作流程的支持。
